| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistics for SGSN fast-path configurations.

Example

The following command displays fast-path statistics for all SGSN session managers:

```
show sgsn sessmgr all
```

show sgsn-map-app

Displays collected statistics for the SGSN Mobile Application Part (MAP).

Product

SGSN

Privilege

Inspector

Syntax

show sgsn-map-app statistics [| { grep *grep_options* **| more }]**

all

Displays collected statistics for the SGSN MAP application.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistics for the SGSN MAP application.

Example

The following command displays SGSN MAP statistics:

```
show sgsn-map-app statistics
```

show sgsn-mode

Displays the SGSN global configuration.

Product

SGSN

Privilege

Inspector

Syntax

show sgsn-mode[| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the configuration created with the commands in the SGSN Global Configuration mode.

Example

The following command displays the SGSN global configuration:

```
show sgsn-mode
```

show sgsn-pool

Displays collected pooling statistics for either GPRS services or SGSN services.

Product

SGSN

Privilege

Inspector

Syntax

show sgsn-pool statistics { gprs-service *srvc_name* **| sgsn-service** *srvc_name***} { nri-value** *nri_value* **| peer-non-broadcast-lac** *lac* **rac** *rac* **| target-load-in-progress [smgr-instance** *smgr_instance* **| target-nri** *target_nri* **] | target-offloaded-to-peer [target-nri** *target_nri* **] } [| { grep** *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the collected statistics for pooling in either GPRS or SGSN services. The outputs can be filtered to focus the statistics displayed.

Example

The following command displays the:

```
show sgsn-pool statistics sgsn-service sgsn1 nri-value 3
```

show sgsn-service

Displays information about the configured SGSN services in the current context.

Product

SGSN

Privilege

Inspector

Syntax

show sgsn-servie { all | name *srvc_name* **}**

all

Displays information for all SGSN services in the current context.

name *srvc_name*

Displays information for an existing SGSN service specified as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to display information for SGSN services.

Example

The following command displays information for all SGSN services in the current context:

```
show sgsn-service all
```

The following command displays information for an SGSN service in the current context that is named *sgsn1*:

```
show sgsn-service name sgsn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtp-service

Displays information about the configured GPRS Tunnelling Protocol (SGTP) services in the current context, including GTP-C and GTP-U operational configuration.

Product

SGSN, PDG/TTG, MME

Privilege

Inspector

Syntax

show sgtp-service { all [gtpu-table] | ggsn-table [smgr-instance *smgr_instance* **] | mbms-bearers | name** *srvc_name* **[gtpu-table] | sgsn-table }**

all [gtpu-table]

Displays configuration information for all of the SGTP services defined for the current context.
gtpu-table: Limits the output to GTPU information for all SGTP services.

ggsn-table [smgr-instance *srvc_name* **]**

Displays GGSN information configured for the SGTP service(s) in the current context.
smgr-instance *srvc_name* enter an integer from 1 through 384 to limit the GGSN output to information for a specific session manager.

mbms-bearers

This keyword is specific to the SGSN and is not yet supported.

name *srvc_name* **[gtpu-table]**

Displays information for the specified SGTP service in the current context. *srvc_name* must be an alphanumeric string of 1 through 63 characters that identifies a configured SGTP service.
gtpu-table: Limits the output to GTPU information for a specific SGTP service.

sgsn-table

Displays SGSN information configured for the SGTP service(s) in the current context.

Usage

Use this command to control the display of SGTP services information.

Example

The following command displays information for all SGTP services in the current context:

```
show sgtp-service all
```

The following command displays the GGSN information in SGTP services in the current context:

```
show sgtp-service ggsn-table
```

The following command displays the SGSN information in SGTP services in the current context:

show sgtp-service sgsn-table

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtpc statistics

Displays all statistics, for SGSN GPRS Tunnelling Protocol (SGTP) interface parameters, collected since the last restart or last use of a **clear** command.

Product

SGSN, PDG/TTG, MME

Privilege

Inspector

Syntax

show sgtpc statistics [all | gsn-address *ipv4_address* **| sgtp-service** *sgtp_srvc_name* **] [verbose][| { grep** *grep_options* **| more }]**

all

Displays configuration information for all of the SGTP services defined for the current context.

gsn-address *ipv4_address*

Displays statistics for an SGSN specified by its IP address in IPv4 dotted-decimal notation. This must be an existing and active interface.

sgtp-service *sgtp_srvc_name*

Displays statistics for an existing SGTP service specified as an alphanumeric string from 1 through 63 characters.

verbose

Causes the system to displays more detailed level of statistics.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for SGSN services.

Example

The following command displays statistics for the SGTP service named *sgtp1*:

```
show sgtpc statistics sgtp-service sgtp1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtpu statistics

Displays all transmission and reception statistics for pre-defined and active GTP-U interfaces collected since the last restart or last use of a **clear** command.

Product

SGSN, PDG/TTG

Privilege

Inspector

Syntax

show sgtpu statistics [ggsn-address *ipv4_address* **| gprs-service** *gprs_srvc_name* **nsei** *nse_id* **| iups-bind-address** *ipv4_address*| **iups-service** *iups_srvc_name* **| rnc-address** *ipv4_address* **| sgtp-service** *sgtp_srvc_name* **][| { grep** *grep_options* **| more }]**

ggsn-address *ipv4_address*

Displays statistics for the GGSN specified by its IP address in IPv4 dotted-decimal notation.

gprs-service *gprs_srvc_name* **nsei** *nse_id*

Displays NSEI-based GTPU statistics associated with an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.
nsei *nse_id*: Specifies a GPRS NSEI as an integer from 0 through 65535.

iups-bind-address *ipv4_address*

Displays SGSN GPRS Tunnelling Protocol (SGTP) statistics for an Iu GTPU interface specified by its IP address in IPv4 dotted-decimal notation.

iups-service *iups_srvc_name*

Displays statistics for an existing IuPS service specified as an alphanumeric string of 1 through 63 characters.

rnc-address *ipv4_address*

Displays statistics for a Radio Network Controller (RNC) identified by its IP address in IPv4 dotted-decimal notation.

sgtp-service *sgtp_srvc_name*

Displays statistics for an existing SGTP service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistics for the SGTPU interface.

Example

The following command displays GPTP-U statistics for the traffic between an SGSN and a connected RNC:

```
show sgtpu statistics rnc-address 123.1.2.3
```

show sgw-service

Displays configuration settings and/or service statistics for Serving Gateway (S-GW) services on this system.

Product

S-GW

Privilege

Inspector

Syntax

show sgw-service { all | name *service_name* **| statistics { all | name** *service_name* **} } [| { grep** *grep_options* **| more }]**

---

all

Displays configuration information for all S-GW services configured on this system.

---

name *service_name*

Displays configuration information for an existing S-GW service c specified as an alphanumeric string of 1 through 63 characters.

---

statistics { all | name *service_name* **}**

all: Displays statistics for all S-GW services on this system or for a specified service.
name *service_name*: Displays statistics for an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration settings and/or service statistics for S-GW services on this system.

Example

The following command displays service statistics for the S-GW service named *sgw1*:

```
show sgw-service statistics name sgw1
```

show sms statistics

Displays traffic statistics for the Short Message Service (SMS).

Product

SGSN

Privilege

Inspector

Syntax

show sms statistics [gprs-only | sgsn-only] [name *map_srvc* **] [verbose] [| { grep** *grep_options* **| more }]**

gprs-only

Displays only GPRS access type SMS statistics.

sgsn-only

Displays only UMTS access type SMS statistics.

name *map_srvc*

Displays statistics for an existing MAP service specified as an alphanumeric string of 1 through 63 characters.

verbose

Causes the system to displays more detailed level of statistics.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display traffic statistics for the SMS services.

Example

Use the following command to display SMS statistics for 3G traffic:

```
show sms statistics sgsn-only
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sndcp statistics

Displays statistics for the packet traffic going through the Subnetwork Dependent Convergence Protocol (SNDCP) layer.

Product

SGSN

Privilege

Inspector

Syntax

show sndcp statistics [gprs-service *srvc_name* **] [verbose] [| { grep** *grep_options* **| more }]**

gprs-service *srvc_name*

Displays statistics for an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.

verbose

Displays a more detailed level of statistics.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display SNDCP traffic statistics. Include the **gprs-service** keyword to filter the output to statistics for only one GPRS service.

Example

Use the following command to display all SNDCP layer traffic statistics:

```
show sndcp statistics verbose
```

Use the following command to display SNDCP layer traffic statistics for the *test1* GPRS service:

```
show sndcp statistics gprs-service test1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show snmp

Displays information on the Simple Network Management Protocol (SNMP) servers and interfaces.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show snmp { accesses | communities | contexts | notifies | server | transports | trap [history | statistics { verbose } { wide }] | views } [| { grep *grep_options* **| more }]**

---

accesses

Displays SNMP server usage statistics.

---

communities

Displays SNMP community strings.

---

contexts

Displays SNMP information per context.

---

notifies

Displays SNMP event trap and notification statistics.

---

server

Displays SNMP server configuration information.

---

transports

Displays trap destination configuration information.

---

trap [history | statistics { verbose } { wide }]

history: Displays SNMP event trap history. **trap history** Displays up to 5,000 time-stamped trap records stored in a buffer. The buffer may be cleared by entering the **clear snmp history** command.
statistics: Displays SNMP event trap and notification statistics.
verbose: Displays rows for every defined trap, even if never generated.
wide: Displays trap statistics data in excess of 80 columns.

---

views

Displays SNMP views.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display SNMP information as part of system verification and troubleshooting.

Example

The following commands display the usage statistics, community string information, event trap and notification data, server information, and trap destination configuration, respectively.

```
show snmp communities

show snmp transport

show snmp server

show snmp accesses

show snmp notifies

show snmp trap history
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show srp

Displays the Service Redundancy Protocol (SRP) information.

Product

All products that support Interchassis Session Recovery (ICSR)

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show srp { audit-statistics [all | instance *number* **] [message-level | session-level] | call-loss statistics | checkpoint statistics [active | standby] [verbose] | info | monitor [all | authentication-probe | bfd | bgp | diameter] | statistics } | [grep** *grep_options* **| more]**

---

audit-statistics [all | instance *number* **] [message-level | session-level]**

Displays statistics of external audit.
all: Displays information for all Session Managers.
instance *number*: Displays information for an instance number of Session Manager.specified as an integer from 1 through 4294967295.
message-level: Displays message-level statistics.
session-level: Displays session-level statistics.

---

call-loss statistics

Displays history of lost calls during switchover.

---

checkpoint statistics [active | standby] [verbose]

Displays check pointing statistics on session redundancy data (session managers, current call recovery records, etc.).
active: Displays information for the active chassis.
standby: Displays information for the standby chassis.
verbose: Displays cumulative information for all session managers in tabular output.

---

info

Displays Service Redundancy Protocol information (context, chassis state, peer, connection state, etc.).

---

monitor [all | authentication-probe | bfd | bgp | diameter]

Displays SRP monitor information.
all: Displays monitor information for all types (authentication-probe, bgp, and diameter).
authentication-probe: Displays authentication probe monitor information.
bfd: Displays BFD monitor information.
bgp: Displays BGP monitor information.
diameter: Displays Diameter monitor information.

---

statistics

Displays SRP statistics (hello messages sent, configuration validation, resource messages, switchovers, etc.).

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the *Interchassis Session Recovery* appendix of the *System Administration Guide* and the *Service Redundancy Protocol Configuration Mode* chapter of this guide.

Example

The following commands display Service Redundancy Protocol information:

```
show srp audit-statistics

show srp call-loss statistics

show srp checkpoint statistics

show srp info

show srp monitor

show srp statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ss7-routing-domain

This command displays the configuration information for the defined Signalling System #7 (SS7) routing domains. Since SS7 routing domains encompass a large number of operational parameters, this command enables you to narrow your displays to specific protocol parameters on a specific link.

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show ss7-routing-domain { all | *ss7rd_id* { m3ua | mtp2 | mtp3 | qsaal | routes [adjacent] | sctp asp { all | instance *asp_id* } | sscf } }

show ss7-routing-domain *ss7rd_id* m3ua { statistics { gen | peer-server { all | id *peer-server_id* peer-server-process { all | instance *psp_instance* } } } | status { address-translation-table | destination-point-code { all | *ss7_dpc* } | gen | peer-server *peer-server_id* [peer-server-process instance *psp_id* | verbose] }

show ss7-routing-domain 1 sscf { statistics linkset { all | id *linkset_id* link { all | id *link_id* } } | status linkset { all | id *linkset_id* link { all | id *link_id* [verbose] } } }

ss7-routing-domain { all | *ss7rd_id* }

all: Displays information for all SS7 routing domains.
ss7rd_id: Displays information for the SS7 routing domain ID specified as an integer from 1 through 12.

m3ua

Displays statistics and status information for the SS7 MTP3 User Adaptation Layer (M3UA) in the specified SS7 routing domain.

mtp2

Displays statistics and status information for the SS7 Message Transfer Part-2 (MTP2) in the specified SS7 routing domain.

mtp3

Displays statistics and status information for the SS7 Message Transfer Part-3 (MTP3) in the specified SS7 routing domain.

qsaal

Displays statistics and status information for the Service Specific Connection-Oriented Protocol (SSCOP) sub-layer of the Quasi Signaling Application Adaptation Layer (QSAAL) in the specified SS7 routing domain.

routes [adjacent]

Displays the destination point code (DPC) routing table.

adjacent: If this keyword is used with the **routes** keyword, access is provided to the statistics and status information for configured adjacent point codes.

---

sctp asp { all | instance *asp_id* **}**

Provides access to the status or statistics for the Stream Control Transmission Protocol (SCTP) application server processes (ASP) in the specified SS7 routing domain for all or a specified SCTP ASP instance.

- **all**: Displays the information for all SCTP application server process instances for a specific SS7 routing domain.
- **instance** *asp_id*: Displays the information for an SCTP application server process instance specified as an integer from 1 through 4.

---

sscf

Displays statistics and status information for the Service Specific Coordination Function (SSCF [q.2140]) in the specified SS7 routing domain.

---

peer-server [all | id *peer-server_id* **]**

Filters the information for the specific protocol in the SS7 routing domain for all or a specific peer server ID.

- **all**: Displays the information for all peer servers for a specific protocol.
- **id** *peer-server_id*: Indicates the specific linkset identifier as an integer from 1 through 49.

---

peer-server-process [all | instance *instance_id* **]**

Filters the information for the specific protocol in the SS7 routing domain for all or a specific instance of peer-server process.

- **all**: Displays the information for all peer server process instances for a specific protocol.
- **instance** *instance_id*: Specifies a peer server process instance as an integer from 1 through 4.

---

destination-point-code [all | *dest_point_code***]**

Filters the information for the specific protocol in the SS7 routing domain for all or a specific DPC.

- **all**: Displays the information for all DPCs in the SS7 routing domain.
- *dest_point_code*: Specifies a DPC in the SS7 routing domain.

---

gen

Displays general information for the specific protocol in the specified SS7 routing domain.

---

verbose

Enables the display of maximum information for a protocol.

---

linkset [all | id *linkset_id* **]**

Filters the information for the specific protocol in SS7 routing domain for all or a specific link set.

- **all**: Displays the information for all linkset for a specific protocol.
- **id** *linkset_id*: Specifies a linkset identifier as an integer from 1 through 49.

---

link [all | id *link_id* **]**

Filters the information for a specified protocol in the SS7 routing domain for all or a specific link set.

- **all**: Displays the information for all links for a specific protocol.

- **id** *link_id*: Specifies a linkset identifier as be an integer from 1 through 16.

Usage

Use this command to display the SS7 routing domain and different layer protocol information for SGSN service.

Example

Displays the information/statistics for all SCTP application server processes of peer server ID 17 and peer server process instance 1 in SS7 routing domain 12:

```
show ss7-routing-domain 12 sctp asp all status peer-server id 17 peer-
server-process instance 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ssh key

Displays the secure shell (SSH) public key information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ssh key [type { v1-rsa | v2-rsa | v2-dsa }] [| { grep *grep_options* **| more }]**

[type { v1-rsa | v2-rsa | v2-dsa }]

Specifies the type of SSH key information to display. If type is not specified, information for all types is displayed.
v1-rsa: SSH v1 RSA host key only
v2-rsa: SSH v2 DSA host key only
v2-dsa: SSH v2 RSA host key only

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Show the secure shell key information for all types to verify installed keys.

Example

The following command shows information for all SSH V1 and SSH V2 keys:

```
show ssh key
```

The following command shows information for only SSH V2 RSA host keys:

```
show ssh key type v2-rsa
```

show ssl cipher-suite

Displays information related to Secure Sockets Layer (SSL) cipher suites since the last restart or **clear** command. A cipher suite contains the cryptographic algorithms supported by the client.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show ssl cipher-suite [name *name* **] [| { grep** *grep_options* **| more }]**

name *name*

Displays information related to the SSL cipher suite specified as an alphanumeric string of 1 through 127 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information related to SSL cipher suites.

Example

The following command displays information for the SSL cipher suite *ssl_cipher_suite_1*:

```
show ssl cipher-suite name ssl_cipher_suite_1
```

show ssl connection

Displays information pertaining to Secure Sockets Layer (SSL) connections on the Proxy Call Session Control Function (P-CSCF).

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show ssl connection [list | summary [service-name *name* **]] [name** *name* **] [| { grep** *grep_options* **| more }]**

list

Lists the SSL connections on the P-CSCF.

summary

Displays state and statistical information for the SSL connections on the P-CSCF.

service-name *name*

Lists the SSL connections on the P-CSCF for the specified P-CSCF service, or displays state and statistical information for the SSL connections on the P-CSCF for the specified P-CSCF service.
name must be an alphanumeric string of 1 through 63 characters.

name *name*

Displays state and statistical information for the SSL connection specified as an alphanumeric string of 1 through 127 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command in Exec Mode to display information and statistics pertaining to SSL connections.
If the **summary** keyword is not used, detailed information is displayed.

Example

The following command displays SSL connection information for the P-CSCF service *pcscf_tls_1*:

```
show ssl connection list service-name pcscf_tls_1
```

show ssl map

Displays information related to configured Secure Sockets Layer (SSL) maps/templates since the last restart or **clear** command.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show ssl map [map-type ssl-subscriber-template] [name *name* **] [| { grep** *grep_options* **| more }]**

map-type ssl-subscriber-template

Displays information related to configured SSL maps/templates for the SSL map/template type ssl-subscriber-template.

name *name*

Displays information related to configured SSL maps/templates for the map/template name specified as n alphanumeric string of 1 through 127 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information related to configured SSL maps/templates.

Example

The following command displays information related to configured SSL maps/templates for the SSL map/template *ssl_template_1*:

```
show ssl map name ssl_template_1
```

show ssl statistics

Displays statistics for Secure Sockets Layer (SSL) since the last restart or **clear** command.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show ssl statistics [service-name *name* **] [| { grep** *grep_options* **| more }]**

service-name *name*

Displays SSL statistics for the Proxy Call Session Control Function (P-CSCF) service. specified as an alphanumeric string of 1 through 127 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display SSL statistics.

Example

The following command displays SSL statistics for all P-CSCF services:

```
show ssl statistics
```

show subscribers

Shows information for subscriber sessions defined by the specified keywords. Keywords described under Command Keywords below are base commands that display distinctive types of data. Keywords described under Filter Keywords modify or filter the output of the base commands. Not all filter keywords are available for all command keywords. Each command keyword lists the filter keywords that it accepts.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show subscribers [*command_keyword* **] [** *filter_keywords* **] [| { grep** *grep_options* **| more }]**

command_keyword

The following keywords are base commands that each have a distinct display output. Only one Command Keyword can entered on the command line.

aaa-configuration

Displays Authentication Authorization and Accounting (AAA) configuration information for subscriber sessions defined by the specified filter keywords. The following filter keywords are valid with this command: **active, all, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant**, **fa**, **fa-service, ggsn-service**, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, **plmn-type, rx-data**, **session-time-left, sgsn-address**, **sgsn-service, tx-data, username, verbose, grep, more**

access-flows { accounting | dynamic | pre-provisioned | static }

Shows the ip-flows for the subscribers defined by the specified filter keywords.
accounting: displays the accounting type of access flows for a subscriber.
dynamic: displays the dynamic type of access flows for a subscriber.
pre-provisioned: displays the pre-provisioned type of access flows for a WiMAX subscriber.
static: displays the static type of access flows for a subscriber.
The following filter keywords are valid with this command:

active, active-charging-service, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, flow-type, ggsn-service, gsm-traffic-class, hnbgw-only, ha, ha-ipsec-only, ha-service, idle-time, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-remote-address, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, msid, msiddn, network-requested, network-type, pcf, pdsn-service, plmn-type, rulebase, rx-data, session-time-left, sgsn-address, sgsn-service, tpo, tx-data, username, verbose, grep, more

activity

Displays subscriber link activity percentage. When no Filter Keywords are specified, the output is a summary of all subscriber activity. When Filter Keywords are specified, the link activity percentage is displayed as graphs in which one is displayed using a high sampling rate, a 10-second interval between samples, and a low sampling rate, a 15-minute interval between samples
The following filter keywords are valid with this command:

```
active, all, asngw-service, asnpc-service, asn-peer-address, apn,
callid, card-num, configured-idle-timeout, connected-time, dhcp-server,
dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi,
ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-
time-left, msid, network-requested, pcf, pdsn-service, plmn-type, rx-
data, session-time-left, sgsn-address, sgsn-service, tpo, tx-data,
username, grep, more
```

asn-peer-address *ip_address*

Displays information for subscribers on an ASN-GW trusted peer.
ip_address is the IP address of the ASN-GW peer server expressed in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

```
all, counters all, asngw-service, full, summary, grep, more
```

asngw-service *service_name*

Displays counters for subscribers accessing the ASN-GW service.
service_name must be an existing service and be from 1 to 63 alphanumeric characters.
The following filter keywords are valid with this command:

```
all, counters all, full, summary, grep, more
```

asnpc-service *service_name*

Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service.
service_name must be an existing Access Service Network Paging Controller (ASN PC) service and be from 1 to 63 alphanumeric characters.
The following filter keywords are valid with this command:

```
all, counters all, full, summary, grep, more
```

bearer-establishment { direct-tunnel | normal | pending }

Selects Bearer Establishment type defined by the specified filter keywords.
direct-tunnel: Select subscribers having direct tunnel established with the Radio Network Controller (RNC).
normal: Select subscribers having bearer established with SGSN.
pending: Select subscribers for whom bearer is not fully established.

configuration

Displays current configuration for all subscribers or a specified subscriber. The following filter keywords are valid with this command:
all, username, grep, more

counters

Shows the counters associated with the subscriber. The following filter keywords are valid with this command:

`active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tpo, tx-data, username, grep, more`

cscf-only

Displays information for Call Session Control Function (CSCF) subscribers only.
The following filter keywords are valid with this command:

`aaa-configuration, access-flows, active, activity, all, bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, dormant, fa, full, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, policy, rx-data, session-time-left, smgr-instance, subscription, summary, tft, tx-data, username, wf1`

cscf-service *service_name*

Displays information for subscribers accessing the specified CSCF service.
service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

`bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, cscf-service, fa, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, rx-data, session-time-left, smgr-instance, subscription, tx-data, username`

css-delivery-sequence

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

css-service *csssvc_name*

Important: This is a restricted keyword. In StarOS 9.0 and later releases, this keyword is obsolete.

data-rate [summary | full] [verbose | graph { high | low }] [high | low]

Indicates how to display subscriber throughput data.

Important: This keyword is best used for individual subscriber output.

summary: Combines statistics for the matching subscriber and displays a summary in text form.
full: Displays a separate output for each matching subscriber separately in tabular form.
verbose: Displays cumulative information for all matching subscribers in tabular output.
graph { **high** | **low** }: Display the throughput data as a graph using either a high sampling rate of every 30 seconds or a low sampling rate of every 15 minutes. The graph contains data points over the last 24 hours, if available. The command displays a graph each for the transmit and receive peak, average, and sustained throughput for a total of six graphs.
high: Display the raw data collected for the throughput analysis using a high sampling rate (smaller interval). The data displayed uses a sampling interval of 30 seconds and includes the data collected over the last 24 hours, if available.
low: Display the raw data collected for the throughput analysis using a low sampling rate (larger interval). The data displayed uses a sampling interval of 15 minutes and includes the data collected over the last 24 hours, if available.
The following filter keywords are valid with this command:

```
active, all, asngw-service, asnpc-service, asn-peer-address, apn,
callid, card-num, configured-idle-timeout, connected-time, dhcp-server,
dormant, fa, fa-service, ggsn-service, ha, ha-service, hnbgw-
service,hsgw-only, hsgw-service, idle-time, imsi, ip-address, ip-pool,
lac, lac-service, lma-service, lns, lns-service, long-duration-time-
left, mag-service, mme-address, mme-service, msid, network-requested,
pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address,
sgsn-service, tpo, tx-data, username, grep, more
```

debug-info { callid *id* **| msid** *id* **| username** *name* **}**

Displays internal call troubleshooting information for subscriber sessions defined by the specified keywords.
callid *id*: Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-digit hexadecimal number.
msid *id*: Displays information for the mobile user identified by *id*. *id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.
username *name*: Displays information for connections for the subscriber identified by *name*. The user must have been previously configured. *name* must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘). For example; ‘$’.

ebi *number*

Displays subscribers based on an EPS bearer identity. *number* specifies the EBI number and must be an integer value from 5 to 15.

enodeb-address *ip_address*

Displays subscribers based on the eNodeB to which they are attached. *ip_address* must be a valid IP address of an existing eNodeB specified in IPv4 dotted-decimal or IPv6 colon-separated notation.

fng-only

Displays Femto Network Gateway (FNG) context information for the session.

fng-service *service_name*

Displays information for subscribers accessing the specified FNG service.
service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters.

full

Shows all available subscriber information. The following filter keywords are valid with this command:

`active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tpo, tx-data, username, grep, more`

ggsn-only

Displays only GGSN-specific subscriber context information.

gprs-only

This keyword is specific to the SGSN and only displays 2G SGSN subscriber information.
The following filter keywords are valid with this keyword:

`apn, callid, card-num, connected-time, idle-time, gprs-service, gsm-traffic-class, gtp-version, imsi, msid, msisdn, nri, nsei, sgsn-service, smgr-instance`

gprs-service *srvc_name*

Enter the name of the configured 2G GPRS service to display subscriber information specific to the named GPRS service for the SGSN.
srvc_name must be an alphanumeric string of 1 through 63 characters that identifies a configured GPRS service.
The following filter keywords are valid with this command:

`apn, callid, card-num, connected-time, idle-time, gprs-service, gsm-traffic-class, gtp-version, imsi, msid, msisdn, nri, nsei, sgsn-service, smgr-instance`

gtp-version { 0 | 1 }

Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1).
The following filter keywords are valid with this command:

`active-charging-service, apn,bearer-establishment, callid, dhcp-server, fa, fa-service, ggsn-service, gprs-service, gsm-traffic-class, msid, msisdn, plmn-type, sgsn-address, sgsn-service, smgr-instance, tx-data, username, grep, more.`

hnbgw-only

Displays HNB-GW subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

hnbgw-service *svc_name*: Displays subscriber information based on the HNB-GW service name. *svc_name* must be an existing HNB-GW service expressed as an alphanumeric string of 1 through 63 characters.

---

hsgw-only

Displays HSGW subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

hsgw-service *svc_name*: Displays subscriber information based on the HSGW service name. *svc_name* must be an existing HSGW service expressed as an alphanumeric string of 1 through 63 characters.

---

hsgw-service *svc_name*

Displays subscriber information based on the HSGW service name. *svc_name* must be an existing HSGW service expressed as an alphanumeric string of 1 through 63 characters.

---

imsi *imsi*

Displays information specific to one subscriber or group of subscribers. Enter 1 to 15 digits to identify a specific subscriber's IMSI (International Mobile Subscriber Identity).
The following filter keywords are valid with this command:

```
apn, callid, card-num, connected-time, idle-time, gprs-service, gsm-traffic-class, gtp-
version, imsi, msid, msisdn, nri, nsei, sgsn-service, smgr-instance
```

---

ip-alloc-method {aaa-assigned | dhcp [relay-agent | proxy-client] | dynamic-pool | l2tp-lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:
aaa-assigned: Selects subscribers whose IP addresses were assigned by AAA.
dhcp: Selects subscribers whose IP addresses were assigned by DHCP.

- **relay-agent**: Selects subscribers whose IP addresses were assigned by the DHCP Relay Agent
- **proxy-client**: Selects subscribers whose IP addresses were assigned by the DHCP Proxy Client

dynamic-pool: Selects subscribers whose IP addresses were assigned from a dynamic IP address pool.
l2tp-lns-assigned: Selects subscribers whose IP addresses were assigned by the Layer 2 Tunneling Protocol (LT2P) Network Server.
mip-ha-assigned: Selects subscribers whose IP addresses were assigned by the Mobile IP Home Agent.
ms-provided-static: Selects subscribers whose IP addresses were provided by the Mobile Station.
not-ms-provided-static: Selects subscribers whose IP addresses were not provided by the Mobile Station.
static-pool: Selects subscribers whose IP addresses were assigned from a static IP address pool.

---

ipsg-only

Displays IPSG subscriber session information.

---

lma-service *svc_name*

Displays subscriber information based on the Local Mobility Anchor (LMA) service name. *svc_name* must be an existing LMA service expressed as an alphanumeric string of 1 through 63 characters.

mag-only

Displays MAG subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

mag-service *svc_name*: Displays subscriber information based on the Mobile Access Gateway (MAG) service name. *svc_name* must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

mag-service *svc_name*

Displays subscriber information based on the MAG service name. *svc_name* must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

mme-address

Displays subscriber information based on the MME IP address. *ip_address* must be an existing MME IP address and be entered in IPv4 dotted-decimal notation.

mme-only

Displays MME subscriber session information.
The following filter keywords are valid with this command:

```
all, full, summary
```

mme-service *svc_name*: Displays subscriber information based on the MME service name. *svc_name* must be an existing MME service expressed as an alphanumeric string of 1 through 63 characters.
mme-address *ip_address*: Displays subscriber information based on the MMM IP address. *ip_address* must be an existing MME IP address entered in IPv4 dotted decimal notation.

mseg-only

Important: This keyword is not supported in this release. For more information please contact your Cisco account representative.

Displays MSEG-specific subscriber information.
The following filter keywords are valid with this option:

```
all, apn, callid, card-num, full, fw-and-nat, gsm-traffic-class, imsi,
ip-alloc-method, mseg-service, network-type, rulebase, smgr-instance,
subscription, summary, tft
```

mseg-service *mseg_service_name*

Important: This keyword is not supported in this release. For more information please contact your Cisco account representative.

Displays MSEG service specific subscriber information.
mseg_service_name must be the name of an existing MSEG service, expressed as an alphanumeric string of 1 through 63 characters.

The following filter keywords are valid with this option:

```
active-charging-service, apn, bandwidth-policy, bearer-establishment,
bng-service, callid, card-num, cbb-policy, configured-idle-timeout,
connected-time, dhcp-server, ebi, enodeb-address, fa, firewall, fw-and-
nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, ha,
idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool,
ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr,
long-duration-time-left, mipv6ha-service, mseg-service, msid, msisdn,
nat, network-requested, network-type, plmn-type, profile-id, qci,
rulebase, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address,
sgsn-service, smgr-instance, tpo, tx-data, username
```

msid *msid*

For this SGSN-specific keyword, enter the MSID (Mobile Station IDentifier) to display information specific to one subscriber's equipment by entering the MSID.
The following filter keywords are valid with this command:

```
apn, callid, card-num, connected-time, idle-time, gprs-service, gsm-traffic-class, gtp-
version, imsi, msid, msisdn, nri, nsei, sgsn-service, smgr-instance
```

msisdn *msisdn*

For this SGSN-specific keyword, enter the MSISDN (Mobile Station ISDN number - unique SIM phone number) to display information specific to one subscriber's equipment by entering the MSISDN.
The following filter keywords are valid with this command:

```
apn, callid, card-num, connected-time, idle-time, gprs-service, gsm-traffic-class, gtp-
version, imsi, msid, msisdn, nri, nsei, sgsn-service, smgr-instance
```

pdg-only

Displays a summary of PDG subscriber statistics.

pdg-service *name*

Displays statistics for users associated with a specific PDG service name.

pdif-only

Displays a summary of Packet Data Interworking Function (PDIF) subscriber statistics.

pdif-service *name*

Displays connection statistics for users associated with a specific PDIF service name.

pgw-only

Displays PDN-Gateway (P-GW) subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

pgw-service *svc_name*: Displays subscriber information based on the P-GW service name. *svc_name* must be an existing P-GW service expressed as an alphanumeric string of 1 through 63 characters.

sgw-address *ip_address*: Displays subscriber information based on the S-GW IP address. *ip_address* must be an existing S-GW IP address in IPv4 dotted-decimal notation.

---

qci *number*

Displays subscriber session information based on the QoS Class Identifier (QCI) value assigned to the subscriber. *number* must be an integer value from 0 to 9.

---

s1u-state { active | idle | idle-active }

Displays session information based on the subscriber's S1-U state. The S1-U interface is the interface from the eNodeB to the S-GW.
active: Displays session information for subscribers with an S1-U state set to active.
idle: Displays session information for subscribers with an S1-U state set to idle.
idle-active: Displays session information for subscribers with an S1-U state set to idle-active.

---

s5-proto { gtp | pmip }

Displays subscriber session information based on the S5 interface protocol used. Choose either GPRS Tunneling Protocol (GTP) or Proxy Mobile IPv6 (PMIP).

---

sgsn-only

This SGSN-only keyword displays only 3G SGSN-specific subscriber context information.
The following filter keywords are valid with this command:

```
apn, callid, card-num, connected-time, idle-time, gprs-service, gsm-traffic-class, gtp-
version, imsi, msid, msisdn, nri, nsei, sgsn-service, smgr-instance
```

---

sgsn-service *service_name*

For this SGSN-only keyword, enter the name of the configured 3G SGSN service to display subscriber information specific to the named SGSN service.
The following filter keywords are valid with this command:

```
apn, callid, card-num, connected-time, idle-time, gprs-service, gsm-traffic-class, gtp-
version, imsi, msid, msisdn, nri, nsei, sgsn-service, smgr-instance
```

---

sgw-only

Displays S-GW subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

sgw-service *svc_name*: Displays subscriber information based on en existing S-GW service specified as an alphanumeric string of 1 through 63 characters.
pgw-address *ip_address*: Displays subscriber information based on an existing P-GW specified by its IP address in IPv4 dotted-decimal notation.

---

sgw-service *svc_name*

Displays subscriber information based on an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.

subscription { aor *address* **| callid** *id* **| full }**

Displays subscription information for defined subscribers, based on defined parameters.
aor *address*: Clears session(s) by Address of Record.
callid *id*: Specifies a Call Identification Number.
full: Displays all available information.

summary

Displays only a summary of the subscriber information. The following filter keywords are valid with this command:

`active, active-charging-service, activity, all, asngw-service, asnpc-service, asn-peer-address, apn, bandwidth-policy, bearer-establishment, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, dhcp-server, dormant, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, ha, ha-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, lac, lac-service, lns, lns-service, long-duration-time-left, mseg-service, msid, msisdn, nat, network-requested pcf, pdsn-service,plmn-type, profile-id, qci, rulebase, rx-data, session-time-left, sgsn-address, tpo, tx-data, username, grep, more`

tft

Displays the current Traffic Flow Template (TFT) associated with the subscriber session.

tx-data

Bytes transmitted by the subscriber.

wf1

Displays subscriber information in wide format number 1. Wide format number 1 includes the following information for each listed subscriber session:

- Access Type
- Access Technology
- Call State
- Link Status
- Network Type
- Call ID
- MSID
- Username
- IP Address
- Time-Idle
- Access Peer Address
- Service Address
- Network Peer Address
- Connect Time

filter_keywords

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.
For example; if you enter the following command:
show subscribers counters ip-pool pool1 card-num 1
Counters for all subscriber sessions that were assigned an IP address from the IP pool named pool1 and also are being processed by the processing card in slot 1 is displayed. Information for all other subscribers is not displayed.

active

Only display information for those subscribers who currently have active sessions.

active-charging-service *acs_service*

Displays information for subscribers being processed by the active charging service specified as an alphanumeric string of 1 through 15 characters.

all

If no keywords are specified before **all**, information for all subscribers is displayed. If keywords are specified before **all**, all information is displayed with no further options being allowed.

apn *name*

Displays subscribers currently facilitated by the access point name (APN) configured on the SGSN or GGSN.

asngw-only

Displays counters for subscribers accessing the ASN-GW service only.

asnpc-only

Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service only.

hnbgw-only

Displays counters for subscribers accessing the HNB-GW service only.

callid *id*

Displays subscriber information for the call ID specified as an 8-byte hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. The slot number is an integer from 1 through 74 or 10 through 16.

ccoa-only

Displays the subscribers that registered a MIP with CoA directly with the HA.
This option is only valid when a MIPHA session license is enabled.

configured-idle-timeout [< | > | greater-than | less-than] *value*

Shows the idle timeout that is configured for the specified subscriber. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

connected-time [< | > | greater-than | less-than] *value*

Shows how long the subscriber has been connected. **<**: Filters output so that only information less than the specified value is displayed.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

cscf-only

Displays information for Call Session Control Function (CSCF) subscribers only.

cscf-service *service_name*

Displays information for subscribers accessing an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.

dhcp-server *address*

Displays subscribers currently accessing the system that have been provided an IP address by the DHCP server specified by its address. GGSN only.

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

enodeb-address *IPv4_ddress*

Displays information for Evolved Packet System (EPS) subscribers connected to the eNodeB specified by IP address in IPv4 dotted-decimal notation.

fa *address*

Displays information for subscribers connected to the foreign agent specified by its IP address in IPv4 dotted-decimal notation.

fa-only

Only display FA-specific context information.

fa-service *name*

Displays information for subscribers connected to the named foreign agent (FA) service.

firewall { not-required | required }

Displays information for the specified subscribers:
not-required: Subscribers for whom firewall processing is not required.
required: Subscribers for whom firewall processing is required.

firewall-policy *fw_policy_name*

This keyword is obsolete.

fw-and-nat policy *fw_nat_policy*

Important: This option is customer-specific and is only available in StarOS 8.1.

Displays information for subscribers using an existing Firewall-and-NAT policy specified as an alphanumeric string of 1 through 15 characters.

ggsn-address *ip_address*

Displays information for subscribers connected to an existing GGSN specified by its IP address in IPv4 doted-decimal notation. SGSN only

ggsn-preservation-mode

Displays information for subscribers connected to the GGSN service with preservation mode enabled. GGSN only.

ggsn-service *name*

Displays information for subscribers connected to the named GGSN service. This keyword is for GGSN only.

gprs-only

Displays only 2G SGSN subscribers content. SGSN only.

gprs-service *srvc_name*

Displays subscriber information for the named 2G GPRS service. SGSN only.

gsm-traffic-class { background | conversational | interactive | streaming }

Displays information for subscriber traffic that matches the specified 3GPP traffic class.

- **background**: 3GPP QoS background class.
- **conversational**: 3GPP QoS conversational class.
- **interactive**: 3GPP QoS interactive class. Must be followed by a traffic priority.
- **streaming**: 3GPP QoS streaming class.

ha *address*

Displays information for subscribers connected to the home agent specified by its IP address in IPv4 dotted-decimal notation.

ha-ipsec-only

Only displays information for subscriber sessions that are using IP-Security (IPSec).

ha-only

Only displays HA-specific context information.

ha-service *name*

Displays information for subscribers connected to the named home agent service.

idle-time [< | > | greater-than | less-than] *value*

Displays how long the subscriber session has been idle or display subscriber sessions that meet the idle time criteria specified.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

ims-auth-service *service_name*

Displays information for subscribers for an existing IMS Authorization Service name.

imsi *id*

Displays the subscriber with the specified ID. The IMSI (International Mobile Subscriber Identity) ID is a 15-character string which identifies the subscriber's home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

ip-address [< | > | greater-than | less-than] *address*

Displays information for subscribers connected to the specified *address*.
<: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
>: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
greater-than: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
less-than: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
address: The address must be specified using IPv4 dotted-decimal notation. Used in conjunction with <, >, greater-than, less-than. If the IP address is specified without a qualifier, only subscribers with the specified IP address have their information displayed.

ip-pool *name*

Displays information for subscribers assigned addresses from an existing IP address pool or IP pool group. *name* will be an IP address in IPv4 dotted-decimal or IPv6 colon-separated notation based on the call line setup for the specified pool.

ipv4

Displays information for subscribers with an IPv4 Firewall enabled/disabled.

ipv6

Displays information for subscribers with an IPv6 Firewall enabled/disabled.

ipv6-address *address*

Displays information for subscribers connected to the specified IPv6 address.

ipv6-prefix *prefix*

Displays information for subscribers connected to the specified IPv6 address prefix.

lac *address*

Displays information for calls to the peer L2TP Access Concentrator (LAC) specified by its IP address.

lac-only

Displays LAC specific information only.

lac-service *name* **[local-tunnel-id id | remote-tunnel-id** *id* **]**

Displays information for calls associated with the LAC service specified as an alphanumeric string of 1 through 63 characters.
local-tunnel-id *id*: Specifies a local tunnel from which to clear calls as an integer from 1 through 65535.
remote-tunnel-id *id*: Specifies a remote tunnel from which to clear calls as an integer from 1 through 65535.

l3-tunnel-local-addr *ip_address*

A layer 3 tunneling interface specified by its IP address in IPv4 dotted-decimal notation.

l3-tunnel-remote-addr *ip_address*

A layer 3 tunneling peer specified by its IP address in IPv4 dotted-decimal notation.

lns *address*

Displays information for calls to the peer L2TP Network Server (LNS) specified by its IP address.

lns-only

Displays LNS specific information only.

lns-service *name* **[local-tunnel-id** *id* **| remote-tunnel-id** *id* **]**

Displays information for calls associated with the LNS service specified as an alphanumeric string of 1 through 63 characters.

local-tunnel-id *id*: Indicates a specific local tunnel from which to clear calls. *id* must be an integer from 1 through 65535.
remote-tunnel-id *id* : Indicates a specific remote tunnel from which to clear calls. *id* must be an integer from 1 through 65535.

---

long-duration-time-left [< | > | greater-than | less-than] *value*

Shows how much time is left for the maximum duration of a specified subscriber session.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

---

mip-udp-tunnel-only

Displays the subscribers that negotiated MIP-UDP tunneling with the HA.
This option is only valid when MIP NAT Traversal license is enabled.

---

mipv6ha-only

Displays MIPV6HA-specific context information for the session.

---

mipv6ha-service *service_name*

Displays specific configured MIPV6 Home Agent service. *service_name* must have been previously defined.

---

msid *id*

Displays information for the mobile user identified by *id*. *id* must be from 7 to 16 hexadecimal digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example: ‘$’.
In case of **enforce imsi-min equivalence** is enabled on the chassis and MIN or IMSI numbers supplied, this filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.
show subscribers msid *ABCD0123456789* or
show subscribers msid *0123456789*
will show any subscriber with a MSID that match the lower 10 digits of MSID supplied, for example, 0123456789.

---

msisdn *msisdn*

Displays information for the mobile user identified by the Mobile Subscriber ISDN Number (MSISDN). *msisdn* must be 7 to 16 digits; specified as an IMSI, MIN, or RMI.

---

nat { not-required | required [nat-ip *nat_ip_address* **| nat-realm** *nat_realm* **] } [ipv4 | ipv6]**

Displays information for the specified subscribers.
not-required: Subscribers for whom Network Address Translation (NAT) processing is not required.
required: Subscribers for whom NAT processing is required.

Important: The **nat-ip** keyword is only available in StarOS 8.3 and later releases.

nat-ip *nat_ip_address*: Subscribers for whom NAT processing is enabled and are using the specified NAT IP address. *nat_ip_address* specifies the NAT IP address and must be in IPv4 dotted-decimal notation.
nat-realm *nat_realm*: Subscribers for whom NAT processing is enabled and are using the specified NAT realm. *nat_realm* specifies the NAT realm name and must be a string from 1 through 63 characters.
ipv4: Subscribers for whom NAT44 processing is required.
ipv6: Subscribers for whom NAT64 processing is required.

network-requested

Display information for currently active subscribers whose sessions were initiated by the GGSN network requested create PDP context procedure.

network-type { gre | ipip | ipsec | ipv4 | ipv6 | l2tp | mobile-ip | proxy-mobile-ip }

Displays network type information for the subscriber session. The following network types can be selected:

- **gre**: Generic Routing Encapsulation (GRE) per RFC 2784
- **ipip**: IP-in-IP encapsulation per RFC 2003
- **ipsec**: IPSec
- **ipv4**: Internet Protocol version 4 (IPv4)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **l2tp**: Layer 2 Tunneling Protocol (L2TP) encryption per RFC 2661
- **mobile-ip**: Mobile IP
- **proxy-mobile-ip**: Proxy Mobile IPv6

nri *nri_value*

This SGSN-specific filter uses the configured network resource identifier (NRI) to identify a specific SGSN in a pool to fine-tuned the subscriber information to be displayed.
nri_value: enter an integer from 0 through 63
This filter can be used in combination with further refining filters.

partial qos { negotiated | requested }

This filter is specific to the SGSN.
Is limits the display of information to requested or negotiated QoS information for the subscriber.
This filter can be used in combination with further defining filters: active, active-charging-service, all, apn, callid, card-num, configured-idle-timeout, connected-time, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, negotiated, plmn-type, requested, rx-data, session-time-left, tx-data

pcf [< | > | less-than | greater-than] *ipv4_address* **[[< | > | less-than | greater-than]** *ipv4_address* **]**

Displays information for subscribers connected via the packet control function with a specific or range of IP addresses. The address must be specified using IPv4 dotted-decimal notation.

- **<**: Filters output so that only information less than the specified IPv4 address value is displayed.
- **>**: Filters output so that only information greater than the specified IPv4 address value is displayed.

- **less-than**: Filters output so that only information less than the specified IPv4 address value is displayed.
- **greater-than**: Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

---

pdsn-only

Show PDSN specific information only.

---

pdsn-service *name*

Displays information for subscribers connected to the packet data service *name*. The packet data service must have been previously configured.

---

plmn-type

Displays subscriber type (HOME, VISITING, or ROAMING).
This keyword is for the GGSN or the SGSN only.

---

policy

Displays the current policies associated with the subscriber session.

---

rnc id *rnc_id* **mcc** *mcc_num* **mnc** *mnc_num*

Displays information for subscribers connected to the SGSN via a specific RNC (radio network controller) identified by the RNC ID, the MCC (mobile country code), and the MNC (mobile network code). SGSN only

---

rx-data [< | > | greater-than | less-than] *value*

The number of bytes received by the specified subscriber.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

---

session-time-left [< | > | greather-than | less] *value*

How much session time is left for the specified subscriber.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

---

smgr-instance *number*

Specific sessmgr instance. *number* must be in the range of 1 to 4294967295.

sgsn-address *address*

Shows information for subscribers whose PDP contexts are currently being facilitated by the SGSN specified by address. This command is for GGSN only.

sgsn-service *srvc_name*

Shows subscriber information for a specified 3G SGSN service.
srvc_name must be an alphanumeric string of 1 through 63 characters that identifies a configured SGSN service.
This command is for SGSN only.

tpo { not-required | required }

Displays information for specified subscribers.

- **not-required**: Subscribers for whom Traffic Performance Optimizer (TPO) processing is not enabled.
- **required**: Subscribers for whom TPO processing is enabled.

tx-data [< | > | greater-than | less-than] *value*

The number of bytes transmitted by the specified subscriber.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

username *name*

Displays information for connections for the subscriber identified by *name*. The user must have been previously configured. *name* must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

verbose

Display detailed information.

wide-format

Display detailed information in a wider screen format.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information about subscriber sessions.
The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant subscribers.
The Command Keywords may be used standalone to display detailed information or you may use one or more of the various Filter Keywords to reduce the amount of information displayed.

Caution: Executing this command may negatively impact performance if multiple instances are executed while the system is under heavy load and simultaneously facilitating multiple CLI sessions.

Example

The following command displays information for all subscriber sessions:

```
show subscribers all
```

The following command displays information for all ggsn-only subscriber sessions:

```
show subscribers ggsn-only all
```

The following command displays information for all subscriber sessions in wide format 1:

```
show subscribers wf1 all
```

```
show subscribers aaa-configuration
```

```
show subscribers counters username isp1user1
```

The following command displays information for subscriber in GGSN service:

```
show subscribers ggsn-only allshow subscribers ggsn-only full
```

The following command displays information for all subscriber with SGSN session having partial QoS requests:

```
show subscribers sgsn-only partial qos requested
```

The following command displays information for all subscriber with MME session connected to MME service having IP address as *10.1.1.1*:

```
show subscribers mme-only mme-address 10.1.1.1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show super-charger

Lists subscribers with valid super-charger configuration. When super-charger is enabled for a subscriber, the SGSN handles 2G or 3G connections controlled by an operator policy and changes hand-off and location update procedures to reduce signaling traffic management (3GPP, TS.23.116).

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show super-charger { imsi imsi | all }
```

imsi

Defines a specific subscriber's international mobile subscriber identity (IMSI) number.
imsi is a string of up to 15 digits that includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number),

all

Instructs the SGSN to display super charger subscription information for all subscribers.

Usage

Use this command to determine if a single subscriber, identified by the IMSI, has a super charger configuration. Also, this command can display the list of all subscribers with a super charger configuration. If a subscriber has super charger as part of the configuration, subscriber data is backed up (using the IMSI Manager) after the subscriber detaches and the purge timer expires.

Example

The following command displays the super charger configuration information for the subscriber identified by the IMSI 90121882144672.

```
show super-charger imsi 90121882144672
```

show support details

Displays a comprehensive list of system information that is useful for troubleshooting purposes. In most cases, the output of this command is requested by the Technical Assistance Center (TAC).

Product

All

Privilege

All

Syntax

show support details [to file *url* **[compress]]**

to file *url*

Specifies the location where a tar file with the support detail information should be created. *url* may refer to a local or a remote file and must be entered using the following format:
[file:] { /flash | /pcmcia1 | /hd } [/*directory* **] /***file_name* **[compress]**
tftp:// { *host* **[** *:port#* **] } [/***directory* **] /***file_name*
[ftp: | sftp:] // [*username***[** *:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **] /***file_name*

Important: Do not use the following characters when entering a string for the field names below: "/" (forward slash), ":" (colon) or "@" (at sign).

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.
If the filename is not specified with a .tar extension, it is automatically appended to the filename when the file is created and a message is generated.
The content of the tar file is:

- **support_summary** - An ASCII text file that contains the support detail information.
- **information.minicores.tar** - A tar file that contains any minicore files found on the system. Minicore files contain memory core dumps that are captured during some events. These core dumps provide specific memory locations and other information about the event. This information is useful to the technical support team in identifying where and when an event occurred along with its probably cause.

compress

Generates a compressed .tar.gz file for the output of the command.

Usage

Use this command to obtain extensive system information for use in troubleshooting. This command does the work of over 30 separate commands, which saves time and ensures that all of the information needed is collected and displayed in the same order every time.

In addition to the information provided, the show support details command includes information that is not otherwise accessible to users but that is helpful in the swift resolution of issues.

Example

The following command displays the system information on your console.

```
show support details
```

The following command displays the information on your console and also writes it to the local device (pcmcia1 in this case) and includes the mini core dumps, using the filename *r-p_problem.tar*:

```
show support details to file /pcmcia1/r-p_problem.tar
```

The following command displays the information on your console and also writes it to an FTP server (named host), placing the file in the **dir** directory and includes the mini core dumps, using the filename *re_problem.tar*:

```
show support details to file ftp://host/dir/re_problem.tar
```

show system uptime

Displays the amount of time the system has been operational since its last down time (maintenance or otherwise).

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show system uptime [| { grep *grep_options* **| more }]**

uptime

Displays system up time in days (D), hours (H) and minutes (M).

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display the system up time to check for the possibility of anomalous behavior related to shorter or longer up times.

Example

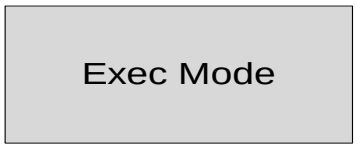
The following command displays basic system basic information and up time.

```
show system uptime
```

Chapter 119
Exec Mode Show Commands (T-Z)

This chapter includes the commands **`show tacacs`** through **`show version`**.

The Exec Mode is the initial entry point into the command line interface system. Exec mode **show** commands are useful in troubleshooting and basic system monitoring.



show tacacs

Displays information about all active Terminal Access Controller Access-Control System Plus (TACACS+) sessions.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax `show tacacs`

This command provides the following TACACS+ session information:

- individual active session number with the following additional session-specific information:
  - login username
  - login tty
  - time of login
  - login server priority
  - current session state
  - current privilege level
  - remote client application (if applicable)
  - remote client ip address (if applicable)
  - last server reply status
- total number of TACACS+ sessions

Usage

Use this command to view detailed session information for all active TACACS+ sessions.

Important: This command is available on version 11.0 and later systems.

Example

```
show tacacs
```

show task

Displays information about system tasks.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show task { info | memory | resources | table } [card *card_num* **] [facility** *facility* **{ all | instance id }] [process** *process_name* **all] [max] [| { grep** *grep_options* **| more }]**

{ info | memory | resources | table }

Specifies the type of information to be displayed and scope of tasks to include in output.
info: Displays detailed task information.
memory: Displays detailed task memory use information.
resources: Displays resource allocation and usage information for all tasks.
table: Displays identification information in tabular format for all tasks.

---

card *card_num*

Default: all powered on cards.
Specifies a single card for which task information is to be displayed where *card_num* must be from 1 to 48.

---

facility *facility* **{ all | instance id }**

Default: all facilities.
Specifies the list of facilities for which task information may be displayed. A specific instance of the facility may be displayed as specified by ID or all instances may be displayed. The value of *id* must be an integer from 0 through 100000. *facility* must be one of:

- **a11mgr**: A11 Interface Manager facility
- **aaamgr**: AAA Manager Facility
- **aaaproxy**: AAA Proxy manager Facility
- **acsctrl**: Active Charging Service (ACS) Controller Facility
- **acsmgr**: Active Charging Service (ACS) Manager Facility
- **asngwmgr**: ASN Gateway Manager
- **asnpcrmg**r: ASN Paging/Location-Registry (ASN-PC) Manager
- **bgp**: Border Gateway Protocol (BGP) Facility
- **bulkstat**: Bulk Statistics Manager Facility
- **cdrmod**: Charging Detail Record Module
- **cli**: Command Line Interface Facility
- **cscfmgr**: SIP CSCF Manager
- **cspctrl**: Card Slot Port controller Facility

- **cssctrl**: Content Service Steering Controller
- **dcardctrl**: IPSEC Daughter-card Controller Logging Facility
- **dcardmgr**: IPSEC Daughter-card Manager Logging Facility
- **dhmgr**: Distributed Host Manager
- **drvctrl**: Driver Controller Facility
- **egtpegmgr**: EGTP Egress Demux Manager
- **egtpinmgr**: EGTP Ingress Demux Manager
- **evlogd**: Event Log Daemon Facility
- **famgr**: Foreign Agent Manager Facility
- **gtpcmr**: GTP-C Protocol Logging facility (GGSN product only)
- **h248prt**: H.248 Protocol Task
- **hamgr**: Home Agent Manager Facility
- **hatcpu**: High Availability Task CPU Facility
- **hatsystem**: High Availability Task Facility
- **ipsecctrl**: IP Security Controller Facility
- **ipsecmgr**: IP Security Manager Facility
- **ipsgmgr**: IP Services Gateway Facility
- **l2tpdemux**: L2TP Demultiplexor (LNS) Facility
- **l2tpmgr**: L2TP Manager Facility
- **magmgr**: Mobile Access Gateway Manager
- **megadiammgr**: MegaDiameter Manager
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager logging facility
- **mmgr**: SGSN/SS7 Master Manager
- **mptest**: Migration Performance Test on Packet Accelerator Card
- **netwstrg**: Network Storage Manager
- **npuctrl**: Network Processor Unit control Facility
- **npumgr**: Network Processor Unit Manager Facility
- **nputst**: Network Processor Unit Tester
- **nsctrl**: Charging Service Controller
- **nsmgr**: Charging Service Process Manager
- **orbns**: Object Request Broker Notification Server Facility
- **orbs**: Object Request Broker System Facility
- **ospf**: Open Shortest Path First Facility
- **rct**: Recovery Control Task Facility
- **rdt**: Redirect Task Facility
- **rip**: Routing Information Protocol Facility

- **rmctrl**: Resource Manager Controller Facility
- **rmmgr**: Resource Manager Facility
- **sct**: Shared Configuration Task Facility
- **sessctrl**: Session Controller Facility
- **sessmgr**: Session Manager Facility
- **sft**: Switch Fabric Monitoring Task
- **sipcdprt**: Sip Call Distributor Task
- **sitmain**: System Initialization Task Main Facility
- **sitparent**: Card based system initialization facility that applies to Packet Accelerator Cards and Switch Processor Cards

Important: **sitparent** replaces the facilities **sitpac, sitspc** and **sittac**.

- **snmp**: SNMP Protocol Facility
- **srdb**: Static Rating Database
- **threshold**: Threshold Server Facility
- **vpnctrl**: Virtual Private Network Controller Facility
- **vpnmgr**: VPN Manager Facility
- **zebos**: ZEBOS™ OSPF Message Facility

`all`: Displays information for all instances of the specified facility.
`instance` *`id`*: Displays information for the facility instance specified as an integer from 0 through 10000000.

`process` *`process_name`* **`all`**

Display information for all instances of the specified process. must be one of the following process names:

- **ftpd**: File Transfer Protocol Daemon
- **inetd**: Internet Super-server Daemon
- **nsproc**: NetSpira Packet Processor
- **ntpd**: Network Time Protocol Daemon
- **orbnsd**: Object Request Broker Notification Server
- **ping**: Ping
- **pvmd-wrapper**: NetSpira Messenger Daemon
- **pvmgs**: NetSpira Messenger Daemon
- **rlogin**: Remote Login
- **sftp-server**: Secure File Transfer Protocol Server
- **sitreap**: System Initialization Task Cleanup Process
- **sn_resolve**: DNS Resolver Process
- **ssh**: Secure Shell
- **sshd**: Secure Shell Daemon

- **telnet**: Telnet
- **telnetd**: Telnet daemon
- **tftpd**: Trivial File Transfer Protocol Daemon
- **traceroute**: Traceroute

max

Default: current usage levels are displayed.
Displays the maximum usage levels for tasks as opposed to the current usage levels.
The keyword **max** is valid only in conjunction with the **resources** keyword.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display task information as part of system troubleshooting unexpected behavior.

Important: This command is not supported on all platforms.

Example

The following commands provide some examples of the combinations of options that may be used to display task information.

```
show task info facility hatspc all

show task info facility hatspc instance 456

show task resources facility zebos all

show task table facility ospf

show task table card 8 facility cli all

show task resources facility rip all max
```

show tcap statistics

This command displays the collected traffic statistics that have passed through the SS7 Transaction Capabilities Application Part (TCAP) layer.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

show tcap statistics [camel-service [all | name *camel_srvc* **] | map-service [all | name** *map_srvc* **]] [| { grep** *grep_options* **| more }]**

camel-service [all | name *camel_srvc* **]**

Displays TCAP statistics for either all Customized Applications for Mobile networks Enhanced Logic (CAMEL) services or only for the named CAMEL service.

map-service [all | name *mapl_srvc* **]**

Displays TCAP statistics for either all Mobile Application Part (MAP) services or only for the named MAP service.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the collected TCAP statistics for MAP or CAMEL services.

Example

The following command displays the collected statistics for a MAP service named *MAP-Tewk*.

```
show tcap statistics map-service name MAP-Tewk
```

show temperature

Displays the current temperature on all installed cards. Also displays the temperature of upper and lower fan trays. Temperature readings are acquired from sensors located on theses components.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show temperature [verbose] [| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

verbose

Indicates that the output is to contain detailed information.

Usage

Verify current temperature of components in chassis.

Example

```
show temperature

show tempterature verbose
```

show terminal

Displays the current terminal settings for number of lines in length and number of characters in width.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show terminal [| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to verify current terminal settings in case the output displayed appears to have line breaks/wraps in unexpected places.

Example

```
show terminal
```

show threshold

Displays thresholding information for the system.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show threshold [ default ]
```

[default]

Used to display the system's thresholding default values.

Usage

Use this command to display information on threshold value configuration and activity.

Example

The following command displays configuration information pertaining to threshold values configured on the system:

```
show threshold
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show timing

Displays the information configured to define a transmit timing source other than the system clock. The display includes related information (such as port status, timing source priority, timing alarms, etc.) for all of the ports configured for either Building Integrated Timing Supply (BITS) or line timing.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show timing
```

Usage

Use this command to determine which line cards are recovering receive timing clocks.

Important: This command is not supported on all platforms.

Example

The following command displays timing configuration and status information for the timing-configured ports.

```
show timing
```

show upgrade

Displays the status of an on-going on-line software upgrade.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show upgrade
```

Usage

Use this command to show the status of an on-going on-line software upgrade.

Important: This command is not supported on all platforms.

show url-blacklisting database

Displays URL Blacklisting static database configurations.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show url-blacklisting database [all | url *url* **| facility acsmgr { all | instance** *instance* **}] [| { grep** *grep_options* **| more }]**

all

Displays configurations of all URL Blacklisting databases present in the default or override directory.

facility acsmgr { all | instance *instance* **}**

Displays configurations of URL Blacklisting database configuration per facility/ACSMgr instance.
all: Displays URL Blacklisting database configuration of all ACSMgrs.
instance *instance*: Displays URL Blacklisting database configuration for the instance number of the database specified as an integer from 1 through 10000000.

url *url*

Displays configurations of the URL Blacklisting database specified in the database's URL expressed as an alphanumeric string of 1 through 512 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configurations associated with in-memory and on-flash Blacklisting database. The **show url-blacklisting database** command displays the active database that is loaded, and is the one set by either the default or override CLI commands.

Example

The following command displays configurations of all the databases present in default or override directory, indicating one as Active and rest as Not Loaded:

```
show url-blacklisting database all
```

The following command displays configurations of the */flash/bl/optblk.bin* database:

```
show url-blacklisting database url /flash/bl/optblk.bin
```

The following command displays database configuration for the ACSMgr instance *1*:

```
show url-blacklisting database facility acsmgr instance 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show version

Displays the version information for the current system image or for a remote image.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show version [*url* **] [all | verbose] [| { grep** *grep_options* **| more }]**

url

Specifies the location of a configuration file for which to display version information. The *url* may refer to a local or a remote file and must be entered in the following format:
[file:] { /flash | /pcmcia1 | /hd } [/*directory* **] /***file_name*
tftp:// { *host* **[** *:port#* **] } [/***directory* **] /***file_name*
[http: | ftp: | sftp:] // [*username* **[** *:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **] /***file_name*

Important: Do not use the following characters when entering a string for the field names below: "/" (forward slash), ":" (colon) or "@" (at sign).

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

all | verbose

all: displays all image information.
verbose: displays detailed information.
The **verbose** keyword may not be used in conjunction with a URL specification.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display the version information to verify the image versions loaded in preparation for maintenance, upgrades, etc.

Important: This command is not supported on all platforms.

Example

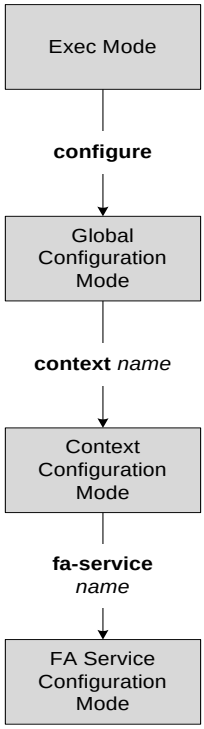
The following commands display the version information with the basic level of output and the detailed level, respectively.

```
show version

show version verbose
```

Chapter 120
FA Service Configuration Mode Commands

The Foreign Agent Service Configuration Mode is used to create and manage the Foreign Agent (FA) services associated with the current context.



advertise

Configures agent advertisement parameters within the FA service.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

advertise {adv-delay *seconds* |**adv-lifetime** *time* | **adv-interval** { *seconds* | **msec** *num* } | **num-adv-sent** *number* | **prefix-length-extn** | **reg-lifetime** *reg_time* }

no advertise{ **prefix-length-extn** | **reg-lifetime** }

[default] advertise adv-delay

no advertise prefix-length-extn

Disables prefix-length-extn

no advertise reg-lifetime

Specifies that there is no limit to the registration lifetime that the FA service will allow in any Registration Request message from the mobile node.

default advertise adv-delay

Sets the initial delay for the unsolicited advertisement to the default value of 1000 ms.

advertise adv-delay *seconds*

Default: 1000
Sets the initial delay for the unsolicited advertisement.
seconds is the advertisement delay in milliseconds and must be an integer from 10 through 5000.

Important: This command is available for WiMAX CMIP calls only.

adv-lifetime *time*

Default: 9000
Specifies the FA agent advertisement lifetime.
The agent advertisement lifetime is the amount of time that an FA agent advertisement remains valid in the absence of further advertisements.
time is measured in seconds and can be configured to an integer from 1 through 65535.

adv-interval { *seconds* | msec *num* }

Default: 5 seconds
Specifies the amount of time between agent advertisements.
seconds is the time in seconds and can be an integer from 1 through1800.

msec *num*: Configures agent advertisement Interval in milliseconds. *num* can be an integer from 100 through 1800000.

num-adv-sent *number*

Default: 5
Specifies the number of unanswered agent advertisements that the FA service sends upon PPP establishment before rejecting the session.
number can be an integer from 1 through 65535.

prefix-length-extn

Default: Disabled
When enabled, the FA includes the FA-service address in the Router Address field of the Agent Advertisement and appends a Prefix Length Extension in Agent Advertisements with a prefix length of 32.

reg-lifetime *reg_time*

Default: 600
Specifies the longest registration lifetime that the FA service will allow in any Registration Request message from the mobile node.
reg_time is measured in seconds and can be configured to an integer from 1 through 65534.

Usage

Use to tailor FA advertisements to meet your network needs and/or conditions.

Example

The following command configures the FA advertisement interval at 10 seconds, the advertise lifetime to *20000* seconds, and the maximum number of unanswered advertisements that will be set to *3*.

```
advertise adv-interval 10 adv-lifetime 20000 num-adv-sent 3
```

authentication aaa

This configuration enables or disables the authentication parameters for the FA service to override dynamic keys from AAA with static keys to support MIP registration with an HA that does not support dynamic keys.

Product

FA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] authentication aaa-distributed-mip-keys override
```

no

Disable the override of dynamic keys from AAA.

default

By default the override behavior is disabled and the system uses dynamic keys from AAA after successful EAP authentication. If EAP authentication fails, the system uses static keys by default.

Usage

Specify how the system will perform authentication of registration request messages. By default dynamic MN-HA and FA-HA keys from AAA after successful EAP authentication used by a PMIP client in WiMAX calls for MIP registration with HA. This configuration in FA service overrides the dynamic keys from AAA with static keys to support MIP registration with an HA that does not support dynamic keys.

Example

The following command configures the FA service to override use of AAA MIP keys and force the use of statically configured FA-HA SPI/key for WiMAX calls.

```
authentication aaa-distributed-mip-keys override
```

authentication mn-aaa

Specifies how the system handles authentication for mobile node re-registrations.

Product

PDSN, ASN GW, GGS

Privilege

Security Administrator, Administrator

Syntax

```
authentication mn-aaa { always | ignore-after-handoff | init-reg | init-reg-except-
handoff | renew-and-dereg-noauth | renew-reg-noauth } [ optimize-retries ]
```

always

Specifies that the FA service performs authentication each time a mobile node registers. This is the default setting.

ignore-after-handoff

MN-AAA authentication is not done at the FA for a handoff Access Gateway (AGW).

init-reg

MN-AAA and MN-FAC extensions are required only in initialization RRQ.

init-reg-except-handoff

MN-AAA and MN-FAC extensions are not required in initialization RRQ after inter-Access Gateway (AGW) handoff.

renew-and-dereg-noauth

Specifies that the FA service does not perform authentication for mobile node re-registration or deregistration authorization requests. Initial registration is handled normally.

renew-reg-noauth

Specifies that the FA service does not perform authentication for mobile node re-registrations. Initial registration and de-registration are handled normally.

optimize-retries

Optimizes the number of Authentication retries sent to the AAA server.
When an authentication request is pending for a MIP call at the AGW, if a retry RRQ is received from the mobile node, the AGW discards the old RRQ and keeps the most recent RRQ. Subsequently when the authentication succeeds, the AGW forwards the most recent RRQ to the HA. If the authentication fails, the AGW replies to the MN using the most recent RRQ.

Usage

Use this command to determine how the FA service handles mobile node re-registrations.
The system is shipped from the factory with the mobile AAA authentication set to always.

Example

The following command configures the configures the FA service to perform mobile node authentication for every re-registration:

```
authentication mn-aaa always
```

The following command specifies that the FA service does not perform authentication for mobile node re-registrations:

```
authentication mn-aaa renew-reg-noauth
```

authentication mn-ha

Configures whether the FA service looks for a Mobile Network-Home Agent (MN-HA) authentication extension in the RRP (registration reply).

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
authentication mn-ha { allow-noauth | always }
```

allow-noauth

Allows a reply that does not contain the auth extension.

always

A reply should always contain the auth extension to be accepted.
This is the default setting.

Usage

Use this command to determine whether or not the FA service requires the MN-HA auth extension in the RRP.
The system is shipped from the factory with this set to always.

Example

The following command configures the FA service to require a reply to contain the authentication extension to be accepted.:

```
authentication mn-ha always
```

bind

Binds the FA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

bind address *address* [**max-subscribers** *count*]

no bind address

address

Specifies the IP address (address) of the interface configured as the Pi interface. *address* is specified in IPv4 dotted-decimal notation.

max-subscribers *max#*

Default: 500000
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to an integer from 0 through 500000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active packet processing cards installed in the system. Refer to the license key command for additional information.

Usage

Associate or tie the FA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces you will configure for use as Pi interfaces
- The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.
Use the **no bind address** command to delete a previously configured binding.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the FA service and specifies that a maximum of *600* simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

challenge-window

Defines the number of recently sent challenge values that are considered valid by the FA.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

challenge-window *number*

number

Default: 2
The number of recently sent challenge values that are considered valid. *number* must be an integer from 1 through 5.

Usage

Use this command to set the number of recently sent challenge values that are considered valid by the FA.

Example

Set the challenge window to *3*:

```
challenge-window 3
```

default subscriber

Specifies the name of a subscriber profile configured within the same context as the FA service from which to base the handling of all other subscriber sessions handled by the FA service.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

default subscriber *profile_name*

no default subscriber *profile_name*

profile_name

Specifies the name of the configured subscriber profile. *profile_name* is an alphanumeric string of 1 through 63 characters that is case sensitive.

Usage

Each subscriber profile specifies "rules" such as permissions, PPP settings, and timeout values.
By default, the FA service will use the information configured for the subscriber named default within the same context. This command allows for multiple FA services within the same context to apply different "rules" to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.
Use the **no default subscriber** *profile_name* command to delete the configured default subscriber.

Example

To configure the FA service to apply the rules configured for a subscriber named *user1* to every other subscriber session it processes, enter the following command:

```
default subscriber user1
```

dynamic-ha-assignment

This command configures various dynamic HA assignment parameters.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] dynamic-ha-assignment [ aaa-override mn-supplied-ha-addr | allow-failover ]
```

default

Feature is disabled by default.

no

Removes the feature and returns it to the default setting of disabled.

aaa-override mn-supplied-ha-addr

Enables the system to override the mobile node supplied HA IP address with the AAA provided HA address.

allow-failover

Enables/disables a failover retry for dynamic HA assignment from the AAA server.

Usage

Use this command to override the mobile node supplied HA IP address with the AAA supplied HA address. Use this command to enable or disable the failover feature that allows the system to receive and use a newer HA address from the AAA server in cases where the original HA address is not responding.
A AAA server may assign different HA addresses each time a retransmitted MIP RRQ is authenticated during the MIP session setup. When this configuration is enabled, if the FA gets a new HA address from AAA during setup, it discards the previous HA address and start using the new address. This allows the FA session to connect to an available HA during setup.

Example

The following command enables the failover feature that allows the system to receive and use a newer HA address from the AAA server:

```
dynamic-ha-assignment allow-failover
```

dynamic-mip-key-update

When enabled, the FA service processes MIP_Key_Update_Request from the AAA server and allows dynamic MIP key updates (DMUs).

Default: Disabled

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

dynamic-mip-key-update

no dynamic-mip-key-update

no

The FA service rejects MIP_Key_Update_Request from the AAA server, not allowing dynamic MIP key updating to occur and terminates the call.

Usage

Use this command to enable or disable the DMU feature in the FA service.

Example

To enable DMU and allow dynamic updates of MIP keys, enter the following command:

```
dynamic-mip-key-update
```

encapsulation allow gre

Enables or disables the use of generic routing encapsulation (GRE) when establishing a Mobile IP (MIP) session. When enabled, if requested by a Mobile Node (MN), the FA requests the HA to use GRE encapsulation when establishing the MIP session. When disabled, the FA does not set the GRE bit in Agent Advertisements to the MN.

Default: GRE is enabled.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
encapsulation allow gre

no encapsulation allow gre
```

Usage

Use to disable or re-enable the use of GRE encapsulation for MIP sessions.

Example

To re-enable GRE encapsulation for MIP sessions, enter the following command:

```
encapsulation allow gre
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fa-ha-spi

Configures the security parameter index (SPI) between the FA service and the HA.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

fa-ha-spi remote-address { *ha_ip_address* | *ip_addr_mask_combo* } **spi-number** *number* { **encrypted secret** *enc_secret* | *secret* } [**description string** | **hash-algorithm** { **hmac-md5** | **md5** | **rfc2002-md5** } | **monitor-ha** | **replay-protection** { **timestamp** | **nonce** } | **timestamp-tolerance** *tolerance* **]**

no fa-ha-spi remote-address { *ha_ip_address* | *ip_addr_mask_combo* } **spi-number** *number*

remote-address { *ha_ip_address* | *ip_addr_mask_combo* }

ha_ip_address: Specifies the IP address of the HA in IPv4 dotted-decimal notation.
ip_addr_mask_combo: Specifies the IP address of the HA including network mask bits.
ip_addr_mask_combo must be specified IPv4 dotted-decimal notation with CIDR subnet mask bits (x.x.x.x/xx).

spi-number *number*

Specifies the Security Parameter Index (SPI) which indicates a security context between the FA and the HA in accordance with RFC 2002.
number can be configured to an integer from 256 through 4294967295.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the FA service and the HA. The secret can be either encrypted or non-encrypted.

- **encrypted secret** *enc_secret* : Specifies the encrypted shared key (enc_secret) between the FA service and the HA. *enc_secret* must be an alphanumeric string of 1 through 254 characters that is case sensitive.

Important: The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

- **secret** *secret*: Specifies the shared key (secret) between the FA service and the HA. *secret* must be an alphanumeric string of 1 through 127 characters that is case sensitive.

description *string*

This is a description for the SPI. *string* must be an alphanumeric string of 1 through 31 characters.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the FA service and the HA.

- **hmac-md5**: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
- **md5**: Configures the hash-algorithm to implement MD5 per RFC 1321.
- **rfc2002-md5**: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

monitor-ha

Default: disabled
Enables the HA monitor feature for this HA address.
To set the behavior of the HA monitor feature, refer to the **ha-monitor** command in this chapter. To disable this command (if enabled) for this HA address, re-enter the entire **fa-ha-spi** command without the **monitor-ha** keyword.

replay-protection { timestamp | nonce }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.

- **nonce**: Configures replay protection to be implemented using NONCE per RFC 2002. Nonce is an arbitrary number used only once to sign a cryptographic communication.
- **timestamp**: Configures replay protection to be implemented using timestamps per RFC 2002.

Important: This keyword should only be used in conjunction with Proxy Mobile IP support.

timestamp-tolerance *tolerance*

Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then timestamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to an integer value from 0 through 65535.

Important: This keyword should only be used in conjunction with Proxy Mobile IP support.

+

More than one of the above keywords can be entered within a single command.

Usage

An SPI is a security mechanism configured and shared by the FA service and the HA. Please refer to RFC 2002 for additional information.
Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a “default” SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.

Important: The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2,048 SPIs can be configured per FA service.
Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the FA service to use an SPI of *512* when communicating with an HA with the IP address *192.168.0.2*. The key that would be shared between the HA and the FA service is *q397F65*. When communicating with this HA, the FA service will also be configured to use the *rfc2002-md5* hash-algorithm.

```
fa-ha-spi remote-address 192.168.0.2 spi-number 512 secret q397F65 hash-
algorithm rfc2002-md5
```

The following command deletes the configured SPI of *400* for an HA with an IP address of *172.100.3.200*:

```
no fa-ha-spi remote-address 172.100.3.200 spi-number 400
```

gre

Configures Generic Routing Encapsulation (GRE) parameters.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

gre { checksum | checksum-verify | reorder-timeout *timeout* **| sequence-mode { none | reorder } | sequence-numbers }**

no gre { checksum | checksum-verify | sequence-numbers }

no

Disables the specified functionality.

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

reorder-timeout *timeout*

Default: 100
Configures maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *timeout* must be an integer from 0 through 5000.

sequence-mode { none | reorder }

Default: none
Configures how incoming out-of-sequence GRE packets should be handled.
none: Disables reordering of incoming out-of-sequence GRE packets.
reorder: Enables reordering of incoming out-of-sequence GRE packets.

sequence-numbers

Default: Disabled.
Enables insertion or removal of GRE sequence numbers in GRE packets.

Usage

Use this command to configure how the FA service handles GRE packets.

Example

To set maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to *500* milliseconds, enter the following command:

```
gre reorder-timeout 500
```

To enable the reordering of incoming out of sequence GRE packets, enter the following command:

```
gre sequence-mode reorder
```

ha-monitor

Configures the behavior of the HA monitor feature.

Product

PDSN, ASN GW, FA, HA

Privilege

Security Administrator, Administrator

Syntax

[default] ha-monitor [interval *sec*| **max-inactivity-time** *sec* | **num-retry** *num* **]**

no ha-monitor

default

Restores the system default setting(s) for the command/keyword(s). This command is disabled by default.

no

Disables the HA monitoring feature for this FA service.

interval *sec*

Default: 30
Configures the time interval before the next monitoring request message is sent to the HA.
sec must be an integer from 1 through 36000.

max-inactivity-time *sec*

Default: 60
Specifies the maximum amount of time the system will wait without receiving MIP control traffic from a HA before the HA monitoring mechanism is triggered.
sec must be an integer from 30 through 600.

num-retry *num*

Default: 5
Configures the number of time the system will attempt to send HA monitor requests before determining the HA is down and a trap is initiated.
num must be an integer from 0 through 10.

Usage

Use this command to set parameters for the HA monitor feature. This feature allows the AGW/FA to monitor HAs with which it has MIP sessions. The monitoring feature is triggered when the AGW/FA does not receive any MIP traffic from a HA for a configured amount of time (**max-inactivity-time**). The AGW/FA starts sending special MIP RRQ monitor messages and waits for RRP monitor message responses from the HA. The RRQ monitor messages are addressed to the HA service address. The source address of the monitor-request messages is the FA service's IP address.
The actions taken during monitoring are comprised of the following:

- If no monitor response is received during the interval time (**interval**), the AGW retransmits the monitor message a configured number of times (**num-retry**).
- If no response is received after retransmitting for the number configured in **num-retry**, the HA is considered down. The AGW/FA sends a trap (HAUnreachable) to the management station. Monitoring of this HA is stopped until a MIP control message is received from the particular HA and when the AGW/FA sends a trap (HAreachable) to the management station and starts monitoring the HA again.
- When an HA receives the RRQ from an FA, it verifies the message and identifies it as a monitor message based on a special reserved NAI (in the message) and a Monitor HA CVSE in the RRQ. The HA responds with an RRP with Reply code 0x00 (accepted) and includes the Monitor HA CVSE. When the FA receives the RRP from the HA, it updates the activity for the peer HA to maintain the "up" state.

Important: This command only sets the behavior of the HA monitor feature. To enable the HA monitor feature for each HA address, refer to the **fa-ha-spi** command in this chapter. Up to 256 HAs can be monitored per system.

Example

The following commands set the HA monitor message interval to *45* seconds, the HA inactivity time to *60* seconds, and the number of HA monitor retries to *6*:

```
ha-monitor interval 45ha-monitor max-inactivity-time 60ha-monitor num-
retry 6
```

idle-timeout-mode

Controls whether Mobile IP data and control packets or only Mobile IP data resets the session idle timer.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
idle-timeout-mode {aggressive | normal}
```

aggressive

Only Mobile IP data resets the session idle timer.

normal

Both Mobile IP data and control packets reset the session idle timer.

Usage

Use this command to control how the session idle timer is reset.

Example

The following command specifies that only Mobile IP data can reset the session idle timer:

```
idle-timeout-mode aggressive
```

ignore-mip-key-data

When this command is enabled, if the Dynamic Mobile IP Key Update (DMU) is not enabled and the mobile node (MN) sends a MIP_Key_Data CVSE, the FA ignores the MIP_Key_Data extension and the call is continued like a regular Mobile IP (MIP) call.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ignore-mip-key-data

no ignore-mip-key-data

no

Disable ignoring of MIP key data.

Usage

When DMU is not enabled, use this command to ignore MIP key data sent by the MN and allow the call to continue normally.

Example

To enable the FA to ignore MIP key data sent by the MN, enter the following command:

```
ignore-mip-key-data
```

ignore-stale-challenge

Enables the system to accept RRQs with previously used challenges. This feature is disabled by default.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ignore-stale-challenge

no ignore-stale-challenge
```

no

Disables this feature. If an RRQ is received with a previously used challenge and there are RRQs pending on the same session, accept the RRQ if it has a new Identification in the retransmitted RRQ. All other RRQs received with previously used challenge are rejected with the Stale Challenge (106) error code.

Usage

Use this command to allow the FA to accept stale challenges regardless of the ID field or if other RRQs are pending.

Example

To enable this functionality in the FA service, enter the following command;

```
ignore-stale-challenge
```

To disable this functionality, enter the following command;

```
no ignore-stale-challenge
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interfaces' IP socket on which to listen for Mobile IP Registration messages.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip local-port *port#*

port#

Specifies the UDP port number.
port# can be an integer from 1 through 65535.

Usage

Specify the UDP port that should be used for communications between the FA service and the HA. The system defaults to using local port 434.

Example

The following command specifies a UDP port of *3950* for FA-to-HA communication on the Pi interface:

```
ip local-port 3950
```

isakmp

Configures support for IPSec within the FA-service.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
isakmp {peer-ha ha_address {crypto map map_name [ [ encrypted ] secret secret ]} |
default { crypto map map_name [ [ encrypted ] secretsecret]}}

no isakmp { peer-ha peer_ip_address | default }
```

---

no

Deletes the reference to the crypto map for the specified HA, or deletes the reference for the default crypto map.

---

peer-ha *ha_address* **{ crypto map** *map_name* **[[encrypted] secret** *preshared_secret* **] }**

Configures a crypto map for a peer HA.

- *ha_address*: The IP address of the HA with which the FA service will establish an IPSec SA. The address must be expressed in IPv4 dotted-decimal format.
- **crypto map** *map_name*: The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map expressed as an alphanumeric string of 1 through 127 characters.
- **encrypted**: This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret** *secret*: The pre-shared secret that will be used during the IKE negotiation. *preshared_secret* is the secret expressed as an alphanumeric string of 1 through 127 characters.

---

default { crypto map *map_name* **[[encrypted] secret** *secret* **] }**

Specifies the default crypto map to use when there is no matching crypto map configured for an HA address.

- **crypto map** *map_name*: The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map expressed as an alphanumeric string of 1 through 127 characters.
- **encrypted**: This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret** *secret*: The pre-shared secret that will be used during the IKE negotiation. *preshared_secret* is the secret expressed as an alphanumeric string of 1 through 127 characters.

Usage

Use this command to configure the FA-service's per-HA IPSec parameters. These dictate how the FA service is to establish an IPSec SA with the specified HA.

Important: For maximum security, the above command should be executed for every possible HA with which the FA service communicates.

A default crypto map can also be configured using the default keyword. The default crypto map is used in the event that the AAA server returns an HA address that is not configured as an isakmp peer-ha.

Important: For maximum security, the default crypto map should be configured in addition to peer-ha crypto maps instead of being used to provide IPSec SAs to all HAs.

Note that once an IPSec tunnel is established between the FA and HA for a particular subscriber, all new Mobile IP sessions using the same FA and HA are passed over the tunnel regardless of whether or not IPSec is supported for the new subscriber sessions. Data for existing Mobile IP sessions is unaffected.

Example

The following command creates a reference for an HA with the IP address *10.2.3.4* to a crypto map named *map1*:

```
isakmp peer-ha 10.2.3.4 crypto map map1
```

The following command deletes the crypto map reference for the HA with the IP address *10.2.3.4*.

```
no isakmp peer-ha 10.2.3.4
```

limit-reg-lifetime

Enable the current default behavior of limiting the Mobile IP (MIP) lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts. When disabled, this command allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] limit-reg-lifetime
```

no

Allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

default

Enables the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Usage

Use the no keyword with this command to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.
Use the base command or the keyword to reset the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Example

Configure the FA service to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts by entering the following command:
no limit-reg-lifetime
Configure the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts by entering either of the following commands:

default limit-reg-lifetimelimit-reg-lifetime

max-challenge-len

For mobile subscribers, the FA generates a random number and sends it to the mobile node as part of the mobile authentication extension (Mobile-Foreign Authentication extension) as described in RFC 3012. This command sets the maximum length of the FA challenge in bytes.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-challenge-len *length*

length

Default: 16
The maximum length, in bytes, of the FA challenge. This value must be an integer from 4 through 32.

Usage

Change the maximum allowed length of the randomly generated FA challenge its default of 16.

Example

Use the following command to change the maximum length of the FA challenge to 18 bytes:

```
max-challenge-len 18
```

mn-aaa-removal-indication

Enables the FA to remove the Mobile Network-Final Assembly Code (MN-FAC) and MN-AAA extensions from RRQs. This is disabled by default.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
mn-aaa-removal-indication

no mn-aaa-removal-indication
```

no

Disable the removal of the MN-FAC and MN-AAA extensions from RRQs.

Usage

Enable this feature if there is no need to authenticate the subscriber at HA using MN-AAA extension.

Example

The following command enables the FA service to remove MN-FAC and MN-AAA extensions from RRQs:

```
mn-aaa-removal-indication
```

multiple-reg

Specifies the number of simultaneous Mobile IP sessions that will be supported for over a single PPP session.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

multiple-reg *number*

number

number can be configured to an integer from 1 through 3.

Usage

Use to support multiple registrations per subscriber.
The system defaults to a setting of "1" for multiple simultaneous MIP sessions.

Important: The system will only support multiple Mobile IP sessions per subscriber if the subscriber's mobile node has a static IP address. The system will only allow a single Mobile IP session for mobile nodes that receive a dynamically assigned IP address. In addition, because only a single Mobile IP or proxy-Mobile IP session is supported for IP PDP contexts, this parameter must remain at its default configuration.

Example

The following command configures the number of supported simultaneous registrations for subscribers using this FA service to *3*.

```
multiple-reg 3
```

optimize tunnel-reassembly

Configures FA to HA optimization for tunnel reassembly.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
optimize tunnel-reassembly

no optimize tunnel-reassembly
```

Usage

Enabling this functionality fragments large packets prior to encapsulation for easier processing. Tunnel reassembly optimization is disabled by default.

Important: You should not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

Important: This functionality works best when the FA service is communicating with an HA service running in a system. However, an FA service running in the system communicating with an HA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the **no** version of this command to disable tunnel optimization if it was previously enabled.

Example

The following command enables tunnel reassembly optimization:

```
optimize tunnel-reassembly
```

private-address allow-no-reverse-tunnel

This command enables the FA to allow calls with private addresses and no reverse tunneling.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
private-address allow-no-reverse-tunnel

no private-address allow-no-reverse-tunnel
```

no

Disables the functionality. This is the default setting.

Usage

Use this command to let the FA allow sessions with private addresses that do not have the reverse tunnel bit set.

Example

To enable sessions with private addresses and no reverse tunneling, enter the following command:

```
private-address allow-no-reverse-tunnel
```

proxy-mip

Configures parameters pertaining to Proxy Mobile IP support.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

proxy-mip { allow | ha-failover [max-attempts *max_attempts* **| num-attempts-before-switching** *num_attempts* **| timeout seconds]| max-retransmissions number | renew-percent-time** *renew-time* **| retransmission-timeout** *time* **}**

```
no proxy-mip {allow | ha-failover }
```

```
default proxy-mip {allow | ha-failover | max-retransmissions | renew-percent-time |
retransmission-timeout}
```

no

Disables FA service support for Proxy Mobile IP or HA failover for Proxy Mobile IP.

default

Restores the specified option to the default setting as described below.

allow

Default: Disabled
Enables FA service support for Proxy Mobile IP.

ha-failover [max-attempts *max_attempts* **| num-attempts-before-switching** *num_attempts* **| timeout** *seconds* **]**

Default: Disabled
Enables HA failover for the Proxy Mobile IP feature.

- **max-attempts** *max_attempts* - Configures the maximum number of retransmissions of Proxy MIP control messages. *max_attempts* must be an integer from 1 through 10. Default is 4
- **num-attempts-before-switching** *num_attempts* - Configures the total number of RRQ attempts (including retransmissions) before failing over to the alternate HA. *num_attempts* must be an integer from 1 through 5. Default is 2.
- **timeout** *seconds* - Configures the retransmission timeout (in seconds) of Proxy MIP control messages when failover happens. *seconds* must be an integer from 1 through 50. Default is 2

max-retransmissions *number*

Default: 5
Configures the maximum number re-try attempts that the FA service is allowed to make when sending Proxy Mobile IP Registration Requests to the HA.
number is the maximum number of retries and can be configured to an integer from 1 through 4294967295.

renew-percent-time *renew-time*

Default: 75
Configures the amount of time that must pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request.
renew-time is entered as a percentage of the advertisement registration lifetime configured for the FA service. (Refer to the **advertise** command in this chapter). *renew-time* can be configured to an integer from 1 through 100.
The following equation can be used to calculate *renew-time*:
renew-time = (duration / lifetime) * 100
duration = The desired amount of time that can pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request
lifetime = The advertisement registration lifetime configured for the FA service.
duration / lifetime

retransmission-timeout *time*

Default: 3
Configures the maximum amount of time allowed by the FA for a response from the HA before re-sending a Proxy Mobile IP Registration Request message.
time is measured in seconds and can be configured to an integer from 1 through 100.

Usage

The **proxy-mip** command and its keywords configure the FA services support for Proxy Mobile IP.
When enabled though the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP.
In addition to the parameters configured via this command, the HA-FA SPI(s) must also be modified to support Proxy Mobile IP. Refer to the **fa-ha-spi** command for more information.

Example

The following command configures the FA service to wait up to *5* seconds for an HA to respond prior to re-sending an a Mobile IP Registration Request message:

```
proxy-mip retransmission-timeout 5
```

If the advertisement registration lifetime configured for the FA service is 900 seconds and you want the system to send a Proxy Mobile IP Registration Renewal Request message after 500 seconds, then the following command must be executed:

```
proxy-mip renew-percent-time 50
```

Note that 50 = (450 / 900) 100.

reg-timeout

Configures the FA registration reply timeout.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

reg-timeout *time*

time

Default: 45
time is measured in seconds and can be configured to an integer from 1 through 65535.

Usage

Configure the amount of time that the FA service will wait for a Registration Reply from an HA before the call is rejected with a reply code of 78H (registration Timeout).

Example

The following command configures a registration timeout of 10.

```
reg-timeout 10
```

reverse-tunnel

Enables the use of reverse tunneling for a Mobile IP (MIP) sessions when requested by the mobile node (MN).

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
reverse-tunnel

no reverse-tunnel
```

no

Indicates the reverse tunnel option is to be disabled. When omitted, the reverse tunnel option is enabled.

Usage

Reverse tunneling involves tunneling datagrams originated by the MN to the HA via the FA service.
When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.
The advantages of using reverse-tunneling:

- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA that the mobile node is registered to and tunnel all datagrams from the mobile node to its HA

Use the **no** option of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, then triangular routing is used.
The system defaults to reverse tunnel enabled.

Important: If reverse tunneling is disabled on the system and an MN requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

Example

The following command disables reverse-tunneling support for the FA service:

```
no reverse-tunnel
```

revocation

Enables the MIP revocation feature and configures revocation parameters.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
revocation { enable | max-retransmission number | negotiate-i-bit | retransmission-
timeout secs | trigger internal-failure }

no revocation enable | trigger internal-failure | negotiate-i-bit
```

no revocation { enable | negotiate-i-bit | trigger internal-failure }

Completely disables registration revocation on the FA.
Disables sending revocation messages to the HA when a session is affected by an internal task failure.

enable

Enables the MIP registration revocation feature on the FA. When enabled, if revocation is negotiated with an HA, and a MIP binding is terminated, the FA can send a Revocation message to the HA. This feature is disabled by default.

max-retransmission *number*

Default: 3
Specifies the maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer from 0 through 10.

negotiate-i-bit

Default: disabled
Enables the FA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

retransmission-timeout *secs*

Default: 3
Specifies the number of seconds to wait for a Revocation Acknowledgement from the HA before retransmitting the Revocation message. *secs* must be an integer from 1 through 10.

trigger internal-failure

Default: disabled
Enable sending a revocation message to the HA for all sessions that are affected by an internal task failure.

Usage

Use this command to enable or disable the MIP revocation feature on the FA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

Example

The following command enables Registration Revocation on the FA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to 6:

```
revocation max-retransmission 6
```

The following command sets the timeout between retransmissions to 10:

```
revocation retransmission-timeout 10
```

threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per FA service.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
threshold reg-reply-error high_thresh [ clear low_thresh ]

no threshold reg-reply-error
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* can be an integer from 0 through 100000.

Important: You must enter a value between 1 and 100000 to trigger an alert/alarm.

clear *low_thresh*

Default:0
The low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* can be an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Important: You must enter a value between 1 and 100000 to trigger an alert/alarm.

Usage

Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- **Enter condition**: Actual number of registration reply errors > High Threshold
- **Clear condition**: Actual number of registration reply errors £ Low Threshold

Example

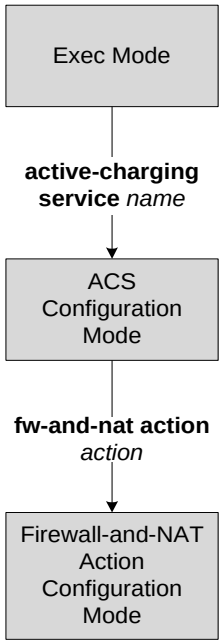
The following command configures a registration reply error threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold reg-reply-error 1000 clear 500
```

Chapter 121
Firewall-and-NAT Action Configuration Mode Commands

The Firewall-and-NAT Action Configuration Mode enables configuring Stateful Firewall (FW) and Network Address Translation (NAT) actions.

Important: This configuration mode is only available in release 11.0 and later releases. This configuration mode must be used to configure Action-based Stateful Firewall and NAT features.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

flow check-point

This command checkpoints all the flows matching the Firewall-and NAT action.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

flow check-point [data-usage *data_usage* **[and | or] | time-duration** *duration* **[and | or]]**

{ default | no } flow check-point

default

Configures the default Firewall action.

no

Deletes the Firewall action configuration.

data-usage *data_usage*

Specifies the data usage in bytes.
data_usage must be an integer from 1 through 4294967295.
The maximum limit for data-usage is 4 GB.

time-duration *duration*

Specifies the time duration in seconds.
duration must be an integer from 1 through 86400.
The maximum limit for time-duration is 24 hours.

and | or

This option allows to configure only **data-usage** or **time-duration**, or a combination of **data-usage** and **time-duration**.

Usage

Use this command to enable/disable the check-pointing of NATed flows and control the type of flows need to be check pointed based on specified criteria. Check pointing is done only for TCP and UDP flows.

Example

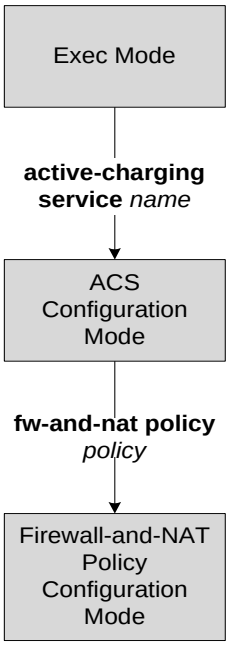
The following command configures Stateful Firewall to drop packets with data-usage *5000*:

```
flow check-point data-usage 5000
```

Chapter 122
Firewall-and-NAT Policy Configuration Mode Commands

The Firewall-and-NAT Policy Configuration Mode enables configuring Stateful Firewall (FW) and Network Address Translation (NAT) policies.

Important: This configuration mode is only available in 8.1, 9.0, and later releases. This configuration mode must be used to configure Policy-based Stateful Firewall and NAT features.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-rule

This command creates and configures an access rule.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

access-rule { no-ruledef-matches { downlink | uplink } action { deny [charging-action *charging_action* **] | permit [bypass-nat | nat-realm** *nat_realm* **[fw-and-nat-action** *name* **]] } | priority** *priority* **{ [dynamic-only | static-and-dynamic] access-ruledef** *ruledef_name* **{ deny [charging-action** *charging_action* **] | permit [[bypass-nat | nat-realm** *nat_realm* **[fw-and-nat-action** *name* **]] | trigger open-port {** *port_number* **| range** *start_port* **to** *end_port* **} direction { both | reverse | same }] } } }**

default access-rule no-ruledef-matches { downlink | uplink } action

no access-rule priority *priority*

default

Configures the default setting.
Default: Uplink direction: **permit**; Downlink direction: **deny**

no

Removes the access rule specified by the priority.

no-ruledef-matches

Configures action on packets with no ruledef match.

downlink

Specifies to act on downlink packets with no ruledef match.

uplink

Specifies to act on uplink packets with no ruledef match.

action

Specifies action to take on downlink/uplink packets with no ruledef match.

deny

Specifies to deny packets.

permit

Specifies to permit packets and allow the creation of data flows.

charging-action *charging_action*

Specifies the charging action. Optionally, a charging action can be configured for deny action. If a packet matches the deny rule, action is taken as configured in the charging action. If a charging action is specified, the content-ID and billing-action configured in the charging action are used. Also, the flow may be terminated (instead of just discarding the packet), if so configured in the specified charging action.
charging_action must be an alphanumeric string of 1 through 63 characters.

bypass-nat

Important: In 9.0 and later releases, this keyword is NAT license dependent.

Specifies to bypass NAT.

nat-realm *nat_realm*

Important: In 9.0 and later releases, this keyword is NAT license dependent.

Specifies the NAT realm to be used to perform NAT on subscriber packets matching the access ruledef. If the NAT realm is not specified, NAT will be bypassed. That is, NAT will not be performed on subscriber packets that are matching a ruledef with no NAT realm name configured in it.
nat_realm must be an alphanumeric string of 1 through 31 characters.

priority *priority*

Specifies priority of an access ruledef in the Firewall-and-NAT policy.
priority must be an integer from 1 through 65535 that is unique for each access ruledef in the Firewall-and-NAT policy.

[dynamic-only | static-and-dynamic] access-ruledef *ruledef_name*

Specifies the access ruledef name. Optionally, the ruledef type can also be specified.

- **dynamic-only**: Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
- **static-and-dynamic**: Static and Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is enabled by default.
- **access-ruledef** *ruledef_name*: Specifies the access ruledef name. *ruledef_name* must be an alphanumeric string of 1 through 63 characters.

trigger open-port { *port_number* | range *start_port* to *end_port* } direction { both | reverse | same }

Important: In 9.0 and later releases, this keyword is Stateful Firewall license dependent.

Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.

- *port_number*: Specifies the auxiliary port number to open for traffic, and must be an integer from 1 through 65535.

- **range** *start_port* **to** *end_port*: Specifies the range of port numbers to open for subscriber traffic.
  - *start_port* must be an integer from 1 through 65535.
  - *end_port* must be an integer from 1 through 65535, and must be greater than *start_port*.
- **direction { both | reverse | same }**: Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.
  - *both*: Provides the trigger to open port for traffic in either direction of the control connection.
  - *reverse*: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).
  - *same*: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add access ruledefs to the Firewall-and-NAT policy and configure the priority and actions for rule matching.
The policy specifies the rules to be applied on calls. The ruledefs in the policy have priorities, based on which priority matching is done.
For Stateful Firewall, the port trigger configuration is optional, and can be configured only if a rule action is permit. When a rule is matched and the rule action is permit, if the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association that matches the rule. Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic.
When a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as Event Data Record (EDR) enabled, an EDR is generated.
- If the content ID is configured, UDR information is updated.
- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Important: For Stateful Firewall, only the terminate-flow action is applicable if configured in the specified charging action.

Allowing/dropping of packets is determined in the following sequence:

- Check is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Access ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the **access-rule priority** configuration.
- If no access ruledef matches, the packet is allowed or dropped as per the **access-rule no-ruledef-matches** configuration.

For a packet dropped due to access ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.

For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command in the ACS Rulebase Configuration Mode.
The GGSN can dynamically activate or deactivate dynamic ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the policy is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

Example

For Stateful Firewall, the following command assigns a priority of *10* to the access ruledef *test_rule*, adds it to the policy, and permits port trigger to be used for the rule to open ports in the range of *1000* to *2000* in either direction of the control connection:

```
access-rule priority 1 access-ruledef test_rule permit trigger open-port
range 1000 to 2000 direction both
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

firewall dos-protection

This command configures Stateful Firewall protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce |
ip-unaligned-timestamp | ipv6-dst-options [ invalid-options | unknown-options ] | ipv6-
extension-hdrs [ limit extension_limit ] | ipv6-frag-hdr nested-fragmentation | ipv6-hop-
by-hop [ invalid-options | jumbo-payload | router-alert | unknown-options ] | mime-flood
| port-scan | source-router | tcp-window-containment | teardrop | winnuke }

default firewall dos-protection
```

no

Disables Stateful Firewall protection for subscribers against the specified Denial of Service (DoS) attack(s).

default

Disables Stateful Firewall protection for subscribers against all DoS attacks.

all

Enables Stateful Firewall protection for subscribers against all DoS attacks supported by the Stateful Firewall service.
The IPv6 extension headers will be enabled only if the **firewall validate-ip-options** command is enabled in the Firewall-and-NAT policy configuration.

flooding { icmp | tcp-syn | udp }

Enables protection against the specified flooding attack:

- **icmp**: Enables protection against ICMP Flood attack.
- **tcp-syn**: Enables protection against TCP Syn Flood attack.
- **udp**: Enables protection against UDP Flood attack.

ftp-bounce

Enables protection against FTP Bounce attacks.

ip-unaligned-timestamp

Enables protection against IP Unaligned Timestamp attacks.

ipv6-dst-options [invalid-options | unknown-options]

Drops IPv6 packets containing the IPv6 destination options header.
The following options are specified in the Destination Options extension header:

- The Tunnel Encapsulation Limit (option type: 0x04) is a destination option defined in RFC 2473.
- The Home Address option (option type: 0xC9) is part of Mobile IP processing defined in RFC 3775. This option is only valid as a Destination Option.
- The NSAP Address option (option type: 0xC3) is assigned as a Destination Option by RFC 1888 and deprecated (reclassified as historic) by RFC 4048.
- **invalid-options**: Drops IPv6 packets containing invalid IPv6 destination options.

  The following values are invalid in a Destination Options extension header option type field. Packets with these options in a Destination Options header will be dropped.

  - Value 0xC2, Jumbo Payload
  - Value 0x05, Router Alert
  - Value 0x06, Quick start
  - Value 0x07, CALIPSO
- **unknown-options**: Drops IPv6 packets containing unknown IPv6 destination options.

ipv6-extension-hdrs [limit *extension_limit* **]**

Default: 8
Limits the number of IPv6 extension headers in an IPv6 packet. An IPv6 packet can contain zero or more extension headers.
Firewall will not fully parse packets with unknown extension headers as the extension header format is unspecified. Under such cases, the transport protocol will be considered as **unknown**. Packets with invalid length field in the extension headers and packets with next header 0x01 (ICMPv4) will be dropped. IPv6 uses ICMPv6 of type 0x3A.
extension_limit must be an integer from 0 through 4294967295.

ipv6-frag-hdr nested-fragmentation

Drops IPv6 packets containing nested fragmentation (reassembled packets containing a fragment header). IPv6 fragmentation is done only by the source node. An IPv6 fragment packet must have only one fragment header. Firewall will drop packets with more than one fragment header. The Reassembled packet containing a fragment header will be dropped by Firewall. As per RFC 2460, the fragment length (except for last fragment) must be a multiple of 8 octets. If not, such fragments are dropped.

ipv6-hop-by-hop [invalid-options | jumbo-payload | router-alert | unknown-options]

Drops IPv6 packets containing the hop-by-hop extension header.
The Hop-by-Hop Options extension header, if present, must be the first header to follow the IPv6 main header. This is indicated by a value of 0x00 in the next header field in the main header. The length must be expressed as a multiple of 8 octets (excluding the first 8 octets). If not, such packets will be dropped.

- **invalid-options**: Drops IPv6 packets containing invalid IPv6 hop-by-hop options.

The following values are invalid in a Hop-by-Hop extension header option type field. Packets with these options in a hop-by-hop header will be dropped.

- Value 0x04, Tunnel Encapsulation limit
- Value 0xC9, Home Address Destination option
- Value 0xC3, NSAP Address option

The options are present in TLV (Type Length Value) format. If the length specified is invalid, then such packets will be dropped.

- **jumbo-payload**: Drops IPv6 packets with jumbo payload hop-by-hop options.

  The Jumbo Payload option (RFC 2675) has the option type value 0xC2 and is only valid as a Hop-by-Hop option. This option allows the creation of very large IP packets (packets larger than 65K bytes). If this option is allowed, the following validity checks will be done.

  - The IP payload length must be 0x00 when the Jumbo Payload option is present.
  - The Jumbo Payload option must be used only when the length is greater than 65,535; the two most significant bytes of the Jumbo length cannot be 0x00.
  - The Jumbo Payload option cannot be used in conjunction with a Fragmentation extension header.

  If any of the above checks fail, then the IPv6 packet will be dropped. The Option Type field must have 4n+2 alignment.

- **router-alert**: Drops IPv6 packets with router alert hop-by-hop options.

  The Router Alert (RFC 2711) option is used to signal the routers that a closer inspection of the packet is warranted. Denial of service (DoS) attacks can occur if an attacker sends large number of packets with this option. Only one option of this type must be present, regardless of value, per Hop-by-Hop header with 2n + 0 alignment.

- **unknown-options**: Drops IPv6 packets containing unknown IPv6 hop-by-hop options.

mime-flood

Enables protection against HTTP Multiple Internet Mail Extension (MIME) header flooding attacks.

port-scan

Enables protection against Port Scan attacks.

tcp-window-containment

Enables protection against TCP sequence number out-of-range attacks.

source-router

Enables protection against IPv4/IPv6 Source Route IP Option attacks.
This command can be used to filter IPv4/IPv6 packets containing Routing header of Type 0 (source routing). In this release, only type 0 filtering is supported.

teardrop

Enables protection against IPv4/IPv6 Teardrop attacks.

winnuke

Enables protection against WIN-NUKE attacks.

Usage

Use this command to enable Stateful Firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Important: DoS attacks are detected only in the downlink direction.

Example

The following command enables protection from all supported DoS attacks:

```
firewall dos-protection all
```

firewall flooding

This command configures Stateful Firewall protection from Packet Flooding attacks.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall flooding { protocol { icmp | tcp-syn | udp } packet limit *packets* **| sampling-interval** *interval* **}**

default firewall flooding { protocol { icmp | tcp-syn | udp } packet limit | sampling-interval }

default

Configures the default setting for the specified configuration.

protocol { icmp | tcp-syn | udp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

packet limit *packets*

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.
packets must be an integer from 1 through 4294967295.
Default: 1000 packets per sampling interval for all protocols.

sampling-interval *interval*

Specifies the flooding sampling interval, in seconds.
interval must be an integer from 1 through 60.
Default: 1 second
The maximum sampling-interval configurable is 60 seconds.

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more than *1000* ICMP packets per sampling interval:

```
firewall flooding protocol icmp packet limit 1000
```

The following command ensures a subscriber will not receive more than *1000* UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IP addresses, those packets will be limited to 1000 packets per sampling interval. This way only “suspected” malicious packets are limited and not “legitimate” packets.

```
firewall flooding protocol udp packet limit 1000
```

The following command ensures a subscriber will not receive more than *1000* TCP-Syn packets per sampling interval:

```
firewall flooding protocol tcp-syn packet limit 1000
```

The following command specifies a flooding sampling interval of *1* second:

```
firewall flooding sampling-interval 1
```

firewall icmp-checksum-error

This command configures Stateful Firewall action on packets with ICMP/ICMPv6 Checksum errors.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall icmp-checksum-error { drop | permit }

default firewall icmp-checksum-error
```

default

Configures the default setting.
Default: **drop**

drop

Drops packets with ICMP/ICMPv6 Checksum errors.

permit

Permits packets with ICMP/ICMPv6 Checksum errors.

Usage

Use this command to configure Stateful Firewall action on packets with ICMP/ICMPv6 Checksum errors. This command also applies to ICMP/ICMPv6 packets with Inner IP Checksum error.
For NAT-only calls, packets with ICMP/ICMPv6 errors are dropped, and other packets are allowed.

Example

The following command configures Stateful Firewall to drop packets with ICMP/ICMPv6 Checksum errors:

```
firewall icmp-checksum-error drop
```

firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP/ICMPv6 error messages sent by the subscriber for a particular data flow.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall icmp-destination-unreachable-message-threshold messages then-block-server

{ default | no } firewall icmp-destination-unreachable-message-threshold
```

default

Configures the default setting.
Default: No limit

no

Removes the previous configuration.

messages

Specifies the threshold on the number of ICMP/ICMPv6 error messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of ICMP/ICMPv6 error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.
Some servers that run QChat ignore the ICMP/ICMPv6 error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of *10* ICMP/ICMPv6 error messages:

```
firewall icmp-destination-unreachable-message-threshold 10 then-block-
server
```

firewall icmp-echo-id-zero

This command configures Stateful Firewall action on echo packets with ICMP/ICMPv6 ID zero.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall icmp-echo-id-zero { drop | permit }

default firewall icmp-echo-id-zero
```

default

Configures the default setting.
Default: **permit**

drop

Drops packets with ICMP/ICMPv6 ID zero.

permit

Permits packets with ICMP/ICMPv6 ID zero.

Usage

Use this command to configure Stateful Firewall action on echo packets with ICMP/ICMPv6 ID zero.

Example

The following command configures Stateful Firewall to drop packets with ICMP/ICMPv6 ID zero:

```
firewall icmp-echo-id-zero drop
```

firewall icmp-fsm

This command enables/disables Stateful Firewall's ICMP/ICMPv6 Finite State Machine (FSM).

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] firewall icmp-fsm
```

default

Configures the default setting.
Default: Enabled. Same as **firewall icmp-fsm**.

no

Disables Stateful Firewall ICMP/ICMPv6 FSM checks.

Usage

Use this command to enable/disable Stateful Firewall ICMP/ICMPv6 FSM checks. When Stateful Firewall and ICMP/ICMPv6 FSM are enabled, ICMP/ICMPv6 reply messages for which there is no saved ICMP/ICMPv6 request message are discarded. ICMP/ICMPv6 error messages (i.e., messages containing an embedded message) for which there is no saved flow for the embedded message are discarded.

Example

The following command disables Stateful Firewall's ICMP/ICMPv6 FSM checks:

```
no firewall icmp-fsm
```

firewall ip-reassembly-failure

This command configures Stateful Firewall action on IPv4/IPv6 packets involved in IP Reassembly Failure scenarios.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall ip-reassembly-failure { drop | permit }

default firewall ip-reassembly-failure
```

default

Configures the default setting.
Default: **permit**

drop

Drops IPv4/IPv6 packets involved in IP reassembly failure scenarios.

permit

Permits IPv4/IPv6 packets involved in IP reassembly failure scenarios.

Usage

Use this command to configure Stateful Firewall action on IPv4/IPv6 packets involved in IP reassembly failure scenarios such as missing fragments, overlapping offset, etc.
For NAT-only calls, packets involved in IP reassembly failure scenarios are dropped.

Example

The following command specifies to drop IPv4/IPv6 packets involved in IP reassembly failure scenarios:

```
firewall ip-reassembly-failure drop
```

firewall malformed-packets

This command configures Stateful Firewall action on malformed packets. In release 12.0, this command supports ICMPv6 and IPv6 packets.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall malformed-packets { drop | permit }

default firewall malformed-packets
```

default

Configures the default setting.
Default: **permit**

drop

Drops malformed packets.

permit

Permits malformed packets.

Usage

Use this command to configure Stateful Firewall action on malformed packets.
For NAT-only calls, malformed packets are always permitted.

Example

The following command specifies Stateful Firewall to drop malformed packets:

```
firewall malformed-packets drop
```

firewall max-ip-packet-size

This command configures the maximum IPv4/IPv6 packet size (after IP reassembly) allowed over Stateful Firewall.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall max-ip-packet-size *packet_size* **protocol { icmp | non-icmp }**

default firewall max-ip-packet-size protocol { icmp | non-icmp }

default

Configures the default setting.
Default: 65535 bytes (for both ICMP/ICMPv6 and non-ICMP/ICMPv6)

packet_size

Specifies the maximum packet size allowed by firewall. Any IPv6 packet with payload size greater than the configured value will be dropped.
packet_size must be an integer from 30000 through 65535.

protocol { icmp | non-icmp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP/ICMPv6 protocol.
- **non-icmp**: Configuration for protocols other than ICMP/ICMPv6.

Usage

Use this command to configure the maximum IPv4/IPv6 packet size allowed for ICMP/ICMPv6 and non-ICMP/ICMPv6 packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt” and “Ping-Of-Death” attacks.

Example

The following command allows a maximum packet size of *60000* for ICMP/ICMPv6 protocol:

```
firewall max-ip-packet-size 60000 protocol icmp
```

firewall mime-flood

This command configures Stateful Firewall protection from MIME Flood attacks.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall mime-flood { http-headers-limit *max_limit* **| max-http-header-field-size** *max_size* **}**

default firewall mime-flood { http-headers-limit | max-http-header-field-size }

default

Configures the default setting for the specified parameter.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.
max_limit must be an integer from 1 through 256.
Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.
max_size must be an integer from 1 through 8192.
Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks.
This command is only effective if Stateful Firewall DoS protection for MIME flood attacks has been enabled using the **firewall dos-protection mime-flood** command, and the **route** command has been configured to send HTTP packets to the HTTP analyzer.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:

```
firewall mime-flood http-headers-limit 100
```

The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:

```
firewall mime-flood max-http-header-field-size 1000
```

firewall policy

This command enables/disables Stateful Firewall support in a Firewall-and-NAT policy.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

In 11.0 and earlier releases:

```
firewall policy firewall-required
```

```
no firewall policy
```

In 12.0 and later releases:

```
firewall policy { ipv4-and-ipv6 | ipv4-only | ipv6-only }
```

```
{ default | no } firewall policy
```

default

Disables IPv4 and IPv6 Stateful Firewall support in the Firewall-and-NAT policy.

no

Disables IPv4 and IPv6 Stateful Firewall support in the Firewall-and-NAT policy.

firewall-required

Enables Stateful Firewall support in the Firewall-and-NAT policy.

Important: This keyword is available only in 11.0 and earlier releases.

ipv4-and-ipv6

Enables both IPv4 and IPv6 Stateful Firewall support in the Firewall-and-NAT policy.

ipv4-only

Enables IPv4 Stateful Firewall and disables IPv6 Stateful Firewall in the Firewall-and-NAT policy.

ipv6-only

Enables IPv6 Stateful Firewall and disables IPv4 Stateful Firewall support in the Firewall-and-NAT policy.

Usage

Use this command to enable/disable IPv4 and/or IPv6 Stateful Firewall support for all subscribers using a Firewall-and-NAT policy.

Example

The following command enables IPv4 and IPv6 Stateful Firewall support in a Firewall-and-NAT policy:

```
firewall policy ipv4-and-ipv6
```

The following command disables Stateful Firewall support in a Firewall-and-NAT policy:

```
no firewall policy
```

firewall tcp-checksum-error

This command configures Stateful Firewall action on packets with TCP Checksum error.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-checksum-error { drop | permit }

default firewall tcp-checksum-error
```

default

Configures the default setting.
Default: **drop**

drop

Drops packets with TCP Checksum errors.

permit

Permits packets with TCP Checksum errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Checksum error.
For NAT-only calls, packets with TCP Checksum errors are permitted.

Example

The following command specifies Stateful Firewall to drop packets with TCP Checksum errors:

```
firewall tcp-checksum-error drop
```

firewall tcp-first-packet-non-syn

This command configures Stateful Firewall action on TCP flows starting with a non-SYN packet.

Important: In release 9.0, this command is deprecated. This configuration is available as the **`firewall tcp-fsm [ first-packet-non-syn { drop | permit | send-reset } ]`** command.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

`firewall tcp-first-packet-non-syn { drop | reset }`

`default firewall tcp-first-packet-non-syn`

`default`

Configures the default setting.
Default: **`drop`**

`drop`

Drops the non-SYN packet.

`reset`

Sends reset.

Usage

Use this command to configure Stateful Firewall action on TCP flows starting with a non-SYN packet.

Example

For flows starting with a non-SYN packet, the following command specifies Stateful Firewall to drop the non-SYN packet:

```
firewall tcp-first-packet-non-syn drop
```

firewall tcp-fsm

This command enables/disables Stateful Firewall's TCP Finite State Machine (FSM).

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-fsm [first-packet-non-syn { drop | permit | send-reset }]

{ default | no } firewall tcp-fsm

default

Configures the default setting.
Default: **drop**

no

Disables Stateful Firewall's TCP FSM.

first-packet-non-syn { drop | permit | send-reset }

Specifies Stateful Firewall action on TCP flows starting with a non-SYN packet:

- **drop**: Specifies to drop the packet.
- **permit**: Specifies to permit the packet.
- **send-reset**: Specifies to drop the packet and send TCP RST.

Default: **drop**

Usage

Use this command to enable/disable Stateful Firewall's TCP FSM checks. When Stateful Firewall and TCP FSM are enabled, state of the TCP session is checked to decide whether to forward TCP packets.

Example

The following command enables TCP FSM, and configures action to take on TCP flows starting with a non-SYN packet to drop the packet:

```
firewall tcp-fsm first-packet-non-syn drop
```

firewall tcp-idle-timeout-action

This command configures action on TCP idle timeout expiry.

Important: In release 9.0 and later this command is also available to NAT.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-idle-timeout-action { drop | reset }

{ default | no } firewall tcp-idle-timeout-action
```

default

Configures the default setting.
Default: **reset**

no

Configures the TCP idle timeout expiry action to reset.

drop

Drops the session on TCP idle timeout expiry.

reset

Resends TCP RST on TCP idle timeout expiry. When configured to reset, the session is dropped, and the system can avoid packets arriving for the idle flow from getting dropped.

Usage

Use this command to configure action to take on TCP idle timeout expiry.

Example

The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```

firewall tcp-options-error

This command configures Stateful Firewall action on packets with TCP Option errors.

Product

FW

Privileges

Security Administrator, Administrator

Syntax

```
firewall tcp-options-error { drop | permit }

default firewall tcp-options-error
```

default

Configures the default setting.
Default: **permit**

drop

Drops packets with TCP Option errors.

permit

Permits packets with TCP Option errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Option errors.

Example

The following command configures Stateful Firewall to drop packets with TCP Option errors:

```
firewall tcp-options-error drop
```

firewall tcp-partial-connection-timeout

This command configures action on idle timeout for partially open TCP connections.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-partial-connection-timeout *timeout*

{ default | no } firewall tcp-partial-connection-timeout

default

Configures the default setting.

no

Disables the idle timeout for partially open TCP connections.

timeout

Specifies the timeout in seconds.
timeout must be an integer from 0 through 86400.
Default: 30 seconds

Usage

Use this command to configure idle timeout for TCP connections that are yet to be established (partially open) in the case of Firewall enabled calls.

Example

The following command sets the idle timeout setting to *30* seconds:

```
firewall tcp-partial-connection-timeout 30
```

firewall tcp-reset-message-threshold

This command configures a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-reset-message-threshold *messages* **then-block-server**

{ default | no } firewall tcp-reset-message-threshold

default

Configures the default setting.
Default: Disabled

no

Disables the configuration.

messages

Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of TCP reset messages (TCP RST+ACK) sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

Example

The following command sets the threshold on the number of TCP reset messages to *10*:

```
firewall tcp-reset-message-threshold 10 then-block-server
```

firewall tcp-syn-flood-intercept

This command configures TCP SYN intercept parameters for protection against TCP SYN flooding attacks.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-syn-flood-intercept { mode { none | watch [aggressive] } | watch-timeout *intercept_watch_timeout* **}**

default firewall tcp-syn-flood-intercept { mode | watch-timeout }

default

Configures the default settings for SYN Flood DoS protection.

mode { none | watch [aggressive] }

Specifies the TCP SYN flood intercept mode:

- **none**: Disables the TCP SYN Flood Intercept feature.
- **watch**: Configures TCP SYN flood intercept feature in watch mode. The Stateful Firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the Stateful Firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

watch-timeout *intercept_watch_timeout*

Specifies the TCP intercept watch timeout, in seconds.
intercept_watch_timeout must be an integer from 5 through 30.
Default: 30

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks. This command enables and configures TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command.

The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the intercept watch timeout setting to *15* seconds:

```
firewall tcp-syn-flood-intercept watch-timeout 15
```

firewall tcp-syn-with-ecn-cwr

This command configures Stateful Firewall action on TCP SYN packets with either ECN or CWR flag set.

Product

FW

Privileges

Security Administrator, Administrator

Syntax

```
firewall tcp-syn-with-ecn-cwr { drop | permit }

default firewall tcp-syn-with-ecn-cwr
```

default

Configures the default setting.
Default: **permit**

drop

Drops TCP SYN packets with either ECN or CWR flag set.

permit

Permits TCP SYN packets with either ECN or CWR flag set.

Usage

Use this command to configure Stateful Firewall action on receiving a TCP SYN packet with either ECN or CWR flag set.

Example

The following command configures Stateful Firewall to drop TCP SYN packets with ECN / CWR flag set:

```
firewall tcp-syn-with-ecn-cwr drop
```

firewall udp-checksum-error

This command configures Stateful Firewall action on packets with UDP Checksum error.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall udp-checksum-error { drop | permit }

default firewall udp-checksum-error
```

default

Configures the default setting.
Default: **drop**

drop

Drops packets with UDP Checksum error.

permit

Permits packets with UDP Checksum error.

Usage

Use this command to configure Stateful Firewall action on packets with UDP Checksum error.
For NAT-only calls, packets with UDP Checksum error are permitted.

Example

The following command specifies to drop packets with UDP Checksum error:

```
firewall udp-checksum-error drop
```

firewall validate-ip-options

This command enables / disables the Stateful Firewall validation of IP options for errors.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] firewall validate-ip-options
```

default

Configures the default setting.
Default: Disabled. Same as **no firewall validate-ip-options**

no

Disables validation of IP options.

Usage

Use this command to enable / disable Stateful Firewall validation of IP options. When enabled, Stateful Firewall will drop packets with IP option errors.
For NAT calls, validation of IP Options is disabled.

Example

The following command enables validation of IP options:

```
firewall validate-ip-options
```

nat binding-record

This command configures the generation of NAT Binding Records.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat binding-record edr-format *edr_format* **[port-chunk-allocation] [port-chunk-release]**

{ default | no } nat binding-record

default

Configures the default setting.
Default: **port-chunk-release**

no

Disables generating NAT Binding Records.

edr-format *edr_format*

Specifies the Event Data Record (EDR) format name.
edr_format must be an alphanumeric string of 1 through 63 characters.

port-chunk-allocation

Specifies generating NAT Binding Records when a port-chunk is allocated.

port-chunk-release

Specifies generating NAT Binding Record when a port-chunk is released.

Usage

Use this command to configure the generation of NAT Binding Records.

Example

The following command configures an EDR format named *test123* and specifies generating NAT Binding Records when a port chunk is allocated:

```
nat binding-record edr-format test123 port-chunk-allocation
```

nat icsr-flow-recovery

This command enables/disables the NAT ICSR Flow checkpointing support for subscribers in a Firewall-and-NAT policy.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
{ default | no } nat icsr-flow-recovery
```

default

Configures the default setting.
Default: Disabled. Same as **no nat icsr-flow-recovery**.

no

Disables the NAT ICSR Flow checkpointing.

Usage

Use this command to enable/disable all NAT ICSR Flow checkpointing for subscribers using this policy.

Example

The following command enables NAT ICSR Flow checkpointing:

```
nat icsr-flow-recovery
```

nat policy

This command enables/disables Network Address Translation (NAT) support in a Firewall-and-NAT policy.

Important: In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

In 12.1 and earlier releases:

nat policy nat-required [default-nat-realm *nat_realm_name* **[fw-and-nat-action** *action_name* **]]**

no nat policy

In 12.2 and later releases:

nat policy [ipv4-and-ipv6 | ipv4-only | ipv6-only] [default-nat-realm *nat_realm_name* **[fw-and-nat-action** *action_name* **]]**

no nat policy

no

Disables both NAT44 and NAT64 support in the Firewall-and-NAT policy.

nat-required

Enables NAT support in the Firewall-and-NAT policy.

Important: This keyword is available only in 12.1 and earlier releases, and is supported in release 12.2 for backward compatibility. The **nat policy nat-required** command enables only NAT44.

ipv4-and-ipv6

Enables NAT processing for both IPv4 and IPv6 in the Firewall-and-NAT policy.

ipv4-only

Enables NAT processing for IPv4 in the Firewall-and-NAT policy.

ipv6-only

Enables NAT processing for IPv6 in the Firewall-and-NAT policy.

default-nat-realm *nat_realm_name*

Specifies the default NAT realm for the Firewall-and-NAT policy.

nat_realm_name must be the name of an existing NAT realm, and must be an alphanumeric string of 1 through 31 characters.

fw-and-nat-action *action_name*

Specifies the Firewall-and-NAT action name.
action_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to enable/disable IPv4 and/or IPv6 NAT support for all subscribers using a Firewall-and-NAT policy.
In release 8.1, to enable NAT support for a subscriber, Stateful Firewall must also be enabled for that subscriber. See the **firewall policy** CLI command.
Once NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms specified in the rules. See the **access-rule** CLI command.
You can enable/disable NAT at any time, however the changed NAT status will not be applied to active calls. The new NAT status will only be applied to new calls.

Example

The following command enables NAT support in a Firewall-and-NAT policy:

```
nat policy nat-required
```

The following command disables NAT support in a Firewall-and-NAT policy:

```
no nat policy
```

The following command enables IPv4 and IPv6 NAT support in a Firewall-and-NAT policy:

```
nat policy ipv4-and-ipv6
```

nat private-ip-flow-timeout

This command configures the Private IP NPU flow timeout setting.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat private-ip-flow-timeout timeout

{ default | no } nat private-ip-flow-timeout
```

default

Configures the default setting.
Default: 180 seconds

no

Disables the Private IP NPU flow timeout configuration.
When disabled, the flow is installed at call setup and will be removed only when the subscriber disconnects.

timeout

Specifies the Private IP NPU flow timeout period in seconds.
timeout must be an integer from 180 through 86400.

Usage

Use this command to configure the Private IP NPU flow timeout setting.
For NAT-enabled calls, by default, the downlink private IP NPU flow will not be installed at call setup for a subscriber session. The flow will only be installed on demand. When there is no traffic on the private flow, the private IP flow will be removed after the configurable timeout period.

Example

The following command configures the Private IP NPU flow timeout setting to *36000* seconds:

```
nat private-ip-flow-timeout 36000
```

nat suppress-aaa-update

This command suppresses sending NAT Bind Update (NBU) to the AAA server when PPP disconnect happens.

Important: This command is customer-specific. For more information please contact your local service representative.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat suppress-aaa-update call-termination

default nat suppress-aaa-update
```

default

Configures the default setting.
Default: No suppression of AAA updates.

Usage

Use this command to suppress sending of NBU to the AAA server when PPP disconnect happens, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NBU are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

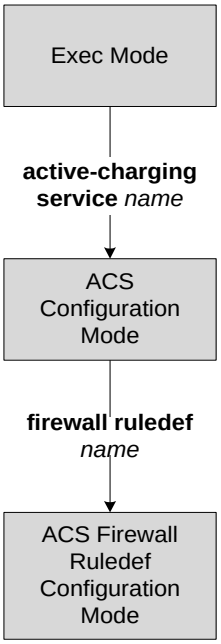
Example

The following command suppresses the sending of NBU to the AAA server:

```
nat suppress-aaa-update call-termination
```

Chapter 123
Firewall-and-NAT Access Ruledef Configuration Mode Commands

The Firewall-and-NAT Access Ruledef Configuration Mode is used to configure and manage Access rule definitions used by the Stateful Firewall (FW) and Network Address Translation (NAT) in-line services.



bearer 3gpp apn

This command configures an access ruledef to analyze user traffic based on APN bearer.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp apn [case-sensitive] *operator value*

no

Removes previously configured bearer ruledef.

case-sensitive

This keyword makes the rule case sensitive.
By default, ruledefs are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the APN name.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

The APN name to match in bearer flow.
value must be an alphanumeric string of 1 through 63 characters that can include punctuation characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on APN name.

Example

The following command creates an access ruledef for analyzing user traffic for an APN named *apn12*:

```
bearer 3gpp apn = apn12
```

bearer 3gpp imsi

This command configures an access ruledef to analyze user traffic based on International Mobile Station Identification (IMSI) number in bearer flow.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp imsi { *operator msid* **| { !range | range } imsi-pool** *imsi_pool* **}**

---

no

Removes previously configured bearer ruledef.

---

operator

Specifies how to logically match the MSID.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

msid

Specifies the Mobile Station Identifier.

{ !range | range } imsi-pool *imsi_pool*

{ !range | range }: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

imsi-pool *imsi_pool*: Specifies the IMSI pool name. *imsi_pool* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on IMSI number of mobile station.

Example

The following command creates an access ruledef to analyze user traffic for the IMSI number *9198838330912*:

```
bearer 3gpp imsi = 9198838330912
```

bearer username

This command configures an access ruledef to analyze user traffic based on user name of the bearer flow.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer username [ case-sensitive ]` *`operator value`*

`no`

Removes previously configured bearer ruledef.

`case-sensitive`

This keyword makes the rule case sensitive.
By default, ruledefs are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the MSID.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`value`

Specifies the user name.
`value` must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to specify a access ruledef to analyze user traffic based on user name of the bearer flow.

Example

The following command creates an access ruledef for analyzing user traffic for the user name *`user12`*:

```
bearer username = user12
```

create-log-record

This command enables/disables access ruledef logging.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] create-log-record
```

no

Disables access ruledef logging.

Usage

Use this command to enable/disable access ruledef logging.

Example

The following command enables access ruledef logging:

```
create-log-record
```

The following command disables access ruledef logging:

```
no create-log-record
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

icmp any-match

This command configures an access ruledef to match any ICMPv4 traffic for the user.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] icmp any-match *operator condition*

no

Removes previously configured ICMPv4 any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access ruledef to match any ICMPv4 traffic of the user.

Example

The following command creates an access ruledef to match any non-ICMPv4 traffic of the user:

```
icmp any-match = FALSE
```

icmp code

This command configures an access ruledef to analyze user traffic based on ICMPv4 code.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] icmp code *operator code*

no

Removes previously configured ICMPv4 code ruledef.

operator

Specifies how to logically match the ICMPv4 code.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

code

Specifies the ICMPv4 code.
code must be an integer from 0 through 255.

Usage

Use this command to define an access ruledef to analyze user traffic based on the ICMPv4 code.

Example

The following command creates an access ruledef for analyzing user traffic using the ICMPv4 code as *23*:

```
icmp code = 23
```

icmp type

This command configures an access ruledef to analyze user traffic based on ICMPv4 type.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] icmp type operator type
```

no

Removes previously configured ICMPv4 type ruledef.

operator

Specifies how to logically match the ICMPv4 type.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

type

Specifies the ICMPv4 type.
type must be an integer from 0 through 255.
For example, 0 for ECHO Reply, 3 for Dest. Unreachable, and 5 for Redirect.

Usage

Use this command to define an access ruledef to analyze user traffic based on the ICMPv4 type.

Example

The following command creates an access ruledef for analyzing user traffic using an ICMPv4 type as *123*:

```
icmp type = 123
```

icmpv6 any-match

This command configures an access ruledef to match any ICMPv6 traffic for the user.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 any-match *operator condition*

no

Removes previously configured ICMPv6 any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access ruledef to match any ICMPv6 traffic of the user.

Example

The following command creates an access ruledef to match any non-ICMPv6 traffic of the user:

```
icmpv6 any-match = FALSE
```

icmpv6 code

This command configures an access ruledef to analyze user traffic based on ICMPv6 code.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 code *operator code*

no

Removes previously configured ICMPv6 code ruledef.

operator

Specifies how to logically match the ICMPv6 code.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

code

Specifies the ICMPv6 code.
code must be an integer from 0 through 255.

Usage

Use this command to define an access ruledef to analyze user traffic based on the ICMPv6 code.

Example

The following command creates an access ruledef for analyzing user traffic using the ICMPv6 code as *23*:

```
icmpv6 code = 23
```

icmpv6 type

This command configures an access ruledef to analyze user traffic based on ICMPv6 type.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 type *operator type*

no

Removes previously configured ICMPv6 type ruledef.

operator

Specifies how to logically match the ICMPv6 type.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

type

Specifies the ICMPv6 type.
type must be an integer from 0 through 255.
For example, 0 for ECHO Reply, 3 for Dest. Unreachable, and 5 for Redirect.

Usage

Use this command to define an access ruledef to analyze user traffic based on the ICMPv6 type.

Example

The following command creates an access ruledef for analyzing user traffic using an ICMPv6 type as *123*:

```
icmpv6 type = 123
```

ip any-match

This command configures an access ruledef to match any IP traffic for the user.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] ip any-match *operator condition*

no

Removes previously configured IP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access ruledef to match any IP traffic of the user.

Example

The following command creates an access ruledef to match any non-IP traffic of the user:

```
ip any-match = FALSE
```

ip downlink

This command configures an access ruledef to analyze user traffic based on IP packet flow in downlink direction (to subscriber).

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] ip downlink *operator condition*

no

Removes previously configured IP ruledef.

operator

Specifies how to logically match the packet flow direction.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **TRUE**: Analyzed
- **FALSE**: Not analyzed

Usage

Use this command to define an access ruledef to analyze user traffic based on the IP packet flow direction as downlink.

Example

The following command creates access ruledef for analyzing user traffic using an IP packet direction to downlink (to subscriber):

```
ip downlink = TRUE
```

ip dst-address

This command configures an access ruledef to analyze user traffic based on IP destination address.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip dst-address { operator { ipv4/ipv6_address | ipv4/ipv6_address/mask } | {
!range | range } host-pool host_pool }
```

no

Removes previously configured IP destination address ruledef.

operator **{** *ipv4/ipv6_address* **|** *ipv4/ipv6_address/mask* **}**

operator specifies how to logically match the IP destination address.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

ipv4/ipv6_address: Specifies the IP address of destination node for outgoing traffic.
ipv4/ipv6_address must be the IP address entered using dotted-decimal notation for IPv4 or colon-separated notation for IPv6.
ipv4/ipv6_address/mask: Specifies the IP address of destination node for outgoing traffic.
ipv4/ipv6_address/mask must be the IP address entered using dotted-decimal notation for IPv4 or colon-separated notation for IPv6. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool* **}**

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on the IP destination address.

Example

The following command creates IP ruledef for analyzing user traffic using an IP destination address of *10.1.1.1*:

```
ip dst-address = 10.1.1.1
```

ip protocol

This command configures an access ruledef to analyze user traffic based on the protocol being transported by IP packets.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] ip protocol { { *operator* { *protocol* | *protocol_assignment* } } | { *operator protocol_assignment* } }

---

no

Removes previously configured IP protocol address ruledef.

---

operator **{** *protocol* **|** *protocol_assignment* **}**

operator: Specifies how to logically match the IP protocol.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

protocol: Specifies the protocol by name.
protocol must be one of the following:

- ah
- esp
- gre
- icmp
- tcp
- udp

protocol_assignment: Specifies the protocol by assignment number. *protocol_assignment* must be an integer from 0 through 255 (for example, 1 for ICMP, 6 for TCP, and 17 for UDP).

---

operator protocol_assignment

operator: Specifies how to logically match the IP protocol.
operator must be one of the following:

- **<=**: Less than or equals
- **>=**: Greater than or equals

protocol_assignment: Specifies the protocol by assignment number.
protocol_assignment must be an integer from 0 through 255 (for example, 1 for ICMP, 6 for TCP, and 17 for UDP).

Usage

Use this command to specify an access ruledef to analyze user traffic based on the IP protocol.

Example

The following command creates IP ruledef for analyzing user traffic using a protocol assignment of *1*:

```
ip protocol = 1
```

ip server-ipv6-network-prefix

This command configures an access ruledef to analyze user traffic based on IPv6 server prefix.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] ip server-ipv6-network-prefix *operator ipv6_prefix/prefix_length*

no

Removes previously configured IPv6 server prefix.

operator ipv6_prefix/prefix_length

operator: Specifies how to logically match the IPv6 server prefix.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

ipv6_prefix/prefix_length: Specifies the server's IPv6 address with subnet mask bit.
ipv6_prefix/prefix_length must be an IPv6 address in colon-separated notation with subnet mask bit. The *prefix_length* is the number of bits to match. The configurable prefix length values are 32, 40, 48, 56, 64 and 96.

Usage

Use this command to specify an access ruledef to analyze user traffic based on IPv6 server prefix. When a first packet for a flow is received, it is matched against a set of rules configured in the Firewall-and-NAT policy. If the incoming IPv6 packet matches a ruledef and configured prefix, then it indicates that NAT64 needs to be applied on the packet. If the packet did not match the prefix configured, then NAT64 will not be applied on the packet. If there is no rule matching the packet or if there is no rule configured, then the incoming IPv6 packet is matched against the well-known prefix. If the well-known prefix matches, then NAT64 is applied on the packet.

Example

The following command creates an IP ruledef to analyze user traffic using the IPv6 server prefix *abcd:dcba* with *32* bits of the server IPv6 address:

```
ip server-ipv6-network-prefix = abcd:dcba::/32
```

ip src-address

This command configures an access ruledef to analyze user traffic based on IP source address.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip src-address { operator { ipv4/ipv6_address | ipv4/ipv6_address/mask } | {
!range | range } host-pool host_pool }
```

no

Removes previously configured IP destination address ruledef.

operator **{** *ipv4/ipv6_address* **|** *ipv4/ipv6_address/mask* **}**

operator: Specifies how to logically match the IP source address.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

ipv4/ipv6_address: Specifies the IP address using dotted-decimal notation for IPv4 or colon-separated notation for IPv6.
ipv4/ipv6_address/mask: Specifies the IP address using dotted-decimal notation for IPv4 or colon-separated notation for IPv6 with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on the IP source address.

Example

The following command creates IP ruledef for analyzing user traffic using an IP source address of *10.1.1.1*:

```
ip src-address = 10.1.1.1
```

ip uplink

This command configures an access ruledef to analyze user traffic based on IP packet flow in the uplink direction (from subscriber).

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] ip uplink *operator condition*

no

Removes previously configured IP uplink match ruledef.

operator

Specifies how to logically match the IP packet flow direction.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **TRUE**: Not analyzed
- **FALSE**: Analyzed

Usage

Use this command to define an access ruledef to analyze user traffic based on the IP packet flow direction as uplink.

Example

The following command creates access ruledef for analyzing user traffic using an IP packet direction to uplink (from subscriber):

```
ip uplink = TRUE
```

ip version

This command defines rule expressions to match version number in IP header.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip version = { ipv4 | ipv6 }
```

no

Deletes the specified rule expression.

ipv4

Specifies the rule expression for IP version 4.

ipv6

Specifies the rule expression for IP version 6.

Usage

Use this command to define rule expressions to match IPv4/IPv6 version number in IP header.

Example

The following command defines a rule expression to match user traffic for the IP version **ipv6**:

```
ip version = ipv6
```

tcp any-match

This command configures an access ruledef to match any TCP traffic for the user.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] tcp any-match *operator condition*

no

Removes previously configured TCP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access ruledef to match any TCP traffic of the user.

Example

The following command creates an access ruledef to match any non-TCP traffic of the user:

```
tcp any-match = FALSE
```

tcp dst-port

This command configures an access ruledef to analyze user traffic based on destination TCP port.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] tcp dst-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

---

no

Removes the previously configured destination TCP port ruledef.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the range of destination TCP ports.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

---

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on destination TCP port.

Example

The following command creates an access ruledef for analyzing user traffic matching destination port for TCP as *10*:

```
tcp dst-port = 10
```

tcp either-port

This command configures an access ruledef to analyze user traffic based on either (destination or source) TCP ports.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] tcp either-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

---

no

Removes previously configured TCP either-port (destination or source) ruledef.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

---

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on either TCP port.

Example

The following command creates an access ruledef for analyzing user traffic matching destination or source port for TCP as *10*:

```
tcp either-port = 10
```

tcp src-port

This command configures an access ruledef to analyze user traffic based on source TCP port.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] tcp src-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

no

Removes previously configured source TCP port ruledef.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 to 65535.

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on source TCP port.

Example

The following command creates an access ruledef for analyzing user traffic matching source port for TCP as *10*:

```
tcp src-port = 10
```

udp any-match

This command configures an access ruledef to match any UDP traffic for the user.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] udp any-match *operator condition*

no

Removes previously configured UDP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access ruledef to match any UDP traffic of the user.

Example

The following command creates an access ruledef to match any UDP traffic of the user:

```
udp any-match = TRUE
```

udp dst-port

This command configures an access ruledef to analyze user traffic based on destination UDP port.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] udp dst-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

no

Removes previously configured destination UDP ports ruledef.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on destination UDP port.

Example

The following command creates an access ruledef for analyzing user traffic matching destination port for UDP as *10*:

```
udp dst-port = 10
```

udp either-port

This command configures an access ruledef to analyze user traffic based on either (destination or source) UDP port.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] udp either-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

no

Removes previously configured either-port (destination or source) UDP ruledef.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on either UDP port.

Example

The following command creates an access ruledef for analyzing user traffic matching destination or source port for UDP as *10*:

```
udp either-port = 10
```

udp src-port

This command configures an access ruledef to analyze user traffic based on source UDP port.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

[no] udp src-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

no

Removes previously configured source UDP port ruledef.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on source UDP port.

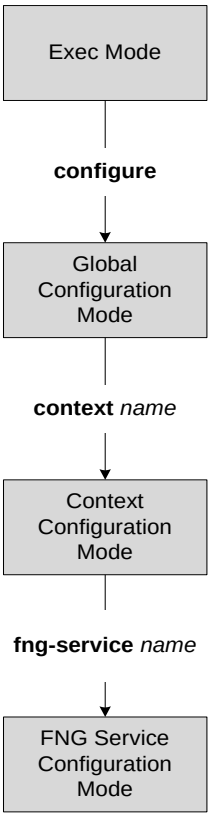
Example

The following command creates an access ruledef for analyzing user traffic matching source port for UDP as *10*:

```
udp src-port = 10
```

Chapter 124
FNG Service Configuration Mode Commands

The FNG Service Configuration Mode is used to configure the properties required for the Femto Network Gateway (FNG) to interface with the Femto Access Points (FAPs) in the network.



aaa aggregation

Sets the system attributes for A12 aggregation for the FNG service.

Product

FNG

Privilege

Security Administrator, Administrator

Syntax

aaa aggregation { interface type *a12*| **destination address** *ipv4_address* | **a12-group { context** *name* **[aaa-group** *name* **] | aaa-group** *name* **[context** *name* **] } }**

no aaa aggregation interface type *a12*

no a12 destination address *ipv4_address*

no aaa aggregation a12-group { context *name* **[aaa-group** *name* **] | aaa-group** *name* **[context** *name* **] }**

aaa aggregation interface type *a12*

Enables A12 aggregation functionality for the FNG service.

aaa aggregation interface a12 destination address *ipv4_address*

Adds a destination address for an AN-AAA server for A12 aggregation. A maximum of ten destination addresses can be configured.

aaa aggregation a12-group { context *name* **[aaa-group** *name* **] | aaa-group [context** *name* **] }**

Defines the AAA context and AAA group to be used for A12 aggregation.
If the context name and AAA group are not specified, the FNG defaults to the FNG service context and the default AAA group in that context. If the AAA group is specified but the context is not specified, the FNG uses the FNG service context and the AAA group in that context. If the AAA group is not specified and the context is specified, the FNG uses the default AAA group in that context.

no aaa aggregation interface type *a12*

Disables A12 aggregation functionality for the FNG service.

no aaa aggregation a12-destination address *ipv4_address*

Deletes the specified destination address for an AN-AAA server.

no aaa aggregation a12-group { context *name* **[aaa-group** *name* **] | aaa-group [context** *name* **] }**

Deletes the specified AAA context and AAA group to be used for A12 aggregation.

Usage

Sets the system attributes for AAA aggregation in the FNG service.

Example

The following command enables the A12 functionality for the FNG service:

```
aggregation interface type a12
```

aaa authentication

Specifies the AAA group to use for FAP authentication.

Product

FNG

Privilege

Security Administrator, Administrator

Syntax

```
aaa authentication { context-name name aaa-group name | context-name name aaa-group name }

no aaa authentication
```

no aaa authentication

Removes any existing authentication configuration.

context-name *name* **aaa-group** *name*

Specifies the context name and the AAA group name configured in the context for FAP authentication.
context-name *name*: Specifies the context where the AAA server group is defined as an alphanumeric string of 1 through 79 characters.
aaa-group *name*: Specifies the name of the AAA group to be used for authentication as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify that during IPSec session establishment using IKEv2 setup, the FNG will use Radius AAA for FAP authentication.

Example

Use the following to configure device authentication for an AAA group named *aaa-10* in the FNG context named *fng1*:

```
aaa authentication context-name fng1 aaa-group aaa-10
```

bind

Binds the FNG service IP address to a crypto template and specifies the maximum number of sessions the FNG service supports.

Product

FNG

Privilege

Security Administrator, Administrator

Syntax

bind address *ipv4_address* **{ crypto-template** *string* **}[max-sessions** *number* **]**

no bind

no bind

Removes a previously configured binding.

address *ipv4_address*

Specifies the IPv4 address of the FNG service.

crypto-template *string*

Specifies the name of the crypto template to be bound to the FNG service.
string is any value from 0 - 127 alpha and/or numeric characters.

max-sessions *number*

Specifies the maximum number of sessions to be supported by the FNG service as an integer from 0 through 1000000. Default: 1000000
If the max-sessions value is changed on an existing system, the new value takes effect immediately if it is higher than the current value. If the new value is lower than the current value, existing sessions remain established, but no new sessions are permitted until usage falls below the newly-configured value.

Usage

Binds the IP address used as the connection point for establishing the IKEv2 sessions to a crypto template. It can also define the maximum number of sessions the FNG can support.

Example

The following command binds an FNG service with an IP address of *10.2.3.4* to the crypto template named *T1* and sets the maximum number of sessions to *500000*:

```
bind address 10.2.3.4 crypto-template T1 max-sessions 500000
```

default

Sets or restores the default condition for the selected parameter.

Product

FNG

Privilege

Security Administrator, Administrator

Syntax

default { { aaa attribute 3gpp2-service-option } | duplicate-session-detection | ip source-violation { drop-limit | period } | setup-timeout | subscriber *name* **}**

aaa attribute 3gpp2-service-option

Sets or restores the default value of 4095.

duplicate-session-detection

Sets or restores the default option for duplicate session detection to be fapid-based.

ip source-violation (drop-limit | period }

Sets or restores the IP source violation detection defaults, as follows:
drop-limit: Sets or restores the maximum number of IP source violations within the detection period before dropping the call to the default value of 10.
period: Sets or restores the detection period for IP source violations to the default value of 120 seconds.

setup-timeout

Sets or restores the maximum time allowed for session setup to the default value of 60 seconds.

subscriber *name*

Sets or restores the name of the default subscriber.
name is a string of 1-127 characters.

username mac-address-stripping

The default behavior is to disable stripping the MAC address from the username.

Usage

Configures the default settings for a given parameter.

Example

Use the following command to set the maximum time allowed for session setup to the default value of 60 seconds:

```
default setup-timeout
```

duplicate-session-detection

Configures the FNG to detect duplicate call sessions based on Femtocell Access Point (FAP) ID and to clear old call information.

This feature is disabled by default.

Product

FNG

Privilege

Security Administrator, Administrator

Syntax

```
duplicate-session-detection { fapid-based }

no duplicate-session-detection

default duplicate-session-detection
```

fapid-based

Sets the FNG to detect duplicate call sessions based on the FAP ID.

no duplicate-session-detection

Disables duplicate session detection.

default duplicate-session-detection

Sets or restores the default option for duplicate session detection to be fapid-based.

Usage

By default, duplicate session detection is disabled.Use this command to enable this feature. It applies only to calls established after the feature has been enabled.
The following command enables duplicate session detection based on FAP ID:

```
duplicate-session-detection fapid-based
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Product

FNG

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { clear-on-valid-packet | drop-limit *num* **| period** *secs* **}**

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Configures the service to reset the drop-limit counters upon receipt of a properly addressed packet. Default: disabled

drop-limit *num*

Sets the maximum number of allowed IP source violations within the detection period before dropping a call as an integer from 1 through 1000000. Default: 10

period *secs*

Sets the detection period (in seconds) for IP source violations as an integer from 1 through 1000000. Default: 120

Usage

This function allows the operator to configure the network to prevent problems such as when a user gets handed back and forth between two gateways a number of times during a handoff scenario.
When a subscriber packet is received with a source IP address violation, the system increments the IP source violation drop-limit counter and starts the timer for the IP source violation period. Every subsequent packet received with a bad source address during the IP source violation period causes the drop-limit counter to increment.
For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The detection period timer continues to count throughout this process.

Example

The following command sets the drop limit to *15* and leaves the other values at their default values:

```
ip source-violation drop-limit 15
```

setup-timeout

Specifies the maximum time allowed to set up a session in seconds.

Product

FNG

Privilege

Security-Administrator, Administrator

Syntax

setup-timeout *integer*

default setup-timeout

setup-timeout *integer*

Sets the session setup timer (in seconds) as an integer from 2 through 300. Default: 60

default

Sets or restores the default session setup timer value to 60 seconds.

Usage

The FNG clears both the user session and tunnels if a call does not initiate successfully before the session setup timer expires.

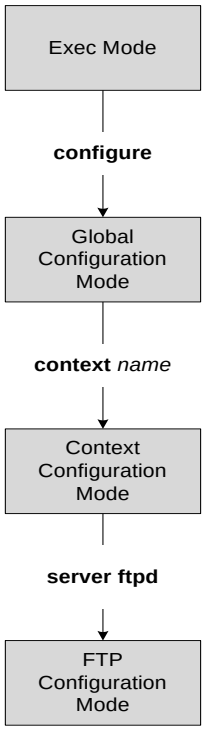
Example

The following command sets the session setup timeout value to the default value of 60 seconds:

```
default setup-timeout
```

Chapter 125
FTP Configuration Mode Commands

The FTP Configuration Mode is used to manage the FTP server options for the current context.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

max servers

Configures the maximum number of FTP servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *count*

count

Default: 40
Specifies the maximum number of servers that can be spawned in any 60-second interval. *count* must be an integer from 1 through 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that FTP services do not cause excessive system impact to other services.

Example

```
max servers 50
```

timeout

Configures the client idle timeout before an FTP session is automatically closed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout *seconds*

seconds

Default: 900
Specifies the number of seconds of inactivity before an FTP session is automatically closed. *seconds* must be an integer from 10 through 86400.

Usage

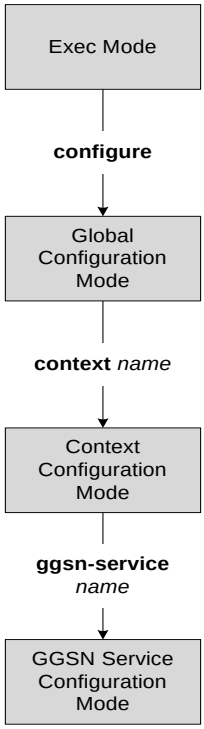
Adjust the session timeout to fine tune the system. FTP session resources can be released sooner to support additional requests by adjusting the timeout to a smaller value.

Example

```
timeout 300
```

Chapter 126
GGSN Service Configuration Mode Commands

The Gateway GPRS Support Node (GGSN) Configuration Mode is used to create and manage GGSN services within the current context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

Configures the name of the context configured on the system that processes accounting for PDP contexts handled by this GGSN service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

accounting context *context_name*

no accounting context

no

Removes a previously configured accounting context.

context_name

Specifies the name of the context to be used for accounting. *context_name* must be an alphanumeric string of 1 through 79 characters that is case sensitive.

Usage

By default, the system attempts to use the same context as the one in which the GGSN service is configured for accounting purposes. This command can be used to either change the system's default behavior, or allow GPRS Tunneling Protocol Prime (GTPP) accounting to a charging gateway (CG).
By default when GTPP accounting is used, accounting records will be sent to the accounting servers configured in whichever context the GGSN service is configured. This command may be used to override that default.

Example

The following command configures the GGSN service's accounting context to be plmn1:

```
accounting context plmn1
```

associate gtpu-service

This command associates a previously configured GTP-U service to bind the GGSN service with a peer. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

associate gtpu-service *svc_name*

noassociate gtpu-service

no

Removes the associated GTP-U service from this GGSN service configuration.

svc_name

Identifies the name of the GTP-U service preconfigured in Context Configuration mode to associate with a GGSN service. *svc_name* is an alphanumeric string from 1 through 63 characters.

Usage

Use this command to configure GTP-U data plan between GGSN service and peer node. The service defined for GTP-U can be configured in Context configuration mode.

Example

Following command associates GTP-U service named *gtpu-hnb1* with specific GGSN service.

```
associate gtpu-service gtpu-hnb1
```

associate pgw-service

This command enables a previously configured P-GW service to which handover will be done by the GGSN service. The P-GW service must be configured in Context Configuration mode before using this configuration.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

associate pgw-service *svc_name*

no associate pgw-service

no

Removes the associated P-GW service from this GGSN service configuration.

svc_name

Identifies the name of the P-GW service preconfigured in Context Configuration mode to which handover will be done.
The *svc_name* must be an alphanumeric string from 1 through 63 characters.

Usage

Use this command to allow enabling/disabling bearer handover from GGSN to a P-GW service. The service defined for P-GW can be configured in Context configuration mode.
The P-GW's eGTP service should have the same bind address as GGSN service and P-GW and GGSN should share same GTP-U, otherwise handover will fail.

Example

Following command enables P-GW service named *pgw-test* handover with specific GGSN service.

```
associate pgw-service pgw-test
```

authorize-with-hss

This command enables or disables subscriber session authorization via a Home Subscriber Server (HSS) over an S6b Diameter interface. This feature is required to support the interworking of GGSN with P-GW and HA.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
authorize-with-hss[ report-ipv6-addr ]

[ default | no ] authorize-with-hss
```

no

Disables the default authorization of subscriber over S6b interface. Resets the command to the default setting of "authorize locally" from an internal APN authorization configuration.

report-ipv6-addr

Enables the IPv6 address reporting through Authorization-Authentication-Request (AAR) towards the S6b interface.

Usage

Use this command to enable/disable the authorization support for subscriber over S6b interface, which is used between GGSN and the 3GPP AAA to exchange the information related to charging, P-CSCF discovery, etc. By use of this feature allows the GGSN service to interact with HSS over S6b interface through Diameter configuration which is already configured on the system.

Important: Diameter configuration must be available before enabling this command. For more information of Diameter interface configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter.

Important: This command is a license-enabled feature.

Example

The following command enables the subscriber authorization via an HSS over an S6b Diameter interface to provide session interoperability between GGSN and PGW and HA in this GGSN service:

```
authorize-with-hss
```

bind

Binds the GGSN service to a logical IP interface serving as the Gn interface. Specifies the maximum number of subscribers that can access this service over the interface.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

bind address *ip_address* **max** [**total-pdp-contexts** *max_total* | **ppp-pdp-contexts** *max_ppp*]

no bind address *address*

no

Removes a previously configured binding for the GGSN service.

ip_address

Specifies the IP address (address) of the interface configured as the Gn interface. *ip_address* is specified in IPv4 dotted-decimal notation.

max

Configures the maximum limits for total/PPP PDP contexts.

total-pdp-contexts *max_total*

Default: 1500000
Specifies the maximum number of PDP contexts (both IP and PPP) that can access this service on this interface.
count is an integer from 0 through 4000000.

Important: The maximum number of supported subscriber contexts varies based on the installed session capacity license and the number of active packet processing cards installed in the system. Note that each PPP PDP context is treated as two IP PDP contexts. Refer to the **license key** command for additional information.

ppp-pdp-contexts *max_ppp*

Default: 750000
Specifies the maximum number of PPP PDP contexts that can access this service on this interface.
count can be configured to an integer from 0 and 2500000.

Important: The maximum number of supported subscriber contexts varies based on the installed session capacity license and the number of active packet processing cards installed in the system. Refer to the **license key** command for additional information.

Usage

Used to associate or tie the GGSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of a Gn interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a "soft" limit as to the number of simultaneous subscriber contexts that can be facilitated by the service/interface at any given time. Soft limits are based on measurements gathered at regular short intervals (several times per minute) as opposed to measurements taken in real-time. Therefore, the sampled measurement may not match the actual number of PDP contexts currently being processed. Every PDP context request received is compared against the result of the last sample. If the sample is less than the soft limit configured, the request will be processed. If it is more, the request will be rejected.

When configuring the **`total-pdp-contexts`** or **`ppp-pdp-contexts`** options, be sure to consider the following:

- Each PPP PDP context is treated as two IP PDP contexts due to the additional CPU and memory resources required
- The total number of configured Gn interfaces
- The maximum number of subscriber PDP contexts that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the PDP contexts
- The type of physical port (10/100Base-T or 1000Base-Tx) to which these interfaces are bound

Taking these factors into account and distributing your subscriber contexts across all available interfaces allows you to configure your interfaces to optimally handle PDP contexts without degrading performance.

Example

The following command would bind the logical IP interface with the address of *`192.168.3.1`* to the GGSN service and specifies that a maximum of *`600`* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

cc behavior

Configures the 3GPP behavior bits associated with the GGSN's charging characteristics (CC).

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
cc behavior no-records nr_value

default cc behavior

no cc behavior no-records
```

no-records *nr_value*

Default: 0 (disabled)
Specifies the behavior bit upon which the GGSN ceases sending accounting records to a server.
nr_value can be configured to an integer from 1 through 12 corresponding to the 12 behavior bits – B1 through B12.

Usage

3GPP standards after 3GPP R98 included 12 behavior bits as part of GGSN charging characteristics. Like the charging characteristics profile index, the behavior bits are sent by the SGSN to the GGSN in the Create PDP Context request message.
This command configures the behavior bits for each of the conditions described.

Example

The following command configures a behavior bit of 10 for no-records:

```
cc behavior no-records 10
```

cc profile

Configures the charging characteristic (CC) profile index properties.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

cc profile *index* [**buckets** *number* | **interval** *time* [**downlink** *down_octets* **uplink** *up_octets* | **total** *total_octets*] | **prepaid** { **prohibited** | **use-rulebase-configuration** } | **sgsns** *num_changes* | **tariff time1** *mins hours* [**time2** *mins hours* [**time3** *mins hours* [**time4** *mins hours* [**time5** *mins hours* [**time6** *mins hours*]]]] | **volume** { **downlink** *vol_down_octets* **uplink** *vol_up_octets* | **total** *total_octets* }]

no cc profile *index* { **buckets** | **interval** | **prepaid** | **sgsns** | **tariff** | **volume** }

default cc profile *index*

no

Removes a previously configured profile index.

default

Returns the specified cc profile to the original default system settings.

index

Configures a profile index for the parameter to be specified. index can be configured to an integer from 0 through 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

buckets *number*

Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.
number can be configured to an integer from 1 through 4.

interval *time* **[downlink** *down_octets* **uplink** *up_octets* **| total** *total_octets* **]**

Specifies the normal time duration that must elapse before closing an accounting record provided that any or all of the following conditions occur:

- Downlink traffic volume is reached within the time interval
- Uplink traffic volume is reached within the time interval
- Total traffic volume (up and downlink) is reached within the time interval

time is measured in seconds and can be configured to an integer from 60 through 40000000.
down_octets is the downlink traffic volume measured in octets and can be configured to an integer from 0 through 1000000.
up_octets is the uplink traffic volume measured in octets and can be configured to an integer from 0 through 1000000.
total_octets is the total traffic volume measured in octets and can be configured to an integer from 0 through 1000000.

prepaid { prohibited | use-rulebase-configuration }

This command enables or disables prepaid for the specified profile index.
Default: N/A
prohibited: Disable prepaid for the specified profile index.
use-rulebase-configuration: Use the prepaid configuration in the rulebase.

sgsns *num_changes*

Default: 4
Specifies the number of SGSN changes (such as, inter-SGSN switchovers) resulting in a new RAI (Routing Area Identity) that can occur before closing an accounting record.
num_changes can be configured to an integer from 1 through 15.

tariff time1 *mins hours* **time2** *mins hours* **time3** *mins hours* **time4** *mins hours* **time5** *mins hours* **time6** *mins hours*

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: The minutes of the hour, an integer value from 0 to 59.
- *hours*: The hour of the day, an integer value from 0 to 23.

volume {downlink *vol_down_octets* **uplink** *vol_up_octets* **| total** *total_octets* **}**

Specifies the downlink, uplink, and total volumes that must be met before closing an accounting record.
vol_down_octets is measured in octets and can be configured to an integer from 100000 to 4000000000.
vol_up_octets is measured in octets and can be configured to an integer from 100000 to 4000000000.
total_octets is the total traffic volume (up and downlink) measured in octets and can be configured to an integer from 100000 to 4000000000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the GGSN's charging characteristics. The GGSN supports up to 16 profile indexes.
This command works in conjunction with the **cc-sgsn** command located in the APN Configuration Mode that dictates which CCs should be used for subscriber PDP contexts.

Example

The following command configures a profile index of *10* for tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
```

default

Sets/restores the default value assigned for the specified parameter.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] { cc { behavior | profile index } | echo-interval | gtpu echo-interval | gtpu
reorder { context | sequence-numbers | timeout } | guard-interval | ip { local-port gtpc-
v1 | qos-dscp } | max-retransmissions | plmn { unlisted-sgsn } | setup-timeout | timeout
}
```

---

cc { behavior | profile *index* }

Restores the GGSN's charging characteristics parameters to the following default settings:

- **behavior**: Restores all behavior parameters to their default values of 0 (disabled).
- **profile:** For the specified index, the following defaults are applied:
  - buckets: 4
  - interval: Disabled
  - volume: Disabled
  - sgsns: 4
  - tariff-time: Disabled

---

echo-interval

Restores the GTP echo-interval parameter to its default setting of 60.

---

gtpu echo-interval

Restores the GTPU echo-interval parameter to its default setting of 60.

---

gtpu reorder {context | sequence-numbers | timeout }

Restores the gtpu reordering parameters to the following default settings:

- gtpu reorder context: Disabled
- gtpu reorder sequence-numbers: Disabled
- gtpu reorder timeout: 100 milliseconds

---

gtpu udp-checksum insert

Restores the GGSN gtpu udp-checksum parameter to its default setting of enabled.

---

guard-interval

Restores the GGSN guard-interval parameter to its default setting of 100.

ip {local-port gtpc-v1 | qos-dscp }

Restores the GGSN ip parameters to the following default setting:

- **local-port gtpc-v1**: 2123
- **qos-dscp**: conversational ef streaming af11 interactive af21 background be

max-retransmissions

Restores the GGSN max-retransmissions parameter to its default setting of 4.

plmn {unlisted-sgsn }

Restores the GGSN plmn unlisted-ggsn parameter to its default setting of reject.

setup-timeout

Restores the GGSN setup-timeout parameter to its default setting of 60.

timeout

Restores the GGSN timeout parameter to its default setting of 5.

Usage

After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the GGSN service's guard interval parameter to its default setting:

```
default guard-interval
```

dns-client

This command defines the context name where a DNS client is configured. It associates an existing DNS client configuration with the GGSN to perform a DNS query for P-CSCF, if a P-CSCF query request in an AAA message is received from the Diameter node.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dns-client context *dns_ctxt_name*

[**no** | **default**] **dns-client context**

no

Removes the association of DNS context which was configured to perform DSN query in this GGSN service.

default

Sets the default context for the DNS client.

dns_ctxt_name

Specifies the name of the context in which a DNS client configuration is present. Typically this should be the same context in which this GGSN service is configured.
dns_ctxt_name is a context name and must be alphanumeric string of 1 through 79 characters.

Usage

Use this command to associate a DNS client configuration to perform DNS query used for the resolution of P-CSCF query received in AAA message from Diameter peer, on the basis of DNS client parameters configured in a context.
A DNS client configuration must be present in the same context as GGSN service before enabling this command to perform DNS query for P-CSCF.

Important: This command is a license-enabled feature.

Example

The following command associates a DNS client configuration to perform DNS query for P-CSCF with this GGSN service which is configured in same context as GGSN service:

```
default dns-client context
```

echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-C Echo packets are sent from the GGSN service to the SGSN.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

echo-interval *time_interval*

[**default** | **no**] **echo-interval**

default

Configures the default value (60 seconds) for echo interval.

no

Disables the sending of GTPv1-C Echo packets.

time_interval

Default: 60
Specifies the frequency at which the GGSN service sends GTPv1-C Echo packets to the SGSN(s) it is configured to communicate with.
time_interval is measured in seconds and can be configured to an integer from 60 through 3600.

Usage

Use this command to adjust the rate at which the GGSN sends these packets. GTPv1-C Echo packets are used to detect whether SGSNs that the GGSN service is communicating with, has become unresponsive or has rebooted.
The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new SGSN on the system using the **sgsn address** command as described in this chapter
- Upon the execution of the path failure detection policy as described in **path-failure** command of this chapter

The echo-interval command is used in conjunction with the **max-retransmissions** and **retransmission-timeout** commands as described in this chapter.
In addition to receiving an echo response for this echo protocol, if GGSN receives a Node Alive Request message or a Echo Request message from a presumed dead SGSN, it will immediately assume the SGSN is active again.
If the GGSN discovers that an SGSN has become unresponsive, it will terminate all PDP contexts that had been established with the SGSN.

Example

The following command configures the GGSN service to send GTP Echo packets every 120 seconds:

```
echo-interval 120
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fqdn

This command defines Fully Qualified Domain Name (FQDN) which would be used for authorization over S6b interface between GGSN and 3GPP AAA/HSS.

Product

All

Privilege

Security Administrator, Administrator

Syntax

fqdn host *host_name* **realm** *realm_id*

[**no** | **default**] **fqdn**

no

Removes the configured FQDN host name and realm ID from the GGSN service.

default

Sets the system to default mode for this command and configures the host and realm ID value to NULL.

host *host_name*

Specifies the name of the host to be used for authorization over an S6b interface to a 3GPP AAA server/HSS from the GGSN service.
host_name is a unique node name for authorization over the S6b interface from this GGSN service.
host_name must be an alphanumeric string of 1 through 127 characters. Punctuation marks are allowed.

realm *realm_id*

Specifies the realm as an FQDN to be used for authorization over S6b interface with 3GPP AAA server/HSS from GGSN service. The realm may typically be a company or service name.
realm_id is a unique identifier configured for the authorization over S6b interface from this GGSN service, expressed as an alphanumeric string of 1 through 127 characters. Punctuation marks are allowed.
host_name

Usage

Use this command to define host and realm as the FQDN for a 3GPP AAA server/HSS that would be used for authorization over an S6b interface with the GGSN. The realm specified as an FQDN may typically be a company or service name.
By default the FQDN host and realm will be NULL

Important: This command is a license-enabled feature.

Example

The following configures the *hss1* as host name and *xyz.com* as realm to support authorization over an S6b from this GGSN service:

```
fqdn host hss1 realm xyz.com
```

gtpc nsapi-in-create-pdp-response

This command excludes or includes the optional information element (IE) Network Service Access Point Identifier (NSAPI) within “Create PDP Context Response” messages in GTP-C.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] gtpc nsapi-in-create-pdp-response
```

default

Sets the default mode for GTP-C messages not to include the NSAPI IE in “Create PDP Context Response” messages.

no

Removes the preconfigured mode for GTP-C messages; the GTP-C message will not include the NSAPI IE in “Create PDP Context Response” messages. By default it is disabled.

Usage

Use this command to exclude or include the NSAPI IE in “Create PDP Context Response” GTP-C messages received from the SGSN.

Example

The following command configures the GGSN service to include the optional NSAPI IE in “Create PDP Context Response” messages:

```
gtpc nsapi-in-create-pdp-response
```

gtpc private-extension

This command includes customer-specific private extensions in GTP-C messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpc private-extension { { { focs | odb } access-list acl_name in disconnect-on-violation
} | ggsn-preservation-mode | loss-of-radio-coverage | none }

default gtpc private-extension

no gtpc private-extension [ focs | ggsn-preservation-mode | loss-of-radio-coverage ]
```

default

Sets the default mode for GTP-C messages. By default it is disabled.

no

Disables the configured private extensions for GTP-C messages.

{focs | odb} access-list *acl_name* **in disconnect-on-violation**

Configures the Free-Of-Charge-Service (FOCS) and Operator Determined Barring (ODB) extensions for all packet-oriented services as defined by operators.
focs: Enables or disables Free of Charge Services for the subscriber who has no credit, and also takes the access-list *acl_name* to be applied for FOCS.
odb: Enables or disables "all packet oriented service barred" for the subscriber, and also takes the access-list *acl_name* to be applied for ODB.
acl_name is the name of a configured access control list (ACL) for this service.

Important: These are the customer-specific keywords and need customer-specific license to use them.

ggsn-preservation-mode

Enables the processing of customer-specific private extension in Update PDP Context requests. This extension indicates whether the subscriber is active or idle, and whether RAN resources have been released. It also indicates the desired "type" of preservation mode behavior.
When **ggsn-preservation-mode** is configured, different types of accounting records are generated based on the "type" of mode. To enable the generation of different accounting records, the trigger for preservation mode must be configured for RADIUS or GTPP for that accounting protocol. If that trigger is not configured, there will be no change in the generation of accounting records.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature.

loss-of-radio-coverage

Enables the protection against overcharging a subscriber due to loss of radio coverage (LORC) in a GGSN service. It also enables the system to understand the private extension for LORC) in GTP-C Update PDP Context messages from the SGSN.

Important: This is a license enabled keyword and need feature-specific license to use it.

none

Removes the private extensions from record which are from GTP-C messages received from the SGSN.

Usage

Use this command to configure the processing of private extensions within GTP-C messages received from the SGSN. It also configures the customer specific features, such as preservation mode for GGSN service. Overcharging protection (LORC) is a solution which provides the ability to accurately bill customers. This implementation is based on Cisco-specific private extension to GTP messages and/or any co-relation of G-CDRs and S-CDRs. It also does not modify any RANAP messages.

Important: This is a license enabled command that requires installation of feature-specific licenses to use this command.

Example

The following command configures the GGSN service to record the private extension for protecting the subscribers from overcharging during loss of radio coverage:

```
gtpc private-extension loss-of-radio-coverage
```

gtpc ran-procedure-ready-delay

This command configures the GGSN to enable the RAN Procedure Ready feature for the particular GGSN service and specify the timeout period for the RAN procedure timer in the GGSN. This timer starts on arrival of every secondary Create PDP Context request.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpc ran-procedure-ready-delay [**timeout** *dur*]

[**default** | **no**] **gtpc ran-procedure-ready-delay**

default

Sets the default mode of RAN Procedure Ready feature for this GGSN service. By default it is disabled.

no

Disables the RAN Procedure Ready feature for this GGSN service. By default it is disabled.

timeout *dur*

Default: 10
Specifies the timeout duration (in seconds) for the RAN procedure timer. This timer starts on the arrival of every secondary "Create PDP Context Request" message.
This is an optional keyword. If no timeout period is specified, the default value is 10 seconds.
dur must be an integer from 1 through 40.

Usage

Use this command to enable the RAN Procedure Ready feature for this GGSN service and specify the timeout period for the RAN procedure timer. This timer starts on the arrival of every secondary "Create PDP Context Request" message.
The GGSN waits until the Radio Access Bearer setup is completed and "Update PDP Context Request" is sent by the SGSN. If any downlink data is received before arrival of the "Update PDP Context Request" or before timer expiry, the downlink packets will be queued or buffered.
If the buffer becomes full (total buffer limit is of 1024 packets), all newly arriving packets are dropped.
The RAN Procedure Ready feature supports the following scenarios when RAB setup timer starts at the GGSN:

- If the GGSN receives the "Update PDP Context Request" before timer expiry, the GGSN stops the timer, sends all the queued/buffered packets in 'first-in first-out' manner and disables buffering of subsequent downlink data.
- If the GGSN receives the "Update PDP Context Request" before the timer expires, it processes the "Update PDP Context Request" as usual, but does not disable the buffering of downlink data. It then waits for another "Update PDP Context Request" to come with the RAN Procedure Ready set, or waits for timer to expire.

- If the GGSN does not receive the "Update PDP Context Request" with RAN Procedure Ready set before timer expiry, the timer is fired and the GGSN starts sending all queued packets and disables buffering of subsequent downlink data (assuming that the corresponding SGSN does not support this feature).
- If the timer has expired and the GGSN receives an "Update PDP Context Request" for a secondary PDP context with or without RAN Procedure Ready bit set, the UPC will be processed normally without buffering the packets.

Important: This feature does not affect the Enhanced Charging Service or deep packet inspection (DPI) since the buffering of downlink data is done before sending it to an ACSMgr.

Important: During an SGSN handoff scenario all packets are processed normally and the downlink packets are buffered until the timer expires.

Example

The following command configures the GGSN service to enable the RAN Procedure Ready feature and specify the timeout period as *20* seconds for the RAN Procedure timer in GGSN:

```
gtpc ran-procedure-ready-delay timeout 20
```

gtpu echo-interval

This command is obsolete and now available for configuration in GTP-U service configuration mode.

guard-interval

Configures the time period after which a redundant PDP context request received from an SGSN is treated as a new request rather than a re-send of a previous request.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

guard-interval *guard_time*

[**default** | **no**] **guard-interval**

default

Configures the default value for guard-interval function for the GGSN service.

no

Disables the guard-interval function for the GGSN service.

guard_time

Default: 100
Specifies the amount of time that must pass before a GGSN service treats a redundant PDP context request as a new request instead of a re-send of a previous request.
guard_time is measured in seconds and can be configured to an integer from 10 through 3600.

Usage

The guard interval is used to protect against replay attacks. Without a guard interval configured, information from a valid PDP context request could be used to gain un-authorized network access.
If the GGSN service receives a PDP context request in which the International Mobile Subscriber Identity (IMSI), the Network Service Access Point Identifier (NSAPI), the end user IP address, and the GTP sequence number are identical to those received in a previous request, the GGSN treats the new request as a re-send of the original. Therefore, information from a valid PDP context request could be collected and re-sent at a later time by an un-authorized user to gain network access.
Configuring a guard interval limits the amount of time that the information contained within a PDP context request remains valid.

Example

The following command configures the GGSN service with a guard interval of *60* seconds:

```
guard-interval 60
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Gn interfaces' GTP-C socket for GTPv1.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip local-port gtpc-v1 port#

default ip local-port gtpc-v1
```

default

Configures the default value for the local UDP port for GTP Version 1 control messaging for this GGSN service.

gtpc-v1 *port#*

Default: 2123
Specifies the UDP port number for GTPv1 GTPC sockets.
port# can be configured to an integer from 1 through 65535.

Usage

By default, the GGSN service attempts to use GTPv1 when communicating with SGSNs. This parameter configures the UDP port over which the GTP control (GTP-C) sockets are sent.
If an SGSN only supports GTPv0, the GGSN service automatically switches to GTPv0 when communicating with this SGSN. In the scenario, the GGSN service communicates with the SGSN on UDP port 3386 and does not have a GTP-C socket.

Important: The UDP port setting on the SGSN must match the local-port setting for the GGSN service on the system in order for the two devices to communicate.

Example

The following command configures the GGSN service to use UDP port *2500* for exchanging GTPC sockets with SGSNs when using GTPv1:

```
ip local port 2500
```

ip qos-dscp

Configures the quality of service (QOS) differentiated service code point (DSCP) used when sending data packets over the Gn interface.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip qos-dscp { qci { 1 { dscp } | 2 { dscp } | 3 { dscp } | 4 { dscp } | 5 { dscp |
allocation-retention-priority } | 6 { dscp | allocation-retention-priority } | 7 { dscp |
allocation-retention-priority } | 8 { dscp | allocation-retention-priority } | 9 { dscp
}} | gtpc } +

no ip qos-dscp { qci { 1 | 2 | 3 | 4 | 5 { allocation-retention-priority | dscp } | 6 {
allocation-retention-priority | dscp } | 7 { allocation-retention-priority | dscp } | 8 {
allocation-retention-priority | dscp } | 9 } | gtpc } +
```

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile.
allocation-retention-priority can be the integer 1, 2, or 3.
DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile.
The following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 19. Default DSCP Value Matrix

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	ef	ef	ef
3	af21	af21	af21
	af21	af21	af21

qci

Configures the QoS Class Identifier (QCI) attribute of QOS. Here the *qci_val* is the QCI for which the negotiate limit is being set; it ranges from 1 to 9.

dscp

Default QCI:
- 1: ef

- 2: ef
- 3: af11
- 4: af11
- 5: ef
- 6: ef
- 7: af21
- 8: af21
- 9: be

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• **af11:** Assured Forwarding 11 per-hop-behavior (PHB)	• **af32:** Assured Forwarding 32 PHB
• **af12:** Assured Forwarding 12 PHB	• **af33:** Assured Forwarding 33 PHB
• **af13:** Assured Forwarding 13 PHB	• **af41:** Assured Forwarding 41 PHB
• **af21:** Assured Forwarding 21 PHB	• **af42:** Assured Forwarding 42 PHB
• **af22:** Assured Forwarding 22 PHB	• **af43:** Assured Forwarding 43 PHB
• **af23:** Assured Forwarding 23 PHB	• **be:** Best effort forwarding PHB
• **af31:** Assured Forwarding 31 PHB	• **ef:** Expedited forwarding PHB

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they are tagged. The diffserv markings are applied to the outer IP header of every GTP data packet. The diffserv marking of the inner IP header is not modified.
The traffic patterns are defined by QCI (1 to 9). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

Table 20. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Table 21. DSCP Precedence

Precedence (low to high)	DSCP
0	Best Effort (be)
1	Class 1
2	Class 2
3	Class 3
4	Class 4
5	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command. The **no ip qos** command can be issued to remove a QOS setting and return it to it's default setting.

Example

The following command configures the DSCP level for QCI to be Expedited Forwarding,**ef**:

```
ip qos-dscp qci 1 ef
```

max-retransmissions

Configures the maximum number of times that GTP control packets are retransmitted to an SGSN before it marks it unreachable.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
max-retransmissions max_number

default max-retransmissions
```

default

Configures the default value for maximum retries for GTP control packets for the GGSN service.

max_number

Default: 4
Indicates the maximum number of times that GTP control packets are retransmitted.
max_number can be configured to an integer from 0 through 15.

Usage

This command is used in conjunction with the **timeout** command to control the retransmission of GTP control packets when no response is received from an SGSN. It is equivalent to the N3-REQUESTS parameter discussed in 3GPP TS 29.060.
If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of this command.
If the max-retransmissions value is exceeded, the GGSN records a “Path Failure” for that SGSN and releases all PDP contexts associated with it.

Example

The following command configures the maximum number of retransmissions to *8*:

```
max-retransmissions 8
```

mbms policy

This command enables/disables the Multimedia Broadcast Multicast Services (MBMS) user service support for multicast and/or broadcast mode. It also specifies the policy for MBMS user service mode.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
mbms policy { multicst broadcast | none }

[ no | default ] mbms policy
```

no

Removes or disables the configured MBMS support for multicast and/or broadcast mode in this GGSN service.

default

Restores the default mode of MBMS support in this GGSN service.

multicst broadcast

Enables the MBMS support and configures the policy for multicast and broadcast of user service.

Usage

Use this command to enable/disable the MBMS user service support for Multicast and/or Broadcast mode. It also specifies the policy for MBMS user service mode.

Example

The following command enables MBMS support in this GGSN service:

```
mbms policy multicast broadcast
```

newcall

This command enables or disables the new call related behavior of this GGSN service when duplicate sessions with the same IP address request are received. This feature is required to support interworking with P-GW and HA.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
newcall duplicate-subscriber-requested-address { accept | reject }

default newcall duplicate-subscriber-requested-address
```

default

Restores the default mode for new call session with the same address request received in this GGSN service. It rejects calls with duplicate address requests.

accept

Sets the system to "accept" another session using the same IP address for a new call. The new session will be created and the old session will be torn down.
Default: Disabled

reject

Rejects new calls with duplicate address requests. This is the default behavior.
Default: Enabled

Usage

Use this command to enable or disable new call connections when the UE is not able to gracefully disconnect from the Enterprise PDN before attempting to reconnect via another access method. When enabled this command tears down the old session in order to accept the new connection with the same IP address assignment.
This feature also allows the GGSN to accept a request for a static subscriber address, even if the address is already used by another session. If this feature is not enabled, a new request with the same IP address for another session will be rejected.

Important: This command is a license-enabled feature.

Example

The following command allows the GGSN to accept the duplicate call session request with the same IP address:

```
newcall duplicate-subscriber-requested-address accept
```

path-failure

Determines the GTP path-failure behavior on echo/non-echo messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
path-failure detection-policy gtp { echo [ non-echo ] | non-echo [ echo ] }

[ no | default ] path-failure detection-policy
```

no

No defined detection policy means path-failures are not detected.

default

Sets the path-failure detection-policy to GTP in echo mode.

detection-policy gtp {echo [non-echo] | non-echo [echo] }

Detection-policy is the policy to be used when path-failure is in active state. GTP messages are either gtp(u) (user) or gtp(c) (control) type, and the gtp keyword takes either echo or non-echo as message type.
echo: gtp(u) or gtp(c) message.
non-echo: a message type other than gtp(u) or gtp(c).

Usage

Under current circumstances, a GGSN shuts down the GTP tunnel if the associated SGSN does not respond to multiple retries of an echo or non-echo message from the GGSN. In this way, a single call failure could be responsible for the loss of all active calls in the tunnel.
This is also an issue when echo is disabled, or when there is very little traffic on the SGSN and the GGSN is configured with large echo intervals.
This behavior adversely impacts the user experience because the customer has to reconnect every time this happens with their SGSN.

Example

The following example detects path failures when the SGSN fails to respond to multiple echo message retries:

```
path-failure detection-policy gtp echo
```

The following example turns off path-failure detection. On timeout of gtp(c) message retries, the particular context will be purged:

```
no path-failure detection-policy
```

plmn id

Configures the GGSN's public land mobile network (PLMN) identifiers. Up to five PLMN IDs can be configured for each GGSN service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_value***mnc** *mnc_value* [**primary**]

no plmn id mcc *mcc_value* **mnc** *mnc_value*

no

Removes a previously configured PLMN identifier for the GGSN service.

mcc *mcc_value*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_number is the PLMN MCC identifier and can be configured to an integer between 100 and 999.

mnc *mnc_value*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_number is the PLMN MNC identifier and can be configured to any 2- or 3-digit integer from 00 through 999.

primary

When multiple PLMN IDs are configured, the **primary** keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute (3GPP-GGSN-MCC-MNC).

Usage

The PLMN identifier is used by the GGSN service to determine whether or not a mobile station is visiting, roaming, or home. Multiple GGSN services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each GGSN Service.

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *2*:

```
plmn id mcc 462 mnc 02
```

plmn unlisted-sgsn

Configures the GGSN's policy for handling communications from SGSNs with which it is not configured to communicate.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] plmn unlisted-sgsn { foreign [ disable-gtpc-echo ] [ reject-foreign-
subscriber ] | home [ disable-gtpc-echo ] | reject | mcc mcc_value mnc mnc_value[
disable-gtpc-echo ] [ reject-foreign-subscriber ] }
```

default

Resets configured parameters to their default settings.

foreign

Default: Disabled
Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the **sgsn address** command.
This keyword also dictates that unlisted SGSNs are treated as if they belong to a foreign PLMN. Therefore, PDP contexts originating from them are treated as visiting or roaming.

mcc *mcc_value*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_value is the PLMN MCC identifier and can be configured to an integer from 100 through 999.

mnc *mnc_value*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_value is the PLMN MNC identifier and can be configured to a 2- or 3-digit integer from 00 through 999.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

reject-foreign-subscriber

Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

home

Default: Disabled
Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the **sgsn address** command.

This keyword also dictates that unlisted SGSNs are treated as if they belong to the GGSN service's home PLMN.

reject

Default: Enabled
Specifies that the GGSN service rejects messages from SGSNs that are not configured within the service using the **sgsn address** command.
When the GGSN service rejects the message(s), it returns a cause code of No Resources 199 (C7H, No resources available).

Usage

This command works in conjunction with the **sgsn** command that configures the GGSN service to communicate with specific SGSNs. Any messages received from SGSNs not configured in that list are subject to the rules dictated by the **unlisted-sgsn** policy.

Example

The following command configures the GGSN service to accept messages from unlisted SGSNs and treat the SGSN as if it is on the GGSN's home network:

```
plmn unlisted-sgsn accept home
```

policy

Specifies the reject code to be used in the "Create PDP Context" response message when a RADIUS server timeouts.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
policy { accounting-server-timeout use-reject-code { system-failure | no-resources } |
authentication-server-timeout use-reject-code { system-failure | user-authentication-
failure } }

default policy { authentication-server-timeout | accounting-server-timeout }
```

default

Restores the specified parameter to its default setting.

accounting-server-timeout use-reject-code { system-failure | no-resources }

Default: **no-resources**
Specifies the reject code used by the GGSN if communication with an accounting server times out. The possible reject codes are:

- system-failure (204 (CCH))
- no-resources (199 (C7H))

authentication-server-timeout use-reject-code {system-failure | user-authentication-failure }

Default: user-authentication-failure
Specifies the reject code used by the GGSN if communication with an authentication server times out. The possible reject codes are:

- system-failure (204 (CCH))
- user-authentication-failure (209 (D1H))

Usage

This command is used to configure the cause code used by the GGSN if communication with either a RADIUS authentication or accounting server times out.
When this parameter is used in conjunction with Radius accounting servers, the response is only set if a flag is configured in the APN Delay GTP Response, only after getting a response to the Accounting Start.

Example

The following command configures the GGSN response to a RADIUS authentication server timeout to be *system-failure*:

```
policy authentication-server-timeout use-reject-code system-failure
```

retransmission-timeout

Configures the timeout period in between retransmissions of GTP control packets. This timeout configuration is not applicable on Echo Request retransmission.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout *retransmit_time*

default retransmission-timeout

default

Configures the default time interval that must pass without an SGSN response before the GGSN service retransmits GTP control packets.

retransmit_time

Default: 5
Specifies the amount of time that must pass without an SGSN response before the GGSN service retransmits GTP control packets.
retransmit_time is measured in seconds and can be configured to an integer from 1 through 20.

Usage

This command is used in conjunction with the **max-retransmissions** command to control the retransmission of GTP control packets when no response is received from an SGSN.
If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of the max-retransmissions command.
If the max-retransmissions value is exceeded within the retransmission-timeout period, the GGSN records a "Path Failure" for that SGSN and releases all PDP contexts associated with it.

Important: This retransmission timeout configuration in not applicable for Echo Requests message retransmission. Echo are sent/retransmitted every echo interval, which can be configured separately.

Example

The following command configures a timeout value of *20* seconds:

```
retransmission-timeout 20
```

setup-timeout

Configures the maximum amount of time the GGSN service allows for the setting up of PDP contexts.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *setup_time*

default setup-timeout

default

Configures the default maximum amount of time the GGSN service allows for the setting up of PDP contexts.

setup-time

Default: 60
Specifies the maximum amount of time the GGSN service allows for the setting up of PDP contexts. *setup_time* is measured in seconds and can be configured to an integer from 1 through 6000.

Usage

Use this command to limit the amount of time allowed for setting up PDP contexts. If the PDP context is not setup within the configured time frame, the GGSN service rejects the PDP context with a cause code of 199 (C7H, No resources available).

Example

The following command allows a maximum of *120* seconds for the setting up of PDP contexts:

```
setup-timeout 120
```

sgsn address

Configures the SGSNs that this GGSN service is allowed to communicate with.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn address { { *ip_address* [**subnetmask** *netmask*] } | *ip_address/netmask* } [**plmn-foreign** [**reject-foreign-subscriber**] | **mcc** *mcc_code* **mnc** *mnc_code* [**reject-foreign-subscriber**]] [**rat-type** { **GAN** | **GERAN** | **HSPA** | **UTRAN** | **WLAN** }] [**description** *description*] [**disable-gtpc-echo**]

no sgsn { **address** *ip_address* [**subnetmask** *netmask*] }

no

Removes a specific SGSN from the list or all configured SGSNs.

address

Configures the IP address of the SGSN.
ip_address must be expressed in IPv4 dotted-decimal notation.

subnetmask

Configures the subnet mask of the SGSN.
netmask must be expressed in IPv4 dotted-decimal notation.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign

Indicates whether or not the SGSN belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber

Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

mcc *mcc_code*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_code is the PLMN MCC identifier and configured as an integer from 100 through 999.

mnc *mnc_code*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_code is the PLMN MNC identifier and configured as a 2- or 3-digit integer from 00 through 999.

rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }

This keyword configures the type of radio access technology.
GAN: Specifies the Generic Access Network type of Radio Access Technology (RAT).
GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.
HSPA: Specifies the High Speed Packet Access type of RAT.
UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.
WLAN: Specifies the Wireless Local Access Network type of RAT.

description *description*

Add description field to the SGSN entry in GGSN service.
description is an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure a list of SGSNs that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSNs.

Important: The GGSN only communicates with the SGSNs configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the **plmn unlisted-sgsn** command.

Example

The following command configures the GGSN to communicate with an SGSN on a foreign PLMN with an IP address of *192.168.1.100* and subnet mask of *255.255.255.0*:

```
sgsn address 192.168.1.100 subnetmask 255.255.255.0 plmn-foreign
```

sgsn define-multiple-address-group

This command defines an SGSN Multiple Address Group and enters SGSN Multiple Address Group Configuration mode. Whenever there is a change in the control address in a GTPC UPC message, it is treated as an inter-SGSN handoff because an SGSN is usually identified uniquely by a single IP-address. This command supports a multiple address group feature which allows you to specify a set of addresses that specify a single SGSN. When a UPC handoff is received from any address in the group, it is treated as an intra-SGSN handoff.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn define-multiple-address-group *grp_name* **-noconfirm**

no sgsn define-multiple-address-group *grp_name*

no

Removes a specific SGSN Multiple Address Group from the list GGSN service configuration.

grp_name

Specifies the name of an SGSN multiple address group to create or configure.
*grp_name*is an alphanumeric string from 1 through 63 characters.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create or configure an SGSN Multiple Address Group that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSN Multiple Address Groups.

Example

The following command creates an SGSN Multiple Address Group named *sgsngrp1* and enters SGSN Multiple Address Group Configuration mode:

```
sgsn define-multiple-address-group sgsngrp1
```

sgsn multiple-address-group

Configures the SGSN multiple address groups that this GGSN service is allowed to communicate with.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn multiple-address-group *grp_name* [**disable-gtpc-echo**] [**mcc** *mcc_code* **mnc** *mnc_code* [**reject-foreign-subscriber**]] [**plmn-foreign** [**reject-foreign-subscriber**] [**rat-type** { **GAN** | **GERAN** | **HSPA** | **UTRAN** | **WLAN** }] [**description** *description*]

no sgsn multiple-address-group *grp_name*

no

Removes a specific SGSN multiple address group from the list of configured SGSN multiple address groups.

grp_name

Specifies the name of a configured SGSN multiple address group to use.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign

Indicates whether or not the SGSN multiple address group belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber

Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

mcc *mcc_code*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_code is the PLMN MCC identifier and can be configured to an integer from 100 through 999.

mnc *mnc_code*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_code is the PLMN MNC identifier configured as a 2- or 3-digit integer from 00 through 999.

rat-type { GAN | GERAN | HSPA | UTRAN | WLAN }

This keyword configures the type of radio access technology.
GAN: Specifies the Generic Access Network type of Radio Access Technology (RAT).
GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.

HSPA: Specifies the High Speed Packet Access type of RAT.
UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.
WLAN: Specifies the Wireless Local Access Network type of RAT.

description *description*

Add a description field to the SGSN multiple address group entry in the GGSN service configuration. *description* must be an alphameric string of 1 through 63 characters.

Usage

Use this command to configure a list of SGSN multiple address groups with which the GGSN service is to communicate. This command can be entered multiple times to configure multiple SGSN multiple address groups.

Important: The GGSN only communicates with the SGSN multiple address groups configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the **plmn unlisted-sgsn** command.

Example

The following command configures the GGSN to communicate with an SGSN with multiple address that is defined by an SGSN multiple address group named *sgsngrp1* that is on a foreign PLMN:

```
sgsn multiple-address-group sgsngrp1 plmn-foreign
```

sgsn mcc-mnc

This command configures sgsn mcc-mnc for this GGSN service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn mcc-mnc { prefer-rai | prefer-uli }

default sgsn mcc-mnc
```

default

Configures the default option for sgsn mcc-mnc. Default is ‘prefer-uli’.

prefer-rai

Configures sgsn mcc-mnc using rai.

prefer-uli

Configures sgsn mcc-mnc using uli.

Usage

Use this command to configure the sgsn mcc-mnc.

Example

The following command configures the sgsn mcc-mnc to ‘prefer-rai’:

```
sgsn mcc-mnc prefer-rai
```

trace-collection-entity

This command configures the trace collection entity IP address. Trace collection entity is the destination node to which trace files are transferred and stored.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

trace-collection-entity *IPv4_addr*

no trace-collection-entity

no

Removes the configured IPv4 address for trace collection in this GGSN service.

IPv4_addr

Specifies the IP address in IPv4 dotted-decimal notation.

Usage

Use this command to configure the trace collection entity IP address. This configuration is required because during signaling session trace activation, CPC REQ and UPC REQ do not provide the IP address for the trace collection entity.

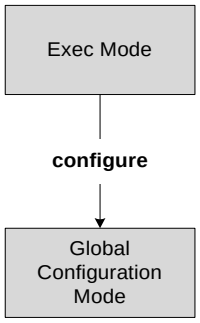
Example

The following command configures the trace collection entity IP address with this GGSN service:

```
trace-collection-entity 192.36.56.56
```

Chapter 127
Global Configuration Mode Commands

The Global Configuration Mode is used to configure basic system-wide parameters.



aaa accounting-overload-protection

This command configures Overload Protection Policy for accounting requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting-overload-protection prioritize-gtpp

{ default | no } aaa accounting-overload-protection
```

default

Configures the default setting.
Default: no priority assigned

no

Disables the Overload Protection configuration.

prioritize-gtpp

Gives higher priority to GTPP requests among the other outstanding requests. So while purging the lower priority requests will be selected first.

Usage

Use this command to configure Overload Protection Policy for accounting requests.

Example

The following command prioritizes GTPP requests among the other outstanding requests:

```
aaa accounting-overload-protection prioritize-gtpp
```

aaa default-domain

Configure global accounting and authentication default domain for subscriber and context-level administrative user sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa default-domain { administrator | subscriber } *domain_name*

no aaa default-domain { administrator | subscriber }

no

Removes all or only the specified configured domain.

administrator | subscriber

administrator: Configures the default domain for context-level administrative users.
subscriber: Configures the default domain for subscribers.

domain_name

Sets the default context.
domain_name must be an alphanumeric string of 1 through 79 characters.

Usage

This command configures the default domain which is used when accounting and authentication services are required for context-level administrative user and subscriber sessions whose user name does not include a domain.

Example

The following commands configure the default domains for context-level administrative users and subscribers, respectively:

```
aaa default-domain administrator sampleAdministratorDomain

aaa default-domain subscriber sampleSubscriberDomain
```

aaa domain-matching ignore-case

This command disables case sensitivity when performing domain matching. When this command is enabled, the system disregard case when matching domains.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa domain-matching ignore-case

default aaa domain-matching
```

default

Configures ignore-case as the domain matching method.

no

Specifies that the system consider case when domain matching.

Usage

Use this command to configure the system to ignore case when matching domains.

Example

The following command configures the system to ignore case when matching domains:

```
aaa domain-matching ignore-case
```

aaa domain-matching imsi-prefix

Enables domain lookup for session based on the International Mobile Subscriber Identity (IMSI) prefix length. Default: Disabled

Important: This command is only available in 8.3 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa domain-matching imsi-prefix prefix-length *prefix_length*

no aaa domain-matching imsi-prefix

default aaa domain-matching

no

Specifies the system must not consider imsi-prefix domain matching method.

prefix-length

Specifies the IMSI length to be matched with the domain.
prefix_length must be an integer from 1 through 15.

Usage

Use this command to configure the IMSI-prefix method of domain matching. This command enables domain lookup for the session based on the IMSI prefix length. If there is a domain configured with the matching IMSI prefix, the associated configuration is used.
This feature does not support partial matches.

Example

The following command configures the IMSI prefix method for domain matching setting the prefix length to *10*.

```
aaa domain-matching imsi-prefix prefix-length 10
```

aaa large-configuration

This command enables or disables the system to accept a large number of RADIUS configurations to be defined and stored.

Important: For this command to take affect, after entering the command the configuration must be saved and reloaded.

When aaa large-configuration is disabled, the following restrictions are in place:

- Only one (1) NAS IP address can be defined per context with the **`radius attribute`** command.
- The RADIUS attribute **nas-ip-address** can only be configured if the RADIUS group is **default**.
- Only 320 RADIUS servers can be configured system-wide.
- Only 64 RADIUS groups can be configured system-wide.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa large-configuration
```

`no`

Disables AAA large configuration support.

Usage

When aaa large-configuration is enabled, the system provides the ability to configure multiple NAS IP addresses in a single context to used with different radius groups. As well, the command allows support for up to 1,600 RADIUS server configurations and for a PDSN a maximum of 400 or for a GGSN a maximum of 800 RADIUS server group configurations system-wide.

Example

To enable the definition of a large number of RADIUS configurations, enter the following commands in the following order:
In APN Configuration mode, enter:

```
default aaa group
```

In Global Configuration mode, enter:

```
aaa large-configuration
```

In Exec mode, use the **`save configuration`** command and then the **`reload`** command.

aaa last-resort

Configure global accounting and authentication last resort domain for subscriber and context-level administrative user sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa last-resort context { administrator | subscriber *context_name* **}**

no aaa last-resort context { administrator | subscriber }

no

Removes all or only the specified previously configured authentication last resort domain name.

administrator | subscriber

administrator: Configures the last resort domain for context-level administrative.
subscriber: Configures the last resort domain for the subscribers.

context_name

Specifies the context which is to be set as the last resort. *context_name* must be an alphanumeric string of 1 to 79 characters.

Usage

Set the last resort context which is used when there is no applicable default domain (context) and there is no domain provided with the subscriber's or context-level administrative user's name for use in the AAA functions.

Example

The following commands configure the last resort domains for context-level administrative user and subscribers, respectively:

```
aaa last-resort administrator sampleAdministratorDomain

aaa last-resort subscriber sampleSubscriberDomain
```

The following command removes the previously configured domain called *sampleAdministratorDomain*:

```
no aaa last-resort administrator sampleAdministratorDomain
```

aaa tacacs+

This command enables or disables system-wide TACACS+ AAA (authentication, authorization and accounting) services for administrative users. This command is valid only if TACACS+ servers and related services have been configured in TACACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa tacacs+
```

Usage

Enables or disables the use of TACACS+ AAA services for administrative users.

Example

```
aaa tacacs+

no aaa tacacs+
```

aaa username-format

Configure global accounting and authentication user name formats for AAA (authentication, authorization and accounting) functions. Up to six formats may be configured.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa username-format { domain | username } separator

default aaa username-format
```

no

Removes the specified user name format from the configuration.

domain | username

Default: username @
domain: indicates the left side of the string from the separator character is a domain name and the right side is the user name.
username: indicates the left side of the string from the separator character is a user name and the right side is the domain name.

Important: The user name string is always searched from right to left for the first occurrence of the separator character.

separator

Specifies the character to use to delimit the domain from the user name for global AAA functions.Permitted characters include: @, %, -, \, #, or /. To specify a back slash ('\') as the separator, you must enter a double back slash ('\\') on the command line.

Usage

Define the formats for user name delimiting if certain domains or groups of users are to be authenticated based upon their user name versus domain name.

Example

```
aaa username-format domain @

aaa username-format username %

no aaa username-format username %
```

active-charging service

This command allows you to create/configure/delete the Active Charging Service (ACS)/Enhanced Charging Service (ECS).

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

active-charging service *acs_service_name* **[-noconfirm]**

no active-charging service *acs_service_name*

no

Deletes the specified Active Charging Service.

acs_service_name

Specifies name of the Active Charging Service.
acs_service_name must be the name of an Active Charging Service, and must be an alphanumeric string of 1 through 15 characters.
If the named Active Charging Service does not exist, it is created, and the CLI mode changes to the ACS Configuration Mode wherein the service can be configured. If the named Active Charging Service already exists, the CLI mode changes to the ACS Configuration Mode.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/configure/delete an Active Charging Service in the system. Note that, in this release, only one Active Charging Service can be created in the system.
Use this command after enabling ACS using the **require active-charging** command. This command allows administrative users to configure the ACS functionality.

Example

The following command creates an ACS service named *test*:

```
active-charging service test
```

alarm

Enables or disables alarming options for the SPIO card internal alarms and the central-office external alarms. To verify the state of the alarms, refer to the **show alarm** command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
alarm { audible | central-office  }

no alarm { audible | central-office  }
```

no

Disables the option specified.

audible | central-office

audible: indicates the internal audible alarm on the SPIO cards are to be enabled.
central-office: indicates the central office alarms are to be enabled.

Usage

Disable CO and audible alarms when an existing device provides such capability.

Example

The following commands enable the SPIO card internal alarms and disable the central office alarms, respectively.

```
alarm audible

no alarm central-office
```

apn-profile

Creates an instance of an Access Point Name (APN) profile.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] apn-profile *apn_profile_name*

no

Deletes the APN profile instance from the configuration.

apn_profile_name

Specifies the name of the APN profile. Enter an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create an instance of an APN profile and to enter the APN profile configuration mode. An APN profile is a template which groups a set of APN-specific commands that may be applicable to one or more APNs. See the *APN Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: An APN profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what APN profiles have already been created, return to the Exec mode and enter the **show apn-profile all** command.

Example

The following command creates a configuration instance of an APN profile:

```
apn-profile apnprof27
```

apn-remap-table

Creates an instance of an Access Point Name (APN) remap table.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] apn-remap-table *apn_remap_table_name*

no

Deletes the APN remap table instance from the configuration.

apn_remap_table_name

Specifies the name of the APN remap table. Enter an alphanumeric string of 1 through 65 characters.

Usage

Use this command to create an instance of an APN remap table and to enter the APN remap table configuration mode. An APN remap table includes entries that define how an incoming APN, or the lack on one, will be handled. See the *APN Remap Table Configuration Mode Commands* chapter for information regarding the definition of the entries contained within the table and the use of the table.

Important: An APN remap table is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what APN remap tables have already been created, return to the Exec mode and enter the **show apn-remap-table all** command.

Example

The following command creates a configuration instance of an APN remap table:

```
apn-remap-table pnremap-USorigins-table1
```

arp

Configures a system-wide time interval for performing Address Resolution Protocol (ARP) refresh.

Product

All

Privilege

Security Administrator, Administrator

Syntax

arp base-reachable-time *time*

default arp base-reachable-time

default

Restores the parameter to its default setting.

time

Default: 30
Specifies the ARP refresh interval (in seconds) as an integer from 30 through 86400.

Usage

Use this command to configure a system-wide ARP refresh interval. Once a neighbor is found, the entry is considered valid for at least a random value between the *time*/2 and the *time**1.5.

Example

The following command configures an ARP refresh interval of 1 hour:

```
arp base-reachable-time 3600
```

autoconfirm

This command disables or enables confirmation for certain commands. This command affects all future CLI sessions.

Important: To change the behavior for the current CLI session only, use the **autoconfirm** command in the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

autoconfirm

no autoconfirm

Usage

When autoconfirm is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When autoconfirm is disabled the confirmation questions never appear. Disabling autoconfirm disables command confirmation for all future CLI sessions.
By default **autoconfirm** is enabled.

Example

The following command enables command confirmation for all future CLI sessions;

```
autoconfirm
```

The following command disables command confirmation for all future CLI sessions;

```
no autoconfirm
```

autoless

This command is obsolete. It is included in the CLI for backward compatibility with older configuration files. When executed, this command issues a warning and performs no function.

banner

Configures the CLI banner which is displayed upon the start of a CLI session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

banner { charging-service | lawful-intercept | motd | pre-login } *string*

no banner { charging-service | lawful-intercept | motd | pre-login }

no

Removes the banner message by setting it to be a string of zero length.

charging-service

Specifies the Active Charging Service banner message. The banner is displayed upon initialization of an SSH CLI session with ACS-admin privileges (whenever anyone with the CLI privilege bit for ACS logs on).

lawful-intercept

Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.

motd

Configures the CLI banner message of the day which is displayed upon the initialization of any CLI session.

pre-login

Configures the CLI banner displayed before a CLI user logs in.

Important: This banner is displayed only for serial port and telnet log ins. It is not supported in ssh and, therefore, will not be displayed before ssh log ins.

string

Specifies the banner or message to be displayed at session initialization. *string* may be an alphanumeric string of 0 through 2048 characters. The string must be enclosed in double quotation marks if the banner or message is to include spaces.

Usage

Set the message of the day banner when an important system wide message is needed. For example, in preparation for removing a chassis from service, set the banner 1 or more days in advance to notify administrative users of the pending maintenance.

Example

```
banner motd "Have a nice day."
```

```
banner motd No_News_Today

no banner motd
```

boot delay

Configures the delay period, in seconds, before attempting to boot the system from a software image file residing on an external network server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

boot delay *time*

no boot delay

no

Deletes the setting for the boot delay. The boot process executes immediately.

time

Specifies the amount of time (in seconds) to delay prior to requesting the software image from the external network server as an integer from 1 through 300.

Usage

Useful when booting from the network when connection delays may cause timeouts. Such as when the Spanning Tree Protocol is used on network equipment.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following sets the boot delay to *10* seconds:

```
boot delay 10
```

boot interface

Configures the Switch Processor I/O card network interfaces for obtaining a system software image during the system boot process.

Product

All

Privilege

Security Administrator, Administrator

Syntax

boot interface { spio-eth1 | spio-eth2 } [medium { auto | speed *medium_speed* **duplex** *medium_duplex* **} [media** *medium_media* **]]**

no boot interface

---

no

Removes the boot interface configuration from the boot.sys file. Only files from the local file system can be loaded.

---

spio-eth1 | spio-eth2

Specifies the network interface to be configured where **spio-eth1** is the primary interface on the SPIO (slot 24 interface 1 or slot 25 interface 1) and **spio-eth2** is the secondary interface on the SPIO (slot 24 interface 2 or slot 25 interface 2). The interfaces refer to either the RJ-45 interfaces for speeds of 10, 100, or 1000 megabit per second (Mbps), or the SFP interface for the optical gigabit (1000 Mbps) interface.

---

medium { auto | speed *medium_speed* **duplex** *medium_duplex* **}**

Default: auto
auto: configures the interface to auto-negotiate the interface speed. and duplex.
speed *medium_speed* **duplex** *medium_duplex*: specifies the speed to use at all times where *medium_speed* must be one of:

- 10
- 100
- 1000

The keyword **duplex** is used to set the communication mode of the interface where *medium_duplex* must be one of:

- full
- half

---

media *medium_media*

Default: rj45
Optionally sets the physical interface where *medium_media* must be either rj45 or sfp.

Usage

Modify the boot interface settings to ensure the system is able to obtain a software image from an external network server.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following configures the primary interface to auto-negotiate the speed.

```
boot interface spio-eth1 medium auto
```

The following command configures the secondary interface to a fixed gigabit speed at full duplex using RJ45 connectors for the physical interface.

```
boot interface spio-eth2 medium speed 1000 duplex full media rj45
```

The following restores the defaults for the boot interface.

```
no boot interface
```

boot nameserver

Configures the IP address of the DNS (Domain Name Service) server to use when looking up hostnames in URLs for network booting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

boot nameserver *ip_address*

no boot nameserver

ip_address

IPv4 dotted-decimal address of the DNS server the system uses to lookup hostnames in URLs for a software image from the network during the system boot process.

no

Removes the network boot nameserver information from the boot.sys file.

Usage

Use this command to identify the DNS server to use to lookup hostnames in a software image URL.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following configures the system to communicate with a DNS nameserver with the IP address of 10.2.3.4:

```
boot nameserver 10.2.3.4
```

boot system priority

Specifies the priority of a boot stack entry to use when the system first initializes or restarts. Up to 10 boot system priorities (entries in the boot.sys file located in the /flash device in the SMC) can be configured.

Product

All

Privilege

Security Administrator, Administrator

Syntax

boot system priority *number* **image** *image_url* **config** *config_path*

no boot system priority *number*

no

Remove a boot stack entry at the priority specified from the boot stack when it is no longer used.

priority *number*

Specifies the priority for the file group (consisting of an image (.bin) and its corresponding configuration (.cfg) file) specified in the boot stack. The value must be in the range from 1 through 100 where a priority of 1 is the highest. Up to 10 boot system priorities (boot stack entries) can be configured.

Important: When performing a software upgrade it is important that the new file group have the highest priority (lowest value) configured.

Important: To ensure that higher priority numbers remain open, use an "N-1" priority numbering methodology, where "N" is the first priority in the current boot stack.

image *image_url*

Specifies the location of a image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted according to the following format:

- [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***directory*]**/***filename*
- [**http:** | **tftp:**]**//***host*[**:***port*][**/***directory*]**/***filename*

Important: Use of the SMC hard drive is not supported in this release.

Important: Do not use the following characters when entering a string for the field names below: "/" (forward slash), ":" (colon) or "@" (at sign).

directory is the directory name.

filename is the actual file of interest.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

Important: A file intended for use on an ASR 5000 uses the convention xxxxx.asr5000.bin, where xxxxx is the software build number.

Important: When using the TFTP, it is advisable to use a server that supports large blocks, per RFC 2348. This can be implemented by using the "block size option" to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

config *config_path*

Specifies the location of a configuration file to use for system startup. This must be formatted according to the following format:

- [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[**/***path*]**/***filename*
- ASR 5000:
- [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***path*]**/***filename*

Important: Use of the SMC hard drive is not supported in this release.

Where *path* is the directory structure to the file of interest, and *filename* is the name of the configuration file. This file typically has a **.cfg** extension.

Usage

This command is useful in prioritizing boot stack entries in the boot.sys file, typically located on the /flash device of the Active SMC, for automatic recovery in case of a failure of a primary boot file group.

Important: The configuration file must reside on the local filesystem, stored on one of its local devices (/flash, /pcmcia1, /hd-raid). Attempts to load the configuration file from an external network server will result in a failure to load that image and configuration file group, causing the system to load the image and configuration file group with the next highest priority in the boot stack.

Important: Configuration changes do not take effect until the system is reloaded.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following commands set up two locations to obtain a boot file group from.

```
boot system priority 1 image tftp: //remoteABC/pub/2012jan.bin config
/flash/pub/data/2012feb.cfg
```

```
boot system priority 2 image /flash /pub/data/2002jun.bin config
/pcmcia1/pub/data/2012feb.cfg
```

The following removes the current priority **1** boot entry from the boot.sys file.

```
no boot system priority 1
```

bulkstats

Enables the collection of bulk statistics by the system and/or enters the bulk statistic configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
bulkstats { collection | historical | mode }

no bulkstats collection
```

collection

Enables the statistics collection process. Collects a period snapshot of data, such as “here is what the value is right now”.

historical collection

Enables the system to collect historical bulk statistics.
If enabled, the system keeps track of some things which require the storing of more data, such as “the highest value that’s been seen over the last 24 hours”.

mode

Enters the bulk statistics configuration mode. The resulting command-line prompt will look similar to:

```
[<context-name>]asr5000(config-bulkstats)#
```

no

Disables the collection of bulk statistics.

Usage

The Bulk Statistics Configuration Code consists of commands for configuring bulk statistic properties, such as the period of collection. Bulk Statistics configuration mode commands are defined in the *Bulk Statistics Configuration Mode Commands* chapter.
The system can be configured to collect bulk statistics and send them to a collection server (called a receiver). Bulk statistics are statistics that are collected in a group or schema, for example, system statistics, port statistics, radius statistics.
Once bulk statistics receiver, schema, and collection properties are configured, this **bulkstats** command is used to enable or disable the collection of the data.
To collect a sample that will provide an average, for example, an average of CPU counters, the “historical” features must be enabled with the **bulkstats historical collection** command.
Since bulk statistics are collected at regular, user-defined intervals, the **bulkstats force** command in the Exec Mode can be used to manually initiate the collection of statistics at any time.

Example

```
bulkstats collection
```

bulkstats mode

no bulkstats collection

ca-certificate

Configures and selects an X.509 CA root certificate to enable a security gateway or SCM to perform certificate-based peer (client) authentication. The system supports a maximum of 16 certificates and 16 CA root certificates. A maximum of four CA root certificates can be bound to a crypto or ssl template.

Product

FNG, SCM (P-CSCF, A-BG)

Privilege

Administrator, Security Administrator, Operator

Syntax

ca-certificate name *name* **pem { data** *pemdata* **| url** *url* **}**

no ca-certificate name *name*

name *name*

Names the CA certificate. *name* must be an alphanumeric string of 1 through 128 characters.

pem

Specifies that the Privacy-enhanced Electronic Mail (PEM) format is to be used.

data *pemdata*

CA certificate data in PEM format. *pemdata* must be an alphanumeric string of 1 through 4095 characters.

url *url*

URL of the file containing CA certificate in PEM. *url* must be an existing URL expressed in one of the following formats:

- `[file:]{/flash | /pcmcia1 | /hd-raid}[/directory]/<filename`
- `tftp://<host>[:<port>][/<directory>]/<filename`
- `ftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `sftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `http://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`

When read via a file, note that **show configuration** will not contain the URL reference, but will instead output the data via **data pemdata**, such that the configuration file is self-contained.

no

Removes the named CA certificate.

Usage

In addition to the X.509 certificate-based gateway authentication method and the PSK (Pre-Shared Key) and EAP-AKA (Extensible Authentication Protocol - Authentication and Key Agreement) peer (client) authentication methods, the FNG and SCM support X.509 certificate-based peer authentication.

The FNG checks the network policy on whether a FAP is authorized to provide service. If the network policy states that all FAPs that pass device authentication are authorized to provide service, no further authorization check may be required. If the network policy requires that each FAP be individually authorized for service (in the case where the FEID is associated with a valid subscription), the FNG sends a RADIUS Access-Request message to the AAA server. If the AAA server sends a RADIUS Access-Accept message, the FNG proceeds with device authentication. Otherwise, the FNG terminates the IPSec tunnel setup by sending an IKEv2 Notification message indicating authentication failure.
The operator/administrator is responsible for configuring the certificates through the CLI. The system will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named *fap1*:

```
no ca-certificate data fap1
```

ca-crl

Configures the name and URL path of a Certificate Authority-Certificate Revocation List (CA-CRL).

Product

S-GW

PDG/TTG

PDIF

FNG

HNB-GW

SCM (P-CSCF, A-BG)

Privilege

Operator

Syntax

ca-crl name *name* **{ der | pem } { url** *url* **}**

no ca-crl name *name*

no

Removes the named CA-CRL.

name

Provides a name of the CA-CRL. *name* must be an alphanumeric string of 1 through 128 characters.

der

Specifies that the Distinguished Encoding Rules (DER) format is to be used for the source format.

pem

Specifies that the Privacy-enhanced Electronic Mail (PEM) format is to be used for the source format.

url *url*

Specifies the URL where the CA-CRL is to be fetched. *url* must be an existing URL expressed in one of the following formats:

- `[file:]{/flash | /pcmcia1 | /hd-raid}[/directory]/<filename`
- `tftp://<host>[:<port>][/<directory>]/<filename`
- `ftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `sftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `http://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`

Usage

Use this command to name and fetch a CA-CRL from a specified location.

Without additional information from the CA, an issued certificate remains valid to any verifier until it expires. To revoke certificates, the CA publishes a CRL periodically to provide an updated list of certificates revoked, but not yet expired. Like a certificate, a CRL is a digital document signed by the CA. In addition to a list of serial numbers of revoked certificates, the CRL includes attributes such as issuer name (same as the issuer name in the certificate), signature (signed by the issuer using the same key that signs certificates), last update (the time this CRL was issued), and next update (the time next CRL will be available).

Example

The following command fetches a CA-CRL named *list1.pem* from a *host.com/CRLs* location and names the list *CRL5*:

```
ca-crl name CRL5 pem url http://host.com/CRLs/list1.pem
```

card

Enters the card configuration mode for the card specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card *number*

number

Specifies the number of the card for which the card configuration mode is to be entered. *number* must be an integer from 1 through 48.

Usage

Enter the configuration mode for a specific card when changes a required.

Important: This command is not supported on all platforms.

Example

```
card 8
```

card-standby-priority

Configures the redundancy priorities for packet processing cards by specifying the slot number search order for a standby card when needed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card-standby-priority *slot_num* **[** *slot_num* **]** **[** *slot_num* **]** **...**

slot_num

Specifies the slot of the card for the order of the standby cards. *slot_num* must be in the range from 1 through 16 excluding slots 8 and 9. *slot_num* may be repeated as many times as necessary to indicate the complete search order.

Usage

Set the standby order of the redundant cards when multiple standby cards are available. Questionable hardware should be placed lower in the priority list.

Important: This command replaces the **pac-standby-priority** command.

Important: This command is not supported on all platforms.

Example

The following command configures the redundancy priority to use the standby cards in slots 16, 14, and 12 in that order:

```
card-standby-priority 16 14 12
```

call-control-profile

Creates an instance of a call-control profile.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] call-control-profile *cc_profile_name*

no

Deletes the Call-Control Profile instance from the configuration.

cc_profile_name

Specifies the name of the call-control profile. Enter an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create an instance of a call-control profile and to enter the call-control profile configuration mode. A call-control profile is a template which groups a set of call-handling instructions that may be applicable to one or more incoming calls. See the *Call-Control Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: A call-control profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what call-control profiles have already been created, return to the Exec mode and enter the **show call-control-profile all** command.

Example

The following command creates a configuration instance of an call-control profile:

```
call-control-profile ccprof1
```

cdr-multi-mode

This command enables multiple instances of CDRMOD, one per packet processing card.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] cdr-multi-mode
```

default

Configures this command with its default setting.
Default: Single-CDRMOD mode

Usage

Use this command to enable the multi-CDRMOD mode, wherein there will be one instance of CDRMOD per packet processing card. All the SessMgr instances that are running on a packet processing card will send the records to the CDRMOD instance running on that card.
By default, CDRMOD runs in single mode, wherein there will be only one instance of CDRMOD running for the entire chassis. All the SessMgr instances that are running on a packet processing card will send the records to the CDRMOD instance.

Important: For changes to this command to take effect, save the configuration and reboot the system.

Important: In multi-CDRMOD mode, you should enable hard-disk usage.

certificate

Configures and selects an X.509 Trusted Author certificate.

Product

ACS

FNG

PDG/TTG

PDIF

SCM (P-CSCF, A-BG)

Privilege

Administrator, Security Administrator, Operator

Syntax

certificate name *name* **pem { data** *pemdata* **| url** *url* **} private-key pem { [encrypted] data** *pemdata* **| url** *url* **}**

no certificate name *name*

---

name *name*

Names the certificate. *name* must be from 1 to 128 alphanumeric characters.

---

pem

Specifies that the Privacy-enhanced Electronic Mail (PEM) format is to be used.

---

data *pemdata*

Certificate/private key data in PEM format. *pemdata* must be an alphanumeric string of 1 through 4095 (certificate) or 1 through 8191 (private key) characters.

---

url *url*

URL of the file containing certificate/private key in PEM. *url* must be an existing URL expressed in one of the following formats:

- `[file:]{/flash | /pcmcia1 | /hd-raid}[/directory]/<filename`
- `tftp://<host>[:<port>][/<directory>]/<filename`
- `ftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `sftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `http://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`

When read via a file, **show configuration** will not contain the URL reference, but instead outputs the data via **data** *pemdata*, such that the configuration file is self-contained.

---

private-key

Private key data.

encrypted

Encrypted private key data.

no

Removes the named certificate.

Usage

A certificate authority or certification authority (CA) is an entity which issues digital certificates for use by other parties. It is an example of a trusted third party. CAs are characteristic of many public key infrastructure (PKI) schemes.
If CERT information is configured, the system will include the CERT payload in the first IKE_AUTH Response during the first authentication. The system stores its own certificate for use in the first AUTH calculation. MS will not have its own certificate from CA. Still, it will be capable of accepting a certificate from the system and verify AUTH.
The operator/administrator is responsible for configuring the certificates through the CLI. The system will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named *box1*:

```
no certificate data box1
```

cli

Configures global Command Line Interface (CLI) parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cli { access { monitor-protocol | monitor-subscriber | show-configuration } { administrator | operator } } | login-failure-delay *number* **| max-sessions** *number* **| operator clear-subscriber-one-only | trap config-mode }**

no cli { max-sessions | login-failure-delay *number* **| operator clear-subscriber-one-only | trap config-mode }**

default cli { access { monitor-protocol | monitor-subscriber | show-configuration } | max-sessions | login-failure-delay *number* **| operator clear-subscriber-one-only | trap config-mode }**

no

Removes the limit on the number of allowed simultaneous CLI sessions on the system. or removes the limit of how many subscribers an Operator can clear.

default

Resets the keywords to their default values.

access { monitor-protocol | monitor-subscriber | show-configuration } { operator | administrator }

Sets access privileges on the **monitor protocol** and **monitor subscriber** commands:
monitor-protocol: Selects privileges for the **monitor protocol** command.
monitor-subscriber: Selects privileges for the **monitor subscriber** command.
show-configuration: Selects privileges for the **show-configuration**command. However the default access level for this command is the user with operator privileges.
operator: Sets the privileges for the selected command to allow use by users with operator privileges.
administrator: Restricts use of the selected command to administrators only.

login-failure-delay *number*

This is the time to wait before a login failure is returned and another login may be attempted. Default is five seconds.

max-sessions *number*

Sets the number of allowed simultaneous CLI sessions on the system. If this value is set to a number below the current number of open CLI sessions, the open sessions will continue until closed. *number* must be an integer from 2 through 100.

Caution: Use caution when setting this command. Limiting simultaneous CLI sessions prevents authorized users from accessing the system if the maximum number allowed has been reached. The system already limits CLI sessions based on available resources. Additional limitation could have adverse effects.

operator clear-subscriber-one-only

Restricts Operator to clearing only one subscriber session at a time.

trap config-mode

Enables sending an SNMP notification (trap) when a CLI user enters the configuration mode.

Usage

This command limits the number of simultaneous CLI sessions on the system at any given time.

Example

The following command sets the number of allowed simultaneous CLI sessions to 5.

```
cli max-sessions 5
```

The following command sets the command **monitor protocol** to administrator-only

```
cli access monitor-protocol administrator
```

clock

Configures system clock timezone and what local time zone to use.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clock timezone *tz* **[local]**

no clock timezone

no

Resets the system timezone to the system default UTC.

tz

Specifies the system time zone to use as one of:

- america-buenos-aires (GMT-3:00; Buenos Aires)
- america-caracas (GMT-4:00) Caracas
- america-guatemala (GMT-6:00; Guatemala, Guatemala)
- america-la_paz (GMT-4:00; La Paz)
- america-lima (GMT-5:00; Lima, Peru)
- america-puerto-rico (GMT-4:00; Puerto Rico)
- america-sao-paulo (GMT -3:00; Brazil)
- america-tijuana (GMT-8:00; Tijuana)
- asia-baghdad (GMT+3:00; Baghdad, Russia Zone 2, Kuwait, Nairobi, Riyadh, Moscow, Tehran)
- asia-bangkok (GMT+7:00; Bangkok)
- asia-calcutta (GMT+5:30; Calcutta, Mumbai, New Delhi)
- asia-dhaka (GMT+6:00; Dhaka)
- asia-hong-kong (GMT+8:00; Hong_Kong)
- asia-irkutsk (GMT+9:30; Irkutsk)
- asia-kabul (GMT+4:30; Kabul)
- asia-karachi (GMT+5:00; Karachi)
- asia-katmandu (GMT+5:45; Kathmandu)
- asia-magadan (GMT+11:00; Magadan)
- asia-muscat (GMT+4:00; Abu Dhabi, UAE, Muscat, Tblisi, Volgograd, Kabul)
- asia-rangoon (GMT+6:30; Rangoon)
- asia-seoul (GMT+9:00) Seoul
- asia-tehran (GMT+3:30; Tehran)

- asia-tokyo (GMT+9:00; Tokyo, Russia Zone 8)
- atlantic-azores (GMT-2:00; Azores)
- atlantic-cape-verde (GMT-1:00; Cape Verde Islands)
- australia-perth (GMT+8:00) Perth
- australia-darwin (GMT+9:30) Northern Territory - Alice Springs, Darwin, Uluru
- australia-adelaide (GMT+9:30) Southern Territory - Adelaide
- australia-melbourne (GMT+10:00) Victoria - Ballarat, Melbourne
- australia-sydney (GMT+10:00) New South Wales - Newcastle, Sydney, Wollongong
- australia-hobart (GMT+10:00) Tasmania - Hobart, Launceston
- australia-brisbane (GMT+10:00) Queensland - Brisbane, Cairns, Toowoomba, Townsville
- australia-lordhowe (GMT+10:30) Lord Howe Island
- canada-newfoundland (GMT-3:30; Newfoundland)
- canada-saskatchewan (GMT-6:00; Saskatchewan)
- europe-central (GMT+1:00; Paris, Berlin, Amsterdam, Brussels, Vienna, Madrid, Rome, Bern, Stockholm, Oslo)
- europe-dublin (GMT+0:00) Dublin, Ireland
- europe-eastern (GMT+2:00; Russia Zone 1, Athens, Helsinki, Istanbul, Jerusalem, Harare)
- newzealand-auckland (GMT +12:00; Auckland, Willington)
- newzealand-chatham (GMT +12:45; Chatham)
- nuku (GMT-13:00; Nuku'alofa)
- pacific-fiji (GMT+12:00; Wellington, Fiji, Marshall Islands)
- pacific-guam (GMT+10:00; Brisbane, Cairns, Sydney, Guam)
- pacific-kwajalein (GMT-12:00; Kwajalein)
- pacific-norfolk - (GMT+11:30) Norfolk Island
- pacific-samoa (GMT-11:00; Samoa)
- us-alaska (GMT-9:00; Alaska)
- us-arizona (GMT-7:00; Arizona)
- us-central (GMT-6:00; Chicago, Mexico City, Saint Louis)
- us-eastern (GMT-5:00; Bogota, Lima, New York City)
- us-hawaii (GMT-10:00; Hawaii)
- us-indiana (GMT-6:00; Indiana)
- us-mountain (GMT-7:00; Cheyenne, Denver, Las Vegas)
- us-pacific (GMT-8:00) San Francisco, LA, Seattle
- utc (GMT; Universal Time Coordinated: London, Dublin, Edinburgh, Lisbon, Reykjavik, Casablanca)

`local`

Indicates the timezone specified by *`tz`* is to be considered the local time zone for local time display and conversion.

Usage

Clock and timezone management is necessary for proper accounting records. The chassis may be set to display a different local time than that of the system clock which allows accounting records to use the system time but to display the proper local time for users.

Example

```
clock timezone utc

clock timezone us-indiana local

no clock timezone
```

congestion-control

Enables or disables support for congestion control on the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
congestion-control policy

default congestion-control

no congestion-control
```

default

Sets the congestion control to its default value.

no

Disables congestion control functionality. This is the default setting.

Usage

Congestion control on the system is used to monitor the system for conditions that could potentially degrade performance when the system is under heavy load. Typically, these conditions are temporary (i.e high CPU or memory utilization) and are quickly resolved. However, continuous or large numbers of these conditions within a specific time interval may impact the system's ability to service subscriber sessions. The purpose of congestion control is to aid in the identification of such conditions and invoke policies for addressing the situation.

Congestion control operation is based on the configuration of the following:

- **Congestion condition thresholds:** Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.

A threshold tolerance is configured to dictate the percentage under the configured threshold that must be reached in order for the condition to be considered "cleared". An SNMP trap (starCongestionClear) is then triggered.

- **Service congestion policies:** Congestion policies are configurable for each service (PDSN, GGSN, or HA). These policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Because congestion control functionality on the system is disabled by default, this command should be executed once congestion-control thresholds and policies have been configured. (Refer to the **congestion-control policy** and **congestion-control threshold** commands for more information.)

congestion-control overload-disconnect

This command enables and disables the policy for disconnecting passive calls (chassis-wide) during an overload situation. It also configures and fine-tunes the overload-disconnect congestion control policy for an entire chassis.

Product

All

Privilege

Security Administrator, Administrator

Syntax

congestion-control overload-disconnect [iterations-per-stage *integer* **| percent** *percentage_value* **| threshold { license-utilization** *percentage_value* **| max-sessions-per-service-utilization** *percentage_value* **| tolerance** *number* **}]**

default congestion-control overload-disconnect [iterations-per-stage | percent | threshold { license-utilization | max-sessions-per-service-utilization | tolerance }]

no congestion-control overload-disconnect

---

iterations-per-stage *integer*

Specifies the number of calls to be disconnected during the defined number of seconds. *integer* is a value from 2 through 8. The default value is 8.

---

percent *percentage_value*

Specifies the percentage of calls to be disconnected, in stages, during an overload situation. *percentage_value* is an integer from 1 through 100. The default value is 5.

---

threshold

license-utilization: Specifies the license-utilization percentage threshold for overload situations. If candidates are available, passive calls are disconnected when this threshold is exceeded. *percentage_value* is an integer from 1 through 100. The default value is 80.
max-sessions-per-service-utilization: Specifies a percentage of the maximum sessions per service. If candidates are available, passive calls are disconnected when this threshold is exceeded. *percentage_value* is an integer from 1 through 100. The default value is 80.
tolerance: Specifies the percentage of calls the system disconnects below the values set for the other two thresholds. In either case, a Clear Traps message is sent after the number of calls goes below the corresponding threshold value. *number* is an integer from 1 through 25. The default value is 10.

---

default

When "default" and one of the keywords is added to the command, the policy remains in its current state and the value for the specified keyword is reset to its default value.
When "default" and the command are entered without keywords, the overload-disconnect policy for congestion control is disabled.

---

no congestion-control overload-disconnect

Disables the overload-disconnect policy for congestion control.

Usage

Use this command to set the policy for call disconnects when the chassis experiences call overload.
To verify the congestion-control configuration use **show congestion-control configuration** from the Exec mode.
To set overload-disconnect policies for individual subscribers., see **overload-disconnect** in Subscriber Configuration Mode Commands.

Example

The following command sets an overload-disconnect policy for the chassis in which 5 calls would be disconnected very 5 seconds during an overload situation.

```
congestion-control overload-disconnect interations-per-stage 5
```

Both of the following commands disable the overload-disconnect policy without changing the policy configuration.

```
default congestion-control overload-disconnect
```

or

```
no congestion-control overload-disconnect
```

To instruct the system to stop call disconnects when the number of calls goes down 85% of the total allowed calls for that service, enter both of the following commands to set the max-sessions-per-service-utilization value to 90% and the tolerance value to 5%:

```
congestion-control overload-disconnect threshold max-sessions-per-
service-utilization 90

congestion-control overload-disconnect threshold tolerance 5
```

congestion-control policy

Configures congestion control policies.

Product

All

Privilege

Security Administrator, Administrator

Syntax

congestion-control policy { asngw-service | asnpc-service | cscf-service | fng-service | ggsn-service | ha-service | hnbgw-service | hsgw-service | lma-service | lns-service | mipv6ha-service | pcc-af-service | pcc-policy-service | pcc-quota-service | pdg-service| pdif-service | pdsn-service | pdsnclosedrp-service | pgw-service | phsgw-service | phspc-service | sgsn-service | sgw-service } action { drop | none | redirect | reject }

congestion-control policy mme-service action { drop | none | reject | report-overload { permit-emergency-sessions | reject-new-sessions | reject-non-emergency-sessions } enodeb-percentage *percentage* **}**

default congestion-control policy { asngw-service | asnpc-service | cscf-service | fng-service | ggsn-service | ha-service | hnbgw-service | hsgw-service | lma-service | lns-service | mipv6ha-service | mme-service | pcc-af-service | pcc-policy-service | pcc-quota-service | pdg-service | pdif-service | pdsn-service | pdsnclosedrp-service | pgw-service | phsgw-service | phspc-service | sgsn-service | sgw-service }

default congestion-control policy *service*

Sets the congestion policy action for the selected service to its default value.

asngw-service

Sets the congestion policy action for the ASN-GW service.

asnpc-service

Sets the congestion policy action for the ASN PC-LR service.

cscf-service

Sets the congestion policy action for the CSCF service.

fng-service

Sets the congestion policy action for the FNG service.

ggsn-service

Sets the congestion policy action for the GGSN service.

ha-service

Sets the congestion policy action for the HA service.

hnbgw-service

Sets the congestion policy action for the HNB-GW service.
Supported policy actions are:

- **drop**: Specifies that the system is to drop incoming packets containing new session requests.
- **none**: Specifies that the system is take no action.
- **reject**: Specifies that the system processes new session request messages and responds with a reject message.

lma-service

Sets the congestion control policy action for the LMA service

lns-service

Sets the congestion policy action for the LNS service.

mipv6ha-service

Sets the congestion policy action for the MIPv6-HA service.

mme-service

Sets the congestion control policy for action to take when subscriber sessions exceeds the defined threshold limit.
For MME type of session/calls **redirect** action is not supported.

pcc-af-service

Sets the congestion policy action for the PCC Application Function (AF) service.
Supported policy actions are:

- **drop**: Specifies that the system is to drop incoming packets containing new session requests.
- **none**: Specifies that the system is take no action.
- **reject**: Specifies that the system processes new session request messages and responds with a reject message.

pcc-policy-service

Sets the congestion policy action for the PCC Policy service.
Supported policy actions are:

- **drop**: Specifies that the system is to drop incoming packets containing new session requests.
- **none**: Specifies that the system is take no action.
- **reject**: Specifies that the system processes new session request messages and responds with a reject message.

pdg-service

Sets the congestion policy action for the PDG service.

pdif-service

Sets the congestion policy action for the PDIF service.

pdsn-service

Sets the congestion policy action for the PDSN service.

sgsn-service

Sets the congestion policy action for the SGSN service.

action { drop | none | redirect | reject }

Defines what policy action is taken:

- **drop**: Specifies that the system is to drop incoming packets containing new session requests. (PDSN, GGSN, ASN GW, LMA, MME, and ASN PC and HA only)
- **none**: Specifies that the system is take no action. This is the default for PDIF-service.
- **redirect**: Specifies that the system is to redirect new session requests to an alternate device. (PDSN and HA only)

  Important: If this option is used, the IP address of the alternate device must be configured using the **policy overload redirect** command that is part of the service configuration. Note that this option can not be used in conjunction with GGSN and MME services.

- **reject**: Specifies that the system processes new session request messages and responds with a reject message. (For PDSN and HA, the reply code is 130, "insufficient resources". For the GGSN, the reply code is 199, "no resources available".)

report-overload { permit-emergency-sessions | reject-new-sessions | reject-non-emergency-sessions } enodeb-percentage *percentage*

Important: This set of keywords is supported only by the MME.

Enables the MME to report overload conditions to eNodeBs and take additional action to alleviate congestion situations.

permit-emergency-sessions: Specifies that only emergency sessions are allowed to access the MME during the overload period.

reject-new-sessions: Specifies that all new sessions destined for the MME will be rejected during the overload period.

reject-non-emergency-sessions: Specifies that all non-emergency sessions will be rejected during the overload period.

enodeb-percentage *percentage*: Configures the percentage of known eNodeBs that will receive the overload report. *percentage* must be an integer from 1 to 100.

Usage

Congestion policies can be configured for each service. When congestion control functionality is enabled, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures a congestion control policy of reject for PDSN services:

```
congestion-control policy pdsn-service action reject
```

The following command configures a congestion control policy of reject for MME services:

```
congestion-control policy mme-service action reject
```

congestion-control threshold

Configures the congestion control threshold values that are to be monitored.

Product

All

Privilege

Security Administrator, Administrator

Syntax

congestion-control threshold { license-utilization *percent* **| max-sessions-per-service-utilization** *percent* **| message-queue-utilization** *percent* **| message-queue-wait-time** *time* **| port-rx-utilization** *percent* **| port-specific {** *slot/port* **| all } [tx-utilization** *percent* **] [rx-utilization** *percent* **] | port-tx-utilization** *percent* **| service-control-cpu-utilization** *percent* **| system-cpu-utilization** *percent* **| system-memory-utilization** *percent* **| tolerance** *percent* **}**

default congestion-control threshold { license-utilization | max-sessions-per-service-utilization | message-queue-utilization | message-queue-wait-time | port-rx-utilization | port-specific | tx-utilization | rx-utilization | port-tx-utilization | service-control-cpu-utilization | system-cpu-utilization | system-memory-utilization | tolerance }

no congestion-control threshold port-specific { *slot/port* **| all }**

no congestion-control threshold port-specific { *slot/port* **| all } [rx-utilization** *percent* **] [tx-utilization** *percent* **]**

no congestion-control threshold { message-queue-utilization | message-queue-wait-time | port-rx-utilization *percent* **| port-tx-utilization percent | service-control-cpu-utilization | system-cpu-utilization | system-memory-utilization }**

---

default congestion-control threshold *keyword*

Sets the threshold keyword to its default value.

---

no congestion-control threshold port-specific { *slot/port* **| all }**

This command disables port specific threshold monitoring on the specified port or on all ports.
slot/port: Specifies the port for which port specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.
all: Set port specific threshold monitoring for all ports on all cards.

---

license-utilization *percent*

Default: 100
The percent utilization of licensed session capacity as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.

---

max-sessions-per-service-utilization *percent*

Default: 80

The percent utilization of the maximum sessions allowed per service as measured in real-time. This threshold is based on the maximum number of sessions or PDP contexts configured for the a particular service. (Refer to the **bind** command for the PDSN, GGSN, SGSN, or HA services.)
percent can be an integer from 0 through 100.

message-queue-utilization *percent*

Default: 80
The percent utilization of the Demux Manager software task's message queue as measured in 10 second intervals. The queue is capable of storing a maximum of 10000 messages.
percent can be an integer from 0 through 100.

message-queue-wait-time *time*

Default: 5
The maximum time (in seconds) messages can be held in queue as measured by packet time stamps.
time is measured in seconds and can be an integer from 1 through 30.

Important: In the event that this threshold is crossed, an SNMP trap is not triggered. The service congestion policy invocation resulting from the crossing of this threshold is enforced only for the packet that triggered the action.

[no] port-rx-utilization *percent*

Default: 80
The average percent utilization of port resources for all ports by received data as measured in 5 minute intervals.
percent can be an integer from 0 through 100.

[no] port-specific { *slot/port* **| all } [rx-utilization** *percent* **] [tx-utilization** *percent***]**

Default: Disabled
Sets port-specific thresholds. If you set port-specific thresholds, when any individual port-specific threshold is reached, congestion control is applied system-wide.
slot/port: Specifies the port for which port-specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.
all: Set port specific threshold monitoring for all ports on all cards.
rx-utilization *percent*: Default 80%. The average percent utilization of port resources for the specified port by received data as measured in 5 minute intervals. *percent* must an integer from 0 through 100.
tx-utilization *percent*: Default 80%. The average percent utilization of port resources for the specified port by transmitted data as measured in 5-minute intervals. *percent* must be an integer from 0 through 100.

[no] port-tx-utilization *percent*

Default: 80
The average percent utilization of port resources for all ports by transmitted data as measured in 5-minute intervals.
percent can be an integer from 0 through 100.

service-control-cpu-utilization *percent*

Default: 80
The average percent utilization of CPUs on which a Demux Manager software task instance is running as measured in 10-second intervals.

percent can be an integer from 0 through 100.

system-cpu-utilization *percent*

Default: 80
The average percent utilization for all PSC/PSC2 CPUs available to the system as measured in 10-second intervals.
percent can be an integer from 0 through 100.
This threshold setting can be disabled with **no congestion-control threshold system-cpu-utilization** command. In case later you want to enable the same threshold setting **congestion-control threshold system-cpu-utilization** command will enable the CPU utilization threshold to preconfigured level.

system-memory-utilization *percent*

Default: 80
The average percent utilization of all CPU memory available to the system as measured in 10-second intervals.
percent can be an integer from 0 through 100.

tolerance *percent*

Default: 10
The percentage under a configured threshold that dictates the point at which the condition is cleared.
percent can be an integer from 0 through 100.

Usage

Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.
The tolerance parameter establishes the threshold at which the condition is cleared. An SNMP trap (starCongestionClear) is generated for the clear condition, as well.

Example

The following command configures a system CPU utilization threshold of 75%.

```
congestion-control threshold system-cpu-utilization 75
```

This setting will remain in configuration unless you specify another threshold value in place of 75. This threshold setting can be disabled with **no congestion-control threshold system-cpu-utilization** command but cannot be removed from configuration. Later if you want to enable the previously configured threshold value of *75* percent, you only need to enter the **congestion-control threshold system-cpu-utilization** command without specifying any threshold value. It will enable the CPU utilization threshold to preconfigured level of *75* percent.
For example, **no congestion-control threshold system-cpu-utilization** disables the configured threshold setting and **congestion-control threshold system-cpu-utilization** again enables the threshold setting of 75%.
The following command configures a threshold tolerance of 5%:

```
congestion-control threshold tolerance 5
```

In the above examples, the starCongestion trap gets triggered if the system CPU utilization goes above 75% and the starCongestionClear trap gets triggered if it reaches or goes below 70%.

content-filtering category database directory

This command configures the base directory to be used for storing all content-rating databases that are required for Category-based Content Filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category database directory path *directory_path*

default content-filtering category database directory path

default

Specifies the default base directory and directory path for Category-based Content Filtering application.

directory_path

Default: /pcmcia1/cf
Specifies the base directory and its path to store all of the full or incremental content rating databases for the Category-based Content Filtering application.
directory_path must be an alphanumeric string of 1 through 255 characters.

Usage

Use this command to specify the directory and its path to download all full or incremental category-rating databases to be used for the Category-based Content Filtering application.
Merging of incremental database can be done as part of the database upgrade process preformed with **upgrade content-filtering category database** command in the Executive Mode.

Example

The following command configures the */flash/cf_temp/DB* as the base directory to download all full and incremental content-rating databases for content filtering application.

```
content-filtering category database directory path /flash/cf_temp/DB
```

content-filtering category database max-versions

This command configures the number of full content-rating databases to maintain/archive in the base directory for category-based content filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category database max-versions *num_archive*

default content-filtering category database max-versions

default

Sets the default number of full databases for specified directory path/location.

num_archive

Default: 2
Specifies the maximum number of database to be archived or maintained in the specific location.
num_archive must be an integer from 1 through 3.

Usage

Use this command to set the number of full content-rating database to be maintained in the specified directory path with the base file name specified using the **content-filtering database override file** command. The specified directory path is the location specified using the **content-filtering category database directory path** command.

Example

The following command configures the system to maintain *3* full content-rating databases for category-based content filtering application.

```
content-filtering category database max-versions 3
```

content-filtering category database override

This command specifies the name of a file to be used by the category-rating database load process for category-based content filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category database override file *file_name.extension*

default content-filtering category database override file

default

Sets the default content rating database file name; for example, optcmd.bin.

file *file_name.extension*

Specifies the header of the file in the database directory path location to determine the newest full database. *file_name* must be an alphanumeric string of up to 10 characters with an extension of 3 characters after a period (.) as *extension*.

Usage

Use this command to configure the category-rating database file name to determine the newest version of full database. A process called "**LOAD_DATABASE**" invokes during the system startup or the database upgrade process by **upgrade content-filtering category database** command in Executive Mode. This process examines the header of each of the files in the database folder specified by **content-filtering category directory path** command in this mode.
Note that by default system examines the header of those files only which begins with the string "OPTCMDB" and having extension ".bin".

Example

The following command configures the system to examine the header of files that begins with *CF_sta.DB* only for content filtering application.

```
content-filtering category database override file CF_sta.DB
```

context

Enters the Context Configuration mode or is used to add or remove a specified context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

context *name* **[-noconfirm]**

no context *name*

no

Removes the specified context from the configuration.

name

Specifies the name of a context to enter, add, or remove. When creating a new context, the context name must be unique.

Important: When creating a new context, the *context name* specified must not conflict with the name of any existing context or domain names.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Configure contexts or remove obsolete contexts.

Important: A maximum of 64 contexts may be created.

Example

context *sampleContext*

no context *sampleContext*

crash enable

Enables or disables the copying of crash data to a specified location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

crash enable [encrypted] url *crash_url* **[filename-pattern** *pattern* **] [restrict** *mbyte* **]**

no crash enable

no

Removes the specified context from the configuration.

Important: System crash information is generated and stored in the crash list even when the **no** keyword is specified. The information maintained in the crash lists is minimal crash information when the **no** keyword has been specified.

encrypted

Indicates that the URL encrypted for security reasons.

filename-pattern *pattern*

The **filename-pattern** is a an alphanumeric string containing any or all of the following variables:

- *%hostname%* - The system hostname.
- *%ip%* - A SPIO IP address
- *%cpu%* - CPU number
- *%card%* - Card number
- *%time%* - POSIX timestamp in hexadecimal notation
- *%filename%* - Alias for *crash-%card%-%cpu%-%time-core%*
- *%%* - A single *%* sign

If no pattern is specified, the result is the same as the pattern *filename*.
Use '/' characters in the filename pattern part to store crashes in per-system subdirectories.

url *crash_url*

Specifies the location to store crash files. *crash_url* may refer to a local or a remote file. *crash_url* must be entered using the following format:

- **[file:]{/flash|/pcmcia1|/pcmcia2}[/***directory***]/**
- **tftp://{***host***[:***port#***]}[/***directory***]/**
- **[ftp:|sftp:]//[***username***[:***password***]@] {***host***}[:***port#***][/***directory***]/**
- ASR 5000:

- **[file:]{/flash|/pcmcia1|/hd}[/***directory***]/**
- **tftp://{***host***[:***port#***]}[/***directory***]/**
- **[ftp:|sftp:]//[***username***[:***password***]@] {***host***}[:***port#***][/***directory***]/**

Important: Use of the SMC hard drive is not supported in this release.

Important: Do not use the following characters when entering a string for the field names below: "/" (forward slash), ":" (colon) or "@" (at sign).

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

restrict *mbyte*

Specifies a maximum amount of memory (in megabytes) to use for storing crash files as an integer from 1 through 128. Default: 128
The **restrict** keyword is only applicable to local URLs.

Usage

Enable crashes if there are systems that are not stable and the crash information will be useful for trouble shooting. The remote storage of the crash file reduces the memory utilized on the chassis.

Example

```
crash enable ftp://remoteABC/pub/crash.dmp

crash enable /flash/pub/data/crash.dmp restrict 64

no crash enable
```

cs-network

This command creates/removes an HNB-CS network configuration instance for Femto UMTS access over Iu-CS/Iu-Flex interface between Home NodeB Gateway (HNB-GW) service and CS networks elements; i.e. MSC/VLR. This command also configures an existing HNB-CS network instance and enters the HNB-CS Network Configuration mode on a system.

Product

HNB-GW

Privilege

Administrator

Syntax

cs-network *cs_instance* **[-noconfirm]**

no cs-network *cs_instance*

no

Removes the specified HNB-CS network instance from the system.

Caution: Removing the HNB-CS network instance is a disruptive operation and it will affect all UEs accessing MSC(s) configured in specific CS core network through the HNB-GW service.

Caution: If any HNB-CS Network instance is removed from system all parameters configured in that mode will be deleted and Iu-CS/Iu-Flex interface will be disabled.

cs_instance

Specifies the name of the Circuit Switched Core Networks instance which needs to be associated with the HNB Radio Network PLMN via the HNB RN-PLMN Configuration mode. If *cs_instance* does not refer to an existing HNB-PS network instance, the new HNB-CS network instance is created.
cs_instance must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to enter the HNB-CS Network Configuration mode for an existing CS network instance or for a newly defined HNB-CS network instance. This command is also used to remove an existing HNB-CS network instance.
This configuration enables/disables the Iu-CS/Iu-Flex interface on HNB-GW service with CS core network elements; i.e. MSC/VLR.
A maximum of one HNB-CS network instance per HNB-GW service instance which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

Caution: This is a critical configuration. The HNBs cannot access MSC(s) in CS core network without this configuration. Any change to this configuration would lead to disruption in HNB access to CS core network.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cs-network)#
```

The various parameters available for configuration of an HNB-CS network instance are defined in the *HNB-CS Network Configuration Mode Commands* chapter.

Example

The following command enters the existing HNB-CS Network configuration mode (or creates it if it does not already exist) for the instance named *hnb-cs1*:

```
cs-network hnb-cs1
```

The following command will remove HNB-CS network instance *hnb-cs1* from the system without any warning to operator:

```
no cs-network hnb-cs1
```

css acsmgr-selection-attempts

This is a restricted command. In 9.0 and later releases this command is obsolete.

css delivery-sequence

This is a restricted command. In 9.0 and later releases this command is obsolete.

css service

This is a restricted command. In 9.0 and later releases this command is obsolete.

default

Restores the system default values for the specified parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default { autoconfirm | banner [lawful-intercept | motd | pre-login] | boot [delay | interface | nameserver | networkconfig] | card-standby-priority | cli max-sessions | congestion-control | logging { display | filter runtime } | operational-mode | pac-standby-priority | qos npu inter-subscriber traffic { bandwidth | priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }] } | require session recovery | snmp { engine-id | notif-threshold } | system hostname | task { facility sessmgr start | resource cpu-memory-low } | threshold { *value* **} | timestamps | upgrade limit [time] [usage] }**

---

autoconfirm

Restores the autoconfirm behavior to its default of disabled.

---

banner

lawful-intercept - Restores the system default message of the day for SSH CLI sessions.
motd – Restores the system default message of the day banner.
pre-login – Restores the CLI log in banner to the system default.

---

boot [delay | interface | nameserver | networkconfig]

interface | networkconfig - Restores the default boot interface and network configuration options. The keywords **interface** and **networkconfig** are used to restore the default option settings for the interface and network configuration options, respectively.
Defaulting the network configuration boot option removes the network boot option from the boot.sys file. It does not remove the network config options from the configuration file which is managed separately from the boot.sys file.
delay - Removes the boot delay setting (if any). The default for boot delay is “no boot delay”.
nameserver - Removes the nameserver IP address.

---

card-standby-priority

Resets the standby priority of the Packet Services Cards.

---

cli max-sessions

Restores the default value of this command to **no cli max-sessions** which removes the limit on the number of allowed simultaneous CLI sessions on the system.

---

congestion-control

Restores the system’s congestion-control functionality to its default setting of disabled.

logging {display | filter runtime}

display: sets the default level of detail to display for trace log information to the system default.
filter runtime: resets the filtering of logged information to log in real time.

operational-mode

Sets the operational mode of the chassis to the system default.

pac-standby-priority

This parameter has been replaced by the **card-standby-priority** keyword.

qos npu inter-subscriber traffic {bandwidth | priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }] }

Restores the following NPU QoS parameters to their default values:

- **bandwidth**:
- gold: 10%
- silver: 20%
- bronze: 30%
- best-effort: 40%
- **priority**: All DSCP values are mapped to the best-effort priority queue but are not configured.

require session recovery

Resets the session recovery feature to its default setting of disabled.

snmp { engine-id | notif-threshold | system hostname | timestamps }

engine-id: restores the SNMP engine ID to the system default.
notif-threshold: restores the SNMP notification threshold to the system default.

task { facility sessmgr start | resource cpu-memory-low }

facility sessmgr start: Restores the default session manager start policy.
resource cpu-memory-low: Resets the system so that when a CPU runs very low on memory (below 12MB) the most over limit task is killed.

system hostname

Sets the system host name for SNMP use to the system default value.

threshold { *value* }

Restores thresholding values to their default setting. The possible values are:

- **10sec-cpu-utilization**: CPU utilization using a 10 sec average.
- **aaa-acct-archive-size**: AAA accounting archive queue threshold settings
- **aaa-acct-failure**: AAA accounting failure threshold settings
- **aaa-acct-failure-rate**: AAA accounting failure rate threshold settings
- **aaa-auth-failure**: AAA authentication failure threshold settings

- **aaa-auth-failure-rate**: AAA authentication failure rate threshold settings
- **aaa-retry-rate**: AAA retry rate threshold settings
- **aaamgr-request-queue**: AAA manager internal request queue threshold settings
- **call-reject-no-resource**: Calls rejected due to no resources threshold settings
- **call-setup**: Calls setup threshold settings
- **call-setup-failure**: Call setup failure threshold settings
- **contfilt-block**: Content Filtering Blocks threshold settings
- **contfilt-rating**: Content Filtering Ratings threshold settings
- **cpu-available-memory**: CPU available memory threshold settings
- **cpu-load**: PSC/PSC2 CPU load using a 5 minute average measurement
- **cpu-memory-usage**: Percentage of total CPU memory usage
- **cpu-session-throughput**: CPU session throughput threshold settings
- **cpu-utilization**: CPU utilization threshold settings
- **dcca-bad-answers**: Diameter Bad Answers threshold settings
- **dcca-protocol-error**: Diameter Protocol Error threshold settings
- **dcca-rating-failed**: Diameter Rating Failed threshold settings
- **dcca-unknown-rating-group**: Diameter Unknown Rating Group threshold settings
- **diameter**: Diameter threshold settings
- **license**: Session license threshold settings
- **model**: Thresholding model settings
- **monitoring**: Threshold monitoring configuration settings
- **packets-filtered-dropped**: Filtered/dropped packet threshold settings
- **packets-forwarded-to-cpu**: Forwarded packet threshold settings
- **pdif-current-sessions**: Threshold monitoring for all current PDIF sessions.
- **pdif-current-active-sessions**: Threshold monitoring for only the currently-active PDIF sessions.
- **per-service-ggsn-sessions**: The number of GGSN sessions per GGSN service
- **per-service-gprs-sessions**: The number of GPRS sessions per GPRS service
- **per-service-gprs-pdp-sessions**: The number of PDP contexts per GPRS service
- **per-service-ha-sessions**: The number of HA sessions per HA service
- **per-service-lns-sessions**: The number of LNS sessions per LNS service
- **per-service-pdsn-sessions**: The number of PDSN sessions per PDSN service
- **per-service-sgsn-sessions**: The number of SGSN sessions per SGSN service
- **per-service-sgsn-pdp-sessions**: The number of PDP contexts per SGSN service
- **poll**: Threshold polling interval configuration settings
- **total**: Total subscriber threshold settings
- **total-ggsn-sessions**: Total GGSN sessions for all GGSN services in the system

- **total-gprs-sessions**: Total GPRS sessions per for all GPRS services in the system
- **total-gprs-pdp-sessions**: Total PDP contexts for all GPRS services in the system
- **total-ha-sessions**: Total HA sessions for all HA services in the system
- **total-lns-sessions**: Total LNS sessions for all LNS services in the system
- **total-pdsn-sessions**: Total PDSN sessions for all PDSN services in the system
- **total-sgsn-sessions**: Total SGSN sessions per for all SGSN services in the system
- **total-sgsn-pdp-sessions**: Total PDP contexts for all SGSN services in the system

timestamps

Resets the inclusion of timestamps in command.

upgrade limit [time] [usage]

Sets upgrade limit values to the defaults. If the optional keywords are not specified all values are reset to their defaults.
time: Resets the maximum time a session may exist during a software upgrade to the default of 120.
usage: Resets the minimum number of sessions before closing the sessions during a software upgrade to the system default of 100.

Usage

Restore system defaults to aid in trouble shooting or just prior to modifying additional configuration options.

Example

```
default banner motd

default boot

default logging display

default system hostname

default upgrade limit time
```

diameter-proxy ram-disk

This command configures the amount of extra RAM disk space in MB to be allocated to Diamproxy task when local storage (hard disk) is enabled.

Product

SGW, PGW, HSGW

Privilege

Security Administrator, Administrator

Syntax

diameter-proxy ram-disk mb *space_mb*

default diameter-proxy ram-disk mb

default

Configures the default setting.
Default: 32 MB

mb space_mb

Specifies the storage space in MB.
space_mb must be an integer from 10 through 256.

Usage

Specifies the additional storage space to be allocated to Diamproxy for file write, in MB. The specified memory in MB is added to the existing memory allocated to Diamproxy only if HDD storage is enabled. By default, 32 MB is additionally allocated.

Example

The following command specifies that *100* MB of additional storage space be allocated to the Diamproxy task:

```
diameter-proxy ram-disk mb 100
```

ecmp-lag hash

This command provides the configuration to select source Boxer Internal Address (SBIA) as the input to the hashing function for ECMP-LAG distribution.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] ecmp-lag hash use-sbia-only
```

no

Disables the hashing function selection and sets the system to use IP Source Address, IP Destination Address, IP Protocol and Source BIA as inputs to the hashing algorithm for ECMP-LAG distribution.

Usage

Use this command to allow the operator to change the way hashing works in deciding which link to use for ECMP and Link Aggregation. In the default hashing algorithm the IP Source Address, IP Destination Address, IP Protocol and Source BIA are used in the hashing function. When “use-sbia-only” option is selected, only the Source BIA is used in the hashing function.

Caution: When using ECMP-LAG on a HNB-GW, this configuration is **mandatory** for standalone HNB-GW deployment and highly recommended in other deployment scenarios where HNB-GW is used in combination with other services.

Example

The following command enables the SBIA as input to hash function for ECMP-LAG on the HNB-GW:

```
ecmp-lag hash use-sbia-only
```

The following commands sets the hashing function to use standard inputs for ECMP-LAG on HNB-GW:

```
no ecmp-lag hash use-sbia-only
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

enforce imsi-min equivalence

Enables the PDSN/HA to treat IMSI and MIN as the same for identifying the PDSN/HA session.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
enforce imsi-min equivalence

[ no | default ] enforce imsi-min equivalence
```

`[ no | default ]`

Disables the PDSN/HA from treating IMSI and MIN as the same for identifying the PDSN/HA session.
Default: Disabled.

Usage

Generally on an HA, the IMSI and MIN are treated as different and hence the RRQs with 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session if the NAI and HoA also match. If the NAI and/or HoA do not match, then the duplicate IMSI session detect and terminate feature is applicable.
Generally on a PDSN, the IMSI and MIN are treated as different and hence RP messages from 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching PDSN sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session.

Example

To monitor or clear subscriber session information filtered by on IMSI/MIN refer to the **`show subscribers msid`** command.

Important: This command must be executed at startup only and will not take effect when reconfigured without rebooting.

Example

The following command enables the treatment of the IMSI and MIN as the same for identifying the session:

```
enforce imsi-min equivalence
```

Either of the following commands disables the treatment of the IMSI and MIN as the same for identifying sessions:

```
no enforce imsi-min equivalence

default enforce imsi-min equivalence
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

fa-spi-list

Replaces a duplicate Foreign Agent- Security Parameter Index (FA-SPI) remote address list applied to multiple FA services with a list name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

fa-spi-list *fa_spi_list*

fa_spi_list

Remote address list name expressed as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to Replace duplicate FA-SPI remote address list applied to multiple FA or HA services with a list name.

Example

The following command configures the list FA SPI list to *fa-list2*:

```
fa-spi-list fa-list2
```

global-title-translation address-map

Creates an instance of a Global Title Translation (GTT) address-map, a database, for global titles (ISDN-type address) used for SCCP routing. Upon creating the instance, the system enters global title translation address-map configuration mode. For the commands to configure the database, go to the *Global Title Translation Address-Map Configuration Mode Commands* chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

global-title-translation address-map instance *instance*

no global-title-translation address-map instance *instance*

no

Removes the specified GTT address-map database from the SCCP portion of the configuration.

instance

This value uniquely identifies a specific instance of a GTT address-map.
instance must be an integer from 1 through 4096.

Usage

Create a GTT address-map with a unique identifier and enter the GTT address-map configuration mode.

Example

```
global-title-translation address-map instance 324
```

global-title-translation association

Creates an instance of a Global Title Translation (GTT) association which defines the rules for handling global title translation. Upon creating the instance, the system enters global title translation association configuration mode. For the commands to configure the rules, go to the *Global Title Translation Association Configuration Mode Commands* chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

global-title-translation association instance *instance*

no global-title-translation association instance *instance*

no

Removes the specified instance of a GTT association from the SCCP portion of the configuration.

instance

This value uniquely identifies a specific instance of a GTT association.
instance must be an integer from 1 through 16.

Usage

Create a GTT association with a unique identifier and enter the GTT association configuration mode.

Example

```
global-title-translation association instance 2
```

gtpp compression-process

This command configures the maximum number of child compression processes that AAA proxy can have. This command is only applicable to the ASR 5000 platform.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp compression-process *max_number*

default gtpp compression-process

default

Restores the system to the default settings for the number of child compression processes allowed.

max_number

Specifies the maximum number of child processes. The default is 1
max_number: must be an integer from 1 through 4.

Usage

This command configures the maximum number of child compression processes that AAA proxy can have only if hard disk storage is enabled.

Example

```
gtpp compression-process 3
```

gtpp ram-disk-limit

This command configures additional storage space to be allocated for writing files. This command is only applicable to the ASR 5000 platform.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp ram-disk-limit mb *mega_bytes*

default gtpp ram-disk-limit

default

Restores the system to the default settings of 32 MB of storage.

mb *mega_bytes*

Specifies the number of megabytes of storage allocated for files.
mega_bytes: must be an integer from 10 through 256. The default is 32 MB.

Usage

The memory specified with this command would be added to the existing memory allocated to the AAA proxy only if hard disk storage is enabled.

Example

```
gtpp ram-disk-limit mb 256
```

gtpp single-source

Configures the system to reserve a CPU for performing a proxy function for accounting.

Product

GGSN, SGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
gtpp single-source [ centralized-lrsn-creation | private-extensions ]

no gtpp single-source
```

centralized-lrsn-creation

Defines Log Record Sequence Number (LRSN) generation at proxy. The AAA proxy will generate the LRSN for all CDR types generated by either the GGSN or the SGSN.
Default: disabled

private-extensions

This optional keyword enables the proprietary use of customer-specific GTPP extensions.
If **private-extensions** is not configured, all customer specific private extensions related to GTPP message transfer with CGF and recovery through GSS are disabled.

Important: In order for the customer-specific extensions to work properly, the **gtpp max-pdu-size** command in the Context Configuration Mode should be set to 65400 and the **gtpp server** command's **max** value should be set to "1".

no

Disables GTPP single-sourcing. This is the default setting.

Caution: Entering this command while PDP contexts are in process could cause the loss of pending CDRs. The configuration must be saved and the chassis reloaded for this option to take effect.

Usage

When GTPP single-sourcing is enabled, the system's AAA proxy function generates requests to the accounting server using a single UDP source port number, instead of having each AAA Manager generate independent requests with unique UDP source port numbers. This is accomplished by the AAA Managers forwarding their GTPP PDUs to the AAA Proxy function that runs on a reserved packet processing card CPU. Since a packet processing card CPU is being reserved, fewer Session Managers and AAA Managers will be started on that card.

Caution: This command must be entered prior to the configuration of other services. Specifying it later may return an error due to a lack of CPU availability.

Example

The following command enables GTPP single-sourcing with the use of private GTPP extensions:

```
gtpp single-source private-extensions
```

The following command disables GTPP single-sourcing:

```
no gtpp single-source
```

ha-spi-list

Replaces a duplicate Home Agent-Security Parameters Index (HA-SPI) remote address list applied to multiple HA services with a list name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ha-spi-list *ha_spi_list*

ha_spi_list

Remote address list name expressed as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to Replace duplicate HA-SPI remote address list applied to multiple HA services with a list name.

Example

The following command configures the list HA SPI list to *ha-list2*:

```
ha-spi-list ha-list2
```

hd raid

Provides access to a local RAID hard drive configuration mode in order to manage parameters supporting local storage of records.

Product

All

Privilege

Security Administrator, Administrator

Syntax

hd raid

raid

Provides access to the HD RAID configuration mode in order to manage the RAID on the ASR 5000 SMC hard drive.

Usage

Enters the HD RAID configuration mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-hd-raid)#
```

HD RAID Configuration Mode commands are defined in the HD RAID Configuration Mode Commands chapter.

Example

The following command opens the hd-raid mode:

```
hd raid
```

hd storage-policy

Provides access to the local hard drive configuration mode in order to manage parameters supporting local storage of records.

Product

GGSN, SGSN, HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

[no] hd storage-policy *name*

no

Removes a configured HD storage policy from the system.

storage-policy *name*

Specifies a name for an HD storage policy and then enters the HD Storage Policy Configuration Mode. *name* must be an alphanumeric string of 1 through 63 characters.

Usage

Creates a new policy or specifies an existing policy and enters the HD Storage Policy Configuration Mode. Entering this command results in the following prompt:
[*context_name*]*hostname*(config-hd-storage-policy)#
HD Storage Policy Configuration Mode commands are defined in the HD Storage Policy Configuration Mode Commands chapter.

Example

The following command creates an HD storage policy named *policy3* and enters the HD Storage Policy Configuration Mode:

```
hd storage-policy policy3
```

high-availability

Configures the speed for detection of packet processing card task failures.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
high-availability fault-detection speed { aggressive | normal }

default high-availability fault-detection speed
```

{ aggressive | normal }

Default: **normal**

- **aggressive**: Initiates packet processing card failover without performing additional checks.
- **normal**: Initiates packet processing card failover after additional checks are performed.

Usage

Use this command to increase the fault detection speed for faster switchovers after a packet processing card task failure.

Setting fault detection speed to aggressive will trigger packet processing card failover as soon as possible if a potential failure is detected. Aggressive mode will reduce the duration of subscriber outages caused by a failed packet processing card if session recovery is enabled.

Aggressive mode also bypasses most information gathering steps and logs that can be used to determine the root cause of the failure.

In normal mode, additional checks are performed before triggering a packet processing card failover to ensure that the card has actually failed. In aggressive mode these checks are bypassed so that session recovery can start as soon as possible. These additional checks reduce the likelihood of a false positive failure.

Example

The following command sets the fault detection speed for packet processing card tasks to **aggressive**:

```
high-availability fault-detection speed aggressive
```

hybrid-mode

Enables an ASR 5000 chassis to run a mix of Packet Services Cards (PSCs) and PSC Type A (PSCAs). When enabled, PSCAs will boot and be compatible with the PSCs as long as encryption services are disabled. The default is to run the chassis in non-hybrid mode; PSCAs will not boot when inserted in the chassis.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] hybrid-mode [force]
```

no

Returns the chassis to non-hybrid mode. PSCAs will not boot.

force

Always updates the configuration, even if the encryption services could not be disabled. However, the PSC and PSCA cards will continue to be incompatible until encryption services are manually disabled.

Usage

To allow a chassis to run in PSC/PSCA hybrid-mode with encryption services disabled you must configure **hybrid-mode force** once.
To go from hybrid mode to non-hybrid mode, you must enter the **no hybrid-mode force** command. Non-hybrid chassis mode allows encryption services to be started through the appropriate CLI commands. However, all PSCAs in the chassis will be disabled.
For additional information, see the *ASR 5000 Installation Guide*.

Example

The following command enables the chassis to run a mix of PSCs and PSCAs without encryption services:

```
hydrid-mode force
```

imei-profile

Creates an instance of an International Mobile Equipment Identity (IMEI) profile.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] imei-profile *imei_profile_name*

no

Deletes the IMEI profile instance from the configuration.

imei_profile_name

Specifies the name of the IMEI profile as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create an instance of an IMEI profile and to enter the IMEI Profile Configuration mode. An IMEI profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy. See the *IMEI Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: An IMEI profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what IMEI profiles have already been created, return to the Exec mode and enter the **show imei-profile all** command.

Example

The following command creates a configuration instance of an IMEI profile:

```
imei-profile imeiprof1
```

license

Configures the session license key.

Product

All

Privilege

Security Administrator, Administrator

Syntax

license key *key_value* **[-force] session-limit**

no license key *key_value* **[-force] session-limit**

no

Removes the license key(s) installed.

key *key_value*

Installs the license key specified by *key_value*. *key_value* is provided by Cisco operations staff.

session-limit

Use this keyword to suppress fail-over calls from being rejected if the licensed threshold is crossed.

Important: This is a customer-specific command that is available for HA, PDSN, EHA, and PDIF. Please contact your local Cisco sales representative for more information.

-force

Sets the license key even if resources are not available. The system supports the dynamic resizing of demultiplexor software tasks based on the licensed session capacity and feature type. When installing a license, the system automatically attempts to resize currently functioning tasks. Warning messages are displayed if there is an issue. Though its use is not recommended, the **-force** keyword can be used to suppress these warning messages.

Caution: Use of this option is not recommended.

Usage

Install or update system session keys when necessary due to expiration and/or capacity needs.

Example

license key *sampleKeyValue*

no license key

line

Enters the terminal display line configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
line
```

Usage

Change the terminal display configuration based upon the users own terminal characteristics.

link-aggregation

Configures the Link Aggregation system priority. This parameter is usually changed to match the feature requirements of the remote switch.

Product

WiMAX, PDSN, HA, FA, GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

link-aggregation { system-mac [MAC | auto] | system-priority *priority* **} [-noconfirm]**

{ default | no } link-aggregation { system-mac | system-priority } [-noconfirm]

default

Resets the configuration to the default.

link-aggregation system-mac { MAC | auto } *priority*

Sets the system MAC address used along with the system priority to form the system ID.
MAC is a manually entered MAC address (six groups of two hexadecimal digits separated by hyphens).
Auto is the default and is the LAG master port's MAC address.

link-aggregation system-priority *priority*

This command sets the system priority used by LACP to form the system ID.
priority is a hexadecimal value from 0x0000 through 0xFFFF.
Default system priority value is 0x8000 (32768).

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

The system MAC address (6 bytes) and system priority (2 bytes) combine to form the system ID. A system consists of a packet processing card and its associated QGLC(s) or XGLCs. The highest system ID priority (the lowest number) handles dynamic changes.
For additional usage and configuration information for the link aggregation feature, go to Configuring Link Aggregation in the *System Administration Guide*.

Important: Not supported on all platforms

Example

The following command configures the link aggregation system-priority to 10640 (*0x2990*):

```
link-aggregation system-priority 0x2990
```

local-policy-service

This command enables creating, configuring, or deleting a local QoS policy.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

local-policy-service *name* **[-noconfirm]**

no local-policy-service *name*

name

Specifies name of the local QoS policy service as an alphanumeric string of 1 through 63 characters.

Important: The *name* must be unique across all contexts.

If the named local QoS policy service does not exist, it is created, and the CLI mode changes to the Local Policy Service Configuration Mode wherein the local QoS policy service can be configured.
If the named local QoS policy service already exists, the CLI mode changes to the Local Policy Service Configuration Mode for that local QoS policy service.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

no

Deletes the specified local QoS policy service from the system.

Usage

Use this command to specify a local QoS policy service name to allow configuration of a local QoS policy service.

Important: This feature is license dependent. Please contact your local sales representative for more information.

A local QoS policy service can be used to control different aspects of a session, such as QoS, data usage, subscription profiles, or server usage, by means of locally defined policies.
Local QoS policies are triggered when certain events occur and the associated conditions are satisfied. For example, when a new call is initiated, the QoS to be applied for the call could be decided based on the IMSI, MSISDN, and APN.

Important: A maximum of 16 local QoS policy services are supported.

Entering this command results in the following prompt:

```
[context_name]hostname(config-local-policy-service)#
```

Local Policy Service Configuration Mode commands are defined in the *Local Policy Service Configuration Mode Commands* chapter.

Example

The following command creates a local QoS policy service named *lctest* and enters the Local Policy Service Configuration Mode:

```
local-policy-service lctest
```

local-user allow-aaa-authentication

Enables or disables the use of administrative accounts other than local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] local-user allow-aaa-authentication
```

no

Disables administrative user accounts other than local-user accounts.

default

Returns this parameter to its default setting of enabled.

Usage

Local-user administrative accounts are separate from other administrative user accounts configured at the context level (Security Administrator, Administrator, Operator, and Inspector).
Context-level administrative users rely on the system's AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server.
Since the T1.276-2003 password security mechanisms are supported only for local-user administrative accounts and not for the AAA-based administrative accounts, this command provides a mechanism for disabling AAA-based administrative accounts.
By default, AAA-based administrative accounts are allowed.

Example

The following command forces the system to authenticate local-user accounts based only on the information in the security account file on its CompactFlash:

```
no local-user allow-aaa-authentication
```

local-user lockout-time

Configures the lockout period for local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-user lockout-time *time*

default local-user lockout-time

default

Restores the parameter to its default setting.

time

Default: 60
Specifies the amount of time (in minutes) that must elapse before a previously locked-out local-user account can attempt to login again. *time* is an integer from 1 through 10080.

Usage

Local-user administrative accounts can become locked for reasons such as exceeding the configured maximum number of login failures.
Once an account is locked, this parameter specifies the lockout duration. Once the amount of time configured by this parameter has elapsed, the local-user can once again attempt to login.

Example

The following command configures a lockout time of *120* minutes (2 hours):

```
local-user lockout-time 120
```

local-user max-failed-logins

Configures the maximum number of failed login attempts a local-user can have before their account is locked out.

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-user max-failed-logins *number*

[default | no] local-user max-failed-logins

no

Disables this functionality.

default

Restores this parameter to its default setting.

number

Default: 5
Specifies the maximum number of times a local-user could experience a login failure before their account is locked out. *number* is an integer from 2 through 100.

Usage

This command configures the maximum number of failed login attempts a local-user can have before their account is locked out. For example if, this parameter is configured to "3" then after the third failed login attempt, the account would be locked.

Important: Local-user accounts can be configured to either enforce or reject a lockout due to the maximum number of failed login being reached. Refer to the **local-user username** command for more information.

Refer to the **local-user lockout-time** command for more information.

Example

The following command configures a maximum of three login attempts:

```
local-user max-failed-logins 3
```

local-user password

Configures local-user administrative account password properties.

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-user password { [complexity { ansi-t1.276-2003 | none }] [history length *number* **[duration** *days* **]] [max-age** *days* **] [min-change-char** *number* **] [min-change-interval** *days* **] [min-length** *number* **] }**

no local-user password { [history] [max-age] [min-change-interval] }

default local-user password { [complexity] [history] [max-age] [min-change-char] [min-change-interval] [min-length] }

no

Disables the specified parameter.

default

Restores the specified parameter to its default setting.

[complexity { ansi-t1.276-2003 | none }]

Default: ansi-t1.276-2003
Specifies the password strength as one of the following:

- **ansi-t1.276-2003:** If this option is selected, the following rules are enforced:
- Passwords may not contain the username or the reverse of the username
- Passwords may contain no more than three of the same characters used consecutively
- Passwords must contain at least three of the following:
  - uppercase alpha character
  - lowercase alpha character
  - numeric character
  - special character
- **none:** No additional password checks are performed.

[history length *number* **[duration** *days* **]]**

Default: length is 5
Specifies the number of previous password entries kept in the history list maintained by the system. A password cannot be reused if it is one of the entries kept in the history list unless the time it was last used was more than the number of days specified by the **duration** keyword.
If the duration keyword is not used, the only check performed by the system is that it is not in the history list.

number is the number of entries for each account stored in the history list entered as an integer from 1 through 100. *days* is the number of days during which a password can not be reused entered an integer from 1 through 365.

[max-age *days* **]**

Default: 90
Specifies the maximum age for a password. Users logging in with a password older than the specified limit are locked out. Once the lockout period expires, at their next login attempt, they are prompted to change their password before accessing the CLI.

Important: Local-user accounts can be configured to either enforce or reject a lockout due to a password's maximum age being reached. Refer to the **local-user username** command for more information.

days is the number of days that passwords remain valid entered as an integer from 1 through 365.

[min-change-char *number* **]**

Default: 2
Specifies the minimum number of characters that must be changed (in comparison to the current password) when a user changes their password.

Important: Changes in password length are counted as "character" changes. For example: changing a password from "password" to "passwo" is a 2-character change, changing a password from "password" to "password2" is a 1-character change, and changing a password from "password" to "apassword" is a 9-character change.

number is the number of characters entered as an integer from 0 through 16.

[min-change-interval *days* **]**

Default: 1
Specifies the frequency that passwords can be changed (other than first login).
days is the minimum number of days that must pass before a user can change their password. It is an integer from 1 through 365.

Important: If the **no local-user password min-change-interval** command is used, users may change their password as often as desired which could allow them to circumvent the password history function.

[min-length *number* **]**

Default: 8
Specifies the minimum length allowed for user-defined password.
number is the minimum number of alphanumeric characters that the password must contain, entered as an integer from 3 through 32.

Usage

This command is used to set the property requirements for user-defined passwords and system behavior in relation to those passwords.
Information pertaining to user passwords, login failures, and password history are stored on the packet processing cards and in the software's Shared Configuration Task (SCT).

The system uses the information in the SCT for runtime operations such as determining password ages and determining if new passwords meet the criteria specified by this command.

Example

The following command configures a minimum password length requirement of *6* characters:

```
local-user password min-length 6
```

The following command configures the system to store the *4* most recently used passwords per user-account in the history list:

```
local-user password history length 4
```

local-user username

Adds or removes local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-user username *name* **[authorization-level { administrator | inspector | operator | security-admin }] [ecs | noecs] [ftp | noftp] [timeout-min-absolute** *time* **] [timeoute-min-idle** *time* **] [no-lockout-login-failure] [no-lockout-password-aging] password** *password*

no local-user username *name*

no

Removes a previously configured user.

name

Specifies the name of the user as an alphanumeric string of 3 through 16 characters that is case sensitive.

[authorization-level { administrator | inspector | operator | security-admin }]

Default: Operator

Configures the authorization level for the user as one of the following:

- **administrator**: Administrator users have read-write privileges and can execute any command throughout the CLI except for a few security functions allowed only in the administrator mode. Administrators can configure or modify the system and are able to execute all system commands, including those available to the operator and inspector user. This level corresponds to the both the System Administrator and Application Administrator levels in the T1.276-2003.
- **inspector**: Inspector users are limited to a small number of read-only Exec Modecommands.The bulk of these are “show” commands giving the inspector the ability to view a variety of statistics and conditions. The Inspector cannot execute show configuration commands and do not have the privilege to enter the Config Mode.
- **operator**: Operator users have read-only privileges to a larger subset of the Exec Mode commands as depicted in the following figure. Operator users can execute all commands that are part of the inspector mode, plus some system monitoring, statistical, and fault management functions. Operators do not have the ability to enter the Config Mode.
- **security-admin**: Security Administrator users have read-write privileges and can execute any command throughout the CLI. Security Administrators can execute all system commands, including those available to the administrator, operator, and inspector users. This level corresponds to both the System Security Administrator and Application Security Administrator levels in T1.276-2003.

[ecs | noecs]

Specifies whether or not the user has access to Active Charging Service configuration parameters.

- **ecs**: The user has access.

- **noecs**: The user does not have access.

Default: **ecs**

[ftp | noftp]

Default: ftp
Specifies whether or not the user is allowed to access the system via the File Transfer Protocol (FTP) and/or the Secure File Transfer Protocol (SFTP).

- **ftp**: The user has access.
- **noftp**: The user does not have access.

[timeout-min-absolute *time* **]**

Default: 0
Specifics the maximum session time (in minutes) for this user. *time* is an integer from 0 through 525600. A value of "0" indicates no limit.

Important: This limit applies only to the user's CLI sessions.

[timeout-min-idle *time* **]**

Default: 0
Specifics the maximum idle time (in minutes) for this user. *time* is an integer from 0 through 525600. A value of "0" indicates no limit.

Important: This limit applies only to the user's CLI sessions.

[no-lockout-login-failure]

Default: Disabled
Specifies that this user will never be locked out due to login attempt failures.

[no-lockout-password-aging]

Default: Disabled
Specifies that this user will never be locked out due to the age of their password.

password *password*

Specifies the initial password for this user. *password* must an alphanumeric string of 6 through 32 characters that is case sensitive.

Important: The user is requested to change their password upon their first login.

Usage

The ability to configure administrative local-users is provided in support of the login security mechanisms specified in ANSI T1.276-2003.
Like administrative users configured at the context level, local-users can be assigned one of 4 security levels:

Local-User Level User	Context Level User

Local-User Level User	Context Level User
Security Administrator	Administrator
Administrator	Config-Administrator
Operator	Operator
Inspector	Inspector

Local-user configuration support is handled differently from that provided for administrative users configured at the context level.
Context-level administrative users rely on the system's AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Passwords for these user types are assigned once and are accessible in the configuration file.
Local-user account information (passwords, password history, lockout states, etc.) is maintained in non-volatile memory and in the software's Shared Configuration Task (SCT). This information is maintained in a separate file – not in configuration files used by the system. As such, the configured local-user accounts are not visible with the rest of the system configuration.
Local-user and context-level administrative accounts can be used in parallel.

Example

The following command configures a security-administrator level local-user administrative account for a user named *User672* that has FTP privileges, a temporary password of *abc123*, and that does not lockout due to either login attempt failures or password aging:

```
local-user username User672 authorization-level security-admin ftp no-
lockout-login-failure no-lockout-password-aging password abc123
```

The following command deletes a previously configured local-user administrative account called admin32:

```
no local-user username admin32
```

logging console

Enables the output of logged events to be displayed on the console terminal.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging console

no logging console
```

no

Disables the output of events to the console port.

Usage

Log console output to allow for offline review during system monitoring and/or trouble shooting.

logging disable

Enables/disables the logging of the specified event ID or range of IDs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

logging disable eventid *id* **[to** *to_id* **]**

no logging disable eventid *id* **[to** *to_id* **]**

no

Indicates the event IDs specified are to be enabled for logging.

eventid *id*

Specifies the event for which no logging is to occur. *id* must be a integer from 1 through 100000.

to *to_id*

Specifies the end ID of the events when a range of event ID is to be disabled from being logged. *to_id* must be an integer from 1 through 100000. The *to_id* must be equal to or larger than the *id* specified.

Usage

Disable common events which may occur with a normal frequency are not of interest in monitoring the system for troubles.

Example

The following commands disables the logging of event ID 4580 and the range of events from 4500 through 4599, respectively.

```
logging disable eventid 4580 4580

logging disable eventid 4500 to 4599
```

The following enables the subset of disabled event IDs:

```
no logging disable eventid 4500 to 4549
```

logging display

Configures the level of detail for information to be logged.

Product

All

Privilege

Security Administrator, Administrator

Syntax

logging display event-verbosity *evt_level* **] [pdu-data** *format* **] [pdu-verbosity** *pdu_level* **]**

event-verbosity *evt_level*

Specifies the level of verboseness to use in logging of events as one of:

- min
- concise
- full

pdu-data *format*

Specifies output *format* for packet data units when logged as one of:

- **none**: outputs in raw format
- **hex**; displays out in hexadecimal format
- **hex-ascii**; displays output in hexadecimal and ASCII similar to a main-frame dump

pdu-verbosity *pdu_level*

Specifies the level of verboseness to use in logging of packet data units as an integer from 1 through 5, where 5 is the most detailed.

Usage

Tune the level of information to be logged so as to avoid flooding a log file with information which is not useful or critical.

Example

The following sets the logging display for events to the maximum.

```
logging display event-verbosity full
```

The following command sets the logging display level of detail for packet data units to level *3* and sets the output format to the main-frame style *hex-ascii*:

```
logging display pdu-data hex-ascii pdu-verbosity 3
```

logging filter

Configures the logging of events to be performed in real time for the specified facility.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging filter runtime facility facility level report_level [ critical-info | no-
critical-info ]
```

facility *facility*

Specifies the facility to modify the filtering of logged information. The following list displays the valid facilities for this command:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **aal2**: AAL2 protocol logging facility
- **acl-log**: Access Control List logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **alcap**: ALCAP protocol logging facility
- **alcapmgr**: ALCAPMgr logging facility
- **all**: All facilities
- **asngwmgr**: ASN Gateway Manager facility
- **asnpcmgr**: ASN Paging Controller Manager facility
- **bfd**: BFD protocol logging facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bindmux**: IPCF BindMux-De-mux Manager logging facility
- **bssap+**: Base Station Sub-system Application Part+ protocol facility for the login interface between the SGSN and the MSC/VLR (2.5G and 3G)
- **bssgp**: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
- **callhome**: Call home application logging facility

- **cap**: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
- **cli**: CLI logging facility
- **credit-control**: Credit Control facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **cscfttmgr**: SIP CSCFTT Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **cx-diameter**: Cx Diameter Messages facility
- **dcardctrl**: IPSEC Daughter Card Controller logging facility
- **dcardmgr**: IPSEC Daughter Card Manager logging facility
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: Dynamic Host Configuration Protocol logging facility
- **dhcpv6**: DHCPv6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase messages facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-dns**: Diameter DNS subsystem
- **diameter-ecs**: ACS Diameter signaling facility
- **diameter-hdd**: Diameter HDD Interface facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSEC Data Path facility
- **drvctrl**: Driver Controller facility
- **eap-ipsec**: EAP
- **eap-sta-s6a-s13-s6b-diameter**: EAP/STA/S6A/S13/S6B Diameter messages facility
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface facility
- **egtpc**: eGTP-C logging facility
- **egtpmgr**: eGTP manager logging facility
- **egtpu**: eGTP-U logging facility
- **epdg**: ePDG logging facility
- **evlog**: Event log facility

- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **fng**: FNG logging facility
- **gmm**:
  - For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
  - For 3G: Logs the access application layer (above the RANAP layer)
- **gprs-app**: GPRS Application logging facility
- **gprs-ns**: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages facility
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility
- **gtpcmgr**: GTP-C protocol Manager logging facility
- **gtpp**: GTP-PRIME protocol logging facility
- **gtpu**: GTP-U protocol logging facility
- **gtpumgr**: GTPU Demux manager
- **gx-ty-diameter**: Gx/Ty Diameter messages facility
- **gy-diameter**: Gy Diameter messages facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **hdctrl**: HD Controller logging facility
- **hnb-gw**: HNB-GW (3G Femto GW) logging facility
- **hnbmgr**: HNBMGR (3G Femto GW DemuxMgr) logging facility
- **hss-peer-service**: HSS Peer Service facility
- **igmp**: IGMP
- **ikev2**: IKEv2
- **ims-authorizatn**: IMS Authorization Service facility
- **ims-sh**: HSS SH Service facility
- **imsimgr**: SGSN IMSI Manager facility
- **imsue**: IMSUE
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipms**: IPMS logging facility
- **ipsec**: IP Security logging facility
- **ipsg**: IP Service Gateway interface logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility

- **kvstore**: KV Store facility
- **l2tp-control**: L2TP control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **lagmgr**: LAGMGR logging facility
- **ldap**: Lightweight Directory Access Protocol (LDAP) messages logging facility
- **li**: Refer to the *Lawful Intercept Interface Reference* for a description of this command.
- **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
- **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
- **local-policy**: Local Policy Service facility
- **m3ua**: M3UA Protocol logging facility
- **magmgr**: Mobile Access Gateway manager logging facility
- **map**: MAP Protocol logging facility
- **megadiammgr**: Megadiameter Manager (SLF Service) logging facility
- **mme-app**: Mobility Management Entity Application logging facility
- **mme-misc**: MME miscellaneous logging facility
- **mmedemux**: Mobility Management Entity Demux Manager logging facility
- **mmemgr**: MME Manager facility
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 logging facility
- **mpls**: MPLS protocol logging facility
- **mseg-app**: MSEG application logging facility
- **mseg-gtpc**: MSEG GTPC application logging facility
- **mseg-gtpu**: MSEG GTPU application logging facility
- **msegmgr**: MSEGMgr (MSEG DemuxMgr) logging facility
- **mtp2**: MTP2 Service logging facility
- **mtp3**: MTP3 Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **npumgr-acl**: NPUMGR ACL logging facility
- **npumgr-flow**: NPUMGR FLOW logging facility
- **npumgr-fwd**: NPUMGR FWD logging facility

- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-port**: NPUMGR PORT logging facility
- **npumgr-recovery**: NPUMGR RECOVERY logging facility
- **ntfy-intf**: Notification Interface logging facility
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF protocol logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer Detection logging facility
- **pccmgr**: IPCF PCC Manager library
- **pdg**: PDG logging facility
- **pdgdmgr**: PDG Demux Manager logging facility
- **pdif**: PDIF logging facility
- **pgw**: PDN Gateway logging facility
- **phs**: Payload Header Suppression
- **phs-control**: PHS X1/X5 and X2/X6 Interface logging facility
- **phs-data**: PHS Data logging facility
- **phs-eapol**: PHS EAPOL logging facility
- **phsgwmgr**: PHS Gateway Manager facility
- **phspcmgr**: PHS Paging Controller Manager facility
- **pmm-app**: PMM application logging facility
- **ppp**: PPP link and packet facilities
- **pppoe**: PPPOE logging facility
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Rf Diameter messages facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **rua**: RUA (3G Femto GW - RUA messages) logging facility
- **s1ap**: S1AP Protocol logging facility

- **sccp:** SCCP Protocol logging connection-oriented messages between RANAP and TCAP layers.
- **sct**: Shared Configuration Task logging facility
- **sctp**: SCTP Protocol logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstrc**: session trace logging facility
- **sft**: Switch Fabric Task logging facility
- **sgs**: SGs protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN 'glue' interfaces, e.g., between PMM, MAP,. GPRS-FSM, SMS.
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN MBMS Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stack manager to log binding and removing between layers
- **sgsn-system**: SGSNs System Components logging facility; used infrequently
- **sgsn-test**: SGSN Tests logging facility; used infrequently
- **sgtpcmgr**: SGSN GTPC Manager logging information exchange through SGTPC and the GGSN
- **sgw**: Serving Gateway facility
- **sh-diameter**: Sh Diameter messages facility
- **sitmain**: System Initialization Task main logging facility
- **sm-app**: SM Protocol logging facility
- **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
- **sndcp**: SNDCP Protocol logging facility
- **snmp**: SNMP logging facility
- **sprmgr**: IPCF SPR Manager logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **sscfnni**: SSCFNNI Protocol logging facility
- **sscop**: SSCOP Protocol logging facility
- **ssh-ipsec**: SSH IP Security logging facility
- **ssl**: SSL (Secure socket layer messages) logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **tcap**: TCAP Protocol logging facility
- **testctrl**: Test Controller logging facility

- **testmgr**: Test Manager logging facility
- **threshold**: threshold logging facility
- **ttg**: TTG logging facility
- **tucl**: TUCL logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **usertcp-stack**: User TCP Stack
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

level *report_level* **[critical-info | no-critical-info]**

level *report_level*: specifies the level of information to be logged, *report_level*, as one of:

- critical
- debug
- error
- info
- trace
- unusual
- warning

critical-info | **no-critical-info**: indicates if critical information is to be displayed or not. The keyword **critical-info** specifies that events with a category attribute of critical information are to be displayed. Examples of these types of events can be seen at bootup when system processes and tasks are being initiated. The **no-critical-info** keyword specifies that events with a category attribute of critical information are not to be displayed.

Usage

This command is useful when it is necessary to get real time output of events. Event output may be cached otherwise which may make it difficult to trouble shoot problems which do not allow the last cache of events to be output prior to system problems.

Caution: Issuing this command could negatively impact system performance depending on system loading, the log level, and/or the type of facility(ies) being logged.

Example

Set real time output for the point-to-point protocol facility and all facilities, respectively, to avoid logging of excessive information.

```
logging filter runtime facility ppp

logging filter runtime facility all level warning
```

logging monitor

Enables or disables the monitoring of a specified user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] logging monitor {ipaddr *ip_address* **| msid** *ms_id* **| username user_name}**

no

Disables the monitoring of the user specified by the options given.

ipaddr *ip_address*

Specifies the IP address of the user for which the monitoring filter is to be set. *ip_address* must entered using IPv4 dotted-decimal notation.

msid *ms_id*

msid *ms_id*: specifies the mobile subscriber ID for which the monitoring filter is to be set. *ms_id* must be from 7 to 16 digits.
This keyword/option can be used to specify the Mobile Subscriber ISDN (MSISDN) for GGSN calls which enables logging based on MSISDN.

username *user_name*

username *user_name*: specifies a user for which the monitoring filter is to be set. *user_name* must refer to a previously configured user.

Usage

Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers for which monitoring is performed and/or the amount of data they're passing.

Example

The following command enables the monitoring of user *user1* and mobile subscriber ID 4441235555, respectively.

```
logging monitor username user1

logging monitor msid 44441235555
```

The following disables the monitoring of user *user1*.

```
no logging monitor username user1
```

logging runtime

Enables events to be filtered and logged in real time.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging runtime buffer store { all-events | filtered-events-only }
```

buffer store { all-events | filtered-events-only }

Determines which logs are stored in internal logging daemon runtime buffer.

- **all-events**: Logging daemon runtime buffer stores all logs that come to it.
- **filtered-events-only**: Logging daemon runtime buffer stores only logs that pass the runtime filter.

Usage

Sets the filtering of logged information to log in real time.

Example

The following command enables storage of logs that pass the runtime filter:

```
logging runtime buffer store filtered-events-only
```

lte-policy

This command enters the LTE Policy Configuration Mode where LTE policy parameters can be configured.

Product

MME, S-GW

Privilege

Administrator

Syntax

lte-policy

Usage

Enters the LTE Policy Configuration Mode.
Entering this command results in the following prompt:
`[context_name]hostname(lte-policy)#`
LTE Policy Configuration Mode commands are defined in the *LTE Policy Configuration Mode Commands* chapter.

mediation-device

This command is obsolete. Even though the CLI accepts the command no function is performed.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mediation-device mode { tcs }
```

mobile-services-edge-gateway

This command allows you to enter the MSEG Global Configuration Mode wherein the global Mobile Edge Service Gateway (MSEG) parameters can be configured.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

```
mobile-services-edge-gateway
```

Usage

Use this command to enter the MSEG Global Configuration Mode.
Also see the *MSEG Global Configuration Mode Commands* chapter.

network-overload-protection

This command configures an attach rate throttle mechanism to control the number of new connections (attaches or inter-SGSN RAUs), through the SGSN, on a per second basis.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

network-overload-protection sgsn-new-connections-per-second *#_new_connections* **action { drop | reject with cause { congestion | network failure } } [queue-size** *queue_size* **] [wait-time** *wait_time* **]**

default network-overload-protection sgsn-new-connections-per-second

default

Using **default** in the command, disables this attach rate throttle feature that provides network overload protection.

sgsn-new-connections-per-second *#_new_connections*

Define the number of new connections to be accepted per second.
#_new_connections: Must be an integer from 50 to 5000.

action

Specifies the action to be taken by the SGSN when the attach rate exceeds the configured limit on the number of attaches. Select one of the following actions:

- **drop:** Drop the new connection request.
- **reject-with-cause:** Reject the new connection request. Include one of the following as the cause in the reject message:
- **congestion**
- **network failure**

queue-size *queue_size*

Defines the maximum size of the pacing queue used for buffering the packets. If configured, the queue-size should be greater than or equal to the *#_new_connections* value and less than or equal to the optimal value (the *wait_time* * *#_new_connections*). This validation is done in the CLI.
queue_size Must be an integer from 250 to 25000.
Default: unconfigured. The default value is the *#_new_connections* * *wait-time*. This will be the optimal value.

wait-time *wait_time*

Defines the maximum life-time (number of seconds) of the packets in the queue beyond which the packets are considered to be “stale”.
wait_time Must be an integer from 1 to 15

Default: 5

Usage

Use this command to configure the rate at which the SGSN must process new connection requests. The rate is the number of new connections to be accepted per second.
With basic network overload protection, the incoming new connection rate is higher than this configured rate. When this occurs, all of the new connection requests cannot be processed. This command can also be used to configure the action to be taken when the rate limit is exceeded. The new connection requests, which cannot be processed, can be either dropped or rejected with a specific reject cause.
The SGSN's *optimized* network overload protection performs attach-rate throttling to avoid overloading Gr, Gn and Gf interfaces. This is enabled with **queue-size** and **wait-time** keywords so that the IMSIMgr throttles the attach rate to values configured with these keywords.
If the SGSN receives more than the configured number of attaches in a second, then the attaches are buffered in the pacing queue and requests are only dropped when the buffer overflows due to high incoming attach rate. Messages in the queue are processed (FIFO) until they age-out when the queued message's lifetime crosses the configured wait-time. The wait-time and the attach rate decide the optimal size of the queue.
Counters for this feature are available in the **show gmm-sm statistics** command display in the Network Overload Protection portion of the table.

Example

Configure the throttle rate or limit to 2500 attaches per second and to drop all requests if the limit is exceeded.

```
network-overload-protection sgsn-new-connections-per-second 2500 action
drop
```

Disables the network-overload protection feature and set the default queue size to 1000 and the wait time to 5 seconds:

```
default network-overload-protection sgsn-new-connections-per-second
```

Set the attach rate to 500 per second, the action to drop, the wait time to 5 seconds, and the queue size to be calculated (as follows: *wait_time* * *#_new_connections* - i.e., 2500)

```
network-overload-protection sgsn-new-connections-per-second 500action
drop wait-time 5
```

network-service-entity

This command creates a new instance of an SGSN network service entity (NSE) for either the IP environment or the Frame Relay environment.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] network-service-entity (ip-local | peer-nsei *peer_nsei_number* **frame-relay)**

no

Deletes the network service entity definition from the system configuration.

ip-local

Configures the local endpoint for NS/IP and enters the NSE-IP configuration mode. The prompt will change to:

```
[local]<hostname>(nse-ip-local)#
```

peer-nsei *peer_nsei_number* **frame-relay**

Configures a peer NSE with frame relay connectivity. This set of keywords also provides access to the NSE-FR Configuration mode. The prompt will change to:

```
[local]<hostname>(nse-fr-peer-nsei-<peer_nsei_number>)#
```

Usage

Use this command to access the configuration modes for either the IP or Frame Relay network service entities.

Example

Enter the NSE for a Frame Relay configuration instance identified as 4554:

```
network-service-entity peer-nsei 4554 frame-relay
```

network-service-entity ip

This command has been deprecated. See the replacement command network-service-entity .

ntp

Enters the network timing protocol configuration mode or disables the use of NTP on the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ntp

no ntp

no

Disables the use of NTP for clock synchronization. When omitted, the NTP client support is enabled on the chassis.

Important: If the use of NTP is disabled the system clock may drift over a period of time. This may require manual updates to the system clock to synchronize the clock with other network elements.

Usage

Used when it is necessary to configure NTP settings.

Example

The following command enters the NTP configuration mode:

```
ntp
```

The following disables the use of the network timing protocol for system clock synchronization.

```
no ntp
```

operator-policy

This command creates an operator policy and enters the operator policy configuration mode. Commands for configuration of the policies are available in the *Operator Policy Configuration Mode Commands* chapter.

Product

MME, SGSN, S-GW

Privilege

Security Administrator, Administrator

Syntax

```
operator-policy ( default | name policy_name } [ -noconfirm ]

no operator-policy ( default | name policy_name }
```

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no

Removes the specified operator policy from the system configuration.

default

default, in this case, is the *name* of a specific operator policy. This default policy is used when no other defined operator policy matches the incoming IMSI.

Important: You should configure this default operator policy to be it available to handle IMSIs that are not matched with other defined policies.

name *policy_name*

Specifies the unique name of an operator policy. *policy_name* is entered as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create an operator policy and to enter the operator policy configuration mode to define or modify policies.

An operator policy associates APNs, APN profiles, IMEI ranges, IMEI profiles, an APN remap table and a call-control profile to ranges of IMSIs. These profiles and tables are created and defined within their own configuration modes to generate sets of rules and instructions that can be reused and assigned to multiple policies. In this manner, an operator policy manages the application of rules governing the services, facilities and privileges available to subscribers. These policies can override standard behaviors and provide mechanisms for an operator to get around the limitations of other infrastructure elements such as DNS servers and HLRs.

The system supports up to 1,000 operator policies, including the *default* operator policy.

Important: An operator policy is **the** key element of the Operator Policy feature. After defining an instance of an operator policy, you must go to the SGSN Global Configuration Mode (from the Global Configuration mode) to define the IMSI range(s). This requirement does not hold if you are using a *default* operator policy.

To see what operator policies have already been created, return to the Exec mode and enter the **`show operator-policy all`** command.

Example

The following command accesses the default operator policy and enters the operator policy configuration mode to view or modify the specified policy:

```
operator-policy default
```

orbem

Enters the Object Request Broker Element Manager (ORBEM) Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

orbem

Usage

Set the configuration mode to allow modification of the ORBEM configuration data.

pac-standby-priority

This command has been renamed to **`card-standby-priority`**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

port atm

Identifies a physical port on a line card that supports ATM signaling and then enters the configuration mode for the specific interface-type. For the commands to configure the port interface, see the CLI chapter ATM Port Configuration Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

port atm *slot/port*

atm

Indicates the port identified is an ATM interface port.

slot/port

To determine valid ATM slot and port numbers, use the Exec mode's command **show port table**
slot: Identifies the chassis slot holding the line card that supplies ATM ports. The slot ID number can be an integer from 17 through 48.
port: Identifies the physical port that is to be configured to support ATM signaling. The ID number can be an integer from 1 through 4.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Important: This command is not supported on all platforms.

Example

The following enters the ATM port configuration mode for ATM port 1 on the card in slot 19:

```
port atm 19/1
```

port bits

Enters the Building Integrated Timing Supply (BITS) port configuration mode by identifying the BITS port on the active or standby SPIO.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

port bits *slot/port*

bits

Identifies the BITS port.

slot/port

slot: Identifies the chassis slot holding the SPIO. The slot ID can be either 24 (active SPIO) or 25 (standby SPIO).
port: Identifies the BITS port on the SPIO. The port ID number must be 4.

Usage

Change the current configuration mode to BITS port configuration mode.

Important: This command is not supported on all platforms.

Example

The following enters the BITS port configuration mode for the active SPIO:

```
port bits 24/4
```

port channelized

Identifies a physical port on a Channelized Line Card (CLC) that supports Frame Relay signaling and creates a Frame Relay interface. This command enters the configuration mode for the commands that configure the Frame Relay interface and the channelized port interface. For additional information, see the *Channelized Port Configuration Mode Commands* chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

port channelized *slot/port*

channelized

Selects the channelized frame relay interface for the selected line card and port.

slot/port

To determine valid slots and port numbers, use the Exec mode's command **show port table** to find the channelized line card**.**
slot: Identifies the chassis slot holding the Channelized Line Card that sources Frame Relay ports. The slot ID number can be an integer from 17 through 48.
port: Identifies the physical port that is to be configured to support Frame Relay signaling. The ID number can only be 1.

Usage

Change the current configuration mode to Channelized Port configuration mode.

Example

The following enters the Channelized port configuration mode for port 1 on the card in slot 20:

```
port channelized 20/1
```

port ethernet

Enters the Ethernet Port Configuration mode for the identified port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port ethernet *slot/port*

ethernet

Indicates the port identified is an Ethernet interface port.

slot/port

Specifies the port for which Ethernet Port Configuration mode is being entered. The slot and port must refer to an installed card and port.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Example

The following command enters the Ethernet Port Configuration mode for ethernet port 1 in slot 17:

```
port ethernet 17/1
```

port mac-address virtual-base-address

This command defines a block of 256 consecutive media access control (MAC) addresses and enables virtual MAC addressing for Ethernet line card ports. Not available for the XT2 platform.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port mac-address virtual-base-address *MAC_Address*

no port mac-address virtual-base-address

no

Disables virtual MAC addressing for Ethernet line card ports. The block of virtual MAC addresses is not saved.

MAC_Address

Specifies the beginning address of a block of 256 MAC addresses that are used for virtual MAC addressing.

Usage

Use this command to disregard the MAC addresses assigned and stored in card firmware and assign MAC addresses for all Ethernet ports from the specified block of virtual MAC addresses. This command does not affect the MAC addresses on SPIO cards.
There are 65536 MAC addresses (00:05:47:FF:00:00 - 00:05:47:FF:FF:FF) reserved for use by customers. This range allows for the creation of 256 address blocks each containing 256 MAC addresses (for example, 00:05:47:FF:00:00, 00:05:47:FF:01:00, 00:05:47:FF:02:00, 00:05:47:FF:03:00, 00:05:47:FF:04:00, etc.).

Caution: This configuration requires the configuration of a valid block of unique MAC addresses that are not used anywhere else. Use of non-unique MAC addresses can degrade and impair the operation of your network.

Important: This command is not supported on all platforms.

Example

To enable virtual MAC addressing for Ethernet ports on all Ethernet line cards in the system using a block of MAC addresses starting at *00:05:47:FF:00:00*, enter the following command:

```
port mac-address virtual-base-address 00:05:47:FF:00:00
```

port rs232

Enters the RS-232 Port Configuration mode for the RS-232 console port on the specified SPIO card. Not available on the XT2 platform.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port rs232 *slot* **3**

rs232

Indicates the port identified is an RS-232 port on a SPIO card.

slot **3**

Specifies the slot of the SPIO for which RS-232 Port Configuration mode is being entered. The slot must refer to an installed SPIO card. The specified port must always be 3 for an RS-232 port.
The value for *slot* must be either 24 or 25.

Usage

Change the current configuration mode to RS-232 Port Configuration mode.

Example

The following command enters the RS-232 Port Configuration mode for the SPIO in slot 24;

```
port rs232 24 3
```

profile-id-qci-mapping

Creates a Qos Class-Identifier-Radio Access Network (QCI-RAN) ID mapping table or specifies an existing table and enters the QCI Mapping Configuration mode for the system.

Product

HSGW

Privilege

Administrator

Syntax

[no] profile-id-qci-mapping *name* **[-noconfrm]**

no

Removes the specified mapping table from the system

name

Creates a new or enters an existing mapping table configuration. *name* must be an alphanumeric string of 1 through 63 alphanumeric.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enters the QCI-RAN ID mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.
Entering this command results in the following prompt:

```
[context_name]hostname(config-hsgw-association-table)#
```

QCI Mapping Configuration Mode commands are defined in the *QCI Mapping Configuration Mode Commands* chapter.
Use this command when configuring the HSGW eHRPD component.

Important: This command creates a mapping table available to any HSGW context configured on the system.

Example

The following command enters the existing QCI mapping configuration mode (or creates it if it doesn't already exist) for a mapping table named *qci_table1*:

```
profile-id-qci-mapping qci_table1
```

The following command will remove *qci_table1* from the system:

```
no profile-id-qci-mapping qci_table1
```

ps-network

This command creates/removes an HNB-PS network configuration instance for Femto UMTS access over Iu-PS/Iu-Flex interface between Home NodeB Gateway (HNB-GW) service and PS networks elements; i.e. SGSN. This command also configures an existing HNB-CS network instance and enters the HNB-CS Network Configuration mode on a system.

Product

HNB-GW

Privilege

Administrator

Syntax

```
[ no ] ps-network ps_instance [ -noconfirm ]

no ps-network ps_instance
```

no

Removes the specified HNB-PS network instance from the system.

Caution: Removing the HNB-PS network instance is a disruptive operation and it will affect all UEs accessing SGSN(s) in specific PS core network through the HNB-GW service.

WARNING: If any HNB-PS Network instance is removed from system all parameters configured in that mode will be deleted and Iu-PS/Iu-Flex interface will be disabled.

ps_instance

Specifies the name of the Packet Switched Core Networks instance which needs to be associated with HNB Radio Network PLMN in HNB RN-PLMN configuration mode. If *ps_instance* does not refer to an existing HNB-PS instance, the new HNB-PS network instance is created.
ps_instance must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to enter the HNB-PS Network Configuration mode for an existing PS network instance or for a newly defined HNB-PS network instance. This command is also used to remove an existing HNB-PS network instance.
This configuration enables the Iu-PS/Iu-Flex interface on HNB-GW service with CS core network elements; i.e. MSC/VLR.
A maximum of 1 HNB-PS networks instance which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

Caution: This is a critical configuration. The HNBs can not access SGSNs in PS core network without this configuration. Any change to this configuration would lead to disruption in HNB access to PS core network.

Entering this command results in the following prompt:

```
[context_name]hostname(config-ps-network)#
```

The various parameters available for configuration of an HNB-PS network instance are defined in the *HNB-PS Network Configuration Mode Commands* chapter.

Example

The following command enters the existing HNB-PS Network configuration mode (or creates it if it doesn't already exist) for the instance named *hnb-ps1*:

```
ps-network hnb-ps1
```

The following command will remove HNB-PS network instance *hnb-ps1* from the system without any prompt to user:

```
no ps-network hnb-ps1
```

qci-qos-mapping

Global QCI-QoS mapping tables are used to map QoS Class Identifier (QCI) values to appropriate Quality of Service (QoS) parameters.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

qci-qos-mapping *name* **[-noconfirm]**

no

Removes the specified mapping configuration from the system

name

Creates a new or enters an existing mapping configuration. *name* must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enter the QCI-QoS mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.
Entering this command results in the following prompt:

```
[context_name]hostname(config-qci-qos-mapping)#
```

QCI - QoS Mapping Configuration Mode commands are defined in the *QCI - QoS Mapping Configuration Mode Commands* chapter.
Use this command when configuring the following eHRPD component: HSGW, P-GW, S-GW.

Important: This command creates a mapping configuration available to any HSGW, P-GW, S-GW context configured on the system.

Example

The following command enters the existing QCI - QoS mapping configuration mode (or creates it if it doesn't already exist) for a mapping configuration named *qci-qos3*:

```
qci-qos-mapping qci-qos3
```

qos npu inter-subscriber traffic bandwidth

Configures NPU QoS bandwidth allocations for the system.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

qos npu inter-subscriber traffic bandwidth gold *percent* **silver** *percent* **bronze** *percent* **best-effort** *percent*

no qos npu inter-subscriber traffic bandwidth

no

Removes a previous bandwidth allocation.

gold *percent*

Default: 10%
Specifies the maximum percentage of bandwidth to be allocated to the gold queue priority.
percent can be configured to an integer from 0 through 100.

silver *percent*

Default: 20%
Specifies the maximum percentage of bandwidth to be allocated to the silver queue priority.
percent can be configured to an integer from 0 through 100.

bronze *percent*

Default: 30%
Specifies the maximum percentage of bandwidth to be allocated to the bronze queue priority.
percent can be configured to an integer from 0 through 100.

best-effort *percent*

Default: 40%
Specifies the maximum percentage of bandwidth to be allocated to the best-effort queue priority.
percent can be configured to an integer from 0 through 100.

Usage

The bandwidth of a subscriber queue is maintained by rate limiting functions which implement packet-rate limiting at the first level and bit-rate limiting at the next level.
The packet-rate limit of a queue is defined by the number of packets-per-second (PPS) permitted for queuing. Before queuing a packet on a subscriber queue, the NPU ensures that the packet falls within the limit. If the packet to be queued exceeds the packet rate limit, it is dropped.
Each subscriber queue is configured with a bit rate limit, measured in megabits-per-second (Mbps), referred to as CP-BPS (bit-per-second to CP). The CP-BPS is available as the total bandwidth for the subscriber traffic

that a CP can sustain. Each subscriber queue receives an allocation of a certain percentage of the CP-BPS. The following maximum CP-BPS values are supported:

- Lead CP (CP0) = 128 Mbps
- Remaining CPs (CP1, CP2, CP3) = 256 Mbps

For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command configures bandwidth allocations of 20, 30, 40, and 50% for the gold, silver, bronze, and best-effort queues respectively:

```
qos npu inter-subscriber traffic bandwidth gold 20 silver 30 bronze 40
best-effort 50
```

Upon executing this command, the priority queues will have the following packet processing card CP bandwidth allocations based on the maximum CP bandwidth specifications:

Priority	Lead CP (CP 0) Bandwidth (Mbps)	CP 1 through CP 3 Bandwidth (Mbps)
Gold	25.6	51.2
Silver	38.4	76.8
Bronze	51.2	102.4
Best-effort	64	128

qos npu inter-subscriber traffic bandwidth-sharing

Configures NPU QoS bandwidth sharing properties for the system.

Product

PDSN, GGSN

Privilege

Administrator

Syntax

qos npu inter-subscriber traffic bandwidth-sharing { { enable | disable } { all | slot *slot_num* **cpu** *cpu_num* **} }**

enable

Enables bandwidth sharing for the specified criteria.

disable

Disables bandwidth sharing for the specified criteria.

all

Specifies that the bandwidth action is to be applied to all packet processing cards and every CPU on each packet processing card.

slot *slot_num*

Specifies that the bandwidth action is to be applied to a packet processing card in a specific chassis slot number.
slot_num is the slot in which a packet processing card is installed. These cards can be installed in slots 1 through 8, and/or 10 through 16.

cpu *cpu_num*

Specifies a specific control processor (CP) on a packet processing card for which to perform the bandwidth action.
cpu_num is an integer value from 0 to 3. 0 represents the lead CP.

Usage

The available bandwidth of a subscriber queue can be shared equally among the other subscriber queues. Any unutilized bandwidth of a queue can be shared with the other queues equally. For example, if only one DSCP is configured and it is mapped to best-effort, that DSCP would get the bandwidth allocated to the best-effort in addition to the rest of the bandwidth allocated to the gold, silver, and bronze.
By default, the system enables sharing for all packet processing cards and their CPs.
For additional information on the NPU QoS functionality, refer to the *System Administration Guide*.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command disables bandwidth sharing for the fourth CP (CP 3) on a packet processing card installed in chassis slot 3:

```
qos npu inter-subscriber traffic bandwidth-sharing disable slot 4 cpu 3
```

qos npu inter-subscriber traffic priority

Configures the DSCP-to-Priority assignments for the system.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

qos npu inter-subscriber traffic priority { best-effort | bronze | gold | silver } assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef | *dscp_num* } }

no qos npu inter-subscriber traffic priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }]

best-effort

Specifies the best-effort queue priority.

bronze

Specifies the bronze queue priority.

gold

Specifies the gold queue priority.

silver

Specifies the silver queue priority.

af*XX*

Assigns the Assured Forwarding *XX* PHB (per-hop behavior) DSCP.
Each Assured Forwarding PHB has a corresponding DSCP value as follows:

- af11 through af13: DSCP values 5 through 7 respectively
- af21 through af23: DSCP values 9 through 11 respectively
- af31 through af33: DSCP values 13 through 15 respectively
- af41 through af43: DSCP values 17 through 19 respectively

be

Assigns the Best Effort forwarding PHB which has a corresponding DSCP value of 0.

ef

Assigns the Expedited Forwarding PHB which has a corresponding DSCP value of 23.

dscp_num

Specifies a specific DSCP value as an integer from 0 through 31.

Usage

The differentiated services (DS) field of a packet contains six bits (0-5) that represent the differentiated service code point (DSCP) value.
Five of the bits (1-5) represent the DSCP. Therefore, up to 32 (25) DSCPs can be assigned to the various priorities. By default, they're all assigned to the lowest priority (best-effort).
For additional information on the NPU QoS functionality, refer to the *System Administration Guide*.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command maps the ef DSCP to the gold priority queue:

```
qos npu inter-subscriber traffic priority gold assigned-to dscp ef
```

ran-peer-map

Creates a Radio Access Network (RAN) Peer Map and enters the RAN Peer Map Configuration Mode.

Product

ASN-GW, PHS

Privilege

Administrator

Syntax

[no] ran-peer-map *name* **[-noconfirm]**

no

Removes the RAN Peer Map from the system.

name

Specifies the name of the RAN Peer Map. *name* must be an alphanumeric string of 1 through 31 characters.

Usage

Use this command to create a new RAN Peer Map or edit an existing one. RAN peer maps reconcile base station MAC addresses received in R6 protocol messages to the base station's IP address.
Entering this command results in the following prompt:

```
[context_name]hostname(config-ran-peer-map)#
```

RAN Peer Map Configuration Mode commands are defined in the ASN RAN Peer Map Configuration Mode Commands chapter in this guide.

Example

The following command creates a RAN peer map named *ran12*:

```
ran-peer-map ran12
```

require active-charging

This command enables/disables Active Charging Service (ACS) with or without the Category-based Content Filtering application.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
require active-charging [ isolated-mode ] [ content-filtering category [ static-and-dynamic ] ] [ optimized-mode ]

no require active-charging
```

no

Disables ACS on the system.

isolated-mode

Enables ACS and separates ACS-related resources from other sub-system resource sharing.

Important: In 8.1 and later releases, this keyword is not supported.

optimized-mode

Enables ACS in Optimized mode, wherein ACS functionality is managed by SessMgrs.

Important: In 8.0 and earlier releases and in 9.0 and later releases, this keyword is not supported.

Important: In Release 8.1, ACS must be configured in the Optimized mode.

Important: In Release 8.1, if the active-charging mode is changed from the default (non-optimized) mode to the Optimized mode, or vice-versa, the system must be rebooted for the change to take effect.

Important: In Release 8.3, this keyword is obsolete. With or without this keyword ACS is always enabled in the Optimized mode.

Use the **require active-charging** command to enable ACS in the non-optimized mode. Wherein, ACS Managers will spawn to support ACS.
Use the **require active-charging optimized-mode** command to enable ACS in the Optimized mode. Wherein, ACS is enabled as part of Session Managers.

content-filtering category [static-and-dynamic]

Enables the Category-based Content Filtering application with ACS support and creates the necessary Static Rating Database (SRDB) tasks to utilize the internal database of static/dynamic URLs.
For Dynamic Content Filtering support, the **static-and-dynamic** keyword must be configured to specify that the Dynamic Rater Package (model and feature files) must be distributed to rating modules on startup, recovery, etc. If not configured, by default, the static-only mode is enabled.

Usage

Use this command to enable/disable ACS with or without Category-based Content Filtering application on the chassis.

Important: This command triggers the resource subsystem to switch to ACS-enabled mode and start ACS-related tasks. This CLI command must be configured before any services are configured, so that the resource subsystem can appropriately reserve adequate memory for the ACS-related tasks. After configuring this command, the configuration must be saved and the system rebooted in order to allocate the resources for ACS upon system startup.

In 8.0 and 8.1 releases, this command must be configured before configuring any services. This is to ensure that the resource subsystem can appropriately reserve adequate memory for ACS Manager tasks. If this command is configured after all the Session Manager tasks are already active, the ACS Manager tasks will not be started even if additional cards are added to the chassis—instead, the chassis must be rebooted.

Example

In Release 8.0, the following command enables resource subsystem to configure ACS in isolated mode:

```
require active-charging isoated-mode
```

In Release 8.1, the following command enables ACS in Optimized mode:

```
require active-charging optimized-mode
```

In Release 8.3, the following command enables ACS in Optimized mode:

```
require active-charging
```

require cipher ssl resource-percentage

Assigns the 8 processing cores on the PSC2 card and splits the hardware acceleration resources between SSL protocol and IPSec protocol processing.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

require cipher ssl resource-percentage *percentage_value*

default require cipher ssl resource-percentage

percentage_value

The system converts the specified resource percentage value to the nearest number of processing cores assigned to SSL processing. The system assigns the remaining processing cores to IPSec processing. This value can be within the range of 0 to 100.
For example, if 20% of the hardware acceleration resources are assigned to SSL processing, the system translates this value to INT((20*8+50)/100) = 2 processing cores assigned to SSL processing, and (8-2) = 6 processing cores assigned to IPSec processing.

default

Sets the default percentage value to 0%, assigning all 8 processing cores to IPSec processing.

Usage

Use this command to split the 8 processing cores on the PSC2 card between SSL protocol and IPSec protocol processing.

Example

The following command assigns 20% of the hardware acceleration resources on the PSC2 card (2 processing cores) to SSL processing, and 80% of the hardware acceleration resources (6 processing cores) to IPSec processing:

```
require cipher ssl resource-percentage 20
```

require demux card

This command enables or disables the demux capabilities.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] require demux card
```

default

Disables the demux capabilities on the card.

no

Disables the demux capabilities on the card.

Usage

Use this command configure the system to allow session recovery task placement scheme when session recovery is off.

Important: This command is not supported on all platforms.

Example

The following command enables demux capabilities:

```
require demux card
```

require detailed-rohc-stats

Enables or disables context-specific Robust Header Compression (RoHC) statistics.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ no ] require detailed-rohc-stats
```

no

Disables require detailed-rohc-stats. This is the default condition.

Usage

Enables context-specific statistics for RoHC calls.

Example

Enter the following command to enable context specific stats for RoHC calls:

```
require detailed-rohc-stats
```

require diameter-proxy

This command enables or disables Diameter Proxy mode.

Default: no require diameter-proxy

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
require diameter-proxy { master-slave | multiple | single }

no require diameter-proxy
```

no

Disables Diameter Proxy mode.

master-slave

Sets the Diameter-Proxy to Master-Slave mode.
In Master-slave mode, multiple Diameter proxies run on system, one on each packet processing card where one of them acts as Master and other Diameter proxies act as Slave.
In such mode the Master relays the traffic from an incoming connection to a specific Slave Diameter proxy.

multiple

To configure one Diameter proxy for each active packet processing card.

single

To configure one Diameter proxy for the entire chassis.

Usage

When the Diameter Proxy mode is enabled, each proxy process is a Diameter host, instead of requiring every Diameter application user (such as, every ACSMgr and/or every SessMgr, depending on the application) to be a host.
In Master-slave mode, multiple Diameter proxies runs on system, one on each packet processing card where one of them acts as Master and other Diameter proxies act as Slave.
In such mode Master relays the traffic from an incoming connection to a specific Slave Diameter proxy.

Example

To configure a Diameter proxy for each active packet processing card, enter the following command:

```
require diameter-proxy multiple
```

To configure a single Diameter proxy for the entire chassis, enter the following command:

```
require diameter-proxy single
```

require ecs credit-control subscriber-mode

This command configures the Diameter Credit-Control Application (DCCA) to work in per subscriber-PDN level Gy mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] require ecs credit-control subscriber-mode
```

no

Creates DCCA/Gy sessions per bearer/PDP-context.

Usage

This command is applicable to all products using the Gy interface. Use this command to configure DCCA/Gy to work in per subscriber-PDN level Gy mode, wherein one Diameter session is created per subscriber PDN rather than per bearer, and only one DCCA/Gy session is created for multi-bearer PDNs.
If this command is not configured, or the **no require ecs credit-control subscriber-mode** command is configured, DCCA/Gy sessions are created per bearer/PDP-context, and as a result when there are multiple PDP contexts or multiple bearers in a PDN as many DCCA/Gy sessions are created.

Important: This command will take effect only when the system is booted/rebooted. When configured after the system comes up, the command will be accepted but will not be applied until after the system is rebooted with the saved configuration.

Important: This command is independent of the **require active-charging** command. The **ecs** keyword in this command is license dependent.

require session recovery

Enables session recovery when hardware or software fault occurs within system.

Product

PDSN, GGSN, SGSN, HA, LNS, ASN-GW, PDIF, PDG/TTG, MME

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] require session recovery
```

no

Disables session recovery feature after configuration file is saved and system is restarted.

Usage

When this feature is enabled, the system attempts to recover any home agent-based Mobile IP sessions that would normally be lost due to a hardware or software fault within the system.
This functionality is available for the following call types:

- ASN-GW services supporting simple IP, Mobile IP, and Proxy Mobile IP
- PDSN services supporting simple IP, Mobile IP, and Proxy Mobile IP
- HA services supporting Mobile IP and/or Proxy Mobile IP session types with or without per-user Layer 3 tunnels
- GGSN services for IPv4 and PPP PDP contexts
- SGSN services for all attached and/or activated subscribers
- LNS session types
- PDIF services supporting Simple-IP, Mobile-IP and Proxy Mobile-P
- MME services

The default setting for this command is disabled.
The **no** option of this command disables this feature.
This command only works when the Session Recovery feature is enabled through a valid Session and Feature Use License Key.

Important: After entering this command, you must restart the system for the command takes effect. Remember to save the configuration file before issuing the **reload** command.

reveal disabled commands

Enables the input of commands for features that do not have license keys installed. The output of the command **show cli** indicates when this is enabled. This command effects all future CLI sessions. This is disabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] reveal disabled commands

no

Do not show disabled commands.

Usage

When this is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command. When this is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

Example

Set the CLI to accept disabled commands and display the required feature for all future CLI sessions with the following command:

```
reveal disabled commands
```

Set the CLI to reject disabled commands and return an error message for all future CLI sessions:

```
no reveal disabled commands
```

rohc-profile

This command allows you to create an RoHC (Robust Header Compression) profile and enter the RoHC Profile Configuration Mode. This mode is used to configure RoHC Compressor and Decompressor parameters. RoHC profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured.

Product

HSGW, PDSN

Privilege

Security Administrator, Administrator

Syntax

rohc-profile profile-name *name* **[-noconfirm] [common-options | compression-options | decompression-options]**

no rohc-profile profile-name *name*

common-options

Configures common parameters for compressor and decompressor.

compression-options

Configures ROHC compression options.

decompression-options

Configures ROHC decompression options.

no

Remove the specified RoHC profile.

name

The name of the RoHC profile to create or remove. *name* must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Do not prompt for additional verification when executing this command.

Usage

Use this command to enter the RoHC Profile Configuration mode.
Entering this command results in the following prompt:

```
[context_name]host(config-rohcprofile-<profile_name>)#
```

RoHC Profile Configuration Mode commands are defined in the *RoHC Profile Configuration Mode Commands* chapter.

Example

Enter the following command to create an RoHC profile named *HomeUsers* and enter the RoHC Configuration mode without prompting for verification:

```
rohc-profile profile-name HomeUsers
```

The following command removes the RoHC profile named *HomeUsers*:

```
no rohc-profile profile-name HomeUsers
```

sccp-network

This command creates or removes a Signaling Connection Control Part (SCCP) network instance which is used to define the SS7 end-to-end routing in a UMTS network. As well, this command enters the SCCP network configuration mode. The SGSN supports up to 12 SCCP network instances at one time.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

sccp-network *sccp_net_id* **[-noconfirm]**

no sccp-network *sccp_net_id*

no

Remove the SCCP network configuration with the specified index number from the system configuration.

sccp_net_id

This number identifies a specific SCCP network configuration.
sccp_net_id: must be an integer from 1 through 12.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create or modify an SCCP network and enter the SCCP network configuration mode. The SCCP network is not a standard SS7 or UMTS concept - this concept is specific to this platform.
For details about the commands and parameters needed to create and edit the SCCP Network configuration, check the *SCCP Network Configuration Mode* chapter.

Example

The following command creates an SCCP network with the index number of *1*:

```
sccp-network 1
```

The following command creates an SCCP network with the index number of *2* to associate with HNB-GW service for HNB access network users without any prompt.:

```
sccp-network 2 -noconfirm
```

sctp-parameter-template

This command allows you to create an SCTP parameter template and enter the SCTP Parameter Template Configuration Mode. This mode is used to configure parameters for SCTP associations.

Product

MME

Privilege

Administrator

Syntax

[no] sctp-param-template *name*

no

Removes the specified SCTP parameter template from the system.

name

Specifies the name of the SCTP parameter template being created or accessed. *name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to enter the SCTP Parameter Template Configuration mode.
Entering this command results in the following prompt:

```
[context_name]host(sctp-param-template)#
```

SCTP Parameter Template Configuration Mode commands are defined in the *SCTP Parameter Template Configuration Mode Commands* chapter.

Example

The following command creates a new SCTP parameter template or enters an existing template named *sctp-tmpl2*:

```
sctp-param-template sctp-tmpl2
```

session trace

This command configures the type of network elements, file transfer protocol, and Trace collection entity mode to be used for the transportation of trace files collected for the subscriber session tracing on the UMTS/EPC network element(s) along with network connection parameters and timers.

Product

GGSN, MME, P-GW, S-GW

Privilege

Administrator

Syntax

session trace network-element { all | mme | pgw | sgw | ggsn } [collection-timer *sec* **] [tce-mode { none | push transport sftp path** *string* **username** *name* **{ encrypted password** *enc_pw* **| password** *password* **} }]**

no session trace network-element { all | mme | pgw | sgw | ggsn }

---

no

Removes the entire session trace configuration from the system or a specific network element trace configuration.

---

network-element { all | mme | pgw | sgw | ggsn }

Identifies the type of service to the session trace application in order to determine the applicable interfaces.
all: Specifies that all network elements and their associated interfaces are to be made available to the session trace application.
ggsn: Specifies that the GGSN as network element and its associated interfaces is to be made available to the session trace application.
mme: Specifies that the MME as network element and its associated interfaces is to be made available to the session trace application.
pgw: Specifies that the P-GW as network element and its associated interfaces is to be made available to the session trace application.
sgw: Specifies that the S-GW as network element and its associated interfaces is to be made available to the session trace application.

---

collection-timer *sec*

Specifies the amount of time (in seconds) to wait from initial activation/data collection before data is reported to the Trace Collection Entity (TCE). *sec* must be an integer from 0 through 255.

---

tce-mode none

Specifies that session trace files are to be stored locally and must be pulled by the TCE.

---

tce-mode push transport sftp path *string* **username** *name* **{ encrypted password** *enc_pw* **| password** *password* **}**

Specifies that session trace files are to be pushed to the Trace Collection Entity (TCE).
sftp: Specifies that Secure FTP is used to push session trace files to the TCE.
path *string*: Specifies the directory path on the TCE where files will be placed.
username *name*: Specifies the username to be used when pushing files to the TCE.

encrypted password *enc_pw*: Specifies the encrypted password to be used when pushing files to the TCE.
password *password*: Specifies the password to be used when pushing files to the TCE.

Usage

Use this command to configure the file transfer methods and modes for subscriber session trace functionality and to how and where session trace files are sent after collection.
This configuration contains collection timer, UMTS/EPC network element, type of file transfer, and user credentials setting to send the collected trace files to the TCE.

Example

The following command configures the collection time for session traces to *30* seconds, identifies the network element as all elements (GGSN, MME, S-GW, and P-GW), and pushes session trace files to a TCE via SFTP into a directory named */trace/agw* using a username *admin* and a password of *pw123*:

```
session trace network-element all collection-timer 30 tce-mode push
transport sftp path /trace/agw username admin password pw123
```

The following command configures the collection time for session traces to *30* seconds, identifies the network element as an MME, and pushes session trace files to a TCE via SFTP into a directory named */trace/sgw* using a username *admin* and a password of *pw123*:

```
session trace network-element mme collection-timer 30 tce-mode push
transport sftp path /trace/mme username admin password pw123
```

The following command configures the collection time for session traces to *30* seconds, identifies the network element as GGSN, and pushes session trace files to a TCE via SFTP into a directory named */trace/ggsn* using a username *admin* and a password of *pw123*:

```
session trace network-element ggsn collection-timer 30 tce-mode push
transport sftp path /trace/ggsn username admin password pw123
```

sgsn-global

This command gives access to the SGSN Global configuration mode to set parameters relevant to the SGSN and HNB-GW as a whole.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
sgsn-global
```

Usage

Using this command moves into SGSN Global Configuration mode. In this mode, you can set system-wide parameters on SGSN and HNB-GW to perform the following tasks:
On SGSN:

- monitoring and managing TLLIs in the BSSGP layer.
- defining IMSI ranges used as filters in the operator policy selection process.

On HNB-GW:

- setting system-wide IPC message aggregation parameters

Example

Enter the SGSN Global configuration mode with the following:

```
sgsn-global
```

snmp authentication-failure-trap

Enables or disables the SNMP traps for authentication failures.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp authentication-failure-trap
```

no

Disables SNMP traps for authentication failures. When omitted, SNMP traps for authentication failures will be generated.

Usage

Disables authentication failure traps if they are not of interest. At this time the option may be changed to support trouble shooting.
By default SNMP authentication failure traps are disabled.

snmp community

Configures the SNMP v1 and v2 community strings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp community *string* **[context** *ctx_name* **] [view** *view_name* **] [read-only | read-write]**

no snmp community *string*

no

The specified community string is removed from the configuration.

string

Specifies a community string whose options are to be modified. *string* must be an alphanumeric string of 1 through 31 characters.

context *ctx_name*

Default: community string applies to all contexts.
Specifies a the context to which the community string shall be applied. *ctx_name* must be an alphanumeric string of 1 through 1023 characters.

view *view_name*

Default: community string applies to all views.
Specifies the view to which the community string shall be applied. *view_name* must be an alphanumeric string of 1 through 1023 characters.

read-only | read-write

Default: read-only
Specifies if access rights for the community string.
read-only: the configuration may only be viewed.
read-write: the configuration may be viewed and edited.

Usage

The community strings define the privileges of SNMP users. It may be desirable to give read-only access to front line operators.

Example

snmp community *sampleString*

snmp community *sampleString* **context** *sampleContext*

snmp community *sampleString* **context** *sampleContext* **view** *sampleView*

snmp community *sampleString* **view** *sampleView* **read-write**

no snmp community *sampleString*

snmp engine-id

Configures the SNMP engine to use for SNMP requests when SNMPv3 agents are utilized.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp engine-id local *id*

id

Specifies the SNMPv3 engine to employ. *id* must be an alphanumeric string of 1 through 31 characters.

Usage

When SNMPv3 is used for SNMP access to the chassis the engine ID can be used to quickly change which schema is used for SNMP access.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

snmp engine-id local *id*

snmp heartbeat

Enables the sending of periodic “heartbeat” notifications (traps).

Product

All

Privilege

Administrator

Syntax

snmp heartbeat { interval [*minutes*] | second-interval [*seconds*] }

[deafult | no] snmp heartbeat

default

Returns the command to its default setting of disabled.

no

Disables the feature.

interval [*minutes*]

Default: 60
Specifies the interval time (in minutes) between notifications. *minutes* must be an integer from 1 through 1440.

second-interval [*seconds*]

Default: 30
Specifies the secondary interval time, in seconds, between notifications. *seconds* must be an integer from 10 through 50.

Usage

Use this command to enable the sending of a heartbeat notification periodically to confirm a system is up and communicating.

Example

The following command sets the SNMP heartbeat notification interval to 2 hours, 15 minutes and 30 seconds:

```
snmp heartbeat interval 135 second-interval 30
```

snmp history heartbeat

Enables the recording of heartbeat notifications in SNMP history.

Product

All

Privilege

Administrator

Syntax

```
[ default | no ] snmp history heartbeat
```

default

Returns the command to the default setting of enabled.

no

Disables the history recording feature.

Usage

Use this command to enable the recording of SNMP heartbeat notifications in SNMP history files.

snmp notif-threshold

Configures the number of SNMP notification that need to be generated for a given event before it is propagated to the SNMP users.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp notif-threshold *count* **[low** *low_count* **] [period** *seconds* **]**

no snmp notif-threshold

no

Removes all SNMP notification thresholds. All notifications will be broadcast to SNMP users.

count

Default: 100
Specifies the number of notifications that must be generated before the next notification is broadcast to SNMP users. *count* must be an integer from 1 through 10000.

low *low_count*

Default: 20
Specifies the number of notifications within the monitoring period before which any subsequent notification for each specific event. *low_count* must be an integer from 1 through 10000.

period *seconds*

Default: 300
Specifies the number of seconds of the monitoring window size before any subsequent notification may be broadcast to users. *seconds* must be an integer from 10 through 3600.

Usage

Set the notification threshold to avoid a flood of events which may be the result of a single failure or maintenance activity.

Example

```
snmp notif-threshold 100

snmp notif-threshold 100 period 30
```

snmp server

Enables the SNMP server as well the configuration of the SNMP server port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp server [port *number* **]**

no snmp server

no

Restores the default SNMP port assignment.

port *number*

Default: 161
Specifies the port number to use for SNMP communications. *number* must be an integer from 1 to 65535.

Usage

Set the SNMP port for communications when SNMP is enabled.

Important: This will result in restarting the SNMP agent when the **no** keyword is omitted. SNMP queries as well as notifications/traps will be blocked until the agent has restarted.

Example

```
snmp server port 100

no snmp server
```

snmp target

Configures remote receivers for SNMP notifications.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp target *name ip_address* **[port** *number* **] [non-default] [security-name** *string* **] [version { 1 | 2c | 3 | view] [security-level { noauth | { auth | priv-auth privacy [encrypted] des** *privpassword* **} authentication [encrypted] { md5 | sha }** *authpassword* **} } [informs | traps]**

no snmp target *name*

---

no

Removes the specified target as a receiver of unsolicited SNMP messages (traps).

---

authentication { md5 | sha } *authpassword*

Reads the authentication type and password if the security level of the SNMP messages is set to **auth** or **priv-auth**. Authentication types are:

- **md5**: Configures the hash-algorithm to implement MD5 per RFC 1321.
- **sha**: Specifies that the hash protocol is Secure Hash Algorithm.

---

security-level **{ noauth | { auth | priv-auth privacy [encrypted] des** *privpassword* **}**

Sets the security level of the SNMPv3 messages, as follows:

- **noauth**: No authentication and encryption is used.
- **auth**: Only authentication will be used.
- **priv-auth**: Both authentication and encryption will be used.
- **privacy des** *privpassword*: Reads the privacy type and password.

---

name

Specifies a logical name to use to refer to the remote receiver. *name* must be an alphanumeric string of 1 through 31 characters.

---

ip_address

Specifies the IP address of the receiver. *ip_address* must be specified using IPv4 dotted-decimal notation.

---

non-default

Specifies that this destination is only used for SNMP traps which have been specifically identified.

port *number*

Default: 162
Specifies the port which is to be used in communicating with the remote receivers. *number* must be an integer from 0 through 65535.

security-name *string*

Default: no community string included
Specifies the community string to use in the unsolicited messages. *string* must be an alphanumeric string of 1 through 31 characters.

version { 1 | 2c | 3 } | view

Default: 1
Specifies the SNMP version the target supports and consequently the version of the SNMP protocol to use for communications.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices.However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must configure this command to use version 1 or version 2c.

informs | traps

Default: traps
Specifies the type of SNMP event to use to send notifications to SNPM targets. **traps** are unacknowledged (fire and forget) whereas **informs** require a response from the SNMP target.
If the notification type is set to **informs**, the notification is resent if no response is received within 5 seconds. The notification is resent at most two times.

Usage

The target manages the list of remote receivers to which unsolicited messages are sent. Use this command to add /remove a monitoring system to/from a network.

Example

```
snmp target sampleReceiver 1.2.3.4 security-name sampleComm

snmp target sampleReceiver 1.2.5.6 port 100

snmp target sampleReceiver 1.2.7.8 version 2c traps

no snmp target sampleReceiver
```

snmp trap

This command enables or disables generation of specific or all SNMP traps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp trap { enable | suppress } [*trap_name1 trap_name2 ... trap_nameN* **| all]**

enable

Enables or allows the generation of one or more SNMP traps by the system.

suppress

Disables the generation of one or more SNMP traps by the system.

trap_name1 trap_name2 ... trap_nameN

The name of the specific SNMP trap to enable or disable. Multiple traps can be listed for a single instance of this command.

Important: The system disregards character case (case insensitive) when entering trap names.

all

Default: Enable All
Specifies that all SNMP traps will be affected by the specified operation (enable or suppress).

Usage

SNMP traps are used by the system to indicate that certain events have occurred. A complete listing of the traps supported by the system and their descriptions can be found in the *SNMP MIB Reference*. Additionally, a trap listing can be viewed using the following command:

snmp trap { enable | suppress } ?

By default, the system enables the generation of all traps. However, individual traps can be disabled allowing only traps of a certain type or alarm level to be generated. This command can be used to disable un-desired traps and/or re-enable previously suppressed traps.

Example

The following command suppresses the LogMessage trap:

```
snmp trap suppress logmessage
```

The following command suppresses the *CLISessEnd* and *CLISessStart*:

```
snmp trap suppress clisessend clisessstart
```

snmp trap-timestamps

Adds an additional system-time varbind to generated traps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap-timestamps
```

no

Disables the adding of timestamps to generated traps.

Usage

The timestamp added to the generated trap reflects the current system time. The timestamp is proprietary. This functionality is disabled by default.

Important: If the Web Element Manager application is used as your alarm server, the application relies on the timestamp provided by enabling this command to identify duplicate traps. As a result, it is recommended that this parameter be enabled for this case.

Example

The following command enables the inclusion of a timestamp with each generated trap:

```
snmp trap-timestamps
```

snmp user

Configures an SNMPv3 user for SNMP access.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp user *user_name* **[[encrypted] password** *password* **| engine** *id* **| group** *grp_name* **| security-model** *model* **auth [[encrypted] password** *password* **]]**

no snmp user *user_name*

---

no

Removes the specified user from the list of valid SNMPv3 users.

---

user_name

Specifies the user which is to use SNMPv3 interfaces to the system. *user_name* must be an alphanumeric string of 1 through 31 characters.

---

engine *id*

The SNMP engine ID. **id** must be an alphanumeric string of 1 through 31characters.

---

group *grp_name*

Default: undefined (not a member of any group)
Specifies the user SNMPv3 group the into which user will be added. *grp_name* must be an alphanumeric string of 1 to 1023 characters.

---

security-model *model* **auth**

Default: USM
Specifies the security model used to authenticate the user. *model* must be configured to the following:

- **usm**: User Security Model

[encrypted] password *password*

Default: undefined
Specifies the password for authenticating the user when the security model is set to User-based Security Model (USM).
The **encrypted** keyword indicates the password will be received in an encrypted form. *password* must be an alphanumeric string of 8 through 31 characters.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Add and remove SNMPv3 users as operations staff or automated systems are updated. The security model will be user dependant based upon the support the users system provides.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

```
snmp user user1

snmp user user1 security-model 2c auth

snmp user user1 group user1 group sampleGroup security-model usm auth

no snmp user user1
```

ss7-routing-domain

This command creates an SS7 routing domain instance and enters the SS7 Routing Domain Configuration mode.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

ss7-routing-domain *rd_id* **variant** *v_type* **[-noconfirm]**

no ss7-routing-domain *rd_id*

no

Removes the specified SS7 routing domain from the system configuration.

rd_id

Identifies a specific SS7 routing domain. Once it has been created, it can be accessed for further configuration and modification by entering the *rd_id* without entering the variant.
rd_id must be an integer from 1 through 12.

variant *v_type*

Identifies the national standard to be used for call setup, routing and control, signaling. Select one of the following:

- **ansi:** American National Standards Institute (U.S.A.)
- **bici:** Broadband Intercarrier Interface standard
- **china:** Chinese standard
- **itu:** International Telecommunication Union (ITU-T) Telecommunication Standardization Sector
- **ntt:** Japanese standard
- **ttc:** Japanese standard

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create an SS7 routing domain configuration instance or to enter the SS7 routing domain configuration mode to edit the configuration.
A routing domain groups configuration items to facilitate the management of the SS7 connection resources for an SGSN service. An Access Gateway supports up to 12 configured SS7 routing domains at one time.
After entering this command, the prompt appears as:
`[context_name]<hostname>(config-ss7-routing-domain-routing_domain_id)#`
For details about the commands and parameters used to define or edit an SS7 routing domain, refer *SS7 Routing Domain Configuration Mode* chapter.

Example

The following creates an SS7 routing domain with an index of *1* and the variant selection of Broadcast Intercarrier Interface (*bici*):

```
ss7-routing-domain 1 variant bici
```

The following command creates an SS7 routing domain instance with an index of *2* and the variant selection of Broadcast Intercarrier Interface (*bici*) to be associated with HNB RN-PLMN in an HNB access network:

```
ss7-routing-domain 1 variant bici
```

suspend local-user

Suspends a local-user administrative account.

Product

All

Privilege

Administrator

Syntax

[no] suspend local-user *name*

no

Removes the suspended status for the specified local-user account.

name

The name of the local-user account expressed as an alphanumeric string of 3 through 16 characters that is case sensitive.

Usage

This command allows a security administrator to suspend local-user administrative accounts.
A "suspended" user cannot login to the system. The user's account information (passwords, password history, etc.), however, is preserved.

Example

The following command suspends a local-user account called *Inspector1*:

```
suspend local-user Inspector1
```

The following command removes the suspension from a local-user account called *Admin300*:

```
no suspend local-user Admin300
```

system

Configures system information which is accessible via SNMP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

system { carrier-id mcc *mcc_id* **mnc** *mnc_id* **| contact** *who* **| description** *string* **| hostname** *host_name* **| location** *text*| **sysdesc-sysoid-style [default | new] }**

default system { contact | location }

default

Removes the configured **system contact** and **system location** form the system.

carrier-id mcc *mcc_id* **mnc** *mnc_id*

Important: This carrier ID is not used by the GGSN

Specifies a carrier-id that is a unique identifier for the carrier that has installed the system. When the carrier ID values are set, the carrier-id and gmt_offset attributes are included in access-request and accounting packets when using the following RADIUS dictionaries:

- 3gpp2
- 3gpp2-835
- starent
- starent-835
- starent-vsa1
- starent-vsa1-835
- custom9

mcc *mcc_id*: The mobile country code. This must be specified as a 3-digit string from 001 through 999.
mnc *mnc_id*: The mobile network code. This must be specified as a 2- or 3-digit string from 01 through 999.

contact *who*

Default: No contact specified.
contact *who*: specifies the contact information for the chassis. *who* must be an alphanumeric string of 0 through 255 characters. The string must be embedded in double quotes (“) if spaces and special punctuation is to be used.

description *string*

Allows a user to describe the system for identification purposes. The system description can be comprised of a mix of alphanumeric characters, as follows:

- **%version%** - software version.

- **%build%** - software build number
- **%chassis%** - chassis type (ASR 5000)
- **%staros%** - OS type
- **%hostname%** - system name
- **%release%** - release number
- **%kerver%** - kernel version
- **%machine%** - machine hardware name
- *string* - an alphanumeric string of 1 through 255 characters.

hostname *host_name*

hostname *host_name*: configures the chassis host name where *host_name* must be an alphanumeric string of 1 through 63 characters.

Important: Please note that changing the chassis host name results in the command prompt changing as well to reflect the new name. This may affect any previously scripted interfaces from an OSS or maintenance facility.

location *text*

Default: No location specified.
location *text*: specifies the system location expressed as an alphanumeric string of 0 through 255 characters. The text specified must be embedded in double quotes (“) if spaces are to be used.

sysdesc-sysoid-style [default | new]

Allows the user to select the SNMP return for the objects sysDescr and sysOId.

- **default** - SNMP returns old style system description and old style system OID string.
- **new** - SNMP returns Cisco style system description and Cisco style OID string.

Usage

Specify system basic information which is useful back at a network operations center which uses the SNMP interfaces for management.

Example

The following commands configure the contact information, system host name, and location text, or remove configured location and system respectively.

```
system contact user1@company.com

system hostname system16

system location “Clark Street Closet\nBasement Rack 4”
```

The following commands remove the configured contact and location from system respectively

```
default system contact

default system location
```

tacacs mode

Enters the TACACS+ (Terminal Access Controller Access Control System+) configuration mode. Use this mode to configure up to three TACACS+ servers for use in authenticating administrative users via the TACACS+ protocol.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
tacacs mode
```

Usage

Enter TACACS Configuration Mode to configure up to three TACACS+ servers for use in authenticating administrative users via the TACACS+ protocol. For additional information, see the *TACACS+ Configuration Mode Commands* chapter.

Example

Use the following command to enter TACACS mode:

```
tacacs mode
```

task facility ipsecmgr

Configures IPSec manager settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
task facility ipsecmgr { ikev1 { task-count { increased | normal } } | task-count {
increased | normal } }
```

ikev1 { task-count { increased | normal } }

Default: **normal**
Adjusts the IPSec manager task count to support EHA for IKEv1. See **task-count** below.

task-count { increased | normal }

Default: **normal**
Adjusts the IPSec manager task count to support EHA.
increased: Starts additional IPSec manager tasks operating on the packet processing cards. In increased mode, they run on all but demux packet processing cards. Also, all the IPSec managers start at the same time when an active non-demux card is detected and IPSec is configured.
normal: Uses the standard algorithm for allocating memory for IPSec manager tasks. In normal mode, IPSec managers do not run on session packet processing cards.

Caution: If **task-count** is set to **normal** and session recovery is enabled, IPSec manager tasks are not allowed to start on most packet processing cards. Because the resources are not reserved, IPSec managers in normal mode only run on demux packet processing cards.

Usage

Sets IPSec manager parameters for all IPSec managers in the system.

Example

Use the following command to set the IPSec manager task count to **increased** mode:

```
task facility ipsecmgr task-count increased
```

task facility sessmgr

Configures system information which is accessible via SNMP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
task { facility sessmgr start { aggressive | normal } | resource cpu-memory-low { kill |
warn } }
```

facility sessmgr start { aggressive | normal }

Default: Normal
Specifies the facility options for the session manager.
aggressive: specifies the maximum number of session manager processes are started immediately.

Caution: The **task facility sessmgr start aggressive** command should only be used if the system will reach capacity (for the existing configuration) during the first few minutes of service.

Caution: This command must only be executed last during configuration (or appended to the end of the configuration file) to ensure the availability of memory resources to contexts and services.

normal: indicates the session manager processes are started as needed.

resource cpu-memory-low { kill | warn }

Default: kill
Sets the action for the Resource Manager to take when the amount of free memory on a CPU falls below 12MB. An SNMP TRAP and CORBA notification are generated and the event is logged.
Once the free memory threshold is crossed, The Resource Manager examines all tasks on that cpu and finds the most over limit task and kills it. If there are no over limit tasks nothing happens. Resource Manager takes preference on killing a non-sessmgr task over a sessmgr task.
kill: The task most over memory limit (if any) is killed and recovered.
warn: The event is logged and no tasks are killed.

Usage

Set the session manager start policy to aggressive on heavily utilized systems to avoid undue delays in processing subscriber sessions.
Set the CPU memory low action to only log CPU low memory events.

Example

```
task facility sessmgr start aggressive

task facility sessmgr start normal

task resource cpu-memory-low warn
```

task facility acsmgr

This command configures ACSMgr task settings.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
task facility acsmgr start [ aggressive | normal ]

no task facility acsmgr start
```

no

Disables the configured ACSMgr setting.

aggressive

Specifies to start the maximum possible ACSMgr tasks.

normal

Configures the resource subsystem to start/stop ACSMgr tasks on an as-needed basis.

Usage

This command provides option for the resource subsystem to start maximum possible ACSMgr tasks based on the license configured and the available system configuration.

Example

The following command starts the maximum possible ACSMgr tasks:

```
task facility acsmgr start aggressive
```

terminal

Configures the console port on the SPIO.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
terminal [ carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol { hardware { off
| on } | none } | parity { even | none | odd } | speed { 115200 | 19200 | 38400 | 57600 |
9600 } | stopbits { 1 | 2 } ]
```

carrierdetect { off | on }

Specifies whether or not the console port is to use Data Carrier Detect (DCD) when connecting to a terminal.
Default: off
off: Do not use DCD.
on: Use DCD.

databits { 7 | 8 }

Specifies the number of data bits used to transmit and receive characters.
Default: **8**
7: Use 7 databits to transmit and receive characters.
8: Use 8 databits to transmit and receive characters.

flowcontrol { hardware {off | on } | none }

Specifies how the flow of data is controlled between the SPIO and a terminal.
Default: **none**
hardware: Enables or disables the use of hardware-based flow control
off: Disables the use of Ready to Send (RTS) and Clear to Send (CTS).
on: Enables the use of Ready to Send (RTS) and Clear to Send (CTS).
none: Disables the use of DCD, RTS and CTS.

parity { even | none | odd }

Specifies the type of error checking used on the port.
Default: none
even - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.
none - Disables error checking.
odd - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

speed { 115200 | 19200 | 38400 | 57600 | 9600 }

Specifies the flow of data in bits per second between the console port and terminal.
Default: **9600**

stopbits { 1 | 2 }

Specifies the number of stop bits between each transmitted character.
Default: **1**
1: Use one stop bit between each transmitted character.
2: Use two stop bits between each transmitted character.

Usage

Sets the SPIO's console port parameters for communication with the terminal device.

Example

The following command sets the SPIO's console port. The terminal must support these values.

```
terminal carrierdetect off databits 7 flowcontrol hardware on parity even
speed 115200 stopbits 1
```

threshold 10sec-cpu-utilization

Configures a threshold that measures a 10-second average of cpu utilization. Its polling interval can be set down to 30 seconds.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold 10sec-cpu-utilization *percent* **[clear** *percent* **]**

percent

Default: 0
Configures Specifies the high threshold for 10-second average cpu-utilization. If the monitored CPU utilization is greater than or equal to the specified percentage an alert is sent. Regardless of the length of the polling interval, only one sample at the end of the polling interval is tested.

clear *percent*

Default: 0:
This is a low watermark value that sets the alarm clearing threshold value. If not specified it is taken from the first value.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set a threshold that sends an alert when CPU utilization over a 10-second average exceeds the limit set.
Alerts or alarms are triggered for 10-second sample of CPU utilization based on the following rules:

- **Enter condition:** 10-second average percentage of CPU utilization is greater than or equal to the high threshold.
- **Clear condition:** 10-second average percentage of CPU utilization is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command generates an alert when the 10-second average CPU utilization reaches *45* percent:

```
threshold 10sec-cpu-utilization 45
```

threshold aaa-acct-archive-queue-size

This command configures AAA accounting archive thresholds based on the maximum values of session manager and ACS manager archive queue size.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold aaa-acct-archive-queue-size1 percent [ clear percent ]

default threshold aaa-acct-archive-queue-size1 percent [ clear percent ]

threshold aaa-acct-archive-queue-size2 percent [ clear percent ]

default threshold aaa-acct-archive-queue-size2 percent [ clear percent ]

threshold aaa-acct-archive-queue-size3 percent [ clear percent ]

default threshold aaa-acct-archive-queue-size3 percent [ clear percent ]
```

percent

Configures Specifies the high threshold for monitoring the accounting message archive queue length. If the queue length is greater than or equal to the specified percentage an alarm is sent.
Default value for **aaa-acct-archive-queue-size1**: 25%
Default value for **aaa-acct-archive-queue-size2**: 50%
Default value for **aaa-acct-archive-queue-size3**: 90%

clear *percent*

This is a low watermark value that sets the alarm clearing threshold value. If not specified it is taken from the first value.
Default value for **aaa-acct-archive-queue-size1**: 25%
Default value for **aaa-acct-archive-queue-size2**: 50%
Default value for **aaa-acct-archive-queue-size3**: 90%

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system cannot communicate with configured AAA accounting servers (RADIUS or CGFs), either due to the server being busy or loss of network connectivity, the system buffers, or archives, the accounting messages.
Accounting message archive queue size thresholds generate alerts or alarms based on the queue length of AAA accounting messages buffered in the archive during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.

Alerts or alarms are triggered for accounting message archive queue size thresholds based on the following rules:

- **Enter condition:** Actual number of archived messages is greater than or equal to the high threshold.
- **Clear condition:** Actual number of archived messages less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command generates an alarm when *70*% of the AAA accounting message archive buffer is filled, and clears the alarm when the buffer size is reduced to *30*%:

```
threshold aaa-acct-archive-queue-size1 70 clear 30
```

threshold aaa-acct-archive-size

This command configures the accounting message archive size threshold.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-acct-archive-size *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-acct-archive-size

high_thresh

Default: 1
Specifies the high threshold number of archived accounting messages that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 1044000.

clear *low_thresh*

Default: 1
Specifies the low threshold number of archived accounting messages that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system cannot communicate with configured AAA accounting servers (RADIUS or CGFs), either due to the server being busy or loss of network connectivity, the system buffers, or archives, the accounting messages.
Accounting message archive size thresholds generate alerts or alarms based on the number of AAA accounting messages buffered in the archive during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of archived messages that is greater than or equal to the high threshold.
- **Clear condition:** Actual number of archived messages that is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *250* AAA accounting archived messages and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold aaa-acct-archive-size 250 clear 100
```

threshold aaa-acct-failure

Configures accounting failure thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-acct-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-acct-failure

high_thresh

Default: 0
Specifies the high threshold number of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of accounting failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Accounting failure thresholds generate alerts or alarms based on the number of failed AAA accounting message requests that occur during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* AAA accounting failures and low threshold of *25* for a system using the Alarm thresholding model:

```
threshold aaa-acct-failure 100 clear 25
```

threshold aaa-acct-failure-rate

Configures accounting failure rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-acct-failure-rate *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-acct-failure-rate

high_thresh

Default: 1
Specifies the high threshold percent of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 and 100.

clear *low_thresh*

Default: 1
Specifies the low threshold percent of accounting failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Accounting failure rate thresholds generate alerts or alarms based on the percentage of AAA accounting message requests that failed during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failure rates based on the following rules:

- **Enter condition:** Actual failure percentage is greater than or equal to the high threshold.
- **Clear condition:** Actual failure percentage is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA accounting failure rate high threshold percentage of *30* and a low threshold percentage of *10* for a system using the Alarm thresholding model:

```
threshold aaa-acct-failure-rate 30 clear 10
```

threshold aaa-auth-failure

Configures authentication failure thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-auth-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-auth-failure

high_thresh

Default: 0
Specifies the high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.*high_thresh* is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Authentication failure thresholds generate alerts or alarms based on the number of failed AAA authentication message requests that occur during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* AAA authentication failures for a system using the Alert thresholding model:

```
threshold aaa-auth-failure 100
```

threshold aaa-auth-failure-rate

Configures authentication failure rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-auth-failure-rate *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-auth-failure-rate

high_thresh

Default: 5
Specifies the high threshold percent of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100.

clear

Allows the configuration of Specifies the low threshold.

low_thresh

Default: 5
Specifies the low threshold percent of authentication failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Authentication failure rate thresholds generate alerts or alarms based on the percentage of AAA authentication message requests that failed during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual failure percentage is greater than or equal to the high threshold.
- **Clear condition:** Actual failure percentage is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA authentication failure rate high threshold percentage of *30* for a system using the Alert thresholding model:

```
threshold aaa-auth-failure-rate 30
```

threshold aaa-retry-rate

Configures AAA retry rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-retry-rate *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-retry-rate

high_thresh

Default: 5
Specifies the high threshold percent of AAA request message retries that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100.

clear *low_thresh*

Default: 5
Specifies the low threshold percent of AAA request message retries that maintains a previously generated alarm condition. If the percentage of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

AAA request message retry rate thresholds generate alerts or alarms based on the percentage of request messages (both authentication and accounting) that were retried during the specified polling interval. The percentage is based on a message count taken for all AAA authentication and accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for request message retries based on the following rules:

- **Enter condition:** Actual retry percentage is greater than or equal to the high threshold.
- **Clear condition:** Actual retry percentage is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA message retry rate high threshold percentage of *25* and a low threshold percentage of *10* for a system using the Alarm thresholding model:

```
threshold aaa-retry-rate 25 clear 10
```

threshold aaamgr-request-queue

This command configures the AAA Manager internal request queue threshold.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaamgr-request-queue *high_thresh* **[clear** *low_thresh* **]**

default threshold aaamgr-request-queue

high_thresh

Default: 0
Specifies the high threshold number of AAA Manager Requests that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 1 through 100.

clear

Allows the configuration of Specifies the low threshold.

low_thresh

Default: 5
Specifies the low threshold number of AAA Manager Requests that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm is generated. *low_thresh* is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

AAA Manager Request thresholds generate alerts or alarms based on the number of AAA Manager Requests for an AAA manager process during the specified polling interval.
Alerts or alarms are triggered for AAA Manager Requests based on the following rules:

- **Enter condition:** Actual number of AAA Manager Requests per AAA manager is greater than or equal to the high threshold.
- **Clear condition:** Actual number of AAA Manager Requests per AAA manager process is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm is not generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA authentication failure rate high threshold percentage of *30* for a system using the Alert thresholding model:

```
threshold aaamgr-request-queue 30
```

threshold asngw-auth-failure

Configures authentication failure thresholds for the ASN-GW system.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-auth-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-auth-failure

high_thresh

Default: 0
Specifies the high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to configure threshold limits to generate alerts or alarms based on the number of failed ASN-GW authentication message requests that occur during the specified polling interval. Authentication requests are counted for all ASN Gateway authentication servers with which that the system is configured to communicate.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* authentication failures for an ASN-GW using the Alert thresholding model:

```
threshold asngw-auth-failure 100
```

threshold asngw-handoff-denial

Configures thresholds for hand-off denial for the ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-handoff-denial *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-handoff-denial

high_thresh

Default: 0
Specifies the high threshold number of hand-off denials that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of hand-off denials that maintains a previously generated alarm condition. If the number of hand-off denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of denied hand-off that occurred during the specified polling interval. Hand-off denial messages are counted for all ASN Gateways that the system is configured to communicate with.
Alerts or alarms are triggered for hand-off denials based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* hand-off denials using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```

threshold asngw-max-eap-retry

Configures thresholds for maximum retries for Extensible Authentication Protocol (EAP) authentication on an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-max-eap-retry *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-max-eap-retry

high_thresh

Default: 0
Specifies the high threshold number of retries for EAP authentication that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of retries for EAP authentication that maintains a previously generated alarm condition. If the number of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of retries for EAP authentication that occur during the specified polling interval.
Alerts or alarms are triggered for maximum number of retries for EAP authentication based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* alerts or alarms generated on maximum number of retries for EAP authentication for an ASN Gateway using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```

threshold asngw-network-entry-denial

Configures thresholds for denial of network entry to an MS with in the ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-network-entry-denial *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-network-entry-denial

high_thresh

Default: 0
Specifies the high threshold number of denial of network entry to an MS that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of denial of network entry to an MS that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of network entry denials that occurred during the specified polling interval. Network denial messages are counted for an MS with which the system is configured to communicate.
Alerts or alarms are triggered for network entry denials based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* network entry denials for an MS using the Alert thresholding model:

```
threshold asngw-network-entry-denial 100
```

threshold asngw-r6-invalid-nai

Configures thresholds to generate alert/alarm for invalid Network Access Identifier (NAI) in R6 message.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-r6-invalid-nai *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-r6-invalid-nai

high_thresh

Default: 0
Specifies the high threshold number of invalid NAIs in R6 messages that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of invalid NAIs in R6 messages that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of invalid NAIs in R6 messages that occurred during the specified polling interval. Invalid NAIs are counted for an MS that the system is configured to communicate with or per system for all R6 messages.
Alerts or alarms are triggered for invalid NAIs based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* invalid NAIs in R6 messages using the Alert thresholding model:

```
threshold asngw-r6-invalid-nai 100
```

threshold asngw-session-setup-timeout

Configures thresholds to generate alert/alarm for session setup timeouts in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-session-setup-timeout *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-session-setup-timeout

high_thresh

Default: 0
Specifies the high threshold number of timeouts during session setup that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of timeouts during session setup that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during session setup that occurred during the specified polling interval.
Alerts or alarms are triggered for session setup timeouts based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* timeouts during session setup using the Alert thresholding model:

```
threshold asngw-session-setup-timeout 100
```

threshold asngw-session-timeout

Configures thresholds to generate alert/alarm for session timeouts in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-session-timeout *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-session-timeout

high_thresh

Default: 0
Specifies the high threshold number of timeouts during session that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of timeouts during session that maintains a previously generated alarm condition. If the number of session timeouts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during a session that occurred during the specified polling interval.
Alerts or alarms are triggered for session timeouts based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* timeouts during a session using the Alert thresholding model:

```
threshold asngw-session-timeout 100
```

threshold call-reject-no-resource

Configures thresholds on the system for calls rejected due to insufficient resources.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold call-reject-no-resource *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of no-resource call rejects issued by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number is an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of no-resource call rejects issued by the system that maintains a previously generated alarm condition. If the number of rejections falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

No resource call reject thresholds generate alerts or alarms based on the total number of calls that were rejected by the system due to insufficient or no resources (memory and/or session licenses) during the specified polling interval.
Alerts or alarms are triggered for no-resource-rejected calls based on the following rules:

- **Enter condition:** Actual number of calls rejected due to no resources is greater than or equal to the high threshold.
- **Clear condition:** Actual number of calls rejected due to no resources is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count for the number of calls rejected by the system due to insufficient or no resources to *100* and allow threshold of *40* for a system using the Alarm thresholding model:

```
threshold call-reject-no-resource 100 clear 40
```

threshold call-setup

Configures call setup thresholds for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold call-setup *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of calls setup by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of calls setup by the system that maintains a previously generated alarm condition. If the number of setups falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Call setup thresholds generate alerts or alarms based on the total number of calls setup by the system during the specified polling interval.
Alerts or alarms are triggered for call setups based on the following rules:

- **Enter condition:** Actual number of call setups is greater than or equal to the high threshold.
- **Clear condition:** Actual number of call setups is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 100 calls setup for a system using the Alert thresholding model:

```
threshold call-setup 100
```

threshold call-setup-failure

Configures call setup failure thresholds for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold call-setup-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of call setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of call setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Call setup failure thresholds generate alerts or alarms based on the total number of call setup failures experienced by the system during the specified polling interval.
Alerts or alarms are triggered for call setup failures based on the following rules:

- **Enter condition:** Actual number of call setup failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of call setup failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* call setup failures and a low threshold of *80* for a system using the Alarm thresholding model:

```
threshold call-setup-failure 100 clear 80
```

threshold cpu-available-memory

Configures thresholds for available CPU memory for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold cpu-available-memory low_thresh  [ clear high_thresh ]
```

low_thresh

Default: 32
Specifies the low threshold amount of CPU memory that must be met or exceeded at the polling time to generate an alert or alarm.
low_thresh is measured in megabytes (MB) and is an integer from 0 through 2048.

clear *high_thresh*

Default: 32
Specifies the high threshold amount of CPU memory that maintains a previously generated alarm condition. If the memory amount rises above the high threshold within the polling interval, a clear alarm will be generated.
high_thresh is measured in megabytes (MB) and is an integer from 0 through 2048.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CPU available memory thresholds generate alerts or alarms based on the amount of available memory for each packet processing card CPU at the polling time. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for available CPU memory based on the following rules:

- **Enter condition:** Average measured amount of memory/CPU for the last 5 minutes is less than or equal to the low threshold.
- **Clear condition:** Average measured amount of memory/CPU for the last 5 minutes is greater than the high threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a low threshold count of *50* MB CPU memory available and a high threshold of *112* MB for a system using the Alarm thresholding model:

```
threshold cpu-available-memory 50 clear 112
```

threshold cpu-load

Configures the threshold for monitoring packet processing card CPU loads using a 5-minute average measurement. The threshold is enabled by enabling CPU resource monitoring.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-load *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
If the monitored CPU load is greater than or equal to the specified number an alert is sent. *high_thresh* must be an integer from 0 through 15.

clear *low_thresh*

Default: 0
This is a low watermark value that sets the alarm clearing threshold value. If not present it is taken from the first value. *low_thresh* must be an integer from 0 through 15.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

Use this command to set an alert when the card's CPU load is equal to or greater than the number specified. Alerts or alarms are triggered for CPU load based on the following rules:

- **Enter condition:** Actual CPU load is greater than or equal to the high threshold.
- **Clear condition:** Actual CPU load is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

To set an alert when the packet processing card CPU load is over *10* and set an alert clear when the CPU load drops down equal or less than *7*, enter the following command;

```
threshold cpu-load 10 clear 7
```

threshold cpu-memory-usage

Configures the threshold for monitoring the percentage of total CPU memory used during the polling interval.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-memory-usage *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold for percentage of total memory used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured as a percentage of total CPU memory used and is an integer from 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold for percentage of total CPU memory used that maintains a previously generated alarm condition. If the memory usage falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured as a percentage of total CPU memory used and is an integer from 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

CPU memory usage generate alerts or alarms based on the percentage of total CPU memory used during the polling interval.
Alerts or alarms are triggered for CPU memory usage session based on the following rules:

- **Enter condition:** Actual percentage of CPU memory usage is greater than or equal to the specified percentage of total CPU memory.
- **Clear condition:** Actual CPU memory usage is less than the specified clear percentage of total CPU memory usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total packet processing card CPU memory usage and a clear threshold of *35* percent:

```
threshold cpu-memory-usage 65 clear 35
```

threshold cpu-orbs-crit

Configures threshold for generating critical-level alerts or alarms based on the percentage of CPU utilization by the Object Request Broker System (ORBS) software task

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-orbs-crit *high_thresh* **[clear** *low_thresh* **]**

[default] threshold cpu-orbs-crit

default

Restores this parameter to its default setting.

high_thresh

Default: 60
Specifies the high threshold percent of CPU utilization by the ORB software task that must be exceeded as measured at the time of polling to generate a critical-level alert or alarm.
high_thresh is measured in percentage of total CPU utilization and is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 60
Specifies the low threshold percent of CPU utilization by the ORB software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to Specifies the low threshold at the time of polling, a clear alarm will be generated.
low_thresh is measured in percentage of total CPU utilization and is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

Object Request Broker (ORB) software task CPU utilization thresholds generate critical-level alerts or alarms based on the percentage of packet processing card CPU resources it is consuming at the time of polling. Critical-level alerts or alarms are triggered for CPU usage by the ORBs software task based on the following rules:

- **Enter condition:** Actual CPU usage percentage is greater than the high threshold.
- **Clear condition:** Actual CPU usage percentage is less than or equal to the low threshold.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a critical-level alarm threshold of *35* percent of CPU utilization by the ORBS task and a clear threshold of *35* percent:

```
threshold cpu-orbs-crit 35 clear 35
```

threshold cpu-orbs-warn

Configures threshold for generating warning-level alerts or alarms based on the percentage of CPU utilization by the Object Request Broker System (ORBS) software task

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-orbs-warn *high_thresh* **[clear** *low_thresh* **]**

[default] threshold cpu-orbs-warn

default

Restores this parameter to its default setting.

high_thresh

Default: 50
Specifies the high threshold percent of CPU utilization by the ORBS software task that must be exceeded as measured at the time of polling to generate a warning-level alert or alarm.
high_thresh is measured in percentage of total CPU utilization and is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 50
Specifies the low threshold percent of CPU utilization by the ORBS software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to Specifies the low threshold at the time of polling, a clear alarm will be generated.
low_thresh is measured in percentage of total CPU utilization and is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

Object Request Broker (ORB) software task CPU utilization thresholds generate warning-level alerts or alarms based on the percentage of packet processing card CPU resources it is consuming at the time of polling.
Warning-level alerts or alarms are triggered for CPU usage by the ORBS software task based on the following rules:

- **Enter condition:** Actual CPU usage percentage is greater than the high threshold.
- **Clear condition:** Actual CPU usage percentage is less than or equal to the low threshold.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a warning-level alarm threshold of *25* percent of CPU utilization by the ORBS task and a clear threshold of *25* percent:

```
threshold cpu-orbs-warn 25 clear 25
```

threshold cpu-session-throughput

Configures thresholds for CPU session throughput for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-session-throughput *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold session throughput that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is measured in kilobytes per second (Kbps) and is an integer from 0 through 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold session thereabout that maintains a previously generated alarm condition. If the throughput falls below Specifies the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is measured in kilobytes per second (Kbps) and is an integer from 0 through 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU session throughput thresholds generate alerts or alarms based on total throughput for all Session Manager tasks running on each packet processing card CPU during the polling interval. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for CPU session throughput based on the following rules:

- **Enter condition:** Actual CPU session throughput is greater than or equal to the high threshold.
- **Clear condition:** Actual CPU session throughput is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold count of *900* Kbps session throughput and a low threshold of *500* KBps for a system using the Alarm thresholding model:

```
threshold cpu-session-throughput 900 clear 500
```

threshold cdr-file-space

Configures the threshold for monitoring the percentage of total file space allocated for Charging Data Records (CDRs) used during the polling interval.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold cdr-file-space *high_thresh* **[clear** *low_thresh* **]**

default threshold cdr-file-space

default

Configures this command with the default threshold settings.

high_thresh

Specifies the high threshold for percentage of total allocated CDR file space used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total allocated CDR file space used and is an integer from 0 through 100. A value of 0 disables the threshold.
Default: 90

clear *low_thresh*

Specifies the low threshold for percentage of total allocated CDR file space used that maintains a previously generated alarm condition. If the space usage falls below Specifies the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in percentage of total allocated CDR file space used and is an integer from 0 through 100. A value of 0 disables the threshold.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

CDR file space usage generate alerts or alarms based on the percentage of total allocated CDR file space used during the polling interval.
Alerts or alarms are triggered for CDR file space usage session based on the following rules:

- **Enter condition:** Actual percentage of allocated CDR file space usage is greater than or equal to the specified percentage of total CDR file space.
- **Clear condition:** Actual CDR file space used is less than the specified clear percentage of total allocated CDR file space usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total allocated CDR file space usage and a clear threshold of *35* percent:

```
threshold cdr-file-space 65 clear 35
```

threshold contfilt-block

Configures the threshold for Content Filtering rating operations blocked during a polling interval at which the threshold are raised or cleared.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

threshold contfilt-block *high_thresh_value* **[clear** *low_thresh_value* **]**

default threshold contfilt-block

default

Configures this command with the default threshold settings.

high_thresh

Specifies the high threshold for number of rating operations blocked for content filtering service that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in numbers of total rating operations blocked and is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Specifies the low threshold for the total number of rating operations blocked for a content filtering service that maintains a previously generated alarm condition. If the threshold falls below Specifies the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in numbers of total rating operations blocked and is an integer from 0 through 1000000. A value of 0 disables the threshold.
Default: 0

Usage

Use this command to configure the threshold for a content filtering service to generates alerts or alarms based on the number of rating operations blocked for a content filtering service during the polling interval.
If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll contfilt-block** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65000* rating operations blocked and a clear threshold of *35000* operations:

```
threshold contfilt-block 65000 clear 35000
```

threshold contfilt-rating

Configures the threshold for Content Filtering rating operations performed during a polling interval at which the threshold are raised or cleared.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

threshold contfilt-rating *high_thresh_value* **[clear** *low_thresh_value* **]**

default threshold contfilt-rating

default

Configures this command with the default threshold settings.

high_thresh

Specifies the high threshold for number of rating operations performed for content filtering service that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in numbers of total rating operations performed and is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Specifies the low threshold for the total number of rating operations performed for a content filtering service that maintains a previously generated alarm condition. If the threshold falls below Specifies the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in umber of total rating operations performed and is an integer from 0 through 1000000. A value of 0 disables the threshold.
Default: 0

Usage

Use this command to configure the threshold for a content filtering service to generates alerts or alarms based on the number of rating operations performed for a content filtering service during the polling interval.
If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll contfilt-rating** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65000* percent of total rating operations performed and a clear threshold of *35000* percent:

```
threshold contfilt-rating 65000 clear 35000
```

threshold cpu-utilization

Configures thresholds for CPU utilization for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 85
Specifies the high threshold CPU utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100.

clear *low_thresh*

Default: 85
Specifies the low threshold CPU utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU utilization thresholds generate alerts or alarms based on the utilization percentage of each packet processing card CPU during the specified polling interval. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for CPU utilization based on the following rules:

- **Enter condition:** Average measured CPU utilization for the last 5 minutes
- **Clear condition:** Average measured CPU utilization for the last 5 minutes is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold CPU utilization percentage of *90* for a system using the Alert thresholding model:

```
threshold cpu-utilization 90
```

threshold dcca-bad-answers

Configures the threshold for invalid or bad responses to the system from Diameter server.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold dcca-bad-answers *high_thresh* **[clear** *low_thresh* **]**

default threshold dcca-bad-answers

default

Disables the threshold for configured alarm and set the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of invalid messages or responses that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of invalid messages/responses that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system receives invalid message or response from Diameter server **dcca-bad-answers** is generated.
DCCA bad answer messages size threshold generates alerts or alarms based on the number of invalid response or messages received during the specified polling interval.
Alerts or alarms are triggered for DCCA bad answers based on the following rules:

- **Enter condition:** Actual number of DCCA bad answer messages is greater than or equal to the high threshold.
- **Clear condition:** Actual number of DCCA bad answer messages is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* DCCA bad answer messages and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold dcca-bad-answers 250 clear 100
```

threshold dcca-protocol-error

Configures the threshold for Diameter Credit Control Application (DCCA) protocol error from Diameter server.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold dcca-protocol-error *high_thresh* **[clear** *low_thresh* **]**

default threshold dcca-protocol-error

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of protocol error received from Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of protocol error received from Diameter server that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system receives the protocol errors from Diameter server, **dcca-protocol-error** is generated.
DCCA protocol error threshold generates alerts or alarms based on the number of protocol error messages received from Diameter server during the specified polling interval.
Alerts or alarms are triggered for DCCA protocol error based on the following rules:

- **Enter condition:** Actual number of DCCA protocol error is greater than or equal to the high threshold.
- **Clear condition:** Actual number of DCCA protocol errors is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* protocol errors and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold dcca-protocol-error 250 clear 100
```

threshold dcca-rating-failed

Configures Diameter Credit Control Application (DCCA) Rating Group (content-id) request reject thresholds.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold dcca-rating-failed *high_thresh* **[clear** *low_thresh* **]**

default threshold dcca-rating-failed

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of requests for a block of credits due to invalid Rating Group (content-id), rejected from the Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of requests for a block of credits due to invalid Rating Group (content-id), rejected from the Diameter server that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the Diameter server rejects the system request for a block of credits due to invalid Rating Group, defined as content-id, **dcca-rating-failed** message is generated.
Rating Group failed threshold generates alerts or alarms based on the number of requests rejected from Diameter server during the specified polling interval.
Alerts or alarms are triggered for Rating Group failed based on the following rules:

- **Enter condition:** Actual number of DCCA Rating Group failed is greater than or equal to the high threshold.
- **Clear condition:** Actual number of DCCA Rating Group failed is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* requests rejected and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold dcca-rating-failed 250 clear 100
```

threshold dcca-unknown-rating-group

Configures the unknown Diameter Credit Control Application (DCCA) Rating Group (content-id) returned by Diameter to system thresholds.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold dcca-unknown-rating-group *high_thresh* **[clear** *low_thresh* **]**

default threshold dcca-unknown-rating-group

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of unknown Rating Group (content-id) sent by the Diameter server and received by system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of unknown Rating Group (content-id) sent by Diameter server and received by system that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the Diameter server sends invalid Rating Groups, **content-ids** to the system, **dcca-unk-rating-group** message is generated.
Unknown Rating Group threshold generates alerts or alarms based on the number of unknown Rating Groups received by the system from Diameter server during the specified polling interval.
Alerts or alarms are triggered for unknown rating groups based on the following rules:

- **Enter condition:** Actual number of unknown rating groups is greater than or equal to the high threshold.
- **Clear condition:** Actual number of unknown rating groups is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* unknown rating groups and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold dcca-unknown-rating-group 250 clear 100
```

threshold diameter diameter-retry-rate

This command configures Diameter Retry Rate threshold for generating alerts or alarms based on the percentage of Diameter requests that were retried during the polling interval.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold diameter diameter-retry-rate *high_thresh* **[clear** *low_thresh* **]**

default threshold diameter diameter-retry-rate

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the high threshold. If, within the polling interval, the percentage of Diameter requests retried equals or exceeds *high_thresh* an alert or alarm is generated.
high_thresh is an integer from 0 through 100.
Default: 0

clear *low_thresh*

Specifies the low threshold. If, within the polling interval, the percentage of Diameter requests retried falls below *low_thresh*, a clear alarm is generated.
low_thresh is an integer from 0 through 100.
Default: 0

Important: This value is applicable for the Alarm mode, and ignored for the Alert mode. In addition, if this value is not configured for the Alarm mode, the system assumes it is identical to the high threshold.

Usage

Diameter Retry Rate threshold generates alerts or alarms based on the percentage of Diameter requests that were retried during the specified polling interval.
Alerts or alarms are triggered based on the following rules:

- **Enter condition:** Percentage of Diameter requests retried is greater than or equal to the high threshold.
- **Clear condition:** Percentage of Diameter requests retried is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold of *75* percent, and a low threshold of *50* percent for a system using the Alarm thresholding model:

```
threshold diameter diameter-retry-rate 75 clear 50
```

threshold dns-learnt-ip-max-entries

This command configures thresholds for the percentage of total DNS-learnt IP entries in relation to the ACS DNS Snooping feature.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold dns-learnt-ip-max-entries *high_thresh* **[clear** *low_thresh* **]**

default threshold dns-learnt-ip-max-entries

default

Configures this command with the default threshold setting.
Default: 90 percent. It is the same for both high and low thresholds.

high_thresh

Default: 90 percent
Specifies the high threshold for percentage of total DNS-learnt IP entries. When the percentage of total DNS-learnt IP entries meets or exceeds the high threshold at the end of the polling interval, an alert or alarm is generated.
When the percentage of total DNS-learnt IPv4 entries meets or exceeds the high threshold, the ECSTotalDNSLearntIPv4Threshold trap is generated.
When the percentage of total DNS-learnt IPv6 entries meets or exceeds the high threshold, the ECSTotalDNSLearntIPv6Threshold trap is generated.
high_thresh is an integer value from 0 through 100. When configured to 0 the threshold is disabled.

clear *low_thresh*

Default: 90 percent
Specifies the low threshold for percentage of total DNS-learnt IP entries. When the percentage of total DNS-learnt IP entries goes below the low threshold within the polling interval, a clear alarm is generated.
When the percentage of total DNS-learnt IPv4 entries goes below the low threshold, the ECSTotalDNSLearntIPv4ThresholdClear trap is generated.
When the percentage of total DNS-learnt IPv6 entries goes below the low threshold, the ECSTotalDNSLearntIPv6ThresholdClear trap is generated.
low_thresh is an integer value from 0 through 100. When configured to 0 the threshold is disabled.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to configure thresholds for the percentage of total DNS-learnt IP entries in relation to the ACS DNS Snooping feature. Note that this threshold applies to both IPv4 and IPv6 DNS entries.

Alerts or alarms are triggered based on the following rules:

- **Enter condition:** Actual percentage of total DNS-learnt IP entries is greater than or equal to the specified percentage of total DNS-learnt IP entries.
- **Clear condition:** Actual of total DNS-learnt IP entries is less than the specified clear percentage of total DNS-learnt IP entries.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval, and the **threshold monitoring ecs** command to enable thresholding for this value.

Example

The following command configures a high threshold of *65* percent and a clear threshold of *35* percent for total DNS-learnt IP entries:

```
threshold dns-learnt-ip-max-entries 65 clear 35
```

threshold edr-file-space

Configures the threshold for monitoring the percentage of total file space allocated for Event Data Records (EDRs) used during the polling interval.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[default] threshold edr-file-space *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 90
Specifies the high threshold for percentage of total allocated EDR file space used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total allocated EDR file space used and is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold for percentage of total allocated EDR file space used that maintains a previously generated alarm condition. If the space usage falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in percentage of total allocated EDR file space used and is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

EDR file space usage generate alerts or alarms based on the percentage of total allocated EDR file space used during the polling interval.
Alerts or alarms are triggered for EDR file space usage session based on the following rules:

- **Enter condition:** Actual percentage of allocated EDR file space usage is greater than or equal to the specified percentage of total EDR file space.
- **Clear condition:** Actual EDR file space used is less than the specified clear percentage of total allocated EDR file space usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold of *65* percent and a clear threshold of *35* percent for of total allocated EDR file space usage:

```
threshold edr-file-space 65 clear 35
```

threshold edr-udr-dropped flow control

This command configures thresholds to monitor the total number of Event Data Records (EDRs) and Usage Data Records (UDRs) discarded due to flow control.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold edr-udr-dropped-flow-control *high_thresh* **[clear** *low_thresh* **]**

default threshold edr-udr-dropped-flow-control

default

Configures this command with the default threshold settings.
Default: High threshold: 90; Low threshold: 10

high_thresh

Specifies the high threshold for total number of EDRs + UDRs dropped due to flow control, which must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh must be an integer from 0 through 100000.
A value of 0 disables the threshold.
Default: 90

clear *low_thresh*

Specifies the low threshold for total number of EDRs + UDRs dropped that maintains a previously generated alarm condition. If the total number of EDRs + UDRs dropped falls below Specifies the low threshold within the polling interval, a clear alarm is generated.
low_thresh must be an integer from 0 through 100000 that must be lower than *high_thresh*.
A value of 0 disables the threshold.
Default: 10

Usage

Use this command to configure thresholds to monitor the total number of EDRs + UDRs discarded due to flow control. Alerts or alarms are generated based on the total number of EDRs + UDRs dropped during polling interval.
Alerts or alarms are triggered for EDR file space usage session based on the following rules:

- **Enter condition:** Actual number of EDRs + UDRs dropped greater than or equal to the specified number of EDRs + UDRs dropped.
- **Clear condition:** Actual number of EDR + UDRs dropped is less than the specified clear number of EDRs + UDRs dropped.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold of *90* and a clear threshold of *45* to monitor EDRs + UDRs dropped due to flow control:

```
threshold edr-udr-dropped-flow-control 90 clear 45
```

threshold fw-deny-rule

This command configures thresholds for Stateful Firewall Deny Rule.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

threshold fw-deny-rule *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-deny-rule

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the Stateful Firewall Deny-Rule threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall Deny-Rule alarm clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of Deny-Rule exceeds a given value, a threshold is raised and it is cleared when the number of Deny-Rule fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval, and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall Deny Rule high threshold of *1000* and a low threshold of *100* for a system using the Alarm Thresholding model:

```
threshold fw-deny-rule 1000 clear 100
```

threshold fw-dos-attack

This command configures thresholds for Stateful Firewall Denial-of-Service (DoS) attacks.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

threshold fw-dos-attack *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-dos-attack

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the Stateful Firewall DoS attacks threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall DoS attacks clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of DoS attacks exceed a given value, a threshold is raised and it is cleared when the number of DoS attacks fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall DoS attacks high threshold of *1000* and a low threshold of *100* for a system using the Alarm Thresholding model:

```
threshold fw-dos-attack 1000 clear 100
```

threshold fw-drop-packet

This command configures thresholds for Stateful Firewall drop packets.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

threshold fw-drop-packet *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-drop-packet

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the Stateful Firewall drop packets threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall drop packets clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of drop packets exceed a given value, a threshold is raised and it is cleared when the number of drop packets fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall drop packets high threshold of *1000* and a low threshold of *100* for a system using the Alarm thresholding model:

```
threshold fw-drop-packet 1000 clear 100
```

threshold fw-no-rule

This command configures thresholds for Stateful Firewall no rules.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

threshold fw-no-rule *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-no-rule

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the Stateful Firewall no rules threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall no rules clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of no rules exceed a given value, a threshold is raised and it is cleared when the number of no rules fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall no rules high threshold of *1000* and a low threshold of *100* for a system using the Alarm Thresholding model:

```
threshold fw-no-rule 1000 clear 100
```

threshold license

Configures thresholds for session license utilization by the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] threshold license remaining-sessions *low_thresh* **clear** *high_thresh*

remaining-sessions *low_thresh*

Default: 10
Specifies the low threshold session license utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
low_thresh is an integer from 0 through 100.

clear *high_thresh*

Default: 10
Specifies the high threshold session license utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated.
high_thresh is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

Session license utilization thresholds generate alerts or alarms based on the utilization percentage of all session capacity licenses during the specified polling interval.
The system uses session capacity license to dictate the maximum number of simultaneous sessions that can be supported. There are multiple session types that require licenses. Although, a single threshold is configured for all session types, alerts or alarms can be generated for each type.
Alerts or alarms are triggered for session license utilization based on the following rules:

- **Enter condition:** Actual session license utilization percentage per session type is greater than or equal to the low threshold.
- **Clear condition:** Actual session license utilization percentage per session type is greater than the high threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a session license low threshold percentage of *10* and a high threshold of *35* for a system using the Alarm thresholding model:

```
threshold license remaining-sessions 10 clear 35
```

threshold mgmt-cpu-memory-usage

Configures the thresholds for CPU memory usage.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold mgmt-cpu-memory-usage *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold percent of CPU memory usage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total memory used and can be configured to an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Specifies the low threshold percent of CPU memory usage that maintains a previously generated alarm condition. If the percentage falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is measured in percentage of total memory used and can be configured to an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU memory usage thresholds generate alerts or alarms based on memory usage for the SMC CPU during the polling interval. A single threshold enables CPU monitoring for both the active and standby SMCs allowing for alerts or alarms to be generated for each CPU.
Alerts or alarms are triggered for SMC CPU memory usage based on the following rules:

- **Enter condition:** Actual CPU memory usage is greater than or equal to the high threshold
- **Clear condition:** Actual CPU memory usage is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a threshold of *65* percent of total SMC CPU memory usage and a clear threshold of *35* percent:

```
threshold mgmt-cpu-memory-usage 65 clear 35
```

threshold mgmt-cpu-utilization

Configures the thresholds for CPU utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold mgmt-cpu-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold CPU utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100.

clear *low_thresh*

Specifies the low threshold CPU utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU utilization thresholds generate alerts or alarms based on the utilization percentage of each SMCCPU during the specified polling interval. Although, a single threshold is configured for both SMC CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for SMC CPU utilization based on the following rules:

- **Enter condition:** Average measured CPU utilization for the last 5 minutes is greater than or equal to the high threshold.
- **Clear condition:** Average measured CPU utilization for the last 5 minutes is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold SMC CPU utilization percentage of *90* for a system using the Alert thresholding model:

```
threshold mgmt-cpu-utilization 90
```

threshold mme-attach-failure

Use this command to configure thresholds for the total number of MME Attach Failure messages to count across all the MME services in the system as threshold limit to generate alert or alarm.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold total-mme-attach-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total MME Attach Failure messages across all services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total MME Attach Failure messages across all services on a system that maintains a previously generated alarm condition. If the number of MME Attach Failure messages across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME Attach Failure message across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME Attach Failure message based on the following rules:

- **Enter condition:** Actual total number of MME Attach Failure messages is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of MME Attach Failure messages is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll mme-attach-failure** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures the limit of MME Attach Failure high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold mme-attach-failure 10000
```

threshold mme-auth-failure

Use this command to configure thresholds for the total number of MME Auth Failure messages to count across all the MME services in the system as threshold limit to generate alert or alarm.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold total-mme-auth-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total MME Auth Failure messages across all MMM services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total MME Auth Failure messages across all services on a system that maintains a previously generated alarm condition. If the number of MME Attach Failure messages across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME Auth Failure message across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME Auth Failure message based on the following rules:

- **Enter condition:** Actual total number of MME Auth Failure messages is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of MME Auth Failure messages is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll mme-auth-failure** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures a total MME Auth Failure high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold mme-auth-failure 10000
```

threshold model

Configures the thresholding model for the system to use.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold model { alarm | alert }
```

alarm

Selects the alarm thresholding model as described in the *Usage* section for this command.

alert

Selects the alert thresholding model as described in the *Usage* section for this command.

Usage

The system supports the following thresholding models:

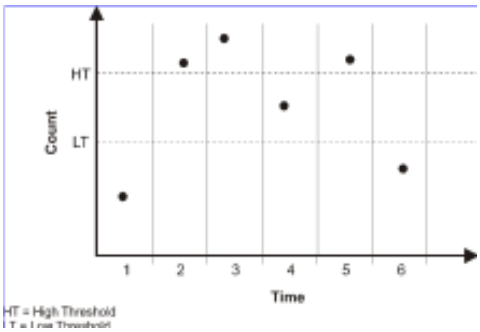
- **Alert:** A value is monitored and an alert condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

In the example shown in the figure below, this model generates alerts during period 2, 3, and 5 at the point where the count exceeded the high threshold.

- **Alarm:** Both high and low threshold are defined for a value. An alarm condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

The alarm is cleared at the end of the first interval where the measured value is below the low threshold. In the example shown in the figure below, this model generates an alarm during period 2 when the count exceeds the high threshold. A second alarm is generated in period 6 when the count falls beneath low threshold. The second alarm indicates a "clear" condition.

Figure 4. Thresholding Model Example



Important: For certain values the alert or alarm serves to warn of low quantities (such as, memory, session licenses, etc.). In these cases, the low threshold is the condition that must be met or exceeded within the polling interval to generate the alert or alarm. When the high threshold is exceeded during an interval, the low quantity condition is cleared.

Refer to the **`threshold monitoring`** command for additional information on thresholding.

Example

The following command configures the system to support the Alarm thresholding model:

```
threshold model alarm
```

threshold monitoring

Enables thresholding for the selected value.

Product

All

Privilege

Administrator

Syntax

[no | default] threshold monitoring { aaa-acct-archive-queue | aaa-acct-archive-size | aaa-acct-failure | aaa-auth-failure | aaa-retry-rate | aaamgr-request-queue | asngw | call-setup | content-filtering | cpu-resource | cpu-session-throughput | diameter | ecs | fa-service | firewall | ha-service | hnbgw-service | hsgw-service | ipsec | license | lma-service | mme-service | packets-filtered-dropped | packets-forwarded-to-cpu | pdsn-service | pdg-service | pdif-service | pgw-service | route-service | sgw-service | subscriber | system | tpo }

no

Disables threshold monitoring for the specified value.

default

Sets or restores the default value assigned to the specified parameter.

aaa-acct-archive-queue

Enables threshold monitoring for the AAA accounting archive message queue size.
Refer to the **threshold aaa-acct-archive-queue-size** command for additional information on these values.

aaa-acct-archive-size

Enables threshold monitoring for the size of the AAA accounting record archive.

aaa-acct-failure

Enables threshold monitoring for AAA accounting failures and AAA accounting failure rate values.
Refer to the **threshold aaa-acct-failure** and **threshold aaa-acct-failure-rate** commands for additional information on these values.

aaa-auth-failure

Enables threshold monitoring for AAA authentication failures and AAA authentication failure rate values.
Refer to the **threshold aaa-auth-failure** and **threshold aaa-auth-failure-rate** commands for additional information on these values.

aaa-retry-rate

Enables threshold monitoring for the AAA retry rate value.
Refer to the **threshold aaa-retry-rate** command for additional information on this value.

aaamgr-request-queue

Enables threshold monitoring for AAA Manager Requests for each AAA manager process. Refer to the **threshold aaamgr-request-queue** command for additional information on these values.

asngw

Enables the threshold monitoring for ASN-GW services.

call-setup

Enables threshold monitoring for the call setup, call setup failures, and no-resource rejected call values.
Refer to the **threshold call-setup, threshold call-setup-failure, threshold ppp-setup-fail-rate, threshold rp-setup-fail-rate**, and **threshold call-reject-no-resource** commands for additional information on these values.

cpu-resource

Enables threshold monitoring for CPU thresholds.
Refer to the **threshold 10sec-cpu-utilization, threshold cpu-available-memory, threshold cpu-load, threshold cpu-memory-usage, threshold cpu-orbs-crit, threshold cpu-orbs-warn, threshold cpu-session-throughput, threshold cpu-utilization, threshold mgmt-cpu-memory-usage**, and **threshold mgmt-cpu-utilization** commands for additional information on these values.

cpu-session-throughput

Enables threshold monitoring for the CPU session throughput value.
Refer to the **threshold cpu-session-throughput** command for additional information on this value.

content-filtering

Enables threshold monitoring for the Content Filtering in-line service.

diameter

Enables threshold monitoring for Diameter.

ecs

Enables threshold monitoring for the Active Charging Service (ACS)/Enhanced Charging Service (ECS).

fa-service

Enables threshold monitoring for Registration Reply errors for each FA service.
Refer to the **threshold reg-reply-error** FA Service Configuration Mode command for additional information on this value.

firewall

Enables threshold monitoring for the Stateful Firewall in-line service.
Default: Disabled
Refer to the **threshold fw-deny-rule, threshold fw-dos-attack, threshold fw-drop-packet**, and **threshold fw-no-rule** commands for additional information on this value.

Important: Stateful Firewall thresholds can only be enabled if the Stateful Firewall license is present.

ha-service

Enables threshold monitoring for Registration Reply errors, re-registration reply errors, deregistration reply errors, and average calls setup per second for each HA service and average calls setup per second at the context level.
Refer to the **threshold init-rrq-rcvd-rate, threshold reg-reply-error, threshold rereg-reply-error,** and **threshold dereg-reply-error** HA Service Configuration Mode commands and the **threshold ha-service init-rrq-rcvd-rate** Context Configuration mode command for additional information on this value.

hnbgw-service

Enables threshold monitoring for HNB-GW sessions including Iu-CS and Iu-PS sessions for HNB-GW services on a system at the system level.

Important: This keyword is required to activate the threshold alarm/alert for HNB-GW service to use **threshold total-hnbgw-hnb-sessions**, **thresshold total-hnbgw-iu-sessions**, and **thresshold total-hnbgw-ue-sessions** command for threshold values.

hsgw-service

Enables threshold monitoring for HSGW services.
Refer to the threshold total-hsgw-sessions for more information on HSGW thresholds.

ipsec

Enables monitoring of IPSec thresholds.
refer to the HA-Service Configuration Mode chapter of the Command Line Interface Reference for information on the IPSec thresholds.

license

Enables threshold monitoring for the session license value.
Refer to the **threshold license** command for additional information on this value.

lma-service

Enables threshold monitoring for LMA services.
Refer to the threshold total-lma-sessions for more information on LMA thresholds.

mme-service

Default: Disabled.
Enables threshold monitoring for the MME services.
Refer to the t**hreshold total-mme-sessions** commands for additional information on this value.

packets-filtered-dropped

Enables threshold monitoring for the filtered/dropped packet value.
Refer to the **threshold packets-filtered-dropped** command for additional information on this value.

packets-forwarded-to-cpu

Enables threshold monitoring for the forwarded packet value.
Refer to the **threshold packets-forwarded-to-cpu** command for additional information on this value.

pdg-service

Enables threshold monitoring for PDG service.
Threshold monitoring for PDG service is disabled by default.

pdif-service

Enables threshold monitoring for PDIF service.

pdsn-service

Enables threshold monitoring for average calls setup per second for contexts and for PDSN services, A11 Request.
Refer to the **threshold packets-forwarded-to-cpu** command for additional information on this value.

pgw-service

Enables threshold monitoring for P-GW services.
Refer to the threshold total-pgw-sessions for more information on P-GW thresholds.

route-service

Enables threshold monitoring for BGP/VRF route services.
Refer to the **ip maximum-routes** command in Context configuration mode and **threshold route-service bgp-routes** in this mode for more information on route thresholds.

sgw-service

Enables threshold monitoring for S-GW services.
Refer to the threshold total-sgw-sessions for more information on S-GW thresholds.

subscriber

Enables threshold monitoring for the subscriber and session values.
Refer to the **threshold subscriber active**, **threshold subscriber total**, **threshold total-ggsn-sessions**, **threshold total-gprs-sessions**, **threshold total-gprs-pdp-sessions**, **threshold total-ha-sessions**, **threshold total-lns-sessions**, **threshold total-pdsn-sessions**, **threshold total-sgsn-sessions**, **threshold total-sgsn-pdp-sessions**, **threshold per-service-ggsn-sessions**, **threshold per-service-ha-sessions**, t**hreshold per-service-lns-sessions**, and **threshold per-service-pdsn-sessions** commands for additional information on these values.

system

Enables system (chassis) thresholds monitoring.

tpo

Enables thresholds monitoring for Traffic Performance Optimization (TPO) in-line service.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 22. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

In addition to the values that can be enabled by this command, the system supports the enabling of threshold monitoring for IP pool address availability (refer to the **ip pool** and threshold commands in this reference) and port utilization (refer to the threshold commands in this chapter).

Example

The following command enables thresholding for subscriber totals:

```
threshold monitoring subscriber
```

threshold nat-port-chunks-usage

This command configures the Network Address Translation (NAT) port chunk utilization threshold settings.

Important: This command is only available in 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

threshold nat-port-chunks-usage *high_thresh* **[clear** *low_thresh* **]**

default threshold nat-port-chunks-usage

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the high NAT-port-chunks-usage percentage threshold that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh must be an integer from 0 through 100. A value of 0 disables the threshold.
Default: 0

clear *low_thresh*

Specifies the low nat-port-chunks-usage percentage threshold that must be met within the polling interval for a clear alarm to be generated.
low_thresh must be an integer from 0 through 100. A value of 0 disables the threshold. If not set, the *high_thresh* will be the high and low threshold setting.
Default: 0

Usage

Use this command to configure the NAT port chunk utilization threshold settings.

Example

The following command sets the NAT port chunk utilization threshold settings to a high of *75*% and a low of *15*%:

```
threshold nat-port-chunks-usage 75 clear 15
```

threshold packets-filtered-dropped

Configures filtered or dropped packet thresholds for the system.

Product

PDSN, GGSN, HA, SGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold packets-filtered-dropped *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of filtered/dropped packets experienced by the system resulting from access control list (ACL) rules that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of filtered/dropped packets experienced by the system resulting from ACL rules that maintains a previously generated alarm condition. If the number of packets falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Filtered/dropped packet thresholds generate alerts or alarms based on the total number of packets that were filtered or dropped by the system as a result of ACL rules during the specified polling interval.
Alerts or alarms are triggered for filtered/dropped packets based on the following rules:

- **Enter condition:** Actual number of filtered/dropped packets is greater than or equal to the high threshold.
- **Clear condition:** Actual number of filtered/dropped packets is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value. In addition, refer to information on ACLs in this reference.

Example

The following command configures a filtered/dropped packet high threshold count of *150000* for a system using the Alert thresholding model:

```
threshold packets-filtered-dropped 150000
```

threshold packets-forwarded-to-cpu

Configures forwarded packet thresholds for the system.

Product

PDSN, GGSN, HA, SGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold packets-forwarded-to-cpu *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of forwarded packets experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of forwarded packets experienced by the system that maintains a previously generated alarm condition. If the number of packets falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Forwarded packet thresholds generate alerts or alarms based on the total number of packets that were forwarded to active system CPU(s) during the specified polling interval. Packets are forwarded to active system CPUs when the NPUs do not have adequate information to properly route them.

Important: Ping and/or traceroute packets are intentionally forwarded to system CPUs for processing. These packet types are included in the packet count for this threshold.

Alerts or alarms are triggered for forwarded packets based on the following rules:

- **Enter condition:** Actual number of forwarded packets is greater than or equal to the high threshold
- **Clear condition:** Actual number of forwarded packets is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a forwarded packet high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold packets-forwarded-to-cpu 10000
```

threshold pdg-current-active-sessions

Configures the threshold for monitoring the total number of all current Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) sessions only.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

threshold pdg-current-active-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of active PDG sessions to be monitored on a chassis. *high_thresh* is an integer from 0 through 300000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears the number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is an integer from 0 through 100000.

Usage

Thresholds are provided for monitoring the overall PDG usage on a chassis. This command is used to monitor the total number of active PDG sessions for an entire chassis.

Example

The following command configures a monitoring threshold of *300000* active PDG sessions on a chassis:

```
threshold pdg-current-active-sessions 300000
```

which turns out to be too many, so the following command clears *100000*:

```
threshold pdg-current-active-sessions 300000 clear 100000
```

threshold pdg-current-sessions

Configures the threshold for monitoring the total number of all current Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) sessions, including inactive sessions.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

threshold pdg-current-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of PDG sessions on a chassis, both active and inactive. *high_thresh* is any integer from 0 through 300000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears any number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is any integer from 0 through 100000.

Usage

Thresholds are provided for monitoring the overall PDG usage on a chassis. This command is used to monitor the total number of PDG sessions, both active and inactive, for an entire chassis.

Example

The following command configures a monitoring threshold of *300000* active and inactive PDG sessions on a chassis:

```
threshold pdg-current-sessions 300000
```

which turns out to be too many, so the following command clears *100000*:

```
threshold pdg-current-sessions 300000 clear 100000
```

threshold pdif-current-sessions

Configures the threshold for monitoring the total number of all current Packet Data Interworking Function (PDIF) sessions, including inactive sessions.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

threshold pdif-current-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of PDIF sessions on a chassis, both active and inactive. *high_thresh* is an integer from 0 through 1000000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears the specified number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is an integer from 0 through 1000000.

Usage

Thresholds are provided for monitoring the overall PDIF usage on a chassis. This command is used to monitor the total number of PDIF sessions, both active and inactive, for an entire chassis.

Example

The following command configures a monitoring threshold of *300000* active and inactive PDIF sessions on a chassis:

```
threshold pdif-current-sessions 300000
```

which turns out to be too many, so the following command clears *100000*:

```
threshold pdif-current-sessions 300000 clear 100000
```

threshold pdif-current-active-sessions

Configures the threshold for monitoring the total number of current Packet Data Interworking Function (PDIF) sessions only.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

threshold pdif-current-active sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of active PDIF sessions to be monitored on a chassis. *high_thresh* is any integer from 0 through 1000000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears the specified number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is any integer from 0 through 1000000.

Usage

Thresholds are provided for monitoring the overall PDIF usage on a chassis. This command is used to monitor the total number of active PDIF sessions for an entire chassis.

Example

The following command configures a monitoring threshold of *300000* active PDIF sessions on a chassis:

```
threshold pdif-current-active-sessions 300000
```

which turns out to be too many, so the following command clears *100000*:

```
threshold pdif-current-active-sessions 300000 clear 100000
```

threshold per-service-ggsn-sessions

Configures thresholds for the number of PDP contexts per GGSN service in the system.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-ggsn-sessions *high_thresh* **[** *clear low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of PDP contexts for any one GGSN service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of PDP contexts for any one GGSN service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of PDP contexts for any GGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of PDP contexts for any GGSN service is greater than or equal to the high threshold
- **Clear condition:** Actual number of PDP contexts is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* subscriber attaches per GGSN service for the Alert thresholding model:

```
threshold per-service-ggsn-sessions 10000
```

threshold per-service-gprs-pdp-sessions

Configures thresholds for the number of 2G-activated PDP contexts per GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-gprs-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of 2G-activated PDP contexts for any one GPRS service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of 2G-activated PDP contexts for any one GPRS service. This number or higher maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, then a clear alarm will be generated.
low_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 2G-activated PDP contexts for any GPRS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of PDP contexts for any GPRS service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PDP contexts is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 2G-activated PDP contexts per GPRS service for the Alert thresholding model:

```
threshold per-service-gprs-sessions 10000
```

threshold per-service-gprs-sessions

Configures the thresholds for the number of 2G-attached subscribers per GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-gprs-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of 2G-attached subscribers for any one GPRS service. This threshold number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of 2G-attached subscribers for any one GPRS service. The number of subscribers must remain above this threshold in order to maintain a previously generated alarm condition. If the number of 2G subscribers falls beneath the low threshold within the polling interval, then a clear alarm will be generated.
low_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 2G-attached subscribers for any GPRS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 2G-attached subscribers for any GPRS service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of 2G-attached subscribers is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 2G-attaches per GPRS service for the Alert thresholding model:

```
threshold per-service-gprs-sessions 10000
```

threshold per-service-ha-sessions

Configures thresholds for the number of HA sessions per HA service in the system.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-ha-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of HA sessions for any one HA service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of HA sessions for any one HA service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of HA sessions for any HA service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HA sessions based on the following rules:

- **Enter condition:** Actual number of HA sessions for any HA service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of HA sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a HA session per service high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold per-service-ha-sessions 10000
```

threshold per-service-lns-sessions

Configures thresholds for the number of L2TP Network Server (LNS) sessions per LNS service in the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-lns-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of LNS sessions for any one LNS service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of LNS sessions for any one LNS service that maintains a previously generated alarm condition. If the number of LNS sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of LNS sessions for any LNS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for LNS sessions based on the following rules:

- **Enter condition:** Actual number of LNS sessions for any LNS service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of LNS sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a LNS session per service high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold per-service-lns-sessions 10000
```

threshold per-service-pdsn-sessions

Configures thresholds for the number of Packet Data Serving Node (PDSN) sessions per PDSN service in the system.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-pdsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of PDSN sessions for any one PDSN service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of PDSN sessions for any one PDSN service that maintains a previously generated alarm condition. If the number of PDSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of PDSN sessions for any PDSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDSN sessions based on the following rules:

- **Enter condition:** Actual number of PDSN sessions for any PDSN service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PDSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a HA session per service high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold per-service-pdsn-sessions 10000
```

threshold per-service-sgsn-pdp-sessions

Configures the thresholds for the number of 3G-activated PDP contexts per SGSN service on the system.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-sgsn-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of 3G-activated PDP contexts for any one SGSN service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of 3G-activated PDP contexts for any one SGSN service. This number or higher maintains a previously generated alarm condition. If the number of 3G-activated PDP contexts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2400000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 3G-activated PDP contexts for any SGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 3G-activated PDP contexts for any SGSN service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of 3G-activated PDP contexts is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 3G-activated PDP contexts per SGSN service for the system's Alert thresholding model:

```
threshold per-service-sgsn-sessions 10000
```

threshold per-service-sgsn-sessions

Configures the thresholds for the number of 3G-attached subscribers per SGSN service in the system.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-sgsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of 3G-attached subscribers for any one SGSN service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of 3G-attached subscribers for any one SGSN service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 3G-attached subscribers for any one SGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 3G-attached subscribers for any single SGSN service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of 3G-attached subscribers for any single SGSN service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 3G-attached subscribers per SGSN service for a system using the Alert thresholding model:

```
threshold per-service-sgsn-sessions 10000
```

threshold poll

This command configures the polling interval over which to count or measure the thresholding value.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default] threshold poll { 10sec-cpu-utilization | all-ppp-send-discard | a11-rac-msg-discard |a11-rrp-failure | a11-rrq-msg-discard | aaa-acct-archive-queue-size1 | aaa-acct-archive-queue-size2 | aaa-acct-archive-queue-size3 aaa-acct-archive-size | aaa-acct-failure | aaa-acct-failure-rate | aaa-auth-failure | aaa-auth-failure-rate | aaa-retry-rate | aaamgr-request-queue | active-subscriber | asngw-auth-failure | asngw-handoff-denial | asngw-max-eap-retry | asngw-network-entry-denial | asngw-session-setup-timeout | asngw-session-timeout | asnpc-idle-mode-timeout | asnpc-im-entry-denial | asnpc-lu-denial | asnpc-session-setup-timeout | available-ip-pool-group | call-reject-no-resource | call-setup | call-setup-failure | call-setup-failures | call-total-active | cdr-file-space | contfilt-block | contfilt-rating | cpu-available-memory | cpu-load | cpu-memory-usage | cpu-orbs-crit | cpu-orbs-warn | cpu-session-throughput | cpu-utilization | cscf-invite-rcvd | cscf-reg-rcvd | cscf-service-route-failures | dcca-bad-answers | dcca-protocol-error | dcca-rating-failed | dcca-unknown-rating-group | dereg-reply-error | | diameter-retry-rate | edr-file-space | edr-udr-dropped-flow-control | error-no-resource| error-presence | error-reg-auth | error-tcp| fa-reg-reply-error | fng-current-active-sessions | fng-current-sessions | fw-deny-rule | fw-dos-attack | fw-drop-packet | fw-no-rule | ha-init-rrq-rcvd-rate | ha-svc-init-rrq-rcvd-rate | ip-pool-free | ip-pool-hold | ip-pool-release | ip-pool-used | ipsec-call-req-rej | ipsec-ike-failrate | ipsec-ike-failures | ipsec-ike-requests | ipsec-tunnels-established | ipsec-tunnels-setup | license-remaining-session | mgmt-cpu-memory-usage interval | mgmt-cpu-utilization | nat-port-chunks-usage | packets-filtered-dropped | packets-forwarded-to-cpu | pdg-current-active-sessions | pdg-current-sessions | pdif-current-active-sessions | pdif-current-sessions | pdsn-init-rrq-rcvd-rate | pdsn-svc-init-rrq-rcvd-rate | per-service-asngw-sessions | per-service-ggsn-sessions | per-service-gprs-sessions | per-service-gprs-pdp-sessions | per-service-ha-sessions | per-service-lns-sessions | per-service-pdsn-sessions | per-service-sgsn-sessions | per-service-sgsn-pdp-sessions | port-high-activity | port-rx-utilization | port-tx-utilization | ppp-setup-fail-rate | reg-reply-error | reg-total-active | rereg-reply-error | route-service | rp-setup-fail-rate | storage-utilization total-asngw-sessions | total-ggsn-sessions | total-gprs-sessions | total-gprs-pdp sessions | total-ha-sessions | total-hsgw-sessions | total-lma-sessions | total-lns-sessions | total-mme-sessions | total-pdsn-sessions | total-pgw-sessions | total-sgsn-sessions | total-sgsn-pdp-sessions | total-sgw-sessions | total-subscriber } interval *time*

default

Restores the specified parameter to its default value.

10sec-cpu-utilization percent

Default: 300 seconds (5 minutes)
Configures the polling interval for measuring a 10-second average of CPU utilization.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

a11-rrp-failure

Default: 0
Configures the polling interval over which to count A11 Registration Response failures. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

a11-rrq-msg-discard

Default: 0
Configures the polling interval over which to count how many A11 Registration Request messages are discarded. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

a11-rac-msg-discard

Default: 0
Configures the polling interval over which to count how many A11 Registration Acknowledgement messages are discarded. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

aaa-acct-archive-queue-size1

Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure AAA accounting archive message queue size.

aaa-acct-archive-queue-size2

Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure AAA accounting archive message queue size.

aaa-acct-archive-queue-size3

Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure AAA accounting archive message queue size.

aaa-acct-archive-size

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count archived AAA accounting messages.

aaa-acct-failure

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count failed AAA accounting requests.

aaa-acct-failure-rate

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of AAA accounting failures.

aaa-auth-failure

Default: 300 seconds (5 minutes)

Configures the polling interval over which to count failed authentication requests.

aaa-auth-failure-rate

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of AAA authentication failures.

aaa-retry-rate

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percent of AAA request message retries.

aaamgr-request-queue

Default: 0
Configures the polling interval over which to count the number of AAA Manager Requests for each AAA manager process. When specifying **interval** *time* for this threshold, the range is from 60 through 60000 seconds.

active-subscriber

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of active subscriber sessions.

all-ppp-send-discard

Default: 0
Configures the polling interval over which to count the number of discarded PPP send packets. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

available-ip-pool-group

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure IP pool utilization.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

call-reject-no-resource

Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls rejected due to insufficient resources.

call-setup

Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls setup.

call-setup-failure

Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls setup failures.

call-setup-failures

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF call setup failures.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

call-total-active

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF total active calls.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

cpu-available-memory

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure packet processing card CPU memory availability.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

cpu-load

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure packet processing card CPU load using a 5-minute average measurement.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

cpu-memory-usage

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of total packet processing card CPU memory used.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

cpu-orbs-crit

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of CPU utilization by the ORBS software task for critical-level alerts.

cpu-orbs-warn

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of CPU utilization by the ORBS software task for warning-level alerts.

cpu-session-throughput

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure packet processing card CPU session throughput.

Important: This command is not supported on all platforms

cpu-utilization

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure packet processing card CPU utilization.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

cscf-invite-rcvd

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the Call State Control Function (CSCF) calls. *time* must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

cscf-reg-rcvd

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the CSCF registrations.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

cscf-service-route-failures

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the CSCF service route failures.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

dcca-bad-answers

Configures the polling interval in seconds over which to count Diameter bad answers.

dcca-protocol-error

Configures the polling interval in seconds over which to count Diameter protocol errors.

dcca-rating-failed

Configures the polling interval in seconds over which to count Diameter rating failures.

dcca-unknown-rating-group

Configures the polling interval in seconds over which to count Diameter unknown rating group errors.

dereg-reply-error

Default: 0
Configures the polling interval over which to measure the number of de-registration reply errors for HA services. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

diameter-retry-rate

Configures the polling interval over which to measure the number of retries to Diameter server. When specifying **interval** *time* for this threshold, the range is from 60 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30.

edr-file-space

Configures the polling interval in seconds over which to count Event Data Record (EDR) file space.

edr-udr-dropped-flow-control

Configures the polling interval in seconds over which to count EDR-UDRs Dropped due to Flow Control at ACSMGR.

error-no-resource

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF No Resource Errors.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

error-presence

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF Presence Errors.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

error-reg-auth

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF Reg-Auth Errors.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

error-tcp

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF TCP Errors.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

fa-reg-reply-error

Default: 0
Configures the polling interval over which to measure the number of registration reply errors for FA services. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

fng-current-active-sessions

Configures the polling interval in seconds over which to count FNG current active sessions.

fng-current-sessions

Configures the polling interval in seconds over which to count FNG current sessions.

fw-deny-rule

Default: 900 seconds (15 minutes)
Configures the Stateful Firewall Deny-Rule threshold polling interval. For this threshold the interval time range is from 60 through 900 seconds.

fw-dos-attack

Default: 900 seconds (15 minutes)
Configures the Stateful Firewall DoS-Attacks threshold polling interval. For this threshold the interval time range is from 60 through 900 seconds.

fw-drop-packet

Default: 900 seconds (15 minutes)
Configures the Stateful Firewall Drop-Packet threshold polling interval. For this threshold the interval time range is from 60 through 900 seconds.

fw-no-rule

Default: 900 seconds (15 minutes)
Configures the Stateful Firewall No-Rule threshold polling interval. For this threshold the interval time range is from 60 through 900 seconds.

ha-init-rrq-rcvd-rate

Default: 0
Configures the polling interval over which to measure the average number of calls setup per minute for the context. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

ha-svc-init-rrq-rcvd-rate

Default: 0
Configures the polling interval over which to measure the average number of calls setup per minute for HA services. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

ip-pool-free

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of the IP pool addresses that are in the free state.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

ip-pool-hold

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of the IP pool address that are in the hold state.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

ip-pool-release

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of IP pool address that are in the release state.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

ip-pool-used

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of the IP pool addresses that are used.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

ipsec-ipsec-call-req-rej

Default: 900
Configures the polling interval over which to count the IPSec call requests that are rejected.

ipsec-ike-failrate

Default: 900
Configures the polling interval over which to count the IPSec IKE failure rate.

ipsec-ike-failures

Default: 900
Configures the polling interval over which to count the IPSec IKE failures.

ipsec-ike-requests

Default: 900
Configures the polling interval over which to count the IPSec IKE request.

ipsec-tunnels-established

Default: 900
Configures the polling interval over which to count the IPSec tunnels established.

ipsec-tunnels-setup

Default: 900
Configures the polling interval over which to count the IPSec tunnels setup.

license-remaining-session

Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure session license utilization.

mgmt-cpu-memory-usage interval

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure SMC CPU memory usage.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

mgmt-cpu-utilization

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure SMC CPU usage.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms.

nat-port-chunks-usage

Important: This keyword is only available in 8.3 and later releases.

Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure NAT port chunks usage.

packets-filtered-dropped

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the filtered/dropped packets.

packets-forwarded-to-cpu

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the forwarded packets.

pdg-current-active-sessions

Configures how frequently the system polls the pdg-current-active-sessions threshold.

pdg-current-sessions

Configures how frequently the system polls the pdg-current-sessions threshold.

threshold poll pdif-current-sessions interval *period*

Configures the polling interval for all current PDIF sessions in seconds rounded to the nearest multiple of 30 seconds. *period* is an integer from 30 to 60000.

threshold poll pdif-current-active-sessions interval *period*

Configures the polling interval for active sessions only in seconds rounded to the nearest multiple of 30 seconds. *period* is an integer from 30 to 60000.

pdsn-init-rrq-rcvd-rate

Default: 0
Configures the polling interval over which to measure the average number of calls setup per second for a PDSN-service. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

pdsn-svc-init-rrq-rcvd-rate

Configures the polling interval in seconds over which to count PDSN per-service call received rate.

per-service-asngw-sessions

Configures the polling interval in seconds over which to count per service ASN-GW sessions.

per-service-ggsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the number of PDP contexts per GGSN service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-gprs-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval during which the SGSN counts the number of 2G-attached subscriber per GPRS service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-gprs-pdp-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval during which the SGSN counts the number of 2G-activated PDP contexts per GPRS service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-ha-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the number of HA sessions per HA service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-lns-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the number of L2TP Network Server (LNS) sessions per LNS service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-pdsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the number of PDSN sessions per PDSN service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-sgsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval during which the SGSN counts the number of 3G-attached subscribers per SGSN service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-sgsn-pdp-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval during which the SGSN counts the number of 3G-activated PDP contexts per SGSN service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

port-high-activity

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure for high port activity.

Important: This command is not supported on all platforms

port-rx-utilization

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure receive port utilization.

Important: This command is not supported on all platforms

port-tx-utilization

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure transmit port utilization.

Important: This command is not supported on all platforms

ppp-setup-fail-rate

Default: 900 seconds (15 minutes)
Configure the polling interval over which to measure the PPP setup failure rate.

reg-reply-error

Default: 0

Configures the polling interval over which to measure number of registration reply errors for HA services. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

reg-total-active

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure CSCF Total Active Registrations.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

rereg-reply-error

Default: 0
Configures the polling interval over which to measure number of re-registration reply errors for HA services. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

rp-setup-fail-rate

Default: 900 seconds (15 minutes)
Configure the polling interval over which to measure the RP setup failure rate.

spc-cpu-memory-usage interval

Important: This command has been renamed to **threshold mgmt-cpu-memory-usage**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms

spc-cpu-utilization

Important: This command has been renamed to **threshold mgmt-cpu-utilization**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms

storage-utilization

Default: 900 seconds (15 minutes)
Configures the polling interval over which to record the CompactFlash utilization percentage threshold interval in seconds.

total-asngw-sessions

Configures the polling interval over which to measure total ASN-GW sessions on the system.

total-ggsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of GGSN sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-gprs-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of 2G-attached subscribers on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-gprs-pdp-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of 2G-activated PDP contexts per GPRS sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-ha-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of HA sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-hsgw-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of HSGW sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-lma-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of Local Mobility Anchor (LMA) sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-lns-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of LNS sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-pdsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of PDSN sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-pgw-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of P-GW sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-sgsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of SGSN sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-sgsn-pdp-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of SGSN sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-sgw-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of S-GW sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-subscriber

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of subscriber sessions.

interval *time*

Specifies the amount of time that comprises the polling interval.
time is measured in seconds and can be configured to any integer value from 60 to 60000 unless otherwise noted in keyword descriptions.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Example

The following command configures the polling interval for the total subscribers threshold value to *600* seconds (10 minutes):

```
threshold poll total-subscriber interval 600
```

threshold poll aaa-acct-archive-queue-size

Configures the polling interval over which to measure AAA accounting archive message queue size.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold poll aaa-acct-archive-queue-size1 interval *duration*

default threshold poll aaa-acct-archive-queue-size1 interval

threshold poll aaa-acct-archive-queue-size2 interval *duration*

default threshold poll aaa-acct-archive-queue-size2 interval

threshold poll aaa-acct-archive-queue-size3 interval *duration*

default threshold poll aaa-acct-archive-queue-size3 interval

default

Restores the specified parameter to its default value 900 seconds.

interval *duration*

Default: 900 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA accounting archive queue size threshold:

```
threshold poll aaa-acct-archive-queue-size1 interval 600
```

threshold poll aaa-acct-archive-size

Configures the polling interval over which to count archived AAA accounting messages.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold poll aaa-acct-archive-size interval *duration*

default threshold poll aaa-acct-archive-size interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA accounting archive size threshold:

```
threshold poll aaa-acct-archive-size interval 600
```

threshold poll aaa-acct-failure

Configures the polling interval over which to count failed AAA accounting requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold poll aaa-acct-failure interval *duration*

default threshold poll aaa-acct-failure interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA accounting failure threshold:

```
threshold poll aaa-acct-failure interval 600
```

threshold poll aaa-acct-failure-rate

Configures the polling interval over which to measure the percentage of AAA accounting failures.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold poll aaa-acct-failure-rate interval *duration*

default threshold poll aaa-acct-failure-rate interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA accounting failure rate threshold:

```
threshold poll aaa-acct-failure-rate interval 600
```

threshold poll aaa-auth-failure

Configures the polling interval over which to count failed authentication requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold poll aaa-auth-failure interval *duration*

default threshold poll aaa-auth-failure interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA authentication failure threshold:

```
threshold poll aaa-auth-failure interval 600
```

threshold poll aaa-auth-failure-rate

Configures the polling interval over which to measure the percentage of AAA authentication failures.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold poll aaa-auth-failure-rate interval *duration*

default threshold poll aaa-auth-failure-rate interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA authentication failure rate threshold:

```
threshold poll aaa-auth-failure-rate interval 600
```

threshold poll aaa-retry-rate

Configures the polling interval over which to measure the percent of AAA request message retries.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold poll aaa-retry-rate interval *duration*

default threshold poll aaa-retry-rate interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA retry rate threshold:

```
threshold poll aaa-retry-rate interval 600
```

threshold poll aaamgr-request-queue

Configures the polling interval over which to count the number of AAA Manager Requests for each AAA manager process.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold poll aaamgr-request-queue interval *duration*

default threshold poll aaamgr-request-queue interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA manager request queue threshold:

```
threshold poll aaamgr-request-queue interval 600
```

threshold poll asngw-auth-failure

Configures the polling interval over which to count or measure the thresholding value for ASN Gateway authentication failure.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-auth-failure interval *dur*

default threshold poll asngw-auth-failure interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the ASN Gateway authentication failure threshold:

```
threshold poll asngw-auth-failure interval 600
```

threshold poll asngw-handoff-denial

Configures the polling interval over which to count or measure the thresholding value for ASN Gateway hand-off denial.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-handoff-denial interval *dur*

default threshold poll asngw-handoff-denial interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the polling interval time in seconds.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for hand-off denial threshold:

```
threshold poll asngw-handoff-denial interval 600
```

threshold poll asngw-max-eap-retry

Configures the polling interval over which to count or measure the thresholding value for maximum Extensible Authentication Protocol (EAP) authentication retries.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-max-eap-retry interval *dur*

default threshold poll asngw-max-eap-retry interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for maximum EAP authentication retry threshold:

```
threshold poll asngw-max-eap-retry interval 600
```

threshold poll asngw-network-entry-denial

Configures the polling interval over which to count or measure the thresholding value for network entry denial to an MS.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-network-entry-denial interval *dur*

default threshold poll asngw-network-entry-denial interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for network entry denial threshold:

```
threshold poll asngw-network-entry-denial interval 600
```

threshold poll asngw-r6-invalid-nai

Configures the polling interval over which to count or measure the thresholding value for invalid Network Access Identifiers (NAIs) in R6 messages.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-r6-invalid-nai interval *dur*

default threshold poll asngw-r6-invalid-nai interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for invalid NAIs in R6 messages threshold:

```
threshold poll asngw-r6-invalid-nai interval 600
```

threshold poll asngw-session-setup-timeout

Configures the polling interval over which to count or measure the thresholding value for session setup timeout.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-session-setup-timeout interval *dur*

default threshold poll asngw-session-setup-timeout interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for session setup timeout threshold:

```
threshold poll asngw-session-setup-timeout interval 600
```

threshold poll asngw-session-timeout

Configures the polling interval over which to count or measure the thresholding value for session timeout.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-session-timeout interval *dur*

default threshold poll asngw-session-timeout interval

default

Restores the specified parameter to its default value (300 seconds).

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for session timeout threshold:

```
threshold poll asngw-session-timeout interval 600
```

threshold poll cdr-file-space

This command configures the polling interval for Charging Data Record (CDR) File Space Usage threshold.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold poll cdr-file-space interval *duration*

default threshold poll cdr-file-space interval

default

Uses the default polling interval.
Default: 300 seconds

interval *duration*

Specifies the polling interval (in seconds) for the CDR File Space Usage threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval for CDR File Space Usage threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the CDR file space usage threshold:

```
threshold poll cdr-file-space interval 600
```

threshold poll contfilt-block

This command configures the polling interval Content Filtering Block threshold.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

threshold poll contfilt-block interval *duration*

default threshold poll contfilt-block interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *duration*

Specifies the polling interval (in seconds) for the Content Filtering Block threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval Content Filtering Block threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the content filtering blocking threshold:

```
threshold poll contfilt-block interval 600
```

threshold poll contfilt-rating

This command configures the polling interval for the Content Filtering Rating threshold.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

threshold poll contfilt-rating interval *duration*

default threshold poll contfilt-rating interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the polling interval (in seconds) for the Content Filtering Rating threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval for the Content Filtering Rating threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the content filtering rating processing threshold:

```
threshold poll contfilt-rating interval 600
```

threshold poll dcca-bad-answers

This command configures the polling interval for DCCA Bad Answers threshold—invalid or bad response to the system from the Diameter server.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold poll dcca-bad-answers interval *duration*

default threshold poll dcca-bad-answers interval

default

Uses the default threshold polling interval.
Default: 900 seconds

interval *duration*

Specifies the polling interval (in seconds) for the DCCA Bad Answers threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the poling interval for DCCA Bad Answers threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Example

The following command configures the polling interval to *600* seconds for invalid or bad response threshold to the system from Diameter server:

```
threshold poll dcca-rating-failed interval 600
```

threshold poll dcca-protocol-error

This command configures the polling interval for Diameter Credit-Control Application (DCCA) Protocol Error threshold.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold poll dcca-protocol-error interval *duration*

default threshold poll dcca-protocol-error interval

default

Uses the default threshold polling interval.
Default: 900 seconds

interval *duration*

Specifies the polling interval (in seconds) for the DCCA Protocol Error threshold.
duration must be an integer from 60 through 60000.

Usage

Use this the polling interval for DCCA Protocol Error threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Example

The following command configures the polling interval to *600* seconds for the DCCA protocol error threshold:

```
threshold poll dcca-protocol-error interval 600
```

threshold poll dcca-rating-failed

This command configures the polling interval for Diameter Credit-Control Application (DCCA) Rating Failed threshold.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold poll dcca-rating-failed interval *duration*

default threshold poll dcca-rating-failed interval

default

Uses the default polling interval.
Default: 900 seconds

interval *duration*

Specifies the polling interval (in seconds) for the DCCA Rating Failed threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval for DCCA Rating Failed threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Example

The following command configures the polling interval to *600* seconds for the Diameter Credit Control Application (DCCA) Rating Group (content-id) request reject thresholds:

```
threshold poll dcca-rating-failed interval 600
```

threshold poll dcca-unknown-rating-group

This command configures the polling interval for Diameter Credit-Control Application (DCCA) Unknown Rating Group threshold.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold poll dcca-unknown-rating-group interval *duration*

default threshold poll dcca-unknown-rating-group interval

default

Uses the default polling interval.
Default: 900 seconds

interval *duration*

Specifies the polling interval (in seconds) for the DCCA Unknown Rating Group threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval for DCCA Unknown Rating Group threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Example

The following command configures the polling interval to *600* seconds to threshold for the unknown DCCA Rating Group (content-id) returned by Diameter to system:

```
threshold poll dcca-unknown-rating-group interval 600
```

threshold poll diameter-retry-rate

This command configures the polling interval for the Diameter Credit-Control Application (DCCA) Diameter Retry Rate threshold.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold poll diameter-retry-rate interval *duration*

default threshold poll diameter-retry-rate interval

default

Uses the default polling interval.
Default: 300 seconds

interval *duration*

Specifies the polling interval (in seconds) for the Diameter Retry Rate threshold.
duration must be an integer from 60 through 60000. The input will be rounded up to the closest multiple of 30.

Usage

This command specifies the polling interval for Diameter Retry Rate threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands in this chapter for additional information on the system's support for thresholding.

Example

The following command configures the Diameter Retry Rate threshold polling interval to *600* seconds:

```
threshold poll diameter-retry-rate interval 600
```

threshold poll edr-file-space

This command configures the polling interval for Event Data Record (EDR) File Space Usage threshold.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

threshold poll edr-file-space interval *duration*

interval *duration*

Default: 300 seconds.
Specifies the polling interval (in seconds) for the EDR File Space Usage threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval for EDR File Space Usage threshold

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring ecs** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the EDR file space usage threshold:

```
threshold poll edr-file-space interval 600
```

threshold poll mme-attach-failure

This command configures the polling interval to count the MME Attach Failure messages across all MME services in the system.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold poll mme-attach-failure interval *dur*

default threshold poll mme-attach-failure interval

default

Restores the polling interval value to its default value of 900 seconds.

interval *dur*

Default: 900 seconds.
Specifies the polling interval (in seconds) for counting MME Attach Failure messages across all MME services in the system.
dur must be an integer from 30 through 60000 in multiples of 30.

Usage

Use this command to configure the polling interval to count the MME Attach Failure messages across all MME services in the system to generate threshold value.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring mme-service** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval of *600* seconds to count the MME Attach Failure messages for threshold limit:

```
threshold poll mme-attach-failure interval 600
```

threshold poll mme-auth-failure

This command configures the polling interval to count the MME Authentication Failure messages across all MME services in the system.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold poll mme-auth-failure interval *dur*

default threshold poll mme-auth-failure interval

default

Restores the specified poll interval value to its default value of 900 seconds.

interval *dur*

Default: 900 seconds.
Specifies the polling interval (in seconds) for counting MME Authentication Failure messages across all MME services in the system.
dur must be an integer from 30 through 60000 in multiples of 30.

Usage

Use this command to configure the polling interval to count the MME Auth Failure messages across all MME services in the system to generate threshold value.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring mme-service** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval of *600* seconds to count the MME Auth Failure messages for threshold limit:

```
threshold poll mme-auth-failure interval 600
```

threshold poll total-hnbgw-hnb-sessions

This command configures the polling interval over which to count or measure the thresholding value for the total number of IuH sessions between the HNB and HNB-GW to count across all the HNB-GW services on a system to trigger an alert or alarm.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll total-hnbgw-hnb-sessions interval *time*

default threshold poll total-hnbgw-hnb-sessions interval

default

Restores the threshold polling interval value to its default value of 900 seconds.

interval *time*

Default: 900 seconds
Specifies the polling interval (in seconds) for counting the total number of IuH sessions between the HNB and HNB-GW across all the HNB-GW services on a system.
time must be an integer from 30 through 60000.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable SNMP trap for threshold monitoring of this threshold use **snmp trap enable ThreshTotalHNBGWHnbSess** command in this mode.

Example

The following command configures the polling interval for counting the total number of IuH sessions between HNB and HNB-GW across all the HNB-GW services on a system, to *600* seconds (10 minutes):

```
threshold poll total-hnbgw-hnb-sessions interval 600
```

threshold poll total-hnbgw-iu-sessions

This command configures the polling interval over which to count or measure the thresholding value for the total number of subscriber sessions on HNB-GW service (over Iu-CS/Iu-PS interface) to count across all the HNB-GW services on a system to trigger alert or alarm.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll total-hnbgw-iu-sessions interval *time*

default threshold poll total-hnbgw-iu-sessions interval

default

Restores the threshold poll interval value to its default value of 900 seconds.

interval *time*

Default: 900 seconds
Specifies the polling interval (in seconds) for counting the total number of subscriber sessions across all the HNB-GW services on a system.
time must be an value from 30 through 60000.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable SNMP trap for threshold monitoring to this threshold use **snmp trap enable ThreshTotalHNBGWIuSess** command in this mode.

Example

The following command configures the polling interval for counting the total number of subscriber sessions across all the HNB-GW services on a system, to *600* seconds (10 minutes):

```
threshold poll total-hnbgw-iu-sessions interval 600
```

threshold poll total-hnbgw-ue-sessions

This command configures the polling interval over which to count or measure the thresholding value for the total number of UEs connected to HNB-GW service to count across all the HNB-GW services on a system to trigger alert or alarm.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll total-hnbgw-iu-sessions interval *time*

default threshold poll total-hnbgw-iu-sessions interval

default

Restores the threshold poll interval value to its default value of 900 seconds.

interval *time*

Default: 900 seconds
Specifies the polling interval (in seconds) for counting the total number UEs connected to an HNB-GW service across all the HNB-GW services on a system.
time must be an integer from 30 through 60000.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable SNMP trap for threshold monitoring to this threshold use **snmp trap enable ThreshTotalHNBGWUeSess** command in this mode.

Example

The following command configures the polling interval for the total number of UEs connected to an HNB-GW service across all the HNB-GW services on a system, to *600* seconds (10 minutes):

```
threshold poll total-hnbgw-ue-sessions interval 600
```

threshold poll total-mme-sessions

This command configures the polling interval over which to count or measure the thresholding value for MME sessions on the system.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold poll total-mme-sessions interval *time*

default threshold poll total-mme-sessions interval

default

Restores the threshold poll interval value to its default value of 900 seconds.

interval *time*

Default: 900 seconds
Specifies the polling interval (in seconds) for counting the total number of MME sessions on the system. *time* must be an ny integer from 30 through 60000.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Example

The following command configures the polling interval for the total MME session threshold polling duration value to *600* seconds (10 minutes):

```
threshold poll total-mme-sessions interval 600
```

threshold poll port-rx-utilization

Enables the generation of alerts or alarms based on the port utilization percentage for data received during the polling interval.

Product

All

Privilege

Administrator Security Administrator

Syntax

threshold poll port-rx-utilization interval *seconds*

interval *seconds*

Configures the threshold polling interval in multiples of 30 seconds. *seconds* is an integer from 30 to 60000

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis configured using the port *port-type slot#/port#* command syntax.

Important: This command is not available on all platforms

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. (The transmitted and received percentages are combined.) Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Example

Use the following example to configure a threshold poll interval of *300* seconds (5 minutes)

```
threshold poll port-rx-utilization interval 300
```

threshold poll port-tx-utilization

Enables the generation of alerts or alarms based on the port utilization percentage for data transmitted during the polling interval.

Product

All

Privilege

Administrator Security Administrator

Syntax

threshold poll port-tx-utilization interval *seconds*

interval *seconds*

Configures the threshold polling interval in multiples of 30 seconds. *seconds* is an integer from 30 through 60000

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis configured using the port *port-type slot#/port#* command syntax.

Important: This command is not available on all platforms

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. (The transmitted and received percentages are combined.) Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Example

Use the following example to configure a threshold poll interval of *300* seconds (5 minutes)

```
threshold poll port-tx-utilization interval 300
```

threshold poll port-high-activity

Enables the generation of alerts or alarms based on the overall port utilization percentage during the polling interval.

Product

All

Privilege

Administrator Security Administrator

Syntax

threshold poll port-high-activity interval *seconds*

interval *seconds*

Configures the threshold polling interval in multiples of 30 seconds. *seconds* is an integer from 30 through 60000

Usage

High port activity thresholds generate alerts or alarms based on the peak utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis. Alerts or alarms are triggered for high port activity based on the following rules:
Enter condition: Actual percent peak utilization of a port is greater than or equal to the high threshold.
Clear condition: Actual percent peak utilization of a port is less than the low threshold.
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.This threshold is configured on a per-port basis configured using the port *port-type slot#/port#* command syntax.

Important: This command is not available on all platforms

Example

Use the following example to configure the polling interval over which to measure for high port activity to *300* seconds:

```
threshold poll port-high-activity interval 300
```

threshold poll route-service

This command configures the polling interval over which to count or measure the thresholding value for route services on the system.

Product

All

Privilege

Administrator Security Administrator

Syntax

threshold poll route-service interval *dur*

default threshold poll route-service interval

default

Restores the threshold poll interval value to its default value of 900 seconds.

interval *time*

Default: 900 seconds
Specifies the polling interval (in seconds) for counting the total number of BGP routes on the system.
dur is any integer from 30 through 60000.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Example

The following command configures the polling interval for the total BGP routes threshold polling duration value to *600* seconds (10 minutes):

```
hreshold poll route-service interval 600
```

threshold poll tpo-dns-failure

This command configures the threshold polling interval for monitoring TPO DNS resolution failures.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

threshold poll tpo-dns-failure interval *interval*

default threshold poll tpo-dns-failure interval

default

Configures this command with the default polling interval.
Default: 900 seconds

interval

Specifies the polling interval (in seconds) for monitoring TPO DNS resolution failures.
interval must be an integer from 30 through 60000. The system rounds up the value to the closest multiple of 30.

Usage

Use this command to configure the threshold polling interval for monitoring TPO DNS resolution failures.

Example

The following command configures the polling interval for TPO DNS resolution failures threshold to *600* seconds:

```
threshold poll tpo-dns-failure interval 600
```

threshold poll tpo-low-compression-gain

This command configures the threshold polling interval for monitoring TPO low-compression-gain results.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

threshold poll tpo-low-compression-gain interval *interval*

default threshold poll tpo-low-compression-gain interval

default

Configures this command with the default polling interval.
Default: 900 seconds

interval

Specifies the polling interval (in seconds) for monitoring TPO low-compression-gain results.
interval must be an integer from 30 through 60000. The system rounds up the value to the closest multiple of 30.

Usage

Use this command to configure the threshold polling interval for monitoring TPO low-compression-gain results.

Example

The following command configures the polling interval for TPO low-compression-gain results threshold to *600* seconds:

```
threshold poll tpo-low-compression-gain interval 600
```

threshold poll tpo-rto-timeout

This command configures the threshold polling interval for monitoring TPO retransmission timeouts (RTOs).

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

threshold poll tpo-rto-timeout interval *interval*

default threshold poll tpo-rto-timeout interval

default

Configures this command with the default polling interval.
Default: 900 seconds

interval

Specifies the polling interval (in seconds) for monitoring TPO retransmission timeouts.
interval must be an integer from 30 through 60000. The system rounds up the value to the closest multiple of 30.

Usage

Use this command to configure the threshold polling interval for monitoring TPO retransmission timeouts.

Example

The following command configures the polling interval for TPO retransmission timeouts threshold to *600* seconds:

```
threshold poll tpo-rto-timeout interval 600
```

threshold ppp-setup-fail-rate

Configures point-to-point protocol (PPP) setup failure rate percentage thresholds.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

threshold ppp-setup-fail-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold rate percentage for PPP setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold rate percentage for PPP setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

PPP setup failure rate thresholds generate alerts or alarms based on the rate of call setup failures experienced by the system during the specified polling interval. The failure rate is the percentage of failures as determined by number of PPP setup failures divided by the total number of PPP sessions initiated.
Alerts or alarms are triggered for PPP setup failure rates based on the following rules:

- **Enter condition:** Actual number of call setup failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of call setup failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a PPP setup failure rate high percentage threshold of *50* percent and a clear threshold of *45* percent:

```
threshold ppp-setup-fail-rate 50 clear 45
```

threshold route-service bgp-routes

This command configures the percentage threshold limits for route services to BGP routes.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold route-service bgp-routes *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold rate percentage for BGP routes on the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold rate percentage for BGP routes on the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to configure a threshold in percentage of maximum BGP routes allowed. If the percentage of the number of BGP routes in a context (including all VRFs) reaches *high_thresh*, a notification is generated. Optionally, if the threshold subsystem is configured in 'alarm' mode, a **Threshold_Clear** notification is generated when the percentage of the number of BGP routes in a context (including all VRFs) goes below *low_thresh*. The maximum number of BGP routes is also sent by BGP task when getting the stats
Alerts or alarms are triggered for BGP routes based on the following rules:

- **Enter condition:** Actual number of call setup failures is greater than the high threshold.
- **Clear condition:** Actual number of call setup failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures system for high threshold of *50* percent and a clear threshold of *45* percent:

```
threshold route-service bgp-routes 50 clear 45
```

threshold rp-setup-fail-rate

Configures RP setup failure rate thresholds.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold rp-setup-fail-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold rate percentage for RP setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold rate percentage for RP setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

RP setup failure rate thresholds generate alerts or alarms based on the rate of call setup failures experienced by the system during the specified polling interval. The failure rate is the percentage of failures as determined by number of Registration Request Messages rejected divided by the total number of Registration Request Messages received.
Alerts or alarms are triggered for RP setup failure rates based on the following rules:

- **Enter condition:** Actual number of call setup failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of call setup failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a RP setup failure rate high threshold of *50* percent and a clear threshold of *45* percent:

```
threshold rp-setup-fail-rate 50 clear 45
```

threshold spc-cpu-memory-usage

This command has been renamed to **`threshold mgmt-cpu-memory-usage`**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms.

threshold spc-cpu-utilization

This command has been renamed to **`threshold mgmt-cpu-utilization`**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

threshold storage-utilization

Configures SMC flash memory utilization thresholds.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold storage-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 90
Specifies the high threshold memory utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 90
Specifies the low threshold memory utilization percentage that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Flash memory utilization thresholds generate alerts or alarms based on the utilization percentage of the flash memory on each installed SMC during the specified polling interval. Although, a single threshold is configured for both SMCs, separate alerts or alarms can be generated for each.
Alerts or alarms are triggered for CompactFlash memory utilization based on the following rules:

- **Enter condition:** Actual percentage memory utilization is greater than or equal to the high threshold.
- **Clear condition:** Actual percentage memory utilization is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold flash utilization percentage of *85* for a system using the Alert thresholding model:

```
threshold storage-utilization 85
```

threshold subscriber active

Configures thresholds for active subscribers in the system.

Product

PDSN, GGSN, SGSN, HA

Privilege

Security Administrator, Administrator

Syntax

threshold subscriber active *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of active subscriber sessions facilitated by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of active subscriber sessions facilitated by the system that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Active subscriber thresholds generate alerts or alarms based on the total number of active subscriber sessions facilitated by the system during the specified polling interval.
Alerts or alarms are triggered for active subscriber totals based on the following rules:

- **Enter condition:** Actual total number of active subscriber sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of active subscriber sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures an active subscriber high threshold count of *150000* and a low threshold of *100000* for a system using the Alarm thresholding model:

```
threshold subscriber active 150000 clear 100000
```

threshold subscriber total

Configures total subscriber thresholds for the system.

Product

PDSN, GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

threshold subscriber total *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of subscriber sessions (active and dormant) facilitated by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of subscriber sessions (active and dormant) facilitated by the system that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Total subscriber thresholds generate alerts or alarms based on the total number of subscriber sessions (active and dormant) facilitated by the system during the specified polling interval.
Alerts or alarms are triggered for subscriber totals based on the following rules:

- **Enter condition:** Actual total number of subscriber sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of subscriber sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures an active subscriber high threshold count of *450000* and a low threshold of *250000* for a system using the Alarm thresholding model:

```
threshold subscriber total 450000 clear 250000
```

threshold total-ggsn-sessions

Configures thresholds for the total number of GGSN sessions across all the services in the system.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

threshold total-ggsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total GGSN sessions across all the sessions in the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total GGSN sessions that maintains a previously generated alarm condition. If the number of GGSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GGSN sessions across all the services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of GGSN sessions based on the following rules:

- **Enter condition:** Actual total number of GGSN sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of GGSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total GGSN session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-ggsn-sessions 10000
```

threshold total-gprs-sessions

Configures thresholds for the total number of GPRS sessions in the system.

Product

SGSN

Privilege

Administrator

Syntax

threshold total-gprs-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total GPRS sessions for all GPRS services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total GPRS sessions for all GPRS services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GPRS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for GPRS sessions based on the following rules:

- **Enter condition:** Actual total number of GPRS sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of GPRS sessions is less than the low threshol.d

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of GPRS sessions high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-gprs-sessions 10000
```

threshold total-gprs-pdp-sessions

Configures thresholds for the total number of PDP contexts per GPRS sessions in the system.

Product

SGSN

Privilege

Administrator

Syntax

threshold total-gprs-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total PDP contexts per GPRS session for all GPRS services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total PDP contexts per GPRS session for all GPRS services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GPRS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for GPRS sessions based on the following rules:

- **Enter condition:** Actual total number of PDP Contexts is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of PDP contexts is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of PDP contexts per GPRS session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-gprs-pdp-sessions 10000
```

threshold total-ha-sessions

Configures thresholds for the total number of HA sessions across all services in the system.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold total-ha-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of HA sessions for all HA services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of HA sessions for all HA services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of HA sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HA sessions based on the following rules:

- **Enter condition:** Actual total number of HA sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of HA sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of HA sessions high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-ha-sessions 10000
```

threshold total-hnbgw-hnb-sessions

Use this command to configure alarm or alert thresholds for the total number of IuH sessions between HNB and HNB-GW across all the HNB-GW services in the system.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

threshold total-hnbgw-hnb-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold for the total number of HNB-HNB-GW sessions on IuH interfaces across all HNB-GW services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold for the total number of HNB-HNB-GW sessions on IuH interfaces across all services on a system that maintains a previously generated alarm condition. If the number of HNB-HNB-GW sessions in a system falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of HNB-HNB-GW sessions on IuH interface across all HNB-GW services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of HNB-HNB-GW sessions on IuH interface based on the following rules:

- **Enter condition:** Actual total number of HNB-HNB-GW sessions on IuH interface is greater than the high threshold.
- **Clear condition:** Actual total number of HNB-HNB-GW sessions on IuH interfaces is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll total-hnbgw-hnb-sessions** command to configure the polling interval and the **threshold monitoring hnbgw-service** command to enable thresholding for this value.

Important: To enable SNMP trap for threshold monitoring to this threshold use **`snmp trap enable ThreshTotalHNBGWHnbSess`** command in this mode.

Example

The following command configures the total number of HNB-GW-HNB sessions on IuH interfaces to a high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-hnbgw-hnb-sessions 10000
```

threshold total-hnbgw-iu-sessions

Use this command to configure alert or alarm thresholds for the total number of subscriber sessions towards the Core Networks (CN) across all HNB-GW services over Iu interfaces (Iu-CS/Iu-PS interface) on a system.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

threshold total-hnbgw-iu-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold for the total number of subscriber sessions towards CN across all HNB-GW services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 3000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold for the total number of subscriber sessions towards CN across all services on a system that maintains a previously generated alarm condition. If the number of subscriber sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 3000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of subscriber sessions towards CN across all HNB-GW services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of subscriber sessions towards CN across all HNB-GW service on a system based on the following rules:

- **Enter condition:** Actual total number of subscriber sessions across all HNB-GW service on a system is greater than the high threshold.
- **Clear condition:** Actual total number of subscriber sessions across all HNB-GW service on a system is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll total-hnbgw-iu-sessions** command to configure the polling interval and the **threshold monitoring hnbgw-service** command to enable thresholding for this value.

Important: To enable SNMP trap for threshold monitoring to this threshold use **snmp trap enable ThreshTotalHNBGWIuSess** command in this mode.

Example

The following command configures the total number of subscriber sessions towards CN across all HNB-GW services to a high threshold count of *30000* for a system using the Alert thresholding model:

```
threshold total-hnbgw-iu-sessions 30000
```

threshold total-hnbgw-ue-sessions

Use this command to configure alert or alarm thresholds for the total number of UEs connected to an HNB-GW service across all the HNB-GW services in the system.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

threshold total-hnbgw-ue-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold for the total number of UEs connected across all HNB-GW services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold for the total number of UEs connected to HNB-GW service across all HNB-GW services that maintains a previously generated alarm condition. If the number of UE sessions across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of UEs connected to HNB-GW service across all HNB-GW services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of UEs connected across all HNB-GW service on a system based on the following rules:

- **Enter condition:** Actual total number of UEs connected to HNB-GW service across all HNB-GW services on a system is greater than the high threshold.
- **Clear condition:** Actual total number of UEs connected to HNB-GW service across all HNB-GW services on a system is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll total-hnbgw-ue-sessions** command to configure the polling interval and the **threshold monitoring hnbgw-service** command to enable thresholding for this value.

Important: To enable SNMP trap for threshold monitoring to this threshold use **`snmp trap enable ThreshTotalHNBGWUeSess`** command in this mode.

Example

The following command configures the total number of UEs connected to HNB-GW service across all HNB-GW services to a high threshold count of *40000* for a system using the Alert thresholding model:

```
threshold total-hnbgw-ue-sessions 40000
```

threshold total-hsgw-sessions

Configures thresholds for the total number of HSGW sessions across all services in the system.

Product

HSGW

Privilege

Administrator

Syntax

threshold total-hsgw-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold for the number of HSGW sessions for all HSGW services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 1500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold for the number of HSGW sessions for all HSGW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of HSGW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HSGW sessions based on the following rules:

- **Enter condition:** Actual total number of HSGW sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of HSGW sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of HSGW sessions high threshold count of *500000* for a system using the Alert thresholding model:

```
threshold total-hsgw-sessions 500000
```

threshold total-lma-sessions

Configures thresholds for the total number of Local Mobility Anchor (LMA) sessions across all services in the system.

Product

P-GW

Privilege

Administrator

Syntax

threshold total-lma-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of LMA sessions for all LMA services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 1500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of LMA sessions for all LMA services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of LMA sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for LMA sessions based on the following rules:

- **Enter condition:** Actual total number of LMA sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of LMA sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of LMA sessions high threshold count of *500000* for a system using the Alert thresholding model:

```
threshold total-lma-sessions 500000
```

threshold total-lns-sessions

Configures thresholds for the total number of L2TP Network Server (LNS) sessions in the system.

Product

PDSN, GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

threshold total-lns-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total LNS sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total LNS sessions that maintains a previously generated alarm condition. If the number of LNS sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of LNS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of LNS sessions based on the following rules:

- **Enter condition:** Actual total number of LNS sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of LNS sessions is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total LNS session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-lns-sessions 10000
```

threshold total-mme-sessions

Use this command to configure thresholds for the total number of MME sessions across all the MME services in the system.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold total-mme-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total MME sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total MME sessions that maintains a previously generated alarm condition. If the number of MME sessions, across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME sessions across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME sessions based on the following rules:

- **Enter condition:** Actual total number of MME sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of MME sessions is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll total-mme-sessions** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures a total MME session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-mme-sessions 10000
```

threshold total-pdsn-sessions

Configures thresholds for the total number of PDSN sessions in the system.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold total-pdsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total PDSN sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total PDSN sessions that maintains a previously generated alarm condition. If the number of PDSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of PDSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of PDSN sessions based on the following rules:

- **Enter condition:** Actual total number of PDSN sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of PDSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total PDSN session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-pdsn-sessions 10000
```

threshold total-pgw-sessions

Configures thresholds for the total number of P-GW sessions across all services in the system.

Product

P-GW

Privilege

Administrator

Syntax

threshold total-pgw-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of P-GW sessions for all P-GW services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 1500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of P-GW sessions for all P-GW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of P-GW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for P-GW sessions based on the following rules:

- **Enter condition:** Actual total number of P-GW sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of P-GW sessions is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of P-GW sessions high threshold count of *500000* for a system using the Alert thresholding model:

```
threshold total-pgw-sessions 500000
```

threshold total-sgw-sessions

Configures thresholds for the total number of S-GW sessions across all services in the system.

Product

S-GW

Privilege

Administrator

Syntax

threshold total-sgw-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of S-GW sessions for all S-GW services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 1500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of S-GW sessions for all S-GW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of S-GW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for S-GW sessions based on the following rules:

- **Enter condition:** Actual total number of S-GW sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of S-GW sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of S-GW sessions high threshold count of *500000* for a system using the Alert thresholding model:

```
threshold total-sgw-sessions 500000
```

threshold total-sgsn-sessions

Configures thresholds for the total number of SGSN sessions in the system.

Product

SGSN

Privilege

Administrator

Syntax

threshold total-sgsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total SGSN sessions for all SGSN services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total SGSN sessions for all SGSN services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of SGSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for SGSN sessions based on the following rules:

- **Enter condition:** Actual total number of SGSN sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of SGSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of SGSN sessions high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-sgsn-sessions 10000
```

threshold total-sgsn-pdp-sessions

Configures thresholds for the total number of PDP contexts per SGSN sessions in the system.

Product

SGSN

Privilege

Administrator

Syntax

threshold total-sgsn-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total PDP contexts per SGSN session for all SGSN services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total PDP contexts per SGSN session for all SGSN services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of SGSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for SGSN sessions based on the following rules:

- **Enter condition:** Actual total number of PDP contexts is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of PDP contexts is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of PDP contexts per SGSN session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-sgsn-pdp-sessions 10000
```

threshold tpo-dns-failure

This command configures thresholds for monitoring TPO DNS resolution failures.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

threshold tpo-dns-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold tpo-dns-failure

default

Configures this command with the default threshold setting.
Default: 0—disabled

high_thresh

Specifies that if in a polling interval the number of TPO DNS failures experienced by the system meets or exceeds *high_thresh* an alert or alarm should be generated.
high_thresh is an integer from 0 through 300000.
Default: 0

clear *low_thresh*

Specifies that if, within the polling interval, the number of TPO DNS failures experienced by the system falls below *low_thresh* a clear alarm should be generated.
low_thresh is an integer from 0 through 300000.
Default: 0

Usage

Use this command to configure thresholds for monitoring TPO DNS resolution failures.

threshold tpo-low-compression-gain

This command configures thresholds for monitoring TPO low-compression-gain comparison results.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

threshold tpo-low-compression-gain *high_thresh* **[clear** *low_thresh* **]**

default threshold tpo-low-compression-gain

default

Configures this command with the default threshold setting.
Default: 0—disabled

high_thresh

Specifies that if in a polling interval the number of TPO low-compression-gain comparison results experienced by the system meets or exceeds *high_thresh* an alert or alarm is generated.
high_thresh is an integer from 0 through 300000.
Default: 0

clear *low_thresh*

Specifies that if, within the polling interval, the number of TPO low-compression-gain comparison results experienced by the system falls below *low_thresh* a clear alarm is generated.
low_thresh is an integer from 0 through 300000.
Default: 0

Usage

Use this command to configure thresholds for monitoring TPO DNS resolution failures.

threshold tpo-rto-timeout

This command configures thresholds for monitoring TPO retransmission timeouts (RTOs).

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

threshold tpo-rto-timeout *high_thresh* **[clear** *low_thresh* **]**

default threshold tpo-rto-timeout

default

Configures this command with the default threshold setting.
Default: 0—disabled

high_thresh

Specifies that if in a polling interval the number of TPO RTOs experienced by the system meets or exceeds *high_thresh* an alert or alarm should be generated.
high_thresh is an integer from 0 through 300000.
Default: 0

clear *low_thresh*

Specifies that if, within the polling interval, the number of TPO RTOs experienced by the system falls below *low_thresh* a clear alarm should be generated.
low_thresh is an integer from 0 through 300000.
Default: 0

Usage

Use this command to configure thresholds for monitoring TPO DNS resolution failures.

timestamps

Enables/disables the generation of a timestamp in response to each commands entered. The timestamp does not appear in any logs as it is a CLI output only. This command affects all future CLI sessions. Use the **timestamps** command in the Exec Mode to change the behavior for the current CLI session only.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
timestamps

no timestamps
```

no

Disables generation of timestamps for each command entered. When omitted, the output of a timestamp for each entered command is enabled.

Usage

Enable the timestamps when logging a CLI session on a remote terminal such that each command will have a line of text indicating the time when the command was entered.

Example

```
timestamps

no timestamps
```

upgrade limit

Configures upgrade session limits that trigger when the system may execute the software upgrade.

Product

All

Privilege

Security Administrator, Administrator

Syntax

upgrade limit [time *session_life* **] [usage** *session_num* **]**

upgrade limit

This command issued with no keywords sets all parameters to their defaults.

time *session_life*

Default: 120
Defines the maximum number of minutes that a session may exist on the system undergoing a software upgrade, before it is terminated by the system. As individual user sessions reach this lifetime limit, the system terminates the individual session(s). *session_life* must be an integer ranging from 1 through 1440.

usage *session_num*

Default: 100
This keyword defines a low threshold limit of sessions running either on a packet processing card or system-wide. When a software upgrade is invoked, this parameter applies to the entire system.
When the threshold is crossed (when the number of sessions on the packet processing card or system is less than this value), the remaining sessions on the card or system are terminated allowing the upgrade to begin. The remaining sessions on the packet processing card or system are terminated regardless of their session life.
session_num must be an integer from 0 through 6000.

Usage

Use this command to configure upgrade session limits that trigger the system to begin executing the software upgrade.

Important: This command is not supported on all platforms.

Important: Software Patch Upgrades are not supported in this release.

Example

The following command sets the number of minutes a session can exist to *200*, and the minimum number of sessions that may exist before terminating them to *50*:

```
upgrade limit time 200 usage 50
```

url-blacklisting database

This command configures URL Blacklisting database directory parameters.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
url-blacklisting database { directory path path | max-versions max_versions | override
file file_name }

default url-blacklisting database { directory path | max-versions | override file }
```

default

Configures this command with the default settings.

directory path *path*

Specifies the path to the directory to be used for storing URL Blacklisting databases.
path must be an alphanumeric string of 1 through 255 characters.
Default: /flash/bl

max-versions *max_versions*

Specifies the maximum number of URL Blacklisting database versions to be maintained in the URL Blacklisting database directory path with the base file name specified by the URL Blacklisting database override file.
max_versions must be an integer from 0 through 3.
Default: 0

override file *file_name*

Specifies the URL Blacklisting database override file name.
file_name must be in *name.extension* format. For example, *abc.bin*. And, must be an alphanumeric string of 1 through 10 characters.
Default: optblk.bin

Usage

Use this command to configure URL Blacklisting database directory parameters.

Example

The following command configures the maximum number of URL Blacklisting database versions to be maintained to *3*:

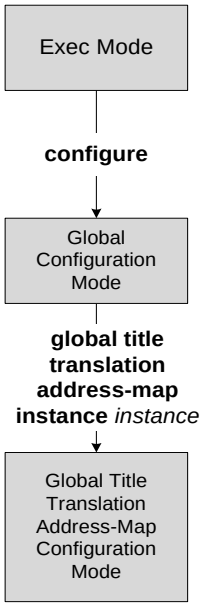
```
url-blacklisting database max-versions 3
```

Chapter 128
Global Title Translation Address-Map Configuration Mode Commands

The Global Title Translation (GTT) Address-Map configuration mode provides the commands to create, configure, and manage a specific GTT address map database.

Upon accessing this mode, your prompt should look similar to the following:

```
[local] <hostname> (config-gtt-assoc-<instance#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

This command associates (links) the global title translation (GTT) address-map with a specific GTT association, which includes the translation action rules.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

associate gtt-association *assoc_num* **action id** *id*

no association

no

Removes the association definition from the GTT address-map configuration.

gtt-association *assoc_num*

Identifies a specific GTT association to link (associate) with the GTT address-map.
assoc_num: Must be an integer from 1 to 16.

action id *id*

Identifies a specific action defined in the GTT association database configuration.
id: Must be an integer from 1 to 8.

Usage

Create an association between a specific translation action rule in a specific GTT association and this GTT address-map.

Example

```
associate gtt-association 1 action id 1
```

description

This command defines a descriptive string to facilitate identification of this particular global title translation (GTT) address-map. This is used for operator reference only.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

no

Removes the description string from the current global title translation address-map configuration.

string

Specifies the alphanumeric string that is stored. must be from 1 through 127 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage

Use this command to set a description for reference by operators.

Example

description *"GTT for Finnish national carrier."*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gt-address

Configures the SCCP global title address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-address *gt_address*

no gt-address

no

Removes the GT address from the GTT address-map configuration.

gt_address

Up to 15 digits.

Usage

Define the SCCP short address.

Example

gt-address *01040552873424*

mode

Configures the mode of operation of the SCCP entities.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
mode [ dominant | loadshare ]
```

dominant

This instructs the system to maintain the associated entity as the primary traffic pipe.

loadshare

This instructs the system to distribute the traffic load.

Usage

This command configure load balance for the system.

Example

```
mode loadshare
```

out-address

Identifies the out-going address of the SCCP entity. After this command is completed, the system enters the Out-Address configuration mode. Refer to the Out-Address Configuration Mode chapter for information about commands to define the out-address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

out-address *name*

no out-address

no

Removes the **out-address** definition from the GSS address-map configuration.

name

Defines a unique string to identify the out-going address using 1 to 63 alphanumeric characters.

Usage

Use this command to identify the address of the SCCP in the GTT configuration. This command also provides access to the Out-Address configuration mode so that the parameters for the out-going SCCP can be configured and maintained.

Example

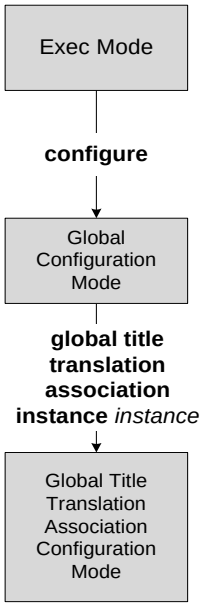
out-address *SCCP_London*

Chapter 129
Global Title Translation Association Configuration Mode Commands

The Global Title Translation (GTT) Association configuration mode provides the commands to create the rules for translating the global titles (destination point codes and subsystem address in the messages) used for routing at the SCCP layer.

Upon accessing this mode, your prompt should look similar to the following:

```
[local] <hostname> (config-gtt-addrmap-<instance#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action

This command configures the actions that determine the operation of rules of the global title translation (GTT).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

action id *id* **type** *action_type* **start-digit** *value* **end-digit** *value*

no action id *id*

id

id uniquely identifies an action. The id must be an integer from 1 to 15.

type *action_type*

The following defines the action rules that will determine how global titles (GT) are translated to locally understood addresses - in most cases point codes (PC). The command can be re-issued multiple times to define multiple action rules.

- **constant:** Defines the starting digit in the range of digits in the incoming global titles that are translated to fixed addresses.
- **fixed:** Defines the starting digit in a fixed range of digits used for performing GTT.
- **gt-to-pc:** Use these digits as first of range of global title digits in incoming message to convert to point code for routing.
- insert-pc: Defines the rule for inserting destination point code before the incoming GTAI and change TT, ES and NAI. Use digits of incoming message global title digits as pc for routing.
- **selins**: Selective insertion type to perform GTT.
- **strip-pc:** Strip first 6 digits from GTAI if first 6 dgts in stripped point code are in INT format.
- **var-asc**: Use a varaible number of digits, in ascending order, to perform GTT.
- **var-des:** Use a variable number of digits. in descending order. to perform GTT.

start-digit *value*

value must be an integer from 0 to 255.

end-digit *value*

value must be an integer from 0 to 255.

Usage

Use this command to create GTT association rules. Rules can be based on ranges of digits or modified ranges depending upon the action types included in the commands.

Example

Use the following command to create a global title translation rule that bases the translation on a fixed range of digits starting at 23 and ending at 122:

```
action id 1 type fixed start-digit 23 end-digit 122
```

description

This command defines a descriptive string to facilitate identification of this particular global title translation (GTT) association. This is used for operator reference only.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

string

Specifies the alphanumeric string that is stored. must be from 1 through 127 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

no

Removes the description string from the current global title translation association configuration.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

```
description "GTT database 2"
```

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gt-format

This command creates an instance of a global title formatting that is applied to the database in the process of address translation. Once the command is completed, the system enters global title (GT) format database configuration mode. The commands for configuration can be found in the GT Format Configuration Mode chapter in this reference guide.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-format *format_num*

format_num

- 1: Selects GT-format 1 options which include **nature-of-address** and **odd/even.** Once selected, the system enters GT-Format1 configuration mode.
- 2: Selects GT-format2 options which include **translation-type**. Once selected, the system enters GT-Format2 configuration mode.
- 3: Selects GT-format3 options which include **encoding-scheme**, **numbering-plan,** and **translation-type**. Once selected, the system enters GT-Format3 configuration mode.
- 4: Selects GT-format4 options which include **encoding-scheme**, **nature-of-address, numbering-plan,** and **translation-type**. Once selected, the system enters GT-Format4 configuration mode.

Usage

Selects GT format #2 for the database GTT process.

Example

Use this command to associate the GT format for GTT:

```
gt-format 2
```

variant

This command configures the choice of national standard protocols to associate with the GTT process databases.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

variant *type*

default

Sets the **variant** configuration to **itu**.

type

The following network variant national standards-based protocols are possible:

- **ansi**
- **china**
- **itu**
- **japan**

Usage

Use this command to select the national standard protocols to associate with the GTT process database.

Example

The following command sets the variant to *ansi*:

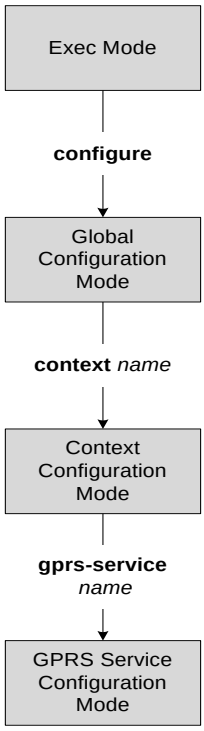
```
variant ansi
```

Chapter 130
GPRS Service Configuration Mode Commands

The GPRS Service Configuration Mode is used within the context configuration mode to define the criteria the SGSN needs to operate within a GPRS network. The GPRS Service works with other services, such as SGSN GPRS Tunneling Protocol (see SGTP Service Configuration Mode Commands) and Mobile Application Part (see MAP Service Configuration Mode Commands), to handle communication parameters required to work with other network entities such as the base station subsystem (BSS).

The prompt for this mode appears as:

```
[context_name]hostname(config-gprs-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

Defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

accounting { cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } + | context *cntx_name* **}**

default accounting cdr-types

no accounting (cdr-types | context }

default

Returns the system to default CDR generation which includes M-CDR, S-CDR, and SMS CDRs.

no

Disables all CDR types.

cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr }

Default: all types enabled.
Defines the types of CDRs to be generated within the specified GPRS service for accounting:

- **mcdr:** Enables generation of M-CDRs.
- **scdr:** Enables generation of S-CDRs.
- **sms:** Enables generation of SMS-type CDRs based on one of the following:
- **mo-cdr:** SMS CDRs originates from the mobile.
- **mt-cdr:** SMS CDRs terminates at the mobile.

+

This symbol indicates that more than one keyword can be used and repeated. This enables you to include more than one type of CDR selection in a single command.

context *cntx_name*

Specifies an accounting context to be associated with the GPRS service.
cntx_name: Define a string of 1 to 79 alphanumeric characters.

Usage

Use this command to define the type of CDRs to generate for GPRS service. By default all types of CDRs are generated. Note that change of this configuration will be applied to new calls and/or to new PDP contexts only.
By default, generation of the S-CDR, M-CDR, SMS-MT-CDR, and SMS MO-CDR types is enabled.

Example

The following command configures the system to generate only M-CDRs for accounting in the current GPRS service:

```
accounting cdr-types mcdr
```

admin-disconnect-behavior

This command defines some of the actions the SGSN will take during an Admin-Disconnect procedure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
admin-disconnect-behavior { clear-subscription | detach-type { reattach-not-required |
reattach-required } }

default admin-disconnect-behavior { clear-subscription | detach-type }
```

clear-subscription

Including this keyword in the configuration instructs the SGSN to clear subscriber contexts and the subscription data database whenever the **clear subscribers all** command is issued (from the Exec mode) for attached subscribers. As well, the SGSN will issue an appropriate Map-Purge-MS-Req to the HLR if needed.
Default: disabled

detach-type

Including this keyword defines which type of detach instruction to include in the Detach-Request message during an Admin-Disconnect procedure. One of the following options must be included when this command is entered:

- **reattach-not-required**
- **reattach-required**

Default: reattach-required

default

Including the **default** keyword in the command, instructs the SGSN to use the default value for the specified parameter.

no

Returns the SGSN to the default where this clear function is disabled

Usage

Using he **clear subscribers all** command (in the Exec Mode) will clear subscriber contexts and the subscription data database, and if needed, issue an appropriate Map-Purge-MS-Req to the HLR.
Include the **clear-subscription** keyword with this command configuration to ensure that more than attached MM-context and active PDP-contexts are cleared when the clear **subscribers all** command is issued for attached subscribers.
To clear subscription data for detached subscribers, refer to the **sgsn clear-detached-subscriptions** command described in the *Exec* mode chapter.

Including the **detach-type** keyword with this command instructs the SGSN to include either a 'reattach-required' or a 'reattach-no-required' instruction in the Detach-Request message.

Example

Enable the clearing function so that subscription data is cleared from the HLR database:

```
admin-disconnect-behavior clear-subscription
```

associate-dscp-template

Identifies a DSCP template to be associated with the GPRS service.

Important: This command can be used before the associated DSCP template instance is created and configured but care should be used to match the template names.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

associate-dscp-template downlink *template_name*

no associate-dscp-template downlink

no

Removes the template association definition from the configuration.

template_name

Specifies a unique DSCP template to associate with this GPRS service.
template_name must be a string of 1 to 64 alphanumeric characters with dots (.), dashes (-), and forward slashes (/) but with no spaces.

Usage

Use this command to associate DSCP templates with this GPRS service. A single template can be associated with multiple GPRS services.

Related commands:

- The dscp-template command in the SGSN Global configuration mode creates / deletes an instance of a template. This command also provides access to the mode containing all the configuration commands used to define DSCP settings for the control packets and data packets for a particular GPRS service (see the *DSCP Template Configuration Mode Commands* section).
- To check the list of DSCP templates configured, use the **show sgsn-mode** command documented in the *Exec Mode Commands* section.

Example

The following command associates the template with DSCP settings for traffic going through one of the SGSNs located in Paris mobile network:

associate-dscp-template *dscp-template-paris3*

associate-service

Identifies services to be associated with the GPRS Service.

Important: This command can be used before the associated service instance is created and configured but care should be used to match the service names.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] associate-service { gs *name* **| map** *name* **| sgtp** *name* **} [context** *ctxt_name* **]**

no

Removes the service association definition from the configuration.

gs *name*

Specifies the Gs service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alphanumeric characters with no spaces.

map *name*

Specifies the MAP service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alphanumeric characters with no spaces.

sgtp *name*

Specifies the SGTP service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alpha numeric characters with no spaces.

context *ctxt_name*

Defines the context in which the service was created.
ctxt_name must be a string of 1 to 63 alphanumeric characters with no spaces.

Usage

Use this command to associate other services, that have been or will be configured, to this GPRS service.

Example

The following command associates Gs service *gs1* with this GPRS service.

```
associate-service gs gs1 context sgsn2
```

cc profile

Configures the charging characteristic (CC) profile index properties.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] cc profile *index* **{ buckets** *number* **| interval** *time* **| tariff time1** *mins hours* **[time2** *mins hours* **[time3** *mins hours* **[time4** *mins hours* **]]] | volume { downlink** *octets* **uplink** *octets* **| total** *octets* **} }**

default cc profile *index*

no

Removes the a specific charging characteristics configuration definition.

default

Resets the charging characteristics to system defaults.

index

Configures a profile index for the parameter to be specified. index can be configured to any integer value from 0 to 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

buckets *number*

Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.
number can be configured to any integer value from 1 through 4.

interval *time*

time is measured in seconds and can be configured to any integer value from 60 to 40,000,000.

tariff time1 *mins hours* **time2** *mins hours* **time3** *mins hours* **time4** *mins hours*

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: The minutes of the hour, an integer value from 0 to 59.
- *hours*: The hour of the day, an integer value from 0 to 23.

volume { downlink *vol_down_octets* **uplink** *vol_up_octets* **| total** *total_octets* **}**

Specifies the downlink, uplink, and total volumes that must be met before closing a CDR.
vol_down_octets : Measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.
vol_up_octets : Measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.
total_octets : The total traffic volume (up and downlink) measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the SGSN's charging characteristics. The SGSN supports up to 16 profile indexes.
This command works in conjunction with the cc-sgsn command located in the APN configuration mode that dictates which CCs should be used for subscriber PDP contexts.

Example

The following command configures a profile index of 10 for tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 0 7 time2 30 19
```

check-imei

This command configures the action the SGSN will take if the route towards the EIR is down.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
check-imei { gf-failure-action | gf-timeout-action } { continue | reject }

default check-imei { gf-failure-action | gf-timeout-action }
```

default

Resets the default function to reject the Attach.

gf-failure-action

Coupled with either **continue** or **reject**, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and if the EIR is temporarily unreachable due to associated DPC/SSN inaccessible/out-of-service.

gf-timeout-action

Coupled with either **continue** or **reject**, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and the route to the EIR is available, but no response is received from the EIR.

continue

Instructs the SGSN to continue the Attach process.

reject

Instructs the SGSN to reject the Attach process.

Usage

Typically, the Attach process will be continued when there is an IMEI check timeout based on the configuration under the SGSN service configuration and/or the GPRS service configuration. But this works only if the route towards the EIR is UP and the IMEI request timer expires. This command configures the SGSN to allow the Attach process to continue in the case the route towards the EIR is down, that is the DPC / SSN is out-of-service.

Example

Use the following command to reset the default and reject Attach:

```
default check-imei gf-failure-action
```

check-imei-timeout-action

This command has been deprecated.

ciphering-algorithm

This command configures the priority, ordering, for the use of the GPRS encryption ciphering algorithms.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ciphering-algorithm { negotiation-failure-action { reject [ failure-code cause_code ] |
use-geo0 } priority priority [ algorithm ]  }

default ciphering-algorithm priority priority
```

default

Returns the system ciphering-algorithm priority to the default of GEA0 - which means that no ciphering will be done.

negotiation-failure-action { reject [failure-code *cause_code*] | use-geo0 }

This set of keywords configure the SGSN's action if there is not a match between the MS and SGSN ciphering algorithm configurations.

- **reject**: Instructs the SGSN to reject a call when the ciphering algorithms do not match.
- **failure-code** *cause_code*: Instructs the SGSN to include a GMM cause code in the Reject message. Enter an integer from 2 to 111; default code is 14 (GPRS services not allowed in this PLMN). Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):
  - 2 - IMSI unknown in HLR
  - 3 - Illegal MS
  - 6 - Illegal ME
  - 7 - GPRS services not allowed
  - 8 - GPRS services and non-GPRS services not allowed
  - 9 - MSID cannot be derived by the network
  - 10 - Implicitly detached
  - 11 - PLMN not allowed
  - 12 - Location Area not allowed
  - 13 - Roaming not allowed in this location area
  - 14 - GPRS services not allowed in this PLMN
  - 15 - No Suitable Cells In Location Area
  - 16 -MSC temporarily not reachable
  - 17 - Network failure
  - 20 - MAC failure

- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

- **use-geo0**: Instructs the SGSN to honor the Attach/RAU Request without ciphering (geo0). This is the default action for negotiation failure.

---

priority *priority algorithm*

Defines the priority, order of use, for the ciphering algorithm.
priority: Must be an integer from 1 to 4.

---

algorithm

Identifies the algorithm to be matched to the priority. Options include:

- gea0 - No ciphering
- gea1 - GPRS Encryption Algorithm - GEA1
- gea2 - GPRS Encryption Algorithm - GEA2
- gea3 - GPRS Encryption Algorithm - GEA3

Usage

Use this command to specify the order (priority) of usage for the GPRS encryption algorithms. All of the GPRS encapsulation algorithms use a 64-bit key derived from a common mechanism: the mobile receives a random challenge, then the SIM calculates an authentication signature and an encryption key.
Also use this command to define the action to be taken if there is not a match between the MS and the SGSN ciphering algorithm configurations.

Example

The following command sets no ciphering to be used after two encryption algorithms have been used:

```
ciphering-algorithm priority 3 gea0
```

The following command configures the SGSN to reject calls if the ciphering algorithm configurations don't match:

```
ciphering-algorithm negotiation-failure-action reject
```

dns israu-mcc-mnc-encoding

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
dns israu-mcc-mnc-encoding { decimal | hexidecimal }

default dns israu-mcc-mnc-encoding
```

default

Resets the SGSN to send the MCC and MNC values in decimal format for DNS queries.

decimal

Default.
Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.

hexadecimal

Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.

Usage

Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query. For example:
In decimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc310.mcc722.gprs
```

In hexadecimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc0136.mcc02d2.gprs
```

Example

Use hexadecimal values for the MCC/MNC in the DNS query.

```
dns israu-mcc-mnc-encoding hexadecimal
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

gmm

gmm actually provides a set of commands used to define the GPRS mobility management parameters for the SGSN service.

Important: The **gmm** commands can be repeated as needed to set each timer.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gmm { accept-procedure [new-tlli | old-tlli] | attach ptmsi-signature-mismatch send-reject failure-code *cause_code* **| ciph-gmm-msg-from-unknown-ms { detach | ignore } | mobile-reachable-timeout** *mins* **| negotiate-t3314-timeout** *secs* **| purge-timeout** *mins* **| T3302-timeout** *mins* **| T3312-timeout** *mins* **| T3313-timeout** *secs* **| T3350-timeout** *secs* **| T3360-timeout** *secs* **| T3370-timeout** *secs* **| trau-timeout***secs* **}**

default gmm { attach ptmsi-signature-mismatch | ciph-gmm-msg-from-unknown-ms | mobile-reachable-timeout | negotiate-t3314-timeout | purge-timeout | T3302-timeout | T3312-timeout | T3313-timeout | T3350-timeout | T3360-timeout | T3370-timeout | trau-timeout }

no gmm negotiate-t3314-timeout

default

Disables the specified function or resets the specified timer to system defaults.

no

Removes the specified GMM definition from the configuration.

accept-procedure [new-tlli | old-tlli]

Default: new-tlli
This keyword enables the use of either a new TLLI (temporary logical link identifier) or an old TLLI for attach-accept or RAU-accept messages sent by the SGSN to the MS during related procedures.

attach ptmsi-signature-mismatch send-reject failure-code *cause_code*

Default: disabled
This keyword enables the SGSN to validate the P-TMSI signature, present in the Attach Request, against the PTMSI-SIGNATURE stored at the SGSN. The SGSN then sends an Attach Reject to the MS if the PTMSI-SIGNATURE does not match.
The P-TMSI signature validation functionality only works if the feature is enabled. But even if it is enabled, the feature does not validate in the following situations:

- when the PTMSI-SIGNATURE is absent from the 2G Attach Request.
- if the first subscriber being in DETACHED state or is purged with FREEZE-PTMSI. In both the scenarios PTMSI-SIGNATURE cannot be validated.

- when the 2G subscriber(MS2) attaches with the same P-TMSI and a different P-TMSI_Signature as previously attached 2G subscriber (MS1), both the subscriber profiles are cleared from the system. This is relevant where the old RAI for MS-2 is the same as the current RAI for MS-1.

Optionally, a GMM failure *cause_code* can be configured to include in the Attach Reject if one is sent. Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

---

ciph-gmm-msg-from-unknown-ms { detach | ignore }

Configures how the SGSN will behave when it receives a ciphered GMM message from an unknown MS.
detach - Instructs the SGSN to send a Detach message to the MS.
ignore - Instructs the SGSN to send an Ignore (drop) message to the MS.
Default: **ignore**

mobile-reachable-timeout *mins*

Default: 58 minutes
Timer value for the mobile reachability timer.
mins must be an integer from 4 to 1440.

negotiate-T3314-timeout *secs*

Set the number of seconds for the T3314-timeout ready timer value. Value sent out from SGSN so MS can negotiate ready timer.
secs must be an integer from 0 to 11160. Default is 44 seconds.

- If the MS does not send the ready timer in the Attach/RAU request, then the SGSN sends this T3314-timeout (ready timer) value.
- If the MS sends the requested value of the ready timer in the Attach/RAU Request, and if the requested value is less than or equal to the value of the negotiate-T3314-timeout timer, then the SGSN sends Att/RAU Accept with the requested T3314 value.
- If the MS sends the requested value of the ready timer in the Attach/RAU Request, and if the requested value is greater than the value of the negotiate-T3314-timeout timer, then the SGSN sends Att/RAU Accept with the negotiate-T3314-timeout value.

Important: This is the only GMM timer that can be disabled by entering **no** at the beginning of the command syntax. **no gmm negotiate-t3314-timeout** By disabling negotiation of the T3314-timeout value, if the MS sends the requested value of the ready timer in the Att/RAU Request, then the SGSN sends the T3314-timeout value in the Att/RAU Accept.

purge-timeout *mins*

Default: 10080 minutes
Value defines the mm-context lifetime in minutes.
mins must be an integer from 1 to 20160.

T3302-timeout *mins*

Default: 12 minutes
Defines the number of minutes for timer to send to MS.
mins is an integer from 1 to 186.

T3312-timeout *min*

Default: 54 minutes
Periodic RAU update timer to send to MS.
mins is an integer from 0 to 186.

T3313-timeout *secs*

Default: 5 seconds
Initial page timeout timer for retransmission for Paging Requests.
secs is an integer from 1 to 60.

T3314-timeout *secs*

Default: 44 seconds
Ready Timer for controlling Cell Update Procedure.

secs must be an integer from 0 to 11519.

T3350-timeout *secs*

Default :6 seconds
Retransmission timer for Attach Accept/RAU Accept/P-TMSI Realloc Command.
secs must be an integer from 1 to 20.

T3360-timeout*secs*

Default :6 seconds
Retransmission timer for Authentication Request.
secs must be an integer from 1 to 20.

T3370-timeout *secs*

Default :6 seconds
Retransmission timer for Identity Request.
secs must be an integer from 1 to 20.

trau-timeout *secs*

This timer is available in releases 9.0 and higher.
Default: 30
Specifies the number of seconds the "old" 3G SGSN waits to purge the MS's data. This timer is started by the "old" SGSN after completion of the inter-SGSN RAU.
secs : Must be an integer from 5 to 60.

Usage

Use this command to set GMM timers.

Example

Set the t3370 timer expiration for 15 seconds:

```
gmm t3370-timeout 15
```

llc

Configures the timers that control the data flow for the logical link control (LLC) sub-layer.

Important: This command may be repeated as often as necessary to define the needed timers.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

llc { iov-ui-in-xid-reset | n201u-max { sapi11 *pkt-size* **| sapi3** *pkt-size* **| sapi5** *pkt-size* **| sapi9** *pkt-size* **} | nu-overflow-detection high-watermark** *high_num* **low-watermark** *low_num* **increment-oc| pdu-lifetime** *secs* **| reset-vur | t200 sapi1** *time* **| t200 [sapi11** *time* **| sapi3** *time* **| sapi5** *time* **| sapi7** *time* **| sapi9** *time* **] | uplink-pdu-len-validation }**

default llc { iov-ui-in-xid-reset | n201u-max { sapi11 | sapi3 | sapi5 | sapi9 } | nu-overflow-detection | pdu-lifetime | reset-vur | T200 [sapi1 | sapi11 | sapi3 | sapi5 | sapi7 | sapi9] | uplink-pdu-len-validation }

no llc { iov-ui-in-xid-reset | nu-overflow-detection | reset-vur | uplink-pdu-len-validation }

default

Resets the configuration to the default values.

no

Disables the **uplink-pdu-len-validation** .

iov-ui-in-xid-reset

This keyword makes it possible for the operator to configure whether or not to send IOV-UI in an XID-RESET. This is useful when the MS is not setup to accept IOV-UI (for example, MS sends Attach/RAU Requests with cksn=7) and including IOV-UI in the XID-Reset would result in Attach/RAU failure.
Default: Enabled

n201u-max sapi *n* *pkt_size*

This keyword sets the maximum number of octets, per service access point identifier (SAPI), for the downlink data packets. This is the upper limit that the SGSN will negotiate with the subscriber for packets sent from the SGSN to the BSC.
sapi *n* : Command must identify one of the following SAPI: sapi11, sapi3, sapi5, or sapi9.
pkt_size : Must be an integer from 140 to 1520. Default size is 1520 octets.

nu-overflow-detection high-watermark *high_num* **low-watermark** *low_num* **increment-oc**

Enables/disables overflow detection for the N(u) counter and setting overflow high/low thresholds facilitates ciphering synchronization between the MS and SGSN.

high_num: Enter an integer between 1 and 511.
low_num: Enter an integer between 0 and 510.
If the expected value of nu(Vur) is greater than or equal to the configured high-watermark, and the received nu(LFN) is less than or equal to the configured low-watermark, the SGSN increments the overflow counter (VurOC).
The recommended overflow settings are as follows:**llc nu-overflow-detection high-watermark 496 low-watermark 15 increment-oc** While expecting a packet with 496 < nu < 511 and a packet with 0 < nu < 15 is received, overflow is detected and VurOC is incremented.

---

pdu-lifetime *secs*

Defines LLC layer PDU lifetime at the BSC. .
secs must be an integer from 0 to 90.
Default: 6

---

reset-vur

Enables/disables the mechanism to reset the Vur value maintained at LLC if the intra RAU request is received with N(U) = 0
Default: Disabled

T200 sapi1 *time*

Sets the retransmission timer (in seconds) for sapi1.
time must be an integer of 1 to 10.
Default: 5

T200 sapi11 *time*

Sets the retransmission timer (in seconds) for sapi11.
time must be an integer of 1 to 50.
Default: 40

T200 sapi3 *time*

Sets the retransmission timer (in seconds) for sapi3.
time must be an integer of 1 to 10.
Default: 5

T200 sapi5 *time*

Sets the retransmission timer (in seconds) for sapi5.
time must be an integer of 1 to 20.
Default: 10

T200 sapi7 *time*

Sets the retransmission timer (in seconds) for sapi7.
time must be an integer of 1 to 40.
Default: 20

T200 sapi9 *time*

Sets the retransmission timer (in seconds) for sapi9.
time must be an integer of 1 to 40.
Default: 20

uplink-pdu-len-validation

Available in releases 8.1 and higher.
This feature enables validation of the size of the uplink LLC packets. With validation enabled, the SGSN will drop any uplinked packets that are larger than the negotiated limit.
If the **no** form of the command is used, then this feature is disabled. The SGSN will be more flexible with uplink packet sizes. So if the SGSN and MS have a mismatch and the MS sends packets that are larger than expected, then the SGSN will not drop the packets.
Default: Enabled.

Usage

Use the command repeatedly to configure additional timers and features for the LLC sub-layer.

Example

Set the T200 retransmission timer to timeout at 12 seconds for SAPI5:

```
llc t200 sapi5 12
```

Use the following command to instruct the SGSN to ignore the N201_U packet size limits for uplink packets from an MS:

```
no uplink-pdu-len-validation
```

nri

This command configures the network resource identifier (NRI) to identify a specific SGSN. The NRI is stored in the P-TMSI. The SGSN uses a portion of this NRI to set the parameters for Gb flex (SGSN pooling) functionality.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nri length *nri_length* **{ nri-value** *nri_value* **| null-nri-value** *null_nri_value* **non-broadcast-lac** *lac_id* **rac** *rac_id* **[nri-value** *value* **}**

no nri

---

no

Removes the configured NRI value and location in P-TMSI for retrieval by this SGSN operator policy.

---

nri length *nri_length*

Specifies the number of bits to be used in the P-TMSI, bits 23 to 18. to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.
nri_length : Must be an integer from 1 to 6 to identify the number of bits.

---

null-nri-value *null_nri_value*

Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the **sgsn offloading** command, see the *Exec Mode* chapter).
null_nri_value : 0 (zero) indicates the keyword is not to be used and 1 to 63 are used to identify the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.

---

non-broadcast lac *lac_id* **rac** *rac_id*

Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure.
lac_id defines a location area code associated with a BSS. Must be an integer between 1 and 65535.
rac_id defines the remote area code to be associated with a BSS. Must be an integer between 1 and 255.

---

nri-value *nri_value*

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.
nri_value must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.
Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: **nri length** *6* **nri-value** *29 43 61*

Usage

Use this command to add or remove the Gb flex pool configuration for this GPRS service. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the GPRS service will round-robin between the available NRIs when new subscribers (re)connect.

Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the GPRS service will round-robin between the available NRIs when new subscribers (re)connect.

Example

The following command specifies the the NRI length as 5 bits, identifies SGSN 23 with LAC 222 and RAC 12 for offloading procedure with NRIs 6 and 41:

```
nri length 5 null-nri-value 34 non-broadcast lac 222 rac 12 nri-value 6
41
```

paging-policy

Configures the paging parameters for the GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
paging-policy { last-known-area { all | bsc | cell | location-area | routing-area } + |
max-retransmissions retran_num }

no paging-policy last-known-area { bsc | cell | location-area | routing-area }

default paging-policy { last-known-area | max-retransmissions }
```

no

Disables the paging-policy definition for this GPRS service configuration.

default

Resets the defaults for parameters managed by this paging policy.

last-known-area

Select one or more paging areas and enter them in preferred paging order:

- **all** : Pages in the last known BSC.
- **bsc** : Pages in last known BSC.
- **cell** : Pages in last known cell.
- **location-area** : Pages in last known location area.
- **routing-area** : Pages in last known routing area.

By default, paging occurs in the following order:
cell, BSC, routing area, location area.

max-retransmission *retran_num*

Configures the maximum number of retries for a page request per paging area.
retran_num: Enter an integer from 0 to 5.

- 2 : default.
- 0 : disables retransmission for paging request so that the SGSN only sends a single 2G PS-paging request to the BSC with no retransmissions.

+

Keywords can be repeated or combined as needed to complete the paging policy configuration.

Usage

Use this command to configure the order of preference for retransmitting into specified paging-areas.

Example

Use the following command to instruct the SGSN to page the cell and BSC as the last-known areas :

```
paging-policy last-known-area cell bsc
```

peer-nsei

This command associates a peer (remote) network service entity (NSEI) for a BSS with this GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
peer-nsei nse_id  { lac lac_id rac rac_id | pooled }

[ no ] peer-nsei nse_id { lac lac_id rac rac_id  | pooled }
```

no

Removes the NSEI LAC/RAC or pooling configuration from this BSS peer configuration.

nse_id

Defines the NSEI for this GPRS service.
nse_id must be an integer from 0 to 65535.

lac *lac_id*

Defines a location area code associated with the NSE BSS.
lac_id must be an integer between 1 and 65535.

rac *rac_id*

Defines the remote area code to be associated with the NSE BSS
rac_id must be an integer between 1 and 255.

pooled

Enables pooling with non-pooled BSCs within the pool area.

Usage

Use this command repeatedly to associate one or more LAC/RAC combinations and/or pooling with this peer-GPRS service configuration.
The Network Service Entity (NSE) at the BSS and the SGSN provides the network management functionality required for the operation of the Gb interface. Each NSE is identified by means of NSE identifier (NSEI).

Example

The following command configures the NSE with identifier as *4114* having location area code *234* and routing area code as *22*:

```
peer-nsei 4114 lac 234 rac 22
```

The following command enables Gb flex (pooling) functionality for this GPRS service:

```
peer-nsei 4114 pooled
```

plmn

This command identifies the Public Land Mobile Network (PLMN) for the GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_num* **mnc** *mnc_num*

no plmn id

no

Removes the PLMN information from the configuration for the current SGSN service.

mcc *mcc_num*

Define the mobile country code (MCC) portion of the PLMN Id.
mnc_num must be a 3 digit integer from 100 to 999.

mnc *mnc_num*

Define the mobile network code (MNC) portion of the PLMN Id.
mnc_num must be a 2 or 3 digit integer from 00 to 999.

Usage

Use this command to set PLMN parameters for the current SGSN service.

Example

The following command identifies the PLMN MCC as 200 and the MNC as 10:

```
plmn id mcc 200 mnc 10
```

reporting-action event-record

This command enables the SGSN to log GMM/SM events in EDR files for 2G services.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
reporting-action event-record

[ default | no ] reporting-action event-record
```

default

Disables the logging function.

no

Removes the logging function from the configuration file.

Usage

This command is one of the steps needed to enable the SGSN to create a log for events such as Attach, RAU, and Activations. The log is an EDR (event data record) in CSV format. For details about how this feature works, refer to the *GMM-SM Event Logging* chapter in the *SGSN Administration Guide*.

Related Commands:

- To enable GMM/SM event logging for 2G services, the **reporting-action event-record** command must be configured in the SGSN service configuration.
- To enable a log to be generated in an EDR file, the **edr-module active-charging-service** command must be enabled in the Context configuration mode.
- To configure parameters for the logging file characteristics and for file transfer, use the commands in the EDR Module Configuration Mode.

Example

Enable GMM/SM event logging for 3G services:

```
reporting-action event-record
```

setup-timout

This command configures the maximum number of seconds allowed for session setup.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

setup-timout *seconds*

default setup-timout

default

Returns the configuration to the default, 60 seconds.

seconds

An integer from 1 to 1000000.

Usage

Use this command to set the time allowed for session setup.

Example

The following command sets the maximum session setup time to 300 seconds:

setup-timout *300*

sgsn-context-request

This command specifies whether or not the PTMSI signature check should be skipped if the PTMSI signature is not included in the SGSN context request.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn-context-request ptmsi-signature-absence allowed

default sgsn-context-request ptmsi-signature-absence

no sgsn-context-request ptmsi-signature-absence allowed
```

default

Returns the configuration to the default action to perform the PTMSI signature check.

no

Removes this definition from the system configuration.

Usage

Use this command to skip the PTMSI signature check.

Example

The following command instructs the system to perform the PTMSI signature check.

```
default sgsn-context-request ptmsi-signature-absence
```

sgsn-number

Define the SGSN E.164 number to be used when interacting via MAP protocol for this GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *sgsn_number*

no sgsn-number

no

Disables the use of this definition in the system configuration.

sgsn-number

Enter a string of 1 to 16 digits to identify the SGSN's E.164 identification.

Usage

Use this command to identify the ISDN number for the SGSN associated with this GPRS service.
The SGSN supports multiple SGSN numbers – different numbers in the 2G GPRS service configuration and the the 3G SGSN service configuration. If an HLR-initiated dialog is received, the SGSN will perform a lookup based on the IMSI and find the correct SGSN number with which the MS is associated. Subsequent messaging will use this address.

Example

Disable the E.164 number for this GPRS service.

```
no sgsn-number
```

sm

This command configures the session management (SM) parameters associated with this particular GPRS service context.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sm { activate-max-retransmissions *num_retries* **| deactivate- max-retransmissions** *num_retries* **| ignore-pco-decode-error | modify-max-retransmissions** *num_retries* **| partial-apn-match | requested-apn-from-first-subrec | t3385-timeout** *secs* **| t3386-timeout** *secs* **| t3395-timeout** *secs* **| trim-trailing-spaces-in-apn }**

default sm { activate-max-retransmissions | deactivate-max-retransmissions | ignore-pco-decode-error | modify-max-retransmissions | t3385-timeout | t3386-timeout | t3395-timeout | trim-trailing-spaces-in-apn }

default

Resets the SM parameters to the defaults.

activate-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit 'activate PDP context request'.
num_retries : Must be an integer from 1 to 10.
Default: 4

deactivate-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit 'deactivate PDP context request'.
num_retries : Must be an integer from 1 to 10.
Default: 4

ignore-pco-decode-error

Enables the SGSN to ignore received decode errors that are due to incorrectly encoded PCO IE length in SM Requests.
Default: disabled

modify-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit 'modify PDP context request'.
num_retries: integer from 1 to 10.
Default: 4

partial-apn-match

Enables partial matching of requested APN during APN selection.

Partial APN or APN with trailing spaces may be present in an Activate Request because incorrect information was keyed in by the user. Though it is valid to reject such Activation Requests, it increases the signaling between the MS and the SGSN. This has an impact on the radio resources.

requested-apn-from-first-subrec

Enables use of a 'requested APN' from the first subscription record. When this feature is enabled, the PDP Activation is not rejected during APN Selection; instead, the APN from the first subscription record is used as the requested APN and the SGSN continues with the rest of the APN Selection process.
A requested APN is an optional IE in an Activate PDP Request. To get the requested PDP type, if multiple PDP subscription records exist for the subscriber, then the MS has to include the APN information to choose the PDP subscription record during APN selection. Otherwise, such activations will be rejected during APN selection (per TS 23.060 Appendix A). Though it is valid to reject such activation requests, it increases the signaling between the MS and the SGSN, which impacts the radio resources.

t3385-timeout*secs*

Defines the maximum amount of time for retransmission of 'activate request' messages.
secs : Must be an integer from 1 to 60.
Default: 8

t3386-timeout *secs*

Defines the maximum amount of time for retransmission of 'modify request' messages.
secs : Must be an integer from 1 to 60.
Default: 8 seconds.

t3395-timeout *secs*

Defines the maximum amount of time for retransmission of 'deactivate request' messages.
secs : Must be an integer from 1 to 60.
Default: 8

trim-trailing-spaces-in-apn

Enables SGSN to strip off any trailing space(s) in requested APN.
If a requested APN in an Activate PDP Context Request has any trailing spaces, then those trailing spaces will be removed and the length field will be updated.

Usage

Repeat this command with different keywords (parameters) to configure the SM (session management) as needed for this GPRS service. Keywords can be used to optimize signaling between the MS and the SGSN to reduce the impact on the radio resources.

Example

Reset the number of retransmission messages for deactivate PDP context request to 5.

```
sm deactivate-max-retransmissions 5
```

sndcp

Define the sub-network dependent convergence protocol (SNDCP) network packet data unit (N-PDU) reassembly timeout interval associated with this GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sndcp reassembly-timeout *seconds*

default sndcp reassembly-timeout

default

Resets the timer configuration to the default value of 30 seconds.

seconds

Defines the the number of seconds the SGSN waits for all the SNDCP segments to arrive before dropping all the disassembled segments.
seconds: Must be an integer from 1 to 300.

Usage

Use this command to modify the SNDCP reassembly timer. This timer starts as soon as the first N-PDU segment is received (either in-order or out-of-order). If all the segments belong to the N-PDU arrive before the timer expires then the segments are reassembled. If all the segments do not arrive before the timer expires, then the stored segments are discarded.

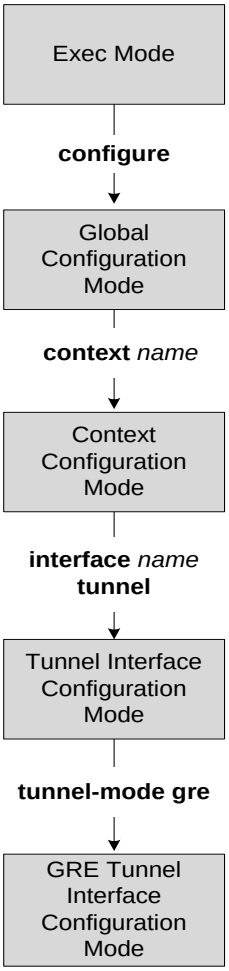
Example

Reset the default for the timer.

```
default sndcp reassembly-timeout
```

Chapter 131
GRE Tunnel Interface Configuration Mode Commands

The Generic Routing Encapsulation (GRE) Tunnel Interface Configuration Mode is used to create and manage the GRE tunneling interfaces for addresses, address resolution options, etc.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

destination

This command configures the destination IP address of the tunnel by specifying the destination end address. This is a mandatory configuration for a GRE tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] destination address ip_address
```

no

Removes or disassociates the configured destination IP address from a specific GRE tunnel interface configuration.

address *ip_address*

Configures the IP address for the interface.
ip_address must be specified using the IPv4 dotted-decimal notation.

Usage

Use this command to configure the destination IP address of the tunnel by specifying the IP address of destination tunnel end for GRE tunnel interface.

Important: State of source address will affect the operational state of the tunnel.

Example

The following command sets the 10.2.3.4 as destination IP address of the GRE tunnel interface:

```
destination address 10.2.3.4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

keepalive

This command configures various parameters for sending Keepalive messages to the remote end-point in GRE tunnel interface configuration. By default sending keepalives is disabled.

Product

All

Privilege

Security Administrator, Administrator

Syntax

keepalive [interval *time_interval* **num-retry** *retry*]

[default | no] keepalive

default

Sets the sending of Keepalives with default parameters.
interval: 10 seconds
num-retry: 3 retries

no

Disables the keepalive and turns off the sending of Keepalives messages.

interval *time_interval*

Default: 10
Specifies the time interval (in seconds) between two Keepalives sent to remote ends of GRE tunnel interface configuration.
time_interval must be an integer from 5 through 3600.

num-retry *retry*

Default: 3
Specifies number of retransmission of keepalives to remote node without getting any response before the remote node is marked as dead/down.
retry must be an integer between 0 through 10.

Usage

Use this command to configure the parameters for sending Keepalives to the remote end-point of GRE tunnel. It also configures the interval at which GRE Keepalives are sent on the interface and number of retries without getting a response from the remote end-point before the tunnel is shutdown. By default, Keepalives will not be sent.

Example

The following command enables the keepalive and sets the other parameters to defaults:

```
default keepalive
```

source

This command configures the source IP address of the tunnel either by specifying the IP address (host address) or by specifying another configured non-tunnel IP interface. This is a mandatory configuration for GRE tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] source {address ip_address | interface interface_name}
```

no

Removes/disassociates the configured source IP address or host interface from a specific GRE tunnel interface configuration.

address *ip_address*

Configures the IP address for the interface specifying the IP address.
ip_address must be specified using IPv4 dotted-decimal notation.

interface *interface_name*

Specifies the name of the preconfigured non-tunnel IP interface, whose address is used as the source address of the GRE tunnel.

Usage

Use this command to configure the source IP address of the tunnel either by specifying the IP address (host address) or by specifying another configured non-tunnel IP interface for GRE tunnel interface.

Important: State of source address will affect the operational state of the tunnel.

Example

The following command sets the 10.2.3.4 as source IP address of the GRE tunnel interface:

```
source address 10.2.3.4
```

tos

This command configures the parameters/action for the type of Service (ToS) parameter in the IP tunnel transport protocol header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip tos {value [ af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 |
af42 | af43 | be | ef | lower-bits tos_value] | copy}

no ip tos
```

default

Sets the IP TOS to lower bits value of 0.

value [*tos_value***]**

Default: **af11**
Specifies the IP QoS DSCP per-hop behavior to be marked on the outer header of signalling packets originating from the Access Gateway. This is a standards-based feature (RFC 2597). The following forwarding types are supported:

- **af11**: Assured Forwarding 11 per-hop behavior
- **af12**: Assured Forwarding 12 per-hop behavior
- **af13**: Assured Forwarding 13 per-hop behavior
- **af21**: Assured Forwarding 21 per-hop behavior
- **af22**: Assured Forwarding 22 per-hop behavior
- **af23**: Assured Forwarding 23 per-hop behavior
- **af31**: Assured Forwarding 31 per-hop behavior
- **af32**: Assured Forwarding 32 per-hop behavior
- **af33**: Assured Forwarding 33 per-hop behavior
- **af41**: Assured Forwarding 41 per-hop behavior
- **af42**: Assured Forwarding 42 per-hop behavior
- **af43**: Assured Forwarding 43 per-hop behavior
- **be**: Best Effort forwarding per-hop behavior
- **ef**: Expedited Forwarding per-hop behavior typically dedicated to low-loss, low-latency traffic.

The assured forwarding behavior groups are listed in the table below.

	Class 1	Class 2	Class 3	Class 4
Low Drop	AF11	AF21	AF31	AF41

	Class 1	Class 2	Class 3	Class 4
Medium Drop	AF12	AF22	AF32	AF42
High Drop	AF13	AF23	AF33	AF43

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.

lower-bits *tos_value*

Default: 0
Sets the least-significant 6 bits in the ToS byte with the specified numeric value.
tos_value must be an integer from 0 through 255.

copy

This keyword instructs the system to copy the ToS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the ToS value of the IPv4 tunnel transport protocol header

Usage

Use this command either to set the ToS parameter in the IPv4 tunnel transport protocol header to the specified value or instructs to copy the ToS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the ToS value of the IPv4 tunnel transport protocol header. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the ToS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the ToS byte.

Example

The following command instructs the system to copy the ToS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the ToS value of the IPv4 tunnel transport protocol header:

```
tos copy
```

ttl

This command configures the Time to live (TTL) parameter to be used in the tunnel transport protocol header for the current GRE tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ttl *ttl_value*

default ttl

default

Sets the TTL value to system default value.

ttl_value

Default: 15
Specifies the maximum time to live to be used in the tunnel transport protocol header
The time to live (TTL) is not a measure of time but the number of hops through the network.
ttl_value must be an integer between 1 through 255.

Usage

Use this command to set the TTL parameter to be used in the tunnel transport protocol header for the GRE tunnel configuration.

Example

The following configures the TTL to a value of *10*:

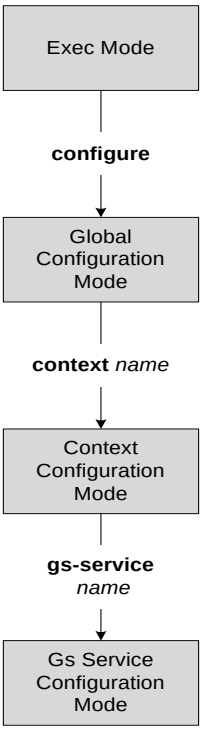
```
ttl 10
```

Chapter 132
Gs Service Configuration Mode Commands

The Gs Service configuration mode configures the parameters used to setup and maintain a Gs interface for a connection between the SGSN and an MSC/VLR.

Upon accessing this mode, your prompt should look similar to the following:

```
[<context_name>]<hostname>(config-gs-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate-sccp-network

This command associates a previously defined Signaling Connection Control Part (SCCP) network instance with the Gs service. This association is required to access Visitor Location Register(s) (VLRs).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

associate-sccp-network *sccp_net_id*

no associate-sccp-network

no

Removes the associated SCCP network configuration instance from this Gs service configuration.

sccp_net_id

Identifies the SCCP network configuration instance to associate with this Gs interface to enable connection with VLR(s).
sccp_network_num: Must be an integer from 1 through 12.

Usage

Use this command to associate the SCCP network configuration instance with the Gs interface in this service.

Important: A single SCCP network configuration instance can not be shared with multiple Gs services.

Important: To enable a Gs service, the user needs to configure **ssn** with the **bssap+** command.

Example

Following command associates SCCP network 2 with this Gs service.

associate-sccp-network *2*

bssap+

This command defines the Base Station System Application Part Plus configuration parameters for the Gs service to enable the SGSN to access a Visitor Location Register(s) (VLRs).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

bssap+ ssn *ss_num*

no bssap+ ssn *ss_num*

no

Removes the configured BSSAP+ subsystem number from this Gs service.

ssn *ss_num*

Specifies the subsystem number to configure in this Gs interface to use BSSAP+.
ss_num must be an integer from 1 through 255.

Usage

Use this command to configure the BSSAP+ subsystem with Gs interface in this service to communicate with VLR(s).

Important: A single SCCP network configuration instance can not be shared with multiple Gs services.

Important: To start a Gs service, the user needs to configure the command parameter.

Example

Following command configures subsystem 101 with BSSAP+ in this Gs service.

bssap+ ssn *101*

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous configuration mode.

max-retransmission

This command configures the retransmission values for different procedure counters in Gs service as described in TS 29.018.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-retransmissions { n8 | n9 | n10 | n12 } *retrans_num*

default max-retransmissions { n8 | n9 | n10 | n12 }

no

Removes the configured Gs procedures from this Gs service.

{ n8 | n9 | n10 | n12 }

Specifies the various Gs service procedures that are available to be used to communicate with VLR(s).

- n8: Defines the maximum number of retries for explicit IMSI detach from a non-GPRS service. Default is 2.
- **n9**: Defines the maximum number of retries for explicit IMSI detach from a non-GPRS service. Default is 2.
- **n10**: Defines the maximum number of retries for implicit IMSI detach from the GPRS service. Default is 2.
- **n12**: Defines the maximum number of retries for BSSAP+ to send Reset Indication messages. Default is 2.

retrans_num

Default: 2
Specifies the number of re-transmission of message for specified procedures.
retrans_num: Must be an integer from 0 through 10.

Usage

Use this command to configure the retransmission values for specific procedure counters in Gs service. counters are based on TS 29.018.
This command can be entered for each procedure counter separately.

Example

Following command configure retransmission value as *3* for counter for procedure to send BSSAP+ Reset Indication messages in this Gs service.

```
max-retransmissions n12 3
```

non-pool-area

This command creates a non-pool area for a set of subscriber location area code (LAC) values that can be used with a specific VLR for the Gs service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

non-pool-area *non_pool_name* **{ use-vlr** *vlr_name* **lac** *lac_num* **} +**

no non-pool-area *non_pool_name* **[lac** *lac_num*

no

Removes the configured non-pool area from this Gs service.

non_pool_name

Specifies the name of the non-pool area to configure with this command.
non_pool_name must be an alpha and/or numeric string of 1 to 63 characters.

use-vlr *vlr_name*

Specifies the name of the VLR to be associated with this non-pool area.
vlr_name is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.

lac *lac_num*

Specifies the subscribers' location area code to be attached with this non-pool area and specific VLR. This LAC of subscriber is obtained from the radio area indicator (RAI).
Including this keyword with the **no** form of the command enables the operator to remove a specific LAC from the non-pool area configuration.
lac_num is the LAC value and must be an integer value from 1 through 65535.

+

More than one *lac_num*, separated by a space, can be entered within a single command.

Usage

This command can be repeated as necessary to define a total of 32 configured LACs for the combined **non-pool-area** and **pool-area** configurations per Gs service.

Example

Following command configure a non-pool area *starpool1* to use VLR named *starvlr1* for LAC *101* in a Gs service.

```
non-pool-area starpool1 use-vlr starvlr1 lac 101
```

pool-area

This command creates a pool area configuration instance. This command also enters the Pool Area configuration mode to define the set of VLRs to use for a pool area for a set of subscriber location area code (LAC) values in the Gs service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

pool-area *pool_name* **[-noconfirm]**

no pool-area *non_pool_name*

no

Removes the configured pool area from this Gs service.

pool_name

Specifies the name of the pool area to configure with this command for VLR pooling and association of a LAC.
pool_name: Must be an alpha and/or numeric string of 1 to 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/enter the pool area configuration mode. This mode is used configure the set of VLRs to be used for a set of subscriber LAC.
This command can be used multiple times, subject to a limit of 128 LAC values (the total number of **non-pool-area** and **pool-area** configurations) per Gs service.

Example

The following command configures a pool area named *starpool1* in a Gs service without any confirmation prompt.

```
pool-area starpool1 -noconfirm
```

sgsn-number

Define the SGSN's E164 number to associate an SGSN with this Gs Service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *E.164_number*

E.164_number

Defines the SGSN's 'telephone' number, the ISDN number for per ITU-T E.164 numbering plan. The number must be a numerical string of 1 to 15 digits.

Usage

For releases 8.1 or higher, use this command to define the SGSN's E.164 ISDN number. This value should match the **sgsn-number** defined for SGSN Service or GPRS Service.

Important: Note: the Gs Service will not start unless the SGSN's E.164 number is configured.

Example

sgsn-number *12345678901234*

timeout

This command configures various timers defining the wait before retransmitting a specific message for Gs service procedures.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout { t6-1-timer *t6_1_dur* **| t8-timer** *t8_dur* **| t9-timer** *t9_dur* **| t10-timer** *t10_dur* **| t12-1-timer minute** *t12_1_dur* **| t12-2-timer** *t12_2_dur***}**

[default] timeout { t6-1-timer | t8-timer | t9-timer | t10-timer | t12-1-timer | t12-2-timer }

default

Sets the timer value to wait in seconds/minutes to default values. Default values for timers are:

- **t6-1-timer**: 10 seconds
- **t8-timer**: 4 seconds
- **t9-timer**: 4 seconds
- **t10-timer**: 4
- **t12-1-timer**: 54 mins (+ 8 seconds)
- **t12-2-timer**: 4 seconds

t6-1-timer *t6_1_dur*

Default: 10
Specifies the retransmission timer value to guard the location update.
t6_1_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 10 through 90.

t8-timer *t8_dur*

Default: 4
Specifies the retransmission timer value to guard the explicit IMSI detach from the GPRS service procedure.
t8_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t9-timer *t9_dur*

Default: 4
Specifies the retransmission timer value to guard the explicit IMSI detach from the non-GPRS service procedure.
t9_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t10-timer *t10_dur*

Default: 4
Specifies the retransmission timer value to guard the implicit IMSI detach from the GPRS service procedure.
t10_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t12-1-timer minute *t12_1_dur*

Default: 54 minutes (plus 8 seconds for transmission delay)
Specifies the retransmission timer value to control the resetting of SGSN-Reset variable procedure.
t12_1_dur is the waiting duration in minutes before retransmitting reset message for the SGSN Reset variable and must be an integer from 0 through 384.

t12-2-timer *t12_2_dur*

Default: 4
Specifies the retransmission timer value to guard the SGSN reset procedure.
t12_2_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 120.

Usage

Use this command to configure the time, for different procedure timers, to wait before retransmitting a procedure message.
This command can be repeated for each timer to configure multiple timers.

Example

Following command sets the timeout duration of 4 seconds for t8 timer to wait before retransmitting the procedure message to explicitly do the IMSI detach from GPRS service:

```
default timeout t8-timer
```

vlr

This command defines a VLR configuration for use with this Gs service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

vlr *vlr_name* **isdn-number** *E164_num* **[bssap+ ssn** *ssn* **] [point-code** *pt_code* **]**

no vlr *vlr_name*

no

Removes the configured VLR from the Gs service.

vlr_name

Specifies the name of the VLR to configure in this Gs mode with ISDN number.
vlr_name must be an alpha and/or numeric string of 1 to 63 characters.

isdn-number *E164_num*

Specifies the VLR number to configure with this command.
E164_num: The ISDN number for the target VLR. Value must be defined according to the E.164 numbering plan and must be a numeric string of 1 to 15 digits.

bssap+ ssn *ssn*

Specifies the subsystem number to configure with this VLR to use BSSAP+.
ssn: Must be an integer from 1 through 255. Default value is 252.

point-code *pt_code*

Specifies SS7 address of VLR in point code value to this configured VLR name.
pt_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ######## format.

Usage

Use this command to define VLR configuration instances to be associated with the Gs service.
A maximum of 32 VLRs can be configured per Gs service.

Example

Following command configures the VLR named *starvlr1* with an ISDN number *12344567*, a subsystem number of *252*, and a point code value of *123.345.567*:

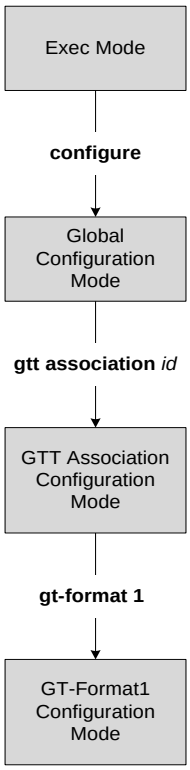
vlr *starvlr1* **isdn-number** *12344567* **point-code** *123.345.567*

Chapter 133
GT-Format1 Configuration Mode Commands

The GT-Format1 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format1)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

nature-of-address

Configures the indicator to identify the nature of the address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
nature-of-address { international | national | subscriber )
```

international

Identifies the numbers as international.

national

Identifies the numbers as matching the national configuration.

subscriber

Identifies the numbers as subscriber numbers.

Usage

Configure the identify of the GT format as national.

Example

```
nature-or-address national
```

odd-even-indicator

Configures the bits for matching the global title translation.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

odd-even-indicator *type*

type

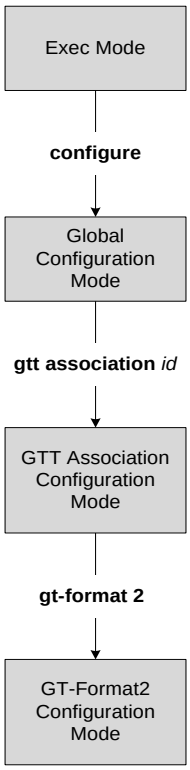
- **odd:** Sets the odd bit for matching the GTT.
- **even:** Sets the even bit for matching the GTT.

Chapter 134
GT-Format2 Configuration Mode Commands

The GT-Format2 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

translation-type

Configures the translation type to be applied during the translation process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0

Usage

Use this command to configure the GTT translation type to be applied during global title translation process.

Example

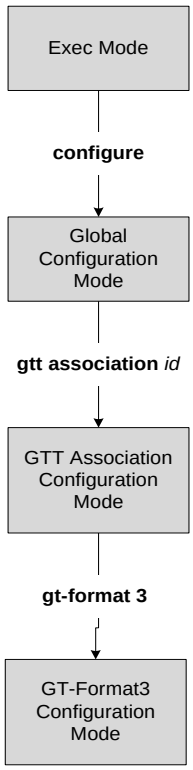
translation-type *232*

Chapter 135
GT-Format3 Configuration Mode Commands

The GT-Format3 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encoding-scheme

Configures the encoding-scheme to use during global title translation (GTT).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

encoding scheme *scheme_type*

scheme_type

Select one of the following encoding scheme types to determine the encoding type to be used during GTT:

- **bcd-even:** BCD even encoding scheme
- **bcd-odd:** BCD odd encoding scheme
- **nw-specfic:** Network specific encoding scheme
- **unknown:** Unknown encoding scheme

Usage

Select BCD even encoding for GTT

Example

encoding scheme *bcd-even*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

numbering-plan

Configures the GTT process to apply one of the numbering-plans during the GT translation process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

numbering-plan *plan_type*

plan_type

Select one of the following numbering plans be employed during GTT:

- **data:** Data numbering plan
- **generic**: Generic number plan
- **isdn** : ISDN tel numbering plan
- **isdn-mobile:** ISDN mobile numbering plan
- **land-mobile:** Land mobile numbering plan
- **maritime-mobile:** Maritime mobile numbering plan
- **nw-specific** : Private network / network-specific numbering plan
- **telex:** Telex numbering plan
- **unknown**: Unknown numbering plan

Usage

Select ISN telephone number plan for GTT process.

Example

The following command sets the numbering plan to use during GTT processing to isdn

```
numbering-plan isdn
```

translation-type

Configures the global title translation (GTT) process to apply a specific number for translation during the GTT process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0

Usage

Use this command to define the translation-type to be used during the global title translation process.

Example

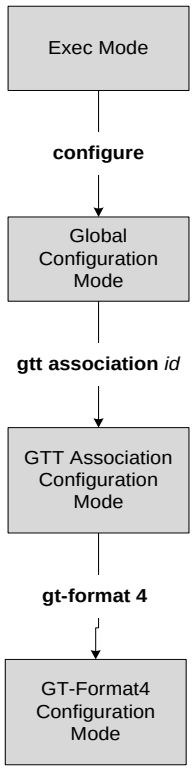
translation-type *233*

Chapter 136
GT-Format4 Configuration Mode Commands

The GT-Format4 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encoding-scheme

Configures the encoding-scheme to use during GTT.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

encoding scheme *scheme_type*

scheme_type

Select one of the following encoding scheme types to determine the encoding type to be used during GTT:

- **bcd-even:** BCD even encoding scheme
- **bcd-odd:** BCD odd encoding scheme
- **nw-specfic:** Network-specific encoding scheme
- **unknown:** Unknown encoding scheme

Usage

Select BCD even encoding for GTT

Example

encoding scheme *bcd-even*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

nature-of-address

Configures the indicator to identify the nature of the address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
nature-of-address { international | national | subscriber )
```

international

Identifies the numbers as international.

national

Identifies the numbers as matching the national configuration.

subscriber

Identifies the numbers as subscriber numbers.

Usage

Configure the identify of the GT format as national.

Example

```
nature-or-address national
```

numbering-plan

Configures the GTT process to apply one of the numbering-plans during the GT translation process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

numbering-plan *plan_type*

plan_type

Select one of the following numbering plans be employed during GTT:

- **data:** Data numbering plan
- **generic**: Generic number plan
- **isdn** : ISDN tel numbering plan
- **isdn-mobile:** ISDN mobile numbering plan
- **land-mobile:** Land mobile numbering plan
- **maritime-mobile:** Maritime mobile numbering plan
- **nw-specific** : Private network/ network-specific numbering plan
- **telex:** Telex numbering plan
- **unknown**: Unknown numbering plan

Usage

Select ISN telephone number plan for GTT process.

Example

numbering-plan *isdn*

translation-type

Configures the GTT process to apply a specific number for translation during the GTT process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0.

Usage

Use this command to configure the translation-type to be implemented during the global title translation process.

Example

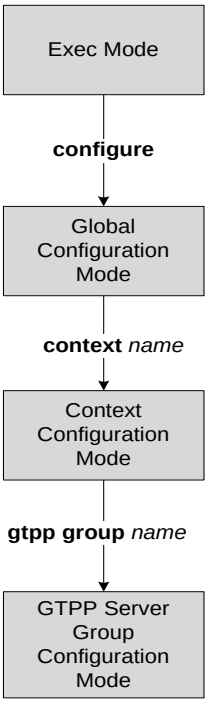
translation-type *231*

Chapter 137
GTPP Server Group Configuration Mode Commands

The GTPP Server Group Configuration Mode is used to create and manage the GTPP server groups within the context or system.

GTPP server group commands facilitate the setup of the hard disk for CDR storage. They also support accounting and charging functionality within a context, and configuration of a group (list) of charging gateway function (CGF) servers on a per subscriber or per GGSN/P-GW APN level.

In this mode, your prompt will be similar to `[context_name]hostname(config-gtpp-group)#`



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

gtpp attribute

Enables the specification of some of the optional fields in the CDRs that the GSN (GGSN or SGSN) generates and/or how the information is to be presented.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp attribute { camel-info | cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | node-id-suffix STRING | plmn-id | rat | record-extensions rat | served-pdp-pdn-address-extension | sms { destination-number | recording-entity | service-centre }  } +

default gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | plmn-id | rat | record-extensions rat | served-pdp-pdn-address-extension | sms { destination-number | recording-entity | service-centre } }

no gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | node-id-suffix | plmn-id | rat | record-extensions rat | served-pdp-pdn-address-extension | sms { destination-number | recording-entity | service-centre } }
```

default

Resets the default attribute values for this GTPP group configuration.

no

Disables the specified optional field so that the information will not be present in generated CDRs.

camel-info

SGSN only
Enter this keyword to include CAMEL-specific fields in SGSN CDRs. Default: Disabled

cell-plmn-id

SGSN only
Enter this keyword to enable the system to include the Cell PLMN ID field in the M-CDR. Default: Disabled

diagnostics

Default: Disabled
Enables the system to include the Diagnostic field in the CDR that is created when PDP contexts are released. The field will include one of the following values:

- **26** - For GGSN: if the GGSN sends “delete PDP context request” for any other reason (e.g., the operator types “clear subscribers” on the GGSN). For SGSN: The SGSN includes this cause code in the S-CDR to indicate that a secondary PDP context activation request or a PDP context modification request has been rejected due to insufficient resources.

- **36** - For GGSN: this cause code is sent in the G-CDR to indicate the PDP context has been deactivated in the GGSN due to the SGSN having sent a "delete PDP context request" to the GGSN. For SGSN, this cause code is used to indicate a regular MS or network-initiated PDP context deactivation.
- **37** - when the network initiates a QoS modification, the SGSN sends in the S-CDR to indicate that the MS initiation deactivate request message has been rejected with QoS not accepted as the cause.
- **38** - if the GGSN sends "delete PDP context request" due to GTP-C/GTP-U echo timeout with SGSN. If the SGSN sends this cause code, it indicates PDP context has been deactivated due to path failure, specifically GTP-C/GTP-U echo timeout.
- **39** - SGSN only - this code indicates the network (GGSN) has requested a PDP context reactivation after a GGSN restart.
- **40** - if the GGSN sends "delete PDP context request" due to receiving a RADIUS Disconnect-Request message.

`duration-ms`

Specifies that the information contained in the mandatory Duration field be reported in milliseconds instead of seconds (as the standards require). Default: Disabled

`imei`

Default: Disabled
For SGSN: includes the IMEI value in the S-CDR.
For GGSN: includes the IMEISV value in the G-CDR.

`local-record-sequence-number`

Default: Disabled
This keyword provides both the local record sequence number and the Node ID. In the x-CDRs, this field indicates the number of CDRs generated by the node and is unique within the session manager.
The Node ID field is included in the x-CDR for any of several reasons, such as when PDP contexts are released or if partial-CDR is generated based on configuration. The field will consist of a AAA Manager identifier automatically appended to the name of the SGSN or GGSN service.
The name of the SGSN or GGSN service may be truncated, because the maximum length of the Node ID field is 20 bytes. Since each AAA Manager generates CDRs independently, this allows the Local Record Sequence Number and Node ID fields to uniquely identify a CDR.

Important: If this keyword is enabled and the **gtpp centralized-lrsn-creation** option is enabled with the **gtpp single-source centralized-lrsn** command, then the Node ID format changes as follows: <1-byte-AAAproxy-restart-counter> <3-byte AAAproxy instance number> <node-id-suffix>. If **gtpp centralized-lrsn-creation** is not enabled, the node-id format for CDRs generated by Sessmgr is as follows: <1-byte Sessmgr restart-value> <3-byte Sessmgr instance number> <node-id-suffix>. If **gtpp centralized-lrsn-creation** is not enabled, the node-id format for CDRs generated by ACSMGR is as follows: <1-byte ACSmgr restart-value> <3-byte ACSmgr instance number> <Active charging service-name>.

`msisdn`

Default: Enabled
For SGSN: includes the MSISDN value in the S-CDR.
For GGSN: includes the MSISDN value in the G-CDR.

node-id-suffix *STRING*

Default: Disabled
Specifies the configured Node-ID-Suffix to use in the NodeID field of GTPP CDRs as an alphanumeric string of 1 through 16 characters. Each Session Manager task generates a unique NodeID string per GTPP context.

Important: The NodeID field is a printable string of the *ndddSTRING* format: *n*: The first digit is the Sessmgr restart counter having a value between 0 and 7. *ddd*: The number of sessmgr instances. Uses the specified NodeID-suffix in all CDRs. The "Node-ID" field consists of sessMgr Recovery counter (1 digit) *n* + AAA Manager identifier (3 digits) *ddd* + the configured Node-Id-suffix (1 to 16 characters) *STRING*. If the centralized LRSN feature is enabled, the "Node-ID" field will consist of only the specified NodeID-suffix (NodeID-prefix is not included). If this option is not configured, then GTPP group name will be used instead (For default GTPP groups, context-name will be used).

Important: If this **node-id-suffix** is not configured, the GGSN uses the GTPP context name as the Node-id-suffix (truncated to 16 characters) and the SGSN uses the GTPP group named as the node-id-suffix.

plmn-id [unknown-use]

Default: Enabled
For SGSN, reports the SGSN PLMN Identifier value (the RAI) in the S-CDR provided if the dictionary supports it.
For GGSN, reports the SGSN PLMN Identifier value (the RAI) in the G-CDR if it was originally provided by the SGSN in the GTP create PDP context request. It is omitted if the SGSN does not supply one.
Normally when SGSN PLMN-id information is not available, the attribute sgsnPLMNIdentifier is not included in the CDR. This keyword enables the inclusion of the sgsnPLMNIdentifier with a specific value when the SGSN PLMN-id is not available.
unknown-use *hex_num*: is aa hexadecimal number from 0x0 through 0xFFFFFF that identifies a foreign SGSN that has not provided a PLMN-id. For GGSN only.

rat

Default: Enabled
For SGSN: includes the RAT (identifies the radio access technology type) value in the S-CDR.
For GGSN: includes the RAT (identifies the radio access technology type) value in the G-CDR.

record-extensions rat

Default: Disabled
Enables network operators and/or manufacturers to add their own recommended extensions to the CDRs according to the standard record definitions from 3GPP TS 32.298 Release 7 or higher.

served-pdp-pdn-address-extension

Default: Disabled
In support of IPv4v6 dual PDP address types, this keyword causes the SGSN to include IPv4v6 address information in the S-CDR. The IPv4 address goes in the a new PDP address extension field and the IPv6 address goes in the existing servedPDPAdress field.
This keyword is applicable for SGSN only.

sms { destination-number | recording-entity | service-centre }

This keyword is specific to the SGSN.
Entering this keyword causes the inclusion of an SMS-related field in the SMS-MO-CDR or SMS-MT-CDR.

destination-number: Includes the "destinationNumber" field in the SMS-MO-CDR or SMS-MT-CDR.
recording-entity: Includes the "recordingEntity" field in the SMS-MO-CDR or SMS-MT-CDR.
service-centre: Includes the "serviceCentre" field in the SMS-MO-CDR or SMS-MT-CDR.

+

Indicates that this command can be entered multiple times to configure multiple attributes.

Usage

This command dictates some of the optional information fields that should be reported in CDRs generated by the GGSN. In addition, it controls how the information for some of the mandatory fields are reported. Fields described as optional by the standards but not listed above will always be present in the CDRs, except for Record Extensions (which will never be present).

Example

The following command dictates that the time provided in the Duration field of the CDR is reported in milliseconds:

```
gtpp attribute duration-ms
```

gtpp charging-agent

Configures the IP address and port of the system interface within the current context used to communicate with the CGF or the GSS.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp charging-agent address ip_address [ port port ]

no gtpp charging-agent
```

no

Removes a previously configured charging agent address.

address *ip_address*

Specifies the IP address of the interface configured within the current context that is used to transmit G-CDR records to the CGF or the GSS.
ip_address is expressed in IPv4 dotted-decimal notation.

port *port*

Specifies the Charging Agent UDP port as an integer from 1 through 65535. If the port is not defined, the default port number 49999 will be used.

Important: Configuring GTPP charging-agent on port 3386 may interfere with ggsn-service configured with the same ip address.

Usage

This command can be used to establish a UDP interface to connect to the GSS or this command can establish a Ga interface to connect to the CFG. These interfaces must exist in the same context in which GTPP functionality is configured (refer to the **gtpp** commands in this chapter).
This command instructs the system as to what interface to use. The IP address supplied is also the address by which the GGSN/SGSN is known to the CGF or the GSS. Therefore, the IP address used for the Ga or UDP interface could be identical to one bound to a GGSN/SGSN service (a Gn interface).
If no GGSN/SGSN services are configured in the same context as the Ga/UDP interface, the address configured by this command is used to receive unsolicited GTPP packets.

Example

The following command configures the system to use the interface with an IP address of 192.168.13.10 as the accounting interface with port *20000* to the CGF:

```
gtpp charging-agent address 192.168.13.10

gtpp charging-agent address 192.168.13.10 port 20000
```

gtpp data-request sequence-numbers

Configures the range of sequence numbers to be used in the GTPP data record transfer record (DRT). Use this command to set the start value for the sequence number.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp data-request sequence-numbers start { 0 | 1 }

default gtpp data-request sequence-numbers start
```

default

Default is 0 (zero).

start { 0 | 1 }

Specifies the value of the start sequence number for the GTPP Data Record Transfer Request. Default: 0

- **0**: Designates the start sequence number as 0.
- **1**: Designates the start sequence number as 1.

Usage

When the GGSN/P-GW/SGSN is configured to send GTPP echo request packets, the SGSN always uses 0 as the sequence number in those packets. Re-using 0 as a sequence number in the DRT packets is allowed by the 3GPP standards; however, this CLI command ensures the possibility of inter-operating with CGFs that can not properly handle the re-use of sequence number 0 in the echo request packets.

Example

The following command sets the sequence to start at 1.

```
gtpp data-request sequence-numbers start 1
```

gtpp deadtime

Configures the amount of time the GGSN/SGSN waits before attempting to communicate with a CGF that was previously marked as unreachable (non-responsive).

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp deadtime *time*

default deadtime

default

Resets the deadtime to the default of 120 seconds.

time

Specifies the amount of time (in seconds) that must elapse before the system attempts to communicate with a CGF that was previously unreachable.
time is an integer from 1 to 65535. Default: 120

Usage

If the system is unable to communicate with a configured CGF, after a pre-configured number of failures the system marks the CGF as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed CGF.
Refer to the **gtpp detect-dead-server** and **gtpp max-retries** commands for additional information on the process the system uses to mark a CGF as down.

Example

The following command configures the system to wait 60 seconds before attempting to re-communicate with a CGF that was marked as down:

```
gtpp deadtime 60
```

gtpp dead-server suppress-cdrs

Configures the action the GGSN or the SGSN will take on CDRs generated during a communication failure between the GGSN or the SGSN and the GTPP servers.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] gtpp dead-server suppress-cdrs
```

no

Removes the suppression instruction from the configuration and sets the CDR suppression mode as disabled.

default

Resets the GGSN or the SGSN to the default mode: disable suppression of CDRs when GTPP server detected as “dead” or unreachable.

Usage

For the GGSN/P-GW: This command works in conjunction with the **gtpp detect-dead-server** to set an action when a communication failure is detected between the GGSN and a configured GTPP server. It disables the archiving of CDRs on the system when the GTPP server is unreachable or dead.
For the GGSN. P-GW, and the SGSN: During a communication or server failure, the GGSN, P-GW, or SGSN typically retains the GTPP requests until the system buffer runs out of resources. This command enables suppression of the CDRs, so with this command the GGSN, P-GW, or the SGSN will start purging all CDRs associated with this GTPP group as soon as the GGSN/P-GW/SGSN detects that the GTPP server is down or that a communication failure has occurred. The CDRs generated, for the period while the server is down/unreachable, will also be purged.

Example

The following command configures the system to start purging CDRs when a communication failure with a server is detected:

```
gtpp dead-server suppress-cdrs
```

gtpp detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a CGF as "dead" (unreachable).

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp detect-dead-server consecutive-failures *max_number*

default gtpp detect-dead-server consecutive-failures

default

Resets the system to the default number of consecutive failures.

consecutive-failures *max_number*

Default: 5
Specifies the number of failures that could occur before marking a CGF as down as an integer from 0 through 1000. If 0 (zero) is the value entered, the system will mark the CGF as dead after a single instance of **max-retries** has been attempted with no success, regardless of configured **deadtime**.

Usage

This command works in conjunction with the **gtpp max-retries** parameter to set a limit to the number of communication failures that can occur with a configured CGF.
The **gtpp max-retries** parameter limits the number of attempts to communicate with a CGF. Once that limit is reached, the system treats it as a single failure. The **gtpp detect-dead-server** parameter limits the number of consecutive failures that can occur before the system marks the CGF as down and communicate with the CGF of next highest priority.
If all of the configured CGFs are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority CGF again.
If the system receives a GTPP Node Alive Request, Echo Request, or Echo Response message from a CGF that was previously marked as down, the system immediately treats it as being active.
Refer to the **gtpp max-retries** command for additional information.

Example

The following command configures the system to allow 8 consecutive communication failures with a CGF before it marks it as down:

```
gtpp detect-dead-server consecutive-failures 8
```

gtpp dictionary

Designates specific dictionary used by GTPP for specific context.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp dictionary { **custom1** | **custom10** | **custom11** | **custom12** | **custom13** | **custom14** | **custom15** | **custom16** | **custom17** | **custom18** | **custom19** | **custom2** | **custom20** | **custom21** | **custom22** | **custom23** | **custom24** | **custom25** | **custom26** | **custom27** | **custom28** | **custom29** | **custom3** | **custom30** | **custom31** | **custom32** | **custom33** | **custom34** | **custom35** | **custom36** | **custom37** | **custom38** | **custom39** | **custom4** | **custom40** | **custom41** | **custom42** | **custom43** | **custom44** | **custom45** | **custom46** | **custom47** | **custom48** | **custom49** | **custom5** | **custom50** | **custom51** | **custom52** | **custom53** | **custom54** | **custom55** | **custom56** | **custom57** | **custom58** | **custom59** | **custom6** | **custom60** | **custom7** | **custom8** | **custom9** | **standard** }**default gtpp dictionary**

default gtpp dictionary

---

default

Configures the default dictionary.

---

custom1

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99. It supports the encoding of IP addresses in text format for G-CDRs.

---

custom2

Custom-defined dictionary.

---

custom3

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 but it does support the encoding of IP addresses in binary format for CDRs.

---

custom4

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 except that:

- the Data Record Format Version information element contains 0x1307 instead of 0x1308
- "QoSRequested" is not present in the LoTV containers
- "QoSnegotiated" is added only for the first container and the container after a QoS change

---

custom5 ... custom20

Custom-defined dictionaries.

custom21 ... custom25

Custom-defined dictionaries for GGSN only.

custom26

Custom-defined dictionary for customization of G-CDR records for GGSN only. This is compliant to 3GPP TS 32.298 (R6 v 6.5.0) for proprietary fields and encoding.

custom27

Custom-defined dictionary for customization of S-CDR records for SGSN only. This is compliant to 3GPP TS 32.298 (R6 v 6.6.0) for proprietary fields and encoding.

custom28 ... custom30

Custom-defined dictionaries for GGSN only.

custom31 ... custom40

Custom-defined dictionaries based on 3GPP 32.298 v6.4.1 for SGSN only.

- **custom31:** Custom-defined dictionary for S-CDR encoding. Includes a field appended for PLMN-ID.
- **custom33:** Custom-defined dictionary for S-CDR encoding. Includes a field appended for PLMN-ID and does not support diagnostic or SGSN-change fields.

standard

Default: Enabled
A dictionary conforming to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

Usage

Use this command to designate specific dictionary used by GTPP for specific context.

Example

The following command configures the system to use custom3 dictionary to encode IP address in Binary format in G-CDRs:

```
gtpp dictionary custom3
```

gtpp duplicate-hold-time

Configures the number of minutes to hold onto CDRs that are possibly duplicates while waiting for the primary CGF to come back up.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp duplicate-hold-time minutes *minutes*

default gtpp duplicate-hold-time

default

Resets the configuration to the default value of 60 minutes for the duplicate hold time.

minutes

When the primary CGF is down, the number of minutes to hold onto CDRs that may be duplicates. *minutes* must be an integer from 1 to 10080. Default is 60.

Usage

Use this command to configure how long to hold onto CDRs, that are possibly duplicates, while waiting for the primary CGF to come back up. If the GGSN determines that the primary CGF is down, CDRs that were sent to the primary CGF, but not acknowledged, are sent by the GGSN to the secondary CGF as "possibly duplicates". When the primary CGF comes back up, the GGSN uses GTPP to determine whether the possibly duplicate CDRs were received by the primary CGF. Then the secondary CGF is told whether to release or cancel those CDRs. This command configures how long the system should wait for the primary CGF to come back up. As soon as the configured time expires, the secondary CGF is told to release all of the possibly duplicate CDRs.

Example

Use the following command to set the amount of time to hold onto CDRs to 2 hours (120 minutes):

```
gtpp duplicate-hold-time minutes 120
```

gtpp echo-interval

Configures the frequency at which the system sends GTPP echo packets to configured CGFs.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp echo-interval time

{ default | no } gtpp echo-interval
```

default

Resets the configuration to the default echo-interval of 60 seconds.

no

Disables the use of the echo protocol except for the scenarios described in the Usage section for this command.

time

Specifies the number of seconds for sending GTPP echo packets as an integer from 60 to 3600. Default: 60.

Usage

The GTPP echo protocol is used by the system to ensure that it can communicate with configured CGFs. The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new CGF server on the system using the **gtpp server** command as described in this chapter
- Upon the execution of the **gtpp test accounting** command as described in the Exec Mode Commands chapter of this reference
- Upon the execution of the **gtpp sequence-numbers private-extensions** command as described in this chapter

The echo-interval command is used in conjunction with the **gtpp max-retries** and **gtpp timeout** commands as described in this chapter.
In addition to receiving an echo response for this echo protocol, if we receive a GTPP Node Alive Request message or a GTPP Echo Request message from a presumed dead CGF server, we will immediately assume the server is active again.
The alive/dead status of the CGFs is used by the AAA Managers to affect the sending of CDRs to the CGFs. If all CGFs are dead, the AAA Managers will still send CDRs, (refer to the **gtpp deadtime** command), albeit at a slower rate than if a CGF were alive. Also, AAA Managers independently determine if CGFs are alive/dead.

Example

The following command configures an echo interval of 120 seconds:

```
gtpp echo-interval 120
```

gtpp egcdr

Configures the eG-CDR and P-CDR (P-GW CDR) parameters and triggers.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
gtpp egcdr { final-record [ [ include-content-ids { all | only-with-traffic } ] [
closing-cause { same-in-all-partials | unique } ] ] | losdv-max-containers
max_losdv_containers | lotdv-max-containers max_lotdv_containers | rulebase-max-length
rulebase_name_max_length | service-data-flow threshold { interval interval | volume {
downlink bytes [ uplink bytes ] | total bytes | uplink bytes [ downlink bytes ] } } |
service-idle-timeout { 0 | service_idle_timeout } }

default gtpp egcdr { final-record include-content-ids only-with-traffic closing-cause
same-in-all-partials | losdv-max-containers | lotdv-max-containers | service-idle-timeout
0 }

no gtpp egcdr { rulebase-max-length | service-data-flow threshold { interval | volume {
downlink [ uplink ] | total | uplink [ downlink ] } } }
```

final-record [[include-content-ids { all | only-with-traffic }] [closing-cause { same-in-all-partials | unique }]]

Enables configuration of the final eG-CDR/P-CDR.

- **include-content-ids**: Controls which content-ids are being included in the final eG-CDR/P-CDR.
  - **all**: Specifies that all content-ids be included in the final eG-CDR/P-CDR.
  - **only-with-traffic**: Specifies that only content-ids with traffic be included in the final eG-CDR/P-CDRs.
- **closing-cause**: Configures closing cause for the final eG-CDR/P-CDR.
  - **same-in-all-partials**: Specifies that the same closing cause is to be included for multiple final eG-CDR/P-CDRs.
  - **unique**: Specifies that the closing cause for final eG-CDR/P-CDRs is to be unique.

losdv-max-containers *max_losdv_containers*

Specifies the maximum number of List of Service Data Volume (LoSDV) containers in one eG-CDR/P-CDR.
max_losdv_containers must be an integer from 1 through 255.
Default: 10

lotdv-max-containers *max_lotdv_containers*

Specifies the maximum number of List of Traffic Data Volume (LoTDV) containers in one eG-CDR/P-CDR.
max_lotdv_containers must be an integer from 1 through 8.
Default: 8

rulebase-max-length *rulebase_name_max_length*

Specifies the maximum character length of charging rulebase name in LOSDVs of eG- CDR/P-GW-CDR. *rulebase_name_max_length* must be an integer from 0 through 63. Zero (0) means the rulebase name is added as-is.
Default: None. That is, full (un-truncated) charging rulebase name will go in LOSDVs of eG-CDR/P-GW-CDR.

service-data-flow threshold { interval *interval* **| volume { downlink** *bytes* **[uplink** *bytes* **] | total** *bytes* **| uplink** *bytes* **[downlink** *bytes* **] } }**

Configures the thresholds for closing a service data flow container within an eG-CDR/P-CDR.

- **interval** *interval*: Specifies the time interval (in seconds) to close the eG-CDR/P-CDR if the minimum time duration thresholds for service data flow containers satisfied in flow-based charging. The interval is an integer from 60 through 40000000. Default: Disabled
- **volume { downlink** *bytes* **[uplink** *bytes* **] | total** *bytes* **| uplink** *bytes* **[downlink** *bytes* **] }**: Specifies the volume octet counts for the generation of the interim eG-CDR/P-CDRs to the service data flow container in FBC.
  - **downlink** *bytes*: Specifies the limit for the number of downlink octets after which the eG-CDR/P-CDR is closed.
  - **total** *bytes*: Specifies the limit for the total number of octets (uplink+downlink) after which the eG-CDR/P-CDR is closed.
  - **uplink** *bytes*: Specifies the limit for the number of uplink octets after which the eG-CDR/P-CDR is closed.
  - *bytes* must be an integer from 10000 through 400000000.

A service data flow container has statistics for an individual content ID. When the threshold is reached, the service data flow container is closed.

service-idle-timeout { 0 | *service_idle_timeout***}**

Specifies a time period during which if no data is reported for a service flow, the service container is closed and added to eG-CDR/P-CDR (as part of LOSDV container list) with service condition change as ServiceIdleOut.
0: Specifies there is no service-idle-timeout trigger.
service_idle_timeout is an integer from 10 through 86,400. Default: 0

Usage

Use this command to configure individual triggers for eG-CDR/P-CDR generation.

Example

Use the following command to set the maximum number of LoSDV containers to 7:

```
gtpp egcdr losdv-max-containers 7
```

gtpp error-response

Configures the response when the system receives an error response after transmitting a DRT (data record transfer) request.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp error-response { discard-cdr | retry-request }

default gtpp error-response
```

default

Resets the system's configuration to the default value for error-response. Default is retry-request.

discard-cdr

Purges the request upon receipt of an error response and not to retry.

retry-request

Retries sending a DRT after receiving an error response. This is the default behavior.

Usage

This command configures the system's response to receiving an error message after sending a DRT request.

Example

```
gtpp error-response discard-cdr
```

gtpp max-cdrs

Configures the maximum number of charging data records (CDRs) to be included in a packet.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-cdrs *max_cdrs* **[wait-time** *wait_time* **]**

default gtpp max-cdrs

default

Sets the default configuration.

max_cdrs

Specifies the maximum number of CDRs to insert in a single packet as an integer from 1 through 255.
Default: 1

wait-time*wait_time*

Specifies the number of seconds the GSN waits to send the packet while accumulating CDRs as defined by **max-cdrs**. If the **wait-time** interval expires before **max-cdrs** is reached, this keyword over-rides and the packet is sent. Default: Disabled
wait_time is an integer from 1 through 300.

Important: The **wait-time** interval can only be enabled if the value for **max-cdrs** is greater than 1.

Usage

The system places CDRs into a packet until either **max-cdrs** is met, **wait-time** times out, or the maximum PDU size, configured by the **gtpp max-pdu-size** command, is met.
The **gtpp max-pdu-size** and the **wait-time** parameters take priority over **max-cdrs**.

Important: This command's configuration is ignored if CDRs are stored on an SMC hard disk.

Example

The following command configures the system to place a maximum of 10 CDRs in a single GTPP packet with a wait-time of *30* seconds:

```
gtpp max-cdrs 10 wait-time 30
```

gtpp max-pdu-size

Configures the maximum payload size of a single GTPP packet that could be sent by the system.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-pdu-size *pdu_size*

default gtpp max-pdu-size

default

Resets the default **max-pdu-size** of 4096.

pdu_size

Specifies the maximum payload size (in bytes) of the GTPP packet as an integer from 1024 to 65400. The payload includes the CDR and the GTPP header. Default: 4096

Usage

The GTPP packet contains headers (layer 2, IP, UDP, and GTPP) followed by the CDR. Each CDR contains one or more volume containers. If a packet containing one CDR exceeds the configured maximum payload size, the system creates and send the packet containing the one CDR regardless.
The larger the packet data unit (PDU) size allowed, the more volume containers that can be fit into the CDR. The system performs standard IP fragmentation for packets that exceed the system's maximum transmission unit (MTU).

Important: The maximum size of an IPv4 PDU (including the IPv4 and subsequent headers) is 65,535. However, a slightly smaller limit is imposed by this command because the system's max-pdu-size doesn't include the IPv4 and UDP headers, and because the system may need to encapsulate GTPP packets in a different/larger IP packet (for sending to a backup device).

Example

The following command configures a maximum PDU size of 2048 octets:

```
gtpp max-pdu-size 2048
```

gtpp max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive CGF.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-retries *max_attempts*

default gtpp max-retries

default

Resets the maximum number of to the default of 4.

max_attempts

Specifies the number of times the system attempts to communicate with a CGF that is not responding as an integer from 1 to 15. Default: 4

Usage

This command works in conjunction with the **gtpp detect-dead-server** and **gtpp timeout** parameters to set a limit to the number of communication failures that can occur with a configured CGF.
When the value specified by this parameter is met, a failure is logged. The **gtpp detect-dead-server** parameter specifies the number of consecutive failures that could occur before the server is marked as down. In addition, the **gtpp timeout** command controls the amount of time between re-tries.
If the value for the max-retries is met, the system begins storing CDRs in Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context). Archived CDRs are re-transmitted to the CGF until they are acknowledged or the system's memory buffer is exceeded.
Refer to the **gtpp detect-dead-server** and **gtpp timeout** commands for additional information.

Example

The following command configures the maximum number of re-tries to be 8.

```
gtpp max-retries 8
```

gtpp mbms bucket

Configures the traffic data volume (bucket) limit of charging buckets due to QoS changes of tariff time that can occur before a G-MBMS-CDR should be closed.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms buckets *number*

[no] gtpp mbms buckets

no

Disables the configured traffic data volume bucket limits trigger for G-MBMS-CDR generation for MBMs user service data.

buckets *number*

Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before a G-MBMS-CDR should be closed as an integer from 1 through 4. Default: 4

Usage

Use this command to configure the traffic data volume (bucket) based G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the bucket-based trigger to generate G-MBMS-CDRs after changes in *2* container:

```
gtpp mbms buckets 2
```

gtpp mbms interval

Configures the interval duration for interval-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms interval *duration_sec*

no gtpp mbms interval

no

Disables the interval-based trigger for G-MBMS-CDR generation for MBMs user service data.

interval *duration_sec*

Specifies the normal time duration (in seconds) that must elapse before closing an accounting record provided that any or all of the following conditions occur:

- Downlink traffic volume is reached within the time interval
- Tariff time based trigger occurred within the time interval
- Data volume (up and downlink) bucket trigger occurred within the time interval

duration_sec is an integer from 60 through 40,000,000. Default: Disabled

Usage

Use this command to configure the G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the interval-based trigger to generate G-MBMS-CDRs in every *60* seconds:

```
gtpp mbms interval 60
```

gtpp mbms tariff

Configures the tariff slots for tariff-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms tariff time1 *mins hours* **[time2** *mins hours* **[time3***mins hours* **[time4***mins hours* **]]]**

[no] gtpp mbms tariff

no

Disables the tariff-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

tariff time1 *mins hours* **[time2***mins hours* **[time3***mins hours* **[time4***mins hours* **]]]**

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Default: Disabled

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: Minute of the hour, an integer from 0 through 59.
- *hours*: Hour of the day, an integer from 0 through 23.

Usage

Use this command to configure the tariff-time-based triggers for G-MBMS-CDR generation in MBMS user data service.

Example

The following command configures the tariff-time-based trigger to generate G-MBMS-CDRs every day at 11 hours and 30 min:

```
gtpp mbms tariff time1 30 11
```

gtpp mbms volume

Configures the download traffic data volume based trigger for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms volume *download_bytes*

[no] gtpp mbms volume

no

Disables the configured download traffic data volume based trigger for G-MBMS-CDR generation for MBMs user service data.

volume *download_bytes*

Specifies the threshold of downlink data volumes that (in bytes) must be met before a G-MBMS-CDR should be closed as an integer from 100000 through 4000000000. Default: Disabled

Usage

Use this command to configure the traffic data volume (download) based G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the traffic data volume (download) limit to trigger to generate G-MBMS-CDRs after reaching 150,000 octets:

```
gtpp mbms volume download_bytes
```

gtpp redirection-allowed

Configures the system to allow/disallow the redirection of CDRs when the primary CGF is unavailable.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] gtpp redirection-allowed
```

default

Resets the system to allow redirection of CDRs.

no

Removes the redirection definition from the configuration.

Usage

This command allows operators to better handle erratic network links, without having to remove the configuration of the backup server(s) via the **no gtpp server** command.
This functionality is enabled by default.
If the **no gtpp redirection-allowed** command is executed, the system only sends CDRs to the primary CGF. If that CGF goes down, the system will buffer the CDRs in memory until the CGF comes back or until the system runs out of buffer memory. In addition, if the primary CGF announces its intent to go down (with a GTPP Redirection Request message), the system responds to that request with an error response.

Example

The following command configures the system to allow the redirection of CDRs when the primary CGF is unavailable:

```
default gtpp redirection-allowed
```

gtpp redirection-disallowed

This command has been obsoleted and is replaced by the **gtpp redirection-allowed** command.

gtpp server

Configures the charging gateway function (CGF) accounting server(s) with in GTPP server group that the system is to communicate with.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp server *ip_address* **[max** *msgs* **] [priority** *priority* **] [udp-port** *port* **] [node-alive { enable | disable }] [-noconfirm]**

no gtpp server *ip_address* **[udp-port** *port* **]**

no

Deletes a previously configured CGF.

ip_address

Specifies the IP address of the CGF in IPv4 dotted-decimal or IPv6 colon-separated notation.

max *msgs*

Specifies the maximum number of outstanding or unacknowledged GTPP packets (from any one AAA Manager task) allowed for this CGF before the system begins buffering the packets.
msgs can be configured to an integer from 1 to 256. Default: 256

priority*priority*

Default:1000
Specifies the relative priority of this CGF as an integer from 1 through 1000. When multiple CGFs are configured, the priority is used to determine which CGF server to send accounting data to. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this.
If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

udp-port*port*

Specifies the UDP port over which the GGSN communicates with the CGF. as an integer from 1 through 65535. Default: 3386

node-alive { enable | disable }

Enable or disables GGSN sending Node Alive Request to a GTPP Server (such as CGF). This configuration can be done per GTPP Server. Default: Disable.

-noconfirm

Executes this command without any additional prompt and confirmation from the user.

Usage

Use this command to configure the CGF(s) that the system sends CDR accounting data to.
Multiple CGFs can be configured using multiple instances of this command subject to the following limits:

- Up to 4 CGFs can be configured in one GTPP server group
- Total of 32 CGFs can be configured per context.

Each configured CGF can be assigned a priority. The priority is used to determine which server to use for any given subscriber based on the routing algorithm that has been implemented. A CGF with a priority of "1" has the highest priority.

Important: The configuration of multiple CGFs with the same IP address but different port numbers is not supported.

Each CGF can also be configured with the maximum allowable number of unacknowledged GTPP packets. Since multiple AAA Manager tasks could be communicating with the same CGF, the maximum is based on any one AAA Manager instance. If the maximum is reached, the system buffers the packets Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context).

Example

The following command configures a CGF with an IP address of 192.168.2.2 and a priority of 5.

```
gtpp server 192.168.2.2 priority 5
```

The following command deletes a previously configured CGF with an IP address of 100.10.35.7:

```
no gtpp server 100.10.35.7
```

gtpp source-port-validation

Configures whether the system validates the UDP source port in received GTPP messages.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] gtpp source-port-validation
```

no

Validates the IP source address but not the UDP source port.

default

Restores this parameter to its default setting of enabled.

Usage

This command configures whether the system validates the UDP source port in received GTPP messages.

Example

The following command disables UDP port validation:

```
no gtpp source-port-validation
```

gtpp storage-server

Configures information for the GTPP back-up storage server.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] gtpp storage-server *ip_address* **port** *port_num*

no

Removes a previously configured back-up storage server.

ip_address

The IP address of the back-up storage server expressed in IPv4 dotted-decimal notation.

port *port_num*

Specifies the UDP port number over which the GGSN communicates with the back-up storage server.
Default: 3386

Usage

This command identifies the connection to the GSS. One backup storage server can be configured per GTPP group.

Example

The following command configures a GSS with an IP address of 192.168.1.2:

```
gtpp storage-server 192.168.1.2
```

gtpp storage-server local file

Configures the parameters for GTPP files stored locally on the GTPP storage server.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server local file { **compression** { **gzip** | **none** } | **format** { **custom1** | **custom2** | **custom3** | **custom4** | **custom5** | **custom6** | **custom7** | **custom8** } | **name** { **format** *string* [**max-file-seq-num** *seq_number*] | **prefix** *prefix* } | **purge-processed-files** [**file-name-pattern** *name_pattern* | **purge-interval** *purge_interval*] | **rotation** { **cdr-count** *count* | **time-interval** *time* [**force-file-rotation**] | **volume mb** *size* } | **start-file-seq-num** *seq_num* [**recover-file-seq-num** }

default gtpp storage-server local file { **compression** | **format** | **name** { **format** | **prefix** } | **purge-processed-files** | **rotation** { **cdr-count** | **time-interval** | **volume** } **start-file-seq-num** }

no gtpp storage-server local file { **purge-processed-files** | **rotation** { **cdr-count** | **time-interval** } }

---

no

Removes a previously configured parameters for local storage of CDR files on HDD on SMC card.

---

compression { gzip | none }

Configures the type of compression to be used on the files stored locally.
gzip – Enables Gzip file compression.
none – Disables Gzip file compression -this is the default value.

---

format custom1 .. 8

Configures the file format to be used to format files to be stored locally.
custom1 – File format custom1 - this is the default file format.
custom2 to custom5 Customer specific CDR file formats.
custom6 – File format custom6 with a block size of 8K for CDR files.
custom7 – File format custom7 is a customer specific CDR file format.
custom8 – File format custom8 is a customer specific CDR file format. It uses *node-id-suffix_date_time_fixed-length-seq-num*.u format for file naming where:

- *date* is date in MMDDYYYYY (01312010) for mat
- *time* is time in HHMMSS (023508) format
- *fixed-length-seq-num* is the fixed length of the sequence number for s specific file having a 6-digit counter starting from 000001 and ending at 999999. When file sequence reaches 999999, the sequence is reset to 000001.

name format *string*

Allows the format of the CDR filenames to be configured independently so that the name format contains the file name with conversion specifications.
string –is an alphanumeric string of 1 through 127 characters. It **must begin** with the % (percent sign).

- **%y** = year as a decimal number without century (range 00 to 99).
- **%Y** = year as a decimal number with century.
- **%m** = month as a decimal number (range 01 to 12).
- **%d** = day of the month as a decimal number (range 01 to 31).
- **%H** = hour as a decimal number 24-hour format (range 00 to 23).
- **%h** = hour as a decimal number 12-hour format (range 01 to 12).
- **%M** = minute as a decimal number (range 00 to 59).
- **%S** = second as a decimal number (range 00 to 60). (The range is up to 60 to allow occasional leap seconds.)
- **%Q** = file sequence number. Field width may be specified between the % and the Q. If the natural size of the field is smaller than this width, then the result string is padded (on the left) to the specified width with 0s
- **%N** = No of CDRs in the file. Field width may be specified between the % and the N. If the natural size of the field is smaller than this width, then the result string is padded (on the left) to the specified width with 0s
- **%%** = This field is used to add % to the CDR file name.
- **max-file-seq-no**: This can be configured optionally. It indicates the maximum value of sequence number in file name (starts from 1). Once the configured max-file-seq-no limit is reached, the sequence number will restart from 1. If no max-file-seq-no is specified then file sequence number ranges from 1- 4294967295.

By default the above keyword is not configured (default gtpp storage-server local file name format). In which case the CDR filenames are generated based on the file format as before (maintains backward compatibility).

name prefix *prefix*

Defines the prefix to be used for the file name. By default the file name prefix would be “GTPP-group-name + VPN-ID”. It is possible to have a NULL value prefix where the system would enter a default, which would be *group+vpn*,
prefix – is an alphanumeric string of 1 through 64 characters, Do not enter a value (NULL).

purge-processed-files [file-name-pattern *name_pattern* **| purge-interval** *purge_interval* **]**

Default: Disabled
Enables the GSN to periodically delete locally processed (*.p) CDR files from the HDD on the SMC card.

Important: This option is available only when GTPP server storage mode is configured for local storage of CDRs with the **gtpp storage-server mode local** command and the **purge-processed-files parameters** is enabled.

file-name-pattern *name_pattern*: Defines a pattern for the file name that will be used to match against the files to be purged. This means that the only files to be selected and deleted will be those with

names matching this pattern and whose age (when to purge) has been specified with the existing **purge-interval** parameter.
name_pattern is an alphanumeric string of up to127 characters that can contain '*' (wild card to match 0+ chars) and one or more ':' (to specify alternate, synonymous with '|'); for example: file-name-pattern "*.P:*.dat" matches "anything.P" AND "anything.dat"
purge-interval *purge_interval*: Specifies the purge interval duration in minutes as an integer from 1 through 259200. Default: 60

---

rotation { cdr-count *count* **| time-interval** *time* **[force-rotation] | volume** *size* **}**

Specifies rotation related configuration for GTPP files stored locally.
cdr-count *count*: Configures the CDR count for the file rotation as an integer from 1000 through 65000. Default value 10000.
time-interval *time*: Configures the time interval for file rotation (in seconds) as an integer from 30 through 86400. Default: 3600 (1 hour).
force-file-rotation : Forces CDR file-rotation at a specified interval configured via the **time-interval** keyword, even if no CDRs were generated. By default this keyword is Disabled.
volume *size* **—**: Configures the file volume (in megabytes) for file rotation as an integer from 2 through 40. This trigger can not be disabled. Default: 10

---

start-file-seq-num *seq_num* **[recover-file-seq-num**

Default: disabled
Enables the continuous file sequence number function. **start-file-seq-num** specifies the lowest number to be used as a file sequence number in the case of an aaaproxy or a chassis restart/reboot.
seq_num is an integer from 1 to 4294967295. Entering a value of 1 disables the recover file sequence number function. Entering any other number, for example 10, would instruct the system to always start from 10 as the file sequence number in the event of an aaaproxy or chassis reload.
When files are moved, the file sequence numbers are synced and stored in both RAM and the hard disk drive (HDD). **recover-file-seq-num** instructs the system to recover the last (largest) stored file sequence number, in the event of an aaaproxy/chassis restart/reboot, to continue file sequence numbering rather than resetting the file sequence numbering to the lowest start file sequence number.

Usage

This command configures the parameters for storage of GTPP packets as files on the local server - meaning the hard disk drive (HDD).

Example

The following command configures rotation for every 1.5 hours for locally stored files.

```
gtpp storage-server local file rotation time-interval 5400
```

Configuring file name format along with max-file-seq-no:

```
gtpp storage-server local file name format processed_2g_%Y%m%d_%5Q_%N.cdr
max-file-seq-no 2345
```

Configuring file name prefix with a NULL value:

```
gtpp storage-server local file name prefix NULL
```

Configure the file name pattern and purge interval to setup file purging from the HDD:

```
gtpp storage-server local file purge-processed-files file-name-pattern
*.z purge-interval 4
```

gtpp storage-server max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive GTPP back-up storage server.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

[default] gtpp storage-server max-retries *max_attempts*

default

Restores the system to the default value of 2 retry attempts.

max_attempts

Specifies the number of times the system attempts to communicate with a GTPP back-up storage server that is not responding as an integer from 1 to 15. Default: 2

Usage

This command works in conjunction with the **gtpp storage-server timeout** parameters to set a limit to the number of communication failures that can occur with a configured GTPP back-up storage server.
The **gtpp storage-server timeout** command controls the amount of time between retries. Refer to the description of this command for additional information.

Example

The following command configures the maximum number of re-tries to be 8.

```
gtpp storage-server max-retries 8
```

gtpp storage-server mode

Configures storage mode, local or remote, for CDRs. Local storage mode is available with ASR 5000 platforms only.

Product

GGSN, P-GW, SGSN, S-GW

Privilege

Security Administrator, Administrator

Syntax

```
gtpp storage-server mode { local | remote | streaming }

default gtpp storage-server mode
```

default

Returns the GTPP group configuration to the default "remote" value for the GTPP storage server mode.

local

Specifies the use of the hard disk for storing CDRs. Default: Disabled

Important: This option is available with ASR 5000 platforms only.

remote

Specifies the use of an external server for storing CDRs. This is the default value.

Important: When the external server is down, the Session Managers will start buffering up to a maximum of 26400 CDRs or a total of 120 MB worth of CDRs, whichever limit reaches first. The maximum CDR limit specified is per the session manager. The chassis level limit varies depending on the number of session manager instances and number of active cards.

streaming

Default: Disabled
This keyword allows the operator to configure "streaming" mode of operation for GTPP group. When this keyword is supplied the CDRs will be stored in following fashion:

- When GTPP link is active with CGF, CDRs are sent to a CGF via GTPP and local hard disk is NOT used as long as every record is acknowledged in time.
- If the GTPP connection is considered to be down, all streaming CDRs will be saved temporarily on the local hard disk and once the connection is restored, unacknowledged records will be retrieved from the hard disk and sent to the CGF.

Important: This option is available with ASR 5000 platforms only.

Usage

This command configures whether the CDRs should be stored on the hard disk of the SMC or remotely, on an external server.

Example

The following command configures use of a hard disk for storing CDRs.

```
gtpp storage-server mode local
```

gtpp storage-server timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the GTPP back-up storage server.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

[default] gtpp storage-server timeout *duration*

default

Restores the timeout duration to the default of 30 seconds.

duration

Specifies the maximum amount of time (in seconds) that the system waits for a response from the GTPP back-up storage server before assuming the packet is lost.
duration is an integer from 30 through 120. Default: 30

Usage

This command works in conjunction with the **gtpp storage-server max-retries** command to establish a limit on the number of times that communication with a GTPP back-up storage server is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of *60* seconds:

```
gtpp storage-server timeout 60
```

gtpp suppress-cdrs zero-volume-and-duration

Suppresses the CDRs created by session having zero duration and/or zero volume. By default this mode is “disabled”.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
gtpp suppress-cdrs zero-volume-and-duration { gcdrs [ egcdrs ] | egcdrs [ gcdrs ] }

default gtpp suppress-cdrs zero-volume-and-duration
```

default

Disables the CDR suppression mode.

gcdrs [egcdrs]

Specifies that this command will handle G-CDRs before eG-CDR/P-CDRs.

gcdrs [egcdrs]

Specifies that this command will handle eG-CDR/P-CDRs before G-CDRs.

Usage

Use this command to suppress the CDRs (G-CDRs and eG-CDR/P-CDRs) which were created due with zero-duration session and zero-volume session due to any reason. By default this command is disabled and system will not suppress any CDR.

Example

The following command configures the system to suppression the eG-CDR/P-CDRs created for a zero duration session or zero volume session:

```
gtpp suppress-cdrs zero-volume-and-duration egcdrs gcdrs
```

gtpp timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the CGF.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

[default] gtpp timeout *time*

default

Resets the systems GTPP timeout value to 20 seconds.

time

Specifies the maximum amount of time (in seconds) the system waits for a response from the CGF before assuming the packet is lost.
time is an integer from 1 through 60. Default: 20

Usage

This command works in conjunction with the **gtpp max-retries** command to establish a limit on the number of times that communication with a CGF is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 30 seconds:

```
gtpp timeout 30
```

gtpp trigger

Disables GTPP trigger conditions that cause either partial CDR record closure or opening of a new CDR record container. GTPP Triggers are specified in 3GPP TS 32.251 v6.6.0. All GTPP trigger changes take affect immediately, except **volume-limit**.

Product

ECS, GGSN, P-GW, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp trigger { cell-update | direct-tunnel | egcdr max-losdv | inter-plmn-sgsn-change |
ms-timezone-change | plmn-id-change | qos-change | rat-change [ generate { cdr |
container } ] | routing-area-update | sgsn-change-limit | serving-node-change-limit  |
tariff-time-change | time-limit | volume-limit }

default gtpp trigger

no gtpp trigger { cell-update | direct-tunnel | egcdr max-losdv | inter-plmn-sgsn-change
| ms-timezone-change | plmn-id-change | qos-change | rat-change | routing-area-update |
sgsn-change-limit | serving-node-change-limit | tariff-time-change | time-limit | volume-
limit }
```

default

Sets the specified trigger condition back to the default setting. All trigger conditions are enabled by default.

no

Re-enables the specified trigger condition.

cell-update

Enables the cell update trigger for S-CDRs, if the dictionary specified in the **gtpp dictionary** configuration includes support for cell update. This trigger is available only for 2G. Currently, custom18 dictionary supports the cell update trigger.

direct-tunnel

Enables the direct tunnel trigger for CDRs.

egcdr max-losdv

Enables the trigger for an eG-CDR/P-CDR if the List of Service Data Volume (LoSDV) containers crosses the configured limit for LOSDV containers. Default: Disabled

inter-plmn-sgsn-change

This keyword is for GGSN only.
Disabling this trigger ignores an Inter-PLMN SGSN change and doesn't release a G-CDR. Default: Enabled

ms-timezone-change

This keyword is specific to GGSN.
No partial record closure for a time zone change occurs when this trigger is disabled. MS time zone change should be applicable only for 3GPP R6 based GTPP dictionaries. Default: Enabled

plmn-id-change

This trigger keyword is specific to the 2G SGSN and is proprietary (non-standard).
Enables the PLMNID change trigger for S-CDRs if the dictionary specified in the **gtpp dictionary** configuration supports the PLMNID change. If enabled, the SGSN generates a partial S-CDR when the MS changes the PLMN while under the same SGSN (intra-system intra-SGSN PLMN-ID handover). Currently, custom18 dictionary supports this trigger. Default: Disabled

qos-change

Enables the QoS-change trigger for CDRs. Disabling this trigger ignores a QoS-change and does not open a new CDR for it. Default: Enabled

rat-change [generate { cdr | container }]

Enables or disables the partial record closure for a RAT change. If disabled, no partial record closure for a RAT change occurs. RAT change should be applicable only for 3GPP R6 based GTPP dictionaries. Default: Enabled
In SGSN, RAT change trigger (2G<->3G) means inter-service handoff (SGSN service <-> GPRS service). If this trigger is enabled, after the RAT change interim CDR is generated. After this RAT change CDR, CDR thresholds such as volume/time etc. and GTPP Group are applicable from new service. If RAT change trigger is disabled, the CDR thresholds and GTPP group etc. will not change and will continue to use from old service.
After the RAT change, the System Type field in CDR changes to indicate the new system type. If this trigger is disabled, then the next CDR generated will indicate System Type, but the data count in the CDR does not necessarily belong to the system type indicated in CDR; instead, it may belong to both 2G and 3G as CDR is not closing when handover takes place.

Important: the System Type field in CDR-related change is not applicable to customized CDR formats, which does not use the System Type field

generate { cdr | container }: Sets generation of CDR or just a Container on a RAT change.
cdr: Generates a CDR on a RAT-change.
container: Generates a container only on a RAT-change.

routing-area-update

Enables the routing-area-update trigger for CDRs.

sgsn-change-limit [also-intra-sgsn-multiple-address-group-change]

This keyword is obsolete and is available to maintain the backward compatibility for existing customers. The new keyword for **sgsn-change-limit** is **serving-node-change-limit**. Default: Enabled
Disabling this trigger ignores an SGSN change and does not add the SGSN IP address into the SGSN address list of the CDR. This helps to reduce the release of CDRs due to SGSN changes crossing the configured limit.
also-intra-sgsn-multiple-address-group-change: This keyword includes Intra-SGSN group changes as an SGSN change.

serving-node-change-limit [also-intra-sgsn-multiple-address-group-change]

This keyword is enabled for PGW, SGW, and GGSN. However, the **also-intra-sgsn-multiple-address-group-change** is enabled only for GGSN. Default: Enabled
Disabling this trigger ignores an SGSN change and does not add the SGSN IP address into the SGSN address list of the CDR. This helps to reduce the release of CDRs due to SGSN changes crossing the configured limit.
also-intra-sgsn-multiple-address-group-change: This keyword includes Intra-SGSN group changes as an SGSN change.

tariff-time-change

When this trigger is disabled, container closure does not happen for a tariff-time change. Default: Enabled
This trigger is applicable for G-MB-CDRs for MBMS session too.

time-limit

When this trigger is disabled, no partial record closure occurs when the configured time limit is reached. Default: Enabled
This trigger is applicable for G-MB-CDRs for MBMS session too.

volume-limit

When this trigger is disabled no partial record closure occurs when volume limit is reached. Default: Enabled
This trigger is applicable for G-MB-CDRs for MBMS session too.

Usage

Use this command to disable or re-enable GTTP triggers that can cause partial CDR record closure or cause a new CDR to be created.

Example

The following command disables partial record closure when a configured time limit is reached:

```
gtpp trigger time-limit
```

The following command re-enables partial record closure when a configured time limit is reached:

```
no gtpp trigger time-limit
```

gtpp transport-layer

Selects the transport layer protocol for Ga interface for communication between AGW (GSNs) and GTPP servers.

Product

GGSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp transport-layer { tcp | udp }

default gtpp transport-layer
```

default

Resets the transport layer protocol to GTPP servers to the default of UDP.

tcp

Enables the system to implement TCP as transport layer protocol for communication with GTPP server.
Default: Disabled

udp

Enables the system to implement UDP as transport layer protocol for communication with GTPP server.
Default: Enabled

Usage

Use this command to select the TCP or UDP as the transport layer protocol for Ga interface communication between GTPP servers and AGWs (GSNs).

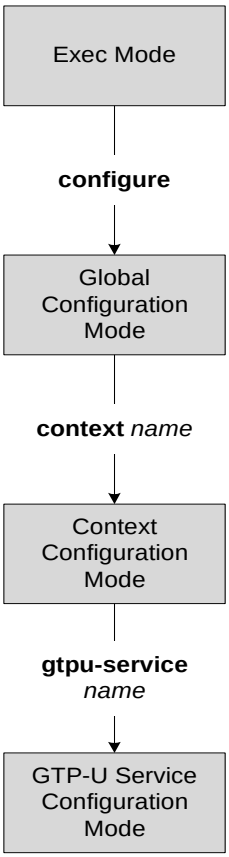
Example

The following command enables TCP as the transport layer protocol for the GSN's Ga interface.

```
gtpp transport-layer tcp
```

Chapter 138
GTP-U Service Configuration Mode Commands

The GTP-U Service Configuration Mode is used to manage parameters applied to incoming GTP-U packets.



bind

Configures the IP address to use for GTP-U data packets.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

[no] bind { ipv4-address *ipv4_address* **[crypto-template** *crypto_template* **] [ike-bind-address { ipv4_address }] [ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[crypto-template** *crypto_template* **] [ike-bind-address {** *ipv6_address* **}] [ipv4-address** *ipv4_address* **] }**

no

removes a configured IP address from this service.

ipv4-address *ipv4_address*

Binds this service to the IPv4 address of a configured interface.
ipv4_address must be entered using IPv4 dotted-decimal notation.

ipv6-address *ipv6_address*

Binds this service to the IPv6 address of a configured interface.
ipv6_address must be entered using IPv6 colon-separated notation.

crypto-template *crypto_template*

Configures crypto template for IPSec, which enables IPSec tunneling for this GTP-U address. Must be followed by the name of an existing crypto template.
crypto_template must be an alphanumeric string of 1 through 127 characters.

ike-bind-address *ip_address*

Configures an IKE bind address. Must be followed by IPv4 or IPv6 address; IP address type must be the same as the GTP-U address type.
ipv4_address must be entered using IPv4 dotted-decimal notation.
ipv6_address must be entered using IPv6 colon-separated notation.

Important: This keyword is only applicable if a crypto template is bound to the GTP-U address.

Usage

Use this command to bind the service to an interface for sending/receiving GTP-U packets.

Important: A GTP-U service can support a maximum of 12 GTP-U endpoints/interfaces.

Example

The following command configures the IPv4 address for this GTP-U service as *10.2.3.4*:

```
bind ipv4-address 10.2.3.4
```

echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-U echo packets are sent.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

echo-interval *seconds*

[default | no] echo-interval

seconds

Specifies the number of seconds between the sending of a GTP-Uv1 echo packet. *seconds* must be an integer from 60 through 3600.

default

Returns the command to its default setting of disabled.

no

Removes the configured echo-interval setting.

Usage

Use this command to configure the rate at which GTP-Uv1 echo packets are sent.

Example

The following command sets the rate between the sending of echo packets at *120* seconds:

```
echo-interval 120
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

extension-header

Configures the addition of an extension header in the GTP-U packet header, allowing for error indication messages.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

```
[ default | no ] extension-header source-udp-port
```

default

Returns the command to its default setting of disabled.

no

Disables the feature.

source-udp-port

Configures extension header type UDP Port support in GTP-U header for GTP-U Error Indication messages.

Usage

Use this command to configure the addition of an extension header in the GTP-U packet to allow for error indication messages

Example

The following command enables the inclusion of an extension header to allow for error indication messages:

```
extension-header source-udp-port
```

ipsec-allow-error-ind-in-clear

Configures whether error-indication is dropped or sent without IPSec tunnel.

Product

S-GW

Privilege

Administrator

Syntax

```
[ default | no ] ipsec-allow-error-ind-in-clear
```

default

Error-indication is dropped if no IPSec tunnel is present for that peer.

no

Disables the feature.

Usage

Use this command to determine whether error-indication is dropped or sent without an IPSec tunnel.
On receiving data packets for a session that does not exist, error-indication needs to be sent back to the peer. If there is no IPSec tunnel present with that peer, error-indication may be either dropped or sent without any IPSec tunnel.

Example

The following command allows error-indication to be sent without any IPSec tunnel:

```
ipsec-allow-error-ind-in-clear
```

ipsec-tunnel-idle-timeout

Configures the IPSec tunnel idle timeout after which IPSec tunnel deletion is triggered.

Product

S-GW

Privilege

Administrator

Syntax

ipsec-tunnel-idle-timeout *seconds*

default ipsec-tunnel-idle-timeout

seconds

Default: 60
Specifies the number of seconds an IPSec tunnel is idle before tunnel deletion is triggered. *seconds* must be an integer from 10 through 600.

default

Returns the command to its default setting of 60.

Usage

When there are no bearers on a particular IPSec tunnel, GTPUMGR initiates the delete for that tunnel. This timer helps to avoid unnecessary IPSec tunnel deletions for an idle tunnel.

Example

The following command sets the IPsec tunnel idle timeout to *100* seconds:

```
ipsec-tunnel-idle-timeout 100
```

max-retransmissions

Configures the maximum retry limit for GTP-U echo retransmissions.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

max-retransmissions *num*

no max-retransmissions

num

Default: 4
Specifies the number of GTP-U echo message retransmissions allowed before triggering a path failure error condition. *num* must be an integer from 0 through 15.

no

Disables the feature.

Usage

Use this command to set the maximum number of GTP-U echo message retransmissions in order to define a limit that triggers a path failure error.

Example

The following command sets the maximum GTP-U echo message retransmissions for this service to *10*:

```
max-retransmissions 10
```

path-failure detection-policy

Configures a path failure detection policy on GTP-U echo messages that have been retransmitted the maximum number of retry times.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

```
path-failure detection-policy gtp echo

[ default | no ] path-failure detection-policy
```

gtp echo

Sets the detection policy to detect a failure upon reaching the maximum number of GTP-U echo message retransmissions.

default

Resets the command to its default setting of enabled.

no

Disables the feature.

Usage

Use this command to set the detection policy for path failures.

Example

The following command sets the path failure detection policy to detect failures upon reaching the maximum number of GTP-U echo message retries:

```
path-failure detection-policy gtp echo
```

retransmission-timeout

Configures retransmission timeout for GTPU echo message retransmissions for this service.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

retransmission-timeout *seconds*

default retransmission-timeout

seconds

Default: 5
Specifies the number of seconds between the re-sending of GTP-U echo messages. *seconds* must be an integer from 1 through 20.

default

Returns the command to its default setting of 5.

Usage

Use this command to set the number of seconds between the retransmission of GTP-U echo messages.

Example

The following command sets the number of seconds between the sending of GTP-U echo messages to 7:

```
retransmission-timeout 7
```

sequence-number

Enables addition of the sequence number to every GTP-U packet. Default is disabled.

Product

GGSN, HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
[ no ] sequence-number
```

no

Disables addition of the sequence number to every GTP-U packet.

Usage

Use this command to enable/disable addition of the sequence number to every GTP-U packet coming from Gi interface and going towards Gn/Gp interface. If GTP-U packets are received out of sequence, sequence numbers would allow the packets to be reorded.

Example

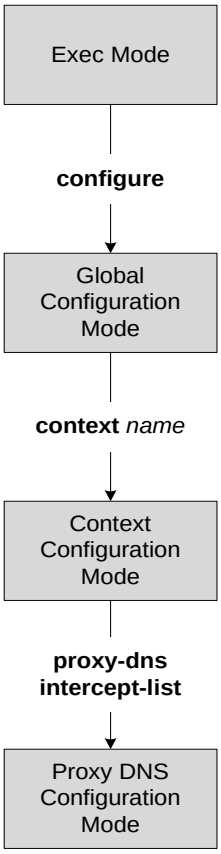
The following command enables addition of the sequence number to every GTP-U packet:

```
sequence-number
```

Chapter 139
HA Proxy DNS Configuration Mode Commands

The HA Proxy DNS Configuration Mode is used to create rules for Home Agent (HA) proxy DNS intercept lists that redirect packets with unknown foreign DNS addresses to a home network DNS server.

Important: HA Proxy DNS Intercept is a license-enabled feature.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

pass-thru

Sets IP addresses that should be allowed through the proxy DNS intercept feature.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] pass-thru *ip_address* [*/ip_mask*]

no

Removes the DNS IP address from the pass-thru rule.

pass-thru *ip_address* **[/***ip_mask* **]**

Specifies an DNS IP address that is allowed through the intercept feature.
ip_address [/*ip_mask*]: Specifies the IP address and network mask bits. *ip_address* [/*ip_mask*] is specified using IPv4 dotted decimal or IPv6 colon-separated notation. The mask bits are a numeric value which is the number of bits in the subnet mask (CIDR notation).

Usage

Use this command to identify DNS IP addresses that should be allowed through the intercept feature. For a more detailed explanation of the proxy DNS intercept feature, see the **proxy-dns intercept-list** command in the *Context Configuration Mode Commands* chapter. A maximum of 16 intercept rules (either **redirect** or **pass-thru**) are allow for each intercept list.

Important: To allow packets through that do not match either the **pass-thru** or **redirect** rules, set a **pass-thru** rule address as: 0.0.0.0/0. If a packet does not match either the **pass-thru** or **redirect** rule, the packet is dropped.

Example

The following command allows a foreign network's DNS with an IP address of *10.2.55.12* to avoid being redirected:

```
pass-thru 10.2.55.12
```

redirect

Redirects DNS IP addresses from foreign networks matching an IP address in this command to a home network DNS.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] redirect any [ primary-dns ip_address [ secondary-dns ip_address ] ]
```

no

Removes the DNS IP address from the redirect rule.

primary-dns *ip_address*

Specifies the IP address of the primary home network DNS.
ip_address is specified using IPv4 dotted-decimal or IPv6 colon-separated notation.

secondary-dns *ip_address*

Specifies the IP address of the secondary home network DNS.
ip_address is specified using IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to identify DNS IP addresses from foreign networks that are to be redirected to the home DNS. For a more detailed explanation of the Proxy DNS feature, see the proxy-dns intercept-list command in the *Context Configuration Mode Commands* chapter. A maximum of 16 intercept rules (either **redirect** or **pass-thru**) are allow for each intercept list.
Since this command is configured in the source context, the destination context containing the path to the home network DNS is identified using the Context Configuration Mode command **ip dns-proxy source-address**.

Important: If a packet does not match the **pass-thru** or **redirect** rule, the packet is dropped. If **primary-dns** or **secondary-dns** is not configured, DNS messages are redirected to the primary-dns-server (or the secondary-dns-server) configured for the subscriber OR inside the context.

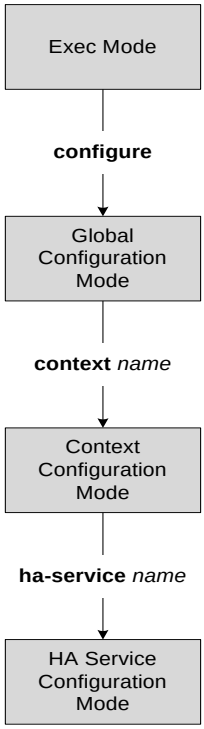
Example

The following command identifies a foreign network DNS with an IP address of *10.2.55.12* and redirects it to a primary home network DNS with an IP address of *10.3.4.5*:

```
predirect 10.2.55.12 primary-dns 10.3.4.5
```

Chapter 140
HA Service Configuration Mode Commands

The HA Service Configuration Mode is used to create and manage the Home Agent (HA) services within the current context.



a11-signalling-packets

Applies Differentiated Services Code Point (DSCP) marking for IP headers carrying outgoing signalling packets.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

a11-signalling-packets ip-header-dscp *ip-header-dscp***no a11-signalling-packets ip-header-dscpdefault a11-signalling-packets ip-header-dscp**

no

Disables DSCP marking for IP header encapsulation for the HA service.

default

Configures DSCP marking for IP header encapsulation for a specific HA service.

ip-header-dscp

Is a hexadecimal number between 0x0 and 0x3F.

Usage

The following command is used to apply DSCP marking for IP header carrying outgoing signalling packets.

Example

The following command applies DSCP marking for IP header carrying outgoing signalling packets.

```
a11-signalling-packets ip-header-dscp 0x2f
```

aaa

Configures the sending of subscriber session AAA accounting by the HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
aaa { accounting [ roaming ] | group string }

no aaa { accounting | group }

default aaa accounting
```

no

Disables AAA accounting for the HA service.

default

Configures AAA parameters for specific HA service

accounting

accounting Enables the sending of AAA accounting information for subscriber sessions by the Home Agent (HA), by default is enabled.
roaming Enables the sending of AAA accounting information for subscriber sessions by the Home Agent (HA) only for roaming subscribers.

group

group configures aaa group for ha-service, **group** has lower priority than subscriber/apn config.
string: size ranges between *1* and *63*.

Usage

Enabling the HA service will send all accounting data (start, stop, and interim) to the configured AAA servers.
The chassis is shipped from the factory with the AAA accounting enabled.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the HA service is configured using the aaa accounting subscriber radius command.

Example

The following command disables aaa accounting for the HA service:
no aaa accounting

access-network

Configures a specific access network configuration.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

access-network accounting identifier *access_network_accounting_identifier***no access-network accounting identifier**

no

Disables a specific access network configuration.

---

accounting

Specifies an access network configuration for accounting

identifier

Specifies an access network accounting identifier

access_network_accounting_identifier

This is an alphanumeric string of 1 through 128 characters.

Usage

This command is used to configure an access network for accounting.

Example

The following command configures an access network for accounting with the identifier *idnt*:
access-network accounting identifier idnt

associate

Associates an HA-service with a QoS policy.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

associate qci-qos-mapping *string***no associate qci-qos-mapping**

no

Disables the association of an HA-service with a QoS policy.

qci-qos-mapping *string*

Maps a QoS Class Identifier (QCI) for this HA service.

string is an alphanumeric string of 1 through 63 characters.

Usage

This command associates an HA-service with a QoS policy.

Example

The following command associates an HA-service with a QCI *map01*.

associate qci-qos-mapping map01

authentication

Configures authentication parameters for a specific HA service within a context.

Product

HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
authentication {aaa-distributed-mip-keys [ disabled | optional | required ]|dmu-refresh-
key | imsi-auth| mn-aaa {allow-noauth  | always| dereg-noauth | noauth | renew-reg-noauth
| renew-and-dereg-noauth } | mn-ha { allow-noauth | always } | pmip-auth | stale-key-
disconnect }

no authentication {imsi-auth | pmip-auth }

default authentication { aaa-distributed-mip-keys |  dmu-refresh-key |  imsi-auth |  mn-
aaa |  mn-ha |  pmip-auth | stale-key-disconnect }
```

no

Disable the parameter.

default

Resets the specified option to its default setting.

aaa-distributed-mip-keys [disabled | optional |required]

Configures use of AAA distributed MIP keys for authenticating RRQ for WiMAX HA calls.
Default is disabled.
disabled: Disables using AAA distributed WiMAX Mobile IP (MIP) keys for authenticating MIP RRQ.
optional: Uses AAA distributed WiMAX MIP keys for authenticating RRQ with fallback option to use static/3GPP2 based MIP keys.
required: AAA distributed WiMAX MIP keys for authenticating MIP RRQ are mandatory

dmu-refresh-key

Typically, when a Dynamic Mobile IP Update (DMU) resets, the next MIP re-registration causes MN-HA authorization failure and the HA rejects the MIP RRQ. This parameter enables the HA to retrieve the MN-HA key again from the AAA during the call and to use the freshly retrieved key value to recheck authentication.
Default is disabled.

imsi-auth

Enable uses the International Subscriber Mobile identity (IMSI) to determine if MN-AAA or MN-FAC extensions are not present in the RRQ.
Default is disabled.

mn-aaa { allow-noauth | always | dereg-noauth | noauth | renew-reg-noauth | renew-and-dereg-noauth }

Specifies how mobile node-to-AAA authentication extension in registration requests from the mobile node should be handled by the HA service.
Default is always.
allow-noauth: Specifies that the HA service does not require authentication for every mobile node registration request. However, if the mn-aaa extension is received, the HA service will authenticate it.
always: Specifies that the HA service will perform authentication each time a mobile node registers.
dereg-noauth: Disables authentication request upon de-registration.
noauth: Specifies that the HA service will not look for mn-aaa extension and will not authenticate it.
renew-reg-noauth: Specifies that the HA service will not perform authentication for mobile node re-registrations. Initial registration and de-registration will be handled normally.
renew-and-dereg-noauth: Disables authentication request upon re-registration and de-registration.

mn-ha { allow-noauth | always }

Specifies whether the HA service looks for an MN-HA authentication extension in the RRQ.
Default is always.
allow-noauth: Allows a request that does not contain the auth extension.
always: A request should always contain the auth extension to be accepted.

pmip-auth

Specifies whether the HA service looks for an MN-HA authentication extension in the RRQ.
Default is always.
allow-noauth: Allows a request that does not contain the auth extension.
always: A request should always contain the auth extension to be accepted.

stale-key-disconnect

If MN-HA auth fails for MIP renew and dereg, disconnects the call immediately.
Disabled by default.

Usage

The **authentication** command, combined with a keyword, can be used to specify how the system will perform authentication of registration request messages.

Example

The following command configures the HA service to always perform mobile node authentication for every registration request.

```
authentication mn-aaa always
```

The following command configures the HA service to always look for an MN-HA authentication extension in the RRQ.

```
authentication mn-ha always
```

bind

Binds the HA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
bind address address [ max-subscribers count ]
no bind address
```

address

Specifies the IP address (address) of the interface configured as the Pi interface. *address* is specified in IPv4 dotted-decimal notation.

max-subscribers *count*

Default: *500000*
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to an integer from 0 through 4000000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active packet processing cards installed in the system.

Usage

Associate the HA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of a Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces that you will configuring for use as Pi interfaces
- The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.
Use the **no bind address** command to delete a previously configured binding.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the HA service and specifies that a maximum of *600* simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

encapsulation

Configures Mobile IP (MIP) encapsulation types supported for a specific HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] encapsulation allow { gre | keyless-gre }
```

no

Disables MIP encapsulation types supported for specific HA service

allow

Allows encapsulation type for MIP data.

gre

Default: Enabled.
Specifies the use of Generic Routing Encapsulation (GRE) for MIP data.

keyless-gre

Default: Disabled.
Specifies the use of GRE without exchanging keys for MIP data.

Usage

Use to disable or re-enable the use of GRE encapsulation or Key-less encapsulation for MIP sessions.
In case of chassis HA operating with other vendor equipment, which does not support the 3GPP2 to exchange key, this command with **keyless-gre** keyword will make the chassis HA to accept MIP data with legacy GRE.

Example

To disable GRE for MIP sessions, enter the following command:

```
no encapsulation allow gre
```

To re-enable GRE for MIP sessions, enter the following command:

```
encapsulation allow gre
```

To enable key-less GRE for MIP sessions, enter the following command:

```
encapsulation allow keyless-gre
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fa-ha-spi

Configures the security parameter index (SPI) for specific HA service parameters.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

fa-ha-spi remote-address { *fa_ip_address* | *fa_ip_address_mask* } **spi-number** *number* { **encrypted secret** *enc_secret* | **secret** *secret* } [**allow-fa-ha-auth-extension**] [**description** *string*] [**disallow-fa-ha-auth-extension**] [**hash-algorithm** { **hmac-md5** | **md5** | **rfc2002-md5** }] [**replay-protection** { **nonce** | **timestamp** [**timestamp-tolerance tolerance**] }] [**timestamp-tolerance** *tolerance*]

no fa-ha-spiremote-address { *ha_ip_address* | *ha_ip_address/mask* }**spi-number** *number*

no

Disables the security parameter index (SPI) for specific HA service parameters.

remote-address { *fa_ip_address* | *fa_ip_address/mask* }

Specifies the IP address of the FA. *fa_ip_address* is entered using IPv4 dotted-decimal notation with CIDR for the subnet mask.

Important: The system supports unlimited peer FA addresses per HA but only maintains statistics for a maximum of 8,192 peer FAs. If more than 8,192 FAs are attached, older statistics are overwritten.

spi-number *number*

Specifies the SPI (number) which indicates a security context between the FA and the HA in accordance with RFC 2002.
number is an integer value from 256 through 4294967295.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the HA service and the FA. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key between the HA service and the FA. *enc_secret* must be an alphanumeric string of 1 through 236 characters that is case sensitive.
secret *secret*: Specifies the shared key between the HA service and the FA. *secret* must be an alphanumeric string of 1 through 236 characters that is case sensitive.

allow-fa-ha-auth-extension

Allows validation of FA HA Authentication extension.

description *string*

This is a description for the SPI. *string* must be an alphanumeric string of 0 through 31 characters.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the HA service and the FA.
hmac-md5: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

replay-protection { timestamp [timestamp-tolerance *tolerance* **]| nonce }**

Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.
nonce: Configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: Configures replay protection to be implemented using timestamps per RFC 2002.
timestamp-tolerance: Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. *tolerance* is measured in seconds and can be configured to an integer from 1 and 65535. The default is 60.

Usage

An SPI is a security mechanism configured and shared by the HA service and the FA. Please refer to RFC 2002 for additional information.
Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a "default" SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.

Important: The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2,048 SPIs can be configured per HA service.
Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the FA service to use an SPI of *512* when communicating with an HA with the IP address *192.168.0.2*. The key that would be shared between the HA and the FA service is *q397F65*. When communicating with this HA, the FA service will also be configured to use the rfc2002-md5 hash-algorithm.

```
fa-ha-spi remote-address 192.168.0.2 spi-number 512 secret q397F65 hash-
algorithm rfc2002-md5
```

The following command deletes the configured SPI of 400 for an HA with an IP address of *172.100.3.200*:

```
no fa-ha-spi remote-address 172.100.3.200 spi-number 400
```

gre

Configures Generic Routing Encapsulation (GRE) parameters.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

gre { **checksum** | **checksum-verify** | **reorder-timeout** *timeout* | **sequence-mode** { **none** | **reorder** } | **sequence-numbers** }

default gre { **checksum** | **checksum-verify** | **reorder-timeout** | **sequence-mode** | **sequence-numbers** }**no gre** { **checksum** | **checksum-verify** | **sequence-numbers** }

no

Disables the specified functionality.

default

Sets or restores default value assigned for specified parameter.

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

reorder-timeout *timeout*

Default: 100
Configures the maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *timeout* must be an integer from 0 through 5000.

sequence-mode { none | reorder }

Default: none
Configures how incoming out-of-sequence GRE packets should be handled.
none: Disables reordering of incoming out-of-sequence GRE packets.
reorder: Enables reordering of incoming out-of-sequence GRE packets.

sequence-numbers

Default: Disabled
Enables the insertion of sequence numbers into the GRE packets.

Usage

Use this command to configure how the HA service handles GRE packets.

Example

To set the maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to *500* milliseconds, enter the following command:

```
gre reorder-timeout 500
```

To enable the reordering of incoming out of sequence GRE packets, enter the following command:

```
gre sequence-mode reorder
```

To enable the insertion or removal of GRE sequence numbers in GRE packets, enter the following command:

```
gre sequence-numbers
```

idle-timeout-mode

Configures the sessions idle-timer reset behavior.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
idle-timeout-mode { aggressive | handoff | normal } [ upstream-only ]

default idle-timeout-mode
```

default

Resets the idle timeout mode to the default settings.

aggressive

Resets the session idle timer only when MIP user data is detected. This is the default behavior.

handoff

Resets the session idle timer when MIP user data is detected and an inter-Access Gateway/FA handoff occurs.

normal

Resets the session idle timer when MIP user data is detected and any MIP control signaling occurs.

upstream-only

Only upstream user data (data from the mobile node) resets the idle timer for the session. This is disabled by default.

Usage

Use this command to set how the current HA service resets the idle timer for a session.

Example

To reset the idle timer whenever user data is detected or whenever an inter-Access Gateway/FA occurs, use the following command:

```
idle-timeout-mode handoff
```

ikev1

Configures IPSec Internet Key Exchange (IKE) parameters.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ikev1 { **aaa-context** *aaa_context_string* | **peer-fa** *IPAddress* **crypto-map** *crypto_map_string* [**encrypted**] [**secret** *secret_string*] | **skew-lifetime** *seconds* } **no ikev1** { **aaa-context** | **peer-fa** *IPAddress* | **skew-lifetime** }

no

Disables IPSec IKE parameters.

aaa-context *aaa_context_string*

Configures AAA context from which to retrieve IKE keys. Must be followed by the context name.

aaa_context_string is an alphanumeric string of 1 through 63 characters.

peer-fa *IPAddress*

Sets the IKE crypto-map for a peer Foreign Agent (FA).

IPAddress is IP address entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

crypto-map *crypto_map_string*

Configures IKE crypto-map. Must be followed by the crypto-map name.

crypto_map_string is an alphanumeric string of 1 through 63 characters.

encrypted designates use of encryption

secret *secret_string* uses a secret that is shared between FA and HA. *secret_string* is an alphanumeric string of 1 through 256 characters.

skew-lifetime *seconds*

Configures the "S" lifetime Skew (in seconds). *seconds* is an integer from 1 through 65534. Default is 10.

Usage

Use this command to configure IPSec IKE parameters.

Example

ikev1 peer-fa 11.22.33.44 crypto-map er encrypted secret ert

ip context-name

Specifies name of the destination context to be applied to the subscribers.

This configuration overrides the local subscriber configuration as well as the return attributes sent by RADIUS. All calls coming to this HA service are assigned this destination context; the IP address is allocated from the specified IP pool or group that is configured in the context specified in the service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ip context-name *name*

no ip context-name

default ip context-name

name

Specifies the name of the context to assign the subscriber to once authenticated. *name* must be an alphanumeric string from 1 through 79 characters.

no

Usage

Removes the current assigned context from the subscriber's data.Set the name of the destination context to be applied to the subscribers.

Example

```
ip context-name sampleName
no ip context-name
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interface's IP socket on which to listen for Mobile IP Registration messages.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ip local-port *number*

default ip local-port

default

Sets or restores the default value assigned for the IP local port.

number

Specifies the UDP port number.
number is an integer from 1 through 65535. Default is 434.

Usage

Specify the UDP port that should be used for communications between the FA service and the HA.

Example

The following command specifies a UDP port of *3950* for the HA service to use to communicate with the HA on the Pi interface:

```
ip local-port 3950
```

ip pool

Specifies name of the IP address pool or group to use for subscriber IP address allocation.

This configuration overrides the local subscriber configuration, as well as the return attributes sent by RADIUS. All calls coming to this HA service are assigned this destination context and an IP address is allocated from the specified IP pool or group that is configured in the context specified in the service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ip pool *name*

no ip pool

default ip pool

name

Specifies the logical name of the IP address pool. *name* must be an alphanumeric string of 1 through 31 characters.

no

Removes the specified IP address pool specified from the current context or disables the option for an IP pool.

default

Clears the IP address pool or group setting.

Usage

Define a pool of IP addresses for the context to use in assigning IPs for this service.

Example

The specifies name of the IP address pool or group to use for subscriber IP address allocation:

```
ip pool pool1
```

The following command removes the specified IP address pool:

```
no ip pool pool1
```

min-reg-lifetime

Configures Mobile IP session minimum registration lifetime, in seconds.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no | default] min-reg-lifetime *min_reg_lifetime_seconds*

no

Disables the min registered lifetime.

default

Configures Mobile IP session minimum registration lifetime to default which is *0*.

min-reg-lifetime

Configures Mobile IP session minimum registration lifetime.

min_reg_lifetime_seconds

Variable in the range between *1* and *65534*.

Usage

Use this command to configure Mobile IP session minimum registration lifetime, in seconds, between *1* and *65534*. Default is *0* seconds.

Example

Use the following command to configure mobile IP session to minimum registered life time to *100* seconds:

min-reg-lifetime *100*

mn-ha-spi

Configures the security parameter index (SPI) between the HA service and the mobile node (MN).

Product

HA

Privilege

Security Administrator, Administrator

Syntax

mn-ha-spi spi-number *number* [**description** *string*] [**encrypted secret** *enc_secret*] [**hash-algorithm** { **hmac-md5** | **md5** | **rfc2002-md5** }] [**permit-any-hash-algorithm**] [**replay-protection** { **nonce** | **timestamp** }] [**secret** *secret*] [**timestamp-tolerance** *tolerance*]

no mn-ha-spi spi-number *number*

spi-number *number*

Specifies the SPI (number) which indicates a security context between the mobile node and the HA service in accordance with RFC 2002. *number* can be configured to an integer from 256 through 4294967295.

description *string*

This is a description for the SPI. *string* is an alphanumeric string of 1 through 31 characters.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the HA service and the mobile node. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key between the HA service and the mobile node. *enc_secret* must be an alphanumeric string of 1 through 254 characters that is case sensitive.
secret *secret*: Specifies the shared key between the HA service and the mobile node. *secret* must be an alphanumeric string of 1 through 127 characters that is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the HA service and the mobile node.
hmac-md5: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

permit-any-hash-algorithm

Default: disabled
Allows verification of the MN-HA authenticator using all other hash-algorithms after failure with configured hash-algorithm. The successful algorithm is logged to aid in troubleshooting and used to create the MN-HA authenticator in the Registration Reply message.

replay-protection { nonce | timestamp }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the HA service for this SPI.
nonce: configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: configures replay protection to be implemented using timestamps per RFC 2002.

timestamp-tolerance *tolerance*

Default: *60*
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to *0*, timestamp tolerance checking is disabled at the receiving end.
Tolerance is measured in seconds and can be configured to an integer from 0 through 65535.

Usage

An SPI is a security mechanism configured and shared by the HA service and the mobile node. Please refer to RFC 2002 for additional information.
Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the HA service to use an SPI of 640 when communicating with a mobile node. The key that would be shared between the mobile node and the HA service is q397F65.

```
mn-ha-spi spi-number 640 secret q397F65
```

The following command deletes the configured SPI of *400*:

```
no mn-ha-spi spi-number 400
```

nat-traversal

This command enables NAT traversal and also configures the forcing of UDP tunnels for NAT traversal.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
nat-traversal [force-accept]

no nat-traversal [force-accept]

default nat-traversal [force-accept]
```

no

Disables NAT traversal or disables forcing the acceptance of UDP tunnels for NAT traversal.

default

Reset the defaults for this command.
Default: NAT traversal disabled, force-accept disabled.

force-accept

This keyword configures the HA to accept requests when NAT is not detected but the Force (F) bit is set in the RRQ with the UDP Tunnel Request. By default this type of request is rejected if NAT is not detected.

Usage

Use this command to enable NAT traversal and enable the forcing of UDP tunnels for NAT traversal.

Example

The following command enables NAT traversal for the current HA service and forces the HA to accept UDP tunnels for NAT traversal:

```
nat-traversal force-accept
```

optimize tunnel-reassembly

Designates that tunnel reassembly optimization will be used for fragmented large packets passed between HA and FA. Default is disabled.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
optimizetunnel-reassembly

no optimize tunnel-reassembly

default optimize tunnel-reassembly
```

Usage

Enabling this functionality fragments large packets prior to encapsulation for easier processing. Tunnel reassembly optimization is disabled by default.

Important: You should not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

Important: This functionality works best when the HA service is communicating with an FA service running in a system. However, an HA service running in the system communicating with an FA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the **no** version of this command to disable tunnel optimization if enabled.

Example

The following command enables tunnel reassembly optimization:

```
optimize tunnel-reassembly
```

per-domain statistics-collection

Enables per-domain statistics collection.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
per-domain statistics-collectionno per-domain statistics-collection
```

Usage

Use this command to enable per-domain statistics collection.

Example

The following command enables per-domain statistics collection.

```
per-domain statistics-collection
```

policy bc-query-result

Configure the binding cache (BC) query Response Result code.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

policy bc-query-result network-failure *code*

default policy bc-query-resultnetwork-failure

network-failure *code*

Default: *0xFFFF*
Specify the response code for BC responses sent on network failures.
code must be either 0xFFFF or 0xFFFE.

Usage

Use this command to specify the type of response code to send in a P-MIP BC query result.

Example

The following command sets the P-MIP BC query result response code to *0xFFFE*:

```
policy bc-query-result network-failure 0xFFFE
```

policy nw-reachability-fail

Specifies the action to take upon detection of an up-stream network -reachability failure.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

policy nw-reachability-fail { **redirect** *ip_addr1* [**weight** *value*] [ip_addr2 [**weight** *value*] ... *ip_addr16* [**weight** *value*]] | **reject** [**use-reject-code** { **admin-prohibited** | **insufficient-resources** }] }

no policy nw-reachability-fail [**redirect** *ip_addr1 ... ip_addr16*]

no

Deletes the network reachability policy completely or deletes the specified redirect addresses fro the policy.

reject [use-reject-code { admin-prohibited | insufficient-resources }]

Upon network reachability failure, reject all new calls for this context.
use-reject-code { **admin-prohibited** | **insufficient-resources** }: When rejecting calls send the specified reject code. If this keyword is not specified the admin-prohibited reject code is sent by default.

reject [use-reject-code { admin-prohibited | insufficient-resources }]

Upon network reachability failure reject all new calls for this context. If no reject code is specified, the HA sends a registration reply code of 81H (admin-prohibited).
use-reject-code { **admin-prohibited** | **insufficient-resources** }: Use the specified reject code when rejecting traffic.
admin-prohibited: When this keyword is specified and traffic is rejected, the error code 81H (admin-prohibited) is returned.
insufficient-resources: When this keyword is specified and traffic is rejected, the error code 82H (insufficient resources) is returned.

redirect *ip_addr1* **[weight** *value* **] [ip_addr2 [weight** *value* **] ...** *ip_addr16* **[weight** *value* **]]**

Upon network reachability failure redirect all calls to the specified IP address.
ip_addr1: This must entered using IPv4 dotted-decimal notation. Up to 16 IP addresses and optional weight values can be entered on one command line.
weight *value*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. If a weight is not specified the entry is automatically assigned a weight of 1. *value* must be an integer from 1 through 10.

Usage

Use this command to set the action for the HA service to take upon a network reachability failure.

Important: Refer to the Context Configuration mode command **nw-reachability server** to configure network reachability servers.

Important: Refer to the Subscriber Configuration mode command **nw-reachability-server** to bind the network reachability to a specific subscriber.

Important: Refer to the **nw-reachability server server_name** keyword of the Context Configuration mode **ip pool** command to bind the network reachability server to an IP pool.

Example

To set the HA service to reject all new calls on a network reachability failure, enter the following command:

```
policy nw-reachability-fail reject
```

Use the following command to set the HA service to redirect all calls to the HA at IP address *192.168.100.10* and *192.168.200.10* on a network reachability failure:

```
policy nw-reachability-fail redirect 192.168.100.10 192.168.200.10
```

policy overload

Configures the overload policy within the HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

policyoverload { **redirect***address* [**weight***weight_num*] [*address2* [**weight***weight_num*] ... *address16*[**weight***weight_num*]] | **reject**[**use-reject-code** { **admin-prohibited** | **insufficient-resources** }] }

no policyoverload [**redirect***address* [*address2...address16*]

---

no policy overload [redirect *address* **[** *address2...address16* **]]**

Deletes a previously set policy or removes a redirect IP address.
overload: Without any options deletes the complete overload policy from the PDSN service.
overload redirect *address* [*address2 ... address16*]: deletes up to 16 IP addresses from the overload redirect policy. The IP addresses must be expressed in IP v4 dotted-decimal notation

---

redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ...** *address16* **[weight** *weight_num* **]**

This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the HA service rejects new sessions with a Registration Reply Code of 136H (unknown home agent address) and provides the IP address of an alternate HA. This command can be issued multiple times.
address: The IP address of an alternate HA expressed in IP v4 dotted-decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy, the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

---

reject [use-reject-code { admin-prohibited | insufficient-resources }]

This option causes any overload traffic to be rejected. If no reject code is specified, the HA sends a registration reply code of 81H (admin-prohibited).
use-reject-code { **admin-prohibited** | **insufficient-resources** }: Use the specified reject code when rejecting traffic.
admin-prohibited: When this keyword is specified and traffic is rejected, the error code 81H (admin-prohibited) is returned.
insufficient-resources: When this keyword is specified and traffic is rejected, the error code 82H (insufficient resources) is returned.

Usage

The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system.
The system automatically invokes the overload policy when an on-line software upgrade is started.
Use the **no** version of this command to restore the default policy.
The setting for overload policy is reject.

Example

The following command enables an overload redirect policy for the HA service that will send overload calls to either of two destinations with weights of *1* and *10* respectively:

```
policy overload redirect 192.168.100.10 weight 1 192.168.100.20 weight 10
```

reg-lifetime

Configures Mobile IP session registration lifetime.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

reg-lifetime *time*

no reg-lifetime

default reg-lifetime

no

Sets the registration lifetime to infinite.

default

Sets the registration lifetime to default value, 600.

time

Specifies the registration lifetime in seconds.
time is an integer from 1 through 65534.

Usage

Use this command o limit a mobile node's lifetime. If the mobile node requests a shorter lifetime than what is specified, it is granted. However, Per RFC 2002, should a mobile node request a lifetime that is longer than the maximum allowed by this parameter, the HA service will respond with the value configured by this command as part of the Registration Reply. The default is 600 seconds.

Example

The following command configures the registration lifetime for the HA service to be *2400* seconds:

```
reg-lifetime 2400
```

The following command configures an infinite registration lifetime for MIP calls:

```
no reg-lifetime
```

reverse-tunnel

Enables use of reverse tunneling for Mobile IP session. Use no reverse-tunnel command to disable. If disabled, mobile node (MN) packets are not tunneled to the HA in the reverse direction.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
reverse-tunnel

no reverse-tunnel

default reverse-tunnel
```

no

Indicates the reverse tunnel option is to be disabled. When omitted, the reverse tunnel option is enabled.

default

Indicates the reverse tunnel option is to be set to the default. When omitted, the reverse tunnel option is enabled.

Usage

Reverse tunneling involves tunneling datagrams originated by the mobile node to the HA service via the FA. When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.
Among the advantages of using reverse-tunneling are that:

- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA to which the mobile node is registered and tunnel all datagrams from the mobile node to its HA

Use the **no** version of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, triangular routing will be performed.
Routing will be used.
The default setting is reverse tunnel enabled.

Important: If reverse tunneling is disabled on the system and a mobile node requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

Example

The following command disables reverse-tunneling support for the HA service:

```
no reverse-tunnel
```

revocation

Configures the Registration Revocation feature for a specific HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
revocation { enable | max-retransmission number | negotiate-i-bit | retransmission-
timeout secs | send-nai-ext | trigger { handoff | idle-timeout } }

no revocation { enable | negotiate-i-bit | send-nai-ext | trigger { handoff | idle-
timeout } }

default revocation [ enable ] [ max-retransmission ] [ negotiate-i-bit ] [
retransmission-timeout ] [ send-nai-ext ] [ trigger { handoff | idle-timeout } ]
```

no

Completely disables registration revocation on the HA, disables trigger handoff, or disables revocation on idle timer expiration.

default

Sets or restores the default value assigned for specified parameter.

enable

Enables the MIP registration revocation feature on the HA. When enabled, if revocation is negotiated with an FA and a MIP binding is terminated, the HA can send a Revocation message to the FA. This feature is disabled by default.

max-retransmission *number*

Default: 3
The maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer from 0 through 10.

negotiate-i-bit

Default: disabled
Enables the HA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

retransmission-timeout *secs*

Default: 3
The number of seconds to wait for a Revocation Acknowledgement from the FA before retransmitting the Revocation message. *secs* must be an integer from 1 through 10.

send-nai-ext

Default: off

Enables sending the NAI extension in the revocation message.

trigger { handoff | idle-timeout }

handoff: Default: Enabled
Triggers the HA to send a Revocation message to the FA when an inter-Access Gateway/FA handoff of the MIP session occurs. If this is disabled, the HA is never triggered to send a Revocation message.
idle-timeout: Default: Enabled
Triggers the HA to send a Revocation message to the FA when a session idle timer expires.

Usage

Use this command to enable or disable the MIP revocation feature on the HA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

Example

The following command enables Registration Revocation on the HA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to *10*:

```
revocation max-retransmission 10
```

The following command sets the timeout between retransmissions to *3*:

```
revocation retransmission-timeout 3
```

The behavior of send MIP revocation to FA is as follows:

- 1st retry: Retransmit in 3 seconds after previous MIP revocation send.
- 2nd retry: Retransmit in 6 seconds after previous MIP revocation send (9 seconds after sending initial MIP revocation).
- 3rd retry: Retransmit in 12 seconds after previous MIP revocation send (21 seconds after sending initial MIP revocation).
- 4th retry: Retransmit in 24 seconds after previous MIP revocation send (45 seconds after sending initial MIP revocation).
- 5th retry: Retransmit in 48 seconds after previous MIP revocation send (93 seconds after sending initial MIP revocation).

Important: The value of retransmission-timeout doubles. HA disconnects the session forcibly in 120 seconds after sending initial MIP revocation.

setup-timeout

The maximum time allowed for session setup in seconds. Default is 60 seconds.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *seconds*

default setup-timeout

default

Sets or restores the default value.

seconds

Default: 60 seconds
The maximum amount of time (in seconds) to allow for setup of a session. *seconds* must be an integer from 1 through 1000000

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

To set the maximum time allowed for setting up a session to 5 minutes (*300* seconds), enter the following command:

```
setup-timeout 300
```

simul-bindings

Specifies the maximum number of “care-of” addresses that can simultaneously be bound for the same user as identified by NAI and Home address.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

simul-bindings *number*

default simul-bindings

default

Sets or restores the default value.

number

Configures the maximum number of simultaneous “care-of” bindings that the HA service will maintain for any given subscriber.
is an integer from 1 through 3.

Usage

Per RFC 2002, the HA service creates a mobile binding record (MBR) for each subscriber session it is facilitating. Each MBR is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care of address.
Typically, the HA service will delete an old binding and create a new one when the information in the Registration Request changes. However, the mobile could request that the HA maintain previously stored MBRs. This command allows you to configure the maximum number of MBRs that can be stored per subscriber if the requested. The default value is 3.

Example

The following command configures the HA service to support up to 4 MBRs per subscriber:

```
simul-bindings 4
```

threshold dereg-reply-error

Sets an alarm or alert based on the number of de-registration reply errors per HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold dereg-reply-error *high_thresh* [**clear** *low_thresh*]

no threshold dereg-reply-error

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of de-registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to an integer from 0 through 100000.

clear *low_thresh*

Default: 0
The low threshold number of de-registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of de-registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of de-registration reply errors on the following rules:

- **Enter condition:** Actual number of de-registration reply errors > High Threshold
- **Clear condition:** Actual number of de-registration reply errors < Low Threshold

Example

The following command configures a de-registration reply error threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold reg-reply-error 1000 clear 500
```

threshold init-rrq-rcvd-rate

Sets an alarm or alert based on the average number of calls setup per second for the context.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
threshold init-rrq-rcvd-rate high_thresh [ clear low_thresh]
no threshold init-rrq-rcvd-rate
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold average number of calls setup per second that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100000.

clear *low_thresh*

Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* is an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second is greater than the high threshold.
- **Clear condition:** Actual number of calls setup per second is less that the low threshold.

Example

The following command configures a number of calls setup per second threshold of 1000 and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold init-rrq-rcvd-rate 1000 clear 500
```

threshold ipsec-call-req-rej

Configures a threshold for the total IPSec calls request rejected.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-call-req-rej *high_thresh* [**clear** *low_thresh*]

no threshold ipsec-call-req-rej

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of IPSec call requests rejected per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default:*0*
Specifies the low threshold number of IPSec call requests rejected per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec call requests rejected is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE requests on the following rules:

- **Enter condition:** Actual number of IPSec IKE requests is greater than the high threshold.
- **Clear condition:** Actual number of IPSec IKE requests is less than the low threshold.

Example

The following command configures a number of IPSec call requests rejected threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-call-req-rej 1000 clear 800
```

threshold ipsec-ike-failrate

Configures a threshold for the percentage of IPSec IKE failures.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
threshold  ipsec-ike-failrate high_thresh [  clear low_thresh ]

no threshold ipsec-ike-failrate
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold percentage of IPSec IKE failures per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100.

clear *low_thresh*

Default: *0*
Specifies the low threshold percentage of IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the percentage of IPSec IKE failures is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the percentage of IPSec IKE failures on the following rules:

- **Enter condition:** Percentage of IPSec IKE failures is greater than the high threshold.
- **Clear condition:** Percentage of IPSec IKE failures is less than the low threshold.

Example

The following command configures a percentage of IPSec IKE failures threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-ike-failrate 90 clear 80
```

threshold ipsec-ike-failures

Configures a threshold for the total IPSec IKE failures.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-ike-failures *high_thresh* [**clear** *low_thresh*]

no threshold ipsec-ike-failures

no

Deletes the alert or alarm.

high_thresh

Default: *0*
Specifies the high threshold number of IPSec IKE failures per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default:0
Specifies the low threshold number of call IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec IKE failures is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE failures on the following rules:

- **Enter condition:** Actual number of IPSec IKE failures is greater than the high threshold.
- **Clear condition:** Actual number of IPSec IKE failures is less than the low threshold.

Example

The following command configures a number of IPSec IKE failures threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-ike-failures 1000 clear 800
```

threshold ipsec-ike-requests

Configures a threshold for the total IPSec IKE requests.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
threshold ipsec-ike-requests high_thresh [ clear low_thresh ]

no threshold ipsec-ike-requests
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of IPSec IKE requests per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default:0
Specifies the low threshold number of call IPSec IKE requests per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec IKE requests is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE requests on the following rules:

- **Enter condition:** Actual number of IPSec IKE failures is greater than the high threshold.
- **Clear condition:** Actual number of IPSec IKE failures is less than the low threshold.

Example

The following command configures a number of IPSec IKE requests threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-ike-requests 1000 clear 800
```

threshold ipsec-tunnels-established

Configures a threshold for the total IPSec tunnels established.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-tunnels-established *high_thresh* [**clear** *low_thresh*]

no threshold ipsec-tunnels-established

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of IPSec tunnels established per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default:0
Specifies the low threshold number of call IPSec tunnels established per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec tunnels established is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec tunnels established on the following rules:

- **Enter condition:** Actual number of IPSec tunnels established is greater than the high threshold.
- **Clear condition:** Actual number of IPSec tunnels established is less than the low threshold.

Example

The following command configures a number of IPSec tunnels established threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-tunnels-established 1000 clear 800
```

threshold ipsec-tunnels-setup

Configures a threshold for the total IPSec tunnels setup.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
threshold ipsec-tunnels-setup high_thresh [ clear low_thresh  ]

no threshold ipsec-tunnels-setup
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of IPSec tunnels setup per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default:0
Specifies the low threshold number of call IPSec tunnels setup per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec tunnels setup is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec tunnels setup on the following rules:

- **Enter condition:** Actual number of IPSec tunnels setup is greater than the high threshold.
- **Clear condition:** Actual number of IPSec tunnels setup is less than the low threshold.

Example

The following command configures a number of IPSec tunnels setup threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-tunnels-setup 1000 clear 800
```

threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold reg-reply-error *high_thresh* [**clear** *low_thresh*]

no threshold reg-reply-error

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100000.

clear *low_thresh*

Default:0
Specifies the low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* is an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- **Enter condition:** Actual number of registration reply errors is greater than the high threshold.
- **Clear condition:** Actual number of registration reply errors is less than the low threshold.

Example

The following command configures a registration reply error threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold reg-reply-error 1000 clear 500
```

threshold rereg-reply-error

Set an alarm or alert based on the number of re-registration reply errors per HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold rereg-reply-error *high_thresh* [**clear** *low_thresh*]

no threshold rereg-reply-error

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of re-registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100000.

clear *low_thresh*

Default:0
Specifies the low threshold number of re-registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* is an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of re-registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of re-registration reply errors on the following rules:

- **Enter condition:** Actual number of re-registration reply errors is greater than the high threshold.
- **Clear condition:** Actual number of re-registration reply errors is less than the low threshold.

Example

The following command configures a reregistration reply error threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold dereg-reply-error 1000 clear 500
```

wimax-3gpp2 interworking

Configures the interworking between WiMAX and 3GPP2 network at HA. This support provides handoff capabilities from 4G to 3G (PDSN) network access and vice-versa.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] wimax-3gpp2 interworking
```

no

Disables the pre-configured interworking between WiMAX and 3GPP2 networks at HA level.

default

Configures the **WiMAX-3GPP2 interworking** to default setting: disabled.

Usage

Use this command to enable/disable the interworking between WiMAX and 3GPP2 network for seamless session continuity.
This functionality provides HA support for both 4G and 3G technology HA (WiMAX HA and PDSN/HA) for handoff from 4G and 3G network access (ASN GW/FA and PDSN/FA) and vice-versa.

Important: Use this command in conjunction with the **authentication aaa-distributed-mip-keys required** command.

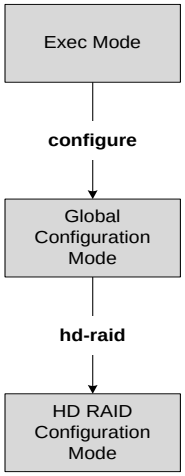
Example

The following command enables the interworking for a subscriber between WiMAX and 3GPP2 network.

```
wimax-3gpp2 interworking
```

Chapter 141
HD RAID Configuration Mode Commands

This mode develops default policies designed to minimize administrative intervention when setting up the RAID on ASR 5000 SMC hard disks.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

overwrite

Sets the RAID overwrite properties.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] overwrite { invalid | unknown | valid } disk [ -noconfirm ]
```

no

Prevents a disk from being overwritten.

default

Configures the default overwrite action:

invalid

This option allows the system to automatically overwrite invalid disks including empty disks, wrongly partitioned disks, and partially constructed disks.
This is the default overwrite action.

unknown

This option allows the system to automatically overwrite unknown disks that has a valid RAID superblock but is not configured in the standard way; most likely because it has data from a different version.

valid

This option allows the system to automatically overwrite a disk that is a clean RAID component but not part of the current or selected RAID.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Sets a policy for automatically overwriting different disk types. If there is a disk that satisfies the changed overwrite policy then the disk would overwrite immediately.

Example

The following command configures a policy for overwriting invalid RAID disks:

```
overwrite invalid disk -noconfirm
```

select

Configures the disk preference when both hard disks on the ASR 5000 have valid RAID information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] select { newer | none } disk [ -noconfirm ]
```

default

Configures the command to its default condition.

newer

Selects the newer disk by timestamp and event counter in superblocks. If all are the same, then the same array will start with both SMC disks, but a different array will need admin intervention).

none

Does not select any disk but defers to administrator intervention.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Determines the selected disc when two valid disks from either the same or different RAIDs are running on the ASR 5000.

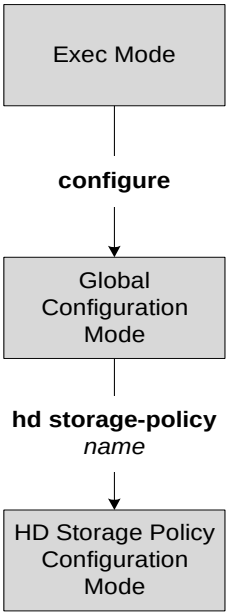
Example

This command forces the RAID to be configured on the newer SMC hard disk:

```
select newer disk -noconfirm
```

Chapter 142
HD Storage Policy Configuration Mode Commands

The HD Storage Policy Configuration Mode is used to configure directory name and file parameters for Diameter record files being stored on the HD storage device.



directory

Configures the name of the directory on the HD storage drive where Diameter records are stored.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

directory name *dir_name*

default directory name

default

Returns the command to its default setting of using the policy name as the directory name.

name *dir_name*

Specifies the name to be applied to the directory. *dir_name* must be an alphanumeric string of 1 through 63 characters.
When configured, the actual directory path is:

```
/hd-raid/records/<record-type>/<dir_name>/
```

So if the directory name variable is entered as "*sgwpgw*", the path is:

```
/hd-raid/records/acr/sgwpgw
```

Usage

Use this command to name a directory on the HD storage drive where Diameter records are to be stored.

Example

The following command configures a directory named *cdr1*:

```
directory name cdr1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

file

Configures file parameters for Diameter records being stored on the HD storage device.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
file { format acr { custom1...custom10 } | name { extension string | prefix string } |
rotation { record-count num | time-interval sec | volume mb mbytes } }

default file { format acr | name prefix | rotation { record-count | time-interval |
volume } }

no file ( extension | rotation { record-count | time-interval } }
```

default

Returns the command to the default settings for the specified keywords.

no

Removes the configuration for the specified parameters.

format acr { custom1...custom10 }

Default: **custom1**
Specifies the file format used when storing records on the HD storage device. **custom1** is a vendor-specific file format.

name { extension *string* **| prefix** *string* **}**

Specifies a string to be pre-pended or appended to the filenames. By default, the policy name is used for the prefix.
extension *string*: Specifies a file extension to append to the filename. *string* must be an alphanumeric string of 1 through 10 characters.
prefix *string*: Specifies a file prefix to append to the filename. *string* must be an alphanumeric string of 1 through 63 characters. This parameter replaces the policy name used by default.

rotation { record-count *num* **| time-interval** *sec* **| volume mb** *mbytes* **}**

Specifies the triggers that prompt file rotation on the HD storage drive. All options can be configured and upon reaching any of the thresholds, file rotation is initiated.
record-count *num*: File rotation occurs when the number of records reaches the number configured in this keyword. *num* must be an integer from 1000 through 65000. Default = 10000
time-interval *sec*: File rotation occurs at time intervals (in seconds) configured by this keyword. *sec* must be an integer from 30 through 86400. Default = 3600 (1 hour)
volume mb *mbytes*: File rotation occurs when the record volume exceeds the value (in megabytes) configured by this keyword. *mbytes* must be an integer from 2 through 40. Default = 4

Usage

Use this command to configure file parameters for Diameter records being stored on the HD storage device.

Example

The following command sets the file rotation thresholds for files being stored on the HD storage device:

```
file rotation volume mb 4

file rotation record-count 15000

file rotation time-interval 7200
```

The following command replaces the policy name as the prefix of all files being stored through this policy with the prefix *sgw*:

```
file name prefix sgw
```

Chapter 143
HLR Configuration Mode Commands

The HLR Configuration Mode provides the commands and parameters to configure the home location register (HLR) node that is the database containing the subscriber profile and connection information for a specific GPRS/UMTS core network.

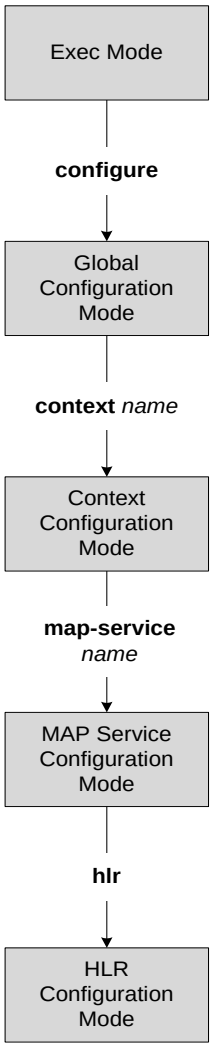
In this mode, your prompt will look similar to:

```
[<context_name>]hostname(config-map-service-<svr_name>-hlr)#
```

The HLR Configuration Mode is a sub-mode derived from the MAP Configuration Mode which controls the MAP service configuration. It is the MAP service that provides the application-layer protocol support used to connect the HLR to other nodes in the network such as the SGSN.

When the mode is accessed, the command line will appear similar to

```
[<ctx_name>]asr5000(config-map-service-<service_name>-hlr)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

acn-version-retention

This command configures the ACN version retention method.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
acn-version-retention { per-imsi-prefix | per-subscriber }

default acn-version-retention
```

default

Returns the configuration to the default value: retains the version information per IMSI prefix.

per-imsi-prefix

Retain ACN version information, for communication with the HLR, on a per IMSI prefix basis.

per-subscriber

Retain ACN version information, for communication with the HLR, on a per buscriber basis.

Usage

By default, the SGSN sends ACN version 3 SAI (service area identity) to the HLR. If the SGSN receives an error message indicating that the HLR does not support that version, then the SGSN tries again with an ACN version 2 SAI. Next time the SGSN communicates with that HLR, it retains that version information and version persists based on the IMSI prefix.
Use this command to enable the SGSN to retain version according to subscriber.

Example

Configure the SGSN to retain version information according to the IMSI prefix:

```
default acn-version-retention
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the MAP Service configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the MAP Service configuration mode.

imsi

This command sets up IMSI (International Mobile Subscriber Identity) -based configuration. The IMSI prefix includes the nobile country code (MCC) and the mobile network code (MNC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] imsi { any | starts-with *prefix_number* **} { imsi [sgsn-source-address-format point-code-ssn [source-ssn** *ssn* **] | isdn** *isdn_number* **| mobile-global-title** *mgt_number* **[max-gt-address-len** *max_gt_address* **] | point-code** *pt-code* **} }**

no

Removes the imsi-prefix definition from the configuration.

any

Configures acceptance of any IMSI prefix.

start-with *prefix_number*

Selects IMSI prefix-based routing.
prefix_number is a string of up to 15 integers.

imsi

Enables configurable default behavior for routing.
Entering **imsi** with the **any** keyword preserves the default behavior and the E.212 address is used as a destination address and the MAP request will be sent towards the HLR.
If this keyword is not used with the **any** keyword, then the MAP request will be rejected.

isdn *isdn_number*

Defines the E.164 number of the HLR.
isdn_number is a string of integers, up to 15.

mobile-global-title *mgt_number* **[max-gt-address-len** *max_gt_address_length* **]**

Defines the mobile global title address that the MCC/MNC portion of the IMSI will be converted to. If the maximum GT address length is specified (optional) and if the length of the MGT string is greater than defined, then the least significant digits will be omitted.
mgt_number is a string of digits, up to 18 digits in length.
max_gt_address is an integer from 1 to 32.

point-code *pt-code* **source-ssn** *ssn*

Defines the point code for the HLR.
pt-code is a string of digits, up to 11; SS7 format preferred.

sgsn-source-address-format point-code-ssn

Selects HLR call process according to SCCP calling party address of the SGSN. This will be filled at MAP level, including the ITU point code address.

source-ssn *ssn*

Defines the SSN of the source that will be used for the call filtering.
ssn: Must be an integer from 1 to 255.

Usage

Routing will be done according to IMSI parameters configured with this command or according to the mobile global title address (replacing the MCC/MNC portion of the IMSI) is so specified.

Example

```
imsi starts-with 3 isdn 123456789 sgsn-source-address-form at point-code-ssn
```

policy routing

This command configures the policy for the routing of MAP messages. If this command is not configured or disabled (with the **default** keyword), then routing is done according to the configuration of the IMSI parameters.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
policy routing { hlr-isdn | ms-isdn }

default policy routing

no policy routing
```

default

Resets the policy routing to the system default, disabled.

no

Removes the policy routing configuration from the system.

hlr-isdn

Selects HLR-ISDN based routing.

ms-isdn

Selects mobile station (MS)-ISDN based routing.

Usage

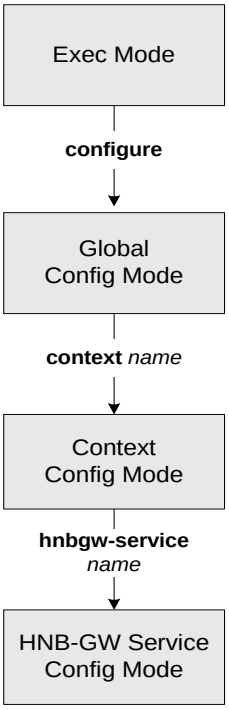
Use this command to set the policy for routing MAP messages.

Example

```
policy routing hlr-isdn
```

Chapter 144
HNB-GW Service Configuration Mode Commands

The 3G UMTS Home-NodeB Gateway Service Configuration Mode manages access to the UMTS core network in a 3G UMTS network through a Femto node.



access-control-db

Configures the access control database parameters in an HNB-GW service instance to control HNB and UE access to the HNB-GW node.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
access-control-db imsi-purge-timeout {immidiate | dur }

default access-control-db imsi-purge-timeout
```

default

Sets the default value to HNB-UE access control database on HNB-GW service instance.
The default timeout duration for purging of the IMSI White List from the HNB-GW Access Control database is 24 hours. The HNB-GW service waits for 24 hours after all referenced HNBs have de-registered before purging the records.

immidiate

Sets the HNB-GW service to purge the HNB-UE access control database immediately after all referenced HNBs have de-registered.

imsi-purge-timeout *dur*

Sets the timeout duration (in minutes) for the access control database to wait before purging the IMSI values received as a White List from HMS/BAC.
After all HNBs have de-registered, the Access Control database on HNB-GW maintains the IMSI White List received from HMS/BAC during HNB registration procedure for the configured durations before purging the list.
dur is an integer from 1 through 1440.

Usage

Use this command to configure the HNB-UE access control database parameters on HNB-GW service.
This command sets the timeout duration to maintain the IMSI White List received from HMS/BAC during HNB registration procedure in HNB-GW service for the configured *dur* in minutes after de-registration of all referenced HNBs from HNB-GW node and then purge the database.

Example

Following command sets the HNB-GW service instance to purge all IMSI records from HNB-UE access control database immediately after all referenced HNBs de-registered from HNB-GW service instance.

```
access-control-db imsi-purge-timeout immidiate
```

associate gtpu-service

Associates a previously configured GTP-U service to bind the HNB-GW service with an HNB towards the HNB side. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate gtpu-service *svc_name*

no associate gtpu-service

no

Removes the associated GTP-U service from this HNB-GW service configuration.

svc_name

Identifies the name of the pre-configured GTP-U service to associate with an HNB-GW service towards the Home-NodeB side.
svc_name ise an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure GTP-U data plan between HNB-GW service and Home-NodeB. The service defined for GTP-U can be configured in Context configuration mode.

Important: Another GTP-U service can be used to bind the HNB-GW service towards the Core Network and can be configured in HNB-PS Configuration mode. For more information on GTP-U service configuration, refer *GTP-U Service Configuration Mode Commands*.

Example

Following command associates GTP-U service named *gtpu-hnb1* with specific HNB-GW service towards Home-NodeB side.

```
associate gtpu-service gtpu-hnb1
```

associate rtp pool

Associates a previously defined RTP pool (IP pool) with the HNB-GW service. This pool is used by HNB-GW to send an IP address to HNB where HNB uses it to map the RTP streams over Iuh interface. This command is used for RTP stream management on HNB-GW.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate rtp pool *pool_name*

no associate rtp pool

no

Removes the associated RTP pool (IP pool) from this HNB-GW service configuration.

pool_name

Specifies the name of the pre-configured RTP IP pool that the HNB-GW uses to assign IP addresses when mapping RTP streams over the Iuh interface.
pool_name is an alphanumeric string of 1 through 31 characters.

Important: For IP pool (RTP pool) configuration, refer **ip pool** command in *Context Configuration Mode Commands* chapter.

Usage

Use this command to associate an RTP pool (IP Pool) with an HNB-GW service for allotment of RTP IP address to HNB-GW node and send the same to HNB for RTP stream management support. The HNB maps the RTP streams with received IP address(es) while communicating with HNB-GW over Iuh interface where HNB-GW communicates with MSC/VLR through IuCS-over-IP tunnel.
This command is used for RTP stream management on HNB-GW.

Important: This command must be used to provide IP address for mapping of RTP streams on Iuh interface between HNB and HNB-GW.

Example

Following command associates RTP pool named *rtp_1* with HNB-GW service for RTP stream end point from Home-NodeB:

```
associate rtp pool rtp_1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

handin

Allows or disallows the incoming hand-over of an MS in HNB-GW via the Serving Radio Network Subsystem (SRNS) Relocation procedure for the specified packet switched/circuit switched (PS/CS) core network (CN) domain.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] handin cn-domain [cs | ps]
```

no

Disallows the incoming MS hand-over for the particular CN domain via SRNS Relocation procedure in an HNB-GW service instance.
If hand-over is restricted the relocation request will be rejected with rejection cause “Relocation Not Supported In Target RNC Or Target System”.

default

Sets the HNB-GW service instance to allow the incoming MS hand-over for the particular CN domain via SRNS Relocation procedure in an HNB-GW service instance.

cs

Sets the HNB-GW service instance to allow the incoming MS hand-over for the CS core network domain via SRNS Relocation procedure in an HNB-GW service instance.

ps

Sets the HNB-GW service instance to allow the incoming MS hand-over for the PS core network domain via SRNS Relocation procedure in an HNB-GW service instance.

Usage

Use this command to set HNB-GW service instance for allowing/disallowing incoming hand-over of an MS in HNB-GW via SRNS Relocation procedure for PS or CS core network domain.
If hand-over is restricted the Relocation Request message will be rejected with rejection cause “Relocation Not Supported In Target RNC Or Target System”.

Example

The following command configures the HNB-GW service instance to allow hand-over of an MS in HNB-W via SRNS Relocation procedure for PS core network domain:

```
handin ps
```

hnb-access-mode

Configures the HNB access mode (open/closed) in HNB-GW service instance and related parameters. Currently it is used to configured Open Access mode support only.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hnb-access-mode open max-registered-ue *reg_ue*

no hnb-access-mode open

default hnb-access-mode open

no

Disables Open Access mode support.
If disabled and an Open HNB tries to register, the HNB-GW sends HNB-Registration-Reject message with "OA&M Intervention" cause.

Important: UE-Reg/CS-Call/PS-Call requests (both existing and future) is allowed from already registered Open HNBs even after operator has disabled the Open Access support. No new Open HNB registration is allowed once operator disables the Open Access support.

default

Sets the default configuration of Open Access mode support.
By default, HNB-GW allows registration of Open HNBs and a maximum of 16 UEs can register from an open HNB in an HNB-GW service instance.

open max-registered-ue *reg_ue*

Sets the HNB-GW service instance to allow the maximum number of UEs through an open HNB under Open Access mode support.
reg_ue defines the maximum number of UEs that can register from an Open HNB as an integer from 1 through 32.
If a UE tries to register from an Open HNB which has already reached to the configured limit configured, the HNB-GW sends HNB-Registration-Reject message with "ue not allowed in this hnb" cause in an HNB-GW service instance.

Usage

Use this command to configure the HNB-GW service instance for Open Access Mode support and related parameters.
This command enable Open Access mode support to allow the UEs that can register from an Open HNB. If a UE tries to register from an Open HNB with an HNB-GW service instance, which is already reached to the limit configured through **max-registered-ue** *reg_ue* the HNB-GW sends HNB-Registration-Reject message with "*ue not allowed in this hnb*" cause.

Important: If Operator has reduced the maximum number of UEs allowed per Open HNB during the session, this will not have any effect on already registered UEs/CS-Calls/PS-Calls even if previously configured *reg_ue* is beyond the newly configured *reg_ue* value. Limits is respected while handling new requests.

Example

The following command configures the HNB-GW service instance to allow 16 UEs to register through an open HNB:

```
default hnb-access-mode open
```

ip iu-qos-dscp

Enables or disables the DSCP marking parameter for data packets carried over over an IuCS/IuPS interface towards MSC/SGSN. By default this command is **Disabled**.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

ip iu-qos-dscp protocol { **sctp payload all** | **udp payload** { **gtpu** | **rtcp**| **rtp**} } *dscp_code*

[**default** | **no**] **ip iu-qos-dscp protocol** { **sctp payload all** | **udp payload** { **gtpu** | **rtcp**| **rtp**} }

no

Use this keyword to place the configuration in **pass-through** mode (no marking of DSCP). Use of this keyword is allowed even when there is no previous DSCP parameter set.

Important: In this configuration the **no** keyword does not disable or remove a previous configuration.

default

Enables the DSCP marking on HNB-GW and set/restores the QoS parameters to their default setting.

sctp payload all *dscp_code*

Specifies the QoS traffic pattern towards MSC/SGSN in SCTP protocol association over IuCS/IuPS interface. By this keyword the Traffic classes specified by a user based on SCTP protocol and all type of payload identified based on the transport level port numbers.
By default DSCP codes **cs5** is supported for **all** payloads in SCTP protocol.

udp payload { gtpu | rtcp| rtp} *dscp_code*

Specifies the QoS traffic pattern towards MSC/SGSN in SCTP protocol association over IuCS/IuPS interface. By this keyword the Traffic classes specified by a user based on UDP protocol and GTPU, RTCP, and RTP type of payload identified based on the transport level port numbers.
Default DSCP code in UDP traffic are:

- **GTP-U**: cs1
- **RTCP**: ef
- **RTP**: af41

dscp_code

Specifies the QoS DSCP codes supported for SCTP and UDP traffic and its payloads towards MSC/SGSN over IuCS/IuPS interface.
following type of DSCP codes *dscp_code* are supported over IuH interface:

- **af11**: Marks traffic as Assured Forwarding 11 PHB (high throughput data)
- **af12**: Marks traffic as Assured Forwarding 12 PHB (high throughput data)
- **af13**: Marks traffic as Assured Forwarding 13 PHB (high throughput data)
- **af21**: Marks traffic as Assured Forwarding 21 PHB (low latency data)
- **af22**: Marks traffic as Assured Forwarding 22 PHB (low latency data)
- **af23**: Marks traffic as Assured Forwarding 23 PHB (low latency data)
- **af31**: Marks traffic as Assured Forwarding 31 PHB (multimedia streaming)
- **af32**: Marks traffic as Assured Forwarding 32 PHB (multimedia streaming)
- **af33**: Marks traffic as Assured Forwarding 33 PHB (multimedia streaming)
- **af41**: Marks traffic as Assured Forwarding 41 PHB (multimedia conferencing). This is the default DSCP code for RTP payloads in UDP protocol.
- **af42**: Marks traffic as Assured Forwarding 42 PHB (multimedia conferencing)
- **af43**: Marks traffic as Assured Forwarding 43 PHB (multimedia conferencing)
- **cs1**: Marks traffic with Class Selector 1 (low priority data). This is the default DSCP code for GTP-U payloads in UDP protocol.
- **cs2**: Marks traffic with Class Selector 2 (OAM)
- **cs3**: Marks traffic with Class Selector 3 (broadcast video)
- **cs4**: Marks traffic with Class Selector 4 (real-time interactive)
- **cs5**: Marks traffic with Class Selector 5 (signaling). This is the default DSCP code for all SCTP payloads.
- **cs6**: Marks traffic with Class Selector 6 (network control)
- **df** : Marks traffic as Default Forwarding (best effort: DSCP = 0)
- **ef**: Marks traffic as Expedited Forwarding PHB (telephony). This is the default DSCP code for RTCP payloads in UDP protocol.

Usage

Use this command to enable/disable the DSCP marking for data packets over IuCS/PS interface. This command assigns the DSCP levels to specific traffic patterns in order to ensure that the packets are delivered according to the precedence with which they are tagged. The Diffserv markings are applied to the IP header of every subscriber data packet transmitted over IuCS/IuPs interface(s) towards MSC/SGSN.
This command adds DSCP marking on egress traffic going towards CN (CS/PS). To make the configuration **pass-through** mode or not marking DSCP at all in the packets, **no** variant of command is used. Use of **no** is allowed even when there is no previous DSCP configuration done.

Important: By default this command is **Disabled**.

Important: When DSCP configuration is not specified, the system works in **pass-through** mode and DSCP values in the ingress (from CN) and egress (to HNB) data packets remain unchanged. Multiple traffic classes can share the same code point value.

Following type shown in following tables respectively:

Table 23. Supported DSCP Codes and Service Class

Service Class	DSCP Code	Service Class	DSCP Code
high throughput data	af11 af12 af13	low priority data	cs1
low latency data	af21 af22 af23	OAM	cs2
multimedia streaming	af31 af32 af33	broadcast video	cs3
multimedia conferencing	af41 af42 af43	real-time interactive	cs4
best effort/ default forwarding, value zero	df	Signaling	cs5
telephony	ef	network control	cs6

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP code for the SCTP IuCS/IuPS streaming traffic pattern for all payloads to be **ef**:

```
ip iu-qos-dscp protocol sctp payload all ef
```

ip iuh-qos-dscp

Enables or disables the DSCP marking parameter for control and data packets transmitted over an IuH interface towards HNB. By default this command is **Disabled**.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

ip iuh-qos-dscp protocol { **sctp payload all** | **udp payload** { **gtpu** | **rtcp**| **rtp**} } *dscp_code*

[**default** | **no**] **ip iuh-qos-dscp protocol** { **sctp payload all** | **udp payload** { **gtpu** | **rtcp**| **rtp**} }

no

Use this keyword to set the configuration in **pass-through** mode. Use of this keyword is allowed even when there is no previous DSCP parameter set.

Important: In this configuration the **no** keyword does not disable/remove a previous configuration.

default

Enables the DSCP marking on HNB-GW and set/restores the QoS parameters to its default setting.

sctp payload all *dscp_code*

Specifies the QOS traffic pattern towards HNB in SCTP protocol association over IuH interface.
By this keyword the Traffic classes specified by a user based on SCTP protocol and all type of payload identified based on the transport level port numbers.
By default DSCP codes **cs5** is supported for **all** payloads in SCTP protocol.

udp payload { gtpu | rtcp| rtp} *dscp_code*

Specifies the QOS traffic pattern towards HNB in SCTP protocol association over IuH interface.
By this keyword the Traffic classes specified by a user based on UDP protocol and GTPU, RTCP, and RTP type of payload identified based on the transport level port numbers.
Default DSCP code in UDP traffic are:

- **GTP-U**: cs1
- **RTCP**: ef
- **RTP**: af41

dscp_code

Specifies the QOS DSCP codes supported for SCTP and UDP traffic and its payloads towards HNB over IuH interface.
following type of DSCP codes *dscp_code* are supported over IuH interface:

- **af11**: Marks traffic as Assured Forwarding 11 PHB (high throughput data)
- **af12**: Marks traffic as Assured Forwarding 12 PHB (high throughput data)
- **af13**: Marks traffic as Assured Forwarding 13 PHB (high throughput data)
- **af21**: Marks traffic as Assured Forwarding 21 PHB (low latency data)
- **af22**: Marks traffic as Assured Forwarding 22 PHB (low latency data)
- **af23**: Marks traffic as Assured Forwarding 23 PHB (low latency data)
- **af31**: Marks traffic as Assured Forwarding 31 PHB (multimedia streaming)
- **af32**: Marks traffic as Assured Forwarding 32 PHB (multimedia streaming)
- **af33**: Marks traffic as Assured Forwarding 33 PHB (multimedia streaming)
- **af41**: Marks traffic as Assured Forwarding 41 PHB (multimedia conferencing). This is the default DSCP code for RTP payloads in UDP protocol.
- **af42**: Marks traffic as Assured Forwarding 42 PHB (multimedia conferencing)
- **af43**: Marks traffic as Assured Forwarding 43 PHB (multimedia conferencing)
- **cs1**: Marks traffic with Class Selector 1 (low priority data). This is the default DSCP code for GTP-U payloads in UDP protocol.
- **cs2**: Marks traffic with Class Selector 2 (OAM)
- **cs3**: Marks traffic with Class Selector 3 (broadcast video)
- **cs4**: Marks traffic with Class Selector 4 (real-time interactive)
- **cs5**: Marks traffic with Class Selector 5 (signaling). This is the default DSCP code for all SCTP payloads.
- **cs6**: Marks traffic with Class Selector 6 (network control)
- **df** : Marks traffic as Default Forwarding (best effort: DSCP = 0)
- **ef**: Marks traffic as Expedited Forwarding PHB (telephony). This is the default DSCP code for RTCP payloads in UDP protocol.

Usage

Use this command to enable/disable the DSCP marking for control and data packets carried by the IP protocols and their payloads on IuH. This command assigns the DSCP levels to specific traffic patterns in order to ensure that the packets are delivered according to the precedence with which they are tagged. The Diffserv markings are applied to the IP header of every subscriber data packet transmitted over IuH interface(s) towards HNB.

This command adds DSCP marking on egress traffic going towards HNB. To make the configuration **pass-through mode** or not marking DSCP at all in the packets, **no** variant of command is used. Use of **no** is allowed even when there is no previous DSCP configuration done.

Important: By default this command is **Disabled**.

Important: When DSCP configuration is not specified, system works in **pass-through** mode and DSCP value in the ingress (from CN) and egress (to HNB) control and data packets remain unchanged. Multiple traffic classes can share the same code point value.

Following type shown in following tables respectively:

Table 24. Supported DSCP Codes and Service Class

Service Class	DSCP Code	Service Class	DSCP Code
high throughput data	af11 af12 af13	low priority data	cs1
low latency data	af21 af22 af23	OAM	cs2
multimedia streaming	af31 af32 af33	broadcast video	cs3
multimedia conferencing	af41 af42 af43	real-time interactive	cs4
best effort/ default forwarding, value zero	df	Signaling	cs5
telephony	ef	network control	cs6

Example

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

The following command configures the DSCP code for the SCTP IuH streaming traffic pattern for all payloads to be **ef**:

```
ip iuh-qos-dscp protocol sctp payload all ef
```

paging open-hnb

Cconfigures paging optimization parameters for open HNBs connected through Open Access mode in the HNB-GW service instance. Currently it is used to configure paging optimization for Open Access mode support only.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

paging open-hnb [**hnb-where-ue-registered fallback**] {**always** | **never** | **only-if-with-paging-area**}

default paging open-hnb

default

Sets the default behavior of paging optimization configuration for an open HNB while using Open Access mode support.
By default the HNB-GW pages open HNBs only if paging-area IE is received in the paging message.

{always | never | only-if-with-paging-area}

Sets the HNB-GW service instance to page open HNB for a paging message.
always: Sets the system to ALWAYS page the open HNBs irrespective of **paging-area** IE is received in paging messages.
never: Sets the system to NEVER page any open HNB.
only-if-with-paging-area: Sets the system to page the open HNBs only when **paging-area** IE is received in paging messages.

hnb-where-ue-registered fallback {always | never | only-if-with-paging-area}

Sets the HNB-GW service instance to page open HNB from where the UE is registered.
always: Sets the system to ALWAYS page the open HNBs from where the UE is registered. If the UE is not registered then it pages the open HNBs irrespective of **paging-area** IE is received in paging messages.
never: Sets the system to page the open HNBs from where the UE is registered. If the UE is not registered then it NEVER pages any open HNB.
only-if-with-paging-area: Sets the system to ALWAYS page the open HNBs from where the UE is registered. If the UE is not registered then it pages the open HNBs only when **paging-area** IE is received in paging messages.

Usage

Use this command to configure the paging optimization parameters for open HNBs connected through Open Access mode in HNB-GW service instance.

Example

The following command configures the HNB-GW service instance to page an open HNB from where the UE is connected and paging-area IE is received in paging message:

```
paging open-hnb hnb-where-ue-registered fallback only-if-with-paging-area
```

radio-network-plmn

Creates, remove and enters the HNB-RN-PLMN Configuration mode. In this mode you can configure various parameters for radio network public mobile land networks (PLMNs). A maximum of 16 radio PLMN-IDs can be configured in an HNB-GW service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

radio-network-plmn mcc *mcc_num* **mnc** *mnc_num* [**-noconfirm**]

no radio-network-plmn mcc *mcc_num* **mnc** *mnc_num*

no

Removes the configured radio network PLMN identifier for an HNB-GW service.

Caution: Removing the PLMN-ID is a disruptive operation; the HNB-GW service will be re-started.

mcc *mcc_num*

Specifies the mobile country code (MCC) part of radio network PLMN identifier as an integer value from 101 through 998.

mnc *mnc_num*

Specifies the mobile network code (MNC) part of radio network PLMN identifier as a 2- or 3-digit integer from 01 through 998.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to configure the radio network PLMN identifier for an HNB-GW service. This command also creates a configuration mode to configure various parameters for defined radio network PLMN identifier in HNB-GW service.

Caution: Changing or removing the PLMN-ID is a disruptive operation; the HNB-GW service will be re-started.

Entering this command results in the following prompt:

```
[context_name]hostname(config-radio-network-plmn)#
```

A maximum of 16 radio network PLMN identifiers are supported for an HNB-GW service.

Example

The following command configures the radio network PLMN identifier with MCC value as *102* and MNC value as *20* for an HNB-GW service:

```
radio-network-plmn mmc 102 mnc 20
```

ranap reset

Configures various Radio Access Network (RAN) Application Part reset procedure parameters in an HNB access network.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

ranap reset {**ack-timeout** *timer_value* | **guard-timeout** *g_timer* | **hnbgw-initiated** | **max-retransmissions** *retries*}

default ranap reset {**ack-timeout** | **guard-timeout** | **hnbgw-initiated** | **max-retransmissions**}

no ranap hnbgw-initiated

default

Resets the RANAP RESET parameters on HNB-GW service instance.

no

Disables the RANAP RESET procedure related parameters in an HNB-GW service instance.

ack-timeout *timer_value*

Sets the timer value (in seconds) to wait for Reset Acknowledge from SGSN/MSC. This is used during HNB-GW initiated RANAP RESET procedure in HNB-GW service instance.
timer_value is an integer value from 5 through 10. Default: 10

guard-timeout *g_timer_value*

Sets the timer value (in seconds) to send Reset Acknowledge to SGSN/MSC. After this duration the HNB-GW sends RESET-ACK to SGSN/MSC. This is used during SGSN/MSC initiated RANAP RESET procedure in HNB-GW service instance.
g_timer_value is an integer value from 5 through 10. Default: 10

hnbgw-initiated

Enables the HNB-GW Initiated RANAP RESET procedures. Default: Disabled

max-retransmission *retries*

Sets the maximum number of retires allowed for transmission of RESET-ACK message to SGSN/MSC. This is used during RANAP RESET procedure in HNB-GW service instance.
retries is an integer value from 0 through 2. When 0 is used retransmission is disabled. Default: 1

Usage

Use this command to configure the RANAP RESET procedure related parameters in HNB-GW service.

Example

The following command configures the HNB-GW initiated RANAP RESET Procedure for an HNB-GW service:

```
ranap reset hnbgw-initiated
```

rtcp report

Enables or disables the generation of RTP Control Protocol (RTCP) packet/report types on a per HNB-GW service instance basis. It also sets the time interval in seconds between two consecutive RTCP reports.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
rtcp report interval dur

[no | default] rtcp report interval
```

no

Disables the RTCP report generation on HNB-GW service. When RTP configuration is not explicitly mentioned, this is the default behavior.

default

Restores the report interval value to its default value of 5 seconds.

interval *dur*

Sets the time interval (in seconds) between two consecutive RTCP reports as an integer from 5 through 30. Default: 5

Usage

Use this command to configure the enabling or disabling of the generation of RTCP packet/ report types on a per HNB-GW service instance basis and sets the specified time interval in seconds between two consecutive RTCP reports.

RTCP enables the receiver to detect if there is any packet loss and needs to compensate for any delay jitter. RTP and RTCP protocols work independently of the underlying Transport layer and Network layer protocols. Whenever this command is disabled, RTCP report generation stops from the next expiry of the previously configured interval and after enabling, reports are generated only for the calls that established as new calls in the future. For existing calls reports generated as per configuration in place.

RTCP reports are generated for each RAB for RTP received from and sent to IuH interface.

Important: The same interval is applicable for all kinds of RTCP packets/ reports across all sessions on an HNB-GW service.

Example

The following command configures the RTCP report generation interval to *15* seconds on an HNB-GW service for RTP stream:

```
rtcp report interval 15
```

rtp mux

Configures the HNB-GW service to allow an Home-NodeB to multiplex multiple RTP streams in one IP packet. This support is provided for RTP stream management feature on HNB-GW.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no | default]rtp mux

default

Sets the multiplexing option to default state of "disabled".

no

Removes the configured option to multiplex multiple RTP stream in one packet by Home-NodeB in HNB-GW configuration.

Usage

Use this command to allow an Home-NodeB to multiplex multiple RTP streams in one IP packet. This configuration support is provided for RTP stream management feature on HNB-GW and it is disabled by default.

Example

The following command sets the HNB-GW to allow HNB to multiplex multiple RTP stream in one packet:

```
rtp mux
```

sctp

Configures the SCTP-related parameters like timeout duration for various timers and cookie life over an IuH interface in an HNB-GW service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

sctp alpha-rto *alpha_rto_dur*

sctp beta-rto *beta_rto_dur*

sctp checksum-type [**adler32** | **crc32**]

sctp cookie-life *cookie_life*

sctp max-retx [**init** | **path** | **assoc**] *max_retry*

sctp mtu-size [**start** | **min** | **max**] *mtu_byte*

sctp rto { **initial** *ini_rto_dur* | **min** *min_rto_dur* | **max** *max_rto_dur* }

sctp sack-frequency *sack_frq*

sctp sack-period *sack_dur*

sctp max-in-strms *in_strms*

sctp max-out-strms *out_strms*

default sctp {**alpha-rto** | **beta-rto** | **checksum-type** | **cookie-life** | **max-retx** [**init** | **path** | **assoc**] | **mtu-size** [**start** | **min** | **max**] | **rto** { **initial** | **min** | **max**} | **sack-frequency** | **sack-period** | **max-in-strms** | **max-out-strms** }

default

Restores the SCTP parameters to default value in HNB-GW service instance. Default values for all parameters are as follows:

- **alpha-rto**: 5 seconds
- **beta-rto**: 10 seconds
- **checksum-type**: CRC32
- **cookie-life**: 600 ms
- **max-retx init**: 5 retries
- **max-retx path**: 5 retries
- **max-retx assoc**: 10 retries

- **mtu-size min**: 508 Bytes
- **mtu-size max**: 1500 Bytes
- **mtu-size start**: 508 Bytes
- **rto initial**: 30 seconds
- **rto min**: 10 seconds
- **rto max**: 600 seconds
- **sack-frequency**: 2
- **sack-period**: 2 ms
- **max-in-strms**: 4
- **max-out-strms**: 4

---

alpha-rto *alpha_rto_dur*

Sets the alpha retransmission timeout duration (in seconds) for SCTP association between HNB and HNB-GW as an integer from 0 through 65535. A "zero" value disables the timer in this configuration. Default: 5

---

beta-rto *beta_rto_dur*

Sets the beta retransmission timeout duration (in seconds) for SCTP association between HNB and HNB-GW an integer from 0 through 65535. A "zero" value disables the timer in this configuration. Default: 10

---

checksum-type [adler32 | crc32]

Sets the checksum algorithm type to be used in SCTP association between HNB and HNB-GW for packet validation. Default: CRC32
adler32: Specifies the SCTP association to use Adler32 checksum algorithm for packet validation. By default this is disabled.
crc32: Specifies the SCTP association to use 32-bit cyclic redundancy check (CRC) algorithm for packet validation. By default this is enabled.

---

cookie-life *cookie_life*

Sets the COOKIE life (in milliseocnds) for SCTP association between HNB and HNB-GW as an integer from 500 through 120000. Default: 600

---

max-retx [init | path | assoc] *max_retry*

Sets the maximum number of retries allowed in SCTP states for SCTP association between HNB and HNB-GW.
init: Sets the maximum attempts allowed after T1-init timer expires. If the T1-init timer expires then the HNB-GW retransmits INIT chunk and re-start the T1-init timer without changing state. This is repeated up to the configured times with this configuration. After that, the HNB-GW aborts the initialization process. Default number of attempts *max_retry* for this state is 5.
path: Sets the maximum attempts allowed after T3-rtx timer expires. Each time the T3-rtx timer expires on any address, or when a HEARTBEAT sent to an idle address is not acknowledged within a RTO, the error counter of that destination address incremented. When the value in the error counter exceeds this protocol parameter of that HNB address, the HNB-GW marks the destination transport address as inactive. Default number of attempts *max_retry* for this state is 5.

assoc: Sets the maximum number of consecutive retransmissions to its peer is allowed. If the value of this counter exceeds the limit configured with this keyword the HNB-GW considers the peer HNB unreachable and stop transmitting any more data to it. The SCTP association is automatically closed when the peer endpoint becomes unreachable. Default number of attempts *max_retry* for this state is 10.
max_retry is an integer from 1 through 255.

---

mtu-size [min | max | sart] *mtu_byte*

Sets the maximum transmission unit (MTU) size in Bytes for SCTP association between HNB and HNB-GW.
min: Sets the minimum size of MTU for SCTP association between HNB and HNB-GW. Default minimum MTU size *mtu_byte* is 508 Bytes.
max: Sets the maximum size of MTU for SCTP association between HNB and HNB-GW. Default maximum MTU size *mtu_byte* is 1500 Bytes.
start: Sets the size of MTU for SCTP association at the start of session between HNB and HNB-GW. Default MTU size *mtu_byte* at initial sate is 508 Bytes.
mtu_byte is an integer from 508 to 65535.

---

rto { initial *ini_rto_dur* **| min** *min_rto_dur* **| max** *max_rto_dur* **}**

Sets the Retransmission TimeOut (RTO) duration parameters for SCTP association between HNB and HNB-GW.
initial *ini_rto_dur*: Sets the initial retransmission timeout duration (in seocnds) for SCTP association between HNB and HNB-GW as an integer from 1 through 1200. Default: 30.
min *min_rto_dur*: Sets the minimal retransmission timeout duration (in seconds) for SCTP association between HNB and HNB-GW as an integer from 1 through 50. Default: 10
max *max_rto_dur*: Sets the maximum retransmission timeout duration (in secinds) for SCTP association between HNB and HNB-GW as an integer from 5 through 1200. Default: 600.

---

sack-frequency *sack_frq*

Sets the number of chunks received before sending the Selective Acknowledgement chunk HNB from HNB-GW in SCTP association. the SACK chunk is sent to the HNB to acknowledge received DATA chunks and to inform the HNB of gaps in subsequently received DATA chunks.
sack_frq is the frequency after which SACK chunk is sent to HNB specified as an integer from 1 through 5. Default: 2

---

sack-period *sack_dur*

Sets the duration (in seconds) after which Selective Acknowledgement chunk is sent to HNB from HNB-GW in SCTP association. The SACK chunk is sent to the HNB to acknowledge received DATA chunks and to inform the HNB of gaps in subsequently received DATA chunks.
sack_dur is an integer from 0 through 5. A “zero” value disables the parameter.

---

max-in-strms *in_strms*

Sets the maximum number of inward SCTP streams allowed on HNB-GW for an associated HNB in an SCTP association as an integer from 1 through 16. Default: 4

---

max-out-strms *out_strms*

Sets the maximum number of outgoing SCTP streams allowed from HNB-GW for an associated HNB in an SCTP association as an integer from 1 through 16. Default: 4

Usage

Use this command to configure the SCTP protocol messaging and session management parameters in SCTP association between HNB and HNB-GW.

Example

The following command sets the SCTP COOKIE life to *600* milliseconds on HNB-GW for the SCTP association:

```
default sctp cookie-life
```

sctp bind

Configures the SCTP IP address and port that is used for binding the SCTP socket to communicate with the Home-NodeB over an Iuh interface within an HNB-GW service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

sctp bind { address *address* **| port** *port_num* **}**

[default | no] sctp bind { address | port }

default

Sets the SCTP port to the default value of 600.

address *address*

Specifies the IP address of the HNB-GW Iuh interface in IPv4 dotted-decimal or IPv6 colon-separated notation.

port *port_num*

Specifies the SCTP port number to communicate with the Home-NodeBs using Iuh interface as an integer form 1 through 65535.

Usage

Use this command to assign the SCTP IP address and port with SCTP socket on HNB-GW to communicate with the Home-NodeB using Iuh interface. This SCTP configuration provides the IP-address and listen port where HNB-GW service shall bind to listen for incoming SCTP associations from HNB.

Example

The following command sets the SCTP port number *999* on HNB-GW to listen from Home-NodeB over Iuh interface:

```
sctp bind port 999
```

The following command sets the SCTP address *10.2.3.4* of HNB-GW to use with Home-NodeB over Iuh interface:

```
sctp bind address 10.2.3.4
```

sctp connection-timeout

Configures the SCTP connection timeout duration to explicitly remove the SCTP association with a non-responsive HNB in an HNB-GW service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

sctp connection-timeout *dur*

[default | no] sctp connection-timeout

no

Disables the connection time out configuration on HNB-GW service.

default

Restores the connection timeout duration value to its default value of 10 seconds.

dur

Sets the connection timeout duration (in seconds) after which the association is explicitly removed. In case of an HNB de-registration scenario, the HNB-GW waits for configured amount time before initiating the procedure to clear the SCTP association.
dur is an integer from 5 through 30. Default: 10

Usage

Use this command to configure the minimum duration value before removing the SCTP association between a non-responding HNB and HNB-GW. If HNB registration not happened within the configured period after the SCTP association is established then the SCTP association is explicitly removed. In a scenario where an HNB de-registered due to any reason, the HNB-GW waits for the configured amount of time before initiating the procedure to clear the SCTP association.

Example

The following command sets the SCTP connection timeout duration to *15* second on HNB-GW after expiry of which the SCTP association is removed:

```
sctp connection-timeout 15
```

sctp heart-beat-timeout

Configures the SCTP heartbeat timer parameters for SCTP connection over an IuH interface in an HNB-GW service instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

sctp heart-beat-timeout *dur*

[default | no] sctp heart-beat-timeout

no

Disables the heartbeat timer configuration for SCTP over IuH in HNB-GW service instance.

default

Restores the default time out value for heartbeat timer to 30 seconds.

dur

Sets the heartbeat timer timeout duration (in seconds) after which the next heartbeat command is sent to HNB from HNB-GW in SCTP over an IuH interface. In an HNB de-registration scenario, the HNB-GW waits for configured amount time before initiating the procedure to clear the SCTP association.
dur is an integer from 1 through 300. Default: 30

Usage

Use this command to configure the minimum duration value before retransmitting the HEARTBEAT chunk to HNB from HNB-GW in SCTP transmission. By default HNB-GW monitors the reachability of the idle HNBs by sending a HEARTBEAT chunk periodically to the HNB address.
Each time the HEARTBEAT timer expires on any address, or when a HEARTBEAT sent to an idle address is not acknowledged within a Retransmission Timeout duration, the error counter of that HNB incremented. When the value in the error counter exceeds the protocol parameter for maximum retransmission for that destination address, the HNB-GW mark the destination HNB as inactive and a notification is sent to the upper layer.

Example

The following command sets the SCTP HEARTBEAT timeout duration to *15* second on HNB-GW after expiry of which the HNB-GW retransmits the HEARTBAT chunk to HNB over SCTP association:

```
sctp heart-beat-timeout 15
```

security-gateway aaa

Associates a pre-configured AAA Service group to use authentication parameters for Security Gateway (SeGW) functionality in HNB-GW service. The associated AAA server group is a pre-configured via Context Configuration mode.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

security-gateway aaa authentication { first-phase | second-phase } context *ctx_name* **aaa-group** *aaa_grp*

no security-gateway aaa { attribute calling-station-id | authentication { first-phase | second-phase }

no

Removes previously configured AAA authentication or attribute setting from HNB-GW service while using SeGW functionary.

attribute calling-station-id *ms_id*

Specifies the calling station identifier from where the user placed the call.

authentication { first-phase | second-phase } context *ctx_name* **aaa-group** *aaa_grp*

Specifies the AAA authentication parameters to be used while using SeGW functionality in an HNB-GW service.
first-phase: Specifies the parameters to be used for first phase of authentication while using SeGW functionality in an HNB-GW service. This associates the AAA parameters through AAA server group association with in it.
second-phase: Specifies the parameters to be used for second phase of authentication while using SeGW functionality in an HNB-GW service. This associates the AAA parameters through AAA server group association with in it.
context *ctx_name*: Specifies the name of the context to be used for first/second or both phases of authentication.
aaa-group *aaa_grp*: Specifies the name of the AAA server group configured via Context Configuration mode with AAA parameters that will be used for first/second or both phases of authentication.

Important: For more information on AAA server groups, refer *AAA Server Group Configuration Mode Commands*.

Usage

Use this command to associate or tie the AAA authentication or attribute parameters with an HNB-GW service which is to be used for first/second or both phase of authentication while using SeGW functionality in

an HNB-GW service or removing AAA attribute “calling-station-id” from AAA message. This functionality is part of SeGW configuration support in an HNB-GW service.

Caution: This is a critical configuration and need to be configured carefully when Security Gateway (SeGW) functionality required on HNB-GW service.

Example

The following command associates an AAA server group named *sec_gw_grp1* with HNB-GW service to use specific AAA authentication parameters in first phase of authentication and another AAA server group named *sec_gw_grp2* to use different AAA authentication parameter in second phase of authentication. Both AAA server groups are configured in same context named *SeGW_ctx1*:

```
security-gateway aaa authentication first-phase context SeGW1 aaa-group
sec_gw_grp1security-gateway aaa authentication second-phase context SeGW1
aaa-group sec_gw_grp2
```

The following command disables a previously configured AAA authentication parameter for first phase of authentication:

```
no security-gateway aaa authentication first-phase
```

security-gateway bind

Binds the SeGW in an HNB-GW service to a logical IP interface serving as an Iuh interface and associates an IPsec IKEv2 crypto-map template.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

security-gateway bind address *address* **crypto-template** *cryp_name* **[context** *ctxt_name***]**

no security-gateway bind

no

Removes a previously configured IPSec IP address use for binding the IKEv2 IPSec tunnel (local bind address) to communicate with the Home-NodeBs using Iuh interface.

bind address *address*

Specifies the IP address for the Iuh interface for the IPSec tunnel. This is the IP address where the HNB-GW service is bound and that is provided to the Home-NodeB during HNB-GW discovery.
The IP address is expressed in IPv4 dotted-decimal or IPv6 colon-separated notation.

crypto-template *cryp_name*

Specifies the Crypto-map template to be used for IPsec IKEv2 tunneling for the interface configured as an Iuh.
cryp_name specifies the name of the pre-configured Crypto-map template which is configured in Crypto-Map Template Configuration mode and associated with the HNB-GW service to create an IPSec tunnel with a Home-NodeB during HNB-GW discovery procedure over an Iuh interface.

context *ctx_name*

Specifies the name of the pre-configured context in which the Security Gateway service is configured. By default this command uses the HNB-GW service context for the ecurity Gateway configuration.

Usage

Use this command to associate or tie the HNB-GW service to a specific logical IP address that is used for binding the Iuh socket to communicate with the Home-NodeB using IPSec tunnel. A maximum of one IP address can be configured with this command for one HNB-GW service.
The HNB-GW passes the IP address during setting up the HNB-GW discovery procedure with the Home-NodeB.

Caution: This is a critical configuration. The HNB-GW service cannot be started without this configuration. Any change to this configuration would lead to restarting the HNB-GW service and removing or disabling this configuration stops the HNB-GW service.

Example

The following command binds the logical IP interface with the address of *10.2.3.4* to the HNB-GW service using existing IPsec Crypto-Map template *crypto1* to establish IPSec tunnel with Home-NodeB:

```
security-gateway bind address 10.2.3.4 crypto-template crypto1
```

The following command disables a binding that was previously configured:

```
security-gateway bind address
```

security-gateway username

Configures the options related to user name received from MS.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no | defualt ] security-gateway username mac-address-stripping
```

no

Disables previously configured option for user name received from MS.

default

Sets the user name option configuration of default setting of "Disable".

mac-address-stripping

Sets the system to strip the MAC address from the user name received from the MS. Default: Disabled

Usage

Use this command to set the user name related options. By enabling this option system trips the MAC address from the user name received from MS.

Example

The following command sets the system to strip the MAC address from user name received from user MS:

```
security-gateway username mac-address-stripping
```

tnnsf-timer

Configures the NAS Node Selection Function (NNSF) timer (T-NNSF) which is used by the HNB-GW to store the IMSI and the relevant Global-CN-ID in the short term after Paging. This timer is used for Iu-Flex feature support.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

tnnsf-timer *dur*

[no | default] tnnsf-timer

no

Disables/removes the configured timer value of NNSF timer (T-NNSF) from HNB-GW service instance.

default

Sets the timer value of NNSF timer (T-NNSF) for HNB-GW service instance to default value of 30 seconds.

tnnsf-timer *dur*

Configures the NNSF timer (in seconds) which is used by the HNB-GW to store the IMSI and the relevant Global-CN-ID as an integer from 10 through 60. Default: 30

Usage

Use this command to configure the NNSF timer value in seconds for Iu-Flex support.
Whenever the MSC sends the paging request with IMSI, the HNB-GW stores the Global_CN_ID of the node which issued the paging request message for the given IMSI and HNB-GW starts the **tnnsf-timer**. HNBGW stores the mapping of IMSI to Global_CN_ID until the **tnnsf-timer** expires

Example

The following command sets the NNSF timer value to *30* seconds in an HNB-GW service instance:

```
default tnssf-timer
```

ue registration-timeout

Configures the UE registration timeout duration to de-register the connected UE from an HNB-GW service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
ue registration-timeout dur

[ default | no ] ue registration-timeout
```

no

Disables the UE registration timeout duration and explicitly de-registers UE from the HNB-GW service.

default

Restores the UE registration timeout duration value to its default value of 120 seconds.

dur

Sets the UE registration timeout duration (in seconds) after which the UE is de-registered from HNB-GW. In a scenario when all Iu connections are released for a subscriber, the HNB-GW service de-registers the UE after cthe onfigured duration only.
dur is an integer from 60 through 300. Default: 120

Usage

Use this command to configure the minimum duration value before de-registering the UE when subscriber fails to establish the Iu connection. If subscriber's Iu session does not established before configured period then UE is de-registered. Also in a scenario where all Iu connections are released for a subscriber, the HNB-GW service waits for configured period before starting UE deregistration procedure.

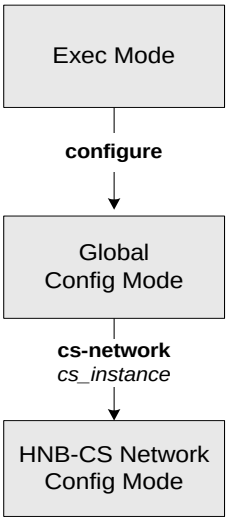
Example

The following command sets the UE registration timeout duration to *150* second on HNB-GW after expiry of which the UE is de-registered:

```
ue registration-timeout 150
```

Chapter 145
HNB-CS Network Configuration Mode Commands

The HNB-CS Network configuration mode provides the commands to create, provide, and manage the circuit switched (CS) network instance allowing the Home Evolved NodeB Gateway (HNB-GW) access with the CS core network in a 3G UMTS network.



associate alcap-service

Associates a previously defined Access Link Control Application Part (ALCAP) service with the CS network instance for multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs). This configuration is provided to support IuCS-over-ATM functionality

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate alcap-service *svc_name* **context** *ctx_name*

no associate alcap-service

no

Removes the associated ALCAP service from this HNB-CS network instance configuration.

svc_name

Identifies the name of the ALCAP service preconfigured in Context configuration mode to associate with an HNB-CS network instance for multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs).
svc_name must be a preconfigured ALCAP service.
Only one instance of this command can be configured.

Caution: If this CLI is not configured any RAB-ASST-REQ requesting AAL2 connection setup shall be rejected with an appropriate cause.

context*ctx_name*

Specifies the name of the context in which ALCAP service is configured.
ctx_name must be an existing context name in which this ALCAP service is configured.

Usage

Use this command to configure IuCS-over-ATM support. This association of ALCAP protocol service configuration in HNB-CS network instance provides multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs).

Caution: If this CLI is not configured any RAB-ASST-REQ message requesting AAL2 connection setup shall be rejected with an appropriate cause.

Important: This command must not be used more than once to configure IuCS-over-ATM support.

Example

Following command associates ALCAP service *alcap_svc1* configured in context named *Ctx_alcap1* with specific HNB-CS network instance:

```
associate alcap-service alcap_svc1context ctx_alcap1
```

associate rtp pool

Associates a previously defined RTP pool (IP pool) with the CS network instance to be used for assignment of IP address/port as RTP streams end point address over IuCS interface. This configuration support is provided for RTP stream management feature in an HNB-GW service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate rtp pool *pool_name* **context** *ctx_name*

no associate rtp pool

no

Removes the associated RTP pool (IP pool) from this HNB-CS network instance configuration.

pool_name

Identifies the name of the RTP IP pool preconfigured in Context configuration mode to associate with an HNB-CS network instance to be used for assignment of IP address/port over the IuCS interface RTP streams. *pool_name* must be an existing IP pool name configured in Context configuration mode.

Important: For IP pool (RTP pool) configuration, refer *Context Configuration Commands Mode* chapter.

context*ctx_name*

Specifies the name of the context in which RTP pool (IP pool) is configured.
ctx_name must be an existing context name in which this IP pool is configured.

Usage

Use this command to associate RTP pool (IP Pool) with an HNB-CS network instance for allotment of IP address/port over IuCS interface for RTP streams across all sessions. A fixed range of RTP ports from 5000 through 65000 shall be used to allocate to RTP stream.

Important: This command must be used to provide IP address/port for RTP streams end point address over IuCS interface.

Important: This configuration support is provided for RTP stream management feature on an HNB-GW service.

Example

Following command associates RTP pool named *rtp_1* with specific HNB-CS network instance:

```
associate rtp pool rtp_1
```

associate sccp-network

Associates a predefined Signaling Connection Control Part (SCCP) network id with the CS network instance in order to route the messages towards MSC/VLR over IuCS interface.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate-sccp-network *sccp_net_id*

no associate-sccp-network

no

Removes the associated SCCP network id from this HNB-CS network instance configuration.

sccp_network_id

Identifies the predefined SCCP network id to associate with an HNB-CS network instance over IuCS/IuFlex interface to enable connection with MSC/VLR(s).
sccp_network_id must be a predefined SCCP network id in Global configuration mode.

Usage

Use this command to associate a preconfigured SCCP network id over IuCS interface in HNB-GW service to connect with CS network elements; i.e. MSC.

Caution: The SCCP network id must be defined in Global Configuration mode before using it with this command.

Important: A single SCCP network configuration instance can not be shared with multiple HNB-CS network instances.

Example

Following command associates SCCP network *2* with specific HNB-CS network instance:

```
associate-sccp-network 2
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

map core-network-id

Maps/associates the CS core network id to a default Mobile Switching Center (MSC) in network using MSC point code in HNB-CS network to allow HNBs to access UMTS network.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

map core-network-id *cn_id* **point-code** *msc_point_code*

no map core-network-id *cn_id*

no

Removes the mapping of a CS core network id with particular MSC point code.

cn_id

Specifies the core network identifier configured to represent a UMTS CS core network as an integer from 0 through 4095.
Multiple instance of this command can be mapped with different MSC point code.

point-code *msc_point_code*

Specifies the SS7 address of the default MSC in the CS network in point code value to a configured HNB-CS network instance.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this MSC point code can be mapped with one CS core network id.

Usage

Use this command to map a UMTS CS core network identifier with a particular MSC point code.
This command can be entered multiple times with same MSC point code to map with one or more CS core network Id, but a particular core network identifier can be mapped to one MSC only.
This command is instrumental in Iu-Flex functionality, whenever HNB-GW receives RESET/RESET-RES messages from MSC with Global CN-ID information element, the response from HNB-GW is sent to the node configured for that particular Global CN-ID.
If the RESET/RESET-RES messages do not have Global CN-ID IE, then the response of those messages is directed to the default MSC which is configured using **msc point-code** command in this mode.

Example

The following command configures the CS core network identifier *101* with an MSC point code *1.2.3*:

```
map core-network-id 101 point-code 1.2.3
```

The following command configures the CS core network identifier *102* with the same MSC point code *1.2.3*:

```
map core-network-id 102 point-code 1.2.3
```

map idnns

Configures the mapping of Intra-Domain NAS Node Selector (IDNNS) IE received from UE in RUA connect message towards HNB-GW to MSC point code. This is an important configuration for CS network resource sharing over Iu-Flex interface.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

map idnns range *idnns_start* **to** *idnns_end* **point-code** *msc_point_code* **[backup point-code** *bkup_msc_point_code***]**

no map idnns range *idnns_start* **to** *idnss_end*

no

Removes the entries of mapping of range of IDNNS received from UE with particular MSC point code.

range *idnns_start* **to** *idnns_end*

Specifies the range of IDNNS received from the UE to map with a particular MSC point code during initial CS core network node selection.
idnns_start is an integer from 0 through 1023 that should be less than *idnns_end*.
idnns_end must be an integer from 0 through 1023 that should be more than *idnns_start*.
The command can be entered more than once to map multiple IDNNS ranges to the same MSC, but overlapping and mapping of the same range to different MSC point codes is not allowed.

point-code *msc_point_code*

Specifies the SS7 address of the MSC in the CS network to map with a range of IDNNS values.
msc_point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

backup point-code *bkup_msc_point_code*

Specifies the SS7 address of the MSC to be used as a backup in the CS network to map with a range of IDNNS values.
bkup_msc_point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a NRI received from UE during initial CS network node selection to MSC point code through NRI range mapping over Iu-Flex interface.
The IDNNS refers to the information element in RUA connect message from UE towards RAN (HNB-GW). In IDNNS IE, if the choice of routing mentioned is other than local P-TMSI, then the value it provides is used against this configuration to map the MSC point code.
If backup MSC point-code is specified, then specified MSC works as backup for the IDNS range configured. This Backup MSC is selected if the mapped MSC for a given IDNNS range is going for offloading using **offload-msc point-code** command.

The command can be entered more than once to map multiple IDNNS ranges to same MSC point code, but overlapping and mapping of same range to different MSC point code is not allowed.

Example

The following command maps the IDNNS range from *101* to *201* with MSC point code *1.2.3* and point code *7.8.9* as backup MSC point code:

```
map nri range 101 to 201 point-code 1.2.3 backup point-code 7.8.9
```

The following command removes all IDNNS range matching entries between *301* to *399* from the configuration:

```
no map idnns range 301 to 399
```

map lac

Configures the mapping of the Location Area Code (LAC) received from UE to an MSC point code. This is an important configuration for CS network resource sharing without Iu-Flex interface configuration.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

map lac range *lac_start* **to** *lac_end* **point-code** *msc_point_code*

no map lac range *lac_start* **to** *lac_end*

no

Removes the entries of mapping of range of LACs received from UE with particular MSC point code.

range *lac_start* **to** *lac_end*

Specifies the range of LACs received from UE to map with particular MSC point code during initial CS core network node selection.
lac_start is an integer from 0 through 65535 that should be less than *lac_end*.
lac_end is an integer from 0 through 65535 that should be more than *lac_start*.
The command can be entered more than once to map multiple LAC ranges to same MSC, but overlapping is not allowed.

point-code *msc_point_code*

Specifies the SS7 address of the MSC in the CS network to map with a range of LAC values.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a LAC, received from UE during HNB registration, for MSC selection over IuCS interface through LAC range mapping with MSC point code.
This configuration is used during initial CS core network node selection when the LAC from the UE is available. This configuration is used when the core network is not using Iu-Flex interface for MSC selection.
The command can be entered more than once to map multiple LAC ranges to same MSC point code.

Important: This command can be used together with Iu-Flex configuration, but MSC selection based on LAC takes place only if Iu-Flex is not configured. If both Iu-Flex and LAC are configured then selection of MSC is based on Iu-Flex configuration only.

Example

The following command maps the LAC range from *20* to *50* with MSC point code *1.2.3*:

```
map lac range 20 to 50 point-code 1.2.3
```

The following command removes all LAC range matching entries between *20* to *50* from the configuration:

```
no map lac range 20 to 50
```

map nri

Configures the mapping of Network Resource Identifier (NRI) sent from UE to the MSC point code. This is an important configuration for CS network resource sharing over Iu-Flex interface.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

map nri range *nri_start* **to** *nri_end* **point-code** *msc_point_code*

no map nri range *nri_start* **to** *nri_end*

no

Removes the entries of mapping of range of NRIs received from UE with particular MSC point code.

range *nri_start* **to** *nri_end*

Specifies the range of NRIs received from UE to map with pa articular MSC point code during initial CS core network node selection.
nri_start is an integer from 0 through 1023 that should be less than *nri_end*.
nri_end is an integer from 0 through 1023 that should be more than *nri_start*.
The command can be entered more than once to map multiple NRI ranges to same MSC, but overlapping is not allowed.

point-code *msc_point_code*

Specifies the SS7 address of the MSC in the CS network to map with a range of NRI values.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a NRI received from UE during initial CS network node selection to MSC point code through NRI range mapping over Iu-Flex interface.
This configuration is used during initial CS core network node selection when the network resource identifier (NRI) from the UE is available. The NRI range is mapped to MSC point code. This configuration is used when the core network uses Iu-Flex interface.
The command can be entered more than once to map multiple NRI ranges to same MSC point code.
It is possible to configure multiple ranges to more than one MSC however this configuration is required only when the CS core network is configured as Multi-Operator Core Network (MOCN).
When the CS core network is not MOCN and one range is mapped to more than one MSC then MSC is selected randomly in a non-predictable manner.

Example

The following command maps the NRI range from *101* to *201* with MSC point code *1.2.3*:

```
map nri range 101 to 201 point-code 1.2.3
```

The following command maps the NRI range from *301* to *399* with MSC point code *1.2.3*:

```
map nri range 301 to 399 point-code 1.2.3
```

The following command removes all NRI range matching entries between *301* to *399* from the configuration:

```
no map nri range 301 to 399
```

msc deadtime

Configures a timer on the HNB-GW to manage MSC availability in a CS core network on receiving of a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from an SCCP instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

msc deadtime { immidiate |*dur* }

[no | default] msc deaddtime

no

Marks the peer node (MSC) as always available; it can never be marked down for a specific HNB-CS network instance.

default

Sets the default action for HNB-GW and provisions it as such that the peer node (MSC) is marked down as soon as HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP in a specific HNB-CS network instance. Default: Enabled

immidiate

Sets the HNB-GW to mark the peer node (MSC) down immediately and clears all Iu-CS connections towards the MSC. Default: Disabled

dur

Sets the duration (in seconds) for a timer that starts when the HNB-GW receives a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer MSC. On expiry of this timer the peer MSC is marked as dead and all Iu-CS connections towards that MSC are released.
dur is an integer from 1 through 30.
Only one instance of this command can be configured.

Usage

This command is used to configure a timer on HNB-GW to manage MSC availability in a CS core network on receiving of PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP. This configuration plays important role during RANAP reset procedure as well.
Timer value sets the duration in seconds for a timer which started once HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer MSC. On expiry of this timer the peer MSC is marked as dead and all Iu-CS connections towards that MSC shall be released.

Important: This command can be entered only once. Reentering this command overwrites the previous parameters.

Example

The following command configures the deadtime timer value for *10* seconds on HNB-GW. Once HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer MSC the HNB-GW waits for configured period and on expiry of timer it marks the specific MSC as dead:

```
msc deadtime 10
```

msc point-code

Configures the default MSC point-code within an HNB-CS network instance. This command is used when HNB-GW is to be connected to only one MSC with in a CS network or as default MSC for all HNBs connected through specific HNB-CS network instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] msc point-code` *`point_code`*

`no`

Removes the configured default MSC point code from a specific HNB-CS network instance.

Caution: Removing the MSC point code is a disruptive operation and affects all HNB sessions which are connected to particular MSC through an HNB-CS network instance.

`msc` *`point_code`*

Specifies the SS7 address of the default MSC in the CS network to this configured HNB-CS network instance.
`point_code` is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this command can be configured.

Usage

Use this command to configure a default MSC to which HNB connects for CS network access through HNB-GW service.
Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

Important: This command can be entered only once. If entered again the previous value shall be overwritten.

Example

The following command configures a default MSC with point code *`101.201.101`* for HNBs to access CS network through HNB-GW service in this HNB-CS network instance:

```
msc point-code 101.201.101
```

nri length

Configures the network resource identifier (NRI) length in bits to identify a specific MSC serving in a pooled area. At least one NRI value has to be assigned to an MSC serving in a pool. The NRI is coded inside of the temporary mobile subscriber identity (TMSI), located within bits 14 to 23 with an variable length between 0 and 10 bits. Operator needs to set this NRI length to indicates the number of bits that shall be used for the NRI field to set the parameters for Iu-Flex (MSC pooling) functionality.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

nri length *nri_value*

default nri length

default

Sets the NRI length to the default value of 0 and disables the Iu-Flex (MSC pooling) functionality.

nri length *nri_value*

Default: 0
Specifies the number of bits to be used in the P-TMSI (bits 23 to 18) to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length is of zero length.
length is an integer from 1 to 10 that identifies the number of bits. When a non-zero value is configured the CS network is considered to be a pool.

Usage

Use this command to enable the Iu-Flex functionality on HNB-GW. This command identifies a unique MSC serving a pooled area for Iu-Flex functionality and at least one NRI value has to assigned to an MSC serving in a pool. It performs MSC pooling/offloading scenario over Iu-Flex interface. The NRI is stored in the bits 14 to 23 of TMSI. The HNB-GW uses a portion of this NRI to set the parameters for Iu-Flex (MSC pooling) functionality.
If more than one NRI is configured, the HNB-GW service does round-robin between the available NRIs when new subscriber(s) (re)connect.
This command must be used in conjunction with **null nri** command to configured MSC pooling/offloading over Iu-Flex interface.

Example

The following command sets the HNB-GW to a bit length of *6* to derive the values from the NRI field (stored in bits 14 to 23 of TMSI) to set the parameters for Iu-Flex (MSC pooling) functionality:

```
nri length 6
```

null-nri

Configures the null NRI for load redistribution in support of Iu-Flex functionality. The NRI value defined with this command must be unique across the pool areas. This null-NRI is used by HNB-GW for load redistribution during MSC offloading.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

null-nri *null_nri_value*

no null-nri *null_nri_value*

no

Disables/removes the configured null-NRI value used for MSC offloading procedure.

null_nri_value

Specifies the null-NRI value to be used by HNB-GW for load re-distribution during MSC offloading as an integer from 0 through 1023.
Without MOCN configuration this value can be entered only once.
For MOCN a unique null-NRI must be assigned to each MOCN operator identified by its PLMN-ID (MCC+MNC).
A 0 (zero) value configured as a null-NRI indicates the keyword is not to be used. There is no default value for this parameter.

Usage

Use this command to identify the MSC to be used by HNB-GW for load redistribution during MSC offloading over an Iu-Flex interface.
There is one unique null-NRI in a PLMN supporting pool functionality.
Without MOCN configuration this command can be entered only once. For MOCN a unique null-NRI must be assigned to each MOCN operator identified by its PLMN-ID (MCC+MNC).

Example

The following command sets the null-NRI as *1001* to be used by HNB-GW for load redistribution during MSC offloading:

```
null-nri 1001
```

offload-msc

Provisions the HNB-GW to enable or disable the exclusion of a particular primary MSC node during an NAS Node Selection Function (NNSF) procedure when it needs to be offloaded while using Iu-Flex functionality on the HNB-GW.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no] offload-msc point-code *msc_point_code*

no

Removes the specified primary MSC point code from the exclusion list for NNSF function on HNB-GW and re-enables the inclusion of the primary MSC to be considered by HNB-GW.

point-code *msc_point_code*

Specifies the SS7 address of the primary MSC in the CS network to be excluded for NNSF function on HNB-GW when it needs to be offloaded via Iu-Flex functionality.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this primary MSC point code can be mapped with one CS core network id.

Usage

Use this command to provision the HNB-GW to enable or disable the exclusion of the primary MSC node when it needs to be offloaded.
When this command is enabled for exclusion of primary MSC node during NNSF function in HNB-GW, the HNB-GW excludes the particular node from being considered.
User can re-enable the inclusion of the primary MSC node to be considered for NNSF functionality by **no offload-msc point-code** command.

Important: Offload check is only for the primary point code and NOT for the backup point code.

This command can be used for planned maintenance as well.

Example

The following command configures the HNB-GW to exclude the primary MSC point code *1.2.3* from being considered in NSSF function for Iu-Flex support:

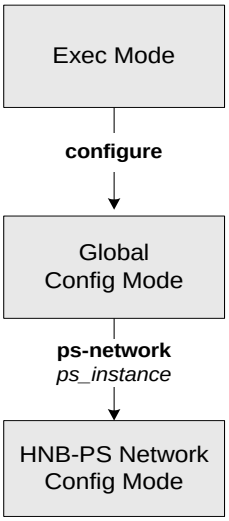
```
offload-msc point-code 1.2.3
```

The following command re-enables the inclusion of MSC point code *1.2.3* from being considered in NSSF function for Iu-Flex support:

```
no offload-msc point-code 1.2.3
```

Chapter 146
HNB-PS Network Configuration Mode Commands

The HNB-PS Network Configuration Mode is used to manage the packet switched (PS) network instance on HNB-GW service to provide HNB access with the PS core network in a 3G UMTS network.



associate gtpu-service

Associates a previously configured GTP-U service to provide a GTP-U tunnel with an SGSN towards the core network side. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate gtpu-service *svc_name* **context** *ctx_name*

no associate gtpu-service

no

Removes the associated GTP-U service from this HNB-GW service configuration.

svc_name

Specifies the name of the preconfigured GTP-U service.

context *ctx_name*

Specifies the name of the context in which the GTP-U service is configured.

Usage

Use this command to configure GTP-U data plan tunnel between HNB-GW service and GSNs in core network. The service defined for GTP-U tunnel must be configured in Context configuration mode.

Important: Another GTP-U service can be used to bind the HNB-GW service to GTP-U tunnel with HNB in HNB access network and can be configured in HNB-GW Service Configuration mode. For more information on GTP-U service configuration, refer to *GTP-U Service Configuration Mode Commands* chapter.

Example

The following command associates GTP-U service *gtpu_svc1* configured in context named *Ctx_gtpu1* with specific HNB-PS network instance for GTP-U tunnel towards GSN in core network:

```
associate gtpu-service gtpu_svc1 context Ctx_gtpu1
```

associate-sccp-network

Associates a previously defined Signaling Connection Control Part (SCCP) network identifier with the PS network instance in order to route the messages towards the SGSN via the IuPS interface.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate-sccp-network *sccp_net_id*

no associate-sccp-network

no

Removes the associated SCCP network configuration instance from this HNB-PS network instance configuration.

sccp_net_id

Specifies a predefined SCCP network identifier.

Usage

Use this command to associate a predefined SCCP network id with the IuPS interface in HNB-GW service to connect with PS network elements; i.e. SGSN.

Caution: The SCCP network id must be defined in Global Configuration mode before using it with this command.

Important: A single SCCP network id can not be shared with multiple HNB-PS network instances.

Example

The following command associates SCCP network id *2* with specific HNB-PS network instance:

```
associate-sccp-network 2
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

map core-network-id

Maps/associates the PS core network identifier to a default SGSN in the network using an SGSN point code to allow HNBs to access the UMTS network.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

map core-network-id *cn_id* **point-code** *sgsn_point_code*

no map core-network-id *cn_id*

no

Removes the mapping of a PS core network id with particular SGSN point code.

cn_id

Specifies the core network identifier configured to represent a UMTS PS core network as n integer from 0 through 4095.
Multiple instance of this command can be mapped with different SGSN point codes.

point-code *sgsn_point_code*

Specifies the SS7 address of the default SGSN in the PS network.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this SGSN point code can be mapped with one PS core network identifier.

Usage

Use this command to map a UMTS PS core network identifier with a particular SGSN point code.
This command can be entered multiple times with same SGSN point code to map with one or more PS core network Id, but a particular core network identifier can be mapped to one SGSN only.
This command is instrumental in Iu-Flex functionality, whenever HNB-GW receives RESET/RESET-RES messages from SGSN with Global CN-ID information element, the response from HNB-GW is sent to the node configured for that particular Global CN-ID.
If the RESET/RESET-RES messages do not have Global CN-ID IE, then the response of those messages is directed to the default SGSN which is configured using **sgsn point-code** command in this mode.

Example

The following command configures the PS core network identifier *101* with an SGSN point code *1.2.3*:

```
map core-network-id 101 point-code 1.2.3
```

The following command configures the PS core network identifier *102* with the same SGSN point code *1.2.3*:

```
map core-network-id 102 point-code 1.2.3
```

map idnns range

Configures the mapping of an Intra-Domain NAS Node Selector (IDNNS) IE received from UE in an RUA connect message towards HNB-GW. This is an important configuration for PS network resource sharing over an Iu-Flex interface.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

map idnns range *idnns_start* **to** *idnns_end* **point-code** *sgsn_point_code* [**backup point-code** *bkup_sgsn_point_code*]

no map idnns range *idnns_start* **to** *idnns_end*

no

Removes the entries of mapping of range of IDNNS received from UE with particular SGSN point code.

range *idnns_start* **to** *idnns_end*

Specifies the range of IDNNSs received from UE to map with particular SGSN point codes during the initial PS core network node selection.
idnns_start is an integer from 0 through 1023 that should be less than *idnns_end*.
idnns_end is an integer from 0 through 1023 that should be more than *idnns_start*.
The command can be entered more than once to map multiple IDNNS ranges to the same SGSN. However, overlapping and mapping of the same range to different SGSN point codes is not allowed.

point-code *sgsn_point_code*

Specifies the SS7 address of the SGSN in the PS network.
sgsn_point_code is ann SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

backup point-code *bkup_sgsn_point_code*

Specifies the SS7 address of the SGSN to be used as the backup in the PS network.
bkup_sgsn_point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a NRI received from UE during initial PS network node selection to SGSN point code through NRI range mapping over Iu-Flex interface.
The IDNNS refers to the information element in RUA connect message from UE towards RAN (HNB-GW). In IDNNS IE, if the choice of routing mentioned is other than local P-TMSI, then the value it provides is used against this configuration to map the SGSN point code.
If backup SGSN point-code is specified, then specified SGSN works as backup for the IDNS range configured. This Backup SGSN is selected if the mapped SGSN for a given IDNNS range is going for offloading using **offload-sgsn point-code** command.

The command can be entered more than once to map multiple IDNNS ranges to same SGSN point code, but overlapping and mapping of same range to different SGSN point code is not allowed.

Example

The following command maps the IDNNS range from *101* to *201* with SGSN point code *1.2.3* and point code 7.8.9 as backup SGSN point code:

```
map nri range 101 to 201 point-code 1.2.3 backup point-code 7.8.9
```

The following command removes all IDNNS range matching entries between *301* to *399* from the configuration:

```
no map idnns range 301 to 399
```

map nri range

Configures the mapping of the Network Resource Identifier (NRI) received from UE to an SGSN point code. This is an important configuration for PS network resource sharing over Iu-Flex interface.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

map nri range *nri_start* **to** *nri_end* **point-code** *sgsn_point_code*

no map nri range *nri_start* **to** *nri_end*

no

Removes the entries of mapping of range of NRIs received from UE with a particular SGSN point code.

range *nri_start* **to** *nri_end*

Specifies the range of NRIs received from UE to map with a particular SGSN point code during initial PS core network node selection.
nri_start is an integer from 0 through 1023 that should be less than *nri_end*.
nri_end is an integer from 0 through 1023 that should be more than *nri_start*.
The command can be entered more than once to map multiple NRI ranges to the same SGSN, but overlapping is not allowed.

point-code *sgsn_point_code*

Specifies the SS7 address of the SGSN in the PS network to map with range of NRI values.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a NRI received from UE during initial PS network node selection to SGSN point code through NRI range mapping over Iu-Flex interface.
This configuration is used during initial PS core network node selection when the network resource identifier (NRI) from the UE is available. The NRI range is mapped to SGSN point code. This configuration is used when the core network uses Iu-Flex interface.
The command can be entered more than once to map multiple NRI ranges to same SGSN point code.
It is possible to configure multiple ranges to more than one SGSN however this configuration is required only when the PS core network is configured as Multi-Operator Core Network (MOCN).
When the PS core network is not MOCN and one range is mapped to more than one SGSN then SGSN is selected randomly in a non-predictable manner.

Example

The following command maps the NRI range from *101* to *201* with SGSN point code *1.2.3*:

```
map nri range 101 to 201 point-code 1.2.3
```

The following command maps the NRI range from *301* to *399* with SGSN point code *1.2.3*:

```
map nri range 301 to 399 point-code 1.2.3
```

The following command removes all NRI range matching entries between *301* to *399* from the configuration:

```
no map nri range 301 to 399
```

nri length

Configures the network resource identifier (NRI) length in bits to identify a specific SGSN serving in a pooled area. At least one NRI value must be assigned to an SGSN serving in a pool. The NRI is coded inside of the temporary mobile subscriber identity (TMSI), located within bits 14 to 23 with a variable length between 0 and 10 bits. The operator must set this NRI length to indicates the number of bits that shall be used for the NRI field to set the parameters for Iu-Flex (SGSN pooling) functionality.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

nri length *nri_value*

default nri length

default

Sets the NRI length to default value of 0 and disables the Iu-Flex (SGSN pooling) functionality.

nri length *nri_length*

Default: 0
Specifies the number of bits to be used in the P-TMS (bits 23 to 18) to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length is set to zero length.
length is an integer from 1 to 10. When a non-zero value is configured the PS network is considered to be a pool. Default: 0

Usage

Use this command to enable the Iu-Flex functionality on HNB-GW. This command identifies a unique SGSN serving a pooled area for Iu-Flex functionality and at least one NRI value has to assigned to an SGSN serving in a pool. It performs SGSN pooling/offloading scenario over Iu-Flex interface. The NRI is stored in the bits 14 to 23 of TMSI. The HNB-GW uses a portion of this NRI to set the parameters for Iu-Flex (SGSN pooling) functionality.
If more than one NRI is configured, the HNB-GW service does round-robin between the available NRIs when new subscriber(s) (re)connect.
This command must be used in conjunction with **null nri** command to configured SGSN pooling/offloading over Iu-Flex interface.

Example

The following command sets the HNB-GW to use bit length as *6* to derive the values from the NRI field (stored in the bits 14 to 23 of TMSI) to set the parameters for Iu-Flex (SGSN pooling) functionality:

```
nri length 6
```

null-nri

Configures the null network resource identifier (NRI) for load redistribution in support of Iu-Flex functionality. The NRI value defined with this command must be unique across the pool areas. This null-NRI is used by HNB-GW for load redistribution during SGSN offloading.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

null-nri *null_nri_value*

no null-nri *null_nri_value*

no

Disables/removes the configured null-NRI value used for SGSN offloading procedure.

null_nri_value

Indicates the null-NRI value to be used by HNB-GW for load re-distribution during SGSN offloading as an integer from 0 through 1023.
Without MOCN configuration this value can be entered only once.For MOCN a unique null-NRI must be assigned to each MOCN operator identify by its PLMN-ID (MCC+MNC).
A 0 (zero) value configured as null-NRI indicates the keyword is not to be used. There is no default value for this parameter.

Usage

Use this command to identify the SGSN by HNB-GW to be used for load redistribution during SGSN offloading over Iu-Flex interface.
There is one unique null-NRI in a PLMN supporting pool functionality.
Without MOCN configuration this command can be entered only once. In case of MOCN a unique null-NRI must be assigned to each MOCN operator identify by its PLMN-id (MCC+MNC).

Example

The following command sets the null-NRI as *1001* to be used by HNB-GW for load redistribution during SGSN offloading:

```
null-nri 1001
```

offload-sgsn

Enables or disables the exclusion of a specified primary SGSN node during the NAS Node Selection Function (NNSF) procedure when it needs to be offloaded using Iu-Flex functionality.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no] offload-sgsn point-code *sgsn_point_code*

no

Removes the specified primary SGSN point code from the exclusion list for NNSF function on HNB-GW and re-enables the inclusion of the primary SGSN node to be considered by HNB-GW.

point-code *sgsn_point_code*

Specifies SS7 address of primary SGSN in PS network having specific point code value to be excluded for NNSF function on HNB-GW when it needs to be offloaded in Iu-Flex functionality.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this primary SGSN point code can be mapped with one PS core network id.

Usage

Use this command to provision the HNB-GW to enable or disable the exclusion of the SGSN node when it needs to be offloaded.
When this command is enabled for exclusion of SGSN node during NNSF function in HNB-GW, the HNB-GW excludes the particular node from being considered.
User can re-enable the inclusion of the SGSN node to be considered for NNSF functionality by **no offload-sgsn point-code** command.

Important: The offload check is only for the primary point code and NOT for the backup point code.

This command can be used for planned maintenance as well.

Example

The following command configures the HNB-GW to exclude the primary SGSN point code *1.2.3* from being considered in NSSF function for Iu-Flex support:

```
offload-sgsn point-code 1.2.3
```

The following command re-enables the inclusion of SGSN point code *1.2.3* from being considered in NSSF function for Iu-Flex support:

```
no offload-sgsn point-code 1.2.3
```

sgsn deadtime

Configures a timer on HNB-GW to manage SGSN availability in a PS core network on receiving of a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

sgsn deadtime { immidiate |*dur* }

[no | default] sgsn deaddtime

no

Makes the peer node (SGSN) always available for all HNB-PS network instances.

default

Sets the default action for HNB-GW such that the peer node (SGSN) is marked down as soon as HNB-GW receives a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP in a specific HNB-PS network instance. Default: Enabled

immidiate

Sets the HNB-GW to mark the peer node (SGSN) down immediately and clears all Iu-PS connections towards the SGSN. Default: Disabled

dur

Sets the duration (in seconds) for a timer which starts once HNB-GW receives a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer SGSN. On expiry of this timer the peer SGSN is marked as dead and all Iu-PS connections towards that SGSN are released.
dur is tan integer from 1 through 30.
Only one instance of this command can be configured.

Usage

This command is used to configure a timer on HNB-GW to manage SGSN availability in a PS core network on receiving of PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP.
Timer value sets the duration in seconds for a timer which started once HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer SGSN. On expiry of this timer the peer SGSN is marked as dead and all Iu-PS connections towards that SGSN shall be released.

Important: This command can be entered only once. Reentering this command overwrites the previous parameters.

Example

The following command configures the deadtime timer value for *10* seconds on HNB-GW. Once HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer SGSN the HNB-GW waits for configured period and on expiry of timer it marks the specific SGSN as dead:

```
sgsn deadtime 10
```

sgsn point-code

Configures the default SGSN point-code with the HNB-PS network instance. This command is used when HNB-GW is to be connected to only one SGSN with in a PS network or as the default SGSN for all HNBs connected through specific HNB-PS network instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] sgsn point-code` *`point_code`*

`no`

Removes the configured default SGSN point code from specific HNB-PS network instance.

Caution: Removing the SGSN point code is a disruptive operation and affects all HNB sessions which are connected to particular SGSN through an HNB-PS network instance.

`point_code`

Specifies the SS7 address of the default SGSN in a PS network.
`point_code` is ann SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this command can be configured.

Usage

Use this command to configure a default SGSN to which HNB connects for PS network access through the HNB-GW service.
Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

Important: This command can be entered only once. If entered again the previous value shall be overwritten.

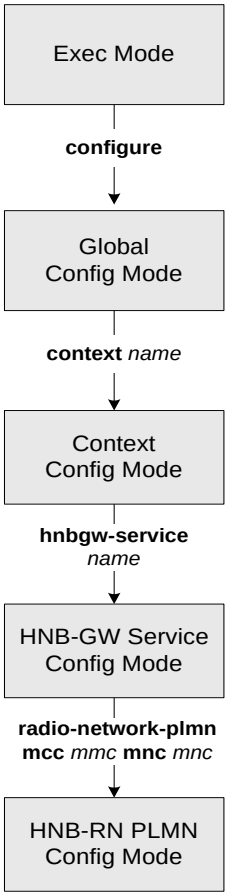
Example

The following command configures a default SGSN with point code *`101.201.101`* for HNBs to access PS network through HNB-GW service in this HNB-PS network instance:

```
sgsn point-code 101.201.101
```

Chapter 147
HNB-RN PLMN Configuration Mode Commands

This HNB Radio Network PLMN configuration mode defines the radio network PLMN parameters related to the HNB-GW connection with a UMTS Femto radio network.



associate cs-network

Associates a preconfigured circuit switched (CS) network within an HNB radio network PLMN with HNB-GW service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] associate cs-network cs_name [ lac lac]
```

no

Disassociates/removes the configured CS network with an HNB radio network PLMN.

cs_name

Specifies the name of a preconfigured CS network in Global Configuration mode to be associated with an HNB radio network PLMN.
To configure CS network, refer to the *HNB-CS Configuration Mode Commands* chapter.

lac *lac_id*

Defines the granularity level of the circuit switch network to a location area code (LAC) level as an integer from 1 and 65535.

Usage

Use this command to associate pre-defined CS networks with a radio network PLMN in an HNB-GW service.
The circuit switched network comprises of one or more MSCs, where CS-domain IU-connections shall be routed. In a typical deployment HNB-GW is connected to only one MSC. However due to Iu-flex and networks-sharing requirements, HNB-GW can be connected to more than one MSCs as well.
Another scenario when HNB-GW can be connected to multiple MSCs is when a set of HNBs should be connected to a particular MSC based on their UTRAN location or geographical location.
This command provides configuration to have one or more MSCs such that these are used in load-shared (IuFlex) or network-shared mode. If location based distribution of HNBs to MSCs is desired, more than one circuit switched network configuration will be required.
This configuration allows association of a circuit switched network with a radio network PLMN and granularity can either be at the PLMN level or at the level of a location area (LAC) in that PLMN.
To configure CS network, refer to the *HNB-CS Configuration Mode Commands* chapter.

Example

The following command associates a CS network *umts1* with radio network PLMN with a granularity of LAC *234*:

```
associate cs-network umts1 lac 234
```

associate ps-network

Associates a preconfigured packet switched (PS) network within an HNB radio network PLMN with HNB-GW service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no] associate ps-network *ps_name* **[lac** *lac* **[rac** *rac* **]]**

no

Disassociates/removes the configured PS network with an HNB radio network PLMN configured in HNB-GW service mode.

ps_name

Specifies the name of a preconfigured PS network to be associated with an HNB radio network PLMN configured in HNB-GW service mode.
To configure the PS network, refer to the *HNB PS Configuration Mode Commands* chapter.

lac *lac_id*

Specifies the granularity level of the packet switched network to a location area code (LAC) level as an integer from 1 and 65535.

rac *rac_id*

Specifies the granularity level of the packet switched network to a radio area code (RAC) level expressed as an integer from 1 and 65535.

Usage

Use this command to associate pre-defined PS networks with HNB radio network PLMN in an HNB-GW service.
The packet switched network comprises of one or more SGSNs where PS-domain IU-connections shall be routed. In a typical deployment HNB-GW is connected to only one SGSN. However with IuFlex and network-sharing functionality, HNB-GW can be connected to more than one SGSNs as well.
Another scenario when HNB-GW can be connected to multiple SGSNs is when a set of HNBs should be connected to a particular SGSN based on their UTRAN location or geographical location.
This command provides configuration to have one or more to have one or more SGSNs such that these are used in load-shared (iu-flex) or network-shared mode. If location based distribution of HNBs to SGSNs is desired then more than one packet switched network configuration will be required.
This command allows association of a packet switched network with a radio network PLMN and granularity could either be at the PLMN level or at the level of a location area code (LAC) in that PLMN or at the level of a routing area code (RAC) in that LAC.
To configure PS network, refer *HNB-PS Configuration Mode Commands* chapter.

Example

The following command associates a PS network *umts_ps1* with radio network PLMN with a granularity of LAC *234* and RAC as 123:

```
associate ps-network umts_ps1 lac 234 rac 123
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

rnc-id

Configures the Radio Network Concentrator (RNC) identifier in a Radio Network PLMN associated with HNB-GW service. The RNC identifier is provided to the HNB during HNB-REGISTRATION.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no] rnc-id *rnc_id* **[lac** *lac_id* **[rac** *rac_id* **| cell-id** *cell_id* **]]**

no

Deletes the LAC and RAC information from the system configuration.

rnc-id

Specifies the RNC identifier as an integer from 1 through 65535.

lac *lac_id*

Specifies the granularity for the location of HNB to a location area code (LAC) and configures the RNC ID for all HNBs operating in particular location-area.
lac_id is an integer from 1 through 65535.

rac *rac_id*

Specifies the granularity level for the location of HNB as a routing area code (RAC) and configures the NC ID for all HNBs operating in particular routing area.
rac_id is an integer from 1 through 65535.

cell-id *cell_id*

Specifies the granularity for the location of HNB to a UTRAN cell level and configures RNC ID for all HNBs operating in particular UTRAN cell area.
cell_id is an integer from 1 through 65535.

Usage

Use this command to configure RNC id for Radio Network PLMN which will be sent to HNBs from HNB-GW during HNB-REGISTRATION procedure. Depending upon the requirement the RNC Identifier can be provided at the desired granularity.
When HNB-REGISTRATION request is received the RNC Id is looked up by matching the parameters received in the request. The most specific entry that matches the request shall have the highest priority, for example in the following configuration:

```
rnc-id 257 lac 1 cell-id 3

rnc-id 258 lac 1 rac 2
```

```
rnc-id 259 lac 1

rnc-id 260
```

- If the request is received with LAC=1, RAC=2, and Cell-Id=3, the selected RNC id will be 257.
- If the request is received with LAC=1, RAC=3, and Cell-Id = 3, the selected RNC id will be 258.
- If the request is received with LAC=1 and any other values of RAC and Cell-id, the selected RNC id will be 259. For all other requests 260 will be returned.

Example

The following command configures the HNB-GW service to return an RNC identifier as *102* when an HNB-REGISTRATION request is received with LAC *1*, and RAC *2*:

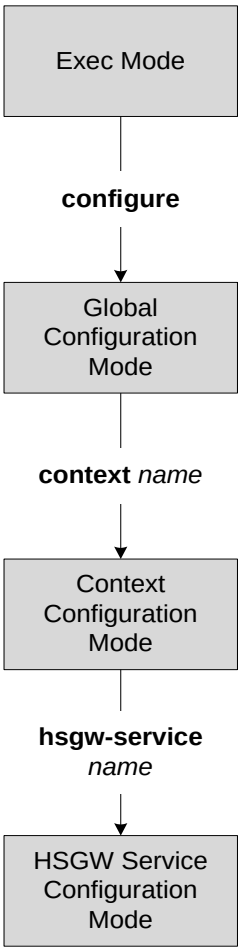
```
rnc-id 102 lac 1 rac 2
```

The following command configures the HNB-GW service to return an RNC identifier as *102* when an HNB-REGISTRATION request is received with LAC *1* and cell-id *4*:

```
rnc-id 102 lac 1 cell-id 5
```

Chapter 148
HSGW Service Configuration Mode Commands

The HSGW Service Configuration Mode is used to create and manage a configuration allowing the HRPD Serving Gateway (HSGW) to communicate, send and receive call data, and session flows to/from a evolved Access Network/evolved Packet Control Function (eAN/ePCF) in an eHRPD network.



a11-signalling-packets

Enables the DSCP marking feature for IP headers carrying outgoing A11-signalling A11 packets (such as RRP, RU, SU).

Product

HSGW

Privilege

Administrator

Syntax

a11-signalling-packets ip-header-dscp *value*

[default | no] a11-signalling-packets ip-header-dscp

default

Restores the specified parameter to its default setting of 0x0.

no

Disables the specified functionality.

ip-header-dscp *value*

Configures the QoS Differentiated Services Code Point (DSCP) marking for IP header encapsulation. *value*: Represents the DSCP setting as the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F. Default is 0x0.

Usage

Use this command to enable or disable the DSCP marking feature for IP headers carrying outgoing A11-signalling A11 packets. DSCP marking is disabled by default.

Example

The following command configures the HSGW service to support DSCP marking for IP headers on A11 packets in outgoing A11-signalling traffic:

```
a11-signalling-packets ip-header-dscp 0x21
```

associate

Associates accounting policies and QCI-QoS mapping parameters with this HSGW service.

Product

HSGW

Privilege

Administrator

Syntax

associate { accounting-policy *name* **| qci-qos-mapping** *name* **}**

no associate { accounting-policy [*name* **] | qci-qos-mapping }**

no

Removes the specified associated policy or mapping from the service.

accounting-policy *name*

Specifies an existing accounting policy to associate with the HSGW service as an alphanumeric string of 1 through 63 characters.

qci-qos-mapping *name*

Specifies an existing QCI-QoS mapping configuration as an alphanumeric string of 1 through 63 characters. QCI-QoS mapping is configured through the **qci-qos-mapping** command in the Global Configuration Mode.

Usage

Use this command to associate an accounting policy with the HSGW service.

Example

The following command associates an accounting policy named *acct2* to the HSGW service:

```
associate accounting-policy acct2
```

bind address

Binds the service to a logical IP interface serving as the A10 interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Product

HSGW

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *num* **]**

no bind address

no

Removes the interface binding from this service.

address *ip_address*

Specifies the IP address of the A10/A11 interface in IPv4 dotted-decimal notation.

max-subscribers *num*

Specifies the maximum number of subscribers that can access this service on this interface as an integer from 0 through 2500000. Default: 2500000

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

Usage

Associate the HSGW service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an A10/A11 interface that provides the session connectivity to/from an eAN/PCF. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of A10/A11 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *112.334.556.778* to the HSGW service and specifies that a maximum of *200,000* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 112.334.556.778 max-subscribers 200000
```

context-retention-timer

Configures the maximum number of consecutive seconds that a UE session context (which includes the LCP, authentication and A10 session context for a given UE) is maintained by the HSGW before it is torn down.

Product

HSGW

Privilege

Administrator

Syntax

context-retention-timer timeout [*sec* **]**

[default | no] context-retention-timer timeout

default

Disables the timer.

no

Disables the timer.

timeout [*sec* **]**

Specifies the amount of time (in seconds) that the session context is maintained before it is disassembled as an integer from 1 through 3600. Default: 60

Usage

Use this command to configure a timer to retain session contexts for a specified amount of time before disassembling it.

Example

The following command allows the HSGW to maintain session contexts for *120* seconds before tearing them down:

```
context-retention-timer timeout 120
```

data-available-indicator

Enables sending the Data Available Indicator extension in A10/A11 Registration Reply messages.

Product

HSGW

Privilege

Administrator

Syntax

```
data-available-indicator
```

Usage

Use this command to enable the sending of the Data Available Indicator extension in A10/A11 Registration Reply messages.

data-over-signaling

Enables the data-over-signaling marking feature for A10 packets.

Product

HSGW

Privilege

Administrator

Syntax

```
[ default | no ] data-over-signaling
```

default

Enables the data-over signaling feature for A10 packets.

no

Disables the data-over signaling feature for A10 packets.

Usage

Use this command to enable or disable the data-over signaling feature for A10 packets.

dns-pgw

Identifies the location of the DNS client to the HSGW service. The DNS client is used to identify an FQDN for the peer P-GW. This command defaults to the same context as the HSGW service.

Product

HSGW

Privilege

Administrator

Syntax

dns-pgw context *name*

[default | no] dns-pgw context

default

Returns the command to its default setting of the current context.

no

Removes the configured DNS client context name from this service.

context *name*

Specifies an existing context in which the DNS client is configured as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to identify to the HSGW service the context where the DNS client is configured.

Example

The following command identifies the context where the DNS client is configured as *isp3*:

```
dns-pgw context isp3
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

fqdn

Configures the Fully Qualified Domain Name (FQDN) for this HSGW service.

Product

HSGW

Privilege

Administrator

Syntax

fqdn *domain_name*

[default | no] fqdn

default

Returns the command to the default setting of "null".

no

Removes the configured FQDN name from this service.

domain_name

Specifies an FQDN for the HSGW service as an alphanumeric string of 1 through 256 characters.

Important: In order to properly interact with other nodes in the network, the FQDN should be 96 alpha and/or numeric characters or less.

Usage

Use this command to configure an FQDN for this HSGW service. The FQDN is used when matching a P-GW with an HSGW.

Topology Matching

You may specify which P-GW you wish an HSGW interface to connect with by enabling topology matching within the FQDNs for both the HSGW service and P-GW service. Topology matching selects geographically closer nodes and reduces backhaul traffic for a specified interface.

The following optional keywords enable or disable topology matching when added to the beginning of an FQDN:

- **topon**.<*interface_name*>.

  Beginning an FQDN with **topon** initiates topology matching with available P-GWs in the network. Once this feature is enabled, the rest of the FQDN is processed from right to left until a matching regional designator is found on a corresponding P-GW FQDN.

- **topoff**.<*interface_name*>.

  By default, topology matching is disabled. If you enable topology matching for any interfaces within a node, however, all interfaces not using this feature should be designated with **topoff**.

Example

The following command configures this HSGW service with an FQDN of *abc123.com*:

```
fqdn abc123.com
```

The following command configures this HSGW service with an FQDN that enables topology matching:

```
fqdn topon.<interface_name>.hsgw01.bos.ma.node.epc.mnc<value>.
mcc<value>.3gppnetwork.org
```

Important: The associated P-GW service must have a corresponding FQDN similar to the following:

```
topon.<interface_name>.pgw01.bos.ma.node.epc.mnc<value>.mcc<value>.3gppne
twork.org
```

fragment

Enables or disables Point-to-Point Protocol (PPP) payload fragmentation.

Product

HSGW

Privilege

Administrator

Syntax

```
[ default | no ] fragment ppp-data
```

default

Returns the command to its default setting of enabled.

no

Disables PPP payload fragmentation.

Usage

Use this command to enable or disable PPP payload fragmentation.

gre

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the HSGW service.

Product

HSGW

Privilege

Administrator

Syntax

gre { checksum | checksum-verify | flow control [action { disconnect-session | resume-session }] [timeout *msecs* **] + | ip-header-dscp** *value* **{ all-control-packets | setup-packets-only } | reorder-timeout** *msecs* **| segmentation | sequence-mode { none | reorder } | sequence-numbers | threegppp2-ext-headers qos-marking }**

default gre { checksum | checksum-verify | flow-control | ip-header-dscp | reorder-timeout | sequence-mode | sequence-numbers | threegppp2-ext-headers qos-marking }

no gre { checksum | checksum-verify | flow-control | ip-header-dscp | segmentation | sequence-numbers | threegppp2-ext-headers qos-marking }

default

Restores the specified parameter to its default setting.

no

Disables the specified functionality.

checksum

Enables the introduction of the checksum field in outgoing GRE packets. Default: disabled

checksum-verify

Enables verification of the GRE checksum (if present) in incoming GRE packets. Default: disabled

flow-control [action { disconnect-session | resume-session }] [timeout *msecs* **] +**

Default: no GRE flow-control
Enables 3GPP2 GRE flow control which causes the HSGW to send flow control enabled Normal Vendor Specific Extensions (NVSE) in A11 RRPs.

action { disconnect-session | resume-session }:
Default: disconnect-session
Specifies the action to be taken when timeout is reached:

- **disconnect-session**: Ends the session and releases the call.
- **resume-session**: Switches flow control to XON and resumes delivery of packets to the RAN.

timeout *msecs*
Specifies the amount of time (in milliseconds) to wait for an XON indicator from the RAN (after receiving an XOFF). Also sets the action to be taken if the timeout limit is reached.

msecs is an integer from 1 through 1000000. Default: 1000

ip-header-dscp *value* **{ all-control-packets | setup-packets-only }**

Default: Disabled
Configures QoS Differentiated Services Code Point (DSCP) marking for GRE packets.

- *value*: Represents the DSCP setting as the first six most-significant bits of the ToS field. It can be configured to any hexadecimal value from 0x0 through 0x3F.
- **all-control-packets**: Dictates that the DSCP marking is to be provided in all GRE control packets.
- **setup-packets-only**: Dictates that the DSCP marking is to be provided only in GRE setup packets.

reorder-timeout *msecs*

Configures the maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets as an integer from 0 through 5000. Default: 100

segmentation

Enables GRE Segmentation for the HSGW service. Default: disabled

sequence-mode { none | reorder }

Default: none
Configures handling of incoming out-of-sequence GRE packets.
none: Specifies that sequence numbers in packets are ignored and all arriving packets are processed in the order they arrive.
reorder: Specifies that out of sequence packets are stored in a sequencing queue until one of the conditions is met:

- The reorder timeout occurs: All queued packets are sent for processing and the accepted sequence number is updated to the highest number in the queue.
- The queue is full (five packets): All packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number in the queue.
- An arriving packet has a sequence number such that the difference between this and the packet at the head of the queue is greater than five. All the packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number that arrived.
- A packet arrives that fills a gap in the sequenced numbers stored in the queue and creates a subset of packets whose sequence numbers are continuous with the current accepted sequence number. This subset of packets in the queue is sent for processing. The reorder timer continues to run and the accepted sequence number is updated to the highest number in the subset delivered.

sequence-numbers

Enables insertion of GRE sequence numbers in data that is about to be transmitted over the A10 interface. Data coming into the system containing sequence numbers but that is out of sequence is not re-sequenced.

threegppp2-ext-headers qos-marking

When threegppp2-ext-headers qos-marking is enabled and the PCF negotiates capability in the A11 RRQ, the HSGW will include the QoS optional data attribute in the GRE 3gpp2 extension header.
The **no** keyword, enables qos-marking in the GRE header based on the tos value in the header.

Usage

Use this command to set GRE parameters for the A10 protocol within the HSGW service.

Example

The following command configures the HSGW service to support the inclusion of GRE sequence numbers in outgoing traffic:

```
gre sequence-numbers
```

ip

Enables the use of Robust Header Compression (RoHC) and enters the HSGW Service ROHC Configuration Mode where RoHC parameters are configured for the service.

Configures the local User Datagram Protocol (UDP) port for the A10/A11 interface IP socket.

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network. Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Product

HSGW

Privilege

Administrator

Syntax

ip { header-compression rohc | local-port *number* **| source-violation { clear-on-valid-packet | drop-limit** *num* **| period** *secs* **| reneg-limit** *num* **} }**

default ip { header-compression rohc | local-port | source-violation { drop-limit | period | reneg-limit } }

no ip { header-compression rohc | source-violation clear-on-valid-packet }

default

Resets the keyword to its default value.

no

header-compression rohc: Removes the RoHC configuration from this service.
ip source-violation clear-on-valid-packet: Disables the ability of the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

header-compression rohc

Specifies that Robust Header Compression will be applied to sessions using this service and enters the HSGW Service RoHC Configuration Mode where RoHC parameters are configured.

local-port *number*

Specifies the UDP port number as an integer from 1 through 65535. Default: 699

source-violation { clear-on-valid-packet | drop-limit *num* **| period** *secs* **| reneg-limit** *num* **}**

clear-on-valid-packet
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet. Default: disabled
drop-limit *num*
Specifies the number of allowed source violations within a detection period before forcing a call disconnect as an integer from 1 through 1000000. If *num* is not specified, the value is set to the default. Default: 10
period *secs*

Specifies the length of time (in seconds) for a source violation detection period to last; drop-limit and reneg-limit counters are decremented each time this value is reached.
The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If *secs* is not specified, the value is set to the default.
secs is an integer from 1 through1000000. Default: 120

reneg-limit *num*

Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If *num* is not specified, the value is set to the default.
num is an integer from 1 through 1000000. Default: 5

Usage

Header Compression RoHC: Use this command to specify that sessions using this service will have Robust Header Compression applied and configure parameters supporting RoHC.
Entering this command results in the following prompt:

```
[context_name]hostname(config-ip-header-compression-rohc)#
```

HSGW Service RoHC Configuration Mode commands are defined in the HSGW Service RoHC Configuration Mode Commands chapter.
Local Port: Specify the UDP port that should be used for communications between the Packet Control Function (PCF) and the HSGW.

Important: The UDP port setting on the PCF must match the local-port setting for the HSGW service on the system in order for the two devices to communicate.

Source Violation: This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two HSGWs a number of times during a handoff scenario.
This function operates in the following manner:
When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.
For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.
If the drop-limit is set to 10, the above process of receiving 5 source violations and renegotiating PPP occurs only once. After the second 5 source violations, the call is dropped. The period timer continues to count throughout this process.
If the configured source-violation period is exceeded at any time before the call is dropped, the reneg-limit counter is checked. If the reneg-limit counter is greater than zero (0), the reneg-limit is decremented by 1. If the reneg-limit counter equals zero, the drop-limit is decremented by half.

Example

The following command specifies a UDP port of 3950 for the HSGW service to use to communicate with the PCF on the A10/A11 interface:

```
ip local-port 3950
```

The following command sets the drop limit to *15* and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```

lifetime

Specifies how long an A10 connection can exist before its registration is considered expired.

Product

HSGW

Privilege

Administrator

Syntax

lifetime *time*

[default | no] lifetime

default

Resets the lifetime value to the default setting of 1800 seconds.

no

Specifies that an A10 connection can exist for an infinite amount of time.

time

Specifies the time (in seconds) that an A10 connection can exist before its registration is considered expired as an integer from 1 through 65534. Default: 1800

Usage

Use this command to set a limit to the amount of time that a subscriber session can remain up whether or not the session is active or dormant. If the lifetime timer expires before the subscriber terminates the session, the connection is terminated automatically.

Example

The following command specifies a time of *3600* seconds (1 hour) for subscriber sessions on this HSGW service:

```
lifetime 3600
```

max-retransmissions

Configures the maximum number of times the HSGW service will attempt to communicate with an eAN/PCF before it marks it as unreachable.

Product

HSGW

Privilege

Administrator

Syntax

max-retransmissions *count*

default max-retransmissions

default

Resets the maximum number of allowed retransmissions to the default value of 5.

count

Specifies the maximum number of times the HSGW service will attempt to communicate with an eAN/PCF before it marks it as unreachable.
count is an integer from 1 through 1000000. Default: 5

Usage

Use this command to limit the number of retransmissions to an eAN/PCF before marking it as unreachable. If the value configured is reached, the call is dropped.

Example

The following command configures the maximum number of retransmissions for the HSGW service to *3*:

```
max-retransmissions 3
```

mobile-access-gateway

Identifies the mobile access gateway (MAG) context through which MIPv6 calls are to be routed.

Product

HSGW

Privilege

Administrator

Syntax

```
mobile-access-gateway context context_name [ mag-service service_name ]

no mobile-access-gateway context
```

no

Removes the configured MAG context route from this service.

context *context_name* **[mag-service** *service_name* **]**

Specifies the name of the context and, optionally, the service through which MIPv6 sessions are to be routed. *context_name* is an existing context expressed as an alphanumeric string of 1 through 79 characters. *service_name* is an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify where MIPv6 sessions are routed through this service.

Example

The following command identifies the MAG context *MAG1* as the context through which MIPv6 sessions are to be routed and further narrows the route by specifying the service name (*mag_serv3*):

```
mobile-access-gateway context MAG1 mag-service mag_serv3
```

network-initiated-qos

Enables the use of network initiated QoS functionality.

Product

HSGW

Privilege

Administrator

Syntax

```
[ default | no ] network-initiated-qos
```

default

Returns the command to its default setting of enabled.

no

Disables the ability to use network initiated QoS functionality.

Usage

Use this command to enable or disable support for network initiated QoS functionality. Network initiated QoS is enabled by default.
When network initiated QoS functionality is enabled, if the vendor specific network control protocol (VSNCP) protocol configuration options (PCO) arrive from the UE with the BCM set, the HSGW CCR-I includes the Network-Request-Support AVP. If the PCRF behavior returns a BCM of MS+NW when this AVP is received, then flows originating from the network (RSVP Resv) would be triggered upon a PCC-Rule install.

plmn id

Configures Public Land Mobile Network identifiers used to determine if a mobile station is visiting, roaming or belongs to this network.

Product

HSGW

Privilege

Administrator

Syntax

plmn id mcc *number* **mnc** *number*

mcc *number* **mnc** *number*

mcc *number*: Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer fromn 100 through 999.
mnc *number*: Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

Usage

The PLMN identifier is used to aid the HSGW service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple P-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each P-GW Service. The configured IDs are used in Diameter-EAP-Request messages (as a Visited-Network-Identifier AVP).

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *2*:

```
plmn id mcc 462 mnc 02
```

policy overload

Specifies how an HSGW service should handle overload conditions.

Product

HSGW

Privilege

Administrator

Syntax

policy overload { redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ... address16 [weight** *weight_num* **]] | reject [use reject-code { admin-prohibite | insufficient-resources }] }**

default policy overload

no policy overload [redirect *address* **[** *address2* **] ... [** *address16* **]**

default

Returns the command to it default setting of "reject" with the "admin-prohibited" code.

no

Removes a specified "redirect address" from this service.

redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ...** *address16* **[weight** *weight_num* **]]**

This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the HSGW service rejects new sessions with an A11 Registration Reply Code of 88H (unknown HSGW address) and provides the IP address of an alternate HSGW. This command can be issued multiple times.
address: The IP address of an alternate HSGW expressed in IPv4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified, the entry is automatically assigned a weight of 1 (default). *weight_num* must be an integer value from 1 through 10.

reject [use reject-code { admin-prohibite | insufficient-resources }]

This option will cause any overload traffic to be rejected. The HSGW sends an A11 Registration Reply Code of 82H (insufficient resources).
use-reject-code admin-prohibited: When this keyword is specified and traffic is rejected, the error code admin prohibited is returned instead of the error code "insufficient resources". This is the default behavior.
use-reject-code insufficient-resources: When this keyword is specified and traffic is rejected, the error code "insufficient resources" is returned instead of the error code admin prohibited.

Usage

Policies can be implemented to dictate HSGW service behavior for overload conditions.
The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system.
The system automatically invokes the overload policy when an on-line software upgrade is started.
Use the **no policy overload** command to delete a previously configured policy. If after deleting the policy setting you desire to return the policy parameter to its default setting, use the **default policy** command.
The chassis is shipped from the factory with the policy options overload disabled

Example

The following command configures the HSGW service to redirect overload traffic to two IPv4 addresses, one priority weighted *1* and the other priority weighted *5*:

```
policy overload redirect 10.2.3.4 weight 1 10.2.3.5 weight 5
```

profile-id-qci-mapping

Associates a configured mapping table for RP QoS Profile ID to LTE QoS Class Index (QCI) mapping with this service.

Product

HSGW

Privilege

Administrator

Syntax

profile-id-qci-mapping *name*

no profile-id-qci-mapping [*name* **]**

no

Removes all profile maps or a specific profile map from this service.

name

Specifies the name of an existing Profile ID - QCI Mapping table to be associated with this service as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associate the HSGW service with a configured Profile ID - QCI Mapping table. The table is configured in the Global Configuration Mode using the **profile-id-qci-mapping-table** command.

Example

The following command associates a Profile ID - QCI Mapping table named *table3* with this service:

```
profile-id-qci-mapping table3
```

registration-deny

Configures parameters related to registration rejection.

Product

HSGW

Privilege

Administrator

Syntax

```
registration-deny { handoff connection-setup-record-absent | newcall connection-setup-record-absent } [ use-deny-code { poorly-formed-request | reason-unspecified } ]

[ default | no ] registration-deny { handoff connection-setup-record-absent | newcall connection-setup-record-absent }
```

default | no

Returns the command to its default settings.

handoff connection-setup-record-absent

When enabled, the HSGW denies or discards handoff R-P sessions that do not have an Airlink Connection Setup record in the A11 Registration Request.
Default is disabled. Default HSGW behavior is to accept such requests.

newcall connection-setup-record-absent

When enabled, the HSGW denies or discards new R-P sessions that do not have the Airlink Connection Setup record in the A11 Registration Request.
Default is disabled. Default HSGW behavior is to accept such requests.

use-deny-code { poorly-formed-request | reason-unspecified }

Sets the specified Registration Deny Code when denying a new call or handoff because of a missing connection setup record.

Usage

Use this command to configure parameters relating to the rejection of registration requests.

Example

The following command denies registration for registration requests missing the connection setup record and replies with a use deny code of “poorly formed request”:

```
registration-deny handoff connection-setup-record-absent use-deny-code poorly-formed-request
```

retransmission-timeout

Configures the maximum allowable time for the HSGW service to wait for a response from the eAN/PCF before it attempts to communicate with the eAN/PCF again (if the system is configured to retry the PCF), or marks the eAN/PCF as unreachable.

Product

HSGW

Privilege

Administrator

Syntax

retransmission-timeout *time*

[default | no] retransmission-timeout

default

Resets the timeout setting to the default value of 3.

no

Deletes a previously configured timeout value.

time

Specifies the maximum allowable time (in seconds) for the HSGW service to wait for a response from the eAN/PCF before it: a) attempts to communicate with the eAN/PCF again (if the system is configured to retry the PCF), or b) marks the eAN/PCF as unreachable.
time is an integer from 1 through 1000000. Default: 3

Usage

Use the retransmission timeout command in conjunction with the **max-retransmissions** command in order to configure the HSGW service's behavior when it does not receive a response from a particular PCF.

Example

The following command configures a retransmission timeout value of *5* seconds:

```
retransmission-timeout 5
```

rsvp

Configures resource reservation protocol (RSVP) parameters for this HSGW service in support of the network initiated QoS feature.

Product

HSGW

Privilege

Administrator

Syntax

```
rsvp { max-retransmissions count | retransmission-timeout seconds }

[ default | no ] rsvp { max-retransmissions | retransmission-timeout }
```

default

Resets the maximum number of allowed retransmissions to the default value of 5 or the timeout setting to the default value of 3.

no

Disables the feature.

max-retransmissions *count*

Specifies the maximum retransmission count of RP control packets as an integer from 1 through 1000000. Default: 5

retransmission-timeout *seconds*

Specifies the maximum amount of time (in seconds) to allow for retransmission of RP control packets as an integer from 1 through 1000000. Default: 3

Usage

Use this command to set RSVP parameters for this HSGW service in support of the network initiated QoS feature.

Example

The following command configures the maximum number of retransmissions to *3*:

```
rsvp max-retransmissions 3
```

setup-timeout

Specifies the maximum amount of time allowed for session setup.

Product

HSGW

Privilege

Administrator

Syntax

setup-timeout *seconds*

[default| no] setup-timeout

default

Resets the command to the default value of enabled with a timeout of 60 seconds.

no

Disables the feature.

seconds

Specifies the maximum amount of time (in seconds) to allow for setup of a session in this service as an integer from 1 though 1000000. Default: 60

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

The following command sets the maximum time allowed for setting up a session to 5 minutes (300 seconds):

```
setup-timeout 300
```

spi remote-address

Configures the security parameter index (SPI) between the HSGW service and the evolved Access Network/evolved Packet Control Function (eAN/ePCF). This command also configures the redirection of calls based on the PCF zone.

Product

HSGW

Privilege

Administrator

Syntax

```
spi remote-address { pcf_ip_address | ip_addr_mask_combo } spi-number number { encrypted
secret enc_secret | secret secret } [ description string ] [ hash-algorithm { md5 |
rfc2002-md5 } ] [ replay-protection { nonce | timestamp } ] [ timestamp-tolerance
tolerance ] [ zone zone_id ]

no spi remote-address pcf_ip_address spi-number number
```

pcf_ip_address **|** *ip_addr_mask_combo*

pcf_ip_address: Specifies the IP address of the ePCF. *pcf_ip_address* is an IP address expressed in IPv4 dotted decimal notation or IPv6 colon separated notation.
ip_addr_mask_combo: Specifies the IP address and mask bits of the PCF. *ip_addr_mask_combo* must be specified using the form "IP Address/Mask Bits" where the IP address must in IPv4 dotted-decimal or IPv6 colon-separated notation, and the mask bits are a numeric value corresponding to the number of bits in the subnet mask.

spi-number *number*

Specifies the SPI which indicates a security context between the PCF and the HSGW as an integer from 256 through 4294967295.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the HSGW service and the PCF. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key (*enc_secret*) between the PCF and the HSGW service. *enc_secret* must be between 1 and 236 alpha and/or numeric characters and is case sensitive.
secret *secret*: Specifies the shared key (secret) between the PCF and the HSGW services. *secret* must be between 1 and 127 alpha and/or numeric characters and is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

description *string*

This is a description for the SPI expressed as an alphanumeric string of 1 through 31 characters.

hash-algorithm { md5 | rfc2002-md5 }

Specifies the hash-algorithm used between the HSGW service and the PCF. Default: md5

md5: Configures the hash-algorithm to implement MD5.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5.

replay-protection { nonce | timestamp }

Specifies the replay-protection scheme that should be implemented by the HSGW service. Default: timestamp
nonce: Configures replay protection to be implemented using NONCE (Number ONCE).
timestamp: Configures replay protection to be implemented using timestamps.

timestamp-tolerance *tolerance*

Specifies the allowable difference (in seconds) between timestamps as an integer from 0 through 65535. If the difference is exceeded, the session will be rejected. If set to 0, timestamp tolerance checking is disabled at the receiving end. Default: 60

zone *zone_id*

Specifies the different PCF zones to configure in HSGW service. Mapping of a zone-number to a set of HSGWs can be done per HSGW service basis.
zone_id is an integer value from 1 through 32. A maximum of 32 PCF zones can be configured for a HSGW service.

Usage

An SPI is a security mechanism configured and shared by the PCF and the HSGW service. Please refer to *IETF RFC 2002: IP Mobility Support* for additional information.
Multiple SPIs can be configured if the HSGW service is communicating with multiple eAN/ePCFs.

Important: The SPI configuration on the PCF must match the SPI configuration for the HSGW service on the system in order for the two devices to communicate properly.

Example

This command used with the **zone** keyword redirects all calls on the basis of PCF zone to the specific HSGW on the basis of parameters configured using the **policy pcf-zone-match** command.

The following command configures the HSGW service to use an SPI of *256* when communicating with a PCF with the IP address *192.168.0.2*. The key that would be shared between the PCF and the HSGW service is *q397F65*.

```
spi remote-address 192.168.0.2 spi-number 256 secret q397F65
```

The following command creates the configured SPI of *400* for an PCF with an IP address of *172.100.3.200* and zone id as *11*:

```
spi remote-address 172.100.3.200 spi-number 400 zone 11
```

unauthorized-flows

Configures the service to wait a specified number of seconds before triggering a QoS update to downgrade an unauthorized flow.

Product

HSGW

Privilege

Administrator

Syntax

unauthorized-flows qos-update wait-timeout *seconds*

[default | no] unauthorized-flows qos-update wait-timeout

default

Returns the command to its default setting.

no

Removes the configure wait-timeout setting for this service.

qos-update wait-timeout *seconds*

Specifies the number of seconds to wait before triggering the QoS update to downgrade the unauthorized flow as an integer from 1 through 65534.

Usage

Use this command to specific a wait timeout trigger for flows that are unauthorized by policy rules received via the Gxa interface from the PCRF. When the wit timer expires, the HSGW triggers a QoS update to downgrade the unauthorized flow.

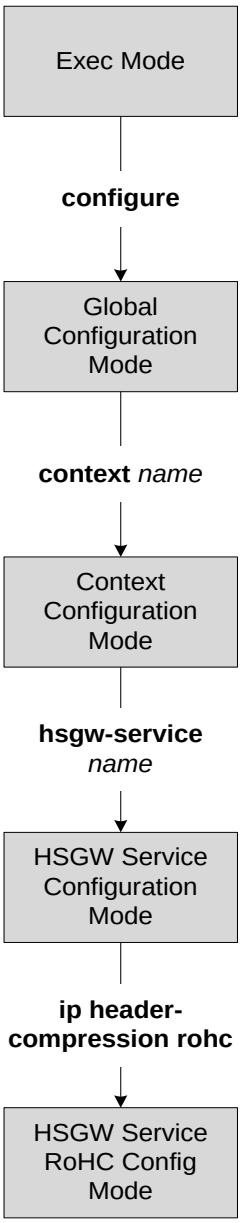
Example

The following command configures the HSGW service to apply the wait time of *30* seconds after receiving an flow unauthorized by the PCRF:

```
unauthorized-flow qos-update wait-timeout 30
```

Chapter 149
HSGW Service RoHC Configuration Mode Commands

The HSGW Service RoHC Configuration Mode is used to configure Robust Header Compression (RoHC) parameters for the service.



cid-mode

This mode allows you to configure options that apply during RoHC compression for the service.

Product

HSGW

Privilege

Administrator

Syntax

cid-mode { large | small } max-cid *integer*

default cid-mode

default

Reset all options in the RoHC Profile Compression Configuration mode to their default values.

large

Use large packets with optional information for RoHC

small

This is the default packet size.
Use small RoHC packets.

max-cid *integer*

Specifies the highest context ID number to be used by the compressor as an integer from 0 through 15 when small packet size is selected, and 0 through 31 when large packet size is selected. Default: 15

Usage

Use this command to set the RoHC packet size and define the maximum

Example

The following command sets large RoHC packet size and sets the maximum CID to *100*:

```
cid-mode large max-cid 100
```

The following command sets the cid-mode to the default settings of small packets and max-cid 0:

```
default cid-mode
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

mrru

Specifies the size of the largest reconstructed reception unit that the decompressor is expected to reassemble from segments. The size includes the CRC. If maximum received reconstructed unit (MRRU) is negotiated to be 0, no segment headers are allowed on the channel.

Product

HSGW

Privilege

Administrator

Syntax

mrru *num_octets*

default mrru

default

Resets the value of this command to its default setting of 0.

num_octets

Specifies the number of allowed octets for the MRRU as an integer from 0 through 65535. Default: 0

Usage

Use this command to set the size, in octets, of the largest reconstructed reception unit that the decompressor is expected to reassemble from segments.

Example

The following command sets the largest reconstructed reception unit to 1024 octets:

```
mrru 1024
```

The following command resets the MRRU size to its default of 0 octets:

```
default mrru
```

profile

Specifies the header compression profiles to use. A header compression profile is a specification of how to compress the headers of a specific kind of packet stream over a specific kind of link. At least one profile must be specified.

Product

HSGW

Privilege

Administrator

Syntax

```
profile { [ esp-ip ] [ rtp-udp ] [ udp-ip ] [ uncompressed-ip ] }

default profile
```

default

Default: esp-ip rtp-udp udp-ip uncompressed-ip
Returns the RoHC profile configuration to its default setting.

esp-ip

Enables RoHC Profile 0x0003 which is for ESP/IP compression, compression of the header chain up to and including the first ESP header, but not subsequent subheaders.

rtp-udp

Enables RoHC Profile 0x0001 which is for RTP/UDP/IP compression

udp-ip

Enables RoHC Profile 0x0002 which is for UDP/IP compression; compression of the first 12 octets of the UDP payload is not attempted.

uncompressed-ip

Enables RoHC Profile 0x0000 which is for sending uncompressed IP packets.

Usage

Use this command to specify the RoHC header compression profiles.

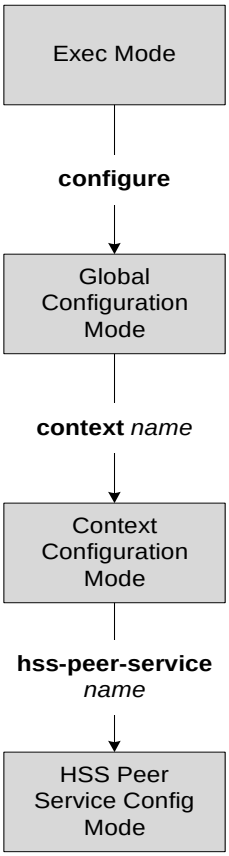
Example

The following command sets the profiles to use as *esp-ip* and *rtp-udp*:

```
profile esp-ip rtp-udp
```

Chapter 150
HSS Peer Service Configuration Mode Commands

The HSS Peer Service Configuration Mode is used to create and manage the Home Subscriber Server (HSS) Peer Service.



auth-request

Configures the number of authentication vectors the MME requests in an Authentication-Information-Request (AIR) message to the HSS for each UE requiring authentication.

Product

MME

Privilege

Administrator

Syntax

auth-request num-auth-vectors *num*

default auth-request num-auth-vectors

num-auth-vectors *num*

Specifies the number of vectors the MME is requesting from the HSS as an integer from 1 through 3. Default = 1

Usage

Use this command to configure the number of authentication vectors the MME requests in an Authentication-Information-Request (AIR) message to the HSS for each UE requiring authentication.
Receiving multiple vectors from the HSS for a given UE helps reduce the number of messages across the diameter connection plus provides the MME with additional vectors for the UE in the event that the connection or the HSS id disabled.
To view the current number of requested vectors, execute the **show hss-peer-service service name** <*name*> command in the Exec mode.

Example

The following command sets the number of requested vectors to 2:

```
auth-request num-auth-vectors 2
```

diameter hss-dictionary

Specifies the Diameter Credit Control dictionary for the HSS peer service.

Product

MME

Privilege

Administrator

Syntax

```
diameter hss-dictionary { custom1 | standard | standard-r9 } [ eir-dictionary { custom1 |
standard | standard-r9 } ]

default diameter hss-dictionary
```

default

Sets the dictionary to default **standard-r9** for HSS service.

custom1

Sets the Diameter dictionary to a customer-specific HSS Diameter dictionary. Default: Disabled

standard

Sets the Diameter dictionary to the standard HSS peer dictionary. Default: Disabled

standard-r9

Sets the Diameter dictionary to the standard HSS peer dictionary for release 9. Default: Enabled

eir-dictionary { custom1 | standard }

Specifies that an Equipment Identity Register (EIR) dictionary is to be used in conjunction with the HSS Diameter dictionary.
custom1: Sets the EIR Diameter dictionary to a customer-specific EIR Diameter dictionary.
standard: Sets the EIR Diameter dictionary to the standard HSS peer dictionary.
standard-r9: Sets the EIR Diameter dictionary to the standard HSS peer dictionary for release 9.

Usage

Use this command to select the Diameter dictionary for the HSS peer service.

Example

The following command sets the Diameter dictionary to IETF RFC 4006 specific:

```
diameter hss-dictionary standard
```

diameter hss-endpoint

Associates a preconfigured Diameter origin endpoint with this HSS peer service.

Product

MME

Privilege

Administrator

Syntax

diameter hss-endpoint *endpoint_name* **[eir-endpoint** *eir_endpoint_name* **]**

no diameter hss-endpoint

no

Removes previously associated Diameter origin endpoint from this HSS peer service.

endpoint_name

Identifies a preconfigured Diameter endpoint specific to the HSS interface. The endpoint must be present in all Diameter messages and is the endpoint that originates the diameter message.
endpoint_name is a preconfigured Diameter endpoint name expressed as an alphanumeric string of 1 through 63 characters.

eir-endpoint *eir_endpoint_name*

Identifies a preconfigured Diameter endpoint specific to the S13 Equipment Identity Register (EIR) interface.
eir_endpoint_name must be an existing Diameter endpoint expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associated a Diameter origin endpoint to create a Diameter-based S6a interface association in this HSS peer service to provide AAA functionality to the EPS bearer context.
Optionally, use this command to associate a Diameter origin endpoint to create a Diameter-based S13 interface association in this HSS peer service to provide IMEI query capability between the MME and an EIR.
Refer to the *Diameter Endpoint Configuration Mode Commands* chapter for more information on Diameter endpoint configuration parameters.

Example

The following command associates the preconfigured Diameter endpoint *hss_1* with this HSS peer service for HSS interface support.

```
diameter hss-endpoint hss_1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

failure-handling

Configures failure handling behavior in the event of a failure with the HSS peer service. It also defines the action on various error codes on the Diameter interface during authentication or session activities.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

failure-handling { authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request } { diameter-result-code *start_error_code* **[to** *end_error_code* **] | request-timeout } action { continue | retry-and-terminate | terminate }**

no failure-handling { authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request } diameter-result-code *start_error_code* **[to** *end_error_code* **]**

default failure-handling { authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request } request-timeout

no

Removes the preconfigured failure handling procedures for calls in an HSS peer service.

default

Sets the default action for failure handling procedure for calls in an HSS peer service.
For default actions on Diameter result/error codes see the *Usage* section below.

authentication-information-request

Configures the MME-HSS service to handle the failures in an Auth-Information-Request message.

check-identity-request

Configures the MME-HSS service to handle the failures in a Check-Identity-Information-Request message.

notify-request

Configures the MME-HSS service to handle the failures in a Notify-Request message.

purge-ue-request

Configures the MME-HSS service to handle the failures in a Purge-UE-Request message.

update-location-request

Configures the HSS peer service to handle the failures in an Update-Location-Request message.

diameter-result-code *start_error_code* **[to** *end_error_code***]**

Configures the HSS peer service to handle the failures for various request message having specific single or range of Diameter result codes in a request message.
start_error_code specifies an individual error code for Diameter protocol as an integer from 3000 through 5999. This will be the starting of code if a range of error codes is specified with the optional keyword **to** *end_error_code*.
to *end_error_code* is used to specify a range of error codes to handle by this command.
end_error_code specifies the end error code for Diameter protocol as an integer from 3000 through 5999.

request-timeout

Configures the HSS peer service to handle the failures for various request messages if response to that message is not received before timeout duration exhausted.

action { continue | retry-and-terminate | terminate }

Specifies the action to be taken on failure of any message as a policy for failure handling.

- **continue**: On receipt of any error, the system allows the HSS peer service to continue with the session procedure without any interruption.
- **retry-and-terminate**: On receipt of any error, the system instructs the HSS peer service to retry the procedure. The system will retry up to the configured number of attempts and terminate the session/procedure if it received a subsequent number of errors after retry attempts.
- **terminate**: The system allows the HSS peer service to terminate the session procedure without any retry attempt on the event of any failure.

Usage

Use this command to configure the failure handling behavior in the event of a communication failure with the HSS peer service.
The following are the default action for Diameter result codes:

- For all protocol error codes 3000 to 3999, the default action is terminate. For all transient error codes 4000, 4001, 4004 to 4180, and 4182 to 4999, the default action is continue.
- For transient error codes 4002, 4003, and 4181, the default action is retry.
- For error code 4001, the default action is terminate.
- For permanent error codes 5000 to 5999, the default action is terminate

Example

The following command will allow HSS peer service to continue if any failure in Auth-Information-Request message occurred with Diameter error code *3050*:

```
failure-handling authentication-information-request diameter-result-code
3050 action continue
```

request timeout

Configures the application request timeout between the HSS peer service and HSS node. The MME waits for this duration before retransmitting the request to corresponding HSS node.

Product

MME

Privilege

Administrator

Syntax

request timeout *dur*

[no | default] request timeout

no

Disables the configured application request timeout value.

default

Sets the application request time out duration to default value of 300 seconds.

dur

Specifies the application request timeout duration (in seconds) as an integer from 1 through 300. The MME will wait for this duration before retrying the request with corresponding HSS. Default: 300

Usage

Use this command to set the waiting period for HSS peer service in seconds after which the request is deemed to have failed or system will resend the request.

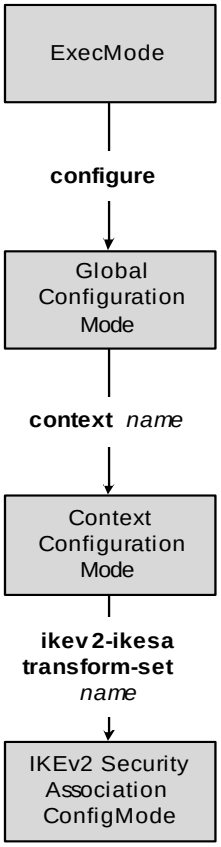
Example

The following example configures the application request timeout duration to 300 seconds:

```
default request timeout
```

Chapter 151
IKEv2 Security Association Configuration Mode Commands

The IKEv2 Security Association Configuration Mode is used to configure a Security Association (SA) at the outset of an IPSec session. A security association is the collection of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. In normal bi-directional traffic, the flows are secured by a pair of security associations.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Sets the default properties for the selected parameter.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

default { encryption | group | hmac | lifetime | prf }

Set the defaults for the following parameters:

- **encryption**: Default algorithm for the IKEv2 IKE SA is AES-CBC-128.
- **group**: Default Diffie-Hellman group is Group 2.
- **hmac**: Default IKEv2 IKE SA hashing algorithm is SHA1-96.
- **lifetime**: Default lifetime for SAs derived from this transform-set is 86400 seconds.
- **prf**: Default PRF for the IKEv2 IKE SA is SHA1.

Usage

Configure default parameters for the IKEv2 IKE SA transform-set.

Example

Use the following configuration to set the default encryption algorithm:

```
default encryption
```

encryption

Configures the appropriate encryption algorithm and encryption key length for the IKEv2 IKE security association. AES-CBC-128 is the default.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
encryption { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc }

default encryption
```

3des-cbc

Data Encryption Standard Cipher Block Chaining encryption applied to the message three times using three different cypher keys (triple DES).

aes-cbc-128

Advanced Encryption Standard Cipher Block Chaining with a key length of 128 bits.

aes-cbc-256

Advanced Encryption Standard Cipher Block Chaining with a key length of 256 bits.

des-cbc

Data Encryption Standard Cipher Block Chaining. Encryption using a 56-bit key size. Relatively insecure.

Usage

IKEv2 requires a confidentiality algorithm to be applied in order to work.
In cipher block cryptography, the plaintext is broken into blocks usually of 64 or 128 bits in length. In cipher block chaining (CBC) each encrypted block is chained into the next block of plaintext to be encrypted. A randomly-generated vector is applied to the first block of plaintext in lieu of an encrypted block. CBC provides confidentiality, but not message integrity.
Because RFC 4307 calls for interoperability between IPSec and IKEv2, the IKEv2 confidentiality algorithms must be the same as those configured for IPSec in order for there to be an acceptable match during the IKE message exchange. Because of RFC4307, in IKEv2, there is no viable NULL option, it is available for testing only.

Example

The following command configures the encryption to be the default aes-cbc-128:

```
default encryption
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

group

Configures the appropriate key exchange cryptographic strength by applying a Diffie-Hellman group. Default is Group 2.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
group { 1 | 2 | 5 | 14 }

default group
```

1

Configures crypto strength at the Group 1 level. Lowest security.

2

Configures crypto strength at the Group 2 (default) level. Medium security.
This is the default setting for this command.

5

Configures crypto strength at the Group 5 level. Higher security.

14

Configures crypto strength at the Group 14 level. Highest security

Usage

Diffie-Hellman groups are used to determine the length of the base prime numbers used during the key exchange process in IKEv2. The cryptographic strength of any key derived depends, in part, on the strength of the Diffie-Hellman group upon which the prime numbers are based.
Group 1 provides 768 bits of keying strength, Group 2 provides 1024 bits, Group 5 provides 1536 bits and Group 14 provides 2048 bits of encryption strength.
Configuring a DH group also enables Perfect Forward Secrecy, which is disabled by default.

Example

This command configures security at the default level (Group 2):

```
default group
```

hmac

Configures the IKEv2 IKE SA integrity algorithm. Default is SHA1-96.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
hmac { md5-96 | sha1-96 | sha2-256-128 | sha2-384-192 | sha2-512-256 }

default hmac
```

md5-96

HMAC-MD5 uses a 128-bit secret key and produces a 128-bit authenticator value.

sha1-96

HMAC-SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value. This is the default setting for this command.

sha2-256-128

HMAC-SHA-256 uses a 256-bit secret key and produces a 128-bit authenticator value.

sha2-384-192

HMAC-SHA-384 uses a 384-bit secret key and produces a 192-bit authenticator value.

sha2-512-256

HMAC-SHA-512 uses a 512-bit secret key and produces a 256-bit authenticator value.

Usage

IKEv2 requires an integrity algorithm be configured in order to work.
A keyed-Hash Message Authentication Code, or HMAC, is a type of message authentication code (MAC) calculated using a cryptographic hash function in combination with a secret key to verify both data integrity and message authenticity. A hash takes a message of any size and transforms it into a message of a fixed size: the authenticator value. This is truncated and transmitted. The authenticator value is reconstituted by the receiver and the first truncated bits are compared for a 100 percent match.
Because RFC 4306 calls for interoperability between IPSec and IKEv2, the IKEv2 integrity algorithms must be the same as those configured for IPSec in order for there to be an acceptable match during the IKE message exchange.

Example

The following command configures the default HMAC value (SHA1-96):

```
default hmac
```

lifetime

Configures the lifetime of a security association (SA) in seconds.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

lifetime *sec*

default lifetime

lifetime *sec*

Sets the value of the timeout parameter in seconds as an integer from 60 through 86400. Default: 86400

Usage

The secret keys that are used for various aspects of a configuration should only be used for a limited amount of time before timing out. This exposes a limited amount of data to the possibility of hacking. If the SA expires, the options are then to either close the SA and open an new one, or renew the existing SA.

Example

The following command sets the lifetime timeout to be the default value (86400):

```
default lifetime
```

prf

Selects one of the HMAC integrity algorithms to act as the IKE Pseudo-Random Function. A PRF produces a string of bits that an attacker cannot distinguish from random bit string without knowledge of the secret key. The default is SHA1.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
prf { md5 | sha1 | sha2-256 | sha2-384 | sha2-512 }

default prf
```

md5

MD5 uses a 128-bit secret key and produces a 128-bit authenticator value.

sha1

SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value.
SHA-1 is considered cryptographically stronger than MD5, but it takes more CPU cycles to compute.
This is the default setting for this command.

sha2-256

PRF-HMAC-SHA-256 uses a 256-bit secret key.

sha2-384

PRF-HMAC-SHA-384 uses a 384-bit secret key.

sha2-512

PRF-HMAC-SHA-512 uses a 512-bit secret key.

Usage

This command generates keying material for all the cryptographic algorithms used in both the IKE_SA and the CHILD_SAs.

Example

This configuration sets the PRF to be the default value (sha1):

```
default prf
```

Chapter 152
IMEI Profile Configuration Mode

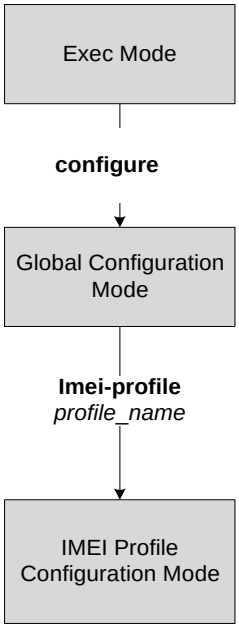
The IMEI profile configuration mode defines a set of parameters controlling the SGSN behavior when a Request is received from a device in the specified IMEI (International Mobile Equipment Identity) range. An IMEI profile is a key element in the Operator Policy feature and an IMEI profile is not used or valid unless it is associated with an IMEI range and this association is specified in an operator policy (see the *Operator Policy Configuration Mode Commands* chapter elsewhere in the *Command Line Interface Reference*).

Essentially, an IMEI profile is a template which groups a set of device-specific commands that may be applicable to one or more IMEIs. The same IMEI profile can be associated with multiple IMEI ranges and multiple operator policies.

An SGSN supports a total of 1000 IMEI profile configurations.

When this mode is accessed, the command prompt should resemble:

```
[local]asr5000(imei-profile-<profile_name>)#
```



associate

Associate an APN remap table with this IMEI profile.

Note that an APN remap table can be associated with an IMEI profile before the table has actually been created/configured.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

associate apn-remap-table *table_name*

no associate apn-remap-table

no

Disables the configured remap table association.

table_name

Define the name of an APN remap table that is to be associated with this IMEI profile for call routing based in IMEI.

Usage

Use this command to associate an APN remap table with this IMEI profile. With such an association, it is possible to override an APN call-routing based on an IMEI.
For example, with the APN exceptions defined in an APN remap table (refer to the *APN Remap Table Configuration Mode* chapter), a blank APN or an incorrect APN could be overriden. So during PDP Activation for in incoming call, the call could be rerouted based on an IMEI in the range defined for the IMEI profile.

Example

Associate the APN remap table ‘remapHO’ (remaps all calls with blank APNS to the head-office) to this IMEI profile:

```
associate apn-remap-table remapHO
```

blacklist

Blacklist all mobile devices that fit the IMEI definitions associated with this IMEI profile.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

blacklist

remove blacklist

remove

Including this keyword with the command, removes the blacklist command from the IMEI profile configuration.

Usage

Blacklists subscribers whose devices bear IMEI that match the defined IMEI range for this profile.

Example

Use this command to black list all subscribers with IMEI that fall within the range set for this IMEI profile:

blacklist

description

Define a descriptive string relevant to the specific APN profile.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *description*

remove description

remove

Removes the configured description from this APN profile.

description

Enter an alphanumeric string of 1 to 100 alphanumeric characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotes (“).

Usage

Define information that identifies this particularly APN profile.

Example

Indicate that this IMEI profile *IMEIprof1* is to be used for customers in the United Kingdom and that the profile:

```
description “IMEIprof1 defines routing actions based on IMEI for
customers in the UK.”
```

direct-tunnel

Instruct the SGSN to enable/disable a direct tunnel between the RNC and the GGSN based on the IuPS service configuration.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
direct-tunnel check-iups-service

no direct-tunnel
```

no direct-tunnel

This command instructs the SGSN to disable the direct tunnel function between the GGSN and the RNC.

Usage

Direct tunnel is enabled by default on the GGSN and often on the RNC. This leaves it to the SGSN's configuration to actually enable or disable a direct tunnel.
With the SGSN, the options for configuring a direct tunnel are complex -- enable/disable on the basis of APNs, or RNCs, or GGSNs, or on the basis of the IMEI range. Refer to the *SGSN Administration Guide* for configuration details.

Example

Assuming the IuPS service configuration has enabled DT for associated RNCs, then use this command to enable DT from the RNC to the GGSN associated with this IMEI profile:

```
direct tunnel check-iups-service
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Move to the previous configuration mode.

ggsn-address

Identify the target GGSN for traffic being managed by this IMEI profile.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ggsn-address *IPv4/IPv6_address*

IPv4/IPv6_address

Enter the IP address of the target GGSN. Enter the address in either standard IPv4 dotted decimal format or in standard IPv6 colon notation format.

Usage

Use this command to define the IP address of the target GGSN to be associated with this IMEI profile.

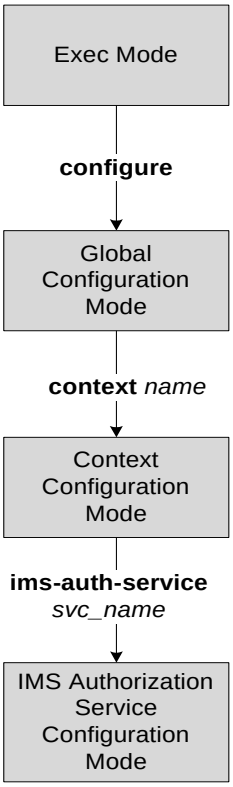
Example

The following command identifes the address of the GGSN associated with this IMEI profile as 123.123.11.1

ggsn-address *123.123.11.1*

Chapter 153
IMS Authorization Service Configuration Mode Commands

The IMS Authorization Service Configuration Mode enables to configure IP Multimedia Subsystem (IMS) authorization services to manage policy control functions and Gx interface support.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

p-cscf discovery

This command defines the method of Proxy-Call Session Control Function (P-CSCF) discovery to be used.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
p-cscf discovery { table { 1 | 2 } [ algorithm { ip-address-modulus | msisdn-modulus |
round-robin } ] | diameter-configured }

[ default | no ] p-cscf discovery
```

default

Sets the P-CSCF discovery to default parameter.

no

Removes/deletes configured parameters for P-CSCF discovery.

table { 1 | 2 }

Specifies that which P-CSCF table is to be used to obtain the primary and secondary P-CSCF addresses. Total 2 tables can be configured for P-CSCF discovery.

algorithm { ip-address-modulus | msisdn-modulus | round-robin }

Specifies the algorithm to select the row from the P-CSCF table to be used for P-CSCF discovery.

- **ip-address-modulus**: This algorithm divides the IP address, in binary, of the subscriber by the number of rows in the table, and the remainder is used as an index into the specified table to select the row.
- **msisdn-modulus**: This algorithm divides the MSISDN value, in binary without the leading "+", of the subscriber by the number of rows in the table, and the remainder is used as an index in the specific table to select the row.
- **round-robin**: This algorithm rotates all rows in the active table for selection of the row in round-robin way. If no algorithm is specified this is the default behavior.

Default: **round-robin**

diameter-configured

This option enables the table number and algorithm specified by the **diameter host-select table** configuration in Policy Control Configuration mode.
If the primary host in that configuration is down it assumes that the primary P-CSCF in the row of P-CSCF table is also down, and it does not return that IP address in the create PDP context response.
This option also performs the deactivation processing of the PDP contexts when Diameter Policy Control Application (DPCA) switches, host tables as detailed in the **diameter host-select** command description in Policy Control Configuration mode.

Usage

Use this command to configure the table and row selection methods to select IP address/host address for P-CSCF discovery.

Example

The following command specifies **table 1** with **round-robin** algorithm to select the rows with IP address for P-CSCF discovery.

```
p-cscf discovery table 1 algorithm round-robin
```

p-cscf table

This command adds/appends rows with primary and/or secondary IPv4/IPv6 addresses to a P-CSCF discovery table with precedence for P-CSCF discovery.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
p-cscf table { 1 | 2 } row-precedence precedence_value { address ip_address | ipv6-
address ipv6_address } [ secondary { address ip_address | ipv6-address ipv6_address } ]

no p-cscf table { 1 | 2 } row-precedence precedence_value
```

no

Removes/deletes configured row with precedence in specified table for P-CSCF discovery address.

{ 1 | 2 }

Specifies which P-CSCF table is to be used to add/append the primary and secondary P-CSCF addresses. Two tables can be configured for P-CSCF discovery address.

row-precedence *precedence_value*

This keyword adds/appends the row with the specified row-precedence to the P-CSCF address table.
In 8.1 and later releases, *precedence_value* must be an integer from 1 through 128, and a maximum of 128 rows can be added to a table.
In release 8.0, *precedence_value* must be an integer from 1 through 100, and a maximum of 16 rows can be added to a table.

secondary

Specifies the secondary IPv4/IPv6 address to be entered in P-CSCF table rows.

address *ip_address*

Specifies the primary and/or secondary IPv4 address for P-CSCF discovery table. This keyword, if used with **secondary** keyword, specifies the secondary IPv4 address.
ip_address must be entered in IPv4 dotted-decimal notation.

ipv6-address *ipv6_address*

Specifies the primary and/or secondary IPv6 address for P-CSCF discovery table. This keyword, if used with **secondary** keyword, specifies the secondary IPv6 address.
ipv6_address must be entered in IPv6 colon-separated notation.

Usage

Use this command to add rows with primary and/or secondary IP addresses for P-CSCF discovery. The row is added with the specified row-precedence.

The operator can add/remove rows to the table that is not currently selected by the **diameter host-select table** command in Policy Control Configuration Mode.

Example

The following command adds a row in **table 2** with primary IP address *10.2.3.4*, secondary IP address as *50.6.7.8*, and row-precedence value as *20* for P-CSCF discovery.

```
p-cscf table 2 row-precedence 20 address 10.2.3.4 secondary 50.6.7.8
```

policy-control

This command enters the Policy Control Configuration mode for Diameter Policy Control Application (DPCA) to configure Diameter authorization and policy control parameter for IMS authorization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] policy-control
```

no

Disables the pre-configured policy control parameters for IMS authorization in this IMS authorization service.

Usage

Use this command to enter the Policy Control Configuration Mode to configure the policy control parameters for Diameter authorization and charging policy in IMS Authorization Service.
Entering this command results in the following prompt:
`[context_name]hostname(config-imsa-dpca)#`
Policy Control configuration commands are described in the *Policy Control Configuration Mode Commands* chapter.

qos-update-timeout

This command is obsolete in release 11.0 and later releases. This command sets the Quality of Service update timeout for a subscriber in IMS authorization service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

qos-update-timeout *timeout_duration*

no qos-update-timeout

no

Disables the pre-configured QoS update timeout parameter in this IMS authorization service.

timeout_duration

Specifies the duration of timeout in seconds as an integer from 0 through 3600.
Default: 60

Usage

Use this command to set the maximum time to wait for a subscriber to initiate the update QoS procedure in IMS authorization service.

Example

The following command sets the QoS update timeout to *90* seconds.

```
qos-update-timeout 90
```

signaling-flag

This command specifies whether a request for a PDP context dedicated to signaling (for IMS sessions) should be granted or denied.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
signaling-flag { deny | permit }

default signaling-flag
```

default

Sets the signaling flag to default mode of deny.

deny

Denies the request for a signaling PDP context for IMS session and keeps signaling co-existed with other traffic on PDP contexts. Default: Enabled

permit

Permits the request for a signaling PDP context for IMS session and a separate signaling context activated. Default: Disabled

Usage

Use this command to allow or deny the activation of a dedicated PDP context for signaling. The user equipment (UE) may indicate that the PDP context should be dedicated for IP multimedia (IM) signaling by setting the IP Multimedia Core Network (IM-CN) signaling flag in the Protocol Configuration Options (PCO).
The **deny** option causes the system to inform the UE that the PDP context will not be dedicated for IM signaling and signaling will co-exist with other traffic on PDP context.
The **permit** option is used to activate the signaling context for signal traffic and the other traffic uses other PDP context for traffic with the following destinations:

- Towards the DHCP and DNS servers for the IMS domain
- Towards the P-CSCF(s)

The UE is not trusted to follow these restrictions, and the system monitors and restricts the traffic from the dedicated PDP context. The **signaling-flow class-map** command is used to configure the restrictions.

Example

The following command denies the request for a signaling PDP context for IMS session.

```
default signaling-flag
```

signaling-flow

This command specifies the packet filters and policy servers for bandwidth control and singling context enforcement that define the traffic that is allowed through the dedicated signaling context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

signaling-flow permit server-address *ipv4/ipv6_address* **[server-port {** *port_num* **| range** *start_port* **to** *end_port* **}] [description** *STRING* **]**

no signaling-flow permit server-address *ipv4/ipv6_address* **[server-port {** *port_num* **| range** *start_port* **to** *end_port* **}]**

no

Disables the signaling flow option configured with this command.

server-address *ipv4/ipv6_address*

The server address refers to the destination IP address in uplink packets, and the source IP address in downlink packets.
ipv4/ipv6_address is an IP address in IPv4 dotted-decimal or IPv6 colon-separated notation and can be used with a subnet mask.
A maximum of 16 signaling server addresses can be configured per IMS Authorization service.

server-port { *port_num* **| range** *start_port* **to** *end_port* **}**

Specifies the TCP/UDP port number(s) of the server to be used for communication.
port_num must be an integer from 1 through 65535.
range *start_port* **to** *end_port* provides the option to configure the range of ports on server for communication.
start_port must be an integer from 1 through 65535 but lesser than *end_port*, and *end_port* must be an integer from 1 through 65535 but greater than *start_port*.

description *STRING*

Specifies the customized description for configured signaling server as an alphanumeric string of 1 through 63 characters.

Usage

Traffic that matches any instance of the signaling-flow command will be forwarded via the signaling PDP context. In addition, the policy server gives policy gates to use for the signaling PDP context.

Example

The following command sets the packet filter server address to *10.2.3.4* with port number *1234* for packet filtering.

```
signaling-flow server-address 10.2.3.4 server-port 1234
```

traffic-policy

This command specifies the action on packets which do not match any policy gates in the general purpose PDP context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
traffic-policy general-pdp-context no-matching-gates direction { downlink | uplink } {
forward | discard }

default traffic-policy general-pdp-context no-matching-gates direction { downlink |
uplink }
```

default

Sets the default traffic policy for packets without any policy gate match in general purpose PDP context. By default packets which do not have any matching policy gate are forwarded.

no-matching gates

Applies traffic policy for packets which do not match any policy gate.

direction { downlink | uplink }

Specifies the direction of traffic to apply this traffic policy in general PDP context.
downlink: Specifies the traffic from system to MN. Default is set to forward.
uplink: Specifies the traffic from MN to system. Default is set to forward.

forward

Forwards the packets which do not match any policy gates. Default: Enabled

discard

Discards the packets which do not match any policy gates. Default: Disabled

Usage

This command provides configuration on traffic policy applied on packets which are not matching any policy gate in general PDP context. Packets can either be forwarded or discarded on the basis of operator's configuration.
This command needs to be configured once for downlink and once for uplink separately.

Example

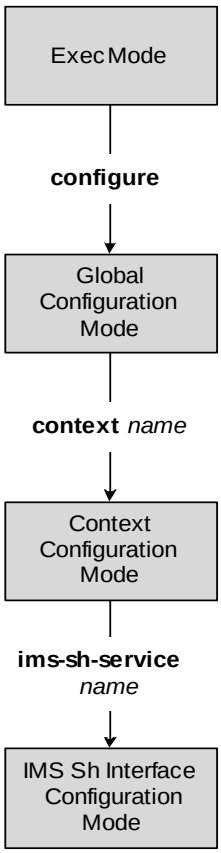
The following command discards uplink packets which do not match any policy gate in general purpose PDP context.

```
traffic-policy general-pdp-context no-matching-gates direction uplink
discard
```

Chapter 154
IMS Sh Service Configuration Mode Commands

The IMS Sh Interface Configuration Mode is used to configure various Diameter parameters in order for:

PDIF to communicate with the HSS server. HSS server is used for MAC address validation in the IKEv2 exchanges to set up SAs and for storing part of the user profile.SCM to communicate with the HSS server. HSS server is used for retrieval and update of call feature parameters and call restriction data.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

diameter

This command configures Diameter parameters.

Product

PDIF, SCM

Privilege

Administrator

Syntax

```
diameter { dictionary { custom1 | standard | endpoint string }
default diameter { dictionary | endpoint }
no diameter endpoint
```

no

Removes previously configured endpoint.

default

Configures parameters to the default value.

dictionary

Specifies the dictionary to use.

- **custom1**: A custom dictionary
- **standard**: The standard dictionary

Important: SCM uses only the standard dictionary.

endpoint *string*

Selects an endpoint to use in the configuration.
string must be the endpoint name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

The Diameter endpoint contains information on the peer names and IP addresses and port, and the local IP address to use for Diameter.
You can have more than one Diameter endpoint configured on the chassis and the ims-sh-service needs to know which Diameter endpoint to use. This command is to select the appropriate Diameter endpoint, even if only one has been configured.

Example

The following example selects a diameter endpoint *diam1:*

```
diameter endpoint diam1
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec Mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

failure-handling

This command configures the action to take in the event of an HSS server request failure.

Product

PDIF, SCM

Privilege

Administrator

Syntax

[default] failure-handling { profile-update-request | user-data-request } { { diameter-result-code *result_code* **[to** *result_code* **] } | timeout } action { continue | retry-and-terminate | terminate } } }**

---

default

Resets configuration for the specified keyword to the default setting.

---

profile-update-request

Configures failure-handling as a result of a profile update request error.

---

user-data-request

Configures failure-handling as a result of a user data request.

---

diameter-result-code *result_code* **[to** *result_code* **]**

The Result-Code data field contains a space representing errors. Diameter provides the following classes of errors, all identified by the thousands digit in the decimal notation:

- 3xxx (Protocol Errors)
- 4xxx (Transient Failures)
- 5xxx (Permanent Failure)

result_code specifies either a result code value (**diameter-result-code** *3001*) or a range of result code values (**diameter-result-code** *3000* **to** *9999*) to which the failure-handling applies.

---

action

Configures the action to take depending on the diameter-result-code:

- Continue the session
- Retry and then terminate
- Terminate the session

---

request-timeout action

Configures the action to take as a result of a request timeout error:

- Continue the session
- Retry and then terminate
- Terminate the session

Usage

Configures all failure-handling parameters.

Example

The following command configures profile-update-request failure-handling using a result-code configuration with the terminate session option:

```
failure-handling profile-update-request diameter-result-code 3005 to
3600action terminate
```

request

Configures application request timeout.

Product

PDIF, SCM

Privilege

Administrator

Syntax

request timeout *secs*

[no | default] request timeout

no

Disables a configured timeout request.

default

Default: 300 seconds
Resets configuration to the default setting.

request timeout *secs*

Configures the request timeout in seconds.
secs must be an integer from 1 through 300.

Usage

Specifies the session request timeout period in seconds after which the request is deemed to have failed.

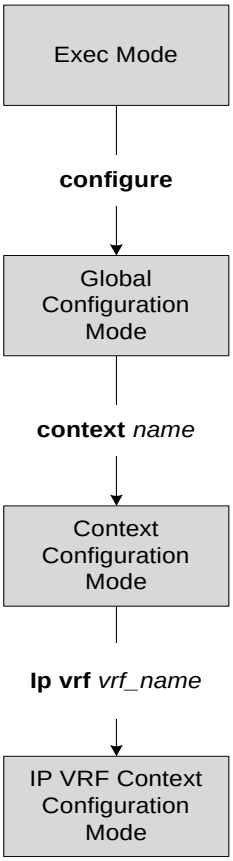
Example

The following example configures the default timeout request of 300 seconds:

```
default request timeout
```

Chapter 155
IP VRF Context Configuration Mode Commands

The IP VRF Context Configuration Mode is used to create and manage the Virtual Routing and Forwarding (VRF) context instance for BGP/MPLS VPN, GRE, IPSec tunneling or service interfaces for virtual routing, addresses, address resolution options, etc.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

ip maximum-routes

This command configures the maximum number of routes in an IP VRF routing table configured in this context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip maximum-routes *max_routes*

no ip maximum-routes

no

Disables the configured maximum routes in specific IP VRF context.

max_routes

Sets the maximum number of routes in a specific IP VRF context.
max_routes must be an integer from 1 through 16384.

Usage

Use this command to configure the maximum number of routes in a particular VRF routing table. When the number of routes in the VRF is more than the maximum limit configured, a critical log is generated indicating that the number of routes is over the limit. Once the number of routes in the VRF goes under the limit, a **clear log** is generated.
The maximum routes configured using this command will be sent to the threshold configuration logic for appropriate action. For more information on threshold configuration, refer to descriptions of the **threshold route-service bgp-routes** and **threshold poll route-service interval** commands in the *Global Configuration Mode Commands* chapter.

Example

The following command sets *1000* routes as a maximum limit for specific VRF context:

```
ip maximum-routes 1000
```

mpls map-dscp-to-exp

This command maps the final differentiated services code point (DSCP) bit value in the IP packet header to the final Experimental (EXP) bit value in the MPLS header for incoming traffic.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] mpls map-dscp-to-exp dscp dscp_bit_value exp exp_bit_value
```

no

Disables the configured DSCP bit value mapping to the EXP bit value from a specific IP VRF context.

dscp *dscp_bit_value*

Specifies the final DSCP bit value which is to map with the final EXP bit value in MPLS header for incoming traffic.
dscp_bit_value specifies the value of DSCP bit values separated in eight groups and represented with integers from 0 through 7.
The default representation of DSCP value in eight groups is given in the following table:

DSCP Marking Value	DSCP Map Group
0-7	0
8-15	1
16-23	2
24-31	3
32-39	4
40-47	5
48-55	6
56-63	7

exp *exp_bit_value*

Specifies the final EXP bit value in MPLS header to which the final DSCP bit value 0 to 7 (represented in eight values) coming from incoming traffic will be mapped.
exp_bit_value is the value of EXP bit in MPLS header and must be an integer between 0 through 7.

Usage

Use this command to map the final DSCP value coming from incoming IP traffic to a final EXP value in MPLS header. This mapping determines the QoS and service parameters to which the packet is assigned.

Example

The following command maps the DSCP value *3* (24 to 31) to EXP bit *3* in MPLS header:

```
mpls map-dscp-to-exp dscp 3 exp 3
```

mpls map-exp-to-dscp

Maps incoming the Experimental (EXP) bit value in MPLS header to the internal differentiated services code point (DSCP) bit value in IP packet headers for outgoing traffic.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] mpls map-exp-to-dscp exp exp_bit_value dscp dscp_bit_value
```

no

Disables the configured EXP bit value mapping to DSCP bit value from specific IP VRF context.

exp *exp_bit_value*

Specifies the incoming EXP bit value in MPLS header to which the internal DSCP bit value 0 to 7 (represented in 8 values) in IP traffic will be mapped.
exp_bit_value is the value of the EXP bit in an MPLS header and must be an integer from 0 through 7.

dscp *dscp_bit_value*

Maps the DSCP bit value with the incoming EXP bit value in an MPLS header.
dscp_bit_value specifies the value of the DSCP bit values separated in eight groups and represented with integers between 0 through 7.
The default representation of DSCP value in eight groups is given in the following table:

DSCP Marking Value	DSCP Map Group
0-7	0
8-15	1
16-23	2
24-31	3
32-39	4
40-47	5
48-55	6
56-63	7

Usage

Use this command to map the incoming EXP bit value in MPLS headers to the DSCP bit value in IP traffic. This mapping determines the QoS and service parameters to which the packet is assigned.

Example

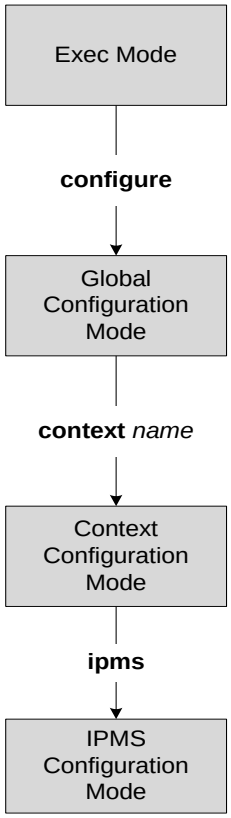
The following command maps the EXP bit value *4* to DSCP value *6* (48 to 55) in IP header:

```
mpls ap-exp-to-dscp exp 4 dscp 6
```

Chapter 156
IPMS Client Configuration Mode Commands

The IPMS Client Configuration Mode is used to enable the Intelligent Packet Monitoring System (IPMS) client service on an Access Gateway and to set basic service-wide options in a context.

Important: This is a license enabled external application support. For more information on this product, refer to the *IPMS Installation and Administration Guide*.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

export keys

Enables the encryption key export in specific key exchange events to IPMS server from IPMS-enabled AGW.

Important: This is a license enabled customer specific command.

Product

IPMS

Privilege

Security Administrator, Administrator

Syntax

no

Removes the configured source IP address from this context for IPMS client communication with IPMS server.

ikev2

Enables the security association (SA) key export for Internet Key Exchange (IKEv2) protocol to IPMS server.

Usage

Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

Example

The following command assigns the IP address *10.2.3.4* to the IPMS client service in context to communicate with IPMS server. This is the IP address allocated for IPMS client service on chassis.

```
source address 10.2.3.4
```

heartbeat

Configures the IPMS heartbeating between the IPMS-enabled AGW and the IPMS server.

Product

IPMS

Privilege

Security Administrator, Administrator

Syntax

heartbeat period *dur* [**permitted-failure***no_of_failures*]

[**no** | **default**] **heartbeat**

default

Configures the heartbeat period and permitted number of failures to the default values of 10 seconds and 1 failure respectively.

no

Disables/removes the configured heartbeat period and permitted number of failures.

period *dur*

Specifies the periodicity (in seconds) between heartbeat messages as an integer from 1 through 3600. Default: 10

permitted-failure *no_of_failures*

Specifies the number of errors/failures allowed before declaring an IPMS server as dead/unreachable as an integer from 1 through 10. Default: 1

Usage

Use this command to configure the heartbeat message periodicity and permissible failure of heartbeat message response before declaring an IPMS server as dead or unreachable. When an IPMS server is declared down an SNMP trap is sent.

Example

Following command configures the heartbeat message periodicity to *5* second and number of failures allowed as *3* to determine an IPMS server as dead.

```
heartbeat period 5 permitted-failure 3
```

server

Configures the IPMS server address and ports on which the IPMS client on an IPMS-enabled AGW communicates. This is the IP address and port range of the IPMS server.

Product

IPMS

Privilege

Security Administrator, Administrator

Syntax

server address*ip_address* [**seconary**] [**start-port** *start_port* [**end-port** *end_port*]][**secondary**]

no server address *ip_address*

no

Removes the configured IPMS server IP address and port range from this context.

address *ip_address*

Specifies the IP address of the IPMS server to which the IPMS client service communicates in IPv4 dotted-decimal notation.
A maximum of 4 IPMS severs can be configured with this command in one context.

[start-port *start_port***[end-port** *end_port* **]]**

Default: 45001 source port
45005 end port
Specifies the range of UDP ports on which IPMS client communicates with the IPMS server.
start-port *start_port*: Specifies starting port number as an integer from 1 through 65535 that is less than *end_port*, if end-port is specified.
end-port *end_port*: Specifies is the end port number as an integer from 1 through 65535 that is more than *start_port*.

secondary

The secondary keyword is used to configure the specified server address as secondary IP address on the IPMS client interface.

Usage

Use this command to configure/remove the IPMS servers. Up to 4 different IPMS servers can be configured with this command. UDP port number can also be configured with this command. IPMS client will search for this IP address to push the event and traffic logs.

Example

The following command configures IPMS server having IP address *10.2.3.4* in the IPMS client service export the event and traffic logs for intelligent packet monitoring functionality. It also specifies the UDP port range from *48000* to *48005* for communication.

```
server address 10.2.3.4 start-port 48000 end-port 48005
```

source

Configures the source address of the IPMS client in this context to communicate with the IPMS server. This is the IP address for IPMS client on the chassis.

Product

IPMS

Privilege

Security Administrator, Administrator

Syntax

source address*ip_address*

address *ip_address*

Specifies the IP address of the IPMS client on the AGW in this context. This is the address which is bound to the IPMS client service in this context.
ip_address is expressed in IPv4 dotted-decimal notation.

Usage

Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

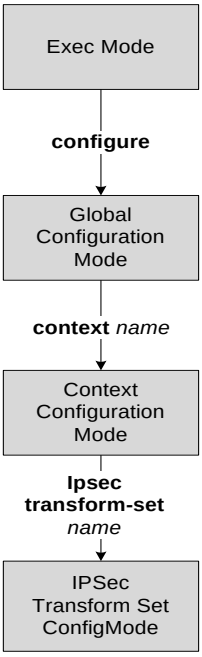
Example

The following command assigns the IP address *10.2.3.4* to the IPMS client service in context to communicate with IPMS server. This is the IP address allocated for IPMS client service on chassis.

```
source address 10.2.3.4
```

Chapter 157
IPSec Transform Set Configuration Mode Commands

The IPSec Transform Set Configuration Mode is used to configure IPSec security parameters. There are two core protocols, the Authentication Header (AH) and Encapsulating Security Payload (ESP). AH may be considered redundant as ESP can provide the same authentication services that AH does.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encryption

Configures the appropriate IPSec ESP encryption algorithm and encryption key length. AES-CBC-128 is the default.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
encryption { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc | null }

default encryption
```

3des-cbc

Data Encryption Standard Cipher Block Chaining encryption applied to the message three times using three different cypher keys (triple DES).

aes-cbc-128

Advanced Encryption Standard Cipher Block Chaining with a key length of 128 bits. This is the default setting for this command.

aes-cbc-256

Advanced Encryption Standard Cipher Block Chaining with a key length of 256 bits.

des-cbc

Data Encryption Standard Cipher Block Chaining. Encryption using a 56-bit key size. Relatively insecure.

null

The NULL encryption algorithm represents the optional use of applying encryption within ESP. ESP can then be used to provide authentication and integrity without confidentiality.

default

Sets the default IPSec ESP algorithm to AES-CBC-128.

Usage

In cipher block cryptography, the plaintext is broken into blocks usually of 64 or 128 bits in length. In cipher block chaining (CBC) each encrypted block is chained into the next block of plaintext to be encrypted. A randomly generated vector is applied to the first block of plaintext in lieu of an encrypted block. CBC provides confidentiality, but not message integrity.
Because RFC 4307 calls for interoperability between IPSec and IKEv2, the IKEv2 confidentiality algorithms must be the same as those configured for IPSec in order for there to be an acceptable match during the IKE message exchange. In IKEv2, there is no NULL option.

Example

The following command configures the encryption to be the default aes-cbc-128:

```
default encryption
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

group

Configures the appropriate key exchange cryptographic strength and activate Perfect Forward Secrecy by applying a Diffie-Hellman group.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
group { 1 | 2 | 5 | 14 | none }

default group
```

default group

Configures the default crypto strength to be **none** and disables Perfect Forward Secrecy.

1

Configures crypto strength at the Group 1 level. Lowest security.

2

Configures crypto strength at the Group 2 level. Medium security.

5

Configures crypto strength at the Group 5 level. Higher security.

14

Configures crypto strength at the Group 14 level. Highest security.

none

Applies no group and disables Perfect Forward Secrecy. This is the default.

default

Sets the default Diffie-Hellman group algorithm to none. This also deactivates PFS.

Usage

Diffie-Hellman groups are used to determine the length of the base prime numbers used during the key exchange process. The cryptographic strength of any key derived depends, in part, on the strength of the Diffie-Hellman group upon which the prime numbers are based.
Group 1 provides 768 bits of keying strength, Group 2 provides 1024 bits, Group 5 provides 1536 bits and Group14 2048 bits. Selecting a group automatically activates Perfect Forward Secrecy. The default value is none, which disables PFS

Example

This command configures security at Group 2 and activates PFS:

```
group 2
```

hmac

Configures the IPSec ESP integrity algorithm using a Hash-based Message Authentication Code (HMAC).

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
hmac { md5-96 | sha1-96 | null }

default hmac
```

md5-96

MD5-96 uses a 128-bit secret key and produces a 128-bit authenticator value.

sha1-96

SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value.
This is the default setting for this command.

null

Configures the hmac value to be null. The NULL encryption algorithm represents the optional use of applying encryption within ESP. ESP can then be used to provide authentication and integrity without confidentiality.

default hmac

Sets the default IPSec hashing algorithm to SHA1-96.

Usage

HMAC is an encryption technique used by IPSec to make sure that a message has not been altered.
A keyed-Hash-based Message Authentication Code (HMAC), is a type of message authentication code that is calculated using a cryptographic hash function in combination with a secret key to verify both data integrity and message authenticity. A hash takes a message of any size and transforms it into a message of a fixed size: the authenticator value. This is truncated to 96 bits and transmitted. The authenticator value is reconstituted by the receiver and the first 96 bits are compared for a 100 percent match.
Because RFC 4306 calls for interoperability between IPSec and IKEv2, the IKEv2 integrity algorithms must be the same as those configured for IPSec in order for there to be an acceptable match during the IKE message exchange.

Example

The following command configures the default HMAC value (SHA1-96):

```
default hmac
```

mode

Configures the security of IP datagrams based on header placement. Tunnel mode applies security to a completely encapsulated IP datagram, while Transport does not. Default is Tunnel mode.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
mode { transport | tunnel }

default mode
```

transport

In Transport mode, the IPSec header is applied only over the IP payload, not over the IP header in front of it. The AH and/or ESP headers appear between the original IP header and the IP payload, as follows:
Original IP header, IPSec headers (AH and/or ESP), IP payload (including transport header).
Transport mode is used for host-to-host communications and is generally unsuited to PDIF traffic.

tunnel

In Tunnel mode, the original IP header is left intact, so a complete IP datagram is encapsulated, forming a virtual tunnel between IPSec-capable devices. The IP datagram is passed to IPSec, where a new IP header is created ahead of the AH and/or ESP IPSec headers, as follows:
New IP header, IPSec headers (AH and/or ESP), old IP header, IP payload.
Tunnel mode is used for network-to-network communications (secure tunnels between routers) or host-to-network and host-to-host communications over the Internet.
This is the default setting for this command.

default mode

Sets the default IPSec Mode to Tunnel.

Usage

IPSec modes are closely related to the function of the two core protocols, the Authentication Header (AH) and Encapsulating Security Payload (ESP). Both of these protocols provide protection by adding to a datagram a header (and possibly other fields) containing security information. The choice of mode does not affect the method by which each generates its header, but rather, changes what specific parts of the IP datagram are protected and how the headers are arranged to accomplish this.

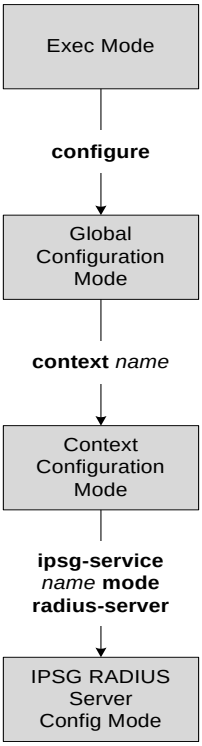
Example

The following command configures the default Tunnel mode:

```
default mode
```

Chapter 158
IPSG RADIUS Server Configuration Mode Commands

The IP Services Gateway (IPSG) RADIUS Server Configuration Mode is used to create and configure IPSG services in the current system context. The IPSG RADIUS Server Mode configures the system to receive RADIUS accounting requests as if it is a RADIUS Accounting Server, and reply after accessing those requests for user information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind

Binds the IPSG RADIUS Server service to a logical AAA interface and specifies the number of allowed subscriber sessions.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

bind { accounting-proxy address *ipv4/ipv6_address* **| address** *ipv4/ipv6_address* **} [max-subscribers** *max_sessions* **| port** *port_number* **| source-context** *source_context* **]**

bind authentication-proxy address *ipv4/ipv6_address* **[acct-port** *port_number* **| auth-port** *port_number* **| max-subscribers** *max-sessions* **| source-context** *source_context* **]**

no bind

---

no

Removes the binding for the service.

---

accounting-proxy address *ipv4/ipv6_address* **| address** *ipv4/ipv6_address* **} [max-subscribers** *max_sessions* **| port** *port_number* **| source-context** *source_context* **]**

- **accounting-proxy address** *ipv4/ipv6_address*: Specifies the IP address of the interface where accounting proxy requests are received by this service in IPv4 dotted-decimal or IPv6 colon-separated notation.
- **address** *ipv4/ipv6_address*: Specifies the IP address of the interface where accounting requests are received by this service in IPv4 dotted-decimal or IPv6 colon-separated notation.
- **max-subscribers** *max_sessions*: Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.

  In 8.3 and earlier releases, *max_sessions* must be an integer from 0 through 3000000.

  In 9.0 and later releases, *max_sessions* must be an integer from 0 through 4000000.
- **port** *port_number*: Specifies the port number of the interface where accounting requests are received by this service.

  port_number must be an integer from 1 through 65535.

  Default: 1813
- **source-context** *source_context*: Specifies the source context where RADIUS accounting requests are received.

  source_context must be an alphanumeric string of 1 through 79 characters.

  This keyword should be configured if the source of the RADIUS requests is in a different context than the IPSG service. If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

authentication-proxy address *ipv4/ipv6_address* **[acct-port** *port_number* **| auth-port** *port_number* **| max-subscribers** *max_sessions* **| source-context** *source_context* **]**

- **authentication-proxy address** *ipv4/ipv6_address*: Specifies the IP address of the interface where authentication proxy requests are received by this service in IPv4 dotted-decimal or IPv6 colon-separated notation.

  Important: Enabling authentication proxy also enables accounting proxy.

- **acct-port** *port_number*: Specifies the port number of the interface where accounting proxy requests are received by this service.

  port_number must be an integer from 0 through 65535.

  Default: 1813

- **auth-port** *port_number*: Specifies the port number of the interface where authentication proxy requests are received by this service.

  port_number must be an integer from 0 through 65535.

  Default: 1812

- **max-subscribers** *max_sessions*: Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.

  In 8.3 and earlier releases, *max_sessions* must be an integer from 0 through 3000000.

  In 9.0 and later releases, *max_sessions* must be an integer from 0 through 4000000.

- **source-context** *source_context*: Specifies the source context where RADIUS accounting requests are received.

  source_context must be an alphanumeric string of 1 through 79 characters.

  This keyword should be configured if the source of the RADIUS requests is in a different context then the IPSG service. If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

Usage

Use this command to bind the IPSG RADIUS Server service to a logical AAA interface and specify the number of allowed subscriber sessions. If the AAA interface is not located in this context, configure the **source-context** parameter.

Use the accounting and authentication proxy settings to enable RADIUS proxy server functionality on the IPSG. These commands are used when the NAS providing the RADIUS request messages is incapable of sending them to two separate devices. The IPSG in RADIUS Server mode proxies the RADIUS request and response messages while performing the user identification task in order to provide services to the session.

Example

The following command binds the service to a AAA interface with and IP address of *10.2.3.4* located in the source context named *aaa_ingress*:

```
bind address 10.2.3.4 source-context aaa_ingress
```

connection authorization

Configures the RADIUS authorization password that must be matched by the RADIUS accounting requests received by this service.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

connection authorization [encrypted] password *password*

no connection authorization

no

Deletes the RADIUS authorization from the current IPSG RADIUS Server service.

[encrypted] password *password*

- **encrypted**: Specifies that the RADIUS authorization password is encrypted.
- **password** *password*: Specifies the password that must be matched by incoming RADIUS accounting requests.

  In 12.0 and earlier releases, *password* must be an alphanumeric string of 1 through 63 characters.

  In 12.2 and later releases, with encryption *password* must be an alphanumeric string of 1 through 132 characters. And without encryption, *password* must be an alphanumeric string of 1 through 63 characters.

Usage

The IPSG RADIUS server service does not terminate RADIUS user authentication so the user password is unknown.
Use this command to configure the authorization password that the RADIUS accounting requests must match in order for the service to examine and extract user information.

Example

The following command sets the RADIUS authorization password that must be matched by the RADIUS accounting requests sent to this service. The password must be encrypted and the example provided is the word "*secret*".

```
connection authorization encrypted password secret
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

profile

Configures the service to use an Access Point NAme (APN) or subscriber profiles.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

```
profile { APN | subscriber }

default profile
```

default

Configures the default setting for this command.
Default: **APN**

APN

Specifies the service to support APN configuration required to enable Gx support.

subscriber

Specifies the service to support subscriber profile lookup.

Usage

Use this command to set the service to support APN profiles (supporting Gx through the enabling of **ims-auth-service**) or for basic subscriber profile lookup.

radius accounting

Specifies the IP address and shared secret of the RADIUS accounting client from which RADIUS accounting requests are received. The RADIUS client can be either the access gateway or the RADIUS accounting server depending on which device is sending accounting requests.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting { { client { ipv4/ipv6_address | ipv4/ipv6_address/mask } [ encrypted ]
key secret [ dictionary dictionary ] [ disconnect-message [ dest-port destination_port ]
] } | { interim create-new-call } }

no radius accounting client { ipv4/ipv6_address | ipv4/ipv6_address/mask }

default radius accounting interim create-new-call
```

no

Removes the RADIUS accounting client address identifier from the service.

ipv4/ipv6_address **|** *ipv4/ipv6_address/mask*

Specifies the IP address and, optionally, subnet mask of the RADIUS client from which RADIUS accounting requests are received.
ipv4/ipv6_address and *ipv6/ipv6_address/mask* are expressed in IPv4 dotted-decimal or IPv6 colon-separated notation with CIDR.
Up to 16 addresses can be configured.

dictionary *dictionary*

Specifies what dictionary database to use. The possible values for *dictionary* are described in the following table:

Dictionary	Description
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.
custom*X*	These are customized dictionaries. For information on custom dictionaries, please contact your Cisco account representative. *X* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.

Dictionary	Description
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.
starent-vsa1	This dictionary consists not only of the 3gpp2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary. ***Important:*** In 12.0 and later releases, no new attributes can be added to the **starent-vsa1** dictionary. If there are any new attributes to be added, these can only be added to the **starent** dictionary. For more information, please contact your Cisco account representative.
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.

[encrypted] key *secret*

- **encrypted**: Specifies that the shared key between the RADIUS client and this service is encrypted.
- **key** *secret*: Specifies the shared key between the RADIUS client and this service.

  In 12.0 and earlier releases, *secret* must be an alphanumeric string of 1 through 127 characters and is case sensitive.

  In 12.2 and later releases, with encryption *secret* must be an alphanumeric string of 1 through 236 characters and is case sensitive. And, without encryption *secret* must be an alphanumeric string of 1 through 127 characters and is case sensitive

disconnect-message [dest-port *destination_port* **]**

Specifies sending disconnect message.
dest-port *destination_port*: Specifies the port number to which the disconnect message must be sent. *destination_port* must be an integer from 1 through 65535.

interim create-new-call

Enables the ability to create a new session upon receipt of a RADIUS interim message. Default: Disabled

Usage

Use this command to configure the communication with the RADIUS client from which RADIUS accounting requests are received.

Example

The following command configures the service to communicate with a RADIUS client with an IP address of *10.2.3.4* and an encrypted shared secret of *secret_1234*:

```
radius accounting client 10.2.3.4 encrypted key secret_1234
```

radius dictionary

Configures the RADIUS database dictionary for use with the IPSG service.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

radius dictionary *dictionary*

default radius dictionary

dictionary *dictionary*

Default: **starent-vsa1**
Specifies what dictionary database to use. The possible values for *dictionary* are described in the table that follows:

Dictionary	Description
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.
custom*XX*	These are customized dictionaries. For information on custom dictionaries, please contact your Cisco account representative. *XX* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.
starent-vsa1	This dictionary consists not only of the 3gpp2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.

Usage

Use this command to specify the RADIUS database dictionary to use for the IPSG service.

Example

The following command configures the IPSG service to use the *custom10* RADIUS database dictionary:

```
radius dictionary custom10
```

setup-timeout

Configures a timeout value for IPSG session set up attempts.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *setup_timeout*

default setup-timeout

setup_timeout

Specifies the time period (in seconds) IPSG session setup attempt is allowed to continue before being terminated.
setup_timeout must be an integer from 1 through 1000000.
Default: 60

Usage

Use this command to prevent IPSG session set up attempts from continuing without termination.

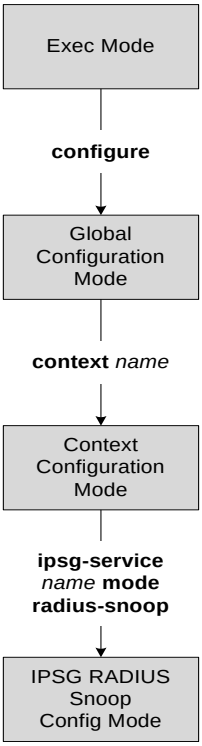
Example

The following command sets the session setup timeout to *20* seconds:

```
setup-timeout 20
```

Chapter 159
IPSG RADIUS Snoop Configuration Mode Commands

The IP Services Gateway (IPSG) RADIUS Snoop Configuration Mode is used to create and configure IPSG services within the current context. The IPSG RADIUS Snoop Mode configures the system to inspect RADIUS accounting requests on the way to the RADIUS accounting server and extract user information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind

Configures the service to accept data on any interface configured in the context. Optionally allows the system to limit the number of sessions processed by this service.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

bind [max-subscribers *max_sessions* **]**

no bind

no

If previously configured, deletes the binding configuration for the service.

max-subscribers *max_sessions*

Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.
In 8.3 and earlier releases, *max_sessions* must be an integer from 0 through 3000000.
In 9.0 and later releases, *max_sessions* must be an integer from 0 through 4000000.

Usage

Use this command to initiate the service and begin accepting data on any interface configured in the context.

Example

The following command prepares the system to receive subscriber sessions on any interface in the context and limits the sessions to *10000*:

```
bind max-subscribers 10000
```

connection authorization

Sets the RADIUS authorization password that must be matched by the RADIUS accounting requests "snooped" by this service.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

connection authorization [encrypted] password *password*

no connection authorization

---

no

Deletes the RADIUS connection authorization configuration from the current IPSG RADIUS snoop service.

[encrypted] password *password*

- **encrypted**: Specifies that the received RADIUS authorization password is encrypted.
- **password** *password*: Specifies the password that must be matched by incoming RADIUS accounting requests.

  In 12.0 and earlier releases, *password* must be an alphanumeric string of 1 through 63 characters.

  In 12.2 and later releases, with encryption *password* must be an alphanumeric string of 1 through 132 characters. And, without *password* must be an alphanumeric string of 1 through 63 characters.

Usage

RADIUS accounting requests being examined by the IPSG RADIUS snoop service are destined for a RADIUS Accounting Server. Since the "snoop" service does not terminate user authentication, the user password is unknown.
Use this command to configure the authorization password that the RADIUS accounting requests must match in order for the service to examine and extract user information.

Example

The following command sets the RADIUS authorization password that must be matched by the RADIUS accounting requests "snooped" by this service. The password must be encrypted and the example provided is the word "*secret*".

```
connection authorization encrypted password secret
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

radius

Specifies the RADIUS accounting servers where accounting requests are sent after being "inspected" by this service.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

[no] radius { accounting server *ipv4/ipv6_address* **[port** *port_number* **| source-context** *context_name* **] | dictionary { 3gpp2 | 3gpp2-835 | custom** *XX* **| standard | starent | starent-835 | starent-vsa1 | starent-vsa1-835 } }**

no

Removes the RADIUS accounting server identifier from this service.

radius accounting server *ipv4/ipv6_address*

Specifies the IP address of a RADIUS accounting server where accounting requests are sent after being "snooped" by this service in IPv4 dotted-decimal or IPv6 colon-separated notation.
Up to 16 addresses can be configured.

port *port_number*

Specifies the port number of the RADIUS Accounting Server where accounting requests are sent after being "snooped" by this service.
port_number must be an integer from 1 through 65535.
Default: 1813

source-context *context_name*

Specifies the source context where RADIUS accounting requests are received.
context_name must be an alphanumeric string of 1through 79 characters.
If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

dictionary { 3gpp2 | 3gpp2-835 | custom *XX* **| standard | starent | starent-835 | starent-vsa1 | starent-vsa1-835 }**

Specifies what dictionary to use. The possible values are described in the following table:

Dictionary	Description
3gpp	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in 3GPP 32.015.
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.

Dictionary	Description
custom*XX*	These are customized dictionaries. For information on custom dictionaries, please contact your Cisco account representative. *XX* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.
starent-vsa1	This dictionary consists not only of the 3gpp2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.

Usage

Use this command to specify the RADIUS Accounting Servers where accounting requests are sent after being snooped by this service.

Example

The following command specifies the IP address (*10.2.3.4*) of a RADIUS Accounting Server whose accounting requests are to be “snooped”, and the source context (*aaa_ingress*) where the requests are received on the system:

```
radius accounting server 10.2.3.4 source-context aaa_ingress
```

setup-timeout

Configures a timeout value for IPSG session setup attempts.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *setup_timeout*

default setup-timeout

setup_timeout

Specifies the period of time (in seconds) the IPSG session setup is allowed to continue before the setup attempt is terminated.
setup_timeout must be an integer from 1 through 1000000.
Default: 60

Usage

Use this command to prevent IPSG session setup attempts from continuing without termination.

Example

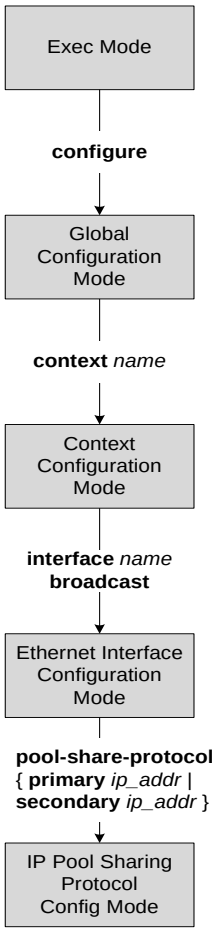
The following command configures the session setup timeout setting to *20* seconds:

```
setup-timeout 20
```

Chapter 160
IPSP Configuration Mode Commands

The IPSP Configuration Mode is used to configure properties for the IP Pool Sharing Protocol (IPSP). System-based HA services use IPSP during an offline-software upgrade to avoid the assignment of duplicate IP addresses to sessions while allowing them to maintain the same address, and to preserve network capacity

Important: For information on configuring and using IPSP refer to the System Administration and Configuration Guide.



dead-interval

Configures the retry time to connect to the remote system for the IP Pool Sharing Protocol.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

dead-interval*seconds*

[no | default] dead-interval

no

Disables the dead interval. On loss of connectivity to the remote system, no retries are attempted and the remote system is marked dead immediately on failure.

default

Resets the dead interval to the default of 3600 seconds.

seconds

Default: 3600 seconds
The amount of time in seconds to wait before retrying the remote system. *seconds* must be an integer from 25 through 259200.

Usage

Use this command to set the amount of time to wait before retrying to connect with the remote system for the IP pool sharing protocol.

Example

Use the following command to set the interval to 180 seconds (3 minutes):
dead-interval 180

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

reserved-free-percentage

This command is used to set the amount of free addresses reserved for use on the primary HA.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

reserved-free-percentage *value*

default reserved-free-percentage

value

Default: 100
value specifies the percentage of free addresses reserved for the use on the primary HA for IP pool sharing during upgrade. It must be an integer from 0 through 100.

Usage

This command is used with **pool-sharing-protocol active mode** on the primary HA. Before using this command, **pool-sharing-protocol** in the Ethernet Interface Configuration Mode must be configured. For more information, refer to the *Ethernet Interface Configuration Mode Commands* chapter in this guide.

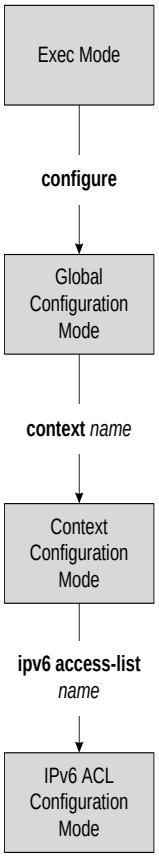
Example

To reserve 40 percent of free addresses in primary HA for IP pool sharing, enter the following command:

```
reserved-free-percentage 40
```

Chapter 161
IPv6 ACL Configuration Mode Commands

The IPv6 Access Control List Configuration Mode is used to create and manage IPv6 access privileges.



deny/permit (by source IP address masking)

Used to filter subscriber sessions based on the IPv6 address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] *source_address source_wildcard*

after { deny | permit } [log] *source_address source_wildcard*

before { deny | permit } [log] *source_address source_wildcard*

no { deny | permit } [log] *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Example

The following command defines two rules with the second logging filtered packets:

```
permit 2001:4A2B::1f3F

deny log 2001:4A2B::1f3F
```

The following sets the insertion point to before the first rule defined above:

```
before permit 2001:4A2B::1f3F
```

The following command sets the insertion point after the second rule defined above:

```
after deny log 2001:4A2B::1f3F
```

The following deletes the first rule defined above:

```
no permit 2001:4A2B::1f3F
```

deny/permit (any)

Used to filter subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] any

after { deny | permit } [ log ] any

before { deny | permit } [ log ] any

no { deny | permit } [ log ] any
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

any

Indicates all packets will match the filter regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules.

Important: It is suggested that any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit any

deny log any
```

The following sets the insertion point to before the first rule defined above:

```
before permit any
```

The following command sets the insertion point after the second rule defined above:

```
after deny log any
```

The following deletes the first rule defined above:

```
no permit any
```

deny/permit (by host IP address)

Used to filter subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] host *source_host_address*

after { deny | permit } [log] host *source_host_address*

before { deny | permit } [log] host *source_host_address*

no { deny | permit } [log] host *source_host_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit host 2001:4A2B::1f3F

deny log host 2001:4A2B::1f3F
```

The following sets the insertion point to before the first rule defined above:

```
before permit host 2001:4A2B::1f3F
```

The following command sets the insertion point after the second rule defined above:

```
after deny log host 2001:4A2B::1f3F
```

The following deletes the first rule defined above:

```
no permit host 2001:4A2B::1f3F
```

deny/permit (by source ICMP packets)

Used to filter subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] icmp { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
icmp_type [ icmp_code ] ]

after { deny | permit } [ log ] icmp { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
icmp_type [ icmp_code ] ]

before { deny | permit } [ log ] icmp { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
icmp_type [ icmp_code ] ]

no { deny | permit } [ log ] icmp { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
icmp_type [ icmp_code ] ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type is an integer from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type is an integer from 0 through 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP filtering allows flexible controls for pairs of individual hosts or groups by IP masking which allows the filtering of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit icmp host 2001:4A2B::1f3F4 any 168

deny log icmp 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410 168 11
```

The following sets the insertion point to before the first rule defined above:

```
before permit icmp host 2001:4A2B::1f3F any 168
```

The following command sets the insertion point after the second rule defined above:

```
after deny log icmp 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410
168 11
```

The following deletes the first rule defined above:

```
no permit icmp host 2001:4A2B::1f3F any 168
```

deny/permit (by IP packets)

Used to filter subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] ip { *source_address source_wildcard* | any | host *source_host_address* } { *dest_address dest_wildcard* | any | host *dest_host_address* } [fragment] [protocol*num*]

after { deny | permit } [log] ip { *source_address source_wildcard* | any | host *source_host_address* } { *dest_address dest_wildcard* | any | host *dest_host_address* } [fragment] [protocol*num*]

before { deny | permit } [log] ip { *source_address source_wildcard* | any | host *source_host_address* } { *dest_address dest_wildcard* | any | host *dest_host_address* } [fragment] [protocol*num*]

no { deny | permit } [log] ip { *source_address source_wildcard* | any | host *source_host_address* } { *dest_address dest_wildcard* | any | host *dest_host_address* } [fragment] [protocol*num*]

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: indicates the rule, when matched, drops the corresponding packets.
- **permit**: indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

fragment

Indicates packet filtering is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit ip host 2001:4A2B::1f3F any fragment

deny log ip 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410
```

The following sets the insertion point to before the first rule defined above:

```
before permit ip host 2001:4A2B::1f3F any fragment
```

The following command sets the insertion point after the second rule defined above:

```
after deny log ip 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410
```

The following deletes the first rule defined above:

```
no permit ip host 2001:4A2B::1f3F any fragment
```

deny/permit (by TCP/UDP packets)

Used to filter subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }

after { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }

before { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }

no { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

tcp | udp

Specifies the filter is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Filter applies to TPC packets.
- **udp**: Filter applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines four rules with the second and fourth rules logging filtered packets:

```
permit tcp host 2001:4A2B::1f3F any

deny log udp 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410

permit tcp host 2001:4A2B::1f3F gt 1023 any
```

The following sets the insertion point to before the first rule defined above:

```
before permit tcp host 2001:4A2B::1f3F any
```

The following command sets the insertion point after the second rule defined above:

```
after deny log udp 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410
```

The following deletes the third rule defined above:

```
no permit tcp host 2001:4A2B::1f3F gt 1023 any
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

readdress server

Alter the destination address and port number in TCP or UDP packet headers to redirect packets to a different server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

redirect_address

The IP address to which the IP packets are redirected. TCP or UDP packet headers are rewritten to contain the new destination address. This must expressed in IPv6 colon-separated notation.

port *port_number*

The number of the port at the redirect address where the packets are sent. TCP or UDP packet headers are rewritten to contain the new destination port number.

tcp | udp

Specifies the redirect is to be applied to the IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TCP packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.

dest_port must be configured to an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

Usage

Use this command to define a rule that redirects packets to a different destination address. The TCP and UDP packet headers are modified with the new destination address and destination port.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the server at *fe80::c0a8:a04*, UDP packets coming from any host with a destination of any host are matched:

```
readdress server fe80::c0a8:a04 udp any any
```

The following sets the insertion point to before the rule defined above:

```
before readdress server fe80::c0a8:a04 udp any any
```

The following deletes the rule defined above:

```
no readdress server fe80::c0a8:a04 udp any any
```

redirect context (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log]** *source_address source_wildcard*

after redirect context *context_id* **[log]** *source_address source_wildcard*

before redirect context *context_id* **[log]** *source_address source_wildcard*

no redirect context *context_id* **[log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

Specifies the context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

Filters by the IP address(es) from which the packet originated. This option filters all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

Filters packets for a group of addresses specified in conjunction with the *source_address* option.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23* and the source IP and wildcard of *2002::c6a2:1600* and *2002::c6a2:1600*:

```
redirect context 23 2002::c6a2:1600 2002::c6a2:1600
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 2002::c6a2:1600 2002::c6a2:1600
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 2002::c6a2:1600 2002::c6a2:1600
```

The following deletes the first rule defined above:

```
no redirect context 23 2002::c6a2:1600 2002::c6a2:1600
```

redirect context (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] any**

after redirect context *context_id* **[log] any**

before redirect context *context_id* **[log] any**

no redirect context *context_id* **[log] any**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23* and any source IP:

```
redirect context 23 any
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 any
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 any
```

The following deletes the first rule defined above:

```
no redirect context 23 any
```

redirect context (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] host** *source_ip_address*

after redirect context *context_id* **[log] host** *source_ip_address*

before redirect context *context_id* **[log] host** *source_ip_address*

no redirect context *context_id* **[log] host** *source_ip_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23* and a host IP address of *fe80::c0a8:c80b*:

```
redirect context 23 host fe80::c0a8:c80b
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 host fe80::c0a8:c80b
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 host fe80::c0a8:c80b
```

The following deletes the first rule defined above:

```
no redirect context 23 host fe80::c0a8:c80b
```

redirect context (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. Type is an integer from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered type is an integer from 0 through 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possibly be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23*, and ICMP packets coming from the host with the IP address *2002::c6a2:6419*:

```
redirect context 23 icmp host 2002::c6a2:6419
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 icmp host 2002::c6a2:6419
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 icmp host 2002::c6a2:6419
```

The following deletes the first rule defined above:

```
no redirect context 23 icmp host 2002::c6a2:6419
```

redirect context (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] ip { *source_address source_wildcard* | any | host** *source_host_address* **} { *dest_address dest_wildcard* | any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

after redirect context *context_id* **[log] ip { *source_address source_wildcard* | any | host** *source_host_address* **} { *dest_address dest_wildcard* | any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

before redirect context *context_id* **[log] ip { *source_address source_wildcard* | any | host** *source_host_address* **} { *dest_address dest_wildcard* | any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

no redirect context *context_id* **[log] ip { *source_address source_wildcard* | any | host** *source_host_address* **} { *dest_address dest_wildcard* | any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num is an integer from 0 through 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23*, and IP packets coming from the host with the IP address *2002::c6a2:6419*, and fragmented packets for any destination are matched:

```
redirect context 23 ip host 2002::c6a2:6419 any fragment
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 ip host 198.162.100.25 any fragment
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 ip host 2002::c6a2:6419 any fragment
```

The following deletes the first rule defined above:

```
no redirect context 23 ip host 2002::c6a2:6419 any fragment
```

redirect context (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }**

after redirect context *context_id* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }**

before redirect context *context_id* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }**

no redirect context *context_id* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23*, and UDP packets coming from any host are matched:

```
redirect context 23 udp any
```

The following sets the insertion point to before the rule defined above:

```
before redirect context 23 udp any
```

The following command sets the insertion point after the rule defined above:

```
after redirect context 23 udp any
```

The following deletes the rule defined above:

```
no redirect context 23 udp any
```

redirect css delivery-sequence

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

redirect css service (any)

Used to redirect subscriber sessions based on any packet received with Content Service Steering (CSS) enabled. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] any**

after redirect css service *svc_name* **[log] any**

before redirect css service *svc_name* **[log] any**

no redirect css service *svc_name* **[log] any**

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definitions which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the CSS service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be a string of 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definitions to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service with the name *css-svc1* and any source IP:

```
redirect css service css-svc1 any
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 any
```

The following command sets the insertion point after the second rule definitions above:

```
after redirect css service css-svc1 any
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 any
```

redirect css service (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] host** *source_host_address*

after redirect css service *svc_name* **[log] host** *source_host_address*

before redirect css service *svc_name* **[log] host** *source_host_address*

no redirect css service *svc_name* **[log] host** *source_host_address*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service with the name *css-svc1* and a host IP address of *fe80::c0a8:c80b*:

```
redirect css service css-svc1 host fe80::c0a8:c80b
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 host fe80::c0a8:c80b
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 host fe80::c0a8:c80b
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 host fe80::c0a8:c80b
```

redirect css service (by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [icmp_type [ icmp_code ] ]

after redirect css service svc_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [icmp_type [ icmp_code ] ]

before redirect css service svc_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [icmp_type [ icmp_code ] ]

no redirect css service svc_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [icmp_type [ icmp_code ] ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured charging services.
`svc_name` must be an alphanumeric string of 1 through 15 characters.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

`dest_address`

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *`dest_wildcard`* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type is an integer from 0 through 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service named *css-svc1*, and ICMP packets coming from the host with the IP address *2002::c6a2:6419*:

```
redirect css service css-svc1 icmp host 2002::c6a2:6419
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 icmp host 2002::c6a2:6419
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 icmp host 2002::c6a2:64195
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 icmp host 2002::c6a2:6419
```

redirect css service (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

after redirect css service svc_name [ log ] ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

before redirect css service svc_name [ log ] ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

no redirect css service svc_name [ log ] ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be an alphanumeric string of 1 through 15 characters.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

`dest_address`

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *`dest_wildcard`* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service named *css-svc1*, and IP packets coming from the host with the IP address *2002::c6a2:6419*, and fragmented packets for any destination are matched:

```
redirect css service css-svc1 ip host 2002::c6a2:6419 any fragment
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 ip host 2002::c6a2:6419 any fragment
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 ip host 2002::c6a2:6419 any fragment
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 ip host 2002::c6a2:6419 any fragment
```

redirect css service (by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log]** *source_address source_wildcard*

after redirect css service *svc_name* **[log]** *source_address source_wildcard*

before redirect css service *svc_name* **[log]** *source_address source_wildcard*

no redirect css service *svc_name* **[log]** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a CSS service named *css-svc1*:

```
redirect css service css=svc1 2002::c6a2:6419
```

redirect css service (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port* | range *start_dest_port end_dest_port*] }**

after redirect css service *svc_name* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port* | range *start_dest_port end_dest_port*] }**

after redirect css service *svc_name* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port* | range *start_dest_port end_dest_port*] }**

no redirect css service *svc_name* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port* | range *start_dest_port end_dest_port*] }**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured charging services.
svc_name must be an alphanumeric string of 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to an integer from 0 to 65535

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service named *css-svc1*, and UDP packets coming from any host are matched:

```
redirect css service css-svc1 udp any
```

The following sets the insertion point to before the rule definition above:

```
before redirect css service css-svc1 udp any
```

The following command sets the insertion point after the rule definition above:

```
after redirect css service css-svc1 udp any
```

The following deletes the rule definition above:

```
no redirect css service css-svc1 udp any
```

redirect css service (for downlink, any)

Used to redirect subscriber sessions based on any packet received in the downlink (from the Mobile Node) direction. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] downlink any

after redirect css service svc_name [ log ] downlink any

before redirect css service svc_name [ log ] downlink any

no redirect css service svc_name [ log ] downlink any
```

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service with the name *css-svc1* and any source IP:

```
redirect css service css-svc1 downlink any
```

The following sets the insertion point to before the first rule definition above:

```
before redirect service css-svc1 downlink any
```

The following command sets the insertion point after the second rule definition above:

```
after redirect service css-svc1 downlink any chgsvc1 downlink any
```

The following deletes the first rule definition above:

```
no redirect service css-svc1 downlink any
```

redirect css service (for downlink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink host** *source_host_address*

after redirect css service *svc_name* **[log] downlink host** *source_host_address*

before redirect css service *svc_name* **[log] downlink host** *source_host_address*

no redirect css service *svc_name* **[log] downlink host** *source_host_address*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *css-svc1* and a host IP address of *fe80::c0a8:c80b*:

```
redirect service css-svc1 downlink host fe80::c0a8:c80b
```

The following sets the insertion point to before the first rule definition above:

```
before redirect service css-svc1 downlink host fe80::c0a8:c80b
```

The following command sets the insertion point after the second rule definition above:

```
after redirect service css-svc1 downlink host fe80::c0a8:c80b
```

The following deletes the first rule definition above:

```
no redirect service css-svc1 downlink host fe80::c0a8:c80b
```

redirect css service (for downlink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

after redirect css service *svc_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect css service *svc_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect css service *svc_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value from 0 through 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *css-svc1*, and ICMP packets coming in the downlink (from the Mobile Node) direction from the host with the IP address *2002::c6a2:6419*:

```
redirect css service css-svc1 downlink icmp host 2002::c6a2:6419
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 downlink icmp host 2002::c6a2:6419
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 downlink icmp host 2002::c6a2:6419
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 downlink icmp host 2002::c6a2:6419
```

redirect css service (for downlink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after redirect css service *svc_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

before redirect css service *svc_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

no redirect css service *svc_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be a string of 1 through 15 characters.

`downlink`

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv6 colon notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *css-svc1*, and downlink IP packets coming from the host with the IP address *2002::c6a2:6419*, and fragmented packets for any destination are matched:

```
redirect css service css-svc1 downlink ip host 2002::c6a2:6419 any
fragment
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 downlink ip host 2002::c6a2:6419 any
fragment
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 downlink ip host 2002::c6a2:6419 any
fragment
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 downlink ip host 2002::c6a2:6419 any
fragment
```

redirect css service (for downlink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

after redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

before redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

no redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a charging service named *css-svc1*:

```
redirect css service css-svc1 donwlink fe80::c0a8:a04
```

redirect css service (for downlink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after redirect css service *svc_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after redirect css service *svc_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

no redirect css service *svc_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *css-svc1*, and UDP packets coming from any host are matched:

```
redirect css service css-svc1 downlink udp any
```

The following sets the insertion point to before the rule definition above:

```
before redirect css service css-svc1 downlink udp any
```

The following command sets the insertion point after the rule definition above:

```
after redirect css service css-svc1 downlink udp any
```

The following deletes the rule definition above:

```
no redirect css service css-svc1 downlink udp any
```

redirect css service (for uplink, any)

Used to redirect subscriber sessions based on any packet received in the uplink (to the Mobile Node) direction. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] uplink any**

after redirect css service *svc_name* **[log] uplink any**

before redirect css service *svc_name* **[log] uplink any**

no redirect css service *svc_name* **[log] uplink any**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *css-svc1* and any source IP:

```
redirect css service css-svc1 uplink any
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 uplink any
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 uplink any
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 uplink any
```

redirect css service (for uplink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] uplink host** *source_host_address*

after redirect css service *svc_name* **[log] uplink host** *source_host_address*

before redirect css service *svc_name* **[log] uplink host** *source_host_address*

no redirect css service *svc_name* **[log] uplink host** *source_host_address*

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.

svc_name must ben alphanumeric string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *css-svc1* and a host IP address of *fe80::c0a8:c80b*:

```
redirect service css-svc1 uplink host fe80::c0a8:c80b
```

The following sets the insertion point to before the first rule definition above:

```
before redirect service css-svc1 uplink host fe80::c0a8:c80b
```

The following command sets the insertion point after the second rule definition above:

```
after redirect service css-svc1 uplink host fe80::c0a8:c80b
```

The following deletes the first rule definition above:

```
no redirect service css-svc1 uplink host fe80::c0a8:c80b
```

redirect css service (for uplink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] uplink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

---

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

---

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

---

no

Removes the rule definition which exactly matches the options specified.

---

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

---

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.

- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value from 0 through 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets in the uplink (to the Mobile Node) direction from the host with the IP address *198.162.100.25*:

```
redirect css service chgsvc1 uplink icmp host 198.162.100.25
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service chgsvc1 uplink icmp host 198.162.100.25
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service chgsvc1 uplink icmp host 198.162.100.25
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink icmp host 198.162.100.25
```

redirect css service (for uplink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] uplink ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

after redirect css service svc_name [ log ] uplink ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

before redirect css service svc_name [ log ] uplink ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

no redirect css service svc_name [ log ] uplink ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and uplink IP packets going to the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

```
redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment
```

The following sets the insertion point to before the first rule definition above:

```
redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

redirect css service (for uplink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] uplink** *source_address source_wildcard*

---

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

---

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

---

no

Removes the rule definition which exactly matches the options specified.

---

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string of 1 through 15 characters.

---

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

---

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

---

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 uplink 1:1:1:1:1:1:1:1
```

redirect css service (for uplink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after redirect css service *svc_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

before redirect css service *svc_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

no redirect css service *svc_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.

dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to an integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered. *start_dest_port* is the initial port in the range and *end_dest_port* is the final port in the range. Both *start_dest_port* and *end_dest_port* can be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

```
redirect css service chgsvc1 uplink udp any
```

The following sets the insertion point to before the rule definition above:

```
before redirect css service chgsvc1 uplink udp any
```

The following command sets the insertion point after the rule definition above:

```
after redirect css service chgsvc1 uplink udp any
```

The following deletes the rule definition above:

```
no redirect css service chgsvc1 uplink udp any
```

redirect nexthop (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *192.168.10.4*, the context with the context ID of *23* and the source IP and wildcard of *198.162.22.0* and *0.0.0.31*:

```
redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following sets the insertion point to before the first rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following command sets the insertion point after the second rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

redirect nexthop (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *192.168.10.4*, the context with the context ID of *23* and any source IP:

```
redirect nexthop 192.168.10.4 context 23 any
```

The following sets the insertion point to before the first rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 any
```

The following command sets the insertion point after the second rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 any
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 any
```

redirect nexthop (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *192.168.10.4*, the context with the context ID of *23* and a host IP address of *192.168.200.11*:

```
redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following sets the insertion point to before the first rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following command sets the insertion point after the second rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

redirect nexthop (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] icmp { ***source_address source_wildcard* **| any | host** *source_host_address* **} { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] icmp { ***source_address source_wildcard* **| any | host** *source_host_address* **} { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] icmp { ***source_address source_wildcard* **| any | host** *source_host_address* **} { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] icmp { ***source_address source_wildcard* **| any | host** *source_host_address* **} { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value from 0 through 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *fe80::c0a8:a04*, the context with the context ID of *23*, and ICMP packets coming from the host with the IP address *2002::c6a2:64195*:

```
redirect nexthop fe80::c0a8:a04 context 23 icmp host 2002::c6a2:6419
```

The following sets the insertion point to before the first rule defined above:

```
before redirect nexthop fe80::c0a8:a04 context 23 icmp host
2002::c6a2:6419
```

The following command sets the insertion point after the second rule defined above:

```
after redirect nexthop fe80::c0a8:a04 context 23 icmp host
2002::c6a2:6419
```

The following deletes the first rule defined above:

```
no redirect nexthop fe80::c0a8:a04 context 23 icmp host 2002::c6a2:6419
```

redirect nexthop (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] ip {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.

- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be an integer from 0 through 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

redirect nexthop (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port*] }**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port*] }**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port*] }**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port*] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TCP packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *fe80::c0a8:a04*, the context with the context ID of *23*, and UDP packets coming from any host are matched:

```
redirect nexthop fe80::c0a8:a04 context 23 udp any
```

The following sets the insertion point to before the rule defined above:

```
before redirect nexthop fe80::c0a8:a04 context 23 udp any
```

The following command sets the insertion point after the rule defined above:

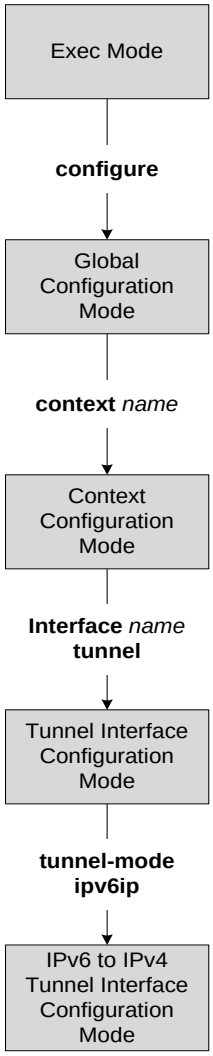
```
after redirect nexthop fe80::c0a8:a04 context 23 udp any
```

The following command deletes the first rule defined above:

```
no redirect nexthop fe80::c0a8:a04 context 23 udp any
```

Chapter 162
IPv6 to IPv4 Tunnel Interface Configuration Mode Commands

The IPv6 to IPv4 Tunnel Interface Configuration Mode is used to create and manage the IP interfaces for addresses, address resolution options, etc.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

destination address

Configures the destination of the tunnelled packets for a manual tunnel.

Product

All

Privilege

Administrator

Syntax

```
destination address address
no destination address
```

no

Removes configuration for the specified keyword.

address

Specifies the IP address of the destination device. *address* must be specified in IPv4 dotted decimal or IPv6 colon-separated notation.

Usage

Use this command to configure the IP address of the destination end of the tunnel.

Example

The following command sets the destination address for packets on this tunnelled interface to *10.2.3.4*:

```
destination address 10.2.3.4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

mode

Configures the mode of IPv6 to IPv4 tunneling. The default is set to manual mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
mode { 6to4 | manual }
default mode
```

6to4

Configures automatic IPv6-to-IPv4 (6to4) tunnels as specified in RFC 3056.

manual

Configures point-to-point manual IPv6-to-IPv4 tunnels by specifying the IPv4 address of the tunnel remote end.

default

Resets the mode of IPv6-to-IPv4 tunneling to manual mode.

Usage

There can be only one IPv6-to-IPv4 tunnel possible in a context. Once an IPv6-to-IPv4 tunnel is configured, all subsequent tunnels will be configured as manual tunnels.

Example

The following command configures the mode to IPv6-to-IPv4 (*6to4*).

```
mode 6to4
```

The following command configures the mode to *6to4*.

```
mode manual
```

source

Configures the source of tunneled packets.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

source { address *ip_address* **| interface***interface_name***}**

no source { address | interface }

address *ip_address*

Specifies the IPv4 address to use as the source address of the tunnel.

ip_address must be expressed in IPv4 dotted-decimal notation.

interface *interface_name*

Specifies the name of a non-tunnel IPv4 interface, whose address is used as the source address of the tunnel. *interface* must be an alphanumeric string of 1 through 79 characters.

no source { address | interface }

Removes configuration for the specified keyword.

Usage

Configures the source IPv4 address of the tunnel by either specifying the IP address (host address) or by specifying another configured non-tunnel IPv4 interface. The source address must be an existing interface address before it is used. State of source address will affect the operational state of the tunnel.

Example

The following command configures the source address of the tunnel.

```
source address 10.2.3.4
```

The following command specifies the source interface as *testsource1*.

```
source interface testsource1
```

tos

Configures the type of service (TOS) settings of the outer IPv4 header of the tunneled packets.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

tos { copy | value *tos_value* **}**

default tos

copy

Copies the DC octet of the IPv6 packet to the TOS octet of IPv4 packet.

default

Configures default setting for the specified keyword.

value *tos_value*

Configures the raw TOS value ranging from 0 to 255. The default is 0.

Usage

Sets the TOS parameter to be used in the tunnel transport protocol or copies the TOS value from the original IPv6 DC byte to the TOS value of the encapsulating IPv4 header.

Example

The following command sets the tos value to *1*:

```
tos value 1
```

ttl

Configures the TTL (Time to live) value of the outer IPv4 header of the tunneled packets.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

ttl value *ttl_value*

default

Configures default setting for the specified keyword.

value *ttl_value*

ttl_value is an integer from 1 through 255. The default is 16.

Usage

Configures the TTL parameter to be used in the tunnel transport protocol.

Example

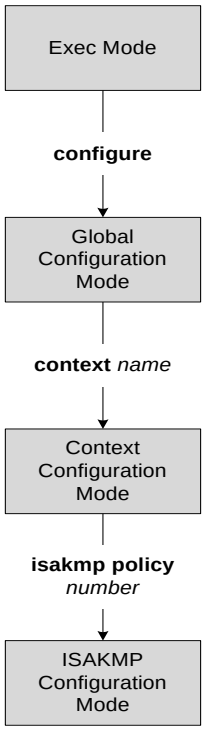
The following command sets the TTL value to *25*.

```
ttl value 25
```

Chapter 163
ISAKMP Configuration Mode Commands

The ISAKMP Configuration Mode is used to configure Internet Security Association Key Management Protocol (ISAKMP) policies that are used to define Internet Key Exchange (IKE) security associations (SAs).

Modification(s) to an existing ISAKMP policy configuration will not take effect until the related security association has been cleared. Refer to the **`clear crypto security-association`** command described in the *Exec Mode (A–C) Commands* chapter for more information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

authentication

Configures the ISAKMP policy authentication mode.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
authentication preshared-key

[ default | no ] authentication
```

default authentication

Restores the default setting of this parameter. This command is enabled by default.

no authentication

Disables the preshared key authentication mode.

preshared-key

Specifies that the policy will be authenticated through the use of the pre-shared key.

Usage

When the system is configured to use ISAKMP-type crypto maps for establishing IPSec tunnels, this command is used to indicate that the policy will be authenticated through the use of the pre-shared key configured in the ISAKMP crypto map.

Example

The following command sets policy authentication mode to use a pre-shared key:

```
authentication preshared-key
```

encryption

Configures the encryption protocol to use to protect subsequent IKE SA negotiations.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
encryption { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc }

[ default | no ] encryption
```

default encryption

Restores the default setting of this parameter.

no encryption

Removes a previously configured encryption type.

3des-cbc

Specifies that the encryption protocol is Triple Data Encryption Standard (3DES) in chain block (CBC) mode.

aes-cbc-128

Specifies that the encryption protocol is Advanced Encryption Standard (AES) in CBC mode with a 128-bit key.

aes-cbc-256

Specifies that the encryption protocol is Advanced Encryption Standard (AES) in CBC mode with a 256-bit key.

des-cbc

Specifies that the encryption protocol is DES in CBC mode. This is the default setting.

Usage

Once the D-H exchange between the system and the security gateway has been successfully completed, subsequent IKE SA negotiations will be protected using the protocol specified by this command.

Example

The following command sets the IKE encryption method to 3des-cbc:

```
encryption 3des-cbc
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

group

Configures the Oakely group (also known as the Diffie-Hellman [D-H] group) in which the D-H exchange occurs.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
group { 1 | 2 | 5 }

[ default | no ] group
```

default group

Restores the default setting of this parameter.

no group

Removes a previously configured group.

{ 1 | 2 | 5 }

Default: **1**

Specifies the number of the Oakley group. The following groups are allowed:

- **1**: Enables Oakley Group 1 using a 768-bit modp as defined in RFC 2409.
- **2**: Enables Oakley Group 2, using a 1024-bit modp as defined in RFC 2409.
- **5**: Enables Oakley Group 5, using a 1536-bit modp as defined in RFC 3526.

Usage

Specifies the Oakley group that determine the length of the base prime numbers that are used during the key exchange process.

Example

The following command sets the group to *5* which specifies 1536-bit base prime numbers:

```
group 5
```

hash

Configures the IKE hash protocol to use during IKE SA negotiations.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator\

Syntax

```
hash { md5 | sha1 }

[ default | no ] hash
```

default

Restores the default setting of this parameter.

no

Removes a previously configured hash algorithm.

md5

Specifies that the hash protocol is Message Digest 5 truncated to 96 bits.

sha1

Specifies that the hash protocol is Secure Hash Algorithm-1 truncated to 96 bits. This is the default setting for this command.

Usage

Use this command to configure the hash algorithm used during key negotiation.

Example

Set the hash algorithm to Message-Digest 5 by entering the following command:

```
hash md5
```

lifetime

Configures the lifetime of the IKE Security Association (SA).

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

lifetime *seconds*

default lifetime

default lifetime

Restores the default setting of this parameter.

seconds

Default: 86400
The number of seconds for the SA to live. *seconds* must be an integer from 60 to 86400.

Usage

Use this command to set the time that an ISAKMP SA will be valid. The lifetime is negotiated with the peer and the lowest configured lifetime duration is used.

Example

The following command sets the SA lifetime to 100 seconds:

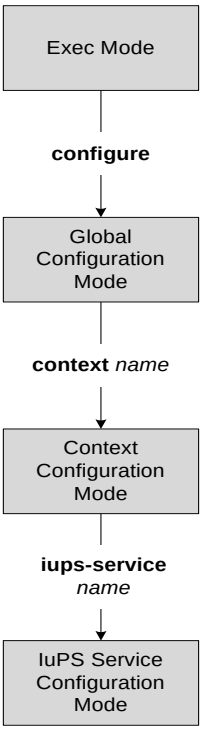
```
lifetime 100
```

Chapter 164
IuPS Service Configuration Mode Commands

The IuPS Service configuration mode is used to define properties for the IuPS service which controls the Iu-PS interface connections to Radio Network Controllers (RNCs) of the UMTS Terrestrial Radio Access Network (UTRAN).

In this mode, the prompt will appear similar to:

```
[<context_name>]hostname(config-ctx-iups-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-protocol

This command configures the access protocol parameters for the IuPS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

access-protocol sccp-network *sccp_net_id*

no access-protocol sccp-network

no

Removes a previously configured access protocol value.

sccp-network *sccp_net_id*

Specifies the Signaling Connection Control Part (SCCP) for this IuPS service to use.
sccp_net_id must be an integer from 1 to 16.

Usage

Use this command to configure access protocol parameters for the current IuPS service.

Example

The following command specifies that the current Iu-PS service should use SCCP *1*:

```
access-protocol sccp-network 1
```

blacklist-timeout-gtpu-bind-addresses

This command specifies the time period that a GTP-U bind address (loopback address) will not be used (is blacklisted) in RAB-Assignment requests after a RAB assignment request, with that GTP-U bind address, has been rejected by an RNC with the cause - Unspecified Error. This is a failure at the RNC's GTP-U IP interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

blacklist-timeout-gtpu-bind-addresses *seconds*

default blacklist-timeout-gtpu-bind-addresses

default

Resets the blacklist time to 60 seconds.

seconds

Number of seconds that the GTP-U bind (loopback) address will not be used in a RAB-Assignment request. *seconds* : Must be an integer from 1 to 1800.

Usage

Use this command to configure the blacklist period.

Example

The following command specifies a 15 minutes (*460 seconds*) blacklist period.

```
blacklist-timeout-gtpu-bind-addresses 460
```

empty-cr

This command allows the operator to determine how empty Connection Request messages will be handled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
empty-cr procedure reject

[ default | no ] empty-cr procedure reject
```

default | no

Using either **default** or **no** with the command disables the rejection function and returns the system to the default behavior, which is to ignore receipt of the empty CRs.

Usage

Use this command to enable/disable the procedure for handling empty (not containing dataparameters) Connection Request (CR) messages.
This feature can be used in the following scenario: During 4G to 3G handovers, some Connection Requests from mobile subscribers might be ignored by the SGSN, even though their UE would display that the WCDMA was available. The RNC would send an SCCP Connection Request (CR) over the Iu interface to the SGSN. Normally, this message contains a RANAP message and GMM, but according to 3GPP and ITU Q.713 standards, it is permissible to send an SCCP CR without any data parameters. In such a situation, normally the SGSN would ignore these SCCP CR messages, because without these data parameters the SGSN would be unable to derive the DeMux key which is the basis for determining the Session Manager instance to be used for a subscriber. Using this feature allows the SGSN to send a Reject to the mobile subscriber when an "empty" SCCP CR is sent from their UE.
Fields have been added to the output of the following CLI show commands to track the receipt and rejection of Connect Request (CR) messages:

- show gmm-sm statistics
- show gmm-sm statistics verbose

Example

The following command enables the empty CR handling procedure:

```
empty-cr procedure reject
```

The following command disables the empty CR handling procedure:

```
default empty-cr procedure reject
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode, the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

force-authenticate consecutive-security-failure

Disable/enable authentication when the MS/UE security fails and configures the procedures and frequency for authentication

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

force-authenticate consecutive-security-failure { inter-sgsn-rau | local-messages count *frequency* **| non-local-messages count** *frequency* **}**

[default | no] force-authenticate consecutive-security-failure { inter-sgsn-rau | local-messages | non-local-messages }

default

Resets the values to defaults. Forced authentication is enabled for all the types of event procedures with the default values for determining frequency for authentication.

no

Disables the specified authentication configuration.

inter-sgsn-rau

Default: enabled
Enables/disables authentication for inter-SGSN RAU.
The SGSN does not remember previous inter-SGSN-RAU failures for a P-TMSI/RAI because the SGSN clears all contexts on the occurrence of an inter-SGSN-RAU security failure. So the next inter-SGSN-RAU can only be authenticated forcefully if it comes before the previous context is cleared. This type of forced authentication is enabled by default because this type of failure is fairly common.

local-messages count *frequency*

Default: 5
Enables/ disables authentication for local messages (such as local RAUs, Service Requests, Detach Requests, etc) . Consecutive security failures is fairly rare for local messages so the default count frequency is fairly high, 5. Setting the count frequency enables the feature and sets the number of consecurity local message security failures that must occur prior t o authentication being forced.
frequency: Enter an integer from 1 to 10.

non-local-messages count *count*

Default: 1
Enables/ disables authentication for non-local messages (such as inter-RAT RAUs and all types of attaches) . Consecutive security failures for non-local messages is fairly common so the default count frequency is 1. Setting the count frequency enables the feature and sets the number of consecurity non-local message security failures that must occur prior t o authentication being forced.
frequency: Enter an integer from 1 to 10.

Usage

GMM authentication is optional for UMTS. When GMM authentication is skipped, the SGSN and the MS continue to re-use the latest keys exchanged during the most recent GMM authentication procedure. This can result in the SGSN and the MS going out of sync with the CK and IK currently in use. If a mismatch occurs when the MS continues to use the correct parameters (e.g., cksn or P-TMSI signature) in the next Iu and if the SGSN skips authentication on the Iu, then, usually, the security mode will timeout or be rejected because the MS will not be able to decipher or perform an integrity check on the network messages. This scenario results in a lot of useless signaling in the network. This command allows the operator to enable a forced GMM authentication that will either resolve this type of problem or avoid it. As well, the operator can configure a frequency of authentication that best meets their needs.

Example

The following command enables forced authentication after every *3rd* local message security failure:

```
force-authenticate consecutive-security-failure local-messages count 3
```

gtpu

This commands configures parameters for the GTP user (GTP-U) dataplane.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpu { bind *ip_addr* **| echo-interval** *seconds* **| max-retransmissions** *number* **| retransmission-timeout** *seconds* **}**

no gtpu { bind address *ip_addr* **| echo-interval | max-retransmissions | retransmission-timeout }**

default gtpu { echo-interval | max-retransmissions | retransmission-timeout }

no

Removes the configured parameter value.

default

Sets the specified parameter to its default setting.

bind address *ip_addr*

This command binds the specified IP address to the Iu-PS GTP-U endpoint.
ip_addr: Must be an IP v4 IP address in dotted decimal notation.

echo-interval *seconds*

Default: 60
Configures the rate, in seconds, at which GTP-U echo packets are sent to the UTRAN over the Iu-PS interface.
seconds : Must be an integer from 60 through 3600.

max-retransmissions *number*

Default: 5
Configures the maximum number of transmission retries for GTP-U packets.
number : Must be an integer from 0 through 15.

retransmission-timeout *seconds*

Default: 5
Configures the retransmission timeout for GTPU packets in seconds.
seconds : Must be an integer from 1 through 20.

Usage

Use this command to configure GTP-U parameters for the Iu-PS interface.

Example

The following command binds the IP address *192.168.0.10* to the Iu-PS interface for communication with the UTRAN:

```
gtpu bind address 192.168.0.10
```

iu-hold-connection

Defines the type and duration of the Iu hold connection.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

iu-hold-connection { always [hold-time *time* **] | requested-by-ms [hold-time** *time* **] }**

default iu-hold-connection

no iu-hold-connection

default

Resets the Iu hold connection parameters to requested-by-ms and 100 second duration.

no

Removes the configuration information for the specified Iu hold connection parameter.

always

Specifies that there is always to be an Iu hold connection procedure.

requested-by-ms

Specifies that there is only an Iu hold connection procedure if requested by the MS/UE.
This is the default setting for Iu-hold-connection.

hold-time *time*

This variable configures the interval (in seconds) that the SGSN holds the Iu connection.
time: must be an integer from 10 to 3600.
Default is 100.

Usage

Define the amount of time the Iu connection will be held open.

Example

Instruct the SGSN to hold the Iu connection open for 120 seconds

```
iu-hold-connection always hold-time 120
```

iu-recovery

This command enables the Iu recovery function.

Important: This command has been deprecated and is no longer available in most 12.0 or 12.2 releases.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
iu-recovery

no iu-recovery
```

no

Disables IU recovery.

Usage

Enable or disable Iu recovery function that should be used whenever sessions are recovered.

Example

The following command disables the Iu Recovery function:

```
no iu-recovery
```

iu-release-complete-timeout

Configures the SGSN's timer for waiting for an Iu Release Complete message from the RNC.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

iu-release-complete-timeout *time*

default iu-release-complete-timeout

default

Resets the timer to its default setting.

time

This variable defines the amount of time (in seconds) that the SGSN waits to receive an 'Iu Release Complete' message from the RNC.
Default: 10.
time: Must be an integer from 1 to 60.

Usage

Configure the number of seconds that the SGSN waits to receive the Iu Release Complete message.

Example

Set the SGSN to wait 20 seconds for Iu-Release-Complete:

```
iu-release-complete-timeout 20
```

loss-of-radio-coverage ranap-cause

This command sets the detection cause included in the Iu Release message. This command is unique to releases 9.0 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

loss-or-radio-coverage ranap-cause *cause_number*

default loss-of-radio-coverage ranap-cause

default

This keyword resets the configuration to the default cause ID number.

ranap-cause *cause_number*

This number identifies the reason the SGSN has detected, from Iu Release messages, for the loss of radio coverage (LORC). This value is included in the IE messages the SGSN sends to either the GGSN or the GGSN and the peer SGSN to indicate LORC state. The range of reasons is a part of the set defined by 3GPP 25413.
cause_number : Must be an integer from 1 to 512.
Default: 46 (MS/UE radio connection lost)

Usage

By defining a cause code, the SGSN knows to detect the LORC state of the mobile from Iu Release messages it receives for the subscriber. This configuration also instructs the SGSN to include the defined cause code for the LORC state in the IE portion of various messages sent to the GGSN and optionally the peer SGSN.
This command is one of the two commands required to enable the SGSN to work with the GGSN and, optionally the peer SGSN, to implement the Overcharging Protection feature (see the *SGSN Overview* in the *SGSN Administration Guide* for feature details. The other command needed to implement the Overcharging Protection feature is the **gtp private extension** command explained in the *SGSN APN Policy Configuration Mode* chapter of the *Command Line Interface Reference*.

Example

Use the following command to set the cause code to indicate that there are no radio resources available in the target cell, cause *53*.

loss-or-radio-coverage ranap-cause 53

mbms

This command is in development for future use so the command and keywords that you might see are **not** currently supported.

Product

SGSN

network-sharing cs-ps-coordination

Enables/disables the SGSN service to perform a CS-PS coordination check.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-sharing cs-ps-coordination

default network-sharing cs-ps-coordination

no network-sharing cs-ps-coordination
```

default

Including this keyword resets the SGSN service to allow the check to be performed.

no

Disables this feature for the SGSN service.

Usage

Use this command to facilitate the network sharing functionality. With this command, the SGSN can be instructed to perform a check to determine if CS-PS coordination is needed.
3GPP TS 25.231 section 4.2.5 describes the functionality of the SGSN to handle CS-PS (circuit-switching/packet-switching) coordination for attached networks not having a Gs-interface. In compliance with the standard, the SGSN rejects an Attach in a MOCN configuration with cause 'CS-PS coordination required', after learning the IMSI, to facilitate the RNC choosing the same operator for both CS and PS domains.

Example

Use the following syntax to disable the CS-PS coordination check:

```
no network-sharing cs-ps-coordination
```

network-sharing failure-code

Configure the reject cause code to included in network-sharing Reject messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

network-sharing failure *failure_code*

default network-sharing failure

default

Resets the SGSN service to use the default cause code,14 (GPRS services not allowed in this PLMN).

failure_code

Enter one of the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message

- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

Usage

Use this command to determine which failure code will be included in Reject messages sent by the SGSN when there is a network-sharing failure.

Example

Use the following syntax to indicate that roaming is not allowed (*#13*) as the cause for the network-sharing failure:

```
network-sharing failure 13
```

plmn

Configures the PLMN (public land mobile network) related parameters for the IuPS service. This command is appicable to releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_num* **mnc** *mnc_num* **[network-sharing common-plmn mcc** *mcc_num* **mnc** *mnc_num* **[plmn-list mcc** *mcc_num* **mnc** *mnc_num* **[mcc** *mcc_num* **mnc** *mnc_num***+]]]**

no plmn id

no

Removes the PLMN ID from the configuration.

id

Creates a PLMN configuration instance based on the PLMN ID (comprised of the MCC and MNC). In accordance with TS 25.413, the SGSN supports up to 32 PLMN configurations for shared networks.

mcc *mcc_num*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_num: The PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_num*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_num: The PLMN MNC identifier and can be configured to any 2-digit or 3-digit value between 00 and 999.

network-sharing common-plmn mcc *mcc_num* **mnc** *mnc_num*

When network sharing is employed, this set of keywords is required to define the PLMN ID of the common PLMN. The common PLMN is usually not the same as the local PLMN.

plmn-list mcc *mcc_num* **mnc** *mnc_num*

When network sharing is employed and more than two PLMNs are available, then use the **plmn-list** keyword to begin a list of all additional PLMNs.

Usage

Use this command to configure the PLMN associated with the SGSN. There can only be one PLMN associated with an SGSN unless one of the following features is enabled and configured: network sharing or multiple PLMN.
For network sharing, use of the **network-sharing** keywords make it possible to identify more than one PLMN. Including the PLMN identified initially. None have precedence. They are all treated equally but they

must each be unique. In a MOCN configuration, the PLMN list will not be used as there would only be one local PLMN.
For multiple PLMN support, the SGSN can support up to 8 Iu-PS configurations for PLMNs. These Iu-PS service configurations must be associated with the SGSN via the **ran-protocol** command in the SGSN Service configuration mode.

Example

Use the following command to identify a PLMN by the MCC *313* and MNC *23* and instruct the SGSN to perform network sharing with a single *common PLMN* identified by MCC *404* and MNC *123*:

```
plmn id mcc 313 mnc 23 network-sharing common-plmn mcc 404 mnc 123
```

rab-assignment-response-timeout

Configures the RAB assignment timer.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

rab-assignment-response-timeout *time*

default rab-assignment-response-timeout

default

Resets the timer to its default setting.

time

This variable configures the amount of time (in seconds) that the SGSN waits to receive a RAB assignment from the RNC.
time: must be an integer from 1 to 60.
Default: 8.

Usage

This command defines time the SGSN waits for the completion of the RAB assignment procedure.

Example

Change the timer setting to *11* seconds.

rab-assignment-response-timeout 11

radio-network-controller

This command creates an instance of an RNC configuration to associate with the IuPS service for the SGSN. This command is only available in release 8.0; use the **rnc** command for releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

radio-network-controller id *rnc_id* **mcc** *mcc_num* **mnc** *mnc_num*

no radio-network-controller id *rnc_id* **mcc** *mcc_num* **mnc** *mnc_num*

no

Removes the configuration information for the specified RNC.

id *rnc_id*

Define the instance number of the RNC configuration.
rnc_id : Must be an integer from 0 to 4095.

mcc *mcc_num*

Specifies the mobile country code (MCC).
mcc_num : Must be an integer between 100 and 999.

mnc *mnc_num*

Specifies the mobile network code (MNC).
mnc_num : Must be an integer between 00 and 999.

Usage

Use this command to configure information for the IuPS service to use to contact specific RNCs.
This command also provides access to the RNC configuration mode.

Example

The following command creates or accesses RNC configuration instance *#1* with MCC of *131* and MNC of *22*:

```
radio-network-controller id 1 mcc 131 mnc 22
```

relocation-alloc-timeout

This command defines the amount of time the SGSN waits for a Relocation Request message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

relocation-alloc-timeout *timeout_value*

default relocation-alloc-timeout

default

Resets the configuration to a 5 second wait time.

timeout_value

Time in seconds that the SGSN waits to receive a Relocation Request message.
timeout_value : Must be an integer from 1 to 60.
Default : 5 seconds.

Usage

Use this command to configure the number of seconds the SGSN will wait for a Relocation Request message to be received. This timeout needs to be set with sufficient time so that SRNS procedure aborts can be avoided if the peer fails to respond in a timely fashion in the case of a hard handoff.

Example

The following command sets the wait time to *10* seconds.

```
relocation-alloc-timeout 10
```

relocation-complete-timeout

This command specifies the maximum time for the SGSN to wait for a Relocation Completion from the core network.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

relocation-complete-timeout *timeout_value*

default relocation-complete-timeout

default

Resets the configuration to a 5 second wait time.

timeout_value

Time in seconds that the SGSN waits for relocation to be completed.
timeout_value : Must be an integer from 1 to 60.
Default : 5 seconds.

Usage

Use this command to configure the number of seconds the SGSN will wait for a relocation to be completed. This timeout needs to be set with sufficient time so that SRNS procedure aborts can be avoided if the peer fails to respond in a timely fashion in the case of a hard handoff.

Example

The following command sets the wait time for *10* seconds.

```
relocation-complete-timeout 10
```

reset

Defines the configuration specific to the RESET procedure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
reset { ack-timeout time | guard-timeout time | max-retransmissions retries | sgsn-initiated }

default reset { ack-timeout | guard-timeout | max-retransmissions | sgsn-initiated }

no reset sgsn-initiated
```

default

Returns to the default settings for the Reset procedure.

no

Removes the SGSN-initiated reset procedure from the configuration.

ack-timeout *time*

Configures the interval (in seconds) for which the SGSN waits for RESET-ACK from the RNC.
time must be an integer from 5 to 60.
Default: 20.

guard-timeout

Configures the interval (in seconds) after which the SGSN sends RESET-ACK to the RNC.
time must be an integer from 5 to 60.
Default : 10

max-retransmissions

Configures maximum retries for RESET message.
retries must be an integer from 0 to 2.
Default: 1.

sgsn-initiated

Enables SGSN initiated RESET procedure.
Default: disabled.

Usage

Configures the parameters that determine a RESET.

Example

Use the following to have the SGSN initiate the RESET procedure:

```
reset sgsn-initiated
```

rnc

This command creates or accesses an instance of an RNC (radio network controller) configuration.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

rnc id *rnc_id*

no rnc id *rnc_id*

no

Removes the configuration information for the specified RNC.

id *rnc_id*

Set the identification number of the RNC configuration instance.
rnc_id : Must be an integer from 0 to 4095 for 8.1 releases. Must be an integer from 0 to 65535 for releases 9.0 and higher.

Usage

Use this command to configure information for the IuPS service to use to contact specific RNCs.
This command also provides access to the RNC configuration mode.

Example

The following command creates an RNC configuration instance *#3442*:

```
rnc id 3442
```

security-mode-complete-timeout

This command configures the security mode timer.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

security-mode-complete-timeout *time*

default security-mode-complete-timeout

default

Resets the timer configuration to the default settings.

time

Configures the interval (in seconds) the SGSN waits for the security mode from the MS to complete.
time must be an integer from 1 to 60.
Default is 5

Usage

Use this command to configure the timer that determines how long the SGSN waits for a Security Mode Complete message from the MS (mobile station).

Example

Instruct the SGSN to wait 7 seconds:

```
security-mode-complete-timeout 7
```

srns-context-response-timeout

This command configures the SGSN context response timer.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

srns-context-response-timeout *time*

default srns-context-response-timeout

default

Resets the timer configuration to the default setting.

time

Configures the interval (in seconds) for which the SGSN waits for an SRNS Context Request message.
time must be an integer from 1 to 60.
Default: 5.

Usage

Configures the time to wait before the SGSN sends a response to the SRNS Context-Request message.

Example

Configure the SGSN to wait 7 seconds for an SRNS Context-Request response:

```
srns-context-response-timeout 7
```

tigoc-timeout

This command configures the TigOc interval.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

tigoc-timeout *time*

default tigoc-timeout

default

Resets the timer configuration to the default setting.

time

This command sets the time in seconds.
time : Must be an integer from 1 to 60.
Default: 5.

Usage

Define the amount of time that the SGSN ignores any overload messages for TigOc interval after receiving one overload message from the RNC.

Example

Use the following command to change the default TigOc interval to *4* seconds:

```
tigoc-timeout 4
```

tintc-timeout

This command configures the TinTc interval..

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

tintc-timeout *time*

default tintc-timeout

default

Resets the timer configuration to the default setting.

time

Set the number of seconds to wait.
time : Must be an integer from 1 to 60.
Default: 30.

Usage

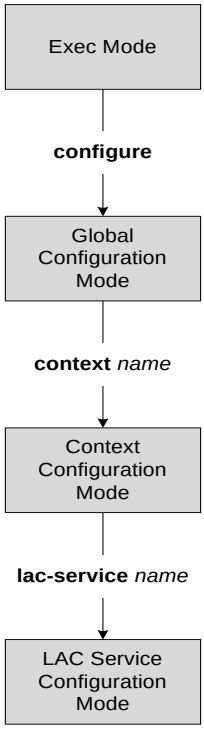
Define *4* as the number of seconds that the SGSN waits before decrementing (by one) the traffic level of the RNC.

Example

```
tintc-timeout 4
```

Chapter 165
LAC Service Configuration Mode Commands

The LAC Service Configuration Mode is used to create and manage L2TP services within contexts on the system. L2TP Access Concentrator (LAC) services facilitate tunneling to peer L2TP Network Servers (LNSs).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

allow

This command configure the system to allow different attributes in the LAC Hostname Attribute Value Pair (AVP) and Called-Number AVP for L2TP messages exchanged between LAC and LNS.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
allow {aaa-assigned-hostname | called-number value apn}

[ no | defualt ] allow {aaa-assigned-hostname | called-number value apn}
```

no

Disable the configured attribute and returns to the behavior that uses the LAC-Service name as the HostName AVP.

aaa-assigned-hostname

When enabled if AAA assigns a valid Tunnel-Client-Auth-ID attribute for the tunnel, it is used as the HostName AVP in the L2TP tunnel setup message.
This keyword works in conjunction with the **local-hostname** *hostname* keyword applied via the **tunnel l2tp** command in APN Configuration mode.
When Tunnel parameters are not received from the RADIUS Server, Tunnel parameters configured in an APN are considered for the LNS peer selection. When APN configuration is selected, the local-hostname configured with the **tunnel l2tp** command in the APN for the LNS peer will be used as an LAC Hostname.

called-number value apn

Configures the system to send the APN name in the Called-Number AVP as a part of ICRQ message sent to the LNS. If this keyword is not configured, Called-Number AVP will not be included in ICRQ message sent to the LNS.

Usage

Use this command to configure the attribute for the HostName AVP for L2TP messages exchanged between LAC and LNS.
LAC Hostname will be different for the subscribers corresponding to the different corporate APNs. In the absence of a AAA assigned HostName, the LAC-Service name is used as HostName. By default the LAC-Service name is used as the HostName AVP.

Example

The following command enables the use of the value of Tunnel-Client-Auth-ID attribute for the HostName AVP:

```
allow aaa-assigned-hostname
```

Use the following command to reset the behavior so that the LAC-Service uses the LAC-Service name as the HostName AVP:

```
no allow aaa-assigned-hostname
```

bind

This command assigns a local end point address to the LAC service in the current context.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

bind *ip_address* **[max-subscribers]**

no bind *ip_address*

no

Unassign, or unbind, the local end point to the LAC service.

ip_address

This must be a valid IP address entered using IPv4 dotted-decimal notation.

max-subscribers

The maximum number of subscribers that can use the endpoint for this LAC service. Must be an integer from 1 to 2500000.

Usage

Use this command to bind a local end point IP address to the LAC service.

Example

The following command binds the local end point IP address *10.10.10.100* to the LAC service in the current context:

```
bind 10.10.10.100
```

The following command removes the binding of the local end point to the LAC service:

```
no bind
```

data sequence-number

Enables data sequence numbering for sessions that use the current LAC service. Data sequence numbering is enabled by default.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
data sequence-number

no data sequence-number
```

no

Disables data sequence numbering for sessions.

Usage

An L2TP data packet header has an optional data sequence numbers field. The data sequence number may be used to ensure ordered delivery of data packets. This command is used to re-enable or disable the use of the data sequence numbers for data packets.

Example

Use the following command to disable the use of data sequence numbering:

```
no data sequence-number
```

Use the following command to re-enable data sequence numbering:

```
data sequence-number
```

default

This command sets the specified LAC service parameter to its default value or setting.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
default {data sequence-number | hide-attributes | keepalive-interval | load-balancing |
local-receive-window | max-retransmission | max-session-per-tunnel | max-tunnel-
challenge-length | max-tunnels | proxy-lcp-authentication | retransmission-timeout-first
| retransmission-timeout-max | trap all |tunnel-authentication}
```

`data sequence-number`

Enables data sequence numbering for sessions.

`hide-attributes`

Disables hiding attributes in control messages sent from the LAC to the LNS.

`keepalive-interval`

Sets the interval for send L2TP Hello keepalive if there is no control or data transactions to the default value of 60 seconds.

`load-balancing`

Sets the load balancing algorithm to be used when many LNS peers have been configured to the default of round robin.

`local-receive-window`

Sets the window size to be used for the local side for the reliable control transport to the default of 16.

`max-retransmission`

Sets the maximum number of retransmissions to the default of 5.

`max-session-per-tunnel`

Sets the maximum number of sessions per tunnel at any point in time to the default of 512.

`max-tunnel-challenge-length`

Sets the maximum length of the tunnel challenge to the default of 16 bytes.

`max-tunnels`

Sets the maximum number of tunnels for this service to the default of 32000.

proxy-lcp-authentication

Sets sending of proxy LCP authentication parameters to the LNS to the default state of enabled.

retransmission-timeout-first

Sets the first retransmit interval to the default of 1 second.

retransmission-timeout-max

Sets the maximum retransmit interval to the default of 8 seconds.

trap all

Generates all supported SNMP traps.

tunnel-authentication

Sets tunnel authentication to the default state of enabled.

Usage

Use the default command to set LAC service parameters to their default states.

Example

Use the following command to set the keep alive interval to the default value of 60 seconds:

```
default

keepalive-interval
```

Use the following command to set the maximum number of sessions per tunnel to the default value of 512:

```
default max-session-per-tunnel
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

hide-attributes

Enables hiding certain attributes (such as proxy-auth-name and proxy-auth-rsp) in control messages sent from the LAC to the LNS. The LAC hides such attributes only if tunnel authentication is enabled between the LAC and the LNS.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
hide-attributes

no hide-attributes
```

no

Disable hiding attributes.

Usage

Use this command to hide certain attributes from control messages when tunnel authentication is enabled between the LAC and the LNS.

Example

The following command enables hiding attributes:

```
hide-attributes
```

keepalive-interval

This command specifies the amount of time to wait before sending a Hello keep alive message.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

keepalive-interval *seconds*

no keepalive-interval

no

Disables the generation of Hello keepalive messages on the tunnel.

seconds

Default: 60
The number of seconds to wait before sending a Hello keepalive message. The number can be configured to an integer from 30 to 2147483648.

Usage

Use this command to set the amount of time to wait before sending a Hello keepalive message or disable the generation of Hello keep alive messages completely. A keepalive mechanism is employed by L2TP in order to differentiate tunnel outages from extended periods of no control or data activity on a tunnel. This is accomplished by injecting Hello control messages after a specified period of time has elapsed since the last data or control message was received on a tunnel. As for any other control message, if the Hello message is not reliably delivered then the tunnel is declared down and is reset. The transport reset mechanism along with the injection of Hello messages ensures that a connectivity failure between the LNS and the LAC is detected at both ends of a tunnel.

Example

Use the following command to set the Hello keepalive message interval to *120* seconds:

```
keepalive-interval 120
```

Use the following command to disable the generation of Hello keepalive messages:

```
no keepalive-interval
```

load-balancing

Configures how LNSs are selected for this LAC service.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
load-balancing {balanced | prioritized | random}
```

balanced

LNS selection is made without regard to prioritization, but in a sequential order that balances the load across the total number of LNS nodes available.

prioritized

LNS selection is made based on the priority assigned in the Tunnel-Preference attribute. An example of this method is three LNS nodes, with preferences of 1, 2, and 3 respectively. In this example, the RADIUS server always tries the tunnel with a preference of 1 before using any of the other LNS nodes.

random

Default: Enabled
LNS selection is random in order, wherein the RADIUS server does not use the Tunnel-Preference attribute in determining which LNS to select.

Usage

Use this command to configure the load-balancing algorithm that defines how the LNS node is selected by the LAC when there are multiple peer LNSs configured in the LAC service.

Example

The following command sets the LAC service to connect to LNSs in a sequential order;

```
load-balancing balanced
```

The following command sets the LAC service to connect to LNSs according to the priority assigned through the Tunnel-Preference attribute:

```
load-balancing prioritized
```

local-receive-window

Specifies the number of control messages the remote peer LNS can send before waiting for an acknowledgement.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

local-receive-window *integer*

integer

Default: 4
Specifies the number of control messages to send before waiting for an acknowledgement. The number can be configured to an integer from 1 to 256.

Usage

Use this command to set the size of the control message receive window being offered to the remote peer LNS. The remote peer LNS may send the specified number of control messages before it must wait for an acknowledgment.

Example

The following command sets the local receive window to *10* control messages:

```
local-receive-window 10
```

max-retransmission

Sets the maximum number of retransmissions of a control message to a peer before the tunnel and all sessions within it are cleared.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

max-retransmission *integer*

integer

Default: 5
Specifies the maximum number of retransmissions of a control message to a peer. This value must be an integer from1 through 10.

Usage

Each tunnel maintains a queue of control messages to be transmitted to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval. For example; if the first retransmission occurs after 1 second, the next retransmission occurs after 2 seconds has elapsed, then the next after 4 seconds. If no peer response is detected after the number of retransmissions set by this command, the tunnel and all sessions within are cleared.
Use this command to set the maximum number of retransmissions that the LAC service sends before closing the tunnel and all sessions within. it.

Example

The following command sets the maximum number of retransmissions of a control message to a peer to *7*:

```
max-retransmissions 7
```

max-session-per-tunnel

Sets the maximum number of sessions that can be facilitated by a single a tunnel at any time.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

max-sessions-per-tunnel *integer*

integer

Default: 512
The maximum number of sessions expressed as an integer from 1 through 65535.

Usage

Use this command to set the maximum number of sessions you want to allow in a tunnel.

Example

The following command sets the maximum number of sessions in a tunnel to *5000*:

```
max-sessions-per-tunnel 5000
```

max-tunnel-challenge-length

Sets the maximum length of the tunnel challenge in bytes.The challenge is used for tunnel authentication purposes during tunnel creation.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

max-tunnel-challenge-length *bytes*

bytes

Default: 16
Specifies the maximum length (in bytes of the tunnel challenge. This must be an integer from 4 through 32.

Usage

Use this command to set the maximum length (in bytes) for the tunnel challenge that is used during tunnel creation.

Example

The following command sets the maximum length of the tunnel challenge to *32* bytes:

```
max-tunnel-challenge-length 32
```

max-tunnels

The maximum number of tunnels that the current LAC service can support.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

max-tunnels *integer*

integer

Default: 32000
The maximum number of tunnels expressed as an integer from 1 through 32000.

Usage

Use this command to set the maximum number tunnels that this LAC service can support at any on time.

Example

Use the following command to set the maximum number of tunnels for the current LAC service to *20000*:

```
max-tunnels 20000
```

peer-lns

Adds a peer LNS address for the current LAC service. Up to eight peer LNSs can be configured for each LAC service.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

peer-lns *ip_address* **[encrypted] secret** *secret* [**crypto-map** *map_name* { [**encrypted**] **isakmp-secret** *secret* }] [**description** *text*] [**preference** *integer*]

no peer-lns *ip_address*

---

no peer-lns *ip_address*

Deletes the peer LNS at the IP address specified by *ip_address*. *ip_address* must be entered in IPv4 dotted-decimal notation.

---

ip_address

The IP address of the peer LNS for the current LAC service. *ip_address* must be entered in IPv4 dotted-decimal notation.

[encrypted] secret *secret*

Designates the secret which is shared between the current LAC service and the peer LNS. *secret* must be an alphanumeric string of 1 through 256 characters that is case sensitive.
encrypted secret *secret*: Specifies that encryption should be used when communicating the secret with the peer LNS.

---

crypto-map *map_name* **{ [encrypted] isakmp-secret** *secret* **}**

map_name is the name of a crypto map that has been configured in the current context. *map_name* must be an alphanumeric string of 1 through 127 characters that is case sensitive.
isakmp-secret *secret*: The pre-shared key for IKE. *secret* must be an alphanumeric string of 1 through 127 characters that is case sensitive.
encrypted isakmp-secret *secret*: The pre-shared key for IKE. Encryption must be used when sending the key. *secret* must be an alphanumeric string of 1 through 127 characters.

---

description *text*

Specifies the descriptive text to use to describe the specified peer LNS. *text* must be an alphanumeric string of 0 through 79 characters.

---

preference *integer*

This sets the priority of the peer LNS if multiple peer LNSs are configured. *integer* must be an integer from 1 through 128.

Usage

Use this command to add a peer LNS address for the current LAC service.

Example

The following command adds a peer LNS to the current LAC service with the IP address of *10.10.10.100*, sets encryption on, specifies the shared secret to be *1b34nnf5d*, and sets the preference to *3*:

```
peer-lns 10.10.10.100 encrypted secret 1b34nnf5d preference 3
```

The following command removes the peer LNS with the IP address of *10.10.10.200* for the current LAC service:

```
no peer-lns 10.10.10.200
```

proxy-lcp-authentication

Enables and disables the sending of proxy LCP authentication parameters to the LNS.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
proxy-lcp-authentication

no proxy-lcp-authentication
```

no

Disables the sending of proxy LCP authentication parameters to the LNS.

proxy-lcp-authentication

Default: Enabled
Enables the sending of proxy LCP authentication parameters to the LNS.

Usage

Use this feature in situations where the peer LNS does not understand the proxy LCP Auth AVPs that the system sends and does not do an LCP renegotiation and tears down the call.

Example

Use the following command to disable the sending of proxy LCP authentication parameters to the LNS;

```
no proxy-lcp-authentication
```

Use the following command to re-enable the sending of proxy LCP authentication parameters to the LNS:

```
proxy-lcp-authentication
```

retransmission-timeout-first

Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted. This command sets the initial timeout for retransmission of control messages.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout-first *integer*

integer

Default: 1
The amount of time to wait (in seconds) before sending the first control message retransmission. This must be an integer from 1 through 100.

Usage

Use this command to set the initial timeout before retransmitting control messages to the peer.

Example

The following command sets the initial retransmission timeout to *3* seconds:

```
retransmission-timeout-first 3
```

retransmission-timeout-max

Configures maximum amount of time between two retransmission of control messages.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout-max *integer*

integer

Default: 8
integer is the maximum time (in seconds) to wait before retransmitting control messages expressed as e an integer from 1 through 100.

Usage

Use this command to set the maximum amount of time that can elapse before retransmitting control messages.
Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval.

Example

The following command sets the maximum retransmission time-out to *10* seconds:

```
retransmission-timeout-max 10
```

single-port-mode

This command enables/disables the L2TP LAC service always to use standard L2TP port 1701 as source port for all L2TP control and data packets originated from LAC node.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] single-port-mode
```

no

Disables the configured single source port configuration from this LAC service.

default

Default: Enabled
Sets this command to its default state of disabled. By default single source port configuration for L2TP LAC packets is disabled.

Usage

Use this command to enable or disable the single port mode for L2TP LAC service.
If this feature is enabled, then L2TP LAC service will always use standard L2TP port 1701 as source port for all L2TP control/data packets originated from LAC (instead of the default scheme in which each L2TPMgr uses a dynamic source port). L2TPMgr instance 1 will handle all L2TP calls for the service.

Caution: Changing this configuration, while the service is already running, will cause restart of the service.

Example

The following command enables the LAC service to use port 1701 as source port for all L2TP control and data packets:

```
single-port-mode
```

snoop framed-ip-address

When enabled, this feature allows the LAC to detect IP Control Protocol (IPCP) packets exchanged between the mobile node and the LNS and extract the framed-ip-address assigned to the mobile node. The address will be reported in accounting start/stop messages and displayed for subscriber sessions.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] snoop framed-ip-address
```

no

Disables the feature. Accounting start/stop will occur before the PPP session is established and the framed IP address field will be reported as 0.0.0.0.

default

Disabled.

Usage

This feature is available to address simple IP roaming scenarios. If this feature is enabled, the Accounting Start will be sent only after the framed-ip-address is detected. If the framed-ip-address is not detected within 16 seconds, an Accounting Start will be sent for the session with the 0.0.0.0 address. If the session is disconnected during the detection attempt, Accounting Start/Stop will be sent for the session. If the session renegotiates IPCP, an Accounting Stop will be generated with a framed-ip-address from the old session, and an Accounting Start will be generated with an IP address for the new session. IPv6 address detection is not supported.

Important: When this feature is enabled and the show subscribers all command is invoked, the framed-IP-address is displayed for the PDSN Simple IP subscriber in the output display.

trap

This command generates SNMP traps.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] trap all
```

no

Disables SNMP traps.

Usage

Use this command to enable/disable all supported SNMP traps.

Example

To enable all supported SNMP traps, enter the following command:

```
trap all
```

tunnel selection-key

Enables the creation of tunnels between an L2TP service and an LNS server on the basis of a key received from AAA server.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
tunnel selection-key { none | tunnel-client-auth-id | tunnel-server-auth-id }

default tunnel selection-key
```

default

Disables the creation of tunnel between LAC service and LNS based on a key value received from AAA server.

none

Default: Enabled
This keyword disables the creation of multiple tunnels between a pair of LAC service and LNS server. LAC will not make use of the key to choose a tunnel with LNS in this setup.

tunnel-client-auth-id

Default: Disabled
This keyword enables the creation of tunnels between LAC service and an LNS server on the basis of domain attribute “Tunnel-Client-Auth-ID” value received from AAA server.

tunnel-server-auth-id

Default: Disabled
This keyword enables the creation of tunnels between LAC service and an LNS server on the basis of domain attribute “Tunnel-Server-Auth-ID” value received from AAA server.

Usage

Use this command to enable or disable the creation of additional L2TP tunnels between LAC service and LNS server on the basis of “Tunnel-Client-Auth-ID” or “Tunnel-Server-Auth-ID” attribute value received from AAA Server in Access-Accept message. This value of attribute is treated as a key for tunnel selection and creation.
When the LAC needs to establish a new L2TP session, it first checks for an existing L2TP tunnel with the peer LNS based on the value of the key configured. If no such tunnel exists for the key, it will create a new tunnel with the LNS.
The default configuration has the selection-key as **none**. Hence, LAC will not make use of key to choose a tunnel with LNS in default setup.
The maximum number of sessions, as configured via the **max-sessions-per-tunnel** command, is applicable for each tunnel created through this command. By default, each tunnel supports 512 sessions.

If the LAC service needs to establish a new tunnel for a new L2TP session with LNS and the tunnel create request fails because maximum tunnel creation limit is reached, LAC will try other LNS addresses received from AAA server in Access-Accept message for the APN/subscriber. If all available peer-LNS are exhausted, LAC service will reject the call.

Example

The following command enables the use of "Tunnel-Server-Auth-ID" attribute value received from AAA Server in Access-Accept message as a key for tunnel selection and creation:

```
tunnel selection-key tunnel-server-auth-id
```

tunnel-authentication

Enables tunnel authentication. When tunnel authentication is enabled, a configured shared secret is used to ensure that the LAC service is communicating with an authorized peer LNS. The shared secret is configured by the **peer-lns** command in the LAC Service Configuration mode, the **tunnel l2tp** command in the Subscriber Configuration mode, or the **Tunnel-Password** attribute in the subscribers RADIUS profile.

Product

GGSN, PDSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] tunnel-authentication
```

no

Disables tunnel authentication.
Tunnel authentication is enabled by default.

Usage

Disable or enable the usage of secrets to authenticate a peer LNS when setting up a tunnel.

Example

To disable tunnel authentication, use the following command:

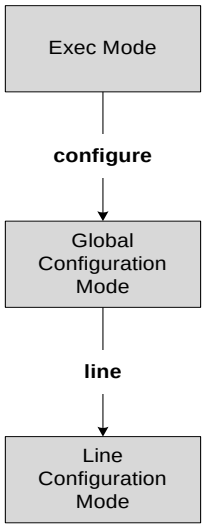
```
no tunnel-authentication
```

To re-enable tunnel authentication, use the following command:

```
tunnel-authentication
```

Chapter 166
Line Configuration Mode Commands

The Line Configuration Mode is used to manage the terminal line characteristics for output formatting.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Restores the default length or width for the output to the display terminal.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { length | width }
```

length | width

length: restores the default value for the number of rows (length) of the output for display.
width: restores the default value for the number of columns (width) of the output for display as the number of characters.

Usage

Reset the output display properties if they had been changed during a session.

Example

```
default length

default width
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

length

Configures the output for the displays length (number of rows).

Product

All

Privilege

Security Administrator, Administrator

Syntax

length *number*

number

Specifies the number of rows (lines) of output that can be displayed at one time for the display (output) terminal. *number* must be 0 or an integer from 5 through 512, where the special value 0 implies an infinite number of rows.

Usage

Set the current session's display terminal has different display characteristics than the defaults. The special infinite value (0) is typically used when logging the output of a session from a remote machine since this will result in no pagination of output.

Example

The following commands set the length of the display to infinite and *33*, respectively.

```
length 0

length 33
```

width

Configures the output for the displays width (number of columns/characters wide).

Product

All

Privilege

Security Administrator, Administrator

Syntax

width *number*

number

Specifies the number of columns (characters) of output that can be displayed at one time for the display (output) terminal. *number* must be an integer from 5 through 512.

Usage

Set the current session's display terminal has different display characteristics than the defaults.

Example

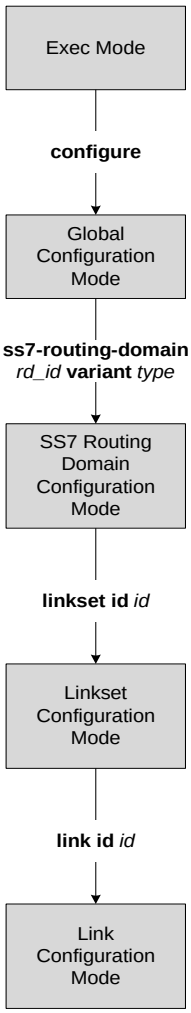
```
width 160
```

Chapter 167
Link Configuration Mode Commands

The Link configuration mode defines the MTP3 link parameters for a specific link in a linkset of an SS7 routing domain instance.

In this mode, the prompt will be similar to:

```
[local]hostname(config-ss7-rd-linkset-<#>-link-<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

arbitration

This command configures link arbitration.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
arbitration { active | passive }

no arbitration
```

no

Removes the arbitration configuration for the link.

active

The SSCOP initiates the transmission of PDUs.

passive

The SSCOP waits to receive PDUs.

Usage

Sets the configuration to initiate transmission of PDUs.

Example

```
arbitration active
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

mtp2-aerm-emergency-threshold

Configure the alignment error rate monitor (AERM) emergency threshold value. This command is only available for a lowspeed-narrowband link-type.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp2-aerm-emergency-threshold *value*

default mtp2-aerm-emergency-threshold

default

Resets the parameter to the default value of 1.

value

value : Enter an integer from 1 to 50. Default: 1.

Usage

This command sets the emergency threshold for the MTP2 alignment error rate monitor.

Example

Set the emergency AERM threshold to 17:

```
mtp2-aerm-emergency-threshold 17
```

mtp2-aerm-normal-threshold

Configure the alignment error rate monitor (AERM) normal threshold value. This command is only available for a lowspeed-narrowband link-type.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp2-aerm-normal-threshold *value*

default mtp2-aerm-normal-threshold

default

Resets the parameter to the default value of 4.

value

value : Enter an integer from 4 to 100. Default: 4.

Usage

This command sets the normal threshold for the MTP2 alignment error rate monitor.

Example

Set the normal AERM threshold to 55:

mtp2-aerm-normal-threshold *55*

mtp2-eim-decrement

Configure the errored interval monitor (EIM) emergency decrement value. This command is only available for a highspeed-narrowband link-type.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp2-eim-decrement *value*

default mtp2-eim-decrement

default

Resets the parameter to the default value of 11.

value

value : Enter an integer from 1 to 63. Default: 11.

Usage

This command sets the emergency decrement value for the EIM.

Example

Reset the EIM emergency decrement to 1:

```
default mtp2-eim-decrement
```

mtp2-eim-increment

Configure the errored interval monitor (EIM) emergency increment value. This command is only available for a highspeed-narrowband link-type.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp2-eim-increment *value*

default mtp2-eim-increment

default

Resets the parameter to the default value of 198.

value

value : Enter an integer from 1 to 1023. Default: 198.

Usage

This command sets the emergency increment value for the EIM.

Example

Set the EIM emergency increment to 2:

mtp2-eim-increment *2*

mtp2-eim-threshold

Configure the errored interval monitor (EIM) emergency threshold value. This command is only available for a highspeed-narrowband link-type.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp2-eim-threshold *value*

default mtp2-eim-threshold

default

Resets the parameter to the default value of 794.

value

value : Enter an integer from 1 to 65535. Default: 794.

Usage

This command sets the emergency threshold value for the EIM.

Example

Set the EIM emergency threshold to 154:

mtp2-eim-threshold *154*

mtp2-error-correction

Configure the error correction method to be used. This command is only available for lowspeed or highspeed narrowband link-types.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
mtp2-error-correction { basic | preventive-cyclic-retransmission }

default mtp2-error-correction
```

default

Resets the parameter to the default value.

basic

Basic error correction (BEC) is a positive / negative acknowledgement method that uses backwards retransmission. This method is best for links with less than 30 ms one-way propagation delays.

preventtive-cyclic-retransmission

PCR is recommended for links with 125 ms, or higher, propagation delays.

Usage

Set the method of MTP2 layer error correct to be used on the link.

Example

Set error correction for a link with 15 ms propagaion delay::

```
mtp2-error-correction basic
```

mtp2-lssu-len

This command sets the length of the link status signal unit (LSSU) which carries link status information used to manage link alignment and indicate the status of the signaling points to each other. This command is only available for lowspeed or highspeed narrowband link-types.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp2-lssu-len *#_octets*

default mtp2-lssu-len

default

Using this keyword with the command resets the length to the default of 1 octet.

#_octets

Sets the number of octets for the length of the LSSU.
#_octets: Must be either 1 or 2.

Usage

Use this command to define the maximum amount of link status information that is to be shared between signaling points.

Example

You can use the following command to set the LSSU length to 2 octets - the maximum length:

mtp2-lssu-len *2*

mtp2-max-outstand-frames

This command sets the maximum number of outstanding packets to be sent by the link manager (linkmgr) - applicable for both high speed (HSL) and low speed (LSL) narrowband links.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp2-max-outstand-frames *#_bytes*

default mtp2-max-outstand-frames

default

Using this keyword with the command resets number of packets to the default of 7 bytes.

#_bytes

Sets the maximum number of packets sent by the linkmgr that can be allowed to be outsanding.
#_bytes: Must be an integer from 5 to 10.

Usage

The linkmgr (MTP2) sends data at a higher rate, than the narrowband (NB) E1 link speed, when in congestion and performing retransmission. This can lead to more congestion leading to more time taken for the link to come out of congestion. If using a value of 10 during congestion, then linkmgr pumps data at a rate higher than 2.5 mbps. To avoid this problem, a lower value is usually considered optimal. This configuration holds good for both HSL and LSL.

Example

Use the following command to reset the default number of outstanding packets sent by the LinkMgr:

```
default mtp2-max-outstand-frames
```

Set the maximum number of oustanding packets the linkmgr can send to 6:

```
mtp2-max-outstand-frames 6
```

mtp2-suerm-threshold

Configure the signal unit error rate monitor (SUERM) threshold. This command is only available for lowspeed-narrowband link-types.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp2-suerm-threshold *value*

default mtp2-suerm-threshold

default

Resets the parameter to the default value.

value

Defines the threshold for number of bad frames
value: Enter an integer from 64 to 1023. Default is 64.

Usage

Sets the threshold for link monitoring of bad frames.

Example

Set a new link monitoring bad frames (SEURM) threshold of 256:

mtp2-suerm-threshold *256*

mtp3-discard-priority

Configure MTP3 message discard priority.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-discard-priority *priority*

default mtp3-discard-priority

default

Resets the priority to the default value.

priority

priority: must be an integer between 0 and 3.
Default is 0.

Usage

Use this command to manage MTP3 messaging.

Example

mtp3-discard-priority *2*

mtp3-max-slt-try

Configure maximum number of times to retry SLT (signaling link test).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-max-slt-try *retries*

default mtp3-max-slt-try

default

Resets the number of retries to the default value.

retries

retries: must be an integer between 1 to 65535.
Default is 10.

Usage

Use this command to troubleshoot MTP3 link mismatch.

Example

mtp3-max-slt-try *35*

mtp3-msg-priority

Configures the priority for sending MTP3 management messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-msg-priority *priority*

default mtp3-msg-priority

default

Resets the number of priority to the default value.

priority

priority: must be an integer from 0 to 3.
Default: 0

Usage

Use this command to set the priority for sending MTP3 management messages.

Example

Use the following to set the message priority to 3:

```
mtp3-msg-priority 3
```

mtp3-msg-size

Configures the size of messages from layer 3 to layer 2.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-msg-size *size*

default mtp3-msg-size

default

Resets the the size to the default value which is 4096 (for q.2140) or 272 (for MTP2)

size

size: must be an integer from 1 to 272 for high-speed or low-speed narrowband SS7 links.
size: must be an integer from 1 to 4096 for ATM broadband links.

Usage

Use this command to set the maximum message size, in bytes.

Example

Use this command to set the MTP3 message size to 4096 bytes:

```
mtp3-msg-size 4096
```

mtp3-p1-qlen

Configure the size for the MTP3 p1 queue length.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-p1-qlen *size*

default mtp3-p1-qlen

default

Resets the number of size of the priority 1 queue to the default value.

size

size: integer from 1 to 65535. Size should be less than MTP3 p2 qlen and p3 qlen.
Default: 1024

Usage

Use this command to configure the queue length threshold for raising the congestion priority to level 1.

Example

Use this command to set the queue length priority to 128:

mtp3-p1-qlen *128*

mtp3-p2-qlen

Configure the size of the priority 2 queue.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-p2-qlen *size*

default mtp3-p2-qlen

default

Resets the number of size of the priority 2 queue to the default value.

size

size: integer from 1 to 65535. Size should be less than MTP3 p3 qlen and greater than p1 qlen.
Default: 1024

Usage

Use this command to configure the queue length threshold for raising the congestion priority to level 2.

Example

Use this command to set the queue length threshold to 256:

mtp3-p2-qlen *256*

mtp3-p3-qlen

Configure the size of the priority 3 queue.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-p3-qlen *size*

default mtp3-p3-qlen

default

Resets the number of size of the priority 3 queue to the default value.

size

size: integer from 1 to 65535. Size should be greater than MTP3 p1 qlen and p2 qlen .
Default: 1024

Usage

Use this command to configure the queue length threshold for raising the congestion priority to level 3.

Example

mtp3-p3-qlen *1024*

mtp3-test-pattern

Configures the character string for the test message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-test-pattern *pattern*

default mtp3-test-pattern

default

Resets the pattern to the default value.

pattern

pattern: 1 to 15 alphanumeric characters.
Default: SGSN-ORIGINATED

Usage

Use this command to define a test pattern string for the signalling link test match (SLTM).

Example

mtp3-test-pattern *TEST1-HomeOffice*

priority

Configures the MTP3 Link Priority.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

priority *pri_value*

no priority

no

Removes the priority configuration.

pri_value

pri_value: 0 represents highest priority and 15 represents the lowest priority.

Usage

Use this command to configure the link priority within the MTP3 link set.

Example

priority *2*

signaling-link-code

Configures the signaling link code (SLC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

signaling-link-code *code*

no signaling-link-code

no

Removes the SLC configuration.

code

code: integer from 0 to 15.

Usage

Use this command to uniquely identify the signaling link to be used for MTP3 management messages.

Example

```
signaling-link-code 4
```

sscf-nni-n1

Configures the SSCF NNI N1. This command is only available for ATM-broadband link-types.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sscf-nni-n1 *value*

no sscf-nni-n1

default

Removes the sscf-nni-n1 configuration.

value

value: integer from 1 to 65535.
Default: 1000

Usage

Use this command to identify the network-to-node interface (NNI) between the MTP3 and SSCOP layers.

Example

sscf-nni-n1 *4064*

sscop-max-cc

Configure the maximum value for the SSCOP connection control (CC) state variable. his command is only available for ATM-broadband link-types.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sscop-max-cc *value*

no sscop-max-cc

default

Removes the sscop-max-cc configuration.

value

value: integer from 1 to 65535.
Default: 4

Usage

Use this command as part of the configuration responsible for managing the SSCOP connection. This command sets the number of times retries.

Example

sscop-max-cc *256*

sscop-max-pd

Configures the maximum acceptable value for the SSCOP state variable VT(PD). his command is only available for ATM-broadband link-types.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sscop-max-pd *value*

no sscop-max-pd

default

Removes the **sscop-max-pd** configuration.

value

value: integer from 1 to 65535.
Default: 500

Usage

Use this command to define the maximum number of data PDUs transmitted between POLL PDUs.

Example

sscop-max-pd *2500*

sscop-max-stat

Configures the maximum number of elements included in a status PDU. his command is only available for ATM-broadband link-types.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sscop-max-stat *value*

no sscop-max-stat

default

Removes the **sscop-max-stat** configuration.

value

value: integer from 3 to 65535. This parameter should be an odd integer greater than or equal to 3. Defaultz; 67

Usage

Received in response to a POLL PDU, the STAT PDU includes information about the number of SD PDUs that have been received.

Example

sscop-max-stat *56000*

timeout

This command enables configuration of an array of signaling and flow control timers - for MTP, SSCF, and SSCOP.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] timeout timer timer_value
```

no

Adding **no** to the **timeout** command removes the timer configuration.

timer timer_value

Select the timer and enter a value from the range.
For timers having different ranges for highspeed and lowspeed links or for different variants, the appropriate ranges will be displayed based on the link-type configured.

Important: Currently, the China variant uses ITU values.

Timer	Link Type & Variant	Range of Times Granularity = 100ms	Default Time
mtp2-tmr-t1 Alignment ready timer	Highspeed; ITU	160..3500 (16 - 350 seconds)	3000 (300 seconds)
	Lowspeed; ITU	120 - 500 (12 - 50 seconds)	400 (40 seconds)
	Highspeed; ANSI	160 - 3500 (16 to 350 seconds)	1700 (170 seconds)
	Lowspeed; ANSI	120 - 500 (12 - 50 seconds)	130 (13 seconds)
mtp2-tmr-t2 Not aligned timer	Highspeed; ITU	50 - 1500 (5 - 150 seconds)	50 (5 seconds)
	Lowspeed; ITU	50 - 150 (5 - 15 seconds)	50 (5 seconds)
	Highspeed; ANSI	50 - 1500 (5 - 150 seconds)	230 (23 seconds)
	Lowspeed; ANSI	50 - 150 (5 - 15 seconds)	115 (11.5 seconds)
mtp2-tmr-t3 Aligned timer	Highspeed/Lowspeed; ITU	10 - 140 (1 - 14 seconds)	15 (1.5 seconds)

Timer	Link Type & Variant	Range of Times Granularity = 100ms	Default Time
	Highspeed/Lowspeed; ANSI	10 - 140 (1 - 14 seconds)	115 (11.5 seconds)
mtp2-tmr-t4e Emergency proving period timer	Highspeed; ITU	4 - 60 (400 milliseconds - 6 seconds)	5 (500 milliseconds)
	Lowspeed; ITU	4 - 6 (400 - 600 milliseconds)	5 (500 milliseconds)
	Highspeed; ANSI	4 - 60 (400 milliseconds - 6 seconds)	50 (5 seconds)
	Lowspeed; ANSI	4 - 6 (400 - 600 milliseconds)	6 (600 milliseconds)
mtp2-tmr-t4n Normal proving period timer Once set this timer can be reset but it can not be disabled.	Highspeed; ITU	30 - 700 (3 to 70 seconds)	3 (30 seconds)
	Lowspeed; ITU	20 - 95 (2 - 9.5 seconds)	82 (8.2 seconds)
	Highspeed; ANSI	30 - 700 (3 to 70 seconds)	3 (30 seconds)
	Lowspeed; ANSI	20 - 95 (2 - 9.5 seconds)	23 (2.3 seconds)
mtp2-tmr-t5 Sending status indication busy (SIB) timer	Highspeed/Lowspeed ITU/ANSI	1 - 2 (100 - 200 milliseconds)	1 (100 milliseconds)
mtp2-tmr-t6 Remote congestion timer	Highspeed/Lowspeed ITU/ANSI	10 - 60 (1 to 6 seconds)	30 (3 seconds)
mtp2-tmr-t7 Excessive delay of acknowledgement timer	Highspeed/Lowspeed ITU/ANSI	5 - 20 (500 milliseconds - 2 seconds)	10 (1 second)
mtp2-tmr-t8 Interval timer for error interval monitor timer	Highspeed ITU/ANSI	1 - 2 (100 - 200 milliseconds)	1 (100 milliseconds)
mtp3-tmr-t1 Delay to avoid mis-sequencing on changeover timer	Highspeed/Lowspeed ITU/ANSI	5 - 12 (500 - 1200 milliseconds)	5 (500 milliseconds
mtp3-tmr-t12 Waiting for uninhibit acknowledgement timer	Highspeed/Lowspeed ITU/ANSI	8 - 15 (800 - 1500 milliseconds	8 (800 milliseconds
mtp3-tmr-t13 Waiting for force uninhibit timer	Highspeed/Lowspeed ITU/ANSI	8 - 15 (800 - 1500 milliseconds	8 (800 milliseconds
mtp3-tmr-t14 Waiting for inhibition acknowledgement timer	Highspeed/Lowspeed ITU/ANSI	20 - 30 (2000 - 3000 milliseconds	20 (2000 milliseconds

Timer	Link Type & Variant	Range of Times Granularity = 100ms	Default Time
mtp3-tmr-t17 Delay to avoid oscillation of initial alignment failure and link restart	Highspeed/Lowspeed ITU/ANSI	8 - 15 (800 - 1500 milliseconds	8 (800 milliseconds
mtp3-tmr-t2 Waiting for changeover acknowledgement	Highspeed/Lowspeed ITU/ANSI	7 - 20 (700 - 2000 milliseconds	7 (700 milliseconds
mtp3-tmr-t22 Local inhibit test timer	Highspeed/Lowspeed ITU/ANSI	1800 - 3000 (180 - 300 seconds	1800 (180 seconds)
mtp3-tmr-t23 Remote inhibit test timer	Highspeed/Lowspeed ITU/ANSI	1800 - 3000 (180 - 300 seconds	1800 (180 seconds)
mtp3-tmr-t24 Stabilising timer after removal of local processor outage, used in LPO latching to RPO (national option)	Highspeed/Lowspeed ITU/ANSI	5 - 15 (500 - 1500 milliseconds)	5 (500 milliseconds)
mtp3-tmr-t3 Time controlled diversion-delay to avoid mis-sequencing on changeback	Highspeed/Lowspeed ITU/ANSI	5 - 12 (500 - 1200 milliseconds)	5 (500 milliseconds)
mtp3-tmr-t31 BSN requested timer	Highspeed/Lowspeed ITU/ANSI	50 - 100 (5 to 10 seconds)	50 (5 seconds)
mtp3-tmr-t32 SLT timer	Highspeed/Lowspeed ITU/ANSI	40 - 120 (4 - 12 seconds)	100 (10 seconds)
mtp3-tmr-t33 Connecting timer	Highspeed/Lowspeed ITU/ANSI	50 - 100 (5 to 10 seconds)	50 (5 seconds)
mtp3-tmr-t34 Periodic signalling link test timer	Highspeed/Lowspeed ITU/ANSI	300 - 900 (30 to 90 seconds)	600 (60 seconds)
mtp3-tmr-t4 Waiting for changeback acknowledgement (first attempt)	Highspeed/Lowspeed ITU/ANSI	5 - 12 (500 to 1200 milliseconds)	5 (500 milliseconds)
mtp3-tmr-t5 Waiting for changeback acknowledgement (second attempt)	Highspeed/Lowspeed ITU/ANSI	5 - 12 (500 to 1200 milliseconds)	5 (500 milliseconds)
mtp3-tmr-t7 Waiting for signalling data link connection acknowledgement	Highspeed/Lowspeed ITU/ANSI	10 - 20 (1000 - 2000 milliseconds)	10 (1000 milliseconds)

Timer	Link type & Variant	Range of Times	Default Time
sscf-nni-tmr-t1	ATM Broadband ITU/ANSI	1 - 65535 (10 - 655350 milliseconds) Granularity = 10 ms	500 (5 seconds)
sscf-nni-tmr-t2	ATM Broadband ITU/ANSI	1 - 65535 (10 - 655350 milliseconds) Granularity = 10 ms	3000 (30 seconds)

Timer	Link type & Variant	Range of Times	Default Time
sscf-nni-tmr-t3	ATM Broadband ITU/ANSI	1 - 65535 (10 - 655350 milliseconds) Granularity = 10 ms	1 (10 milliseconds)
sscop-tmr-cc SSCOP CC timer	ATM Broadband ITU/ANSI	1 - 65535 (100 - 6553500 milliseconds) Granularity = 100 ms	2 (200 milliseconds)
sscop-tmr-idle SSCOP idle timer (UNI 3.1 only)	ATM Broadband ITU/ANSI	1 - 65535 (100 - 6553500 milliseconds) Granularity = 100 ms	1 (100 milliseconds)
sscop-tmr-keep-alive SSCOP keep alive timer For stability purposes, tmrKeepAlive >/= tmrPoll and tmrKeepAlive < tmrNoResponse.	ATM Broadband ITU/ANSI	1 - 65535 (100 - 6553500 milliseconds) Granularity = 100 ms	1 (100 milliseconds)
sscop-tmr-no-rsp SSCOP no response timer For stability purposes, tmrNoResponse > tmrKeepAlive.	ATM Broadband ITU/ANSI	1 - 65535 (100 - 6553500 milliseconds) Granularity = 100 ms	15 (1.5 seconds)
sscop-tmr-poll SSCOP poll timer For stability purposes, tmrPoll <= tmrKeepAlive.	ATM Broadband ITU/ANSI	1 - 65535 (100 - 6553500 milliseconds) Granularity = 100 ms	1 (100 milliseconds)

Usage

For a single link and specified link-type (highspeed or lowspeed), this command sets the timer values listed above. The SS7 variant is determined when the SS7 routing domain is first defined from the Global Configuration mode.

Repeat the **timeout** command (one timer and value per entry) as needed to configure all required timers.

Important: Currently, the China variant uses the same timers, values, and defaults as the ITU variant.

Example

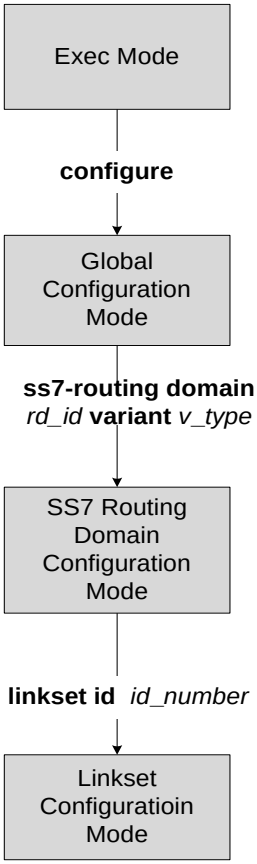
timeout *timer timer_value*

Chapter 168
Linkset Configuration Mode Commands

The Linkset configuration mode defines the MTP3 linkset parameters for a specific SS7 routing domain instance.

In this mode, the prompt will appear similar to:

```
[local]hostname(config-ss7-rd-linkset-<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

adjacent-point-code

This command defines the point-code for the adjacent (next) network element in the SS7 network.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

adjacent-point-code *point-code*

no adjacent-point-code

point-code

Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

no

Removes the adjacent-point-code configuration for this linkset in the SS7 routing domain

Important: Removing the linkset configuration will result in the termination of all of the links within the linkset.

Usage

Use this command to define the point-code for the adjacent element in the SS7 network.

Example

adjacent-point-code *6.202.7*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

link

This command creates an MTP3 link configuration for the SS7 linkset and enters the Link configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

link id *id* **[link-type [atm-broadband | highspeed-narrowband | lowspeed-narrowband]**

no link id *id*

no

Disables the specified link configuration.

Important: Removing the link configuration will result in the termination of traffic on the specified link.

#_octets

Sets the number of octets for the length of the LSSU.

id

This number uniquely identifies the link in the linkset.
id: an integer between 1 and 16.

link-type

Identifies the signalling type for this link; options include:

- ATM broadband -- ATM AAL5 over an optical line card (OLC2)
- high speed-narrowband -- 64 kbps over a channelized optical line card (CLC2)
- low speed-narrowband -- 4.8 kbps over a channelized optical line card (CLC2)

Important: Be default link-type is ATM-broadband. To support narrowband SS7, one of the other options must be set.

Usage

Access the Link configuration mode to configure the parameters for the the link.

Example

Access configuration for link 4:

```
link id 4
```

self-point-code

This command defines the SS7 network point-code to identify this SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point-code*

no self-point-code

point-code

Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

no

Removes the self-point-code configuration for this linkset in the SS7 routing domain.

Important: Removing the self-point-code will result in the termination of all traffic on this link.

Usage

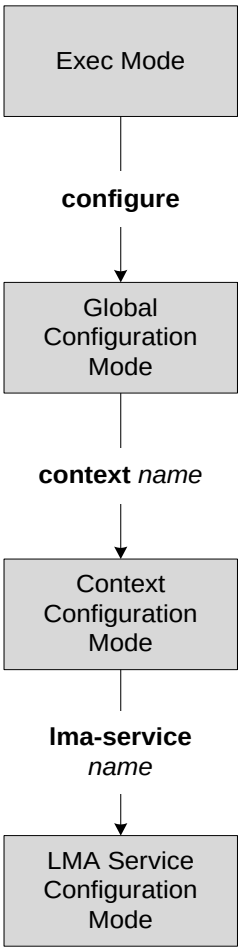
Use this command to define the SS7 point-code to identify this system.

Example

self-point-code *6.192.7*

Chapter 169
LMA Service Configuration Mode Commands

The LMA Service Configuration Mode is used to create and manage the Local Mobility Anchor configuration supporting Proxy Mobile IP on a PDN Gateway in an eHRPD and E-UTRAN/EPC network.



aaa accounting

Enables the LMA to send AAA accounting information for subscriber sessions.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] aaa accounting
```

default

Sets the command to the default condition of enabled.

no

Disables the ability of the LMA to send AAA accounting information.

Usage

Use this command to enable the LMA service to send all accounting data (start, stop, and interim) to the configured AAA servers.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the LMA service is configured using the **aaa accounting subscriber radius** command.

Example

The following command disables aaa accounting for the LMA service:

```
no aaa accounting
```

bind address

Binds the LMA service to a logical IP interface serving as the S2a (HSGW) or S5/S8 (S-GW) interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Product

P-GW

Privilege

Administrator

Syntax

bind address *ipv6_address* **[ipv4-address** *ipv4_address* **] [max-subscribers** *num* **]**

no bind address

no

Removes the interface binding from this service.

address *ipv6_address*

Specifies the IPv6 address of the interface configured as the S2a or S5/S8 interface. *ipv6_address* is specified in colon separated notation.

ipv4-address *ipv4_address*

Specifies optional IPv4 HA/P-GW address to support DSMIP6 session using IPv4 transport. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation.

max-subscribers *num*

Default: 3000000
Specifies the maximum number of subscribers that can access this service on this interface. *num* must be configured to an integer between 0 and 3,000,000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

Usage

Associate the LMA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an S2a or S5/S8 interface that provides the session connectivity to an HSGW (S2a) or S-GW (S5/S8). Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of S2a or S5/S8 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours

- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *4551:0db8:85a3:08d3:3319:8a2e:0370:1344* to the LMA service and specifies that a maximum of *300,000* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 4551:0db8:85a3:08d3:3319:8a2e:0370:1344 max-subscribers
300000
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax `end`

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax `exit`

Usage

Return to the previous mode.

mobility-option-type-value

Changes the mobility option type value used in mobility messages.

Product

P-GW

Privilege

Administrator

Syntax

```
mobility-option-type-value { custom1 | standard }

default mobility-option-type-value
```

default

Sets the command to the default value of custom1.

custom1

(Default) Non-standard type values used before they were defined by IANA.

standard

Standard type values as defined by IANA. In addition, standard option uses type values defined in RFC 5844 for HoA options for PMIPv6 PBU/PBA/revocation message.

Usage

Use this command to change the mobility option type value used in mobility messages.

Example

The following command changes the mobility option type value to standard:

```
mobility-option-type-value standard
```

refresh-advice-option

Configures inclusion of a refresh advice option in the binding acknowledgement message sent by the LMA.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] refresh-advice-option
```

default

Returns the command setting to the default setting of disabled.

no

Disables the inclusion of the refresh advice option in the binding acknowledgement message sent by the LMA

Usage

Use this command to enable the LMA to include this option in a binding acknowledgment sent to the requesting MAG. The option provides a “hint” to the MAG of when it should refresh the binding.
As defined in RFC 3775 “Mobility Support in IPv6”, the binding refresh advice option can only be present in the binding acknowledgement sent from the mobile node's home agent in reply to a registration request. A refresh interval parameter determines the amount of time until the mobile node must send a new registration to the home agent to avoid de-registration and loss of session.

Important: Refer to the refresh-interval-percent and reg-lifetime commands for a complete understanding of registration (binding) lifetimes and refresh intervals.

refresh-interval-percent

Configures percentage of the granted registration lifetime to be used in the refresh interval mobility option in a binding acknowledgement message sent by the LMA service.

Product

P-GW

Privilege

Administrator

Syntax

refresh-interval-percent *number*

default refresh-interval-percent

default

Resets the command value to the default setting of 75.

number

Default: 75
Sets the percent value for session lifetimes for this service.
number must be an integer value from 1 to 99.

Usage

Use this command to configure the amount of the granted registration lifetime to be used in the refresh interval mobility option in the binding acknowledgement message sent by the LMA service to the requesting MAG.
Refreshing a binding or registration is based on the granted registration lifetime. Since a refresh request must be within the granted range of a registration lifetime, this command provides a method of setting the interval of when a refresh request is sent.
As described in RFC 3775 “Mobility Support in IPv6”, if a binding refresh advice option is present in the binding acknowledgement, the refresh interval field in the option must be a value less than the binding lifetime (also returned in the binding acknowledgement). The mobile node then should attempt to refresh its registration at the shorter refresh interval. The home agent will still honor the registration for the lifetime period, even if the mobile node does not refresh its registration within the refresh period.

Important: Refer to the refresh-advice-option and reg-lifetime commands for a complete understanding of registration (binding) lifetimes and refresh intervals.

Example

The following command sets the refresh interval percent to *90*:

```
refresh-interval-percent 90
```

reg-lifetime

Configures the Mobile IPv6 session registration lifetime for this service.

Product

P-GW

Privilege

Administrator

Syntax

reg-lifetime *seconds*

default reg-lifetime

default

Resets the command value to the default setting of 600.

seconds

Default: 600
Sets the time value for session lifetimes for this service.
seconds must be an integer value from1 to 262140.

Usage

Use this command to limit PMIPv6 lifetime on this service. If the PBU contains a lifetime shorter than what is specified, it is granted. If the lifetime is longer, then HA service will limit the granted lifetime to the configured value.

Important: Refer to the refresh-interval-percent and refresh-advice-option commands for a complete understanding of registration (binding) lifetimes and refresh intervals.

Example

The following command sets the registration lifetime for Mobile IPv6 sessions using this service to *1200* seconds (20 minutes):

```
reg-lifetime 1200
```

revocation

Enables the MIP revocation feature and configures revocation parameters.

Product

P-GW

Privilege

Administrator

Syntax

revocation { enable | max-retransmission *number* **| retransmission-timeout** *msecs* **}**

default revocation { enable | max-retransmission | retransmission-timeout }

no revocation enable

default

Resets the keyword to its default value.

no

Disables revocation for this service.

enable

Default: disabled
Enables the MIP registration revocation feature for the LMA service. When enabled, if revocation is negotiated with a MAG and a MIP binding is terminated, the LMA can send a Revocation message to the MAG. This feature is disabled by default.

max-retransmission *number*

Default: 3
The maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer value from 0 through 10.

retransmission-timeout *msecs*

Default: 3000
The number of milliseconds to wait for a Revocation Acknowledgement from the MAG before retransmitting the Revocation message. *msecs* must be an integer value from 500 through 10000.

Usage

Use this command to enable or disable the MIP revocation feature on the LMA or to change settings for this feature.

Example

The following command sets the maximum number of retries for a Revocation message to *6*:

```
revocation max-retransmission 6
```

The following command sets the timeout between retransmissions to *10*:

```
revocation retransmission-timeout 10
```

sequence-number-validate

Configures sequence number validation of the received MIPv6 control packets by the LMA service according to RFC 3775.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] sequence-number-validate
```

default

Resets the command value to the default setting of enabled.

no

Disables the feature.

Usage

Use this command to configure the sequence number validation of the received MIPv6 control packets (PBUs) by the LMA service. This feature validates MIPv6 control packets and insures that any incoming packets with a sequence number prior to the last number received is consider invalid.
If this service has no cache entry of the home address included in the PBU, it will accept any sequence value in the initial PBU from the mobile node.

setup-timeout

The maximum amount of time allowed for session setup.

Product

P-GW

Privilege

Administrator

Syntax

setup-timeout *seconds*

default setup-timeout

default

Resets the command value to the default setting of 60.

seconds

Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session in this service. *seconds* must be an integer value from 1 through 1000000.

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

The following command sets the maximum time allowed for setting up a session to 5 minutes (300 seconds):

```
setup-timeout 300
```

signalling-packets

Enables the DSCP marking feature for IP headers carrying outgoing signalling packets.

Product

P-GW

Privilege

Administrator

Syntax

signalling-packets ip-header-dscp *value*

[default | no] signalling-packets ip-header-dscp

default

Restores the specified parameter to its default setting of 0x0.

no

Disables the specified functionality.

ip-header-dscp *value*

Used to configure the QoS Differentiated Services Code Point (DSCP) marking for IP header encapsulation. *value*: Represents the DSCP setting. It represents the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F. Default is 0x0.

Usage

Use this command to enable or disable the DSCP marking feature for IP headers carrying outgoing signalling packets. DSCP marking is disabled by default.

Example

The following command configures the HSGW service to support DSCP marking for IP headers carrying outgoing signalling packets:

```
signalling-packets ip-header-dscp 0x21
```

simul-bindings

Specifies the maximum number of "care-of" addresses that can simultaneously be bound for the same user as identified by NAI and Home address.

Product

P-GW

Privilege

Administrator

Syntax

simul-bindings *number*

default simul-bindings

default

Resets the command value to the default setting of 1.

number

Default: 1
Configures maximum number of "care of" addresses that can be simultaneously bound for the same user as identified by their NAI and home address. *number* must be an integer value between 1 and 3.

Usage

Per RFC 5213 (and 3775), the LMA service creates a binding record known as a binding cache entry (BCE) for each subscriber session it is facilitating. Each BCE is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care of address.
Typically, the LMA service will delete an old binding and create a new one when the information in the registration request changes. However, the mobile node could request that the LMA maintains previously stored BCEs. This command allows you to configure the maximum number of BCEs that can be stored per subscriber if more than one is requested.

Example

The following command configures the service to support up to 2 addresses per subscriber:

```
simul-bindings 2
```

standalone

Configures the LMA service to start in standalone mode.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] standalone
```

default

Resets the command value to the default setting.

no

Disables the feature.

Usage

Use this command to start the LMA service in standalone mode.

timestamp-option-validation

Configures validation of timestamp option in binding update messages. By default, timestamp option is mandatory.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] timestamp-option-validation
```

default

Resets the command value to the default setting of enabled.

no

Disables the feature.

Usage

Use this command to configure timestamp validation in binding update messages.

timestamp-replay-protection

Designates timestamp replay protection scheme as per RFC 4285.

Product

P-GW

Privilege

Administrator

Syntax

timestamp-replay-protection tolerance *seconds*

[default | no] timestamp-replay-protection tolerance

default

Resets the command value to the default setting of 7.

no

Disables the timestamp replay protection feature.

tolerance *seconds*

Default: 7
Defines the acceptable difference in timing (between timestamps) before rejecting packet, in seconds.
seconds must be an integer value between 0 and 65535.

Usage

Use this command to define the acceptable difference in timing (between timestamps) before rejecting packet.

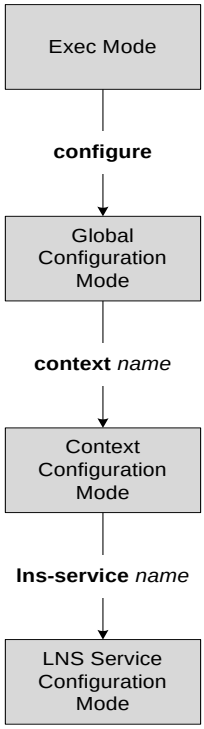
Example

The following command sets the acceptable difference for timestamps to 10 seconds:

```
timestamp-replay-protection tolerance 10
```

Chapter 170
LNS Service Configuration Mode Commands

The LNS Service Configuration Mode is used to create and manage L2TP services within contexts on the system. L2TP Network Server (LNS) services facilitate tunneling with peer L2TP Access Concentrators (LACs).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa accounting

Enables the sending of authentication, authorization, and accounting (AAA) accounting information by the LNS.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting [ roaming ]

[ no ] aaa accounting
```

no

Disables this option.

accounting [roaming]

Enables the sending of AAA accounting information for subscriber sessions by the LNS, by default is enabled.

roaming: Enables the sending of AAA accounting information by the LNS only for roaming subscribers.

Usage

Use this command to enable the sending of AAA accounting information by the LNS. By default this is enabled.

Example

The following command enables the sending of AAA accounting information by the LNS:

```
aaa accounting
```

authentication

Configures the type of subscriber authentication for PPP sessions terminated at the current LNS.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

authentication { { [allow-noauth] [chap *chap_priority* **] [mschap** *mschap_priority* **] [pap** *pap_priority* **] } | msid-auth }**

allow-noauth

Default: Disabled
Configures the LNS to allow PPP sessions access even though they have not been authenticated. This command issued by itself causes the LNS not to attempt authentication for any PPP sessions.
When the **allow-noauth** option is used in conjunction with commands specifying other authentication protocols and priorities to use, then if attempts to use those protocols fail, the system treats the **allow-noauth** option as the lowest priority.
If no authentication is allowed, the system constructs an Network Access Identifier (NAI) to provide accounting records for the PPP session.

chap *chap_priority*

Default: 1
Configures the LNS to attempt to use Challenge Handshake Authentication Protocol (CHAP) to authenticate the PPP session.
A *chap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
chap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.
CHAP is enabled by default as the highest preference.

mschap *mschap_priority*

Default: Disabled
Configures the LNS to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the PPP session.
A *mschap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
mschap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.

pap *pap_priority*

Default: 2
This option configures the LNS to attempt to use the Password Authentication Protocol (PAP) to authenticate the PPP session.
A *pap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
pap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.
PAP is enabled by default as the second highest preference.

msid-auth

Default: Disabled
This option configures the LNS to attempt to authenticate the PPP session based on the Mobile Station Identity (MSID).

Usage

Use to specify how the LNS service should handle authentication and what protocols to use. The flexibility is given to configure this option to accommodate the fact that not every mobile will implement the same authentication protocols.
By default LNS authentication options are set as follows:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

Important: At least one of the keywords must be used to complete the command.

Example

The following command configures the LNS service to allow no authentication for PPP sessions and would perform accounting using the default NAI-construct of username@domain:

```
authentication allow-noauth
```

The following command configures the system to attempt authentication first using CHAP, then MSCHAP, and finally PAP. If the allow-noauth command was also issued, when all attempts to authenticate the subscriber using these protocols failed, then the subscriber would be allowed access:

```
authentication chap 1 mschap 2 pap 3
```

avp map called-number apn

This command maps an incoming Attribute Value Pair (AVP) to a GGSN Access Point Name (APN) for authentication and authorization of the call.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
{ default | no } avp map called-number apn
```

default

Disables mapping.

no

Disables mapping.

Usage

For LNS calls received through a LAC, the ICRQ message includes an APN name in the Called Number AVP. This mapping function enables a GGSN system to provide RADIUS authentication/authorization via a defined APN in place of an LNS configuration. If the mapped APN has not been defined within the GGSN configuration then the call will be rejected.

Example

Enter the following command to enable mapping:

```
avp map called-number apn
```

Enter the following command to disable mapping:

```
no avp map called-number apn
```

bind

This command assigns the IP address of an interface in the current context to the LNS service.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

bind *ip_address* **[max-subscribers** *max_value* **]**

no bind *ip_address*

no

Unassign, or unbind, the local end point to the LNS service.

ip_address

Specifies the IP address of an interface in the current context. This must be a valid IP address entered using IPV4 dotted-decimal notation.

max-subscribers *max_value*

Default: 10000
Specifies the maximum number of subscribers that can be connected to this service at any time. *max_value* must be an integer from 1 through 2500000.

Usage

Use this command to bind the IP address of an interface in the current context to the LNS service.

Example

The following command binds the current context interface IP address *192.168.100.10* to the current LNS service:

```
bind 192.168.100.10
```

The following command removes the binding of the IP address from the LNS service:

```
no bind
```

data sequence-number

Enables data sequence numbering for sessions that use the current LNS service. Data sequence numbering is enabled by default.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] data sequence-number
```

no

Disables data sequence numbering for sessions.

Usage

An L2TP data packet header has an optional data sequence numbers field. The data sequence number may be used to ensure ordered delivery of data packets. This command is used to re-enable or disable the use of the data sequence numbers for data packets.

Example

Use the following command to disable the use of data sequence numbering:

```
no data sequence-number
```

Use the following command to re-enable data sequence numbering:

```
data sequence-number
```

default

This command sets the specified LAC service parameter to its default value or setting.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default { authentication | data sequence-number | ip source-violation | keepalive-
interval | load-balancing | local-receive-window | max-retransmission | max-session-per-
tunnel | max-tunnel-challenge-length | max-tunnels | proxy-lcp-authentication |
retransmission-timeout-first | retransmission-timeout-max | setup-timeout| single-port-
mode | subscriber| trap all tunnel-authentication}
```

authentication

Sets the authentication parameters for PPP sessions to the following defaults:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

data sequence-number

Enables data sequence numbering for sessions.

ip source-violation

Sets the IP source violation parameters to the following defaults:

- drop-limit 10
- period 120 seconds
- reneg-limit 5

keepalive-interval

Sets the interval for send L2TP Hello keepalive if there is no control or data transactions to the default value of 60 seconds.

local-receive-window

Sets the window size to be used for the local side for the reliable control transport to the default of 4.

max-retransmission

Sets the maximum number of retransmissions to the default of 5.

max-session-per-tunnel

Sets the maximum number of sessions per tunnel at any point in time to the default of 65535.

max-tunnel-challenge-length

Sets the maximum length of the tunnel challenge to the default of 16 bytes.

max-tunnels

Sets the maximum number of tunnels for this service to the default of 32000.

proxy-lcp-authentication

Sets sending of proxy LCP authentication parameters to the LNS to the default state of enabled.

retransmission-timeout-first

Sets the first retransmit interval to the default of 1 second.

retransmission-timeout-max

Sets the maximum retransmit interval to the default of 8 seconds.

setup-timeout

Sets the maximum time allowed for session setup to the default of 60 seconds.

single-port-mode

Disables assignment of only port 1107 for incoming tunnels and allows dynamic assignment of ports.

subscriber

Sets the name of the default subscriber configuration to use.

tunnel-authentication

Sets tunnel authentication to the default state of enabled.

trap all

Generates all supported SNMP traps.

tunnel-switching

Sets the ability of the LNS to create subsequent tunnels to the default of enabled.

Usage

Use the default command to set LAC service parameters to their default states.

Example

Use the following command to set the keepalive interval to the default value of 60 seconds:

```
default keepalive-interval
```

Use the following command to set the maximum number of sessions per tunnel to the default value of 512:

default max-session-per-tunnel

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ip source-violation

This command configures settings related to IP source-violation detection.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { clear-on-valid-packet | drop-limit *num* **| period** *secs* **| reneg-limit** *num* **}**

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

drop-limit *num*

Default: 10
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.
num can be an integer from 1 through 1000000.

period *secs*

Default: 120
The length of time (in seconds) for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.
The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If *secs* is not specified, the value is set to the default.
secs can be an integer from 1 through 1000000.

reneg-limit *num*

Default: 5
Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If *num* is not specified, the value is set to the default.
num can be an integer from 1 through 1000000.

Usage

This function allows the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDSNs a number of times during a handoff scenario.
When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period.

Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.
For example, if reneg-limit is set to 5, the system allows five packets with a bad source address (source violations), but on the fifth packet, it re-negotiates PPP.
If the drop-limit is set to 10, the above process of receiving five source violations and renegotiating PPP occurs only once. After the second 5-source violation, the call is dropped. The period timer continues to count throughout this process.
If at any time before the call is dropped, the configured source-violation period is exceeded, the counters for drop-limit is decremented by half and reneg-limit is decremented by 1. See period definition above.

Example

To set the maximum number of source violations before dropping a call to 100, enter the following command:

```
ip source-violation drop-limit 100
```

keepalive-interval

This command specifies the amount of time to wait before sending a Hello keepalive message.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

keepalive-interval *seconds*

no keepalive-interval

no

Disables the generation of Hello keepalive messages on the tunnel.

seconds

Default: 60
Specifies the number of seconds to wait before sending a Hello keepalive message as an integer from 30 through 2147483648.

Usage

Use this command to set the amount of time to wait before sending a Hello keepalive message or disable the generation of Hello keepalive messages completely. A keepalive mechanism is employed by L2TP in order to differentiate tunnel outages from extended periods of no control or data activity on a tunnel. This is accomplished by injecting Hello control messages after a specified period of time has elapsed since the last data or control message was received on a tunnel. As for any other control message, if the Hello message is not reliably delivered then the tunnel is declared down and is reset. The transport reset mechanism along with the injection of Hello messages ensures that a connectivity failure between the LNS and the LAC is detected at both ends of a tunnel.

Example

Use the following command to set the Hello keepalive message interval to *120* seconds:

```
keepalive-interval 120
```

Use the following command to disable the generation of Hello keepalive messages:

```
no keepalive-interval
```

local-receive-window

Specifies the number of control messages the remote peer LAC can send before waiting for an acknowledgement.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

local-receive-window *integer*

integer

Default: 4
Specifies the number of control messages to send before waiting for an acknowledgement as an integer from 1 through 256.

Usage

Use this command to set the size of the control message receive window being offered to the remote peer LAC. The remote peer LAC may send the specified number of control messages before it must wait for an acknowledgment.

Example

The following command sets the local receive window to *10* control messages:

```
local-receive-window 10
```

max-retransmission

Sets the maximum number of retransmissions of a control message to a peer before the tunnel and all sessions within it are cleared.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-retransmission *integer*

integer

Default: 5
Specifies the maximum number of retransmissions of a control message to a peer as an integer from 1 through 10.

Usage

Each tunnel maintains a queue of control messages to be transmitted to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval. For example; if the first retransmission occurs after 1 second, the next retransmission occurs after 2 seconds has elapsed, then the next after 4 seconds. If no peer response is detected after the number of retransmissions set by this command, the tunnel and all sessions within are cleared.
Use this command to set the maximum number of retransmissions that the LAC service sends before closing the tunnel and all sessions within. it.

Example

The following command sets the maximum number of retransmissions of a control message to a peer to 7:

```
max-retransmissions 7
```

max-session-per-tunnel

Sets the maximum number of sessions that can be facilitated by a single tunnel at any time.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-sessions-per-tunnel *integer*

integer

Default: 512
Specifies the maximum number of sessions as an integer from 1 through 65535.

Usage

Use this command to set the maximum number of sessions you want to allow in a tunnel.

Example

The following command sets the maximum number of sessions in a tunnel to *5000*:

```
max-sessions-per-tunnel 5000
```

max-tunnel-challenge-length

Sets the maximum length of the tunnel challenge in bytes. The challenge is used for authentication purposes during tunnel creation.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-tunnel-challenge-length *bytes*

bytes

Default: 16
Specifies the number of bytes to set the maximum length of the tunnel challenge as an integer from 4 through 32.

Usage

Use this command to set the maximum length, in bytes, for the tunnel challenge that is used during tunnel creation.

Example

The following command sets the maximum length of the tunnel challenge to *32* bytes:

```
max-tunnel-challenge-length 32
```

max-tunnels

The maximum number of tunnels that the current LNS service can support.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-tunnels *integer*

integer

Default: 32000
Specifies the maximum number of tunnels as an integer from 1 through 32000.

Usage

Use this command to set the maximum number tunnels that this LNS service can support at any one time.

Example

Use the following command to set the maximum number of tunnels for the current LNS service to *20000*:

```
max-tunnels 20000
```

nai-construction domain

Designates the alias domain name to use for Network Access Identifier (NAI) construction.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

nai-construction domain *domain_name* **{ @ | % | - | \ | # | / }**

no nai-construction domain

---

no

Deletes the NAI construction domain alias.

---

domain_name **{ @ | % | - | \ | # | / }**

Specifies the desired domain name alias followed immediately by a separator from the valid list. *domain_name* must be an alphanumeric string of from 1 through 79 characters.

Usage

Use this command to specify the domain alias and separator to use for NAI construction. The specified domain name must be followed by a valid separator (@ | % | - | \ | # | /).

Example

To specify a domain alias of *mydomain@* with a separator of @, enter the following command:

```
nai-construction domain mydomain@
```

To delete the current setting for the NAI construction domain alias, enter the following command:

```
no nai-construction domain
```

newcall

Configures new call related behavior.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
newcall duplicate-subscriber-requested-address { accept | reject }

default newcall duplicate-subscriber-requested-address
```

duplicate-subscriber-requested-address

Configures how duplicate sessions with same address request are handled

default

Sets or restores default value assigned for specified parameter

Example

The following command configures new call with duplicate address request to accept:

```
newcall duplicate-subscriber-requested-address accept
```

peer-lac

Adds a peer LAC address for the current LNS service. Up to eight peer LACs can be configured for each LNS service.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

peer-lac { *ip_address* | *ip_address*/*mask* } [encrypted] secret *secret* [description *text*]

no peer-lac *ip_address*

no peer-lac *ip_address*

Deletes the peer LAC IP address specified by *ip_address*. *ip_address* must be entered using IPv4 dotted-decimal notation.

ip_address

The IP address of a specific peer LAC for the current LNS service. *ip_address* must be entered using IPv4 dotted-decimal notation.

ip_address/*mask*

A network prefix and mask enabling communication with a group of peer LACs. *ip_address* is the network prefix expressed in IPv4 dotted-decimal notation.
mask is the number of bits that defines the prefix.

[encrypted]

Specifies the encrypted shared key between the LAC and the LNS service.
This keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

secret *secret*

Designates the secret which is shared between the current LNS service and the peer LAC. *secret* must ben alphanumeric string of 1 through 127 characters that is case sensitive.

description *text*

Specifies the descriptive text to use to describe the specified peer LAC. *text* must be an alphanumeric string of 0 through 79 characters.

Usage

Use this command to add a peer LAC address for the current LNS service.

Specific peer LACs can be configured by specifying their individual IP addresses. In addition, to simplify configuration, communication with a group of peer LACs can be enabled by specifying a network prefix and a mask.

Example

The following command adds a peer LAC to the current LNS service with the IP address of *10.10.10.100*, and specifies the shared secret to be *1b34nnf5d*:

```
peer-lac 10.10.10.100 secret 1b34nnf5d
```

The following command enables communication with up to 16 peer LACs on the 192.168.1.0 network each having a secret of *abc123*:

```
peer-lac 92.168.1.0/28 secret abc123
```

The following command removes the peer LAC with the IP address of *10.10.10.200* for the current LNS service:

```
no peer-lac 10.10.10.200
```

proxy-lcp-authentication

Enables/disables proxy LCP authentication.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] proxy-lcp-authentication
```

no

Disables the processing of proxy LCP authentication parameters from the LAC.

proxy-lcp-authentication

Default: Enabled
Enables the processing proxy LCP authentication parameters from the LAC.

Usage

When enabled, if proxy LCP authentication parameters are received from the LAC and are acceptable, the LNS resumes the PPP session from the authentication phase and goes to the IPCP phase.
When disabled, PPP is always started from the LCP phase, ignoring and discarding any proxy LCP authentication parameters received from the LAC. Disable this feature in situations where accept proxy LCP Auth AVPs that the peer LAC sends should not be expected.

Example

Use the following command to disable the processing of proxy LCP authentication parameters from the LAC:

```
no proxy-lcp-authentication
```

Use the following command to re-enable the processing of proxy LCP authentication parameters from the LAC:

```
proxy-lcp-authentication
```

retransmission-timeout-first

Configures the initial timeout for the retransmission of control messages to the peer LAC.

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout-first *integer*

integer

Default: 1
Specifies the amount of time (in seconds) to wait before sending the first control message retransmission. This value is an integer from 1 through 100.

Usage

Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted.

Example

The following command sets the initial retransmission timeout to 3 seconds:

```
retransmission-timeout-first 3
```

retransmission-timeout-max

Configures the maximum amount of time that can elapse before retransmitting control messages to the peer LAC.

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout-max *integer*

integer

Default: 8
Specifies the maximum time (in seconds) to wait before retransmitting control messages. If this limit is reached, the tunnel, and all sessions within it, is cleared. This value is an integer from 1 through 100.

Usage

Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval. For example; if the first retransmission occurs after 1 second, the next retransmission occurs after 2 seconds has elapsed, then the next after 4 seconds. This continues until the limit set by this command is reached. If this limit is reached, the tunnel, and all sessions within it, is cleared.

Example

Use the following command to set the maximum retransmission time-out to *10* seconds:

```
retransmission-timeout-max 10
```

setup-timeout

Configures the maximum amount of time, in seconds, allowed for session setup.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *seconds*

seconds

Default: 60
Specifies the maximum time (in seconds) to wait for the setup of a session. *seconds* must be an integer from 1 through 1000000.

Usage

This command controls the amount of time allowed for tunnel establishment with a peer LAC. If this timer is exceeded the tunnel setup is aborted.

Example

The following command configures a maximum setup time of *120* seconds:

```
setup-timeout 120
```

single-port-mode

When enabled, this command sets the LNS to use only the default local UDP port (port 1701) for the life of a tunnel.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] single-port-mode
```

no

Disable single port mode

Usage

Use this command to control the L2TP LNS tunnel local UDP port assignment mode. If single-port-mode is enabled, the LNS-service uses the standard UDP port (port 1701) for the life of the incoming tunnel. Otherwise, it assigns a new local UDP port number for a tunnel when it responds to a tunnel create request received on the standard port number. This is done for load distributing the tunnel processing between multiple tasks within the system to increase the capacity and performance. Even though all L2TP LACs are required to support such dynamic port assignments during tunnel establishments, there exist some LACs that do not support port assignment other than port 1701. This single-port-mode feature can be enabled to support such LAC peers. This configuration must be applied for the LNS-Service before the **bind** command is executed.

Example

The following command enables single port mode for the current LNS service:

```
single-port-mode
```

trap

This command generates SNMP traps.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] trap all
```

no

Disables SNMP traps.

Usage

Use this command to enable/disable all supported SNMP traps.

Example

To enable all supported SNMP traps, enter the following command;

```
trap all
```

tunnel-authentication

Enables/disables L2TP tunnel authentication for the LNS service.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] tunnel-authentication
```

no

Disables tunnel authentication
Tunnel authentication is enabled by default.

Usage

When tunnel authentication is enabled, a configured shared secret is used to ensure that the LNS service is communicating with an authorized peer LAC. The shared secret is configured by the **peer-lac** command, the **tunnel l2tp** command in the Subscriber Configuration mode, or the **Tunnel-Password** attribute in the subscribers RADIUS profile.

Example

To disable tunnel authentication, use the following command:

```
no tunnel-authentication
```

To re-enable tunnel authentication, use the following command:

```
tunnel-authentication
```

tunnel-switching

Enables or disables the LNS service from creating tunnels to another LAC for an existing tunnel.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] tunnel-switching
```

no

Disable tunnel switching.
Tunnel switching is enabled by default.

Usage

Tunnel switching is when the LNS has a tunnel connected to a LAC and creates a tunnel to a different LAC and routes the data from the original LAC through the new tunnel to the other LAC.

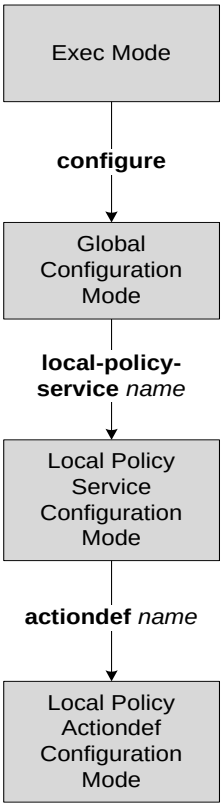
Example

To disable tunnel switching in the LNS, enter the following command;

```
no tunnel-switching
```

Chapter 171
Local Policy Actiondef Configuration Mode Commands

The Local Policy Actiondef Configuration Mode is used to define the action definitions to be used for local QoS policies.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action

This command configures the action priority for an actiondef.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

action priority *priority action_name arguments*

no action priority *priority*

---

priority *priority*

Specifies a priority for the specified action.
priority must be a unique integer from 1 to 2048.

---

action_name arguments

The following actions are supported. *arguments* specifies a set of parameters to be used when invoking the action.

- **activate-ambr uplink** *bandwidth* **downlink** *bandwidth*

  Sets the aggregated maximum bit rate (AMBR) for the APN.

  Configures uplink and downlink bandwidth. *bandwidth* must be an integer from 1 to 1000000000.

- **activate-flow-detection { initiation | termination } ruledef** *ruledef_name*

  Detects a flow and takes action.

  initiation ruledef: Checks for flow initiation and adds a rule definition.

  termination ruledef: Checks for flow termination and adds a rule definition.

  ruledef_name must be an existing ruledef.

- **activate-policy-group**

  Not supported in this release.

- **activate-rule name** *rule_name*

  Activates a rule within ECS rulebase for a subscriber.

  rule_name must be an existing rule within this local QoS policy service expressed as an alphanumeric string of 1 through 63 characters.

- **activate-rulebase name** *rulebase_name*

  Associates the session with a specific rulebase.

  rulebase_name must be an existing rulebase within this local QoS policy service expressed as an alphanumeric string of 1 through 63 characters.

- **allow-requested-qos**

  Allow a specific UE initiated QoS request.

- **allow-session**

Allows the session to continue.

- **create-bearer qci** *value* **arp** *value* **uplink-mbr** *mbr_rate* **downlink-mbr** *mbr_rate* **[uplink-gbr** *gbr_rate* **] downlink-gbr** *gbr_rate*

  Creates a bearer with a specific QCI and BANDWIDTH.

  qci *value* must be an integer from 1 through 254.

  arp *value* must be an integer from 1 through 15 (StarOS v12.1 and earlier) or 1 through 127 (StarOS v12.2 and later).

  uplink-mbr: Uplink maximum bitrate. *mbr_rate* must be an integer from 1 through 1000000000.

  downlink-mbr: Downlink maximum bitrate. *mbr_rate* must be an integer from 1 through 1000000000.

  uplink-gbr: Uplink guaranteed bitrate. *gbr_rate* must be an integer from 1 through 1000000000.

  downlink-gbr: Downlink guaranteed bitrate. *gbr_rate* must be an integer from 1 through 1000000000.

- **deactivate-ambr**

  Removes AMBR control for the specific session.

- **deactivate-flow-detection { initiation | termination } ruledef** *ruledef_name*

  Deactivates detection of flow and takes action.

  initiation ruledef: Checks for flow initiation and adds a rule definition.

  termination ruledef: Checks for flow termination and adds a rule definition.

  ruledef_name must be an existing ruledef.

- **deactivate-policy-group**

  Not supported in this release.

- **deactivate-rule name** *rule_name*

  Deactivates a rule within ECS.

  rule_name must be an existing rule within this local QoS policy service expressed as an alphanumeric string of 1 through 63 characters.

- **deactivate-rulebase name** *rulebase_name*

  Disassociates the rulebase from a session.

  rulebase_name must be an existing rulebase within this local QoS policy service expressed as an alphanumeric string of 1 through 63 characters.

- **default-qos qci** *value* **arp** *value*

  Sets the default QoS parameters for the session

  qci *value* must be an integer from 1 through 254.

  arp *value* must be an integer from 1 through 15 (StarOS v12.1 and earlier) or 1 through 127 (StarOS v12.2 and later).

- **delete-bearer qci** *value* **arp** *value*

  Deletes a bearer

  qci *value* must be an integer from 1 through 254.

arp *value* must be an integer from 1 through 15 (StarOS v12.1 and earlier) or 1 through 127 (StarOS v12.2 and later).

- **reject-requested-qos**

  Reject UE QoS resource request.

- **terminate-session**

  Terminates the session.

no action priority *priority*

Deletes the specified action.

Usage

Use this command to enable the setting of parameters to be used when invoking actions. Actions are a series of operations that are triggered by activated rules.
This command can be entered multiple times to configure multiple actions for an actiondef. The actions are examined in priority order until a match is found and the corresponding action is applied.

Example

The following command creates an action to allow a session to continue with priority set to *125*:

```
action priority 125 allow-session
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

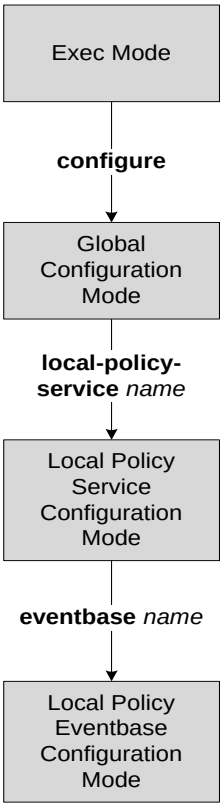
```
exit
```

Usage

Use this command to return to the parent configuration mode.

Chapter 172
Local Policy Eventbase Configuration Mode Commands

The Local Policy Eventbase Configuration Mode is used to configure the events to be used for local QoS policies.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

rule

This command enables the setting of event rules. An event is something that occurs in the system which would trigger a set of actions to take place, such as new-call or rat-change.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

rule priority *priority* **[event** *list_of_events* **] ruledef** *ruledef_name* **actiondef** *actiondef_name* **[continue]**

no rule priority *priority*

---

priority *priority*

Specifies a priority for the specified rule.
priority must be unique and an integer from 1 to 2048.

---

event *list_of_events*

The event is defined by any of the following events. Upon triggering the event, the rules specified in the eventbase are executed.

- **default-qos-change**: The event is triggered as a result of a default QoS change.
- **location-change**: The event is triggered as a result of any change relating to location.
- **new-call**: This event is initiated when a new call is established.
- **out-of-credit**: This event is initiated on out of OCS credit.
- **realloc-of-credit**: This event is initiated on OCS reallocation of credit
- **request-qos**: This event is initiated as the result of UE requested QoS.
- **service-flow**: The event is triggered as a result of a new service flow being detected for the subscriber.

---

ruledef *ruledef_name*

Associates the rule with a specific ruledef.
ruledef_name must be an existing ruledef within this local QoS policy service.

---

actiondef *actiondef_name*

Associates the rule with a specific actiondef.
actiondef_name must be an existing actiondef within this local QoS policy service expressed as an alphanumeric string of 1 through 63 characters.

---

continue

Subsequent rules are also matched; otherwise, rule evaluation is terminated on first match.

no rule priority *priority*

Deletes the specified rule.

Usage

Use this command to create, configure, or delete event rules.
The rules are executed in priority order, and if the rule is matched the action specified in the actiondef is executed. If an event qualifier is associated with a rule, the rule is matched only for that specific event. If a qualifier of **continue** is present at the end of the rule, the subsequent rules are also matched; otherwise, rule evaluation is terminated on first match.
This command can be entered multiple times to configure multiple rules for an eventbase.

Important: A maximum 256 rules are suggested in an eventbase for performance reasons.

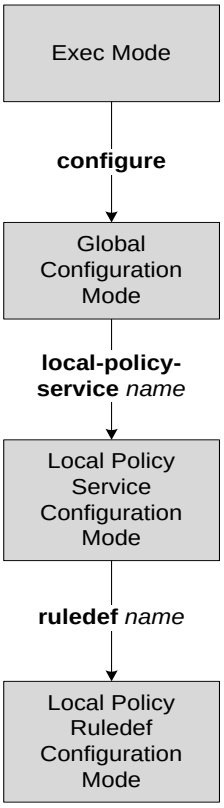
Example

The following command creates a rule with priority set to *2* and associated with **ruledef** *rule5* and **actiondef** *action7*:

```
rule priority 2 ruledef rule5 actiondef action7
```

Chapter 173
Local Policy Ruledef Configuration Mode Commands

The Local Policy Ruledef Configuration Mode is used to configure the rule definitions to be used for local QoS policies.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

condition

This command is used to configure the conditions which trigger the ruledef event.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

```
condition priority priority { variable { eq | ge | gt | le | lt | match | ne | nomatch }
regex | string_value | int_value | set }

no condition priority priority
```

priority *priority*

Specifies a priority for the specified condition.
priority must be unique and an integer from 1 to 2048.

variable

The following variables are supported:

- **apn**

  The APN associated with the current session expressed as an alphanumeric string of 1 through 63 characters.

- **arp**

  The APN associated with the current session expressed as an integer from 1 through 15.

- **bandwidth**

  Total bandwidth associated with the QCI and ARP value associated with the request, expresed as an integer from 0 through 1000000000.

- **date**

  Date value to match. <Clock in format YYYY:MM:DD>

- **day-of-month**

  The day of the month to match the rule to, expressed as an integer from 1 through 31.

- **day-of-week**

  Sunday...Saturday, expressed as an integer from 1 to 7.

- **imeisv**

  IMEISV of the user equipment expressed as an alphanumeric string of 1 through 63 characters.

- **imsi**

  IMSI associated with the subscriber expressed as an alphanumeric string of 1 through 63 characters.

- **meid**

  MEID associated with the subscriber expressed as an alphanumeric string of 1 through 63 characters.

- **month-of-year**

Jan, Feb….Dec, expressed as an integer from 1 through 12.

- **msisdn**

  MSISDN associated with the session expressed as an alphanumeric string of 1 through 63 characters.

- **nai**

  NAI associated with the session expressed as an alphanumeric string of 1 through 63 characters.

- **pdn-count**

  Number of PDNs associated with the same APN, expressed as an integer from 0 through 1000000000.

- **qci**

  QCI associated with the current event expressed as an nteger from 1 through 254.

- **radio-access-technology**

  Radio access technology associated with the subscriber:

  - **cdma-1xrtt**: CDMA 1X RTT radio access technology
  - **cdma-evdo**: CDMA-EVDO radio access technology
  - **cdma-evdo-reva**: CDMA EVDO REVA radio access technology
  - **cdma-other**: Other CDMA radio access technologies
  - **ehrpd**: EHRPD radio access technology
  - **eutran**: EUTRAN radio access technology
  - **gan**: GAN radio access technology
  - **gprs-geran**: GPRS GERAN radio access technology
  - **gprs-other**: Other GPRS radio access technology
  - **hspa**: HSPA radio access technology
  - **unknown**: Unknown radio access technology
  - **wcdma-utran**: WCDMA UTRAN radio access technology
  - **wimax**: WiMax radio access technology
  - **wireless-lan**: Wireless LAN radio access technology

- **serving-node-address**

  IP address associated with the current node serving the subscriber entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

- **serving-plmn**

  PLMN associated with the current node serving the subscribe expressed as an alphanumeric string of 1 through 63 characters.

- **time-of-day**

  Time associated with the change. <Clock in format HH:mm:ss or HH:mm >

---

eq | ge | gt | le | lt | match | ne | nomatch

eq: Operation equal to
ge: Operation greater than or equal to
gt: Operation greater than

le: Operation less than or equal to
lt: Operation less than
match: Operation match
ne: Operation not equal to
nomatch: Operation nomatch

no condition priority *priority*

Deletes the specified condition.

Usage

Use this command to configure the conditions which trigger the ruledef event. A ruledef represents a set of matching conditions.
This command can be entered multiple times to configure multiple conditions for a ruledef. The conditions are examined in priority order until a match is found and the corresponding condition is applied.

Example

The following command creates a condition with priority set to *5* and configured match apn *myapn**:

```
condition priority 5 apn match myapn*
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

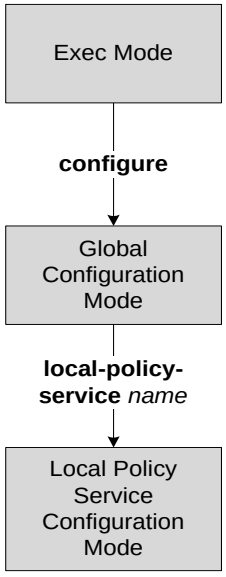
Usage

Use this command to return to the parent configuration mode.

Chapter 174
Local Policy Service Configuration Mode Commands

The Local Policy Service Configuration Mode is used to configure the local QoS policy for one or more services.

Important: A maximum of 16 local QoS policy services are supported.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

actiondef

This command enables creating, configuring, or deleting action definitions for an event.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

actiondef *actiondef_name* **[-noconfirm]**

no actiondef *actiondef_name*

no

Deletes the specified actiondef from the local QoS policy service.

actiondef_name

Specifies name of the actiondef.
actiondef_name must be unique within the service expressed as an alphanumeric string of 1 through 63 characters.
If the named actiondef does not exist, it is created, and the CLI mode changes to the Local Policy Actiondef Configuration Mode wherein the actiondef can be configured.
If the named actiondef already exists, the CLI mode changes to the Local Policy Actiondef Configuration Mode for that actiondef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create, configure, or delete an actiondef. The actiondef configuration is used to configure the action definitions for an event. The event ruledef will have one or more rules and associated action(s).
This command can be entered multiple times to specify multiple actiondefs.

Important: A maximum of 256 actiondefs are suggested in a local QoS policy service for performance reasons. An actiondef can be referenced by multiple eventbases.

Entering this command results in the following prompt:

```
[context_name]hostname(config-local-policy-actiondef)#
```

Local Policy Actiondef Configuration Mode commands are defined in the *Local Policy Actiondef Configuration Mode Commands* chapter.

Example

The following command creates an actiondef named *actiondef1* and enters the Local Policy Actiondef Configuration Mode:

```
actiondef actiondef1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

eventbase

This command enables creating, configuring, or deleting an eventbase.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

eventbase *eventbase_name* **[-noconfirm]**

no eventbase *eventbase_name*

no

Deletes the specified eventbase from the local QoS policy service.

eventbase_name

Specifies name of the eventbase.
eventbase_name must be unique within the service expressed as an alphanumeric string of 1 through 63 characters.

Important: Currently, only one eventbase is supported, and it must be named "default".

If the named eventbase does not exist, it is created, and the CLI mode changes to the Local Policy Eventbase Configuration Mode wherein the eventbase can be configured.
If the named eventbase already exists, the CLI mode changes to the Local Policy Eventbase Configuration Mode for that eventbase.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create, configure, or delete an eventbase.
Entering this command results in the following prompt:

```
[context_name]hostname(config-local-policy-eventbase)#
```

Local Policy Eventbase Configuration Mode commands are defined in the *Local Policy Eventbase Configuration Mode Commands* chapter.

Example

The following command creates an eventbase named *default* and enters the Local Policy Eventbase Configuration Mode:

```
eventbase default
```

ruledef

This command enables creating, configuring, or deleting a rule definition.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

ruledef *ruledef_name* **[-noconfirm]**

no ruledef *ruledef_name*

no

Deletes the specified ruledef from the local QoS policy service.

ruledef_name

Specifies name of the ruledef.
ruledef_name must be unique within the service expressed as an alphanumeric string of 1 through 63 characters.
If the named ruledef does not exist, it is created, and the CLI mode changes to the Local Policy Ruledef Configuration Mode wherein the ruledef can be configured.
If the named ruledef already exists, the CLI mode changes to the Local Policy Ruledef Configuration Mode for that ruledef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create, configure, or delete a ruledef. A ruledef represents a set of matching conditions. This command can be entered multiple times to specify multiple ruledefs.

Important: A maximum 256 ruledefs are suggested in a local QoS policy service for performance reasons.

Entering this command results in the following prompt:

```
[context_name]hostname(config-local-policy-ruledef)#
```

Local Policy Ruledef Configuration Mode commands are defined in the *Local Policy Ruledef Configuration Mode Commands* chapter.

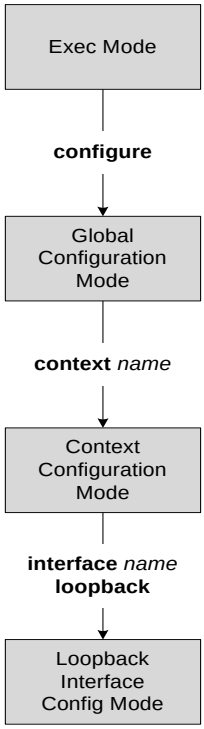
Example

The following command creates a ruledef named *rule5* and enters the Local Policy Ruledef Configuration Mode:

```
ruledef rule5
```

Chapter 175
Loopback Interface Configuration Mode Commands

Use the Loopback Interface Configuration mode to create and manage loopback interfaces that provide IP addresses that are always available and reachable from any interface within a given context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

crypto-map

Applies the specified IPSec crypto-map to this interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

crypto-map *map_name* **[secondary-address** *sec_ip_addr* **]**

no

Deletes the application of the crypto map on this interface.

map_name

Specifies the name of the crypto map being applied. The name is an alphanumeric string of 1 through 127 characters that is case sensitive.

secondary-address *sec_ip_addr*

Applies the crypto map to the secondary address for this interface that is specified by *sec_ip_addr*. *sec_ip_addr* must be specified using the IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

In order for ISAKMP and/or manual crypto maps to work, they must be applied to a specific interface using this command. Dynamic crypto maps should **not** be applied to interfaces.
The crypto map must be configured in the same context as the interface.

Example

To apply the IPSec crypto map named cmap1 to this interface, use the following command:

```
crypto-map cmap1
```

description

Use this command to configure the descriptive text for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

description *text***no description**

no

Clears the description for the interface.

text

Specifies the descriptive text to use. For *text*, enter an alphanumeric string of 0 through 79 characters. If spaces or special characters are required, the stirng must be bracketed with double quotation marks.

Usage

Set the description to provide any useful information on the interface's primary function, services, end users.

Example

```
description sampleInterfaceDescriptiveText
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

ip address

Use this command to configure the IP options for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip address { *ip_address ip_mask* | *ip_address/bitmask* **} [secondary | srp-activate]**

no ip address ip_address

no

Deletes the IP address you specify from the interface configuration.

address {*ip_address ip_mask* | *ip_address/bitmask***} [secondary | srp-activate]**

Configures the IP address and network mask for the interface.
Enter an *ip_address ip_mask* to specify an IP address and the subnet mask pair that identifies the IP address of the interface. *ip_address* is entered in IPv4 dotted-decimal or IPv6 colon-separated notation. Currently, the only value accepted for *ip_mask* is 255.255.255.255 (IPv4) or 120 (IPv6) .
For the network mask, *ip_address/net_mask*, enter the IP address and the length in bits of the network mask, Fo example, 192.168.1.0/32 (IPv4) or fe80::c0a8:100/32 (IPV6). Currently, the only value accepted for bit_mask is 32.
Use the **secondary** keyword ito configure a secondary IP address on the interface. This is referred to as multi-homing of the interface.
Use the **srp-activate** keyword to activate the IP address for Interchassis Session Recovery (ICSR).

Usage

Create and manage loopback interfaces for the current context.

Example

The following command configures IP address to associate with the interface:

```
ip address 1.2.3.4 255.255.255.255
```

The following command removes the associated IP address for the interface:

```
no ip address 10.2.3.4
```

ip vrf

Use this command to configure the IP VPN Routing Forwarding (VRF) instance for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip vrf forwarding *vrf_name***no vrf forwarding**

no

Deletes the IP VRF instance you specify from the interface configuration.

vrf_name

Specifies the preconfigured IP VRF instance name to be used with this interface.
For *vrf_name*, enter a VRF instance name that was preconfigured via the **ip vrf forwarding** command in Context Configuration mode.

Usage

Use this command to associate a preconfigured IP VRF instance for the current interface.

Example

The following command associates a preconfigured IP VRF instance named *vrf_1* with this interface:

```
ip vrf forwarding vrf_1
```

ipv6 address

Use this command to configure the IPv6 options for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ipv6 address *ipv6_address ip_mask* **[srp-activate]**

no iv6p address *ipv6_address*

no

Deletes the specified IPv6 address from the interface configuration.

address *ipv6_address ip_mask* **[srp-activate]**

Configures the IP address and network mask for the interface.
ipv6_address ip_mask specifies an IP address and the subnet mask pair that identifies the IPv6 address of the interface. Specify *ipv6_address* in IPv6 colon-separated notation.
The **srp-activate** keyword activates the IPv6 address for Session Recovery.

Usage

Create and manage loopback interfaces for the current context and enable Session Redundancy Protocol (SRP) when appropriate.

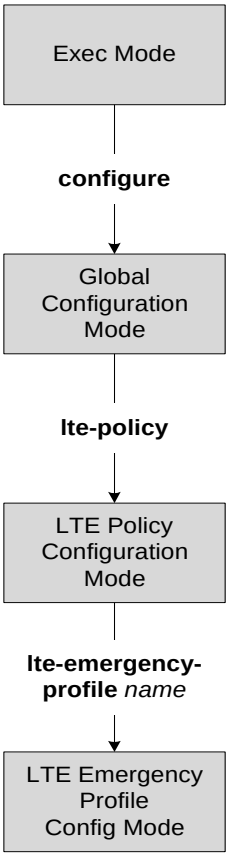
Example

The following command configures an IPv6 address to associate with the interface and enables SRP:

```
ipv6 address 2001:268:2008:b::1021/128 srp-activate
```

Chapter 176
LTE Emergency Profile Configuration Mode Commands

This mode configures parameters supporting the IP Multimedia Subsystem (IMS) emergency bearer services. Connectivity to an emergency Packet Data Network (PDN) is statically configured in this mode.



ambr

Configures the maximum aggregated uplink and downlink bitrate values for this profile.

Product

MME

Privilege

Administrator

Syntax

ambr max-ul *bitrate* **max-dl** *bitrate*

no ambr

no

Removes the aggregated maximum bitrate (AMBR) configuration for this emergency profile.

max-ul *bitrate*

Configures the maximum aggregated bitrate value for the uplink as an integer from 0 through 1410065408.

max-dl *bitrate*

Configures the maximum aggregated bitrate value for the downlink as an integer from 0 through 1410065408.

Usage

Use this command to configure uplink and downlink maximum aggregated bitrate values to be shared across all non-guaranteed bitrate bearers established for the emergency session.

Example

The following example configures the uplink AMBR value to *2000* bps and the downlink AMBR value to *2000* bps:

```
ambr max-ul 2000 max-dl 2000
```

apn

Configures the name and PDN type of the access point name (APN) used for emergency PDN connections.

Product

MME

Privilege

Administrator

Syntax

apn *apn_name* **pdn-type { ipv4 | ipv4v6 | ipv6 }**

no apn

no

Removes the selected APN from the profile.

apn_name

apn_name specifies the name of a pre-configured APN profile to associate with this LTE emergency profile. For more information on APNs, refer to the **apn** command in the *Context Configuration Mode Commands* chapter.

pdn-type { ipv4 | ipv4v6 | ipv6 }

Configures the packet data network type supported by the APN and this profile.
ipv4: Specifies that the PDN supports IPv4 network traffic.
ipv4v6: Specifies that the PDN supports both IPv4 and IPv6 network traffic.
ipv6: Specifies that the PDN supports IPv6 network traffic.

Usage

Use this command to select the APN to be used for emergency bearer services. APNs are configured through the APN Configuration mode. For more information regarding APN configuration mode commands, refer to the *APN Configuration Mode Commands* chapter.

Example

The following command specifies that the APN named *apn-3.com* is to be used for emergency bearer services and that the PDN supports IPv4 traffic only:

```
apn apn-3.com pdn-type ipv4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

pgw

Statically configures a P-GW to support emergency bearer services for this profile.

Product

MME

Privilege

Administrator

Syntax

pgw fqdn *fqdn*

pgw ip-address *address* **protocol { both | gtp | pmip } weight** *value*

no pgw { fqdn | ip-address *address* **}**

no *fqdn*

Removes the specified P-GW Fully Qualified Domain Name (FQDN) or IP address from this profile.

fqdn *fqdn*

Specifies the domain name of the P-GW as an alphanumeric string of 1 through 256 characters.

Important: A maximum of one P-GW FQDN configuration is allowed per profile.

ip-address *address*

Specifies the IP address for the P-GW in IPv4 dotted-decimal or IPv6 colon-separated notation.

Important: A maximum of four P-GW IP address configurations are allowed per profile.

protocol { both | gtp | pmip }

Specifies the protocol the P-GW supports. Options are:

- **both**: Specifies that both the GTP and PMIP protocols are supported.
- **gtp**: Specifies that only GTP is supported.
- **pmip**: Specifies that only PMIP is supported.

weight *value*

Assigns a weight to P-GW IP address to use as a preferred P-GW as an integer from 1 through 100. Lowest value has the least preference.

Usage

Use this command to statically configure the P-GW used to support emergency bearer services through this profile.

Example

The following command configures the P-GW supporting emergency bearer services for this profile as *pdn-911.gov*:

```
pgw fqdn P-GW FQDN
```

The following command configures the P-GW supporting emergency bearer services for this profile as having an IPv4 address of *10.2.3.4*, supporting GTP only, and having a weight of *10*:

```
pgw ip-address 10.2.3.4 protocol gtp weight 10
```

qos

Configures the quality of service (QoS) parameters for the emergency bearer service.

Product

MME

Privilege

Administrator

Syntax

qos qci *qci* **arp** *arp_value* **preemption-capability { may | shall-not } vulnerability { not-preemptable | preemtable }**

no qos

qci *qci*

Specifies the QoS Class Identifier (QCI) for the emergency bearer profile as an integer from 0 through 255.

arp *arp_value*

Defines the address retention priority value as an integer from 1 through 15.

preemption-capability { may | shall-not }

Specifies the preemption capability flag. Options are:

- **may**: Bearer may be preempted
- **shall-not**: Bearer shall not be preempted

vulnerability { not-preemptable | preemptable }

Specifies the vulnerability flag. Options are:

- **not-preemptable**: Bearer cannot be preempted.
- **preemptable**: Bearer can be preempted.

Usage

Use this command to set the QoS ARP and QCI parameters for the emergency bearer configuration.

Example

The following command sets the QCI number to *7*, the ARP value to *2* the preemption capability to “may”, and the vulnerability flag to “pre-emptable”:

```
qos qci 7 arp 2 preemption-capability may vulnerability preemptable
```

ue-validation-level

Configures the type of user equipment (UE) that can use the emergency bearer service through the profile.

Product

MME

Privilege

Administrator

Syntax

```
ue-validation-level { auth-only | full | imsi | none }

default ue-validation-level
```

default

Returns the command to its default setting of "none".

{ auth-only | full | imsi | none }

Specifies the type of UE allowed to use the emergency bearer service. Options are:

- **auth-only**: Specifies that UEs that have been authenticated are allowed to use the emergency bearer service. These UEs may be in a limited service state in that they may be in an area with restricted service or where they are restricted from services. Enabling this option also causes subscription and location validation to be bypassed.
- **full**: Specifies that only UEs that have been authenticated and have successfully passed subscription and location validation are allowed to use the emergency bearer service. Enabling this option indicates that only UEs that are capable of normal attach procedures will be allowed to use the emergency bearer service.
- **imsi**: Specifies that UEs with an International Mobile Subscriber Identity (IMSI) are allowed to use the emergency bearer service regardless of authentication. Even if authentication fails, the UE is granted access.
- **none**: Specifies that all UEs are allowed to use the service. This is the default value for the command.

Usage

Use this command to indicate which UEs can use the emergency bearer service through this profile.

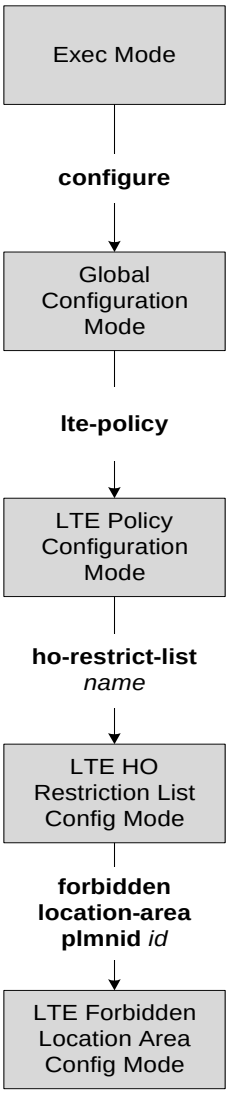
Example

The following command configures the type of UE allowed to use the emergency bearer service to "IMSI required, authentication optional":

```
ue-validation-level imsi
```

Chapter 177
LTE Forbidden Location Area Configuration Mode Commands

The LTE Forbidden Location Area Configuration Mode is used to create and manage forbidden 3G location area code (LAC) configurations.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

lac

Configures a 3G location area code (LAC) or area codes where a UE, associated with this LTE policy, is restricted from participating in a handover scenario.

Product

MME

Privilege

Administrator

Syntax

```
[ no ] lac { area_code } +
```

no

Removes a configured forbidden handover area code or area codes from this policy. If no location area code is specified, then all location area codes are removed.

area_code

Specifies an area code or area codes from which UEs are restricted from participating in a handover as an integer from 0 through 65535. Multiple area codes can be entered (up to 128 in a single line, separated by spaces).

Usage

Use this command to configure 3G location-based area codes that will be forbidden to UEs associated with this LTE policy.

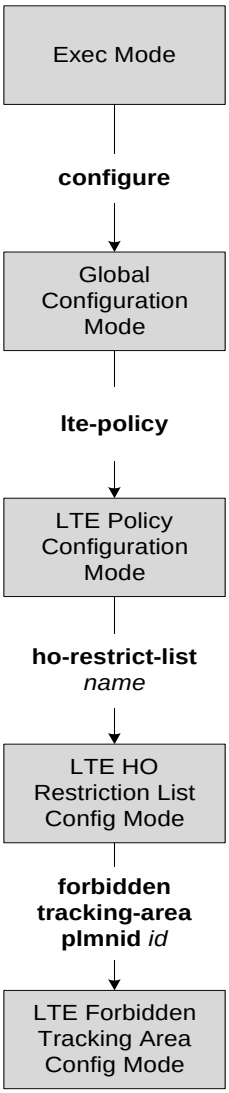
Example

The following command configures eight location-based area codes (1, 2, 3, 4, 5, 6, 7, 8) where a UE, associated with this LTE policy, is restricted from participating in a handover scenario:

```
lac 1 2 3 4 5 6 7 8
```

Chapter 178
LTE Forbidden Tracking Area Configuration Mode Commands

The LTE Forbidden Tracking Area Configuration Mode is used to create and manage forbidden tracking area code (TAC) configurations.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

tac

Configures a tracking area code (TAC) or area codes where a UE, associated with this LTE policy, is restricted from participating in a handover scenario.

Product

MME

Privilege

Administrator

Syntax

[no] tac *area_code*

no

Removes a configured forbidden handover area code or area codes from this policy. If no tracking area code is specified, then all tracking area codes are removed.

area_code

Specifies a tracking area code or area codes from which UEs are restricted from participating in a handover as an integer from 0 to 65535. Multiple area codes can be entered (up to 128 in a single line, separated by spaces).

Usage

Use this command to configure tracking area codes that will be forbidden to UEs associated with this LTE policy.

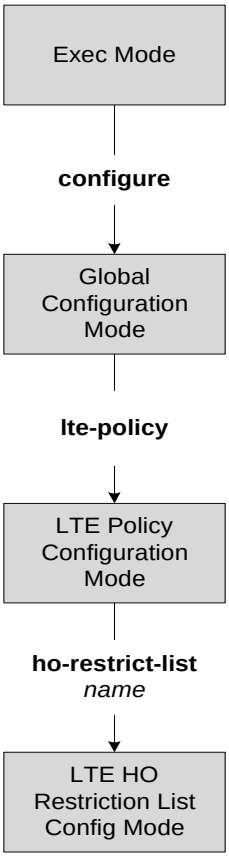
Example

The following command configures two tracking area codes (1, 2, 3, 4, 5, 6, 7, 8) where a UE, associated with this LTE policy, is restricted from participating in a handover *scenario*:

```
tac 1 2 3 4 5 6 7 8
```

Chapter 179
LTE Handover Restriction List Configuration Mode Commands

The LTE Handover Restriction List Configuration Mode is used to create and manage the LTE handover restriction lists for LTE/SAE networks. Handover restriction lists are used to restrict user equipment (UE) from participating in specified handovers. The MME creates the handover restriction lists as part of its local policy and provides them to the eNobeB where the restrictions are enforced.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

forbidden

Configures the handover restriction lists provided to eNodeBs where handover restrictions are enforced for UEs.

Product

MME

Privilege

Administrator

Syntax

```
[ no ] forbidden { inter-rat { all | cdma2000 | geran | utran } | location-area plmnid id
| tracking-area plmnid id }

default forbidden inter-rat
```

default forbidden inter-rat

Removes the forbidden inter-RAT configuration from the LTE policy.

no

Removes the forbidden configuration from the LTE policy.

inter-rat { all | cdma2000 | geran | utran }

Specifies that one or all Radio Access Technology (RAT) handovers are to be prohibited for UEs associated with the LTE policy.
all: Specifies that all inter-RAT handovers are to be prohibited for UEs associated with the LTE policy.
cdma2000: Specifies that all CDMA2000 handovers are to be prohibited for UEs associated with the LTE policy.
geran: Specifies that all GSM EDGE Radio Access Network (GERAN) handovers are to be prohibited for UEs associated with the LTE policy.
utran: Specifies that all UMTS Terrestrial Radio Access Network (UTRAN) handovers are to be prohibited for UEs associated with the LTE policy.

location-area plmnid *id*

Specifies that handovers to 3G location area codes defined through this keyword and subsequent configuration mode are to be prohibited for UEs associated with the LTE policy. Enters the LTE Forbidden Location Area Configuration Mode. *id* must be a valid PLMN ID expressed as an integer comprised of an MCC (Mobile Country Code) and MNC (Mobile Network Code) [five-digit minimum, six-digit maximum].

Important: Up to 16 forbidden location area PLMN IDs can be configured per handover restriction list.

Entering this command results in the following prompt:

```
[context_name]hostname(forbidden_la)#
```

LTE Forbidden Location Area Configuration Mode commands are defined in the *LTE Forbidden Location Area Configuration Mode Commands* chapter.

tracking-area plmnid *id*

Specifies that handovers to 4G tracking area codes defined through this keyword and subsequent configuration mode are to be prohibited for UEs associated with the LTE policy. Enters the LTE Forbidden Tracking Area Configuration Mode. *id* must be a valid PLMN ID and be an integer value comprising an MCC and MNC (five-digit minimum, six-digit maximum).

Important: Up to 16 forbidden tracking area PLMN IDs can be configured per handover restriction list.

Entering this command results in the following prompt:

```
[context_name]hostname(forbidden_ta)#
```

LTE Forbidden Tracking Area Configuration Mode commands are defined in the *LTE Forbidden Tracking Area Configuration Mode Commands* chapter.

Usage

Use this command to create the list of restricted handover types that apply to all UEs associated with the LTE policy.

Example

The following command prohibits UEs associated with this LTE policy from participating in a handover to a GERAN network type:

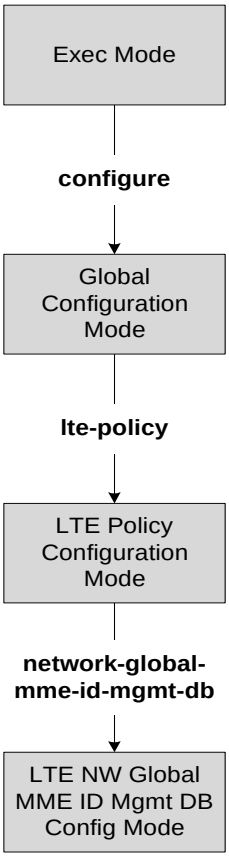
```
forbidden inter-rat geran
```

The following command prohibits UEs, associated with this LTE policy and a mobile network with a PLMN ID of *12345*, from participating in a handover to location area codes defined in the Location Area Configuration Mode:

```
forbidden location-area plmnid 12345
```

Chapter 180
LTE Network Global MME ID Management Database Configuration Mode Commands

The LTE Network Global MME ID Management Database Configuration Mode is used to create associations between PLMN IDs and MME group ID ranges.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

plmn

Configures associations between public land mobile network (PLMN) IDs and ranges of MME group IDs.

Product

MME

Privilege

Administrator

Syntax

[no] plmn mcc *mcc_value* **mnc** *mnc_value* **mme-group-id-range first** *id* **last** *id*

no

Removes the selected PLMN ID to MME group ID range from the MME ID management database.

mcc *mcc_value* **mnc** *mnc_value*

mcc *mcc_value*: Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.
mnc *mnc_value*: Specifies the mobile network code (MNC) portion of the PLMN identifier a 2- or 3-digit integer from 00 through 999.

mme-group-id-range first *id* **last** *id*

Specifies the range of MME group IDs to apply to the PLMN ID as an integer from 0 to 65535.

Usage

Use this command to create associations between PLMN IDs and a range of MME group IDs.

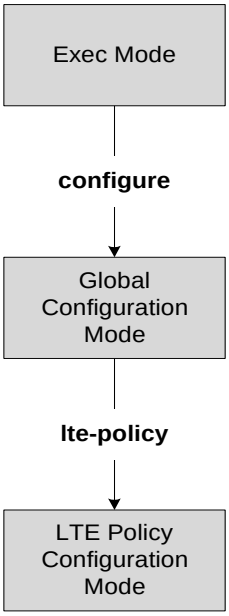
Example

The following command creates an association between a PLMN ID of *12323* and a set of MME group IDs with a range of *500* through *575*:

```
plmn mcc 12323 mnc 23 mme-group-id-range first 500 last 575
```

Chapter 181
LTE Policy Configuration Mode Commands

The LTE Policy Configuration Mode is used to create and manage the LTE policies supporting MME and S-GW configurations on the system.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

ho-restrict-list

Creates a handover (HO) restriction list or specifies an existing HO restriction list and enters the Handover Restriction List Configuration Mode.

Product

MME, S-GW

Privilege

Administrator

Syntax

[no] ho-restrict-list *list_name* **[-noconfirm]**

no

Removes the specified restriction list from the system.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

list_name

Specifies the name of the HO restriction list. If the entered list name does not refer to an existing list, a new list is created. *list_name* is an alphanumeric string of 1 through 64 characters.

Usage

Use this command to enter the Handover Restriction List Configuration Mode for an existing list or for a newly defined list. This command is also used to remove an existing list.
Entering this command results in the following prompt:

```
[context_name]hostname(ho-restrict-list)#
```

Handover Restriction List Configuration Mode commands are defined in the *LTE Handover Restriction List Configuration Mode Commands* chapter.

Example

The following command enters the Handover Restriction List Configuration Mode for a new or existing list named *ho_restricit_list1*:

```
ho-restrict-list ho_restrict_list1
```

lte-emergency-profile

Creates an LTE emergency profile or specifies an existing emergency profile and enters the LTE Emergency Profile Configuration Mode.

Product

MME, S-GW

Privilege

Administrator

Syntax

`[ no ] lte-emergency-profile` *`profile_name`* **`[ -noconfirm ]`**

`no`

Removes an LTE emergency profile from the system.

`name`

Specifies the name of the LTE emergency profile being created or accessed. If the profile name does not refer to an existing profile, a new profile is created. *`profile_name`* is an alphanumeric string of 1 through 64 characters.

`-noconfirm`

Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to enter the LTE Emergency Profile Configuration Mode for an existing profile or for a newly defined profile. This command is also used to remove an existing profile.

Important: A maximum of four LTE emergency profiles are allowed per system.

Entering this command results in the following prompt:

```
[context_name]hostname(lte-emergency-profile)#
```

LTE Emergency Profile Configuration Mode commands are defined in the *LTE Emergency Profile Configuration Mode Commands* chapter.

Example

The following command enters the LTE Emergency Profile Configuration Mode for a new or existing profile named *`emergency_profile3`*:

```
lte-emergency-profile emergency_profile3
```

network-global-mme-id-mgmt-db

Creates a new, or enters the existing MME group ID management database.

Product

MME, S-GW

Privilege

Administrator

Syntax

```
[ no ] network-global-mme-id-mgmt-db
```

no

Remove the global MME ID management database from the system.

Usage

Use this command to create a new, or enter the existing MME group ID management database. The MME group ID management database is used to create associations between PLMN IDs and ranges of MME group IDs.

Important: Only one MME group ID management database can be created per system.

Entering this command results in the following prompt:

```
[context_name]hostname(network-global-mme-id-mgmt-db)#
```

Global MME ID management database commands are defined in the *LTE Network Global MME ID Management Database Configuration Mode Commands* chapter.

subscriber-map

Creates a subscriber map or specifies an existing subscriber map and enters the Subscriber Map Configuration Mode.

Product

MME, S-GW

Privilege

Administrator

Syntax

[no] subscriber-map *map_name* **[-noconfirm]**

no

Removes the specified subscriber map from the system.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

map_name

Specifies the name of the subscriber map. If the map name does not refer to an existing map, a new map is created. *map_name* must be an alphanumeric string of 1 through 64 characters.

Usage

Enter the Subscriber Map Configuration Mode for an existing or newly defined map. This command is also used to remove an existing map.
Entering this command results in the following prompt:

```
[context_name]hostname(subscriber-map)#
```

Subscriber Map Configuration Mode commands are defined in the *Subscriber Map Configuration Mode Commands* chapter.

Example

The following command enters the existing Subscriber Map Configuration Mode (or creates it if it does not already exist) for the map named *map1*:

```
subscriber-map map1
```

tai-mgmt-db

Creates a Tracking Area Identifier (TAI) Management Database or specifies an existing database and enters the TAI Management Database Configuration mode.

Product

MME, S-GW

Privilege

Administrator

Syntax

[no] tai-mgmt-db *db_name* **[-noconfirm]**

no

Removes the specified management database from the system.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

db_name

Specifies the name of the management database. If the name does not refer to an existing database, a new database is created. *db_name* is an alphanumeric string of 1 through 64 characters.

Usage

Enter the TAI Management Database Configuration Mode for an existing or newly defined database. This command is also used to remove an existing database.
Entering this command results in the following prompt:

```
[context_name]hostname(tai-mgmt-db)#
```

TAI Management Database Configuration Mode commands are defined in the *TAI Management Database Configuration Mode Commands* chapter.

Example

The following command enters the existing TAI Management Database configuration mode (or creates it if it does not already exist) for the database named *tai_db1*:

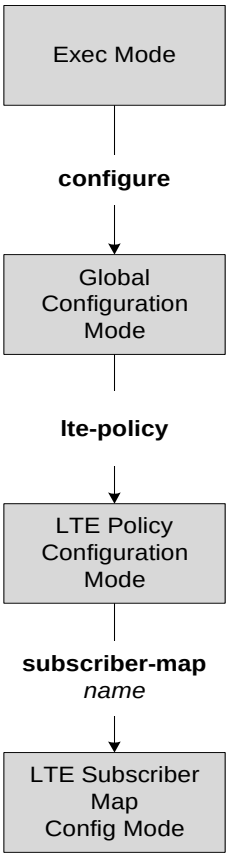
```
tai-mgmt-db tai_db1
```

Chapter 182
LTE Subscriber Map Configuration Mode Commands

The LTE Subscriber Map Configuration Mode is used to create and manage subscriber maps for applying operator policy templates to individual subscribers and/or groups of subscribers.

Subscriber mappings are ordered lists containing explicit UE matching criteria. The maps are examined for specific UE identity information such as the UE's IMSI. The system uses the first map that matches the criteria to associate an operator policy with the UE.

Subscriber maps can be modified but will only affect future subscribers and not subscribers already attached to UEs.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

precedence

Sets the order of precedence, the matching criteria and the association to an operator policy for subscribers meeting the match criteria.

Product

MME, S-GW

Privilege

Administrator

Syntax

precedence *number* **match-criteria all operator-policy-name** *policy_name*

precedence *number* **match-criteria imsi mcc** *mcc_num* **mnc** *mnc_num* **[msin first** *start_range* **last** *end_range* **| service-plmnid** *id* **] operator-policy-name** *policy_name*

precedence *number* **match-criteria service-plmnid** *id* **operator-policy-name** *policy_name*

no precedence *number*

no

Removes the selected precedence number from the subscriber map. *number* must be an integer value from 1 to 1024.

number

Specifies the order of precedence for the subscriber map. 1 is the highest precedence. *number* must be an integer value from 1 to 1024.

match-criteria

Specifies that the keyword following this keyword is the criteria to be used to match a UE.

all

Specifies that all UEs are to be associated with the operator policy.

imsi mcc *mcc_num* **mnc** *mnc_num* **[msin first** *start_range* **last** *end_range* **| service-plmnid** *id* **]**

Specifies that UEs with criteria matching the International Mobile Subscriber Identifier (IMSI) information (MCC and MNC) are to be associated with a specified operator policy.
mcc *mcc_num*: Specifies the mobile country code (MCC) portion of the IMSI identifier as an integer value between 100 and 999.
mnc *mnc_num*: Specifies the mobile network code (MNC) portion of the IMSI identifier as a 2- or 3-digit integer value between 00 and 999.
msin first *start_range* **last** *end_range*: Optionally specifies a range of Mobile Subscriber Identification Numbers that further narrows the match criteria for the IMSI match configuration. *start_range* and *end_range* must each be an integer value of 10 digits.

service-plmnid *id*: Optionally specifies a local service PLMN ID number used further narrow the IMSI-based operator policy selection. *id* must be an integer value of five digits minimum and six digits maximum (the combination of the MCC and MNC).

service-plmnid *id*

Specifies a local service PLMN ID number used for PLMN ID-based operator policy selection. *id* must be an integer value of five digits minimum and six digits maximum (the combination of the MCC and MNC).

operator-policy-name *policy_name*

Sets the operator policy with which the matching criteria is associated. *policy_name* must be an existing operator policy expressed as an alphanumeric string of 1 through 64 characters. Operator policies are configured in the Operator Policy Configuration Mode. For more information about operator policies, refer to the *Operator Policy Configuration Mode Commands* chapter.

Usage

The operator policy provides mechanisms to fine tune the behavior of subsets of subscribers above and beyond the behaviors described in the user profile. It is also used to control the behavior or visiting subscribers in roaming scenarios, enforce roaming agreements, and provide a measure of local protection against foreign subscribers.

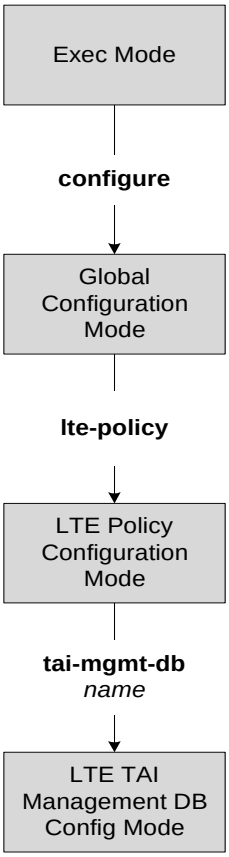
Example

The following command associates the operator policy named *op_pol1* with UEs associated with an IMSI MCC of *111*, an MNC of *222*, and a service PLMN ID of *123456*:

```
precedence 100 match-criteria imsi mcc 111 mnc 222 service-plmnid 123456
operator-policy-name op_pol1
```

Chapter 183
LTE TAI Management Database Configuration Mode Commands

The LTE TAI Management Database Configuration Mode is used to create and manage the LTE Tracking Area Identifier (TAI) management database configuration for LTE polices configured on this system.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

tai-mgmt-obj

Creates new, or removes/enters existing, LTE Tracking Area Identifier (TAI) object configurations.

Product

MME

Privilege

Administrator

Syntax

[no] tai-mgmt-obj *object_name* **[-noconfirm]**

no

Removes a configured TAI management object from the TAI management database.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

object_name

Specifies the name of the TAI management object and enters the LTE TAI Management Object Configuration Mode as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to enter the LTE TAI Management Object Configuration Mode for an existing object or for a newly defined object. This command is also used to remove an existing object.
Entering this command results in the following prompt:

```
[context_name]hostname(tai-mgmt-obj)#
```

LTE TAI Management Object Configuration Mode commands are defined in the *LTE TAI Management Object Configuration Mode Commands* chapter.

Example

The following command creates a TAI management object called *tai-obj3* and enters the LTE TAI Management Object Configuration Mode:

```
tai-mgmt-obj tai-obj3
```

timezone

Configures the timezone to be used for the UE timezone in S11 and Non Access Stratum (NAS) messages.

Product

MME

Privilege

Administrator

Syntax

timezone { + | - } hours *value* **[minutes { 0 | 15 | 30 | 45 }]**

no timezone

Removes the timezone configuration from the management database.

+ | -

Specifies the offset direction from the Coordinated Universal Time (UTC).

hours *value*

Specifies the offset from UTC in hours. *value* must be an integer from 0 through 14.

minutes { 0 | 15 | 30 | 45 }

Optionally specifies the offset minutes added to the hours value.

Usage

Use this command to configure the timezone to be used for the UE timezone in S11 and NAS messages.

Important: Time zone configurations at the TAI Management Object level take precedence over time zone configurations at the TAI Management Database level. If neither is configured, the system defaults to the MME time zone.

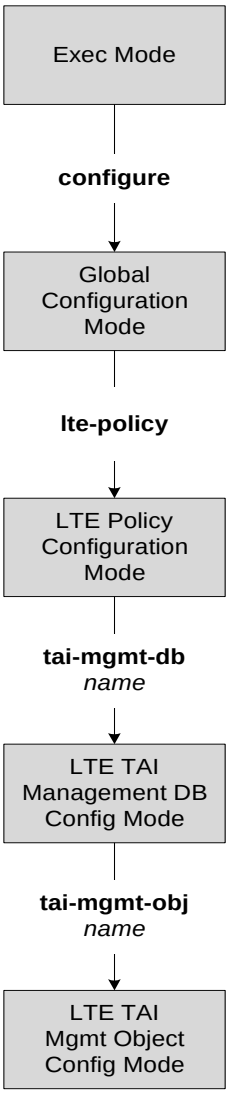
Example

The following command sets the timezone mapping for this management database to plus-3 hours and 15 minutes from UTC:

```
timezone + hours 3 minutes 15
```

Chapter 184
LTE TAI Management Object Configuration Mode Commands

The LTE TAI Management Object Configuration Mode is used to create and manage the LTE Tracking Area Identifiers for the TAI database.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

lai

Configures a Location Area Identifier (LAI) for this TAI management object.

Product

MME

Privilege

Administrator

Syntax

lai mcc *number* **mnc** *number* **lac** *area_code*

no lai

no

Removes a configured LAI from the TAI management object.

mcc *number*

Specifies the mobile country code (MCC) portion of a PLMN identifier as an integer from 100 through 999.

mnc *number*

Specifies the mobile network code (MNC) portion of a PLMN identifier as a 2- or 3-digit integer from 00 through 999.

lac *area_code*

Specifies the Location Area Code portion of the TAI as an integer from 1 through 65535.

Usage

Use this command to configure an LAI for this management object.

Example

The following command adds an LAI to this management object with an MCC of *111*, an MNC of *22*, and a LAC of *101*:

```
lai mcc 122 mnc 22 lac 101
```

sgw-address

Configures an IP address for a Serving Gateway (S-GW), a supported S5/S8 protocol type, and selection weight used in a pool for S-GW selection.

Product

MME

Privilege

Administrator

Syntax

sgw-address *ipv4_or_ipv6_address* **s5-s8-protocol { both | gtp | pmip } weight** *number*

no sgw-address *ipv4_or_ipv6_address* **s5-s8-protocol { both | gtp | pmip }**

no sgw-address *ipv4_or_ipv6_address* **s5-s8-protocol { both | gtp | pmip }**

Removes the configured S-GW address from this TAI management object.

ipv4_or_ipv6_address

Specifies the IP address of the S-GW in the selection pool in IPv4 dotted-decimal or IPv6 colon-separated notation.
Up to 32 S-GW addresses can be configured per TAI management object.

s5-s8-protocol { both | gtp | pmip }

Specifies the S5/S8 interface type found between the configured S-GW and the P-GW.
both: Specifies that both the GTP and PMIP protocols are supported over the S5/S8 interface.
gtp: Specifies that the GTP protocol is supported over the S5/S8 interface.
pmip: Specifies that the PMIP protocol is supported over the S5/S8 interface.

weight *number*

Specifies the priority or weight of the S-GW address used during weighted round-robin selection within this TAI management object. *number* must be an integer from 1 through 100.

Usage

Use this command to configure a pool of S-GW addresses used for S-GW selection.

Example

The following command configures an S-GW with an IPv4 address of *10.2.3.4*, a supported S5/S8 protocol type of GTP, and a selection weight of *3*:

```
sgw-address 10.2.3.4 s5-s8-protocol gtp weight 3
```

tai

Configures a Tracking Area Identifier (TAI) for this TAI management object.

Product

MME

Privilege

Administrator

Syntax

[no] tai mcc *number* **mnc** *number* **{ tac** *value* **} +**

no

Removes a configured TAI from the TAI management object.

mcc *number*

Specifies the mobile country code (MCC) portion of a PLMN identifier as an integer from 100 through 999.

mnc *number*

Specifies the mobile network code (MNC) portion of a PLMN identifier as a 2- or 3-digit integer from 00 through 999.

tac *value* **+**

Specifies the Tracking Area Code portion of the TAI as an integer from 1 through 65535. Up to 16 TAC values can be entered on a single line.

Usage

Use this command to configure one or more TAIs for this management object. Up to 16 TAIs can be configured per management object.

Example

The following command adds a TAI to this management object with an MCC of *111*, an MNC of *22*, and a TAC value of *1001*:

```
tai mcc 122 mnc 22 tac 1001
```

timezone

Configures the timezone to be used for the UE timezone in S11 and Non-Access Stratum (NAS) messages.

Product

MME

Privilege

Administrator

Syntax

timezone { + | - } hours *value* **[minutes { 0 | 15 | 30 | 45 }]**

no timezone

Removes the timezone configuration from the management object.

+ | -

Specifies the offset direction from Coordinated Universal Time (UTC).

hours *value*

Specifies the offset from UTC in hours as an integer from 0 through 14.

minutes { 0 | 15 | 30 | 45 }

Optionally specifies the offset minutes added to the hours value.

Usage

Use this command to configure the time one to be used for the UE timezone in S11 and NAS messages.

Important: Time zone configurations at the TAI Management Object level take precedence over time zone configurations at the TAI Management Database level. If neither is configured, the system defaults to the MME time zone.

Example

The following command sets the time zone mapping for this management object to plus-3 hours and 15 minutes from UTC:

```
timezone + hours 3 minutes 15
```

zone-code

Configures a zone code for the management object.

Product

MME

Privilege

Administrator

Syntax

zone-code *zc_id*

no zone-code

no

Removes the configured zone-code from the management object.

zc_id

Identifies the zone code configuration instance as an integer from 1 through 65535.

Usage

Important: While there is no limit to the number of zone codes that can be created, only 10 LACs per zone code can be defined.

Use this command to define zone code restrictions. Regional subscription data at the home subscriber service (HSS) is used to determine the regional subscription area in which the subscriber is allowed to roam. The regional subscription data consists of a list of zone codes which are comprised of one or more location areas (identified by a LAC) into which the subscriber is allowed to roam. Regional subscription data, if present in the Insert-Subscriber-Data-Request (IDR) and the Update-Location-Answer (ULA) from the HSS, defines the subscriber's subscription area for the addressed MME. It contains the complete list (up to 10 zone codes) that apply to a subscriber in the currently visited PLMN. During the Location Update procedure, the zone code list is received in the ULA from the HSS. The zone code list is validated against the configured values in this command. If matched, the Location Update procedure is allowed to proceed. If not matched, the response is that the Network Node Area is restricted and the Location Update procedure fails.

Example

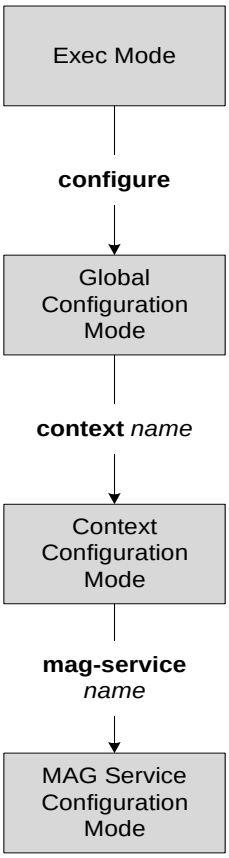
The following command sets the zone code for this management object to *1*:

```
zone-code 1
```

Chapter 185
MAG Service Configuration Mode Commands

Products using commands in this mode: HSGW, S-GW

The MAG Service Configuration Mode is used to create and manage a Mobility Access Gateway service in an HSGW (eHRPD network) or a P-MIP S-GW (LTE-SAE network). The MAG is the PMIP client and communicates with the Local Mobility Anchor (LMA) configured on a PDN Gateway (P-GW).



bind address

Binds the service to a logical IP interface serving as the S2a (HSGW) or S5/S8 (S-GW) interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *num* **]**

no bind address

no

Removes the interface binding from this service.

ip_address

Specifies the IPv6 address of the interface configured as the S5/S8 interface. *ip_address* is specified in IPv6 colon-separated notation.

max-subscribers *num*

Default: 1500000
Specifies the maximum number of subscribers that can access this service on this interface. *num* must be an integer from 0 through 3000000.

Important: The maximum number of subscribers supported depends on the installed license key and the number of active packet processing cards in the system. A fully loaded system can support 3,000,000 total subscribers. Refer to the **license key** command and the *Usage* section (below) for additional information.

Usage

Associate the MAG service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an S2a or S5/S8 interface that provides the session connectivity to/from a P-GW. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of S2a or S5/S8 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *4551:0db8:85a3:08d3:3319:8a2e:0370:1344* to the MAG service and specifies that a maximum of *300,000* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 4551:0db8:85a3:08d3:3319:8a2e:0370:1344 max-subscribers
300000
```

encapsulation

Configures data encapsulation type to be used for specific MAG service.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

```
encapsulation { gre | ipip }

default encapsulation
```

default

Resets the encapsulation type to be used by this service to the default option of GRE.

{ gre | ipip }

gre: Specifies that GRE encapsulation is to be used for PMIPv6 tunnel data between the MAG and the Local Mobility Anchor (LMA). This is the default for this command.
ipip: Specifies that IP-in-IP encapsulation is to be used for PMIPv6 tunnel data between the MAG and the LMA.

Usage

Use this command to select the encapsulation type to be used for PMIPv6 tunnel data between the MAG and the LMA.

Example

The following command sets the encapsulation data to IP-in-IP:

```
encapsulation ipip
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

information-element-set

Identifies the information element set of mobility options to be used in Proxy Binding Update (PBU) messages sent by the MAG to the LMA.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

```
information-element-set { custom1 | standard }

default information-element-set
```

default

Resets the command to the default value of "standard".

{ custom1 | standard }

custom1: Specifies that a custom set of mobility options will be used in proxy binding update messages that are sent in Vendor Specific Mobility Options. These options are:

- User Location Info
- Hardware Identifier
- Access Network Charging Identifier

standard: Specifies that a standard set of mobility options are to be used in proxy binding update messages. 3GPP specification 29.275 defines these as Protocol Configuration Options.

Usage

Use this command to identify the type of information element set of mobility options to be used in PBU messages sent form the MAG to the LMA. The mobility options can be either standards-based (3GPP 29.275) or custom (vendor-specific as defined by 3GPP 29.275).

Example

The following command identifies the information element set of mobility options to use in PBU messages as custom:

```
information-element-set custom1
```

max-retransmissions

Configures maximum number of retransmissions of Proxy MIP control messages to the Local Mobility Anchor (LMA).

Product

HSGW, S-GW

Privilege

Administrator

Syntax

max-retransmissions *num*

default max-retransmissions

default

Rests the maximum number of allowed retransmissions to the default value of 5.

num

Default: 5
Specifies the maximum number of times the MAG service will attempt to communicate with the LMA before it marks it as unreachable.
count must be an integer from 1 through 4294967295.

Usage

Use this command to limit the number of retransmissions to LMA before marking it as unreachable. If the value configured is reached, the call is dropped.

Example

The following command configures the maximum number of retransmissions for the MAG service to *3*:

```
max-retransmissions 3
```

mobility-option-type-value

Changes the mobility option type value used in mobility messages.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

```
mobility-option-type-value { custom1 | standard }

default mobility-option-type-value
```

default

Sets the command to the default value of custom1.

custom1

(Default) Non-standard type values used before they were defined by IANA.

standard

Standard type values as defined by IANA. In addition, standard option uses type values defined in RFC 5844 for home address (HoA) options for the PMIPv6 PBU/PBA/revocation message.

Usage

Use this command to change the mobility option type value used in mobility messages.

Example

The following command changes the mobility option type value to standard:

```
mobility-option-type-value standard
```

reg-lifetime

Configures the Mobile IPv6 session registration lifetime for this service.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

reg-lifetime *seconds*

default reg-lifetime

default

Resets the command value to the default setting of 600.

seconds

Default: 600
Sets the time value (in seconds) for session lifetimes for this service.
seconds must be an integer from1 through 262140.

Usage

Use this command to limit PMIPv6 lifetime on this service. If the Proxy Binding Acknowledge (PBA) from the LMA contains a lifetime shorter or longer than what is specified, it is used instead.

Example

The following command sets the registration lifetime for Mobile IPv6 sessions using this service to *1200* seconds (20 minutes):

```
reg-lifetime 1200
```

renew-percent-time

Configures percentage of lifetime at which a registration renewal is sent to the Local Mobility Anchor (LMA).

Product

HSGW, S-GW

Privilege

Administrator

Syntax

renew-percent-time *percent*

default renew-percent-time

default

Resets the command to the default value of 75.

percent

Default: 75
Specifies the time percentage when the registration renewal is sent to the LMA. *percent* is a percentage value of the registration lifetime expressed as an integer from 1 through 100.

Usage

Use this command to specify when a registration renewal is sent to the LMA for subscribers using this service.
If the registration lifetime is 600 seconds (10 minutes) and this command is set to 75 (percent), then the registration renewal message is sent after 450 seconds of the registration lifetime has expired.

Example

The following command sets the registration renewal time for subscribers using this service to *90* percent of the registration lifetime:

```
renew-percent-time 90
```

retransmission-policy

Configures the retransmission policy for Proxy MIP control message retransmissions.

Product

HSGW

Privilege

Administrator

Syntax

```
retransmission-policy { exponential-backoff | normal }

default retransmission-policy
```

default

Returns the command to its default setting of exponential-backoff.

{ exponential-backoff | normal }

Sets the retransmission timeout behavior for this service.
exponential-backoff: Specifies that the Proxy Binding Update (PBU) retransmission uses an exponential backoff to increase the retransmission timeout for each retry.
normal: Specifies that the PBU retransmission uses the configured retransmission timeout value for all PBU retransmission retries.

Usage

Use this command to specify the retransmission policy for PMIP control messages.

Example

The following command sets the retransmission timeout policy for PMIP control packets to “normal”:

```
retransmission-policy normal
```

retransmission-timeout

Configures the maximum allowable time for the MAG service to wait for a response from the LMA before it attempts to communicate with the LMA again (if the system is configured to retry the LMA), or marks the LMA as unreachable.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

retransmission-timeout *time*

[default | no] retransmission-timeout

default

Resets the timeout setting to the default value of 3,000 milliseconds.

no

Deletes a previously configured timeout value.

time

Default: 3000
Specifies the maximum allowable time (in milliseconds) for the MAG service to wait for a response from the LMA before it: (a) attempts to communicate with the LMA again (if the system is configured to retry the LMA) or (b) marks the LMA as unreachable.
time must be an integer from 100 through 100000.

Usage

Use the retransmission timeout command in conjunction with the **max-retransmissions** command in order to configure the MAG services behavior when it does not receive a response from a particular LMA.

Example

The following command configures a retransmission timeout value of 5000 milliseconds:

```
retransmission-timeout 5000
```

signalling-packets

Enables the QoS Differentiated Services Code Point (DSCP) marking feature for IP headers carrying outgoing signalling packets.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

signalling-packets ip-header-dscp *value*

[default | no] signalling-packets ip-header-dscp

default

Restores the specified parameter to its default setting of 0x0.

no

Disables the specified functionality.

ip-header-dscp *value*

Used to configure the QoS Differentiated Services Code Point (DSCP) marking for IP header encapsulation. *value*: Represents the DSCP setting as the first six most-significant bits of the ToS field. It can be configured to any hexadecimal value from 0x0 through 0x3F. Default is 0x0.

Usage

Use this command to enable or disable the DSCP marking feature for IP headers carrying outgoing signalling packets. DSCP marking is disabled by default.

Example

The following command configures the HSGW service to support DSCP marking for IP headers carrying outgoing signalling packets:

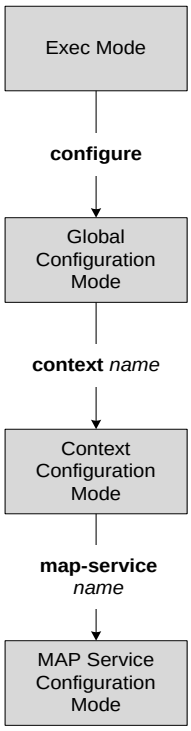
```
signalling-packets ip-header-dscp 0x21
```

Chapter 186
MAP Service Configuration Mode Commands

The MAP Service Configuration Mode is used to configure properties for Mobile Application Part (MAP) service.

Mobile Application Part (MAP) is a protocol which provides an application layer for the various nodes in the core mobile network and GPRS and UMTS core network to communicate with each other in order to provide services to mobile phone users. The MAP service provides the application-layer protocol support used to access the Home Location Register (HLR).

[<*context_name*>]*hostname*(config-map-service-<*svc_name*>)#



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-protocol

Configures access protocol parameters for the MAP service as defined for a specific SCCP network instance.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

access-protocol sccp-network *sccp_id* **ssn** *subsys_num*

no access-protocol sccp-network *sccp_id* **ssn** *subsys_num*

sccp-network *sccp_id*

Specifies the ID number of the SCCP network to use for the SGSN connection.
sccp_id : Must be an integer from 1 to 16.

ssn *subsys_num*

Identifies the subsystem number for the destination.
subsys_num: Enter an integer from 1 through 255.

no

Removes the access protocol SCCP network instance ID from the configuration.

Usage

Use this command to associate access protocol parameters to a specific instance of the MAP service for an SCCP network.

Example

The following command associates the access protocols with the SCCP network ID #10:

```
access-protocol sccp-network 10
```

application-context-name

Configure the operation timer(s) for one or more MAP application contexts.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

application-context-name *application* **operation-timer** *value*

default application-context-name *application* **operation-timer**

default

Resets the operation timers for all applications to system defaults.

application

Select one of the following applications to enable the application:

- **authentication-failure-report** : Sets the reporting operation timer for authentication failure. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **cancel-location** : Sets the cancel location operation timer. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **check-imei** : Sets the check-IMEI operation timer. The setting range for this timer is 15 to 30 seconds for releases 8.0 and 8.1 and 1 to 30 seconds for releases 9.0 and higher. The default setting is 15 seconds.
- **delete-subscriber-data** : Sets the delete subscriber data operation timer. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **mo-fwd-sm** : Sets the operation timer for fowarding mobile-originated SMS. The setting range for this timer is 1 to 10 minutes and the default setting is 1 minute (60 seconds).
- **ms-purge** : Sets the operation timer for MS-purge function. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **mt-fwd-sm** : Sets the operation timer for fowarding mobile-terminated SMS. The setting range for this timer is 1 to 10 minutes and the default setting is 1 minute (60 seconds).
- **ready-for-sm** : Sets the operation timer for the ready for SMS operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **send-authentication-info** : Sets the operation timer for the sending authentication information operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **stand-alone-insert-subscriber-data** : Sets the operation timer for the standalone insert subscriber data operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **ugl-insert-subscriber-data** : Sets the operation timer for the insert subscriber data portion of the update GPRS location operation. TThe setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

- **update-gprs-location** : Sets the operation timer for the update GPRS location operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

operation-timer*value*

Configures the operation timer for the selected application. Timer values are indicated above.

Usage

Repeat this command entering a different application each time to enable multiple applications.

Example

application-context-name *stand-alone-insert-subscriber-data operation-timer* **operation-timer** *20*

auth-vectors

Configures the number of authorization vectors to be requested from the home location register (HLR) during call setup to provide subscriber authentication.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

auth-vectors number-to-request *number*

default auth-vectors number-to-request

default

Resets the number of vectors requested from the HLR to the system default.

number-to-request *number*

number: Must be an integer from 1 to 5 to define the number of authorization vectors be requested from the HLR.
Default is 5.

Usage

Set the number of requests to be received from the HLR.

Example

auth-vectors number-to-request *4*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

equipment-identity-register

Defines the information relevant to the equipment-identity-register (EIR) used by the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

equipment-identity-register { isdn *E.164_num* **| point code** *pt_code* **} [source-ssn** *ssn***| check-imei-every-n-events***times*]

no equipment-identity-register { isdn *E.164_num* **| point code***pt_code* **}**

no

Deletes the EIR configuration.

isdn *number*

Enter the E.164 number of the EIR.
number: must be a string of 1 to 15 digits.

point code *pt_code*

Enter SS7 point code address of the EIR in dotted-decimal format according to variant settings:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- or a string of 1 to 11 characters

source-ssn *ssn*

Identifies the subsystem number (SSN) to be used.
ssn must be an integer from 1 to 255.

check-imei-every-n-events *times*

Configures the frequency with which a 'check IMEI' message is sent to the EIR. When set, the SGSN skips sending the 'check IMEI' message for the first N-1 where IMDI/IMEISV is received.
times :

- For releases 8.0 and 8.1, the value must be an integer from 1 to 15.
- For releases 9.0 and higher, the value must be an integer from 1 to 255.

Important: This feature requires the enabling of **verify-equipment-identity** for IMEI or IMEISV as specified with the the **gmm retrieve-equipment-identity imei** command of the call-control-profile configuration mode.

Usage

Configure the identity of the EIR that the SGSN uses and the interaction parameters.
Increasing the **check-imei-every-n-events** frequency enables the EIR to avoid overload as the number of data-only devices attaching to the network increases.

Example

Configure EIR with point code 1.255.1 to perform IMEI check after every 61st received Attach Request message:

```
equipment-identity-register point code 1.255.1 check-imei-every-n-events
62
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

hlr

This command enters the configuration mode for the home location register (HLR). The HLR is a database containing the subscriber profile information for all mobile stations (MS) / user equipment (UE) connecting to a specific GPRS or UMTS core network.

Important: The commands and options for this mode are documented in the HLR Configuration Mode chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
hlr
```

policy

This command configures the Transaction Capabilities Application Part (TCAP) -specific MAP policy for either ANSI or ITU SS7 variants.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] policy tcap { use-received-destination-address | use-received-source-address
}
```

use-received-destination-address

Selecting this keyword overwrites stored CG and CD addresses with a new address received in first TC CNT msg

use-received-source-address

Selecting this keyword instructs the MAP service to use the received source address for the dialog.

Usage

Use this command to determine how TCAP will handle MAP messages.

Example

```
policy tcap use-received-destination-address
```

short-message-service

This command enables and disables the short message service (SMS service) and provides access to the SMS Service configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
short-message-service
```

```
no short-message-service
```

no

Disables the SMS service.

Usage

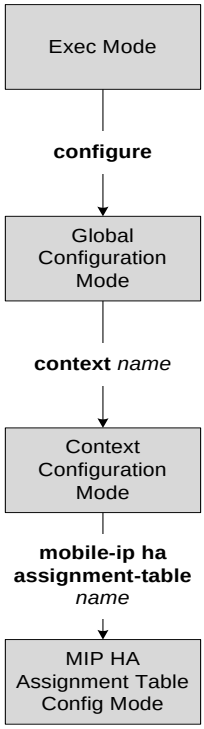
Enter the command to access the SMS service configuration mode to fine tune the SMS functionality.

Example

```
short-message-service
```

Chapter 187
MIP HA Assignment Table Configuration Mode Commands

The Mobile IP HA Assignment Table Configuration Mode is used to assign specific Home Agent (HA) IP addresses to ranges of Mobile Node (MN) IP addresses.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

hoa-range

This command assigns ranges of Mobile Node (MN) IP addresses to specific Home agent IP addresses.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

hoa-range *ip_addressip_address2* **ha** *ip_address3*

no hoa-range *ip_address ip_address2 ha ip_address3*

no

Removes the specified Home Agent assignment from the assignment table.

ip_address ip_address2

Specifies a range of MN IP addresses. *ip_address* and *ip_address2* must be specified in IPv4 dotted-decimal or IPv6 colon-separated notation.

ha *ip_address3*

Specifies the IP address of the Home Agent to assign to MNs that are within the specified range. *ip_address3* must be specified in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to assign ranges of MN IP addresses to specific HAs.

Important: A maximum of eight MIP HA assignment tables can be configured per context with a maximum of eight MIP HA assignment tables across all contexts.

Important: A maximum of 256 non-overlapping hoa-ranges can be configured per MIP HA Assignment table with a maximum of 256 non-overlapping hoa-ranges across all MIP HA Assignment tables.

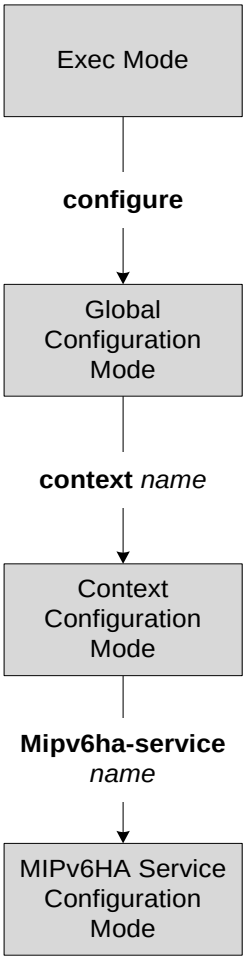
Example

The following command assigns any MN IP address that falls in the range of *192.168.100.0* through *192.168.101.0* to the HA with the IP address of *192.168.200.10*:

```
hoa-range 192.168.100.0 192.168.101.0 ha 192.168.200.10
```

Chapter 188
MIPv6HA Service Configuration Mode Commands

The MIPv6 HA Service Configuration Mode is used to create and manage Mobile IPv6 (MIPv6) access privileges.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa accounting

Configures the sending of subscriber session AAA accounting by the Home Agent (HA) service.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting

no aaa accounting
```

Usage

Enabling the HA service will send all accounting data (start, stop, and interim) to the configured AAA servers. The default is AAA accounting enabled.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the HA service is configured using the **aaa accounting subscriber radius** command.

Example

AAA accounting for the HA service can be disabled using the **no** version of the command.

The following command disables aaa accounting for the HA service:

```
no aaa accounting
```

bind

Designates the address of the MIPv6HA service and specifies the maximum number of subscribers that can access this service over the interface.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

bind address *IPv6_address* **[max-subscribers** *count* **]**

no bind address

address

Specifies the IPv6 address of the MIPv6HA service using IPv6 colon-separated notation.

max-subscribers *count*

Default: 3000000
Specifies the maximum number of subscribers that can access this service on this interface.
count is an integer from 0 through 4000000.

default

Restore default values assigned for specified parameter.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
default { aaa | refresh-advice-option | refresh-interval-percent | reg-lifetime |
sequence-number-validate | setup-timeout | simul-bindings | subscriber | timestamp-
replay-protection }
```

aaa

Restores the AAA setting configured by the **aaa** command to its default of enabled.

refresh-advice-option

Restores the refresh-advice-option setting to its default of disabled.

refresh-interval-percent

Restores the refresh-interval-percent setting to its default of 75.

reg-lifetime

Restores the Mobile IP session registration lifetime setting configured by the **reg-lifetime** command to its default: 600 seconds.

sequence-number-validate

Restores the sequence-number-validate setting to its default of enabled.

setup-timeout

Restore the maximum amount of time allowed for setting up a session to the default: 60 seconds.

simul-bindings

Restores the simultaneous bindings setting to its default: 1.

subscriber

Configures settings for the default subscriber.

timestamp-replay-protection

Restores the timestamp-replay-protection scheme according to RFC 4285.

Usage

After the system has been modified from its default values, this command is used to set or restore specific parameters to their default values.

Example

The following command is used to return the simultaneous bindings setting parameter to it's default value:

```
default simul-bindings
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

refresh-advice-option

Configures inclusion of refresh advice option in the Binding Acknowledgement sent by the Home Agent (HA).

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
refresh-advice-option
```

Usage

Includes the refresh advice option in the binding acknowledgements sent by the home agent. Default is disabled.

refresh-interval-percent

Configures the percentage of the granted lifetime to be used in the refresh interval mobility option in the Binding Acknowledgement sent by the Home Agent (HA).

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

refresh-interval-percent *value*

value

value represents a percentage expressed as an integer from 1 through 99. Default is 75.

Usage

Use this command to configure the amount of the granted lifetime to be used in the refresh interval mobility option in the Binding Acknowledgement sent by the Home Agent (HA).

Example

The following command sets the refresh-interval-percent value to 50%:

```
refresh-interval-percent 50
```

reg-lifetime

Specifies the longest registration lifetime that the HA service will be allowed in any Registration Request message from the mobile node.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

reg-lifetime *time*

no

Sets the registration lifetime to infinite.

time

Specifies the registration lifetime in seconds. *time* is an integer from 1 through 262140. Default is 600.

Usage

Use to limit a mobile nodes' lifetime. If the mobile node requests a shorter lifetime than what is specified, it is granted. However, Per RFC 2002, should a mobile node request a lifetime that is longer than the maximum allowed by this parameter, the HA service will respond with the value configured by this command as part of the Registration Reply.

Example

The following command configures the registration lifetime for the HA service to be 2400 seconds:

```
reg-lifetime 2400
```

The following command configures an infinite registration lifetime for MIPv6 calls:

```
no reg-lifetime
```

sequence-number-validate

Configures sequence number validation of the received MIPV6 control packet by the Home Agent (HA) according to RFC 3775.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
sequence-number-validate
```

Usage

Use this command to enable sequence number validation of the received MIPV6 control packet by the Home Agent (HA) as per RFC 3775. Default is enabled.

setup-timeout

The maximum amount of time allowed for session setup.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *seconds*

seconds

Default: 60 seconds
The maximum amount of time (in seconds) to allow for setup of a session expressed as an integer from 1 through 1000000. Default is 60 seconds.

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

To set the maximum time allowed for setting up a session to 5 minutes (300 seconds), enter the following command:

```
setup-timeout 300
```

simul-bindings

Specifies the maximum number of “care-of” addresses that can be simultaneously bound for the same user as identified by NAI and Home address.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

simul-bindings *number*

number

Configures maximum number of "care of" addresses that can be simultaneously bound for the same user as identified by their NAI and home address. *number* is an integer from 1 through 3. Default is 1.

Usage

Per RFC 2002, the HA service creates a mobile binding record (MBR) for each subscriber session it is facilitating. Each MBR is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care-of address.
Typically, the HA service will delete an old binding and create a new one when the information in the Registration Request changes. However, the mobile could request that the HA maintains previously stored MBRs. This command allows you to configure the maximum number of MBRs that can be stored per subscriber if the requested.

Example

The following command configures the service to support up to *2* addresses per subscriber:

```
simul-bindings 2
```

timestamp-replay-protection tolerance

Designates timestamp replay protection scheme as per RFC 4285.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

timestamp-replay-protection tolerance*seconds*

tolerance *seconds*

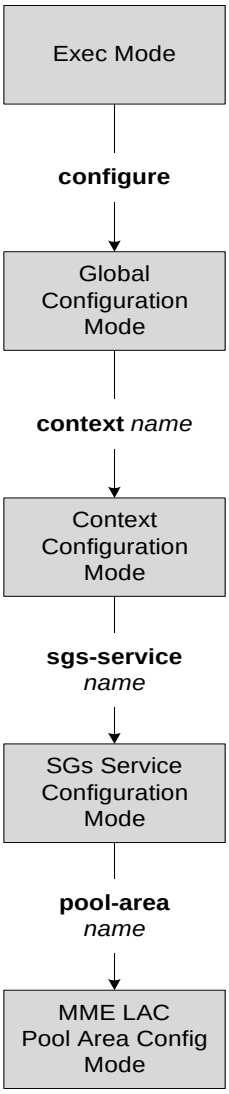
Defines the acceptable difference in timing (between timestamps) before rejecting packet, in seconds. *seconds* must be an integer from 0 through 65535. The default is 7.

Usage

Use this command to define the acceptable difference in timing (between timestamps) before rejecting packet.

Chapter 189
MME LAC Pool Area Configuration Mode Commands

The MME LAC Pool Area Configuration Mode is used to create and manage the Location Area Code (LAC) pool areas.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

hash-value

Configures the Visitor Location Register (VLR) hash value mapping for this pool area.

Product

MME

Privilege

Administrator

Syntax

hash-value { *value* | non-configured-values | range *value* to *value* } use-vlr *vlr_name*

no hash-value { *value* | non-configured-values | range *value* to *value* }

no

Removes the configured hash-value from the pool-area configuration.

value

Specifies the VLR hash value to be used with the configured VLR. *value* must be an integer from 0 through 999.

non-configured-values

Specifies that the VLR configured in this command is to be used non-configured hash values.

range *value* to *value vlr_name*

Specifies a range of hash values to use with the configured VLR as an integer from 0 through 999.

use-vlr

Specifies the VLR to be used with the hash value configuration in this command.

Usage

Use this command to configure hash values to be used with VLRs.
In a pool configuration, the MME selects the VLR that corresponds to the hash of the UE's IMSI. If that VLR is inactive, the MME will use the default VLR (as defined by the **non-configured-value** option). If no default VLR has been configured, or if the default VLR is inactive, the MME selects any other available VLR from the pool.
If the chosen VLR is active at the time of selection and then subsequently becomes inactive when the request is sent to it, the current request fails. On the next request from the UE, the VLR selection mechanism is applied again. A VLR that failed previously will only be selected again if it became active since the earlier failure.

Example

The following command configures all hash values within a range of *0* to *500* to use a VLR named *vlr1*:

```
hash-value range 0 to 500 use-vlr vlr1
```

The following command configures hash values of *501* to use a VLR named *vlr2*:

```
hash-value 501 use-vlr vlr2
```

The following command configures all non-configured hash values to use a VLR named *vlr3*:

```
hash-value non-configured-values use-vlr vlr3
```

lac

Configures a 3G location area code or area codes that define this pool area.

Product

MME

Privilege

Administrator

Syntax

```
[ no ] lac { area_code } +
```

no

Removes a configured forbidden handover area code or area codes from this policy. If no location area code is specified, then all location area codes are removed.

area_code

Specifies an area code or area codes used to select a VLR for the pool area as an integer from 0 through 65535. Multiple area codes can be entered (up to 16 in a single line, separated by spaces).

Important: A total of 16 area codes can be added in a single line or separately.

Usage

Use this command to configure 3G location-based area codes that define this pool area.

Example

The following command configures eight location-based area codes (1, 2, 3, 4, 5, 6, 7, 8) that define this pool area:

```
lac 1 2 3 4 5 6 7 8
```

plmn-id

Configures the Public Land Mobile Network (PLMN) identifier for the LAC pool area. The PLMN identifier is consists of the Mobile Country Code (MCC) and the Mobile Network Code (MNC).

Product

MME

Privilege

Administrator

Syntax

plmn-id mcc *mcc_value* **mnc** *mnc_value*

no plmn-id

no

Removes the configured PLMN identifier for the LAC pool area.

mcc *mcc_value*

Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.

mnc *mnc_value*

Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

Usage

Use this command to set the PLMN identifier for the LAC pool area.

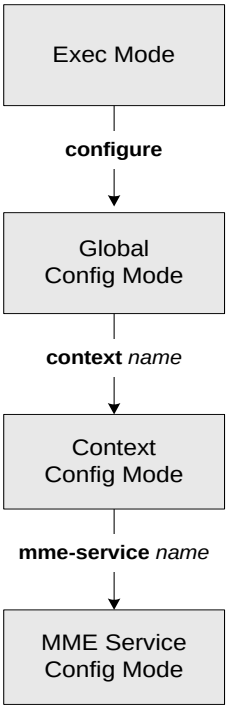
Example

The following command configures the PLMN identifier with MCC value as *102* and MNC value as *20* for this MME service:

```
plmn-id mmc 102 mnc 20
```

Chapter 190
MME Service Configuration Mode Commands

The MME Service Configuration Mode is used to create and manage the LTE Mobility Management Entity (MME) services for the LTE/SAE network. This service works in conjunction with MME-HSS Service and eGTP Service.



associate

Associates or disassociates supportive services and policies, such as an Evolved GPRS Tunnelling Protocol (eGTP) service, an HSS peer service, or an MME policy subscriber map with an MME service.

Product

MME

Privilege

Administrator

Syntax

associate { { egtp-service *egtp_svc_name* **| egtp-sv-service** *egtp_sv_svc_name* **| hss-peer-service** *hss_svc_name* **| lte-emergency-profile** *profile_name* **| network-global-mme-id-mgmt-db | sctp-param-template** *template_name* **| sgs-service** *sgs_svc_name* **| sgtpc-service** *sgtpc_svc_name* **} [context** *ctx_name* **] | subscriber-map** *map_name* **| tai-mgmt-db** *database_name* **}**

no associate { egtp-service | egtp-sv-service | hss-peer-service | lte-emergency-profile | network-global-mme-id-mgmt-db | sctp-param-template | sgs-service | sgtpc-service | subscriber-map | tai-mgmt-db }

no

Disassociates a previously associated service with this MME service.

egtp-service *egtp_svc_name*

Associates an eGTP service with MME service.
egtp_svc_name specifies the name for a pre-configured eGTP service to associate with the MME service. For more information on the eGTP service, refer to the **egtp-service** command in the *Context Configuration Mode Commands* chapter.

egtp-sv-service *egtp_sv_svc_name*

Associates an eGTP Sv service with this MME service.
egtp_sv_svc_name specifies the name for a pre-configured eGTP Sv service to associate with the MME service. For more information on the eGTP Sv service, refer to the **egtp-service** command in the *Context Configuration Mode Commands* chapter.

hss-peer-service *hss_svc_name*

Associates an HSS peer service with this MME service.
hss_svc_name specifies the name for a pre-configured HSS peer service to associate with the MME service as an alphanumeric string of 1 through 64 characters. For more information about the HSS peer service, refer to the **hss-peer-service** command in the *Context Configuration Mode Commands* chapter and the *HSS Peer Service Configuration Mode Commands* chapter.

lte-emergency-profile *profile_name*

Associates an LTE emergency profile with this MME service.
profile_name specifies the name for a pre-configured LTE emergency profile to associate with the MME service as an alphanumeric string of 1 through 64 characters. For more information about the LTE emergency

profile, refer to the **lte-emergency-profile** command in the *LTE Policy Configuration Mode Commands* chapter and the *LTE Emergency Profile Configuration Mode Commands* chapter.

---

network-global-mme-id-mgmt-db

Associates the configured global MME ID management database with the MME service. The global MME ID management database is configured through the LTE Policy Configuration Mode using the **network-global-mme-id-mgmt-db** command.

---

sctp-param-template *template_name*

Associates a Stream Control Transmission Protocol (SCTP) parameter template with the MME service.
template_name specifies the name for a pre-configured SCTP parameter template to associate with this MME service as an alphanumeric string of 1 through 63 characters. For more information on the SCTP parameter template, refer to the **sctp-param-template** command in the *Global Configuration Mode Commands* chapter and the *SCTP Parameter Template Configuration Mode Commands* chapter.

---

sgs-service *sgs_svc_name*

Associates an SGs service with this MME service.
sgs_svc_name specifies the name for a pre-configured SGs service to associate with the MME service as an alphanumeric string of 1 through 64 characters. For more information on the SGs service, refer to the **sgs-service** command in the *Context Configuration Mode Commands* chapter andthe *MME SGs Service Configuration Mode Commands* chapter.

---

sgtpc-service *sgtpc_svc_name*

Associates an SGTPC service with this MME service.
sgtpc_svc_name specifies the name for a pre-configured SGTPC service to associate with the MME service as an alphanumeric string of 1 through 64 characters. For more information on the SGTPC service, refer to the **sgtp-service** command in the *Context Configuration Mode Commands* chapter and/or the *SGTP Service Configuration Mode Commands* chapter.

---

context *ctx_name*

Identifies a specific context name where the named service is configured. If this keyword is omitted, the named service must exist in the same context as the MME service.
ctx_name is name of the configured context of the named service expressed as an alphanumeric string of 1 through 63 characters that is case sensitive.

---

subscriber-map *map_name*

Associates this MME service with a pre-configured subscriber map.
map_name specifies the name of a pre-configured subscriber map to associate with the MME service as an alphanumeric string of 1 through 64 characters. For more information on subscriber maps, refer to the **subscriber-map** command in the *LTE Policy Configuration Mode Commands* chapter andthe *LTE Subscriber Map Configuration Mode Commands* chapter.

---

tai-mgmt-db *database_name*

Associates this MME service with a pre-configured TAI Management Database.
database_name specifies the name of a pre-configured TAI Management Database to associate with the MME service as alphanumeric string of 1 through 64 characters. For more information on subscriber maps, refer to the **tai-mgmt-db** command in the *LTE Policy Configuration Mode Commands* chapter and the *LTE TAI Management Database Configuration Mode Commands* chapter.

Usage

Use this command to associate a pre-configured service or policy with an MME service.
The eGTP service provides eGTP-C protocol interface support between EPS nodes. For more information on the eGTP service and the supported interface type, refer to the *eGTP Service Configuration Mode Commands* chapter.

Important: Only one eGTP service can be associated with a service. The eGTP service should be configured prior to issuing this command.

The HSS peer service provides S6a and S13 interface support via the Diameter protocol between the MME and an HSS (S6a) or EIR (S13). For more information on HSS peer service and other parameters, refer to the *HSS Peer Service Configuration Mode Commands* chapter.

Important: Only one HSS peer service can be associated to a service in this release. The HSS peer service should be configured prior to issuing this command.

Caution: This is a critical configuration. The MME service cannot be started without this configuration. Any change to this configuration would lead to restarting the MME service. Removing or disabling this configuration will stop the MME service.

Example

The following command associates a pre-configured eGTP service called *egtp1* in the *dst_ctx* context to an MME service:

```
associate egtp-service egtp1 context dst_ctx
```

The following command associates a pre-configured HSS peer service called *hss1* in the same context as MME service to an MME service:

```
associate hss-peer-service hss1
```

bind s1-mme

Binds the MME service to a logical IP interface serving as the S1-MME interface.

Product

MME

Privilege

Administrator

Syntax

bind s1-mme { ipv4-address *address* **[ipv4-address** *secondary_address* **] | ipv6-address** *address* **[ipv6-address** *secondary_address* **] } [crypto-template** *name* **] [max-subscribers** *number* **]**

no bind s1-mme

no

Removes a previously configured IP address used for binding the SCTP (local bind address) to communicate with the eNodeBs using an S1-MME interface.

{ ipv4-address *address* **[ipv4-address** *secondary_address* **] | ipv6-address** *address* **[ipv6-address** *secondary_address* **] }**

Specifies the IP address for the interface configured as an S1-MME interface in IPv4 dotted-decimal or IPv6 colon-separated notation. Optionally configure a secondary IP address for either address type.

crypto-template *name*

Specifies an existing crypto template name used when implementing IP Security (IPSec) on the S1-MME interface. *name* is an alphanumeric string of 1 through 104 characters.

max-subscribers *number*

Specifies the maximum number of subscribers that can access this service on this interface as an integer from 0 through 4000000.

Usage

Use this command to associate the MME service with a specific logical IP address that will be used for binding the SCTP socket that communicates with the eNodeB using S1AP. Only one IP address can be configured with this command for one MME service.
The MME passes the IP address during setting up the SCTP association with the eNodeB.

Caution: This is a critical configuration. The MME service can not be started without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

Important: Up to two IPv4 or IPv6 addresses can be configured to support SCTP multi-homing.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the MME service to interact with eNodeB:

```
bind s1-mme ipv4-address 192.168.3.1
```

The following command disables a binding that was previously configured:

```
no bind s1-mme ipv4address
```

csg-change-notification

This command enables or disables the Closed Subscriber Group (CSG) Information reporting (notification) mechanism on the MME. When enabled, the MME includes the CSG Information Reporting Action IE with the appropriate Action field for subscribers.

Product

MME

Privilege

Administrator

Syntax

```
[ default | no ] csg-change-notification
```

default

Returns the command to its default value of disabled.

no

Disables the feature.

dns

Associates or disassociates the Domain Name System (DNS) client service configured for DNS query in a context to select P-GW and S-GW in an MME service.

Product

MME

Privilege

Administrator

Syntax

dns { peer-mme | peer-sgsn | pgw | sgw } [context *ctx_name* **]**

no dns { peer-mme | pgw | sgw }

no

Disassociates a previously associated context having DNS client service configured for DNS query to select peer MME, P-GW or S-GW with this MME service.

peer-mme

Associates the named context with a DNS client service for DNS query for selecting a peer MME and associating it with this MME service for inter-MME handovers.

peer-sgsn

Associates the named context with a DNS client service for DNS query for selecting a peer SGSN and associating it with this MME service for inter-RAT handovers.

pgw

Associates the named context with a DNS client service for DNS query for selecting a P-GW and associating it with this MME service.

sgw

Associates the named context with a DNS client service for DNS query for selecting an S-GW and associating it with this MME service.

context *ctx_name*

Optionally associates the specific context name where DNS client service is configured to select a peer MME, a P-GW and/or an S-GW for this MME service. If this keyword is omitted DNS client service must be configured in the same context as this MME service.
ctx_name is name of the configured context of the DNS client service expressed as an alphanumeric string of 1 through 63 characters that is case sensitive.

Usage

Use this command to associate a pre-configured context where a DNS client service is configured with an MME service.

The DNS Client service configured in a context provides the DNS query support to locate peer MMEs, peer-SGSNs, P-GWs, or S-GWs from an MME service. For more information on DNS Client service and support, refer to the *DNS Client Service Configuration Mode Commands* chapter.
A maximum of one DNS client service for a peer MME, one DNS client service for a peer SGSN, one DNS client service for a P-GW, and one DNS client service for S-GW can be associated with an MME service.

Example

The following command associates a pre-configured context *dns_ctx1* where a DNS client service is configured for DNS query to P-GW from an MME service:

```
dns pgw context dns_ctx1
```

The following command associates a pre-configured context *dns_ctx2* where a DNS client service is configured for DNS query to S-GW from an MME service:

```
dns sgw context dns_ctx2
```

emm

Defines the Evolved Mobility Management timer parameters, such as timeout durations for timers and retransmission counts, for Non-Access Stratum (NAS) message retransmission in MME service.

Product

MME

Privilege

Administrator

Syntax

emm { implicit-detach-timeout *detach_dur* **| mobile-reachable-timeout** *mob_reach_dur* **| t3412-timeout** *t3412_dur* **| t3413-timeout** *t3413_dur* **| t3422-timeout** *t3422_dur* **| t3423-timeout** *t3423_dur* **| t3450-timeout** *t3450_dur* **| t3460-timeout** *t3460_dur* **| t3470-timeout** *t3470_dur* **}**

default emm { mobile-reachable-timeout | t3412-timeout | t3413-timeout | t3422-timeout | t3423-timeout | t3450-timeout | t3460-timeout | t3470-timeout }

no emm implicit-detach-timeout

default

Resets the specified timer timeout to the system default value.

no

Removes the specified EMM timeout definition from the configuration.

implicit-detach-timeout *detach_dur*

Sets the timer timeout duration (in seconds) after which subscriber will implicitly detached from the network if there is no activity. Generally this timer value is 240 seconds (4 minutes) more than the timeout value of the T3423 timer.
This timer starts when mobile reachable timer expires while the network is in EMM-IDLE mode and ISR is activated and stops when a NAS signalling connection established.
detach_dur is an integer from 1 through 12000. Default: 3480

mobile-reachable-timeout *mob_reach_dur*

Sets the timeout timer duration (in seconds) after which reachability procedure will be discarded and reattempt starts.
mob_reach_dur is an integer from 1 through 12000. Default: 3480

t3412-timeout *t3412_dur*

Sets the timeout duration (in seconds) for the T3412 timer. This timer is used for periodic tracking area update (P-TAU). When this timer expires, the periodic tracking area updating procedure starts and the timer is set to its initial value for the next start.
This timer starts when the UE goes from EMM-CONNECTED to EMM-IDLE mode and stops when the UE enters EMM-CONNECTED mode.
t3412_dur is an integer from 1 through 11160. Default: 3240

t3413-timeout *t3413_dur*

Sets the timeout duration (in seconds) for the T3413 timer. The timer starts when MME initiates the EPS paging procedure to the EMM entity in the network and requests the lower layer to start paging. This timer stops for the paging procedure when a response received from the UE.
t3413_dur is an integer from 1 through 20. Default: 6

t3422-timeout *t3422_dur*

Sets the timeout duration (in seconds) for the T3422 timer. This timer starts when MME initiates the detach procedure by sending a DETACH REQUEST message to the UE and stops upon receipt of the DETACH ACCEPT message.
t3422_dur is tan integer from 1 through 20. Default: 6

t3423-timeout *t3423_dur*

Sets the timeout duration (in seconds) for the T3423 timer. This timer starts when UE enters the EMM-DEREGISTERED state or when entering EMM-CONNECTED mode. It stops while the UE is in EMM-REGISTERED.NO-CELL-AVAILABLE state and Idle mode Signalling Reduction (ISR) is activated.
t3423_dur is an integer from 1 through 11160. Default: 3240

t3450-timeout *t3450_dur*

Sets the timeout duration (in seconds) for the T3450 timer. This timer starts when MME initiates the Globally Unique Temporary Identifier (GUTI) reallocation procedure by sending a GUTI REALLOCATION COMMAND message to the UE and stops upon receipt of the GUTI REALLOCATION COMPLETE message.
This timer is also used for the Tracking Area update procedure.
t3450_dur is an integer from 1 through 20. Default: 6

t3460-timeout *t3460_dur*

Sets the timeout duration (in seconds) for the T3460 timer. This timer starts when the network initiates the authentication procedure by sending an AUTHENTICATION REQUEST message to the UE and stops upon receipt of the AUTHENTICATION RESPONSE message.
t3460_dur is an integer from 1 through 20. Default: 6

t3470-timeout *t3470_dur*

Sets the timeout duration (in seconds) for the T3470 timer. The MME starts this timer when the network initiates the identification procedure by sending an IDENTITY REQUEST message to the UE and stops upon receipt of the IDENTITY RESPONSE message.
t3470_dur is an integer from 1 through 20. Default: 6

Usage

Use this command to set EMM timers.
The following tables describe the triggers and states for timers:

Table 25. EPS Mobility Management Timers – UE Side

Timer	State	Cause of Start	Normal Stop	On Expiry

Timer	State	Cause of Start	Normal Stop	On Expiry
T3402	• EMM-DEREGISTERED • EMM-REGISTERED	• At attach failure and the attempt counter is equal to 5. • At tracking area updating failure and the attempt counter is equal to 5.	• ATTACH REQUEST sent • TRACKING AREA UPDATE REQUEST sent	Initiation of the attach procedure or TAU procedure
T3410	EMM-REGISTERED-INITIATED	ATTACH REQUEST sent	• ATTACH ACCEPT received • ATTACH REJECT received	Start T3411 or T3402 as described in subclause 5.5.1.2.6
T3411	• EMM-DEREGISTERED. ATTEMPTING-TO-ATTACH • EMM-REGISTERED. ATTEMPTING-TO-UPDATE	• At attach failure due to lower layer failure, T3410 timeout or attach rejected with other EMM cause values than those treated in subclause 5.5.1.2.5. • At tracking area updating failure due to lower layer failure, T3430 timeout or TAU rejected with other EMM cause values than those treated in subclause 5.5.3.2.5.	• ATTACH REQUEST sent • TRACKING AREA UPDATE REQUEST sent	Retransmission of the ATTACH REQUEST or TRACKING AREA UPDATE REQUEST
T3412	EMM-REGISTERED	In EMM-REGISTERED, when EMM-CONNECTED mode is left.	• When entering state EMM-DEREGISTERED or • When entering EMM-CONNECTED mode.	Initiation of the periodic TAU procedure

Timer	State	Cause of Start	Normal Stop	On Expiry
T3416	• EMM-REGISTERED-INITIATED • EMM-REGISTERED • EMM-DEREGISTERED-INITIATED • EMM-TRACKING-AREA-UPDATING-INITIATED • EMM-SERVICE-REQUEST-INITIATED	RAND and RES stored as a result of a UMTS authentication challenge	• SECURITY MODE COMMAND received • SERVICE REJECT received • TRACKING AREA UPDATE ACCEPT received • AUTHENTICATION REJECT received • AUTHENTICATION FAILURE sent • EMM-DEREGISTERED or EMM-NULL entered	Delete the stored RAND and RES
T3417	EMM-SERVICE-REQUEST-INITIATED	• SERVICE REQUEST sent • EXTENDED SERVICE REQUEST sent in case f and g in subclause 5.6.1.1	• Bearers have been set up • SERVICE REJECT received	Abort the procedure
T3417ext	EMM-SERVICE-REQUEST-INITIATED	• EXTENDED SERVICE REQUEST sent in case d in subclause 5.6.1.1 • EXTENDED SERVICE REQUEST sent in case e in subclause 5.6.1.1 and the CSFB response was set to “CS fallback accepted by the UE”.	• Inter-system change from S1 mode to A/Gb mode or Iu mode is completed • Inter-system change from S1 mode to A/Gb mode or Iu mode is failed • SERVICE REJECT received	Abort the procedure

Timer	State	Cause of Start	Normal Stop	On Expiry
T3418	• EMM-REGISTERED-INITIATED • EMM-REGISTERED • EMM-TRACKING-AREA-UPDATING-INITIATED • EMM-DEREGISTERED-INITIATED • EMM-SERVICE-REQUEST-INITIATED	AUTHENTICATION FAILURE (EMM cause = #20 “MAC failure” or #26 “Non-EPS authentication unacceptable”) sent	AUTHENTICATION REQUEST received	On first expiry, the UE should consider the network as false
T3420	• EMM-REGISTERED-INITIATED • EMM-REGISTERED • EMM-DEREGISTERED-INITIATED • EMM-TRACKING-AREA-UPDATING-INITIATED • EMM-SERVICE-REQUEST-INITIATED	AUTHENTICATION FAILURE (cause = #21 “synch failure”) sent	AUTHENTICATION REQUEST received	On first expiry, the UE should consider the network as false
T3421	EMM-DEREGISTERED-INITIATED	DETACH REQUEST sent	DETACH ACCEPT received	Retransmission of DETACH REQUEST

Timer	State	Cause of Start	Normal Stop	On Expiry
T3423	EMM-REGISTERED	T3412 expires while the UE is in EMM-REGISTERED.NO-CELL-AVAILABLE and ISR is activated.	• When entering state EMM-DEREGISTERED or • When entering EMM-CONNECTED mode.	Set TIN to "P-TMSI"
T3430	EMM-TRACKING-AREA-UPDATING-INITIATED	TRACKING AREA UPDATE REQUEST sent	• TRACKING AREA UPDATE ACCEPT received • TRACKING AREA UPDATE REJECT received	Start T3411 or T3402 as described in subclause 5.5.3.2.6
T3440	• EMM-REGISTERED-INITIATED • EMM-TRACKING-AREA-UPDATING-INITIATED • EMM-DEREGISTERED-INITIATED • EMM-SERVICE-REQUEST-INITIATED • EMM-REGISTERED	• ATTACH REJECT, DETACH REQUEST, TRACKING AREA UPDATE REJECT with any of the EMM cause values #11, #12, #13, #14 or #15 • SERVICE REJECT received with any of the EMM cause values #11, #12, #13 or #15 • TRACKING AREA UPDATE ACCEPT received after the UE sent TRACKING AREA UPDATE REQUEST in EMM-IDLE mode with no "active" flag	• Signalling connection released • Bearers have been set up	Release the signalling connection and proceed as described in subclause 5.3.1.2
T3442	EMM-REGISTERED	SERVICE REJECT received with EMM cause #39	TRACKING AREA UPDATE REQUEST sent	None
NOTE 1: The default value of this timer is used if the network does not indicate another value in an EMM signalling procedure.				
NOTE 2: The value of this timer is provided by the network operator during the attach and tracking area updating procedures.				
NOTE 3: The value of this timer may be provided by the network in the ATTACH ACCEPT message and TRACKING AREA UPDATE ACCEPT message. The default value of this timer is identical to the value of T3412.				

Timer	State	Cause of Start	Normal Stop	On Expiry
NOTE 4: The value of this timer is provided by the network operator when a service request for CS fallback is rejected by the network with EMM cause #39 “CS domain temporarily not available”.				

Table 26. EPS Mobility Management Timers – Network Side

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
T3413	EMM-REGISTERED	Paging procedure initiated	Paging procedure completed	Network dependent
T3422	EMM-DEREGISTERED-INITIATED	DETACH REQUEST sent	DETACH ACCEPT received	Retransmission of DETACH REQUEST
T3450	EMM-COMMON-PROC-INIT	• ATTACH ACCEPT sent • TRACKING AREA UPDATE ACCEPT sent with GUTI • GUTI REALLOCATION COMMAND sent	• ATTACH COMPLETE received • TRACKING AREA UPDATE COMPLETE received • GUTI REALLOCATION COMPLETE received	Retransmission of the same message type, i.e. ATTACH ACCEPT, TRACKING AREA UPDATE ACCEPT or GUTI REALLOCATION COMMAND
T3460	EMM-COMMON-PROC-INIT	• AUTHENTICATION REQUEST sent • SECURITY MODE COMMAND sent	• AUTHENTICATION RESPONSE received • AUTHENTICATION FAILURE received • SECURITY MODE COMPLETE received • SECURITY MODE REJECT received	Retransmission of the same message type, i.e. AUTHENTICATION REQUEST or SECURITY MODE COMMAND
T3470	EMM-COMMON-PROC-INIT	IDENTITY REQUEST sent	IDENTITY RESPONSE received	Retransmission of IDENTITY REQUEST
Mobile reachable timer	All except EMM-DEREGISTERED	Entering EMM-IDLE mode	NAS signalling connection established	Network dependent, but typically paging is halted on 1st expiry
Implicit detach timer	All except EMM-DEREGISTERED	The mobile reachable timer expires while the network is in EMM-IDLE mode and ISR is activated	NAS signalling connection established	Implicitly detach the UE on 1st expiry

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.				
NOTE 2: The value of this timer is network dependent.				

Table 27. EPS Session Management Timers – UE Side

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
T3480	PROCEDURE TRANSACTION PENDING	BEARER RESOURCE ALLOCATION REQUEST sent	ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST received or MODIFY EPS BEARER CONTEXT REQUEST received or BEARER RESOURCE ALLOCATION REJECT received	Retransmission of BEARER RESOURCE ALLOCATION REQUEST
T3481	PROCEDURE TRANSACTION PENDING	BEARER RESOURCE MODIFICATION REQUEST sent	ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST received or MODIFY EPS BEARER CONTEXT REQUEST received or DEACTIVATE EPS BEARER CONTEXT REQUEST received or BEARER RESOURCE MODIFICATION REJECT received	Retransmission of BEARER RESOURCE MODIFICATION REQUEST
T3482	PROCEDURE TRANSACTION PENDING	An additional PDN connection is requested by the UE which is not combined in attach procedure	ACTIVE DEFAULT EPS BEARER CONTEXT REQUEST received or PDN CONNECTIVITY REJECT received	Retransmission of PDN CONNECTIVITY REQUEST
T3492	PROCEDURE TRANSACTION PENDING	PDN DISCONNECT REQUEST sent	DEACTIVATE EPS BEARER CONTEXT REQUEST received or PDN DISCONNECT REJECT received	Retransmission of PDN DISCONNECT REQUEST
NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.				

This command can be repeated to set each timer as needed.
The retransmission of all type of NAS messages can be configured through **`nas-max-retransmissions`** command.

Example

The following command sets the timeout value for EPS paging procedure timer T3413 for *10* seconds.

```
emm t3413-timeout 10
```

enb-cache-timeout

Configures the amount of time that eNodeB information is stored in cache after the eNodeB terminates the connection.

Product

MME

Privilege

Administrator

Syntax

enb-cache-timeout *min*

default enb-cache-timeout

default

Returns the command to its default value of 10.

min

Specifies the amount of time (in minutes) that the MME stores eNodeB information after the eNodeB terminates the connection. *min* is an integer value from 1 through 1440. Default: 10
In releases prior to 12.2, *min* is an integer value from 1 through 60.

Usage

Use this command to set the amount of time the MME stores eNodeB information in cache after the eNodeB terminates the connection.

Example

The following command sets the amount of time the MME stores eNodeB information to *15* minutes:

```
enb-cache-timeout 15
```

encryption-algorithm-lte

Configures the precedence for LTE encryption algorithms to use for security procedures through this MME service.

Product

MME

Privilege

Administrator

Syntax

```
encryption-algorithm-lte priority1 { 128-eea0 | 128-eea1 | 128-eea2 } [ priority2 { 128-eea0 | 128-eea1 | 128-eea2 } ] [ priority3 { 128-eea0 | 128-eea1 | 128-eea2 } ]

default encryption-algorithm-lte
```

default

Sets the default LTE encryption algorithm for security procedures with configured priority *value*. Lowest value has highest preference. Default configuration of LTE encryption algorithm is:

- priority1 with 128-eea0 encryption algorithm
- priority2 with 128-eea1 encryption algorithm
- priority3 with 128-eea2 encryption algorithm

priority1

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 1.

priority2

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 2.

priority3

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 3.

128-eea0

Sets the Null ciphering algorithm (128-EEA0) for LTE encryption as the encryption algorithm for security procedures. Default: Enabled

128-eea1

This keyword sets the SNOW 3G synchronous stream ciphering algorithm (128-EEA1) for LTE encryption as the encryption algorithm for security procedures. SNOW 3G is a stream cipher that forms the base of the 3GPP confidentiality algorithm UEA2 and the 3GPP integrity algorithm UIA2. Default: priority2

128-eea2

Sets the Advance Encryption Standard (AES) ciphering algorithm (128-EEA2) for LTE encryption as the encryption algorithm for security procedures. Default: priority3

Usage

Use this command to set the LTE encryption algorithms for security procedures to use with this MME service.

Caution: When this command is executed, all the existing priority-to-algorithm mappings will be removed and the newly configured ones will be applicable for security procedures.

Caution: Configuration of the same algorithm to multiple priorities is prohibited.

Example

The following command sets the 128-EEA1 as the LTE encryption algorithm with priority 2 for security procedures with an MME service:

```
encryption-algorithm-lte priority2 128-eea1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

esm

Defines the Evolved Session Management timer parameters like timeout durations for timers and retransmission counts for the retransmission of Non-Access Stratum (NAS) messages in MME service.

Product

MME

Privilege

Administrator

Syntax

esm { t3485-timeout *t3485_dur* **| t3486-timeout** *t3486_dur* **| t3489-timeout** *t3489_dur* **| t3495-timeout** *t3495_dur* **}**

default esm { t3485-timeout | t3486-timeout | t3489-timeout | t3495-timeout }

default

Resets the specified Evolved Session Management timer timeout to the system default value.

t3485-timeout *t3485_dur*

Sets the timeout duration (in seconds) for the T3485 timer. This timer is used by the default EPS bearer context activation procedure.
This timer starts when the MME sends an ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message to UE and stops when receives ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEFAULT EPS BEARER CONTEXT REJECT message from UE.
t3485_dur is an integer from 1 through 60. Default: 8

t3486-timeout *t3486_dur*

Sets the timeout duration (in seconds) for theT3486 timer. This timer is used by the default EPS bearer context modification procedure.
This timer starts when the MME sends a MODIFY EPS BEARER CONTEXT REQUEST message to the UE and stops when it receives a MODIFY EPS BEARER CONTEXT ACCEPT received or a MODIFY EPS BEARER CONTEXT REJECT message from UE.
t3485_dur is an integer from 1 through 60. Default: 8

t3489-timeout *t3489_dur*

Sets the timeout duration (in seconds) for the T3489 timer. This timer is used for the default EPS bearer context deactivation procedure.
This timer starts when the MME sends an ESM INFORMATION REQUEST message to the UE and stops when receives a ESM INFORMATION RESPONSE message from the UE.
t3495_dur is an integer from 1 through 60. Default: 4

t3495-timeout *t3495_dur*

Sets the timeout duration (in seconds) for the T3495 timer. This timer is used for default EPS bearer context deactivation procedure.

This timer starts when the MME sends a DEACTIVATE EPS BEARER CONTEXT REQUEST message to UE and stops when receives DEACTIVATE EPS BEARER CONTEXT ACCEPT or DEACTIVATE EPS BEARER CONTEXT REJECT message from UE.
t3495_dur is tan integer from 1 through 60. Default: 8

Usage

Use this command to set Evolved Session Management timers.
the following tables describe the triggers and states for timers:

Table 28. EPS Session Management Timers – Network Side

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
T3485	BEARER CONTEXT ACTIVE PENDING	• ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST sent • ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST sent	• ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT received or • ACTIVATE DEFAULT EPS BEARER CONTEXT REJECT received or • ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT received or • ACTIVATE DEDICATED EPS BEARER CONTEXT REJECT received	Retransmission of the same message
T3486	BEARER CONTEXT MODIFY PENDING	MODIFY EPS BEARER CONTEXT REQUEST sent	• MODIFY EPS BEARER CONTEXT ACCEPT received or • MODIFY EPS BEARER CONTEXT REJECT received	Retransmission of MODIFY EPS BEARER CONTEXT REQUEST

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
T3489	PROCEDURETRANSACTION PENDING	ESM INFORMATION REQUEST sent	ESM INFORMATION RESPONSE received	Retransmission of ESM INFORMATION REQUEST on 1st and 2nd expiry only
T3495	BEARER CONTEXT INACTIVE PENDING	DEACTIVATE EPS BEARER CONTEXT REQUEST sent	DEACTIVATE EPS BEARER CONTEXT ACCEPT received	Retransmission of DEACTIVATE EPS BEARER CONTEXT REQUEST
NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.				

This command can be repeated to set each timer as needed.
The retransmission of all type of NAS messages can be configured through **nas-max-retransmissions** command.

Example

The following command sets the timeout value for the default EPS bearer context activation procedure timer (T3485) for 10 seconds.

```
esm t3485-timeout 10
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

gtpv2

Configures GTPv2 piggybacking support from the MME to the P-GW. A piggybacking flag is sent by the MME to a P-GW in the S11 “Create Session Request” message and determines whether dedicated bearer creation (Create Bearer Request) is piggybacked onto the “Create Session Response” message or not.

Product

MME

Privilege

Administrator

Syntax

```
[ default | no ] gtpv2 piggybacking
```

default

Returns the command to its default setting of enabled.

no

Disables the feature.

piggybacking

Specifies that piggybacking is to be performed by the P-GW.

Usage

Use this command to enable the sending of a piggybacking flag to the P-GW over the S11 interface requesting that the Create Bearer Request message is piggybacked on the Create Session Response message (sent from the P-GW to the MME.

Example

The following command disables this feature:

```
no gtpv2 piggybacking
```

heuristic-paging

Enables or disables the heuristic or optimized paging feature for the service.

Product

MME

Privilege

Administrator

Syntax

```
[ default | no ] heuristic-paging
```

default

Returns the command to its default setting of disabled.

no

Disables the feature.

Usage

Use this command to enable or disable the heuristic paging feature for the service. Also known as idle-mode paging, enabling this feature prompts the MME service to keep track of the eNodeBs to which the access terminal (AT) most commonly attaches, thus reducing the signalling otherwise associated with continuous paging.

Important: Optimized Paging is a licensed feature and will not appear as a command option unless the proper licensed is installed.

integrity-algorithm-lte

Configures the precedence of LTE integrity algorithms to use for security procedures through this MME service. By default the integrity algorithm is enabled on MME service and cannot be disabled.

Product

MME

Privilege

Administrator

Syntax

```
integrity-algorithm-lte priority1 { 128-eia1 | 128-eia2 } [ priority2 { 128-eia1 | 128-eia2 } ]

default integrity-algorithm-lte
```

default

Removes the preconfigured integrity algorithm and sets the default LTE integrity algorithm for security procedures. Default configuration of LTE integrity algorithm is:

- priority1 with 128-eia1 integrity algorithm
- priority2 with 128-eia2 integrity algorithm

priority1

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 1. This is the mandatory and default priority keyword.

priority2

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 2.

128-eia1

This keyword sets the SNOW 3G synchronous stream ciphering algorithm (128-EIA1) for LTE integrity as the integrity algorithm for security procedures. SNOW 3G is a stream cipher that forms the base of the 3GPP confidentiality algorithm UEA2 and the 3GPP integrity algorithm UIA2. Default: priority1

128-eia2

Sets the Advance Encryption Standard (AES) ciphering algorithm (128-EIA2) for LTE integrity as the integrity algorithm for security procedures. Default: Enabled

Usage

Use this command to set the LTE integrity algorithms for security procedures to use with this MME service.

WARNING: Integrity algorithm is a mandatory aspect and can not be disabled in MME service.

Caution: When this command is executed, all the existing priority to algorithm mappings will be removed and the newly configured ones will be applicable for security procedures.

Caution: Configuration of same algorithm to multiple priorities is prohibited.

Example

The following command sets the AES ciphering algorithms (128-EIA2) as the LTE integrity algorithm with priority as *1* for security procedures with an MME service:

```
integrity-algorithm-lte priority1 128-eia2
```

location-reporting

Enables or disables the UE location reporting function on the MME service.

Product

MME

Privilege

Administrator

Syntax

```
[ no | default ] location-reporting
```

default

Disables the location reporting feature on MME service.

no

Disables the location reporting feature on MME service.

Usage

Use this command to enable or disable the UE location reporting feature on the MME service. When enabled the MME forwards a location report request for a specific UE from the P-GW to the eNodeB.

Important: Location reporting, also known as User Location Information (ULI) Reporting, is a licensed feature and requires the purchase of the ULI Reporting feature license.

Example

The following command sets the MME service to allow for location reporting for UEs:

```
location-reporting
```

max-bearers per-subscriber

Specifies the maximum number of EPS bearers that a subscriber may simultaneously use to access this MME service.

Product

MME

Privilege

Administrator

Syntax

max-bearers per-subscriber *max_bearer*

default max-bearers per-subscriber

default

Configures the maximum EPS bearers for a subscriber to use simultaneously to the default value of 11.

max_bearer

Specifies the maximum number of EPS bearers for a subscriber may simultaneously use to access this MME service.
max_bearer is an integer from 1 through 11. Default: 11

Usage

Use this command to set the maximum number of EPS bearers that a subscriber may simultaneously use to access this MME service.

Example

The following command specifies that a maximum of *6* simultaneous EPS bearers can be facilitated for a subscriber at any given time:

```
max-bearers per-subscriber 6
```

max-paging-attempts

This command configures the maximum number of paging attempt retransmissions allowed for network requested service creation to a subscriber after the first attempt failed.

Product

MME

Privilege

Administrator

Syntax

max-paging-attempts *max_paging_retry*

default max-paging-attempts

default

Configures the maximum number of paging request retransmissions to the default value of 3.

max_paging_retry

Specifies the maximum number of paging attempt retransmissions allowed for network requested service creation to a subscriber after the first attempt failed.
max_paging_retry is an integer from 1 through 10. Default: 3

Usage

Use this command to set the maximum number of paging attempt retransmissions allowed for network requested service creation to a subscriber after the first attempt failed.

Example

The following command specifies that a maximum of *6* paging attempt retransmissions allowed for network requested service creation to a subscriber:

```
max-paging- 6
```

max-pdns per-subscriber

Specifies the maximum number of Packet Data Networks (PDNs) that a subscriber may simultaneously access through this MME service.

Product

MME

Privilege

Administrator

Syntax

max-pdns per-subscriber *max_pdn*

default max-pdns per-subscriber

default

Configures the maximum PDNs that a subscriber can simultaneously access through this MME service to the default value of 3.

max_pdn

Specifies the maximum number of PDNs that a subscriber may simultaneously access through this MME service.
max_pdn is an integer from 1 through 11. Default: 3

Usage

Use this command to set the maximum number of PDNs that a subscriber may simultaneously access through this MME service.

Example

The following command specifies that a maximum of *2* simultaneous PDNs can be accessed by a subscriber at any given time through this MME service:

```
max-pdns per-subscriber 2
```

mme-id

Configures the MME identifier within an MME service. The MME identifier is constructed form the MME group ID and MME Code.

Product

MME

Privilege

Administrator

Syntax

mme-id group-id *grp_id* **mme-code** *mme_code*

no mme-id

no

Removes the configured MME identifier for this MME service.

Caution: Removing the MME identifier is a disruptive operation; the MME service is removed from the system.

group-id *grp_id*

Specifies the group identifier for the group of which this MME belongs as an integer from 0 through 65535.

mme-code *mme_code*

Specifies the unique code for this MME service as an integer from 0 through 255.

Usage

Use this command to set the MME identifier for this MME service. This MME identifier will be the identity of this MME in network.

Caution: Changing or removing the MME identifier is a disruptive operation; the MME service will be re-started or removed from service.

Example

The following command configures the MME identifier with group id as *41025* and MME code as *101* for this MME service:

```
mme-id group-id 41025 mme-code 101
```

mmemgr-recovery

Configures the recovery action for the MME manager.

Product

MME

Privilege

Administrator

Syntax

```
mmemgr-recovery { no-reset | reset-s1-peers }

default mmemgr-recovery
```

default

Resets the command to its default value.

no-reset

Specifies that the recovery action is to NOT reset S1 peers.

reset-s1-peers

Specifies that the recovery action is TO reset S1 peers.

Usage

Use this command to set a recovery action for the MME Manager.

Example

The following command configures the MME Manager recovery action to reset all S1 peers:

```
mmemgr-recovery reset-s1-peers
```

msc

Specifies the IP address of the enhanced Mobile Switching Center (eMSC) server for the MME service. This parameter is used for communicating with the eMSC server over the Sv interface in support of the Single Radio Voice Call Continuity (SRVCC) feature.

Product

MME

Privilege

Administrator

Syntax

msc *ip_address*

no msc

no

Removes the eMSC IP address configuration from the MME service.

ip_address

Specifies the IP address of the peer eMSC server in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to specify the IP address of the peer eMSC server used during SRVCC handovers.

Example

The following command specifies an IPv4 address for the peer eMSC server as *10.2.3.4*:

```
msc 10.2.3.4
```

nas-max-retransmission

Sets the retransmission counter for all type of Non-Access Stratum (NAS) messages in an MME service.

Product

MME

Privilege

Administrator

Syntax

nas-max-retransmissions *nas_retrans_count*

default nas-max-retransmissions

default

Resets the retransmission counter to the default value of 4.

nas_retrans_count

Sets the maximum number of retransmission of NAS messages permitted during any procedure after which the activation procedure will be discarded.
nas_retrans_count is an integer from 1 through 10. Default: 4

Usage

Use this command to set maximum number of retries allowed for any type of NAS messages.
NAS Messages sent by the MME which require a response from the UE for procedure completion are retransmitted. Retransmission happens based on timer expiry. The timers are configured through the **emm** and **esm** commands. NAS messages are retransmitted per configuration, and if no response is received from the UE, the pending transaction is abandoned. If the transaction is a DETACH or PDN DISCONNECT REQUEST, the transaction is completed without further UE signaling.
The timeout duration configured through the **emm** and **esm** commands will be applicable between two retries.

Example

The following command sets the maximum number of retries allowed as *4* for all type of NAS messages in an MME service.

```
default nas-max-retransmissions
```

network-sharing

Configures additional PLMN IDs for this MME service. Refer to the **plmn-id** command to create the base PLMN identifier for an MME service. Each PLMN ID consists of the Mobile Country Code (MCC) and Mobile Network Code (MNC). A maximum of four network sharing entries can be configured per MME service. These PLMN IDs will be communicated to the eNodeBs in the S1 SETUP response and MME CFG Update messages.

Product

MME

Privilege

Administrator

Syntax

network-sharing plmnid mcc *number* **mnc** *number* **mme-id group-id** *id* **mme-code** *code*

no network-sharing plmnid mcc *number* **mnc** *number*

no

Disables the network sharing mode on this MME service.

Caution: Removing the PLMN identifier is a disruptive operation; the MME service will be restarted.

plmnid mcc *number* **mnc** *number*

Sets the mobile country code (MCC) and mobile network code (MNC) of the PLMN ID for this service.
mcc *number*: Specifies the MCC portion of the PLMN identifier as an integer from 100 through 999.
mnc *number*: Specifies the MNC portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

mme-id group-id *id*

Specifies the group identifier for the group to which this MME belongs as an integer from 0 through 65535.

mme-code *code*

Specifies the unique code for an MME service as an integer from 0 through 255.

Usage

Use this command to configure additional PLMN IDs for an MME service. In a given MME service, each PLMN ID (MCC and MNC) must be unique.

Caution: Changing or removing the PLMN identifier is a disruptive operation; the MME service will be restarted.

Example

The following command configures the network sharing parameters to an MCC of *123*, an MNC of *12*, a MME-ID/Group ID of *100*, and a MME code of *50*:

```
network-sharing plmnid mcc 123 mnc 12 mme-id group-id 100 mme-code 50
```

nri

Configures the network resource identifier (NRI) length used for source SGSN discovery via NRI-FQDN (Fully Qualified Domain Name) based DNS resolution.

Product

MME

Privilege

Administrator

Syntax

[no] nri length *length* **plmn-id mcc** *mcc_value* **mnc** *mnc_value*

no

Removes a configured NRI length.

length *length*

Specifies the number of bits to be used in the P-TMSI (bits 23 to 18) to define the NRI as an integer from 1 through 8.

plmn-id mcc *mcc_value* **mnc** *mnc_value*

Specifies the PLMN-ID of the SGSN pool.
mcc *mcc_value*: Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.
mnc *mnc_value*: Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

Usage

Use this command to retrieve the NRI (identity of an SGSN) stored in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). Up to eight NRI length values can be configured.

Important: In the absence of this configuration, the MME treats the NRI as invalid. The MME will use a plain RAI-based FQDN (and not an NRI-based FQDN) for DNS queries made to resolve the source SGSN.

Example

The following command creates an NRI length of *5* and associates it with an SGSN pool with the PLMN-ID of *123*:

```
nri length 5 plmnid mcc 123 mnc 23
```

peer-mme

Configures parameters that, when matched by another MME, specifies that MME as a peer for inter-MME relocations.

Product

MME

Privilege

Administrator

Syntax

peer-mme { gummei mcc *number* **mnc** *number* **group-id** *id* **mme-code** *code* **address** *ipv4_address* **| tai-match priority** *value* **mcc** *number* **mnc** *number* **tac {** *area_code* **| any |** *start_area_code* **to** *end_area_code* **} address** *ipv4_address* **}**

no peer-mme { gummei mcc *number* **mnc** *number* **group-id** *id* **mme-code** *code* **| tai-match priority** *value*

---

no

Removes the configured peer Globally Unique MME Identifier (GUMMEI) or TAI match priority from this service.

---

gummei mcc *number* **mnc** *number* **group-id** *id* **mme-code** *code* **address** *ipv4_address*

Specifies that an MME with values matching those configured in this GUMMEI is to be considered a peer MME. This variable supports the lookup of an IP address for a peer MME based on the exact match of the supporting keyword below (which make up the GUMMEI).
mcc *number*: Sets the mobile country code (MCC) for peer match as an integer from 100 through 999.
mnc *number*: Sets the mobile network code (MNC) for this peer match as a 2- or 3-digit integer from 00 through 999.
group-id *id*: Specifies the group identifier for the group to which this MME belongs as an integer from 32768 through 65535.
mme-code *code*: Specifies the unique code for an MME service as an integer from 0 through 255.
address *ipv4_address*: Specifies the IP address of the peer MME in IPv4 dotted-decimal notation.

---

tai-match priority *value* **mcc** *number* **mnc** *number* **tac {** *area_code* **| any |** *start_area_code* **to** *end_area_code* **} address** *ipv4_address*

Specifies that an MME with values matching those configured in this Tracking Area Identifier (TAI) match, is to be considered a peer MME. This keyword provides a priority-ordered list of TAI descriptions where the Tracking Area Code (TAC) field may be either an exact value, a range of values, or a “wildcard” value. It also provides an IP address of the peer MME corresponding to the TAI description.
priority *value*:
mcc *number*: Sets the mobile country code (MCC) for peer match as an integer from 100 through 999.
mnc *number*: Sets the mobile network code (MNC) for this peer match as an integer from 00 through 999.
tac *area_code*: Sets a specific Tracking Area Code (TAC) for the peer MME match as an integer from 1 through 65535.
tac any: Specifies that any TAC value can be considered for a peer MME.
tac *start_area_code* **to** *end_area_code*: Specifies a range of TACs. MMEs within this range and matching the rest of the criteria in this command are to be considered peer MMEs. *start_area_code* and *end_area_code* are integers from 1 through 268435455.

address *ipv4_address*: Sets a specific IP address for this TAI peer MME match in IPv4 dotted-decimal notation.

Usage

Use this command to configure parameters that, when matched by another MME, specifies that MME as a peer for inter-MME relocations.
This command allows configuration for two relocation scenarios:

- **gummei**: an MME receives either an Attach or a TAU request with a Globally Unique Temporary Identity (GUTI) that originated from another MME.
- **tai-match**: an MME receives an S1 Handover Required message and must select a new MME based on the TAI.

Up to 32 peer-mme gummei or tai-match entries may be configured per MME service.

Example

The following command identifies a peer MME with GUMMEI parameters:

```
peer-mme gummei mcc 123 mnc 12 group-id 40000 mme-code 100 address
10.2.3.4
```

peer-sgsn

Statically configures peer SGSN environments to facilitate MME-SGSN relocations over S3 or Gn/Gp interfaces.

Product

MME

Privilege

Administrator

Syntax

peer-sgsn rai mcc *mcc_value* **mnc** *mnc_value* **[nri** *value* **] rac** *value* **lac** *value* **address** *ip_address* **capability [gn] [gp] [s16] [s3]**

no peer-sgsn rai mcc *mcc_value* **mnc** *mnc_value* **[nri** *value* **] rac** *value* **lac** *value*

peer-sgsn rnc-id mcc *mcc_value* **mnc** *mnc_value* **rnc** *value* **address** *ip_address* **capability [gn] [gp] [s16] [s3]**

no peer-sgsn rnc-id mcc *mcc_value* **mnc** *mnc_value* **rnc** *value*

rai

Configures Routing Area Identity (RAI) parameters used to facilitate a lookup for a specific peer SGSN.

rnc-id

Configures Radio Network Controller Identification (RNC-ID) parameters used to facilitate a lookup for a specific peer SGSN.

mcc *mcc_value*

Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.

mnc *mnc_value*

Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

nri *value*

Specifies the Network Resource Identifier (NRI) value used as an additional identity along with the RAC within the RAI parameters as an integer from 0 through 65535.

rac *value*

Specifies the Routing Area Code (RAC) used to facilitate a lookup for a specific peer SGSN as an integer from 0 through 255.

rnc *value*

Specifies the Radio Network Controller (RNC) identification number used to facilitate a lookup for a specific peer SGSN as an integer from 0 through 65535.

lac *value*

Specifies the Location Area Code (LAC) value used to facilitate a lookup for a specific peer SGSN as an integer from 0 through 65535.

address *ip_address*

Specifies an existing IP address of the peer SGSN in IPv4 dotted-decimal or IPv6 colon-separated notation.

capability [gn] [gp] [s16] [s3]

Configures the GTP interface capability of the peer SGSN.
gn: Specifies that the peer SGSN is capable of communication over the Gn interface.
gp: Specifies that the peer SGSN is capable of communication over the Gp interface.
s16: Specifies that the peer SGSN is capable of communication over the S16 interface.
s3: Specifies that the peer SGSN is capable of communication over the S3 interface.

Usage

Use this command to configure parameters that, when matched by an SGSN, specifies that SGSN as a peer for inter-RAT relocations.
This command allows configuration for two relocation scenarios:

- **rai**: the lookup of an IP address for a peer MME based on the exact match of the RAI (and optionally NRI).
- **rnc-id**: the lookup of an IP address for a peer SGSN based on the exact match of the RNC-ID.

Up to 32 peer-SGSN RAI and RNC-ID entries may be configured per MME service.

Example

The following command configures an SGSN lookup using RNC-ID parameters with Gn interface capability:

```
peer-sgsn rnc-id mcc 123 mnc 12 rnc 2000 address 10.2.3.4 capability gn
```

pgw-address

Configures the PDN Gateway (P-GW) address, specifies the protocol for S5 and S8 interfaces, and sets other parameters within the MME service. By default S5 and S8 use GTP protocol for this.

Product

MME

Privilege

Administrator

Syntax

pgw-address *address* **[s5-s8-protocol pmip] [weight** *value* **]**

no pgw-address *address* **[s5-s8-protocol pmip]**

no

Removes a previously configured IP address for a P-GW along with the S5 and S8 interface of P-MIP protocol type, and other parameters from this MME service.

address

Specifies the IP address of the P-GW in IPv4 dotted-decimal or IPv6 colon-separated notation.

s5-s8-protocol pmip

Specifies that Proxy-MIP is to be used for S5 and S8 interfaces with the P-GW. By default S5 and S8 interface uses GTP protocol.
pmip Sets the protocol to Proxy-MIP for S5 and S8 interface.

weight *value*

Assigns a weight to the P-GW address to use as a preferred P-GW as an integer from 1 through 100. Lowest value has the least preference.

Usage

Use this command to configure the PDN Gateway (P-GW) addresses to use with MME service. This command also changes the default protocol from GTP to P-MIP for the S5 and S8 interface, and assigns a weight to use when sharing the load between associated P-GWs. A maximum of 16 P-GW addresses can be configured with this command.
This command only changes the use of protocol for the S5 and S8 interface. By default a P-GW uses GTP protocol for S5 and S8 interfaces. This command allows an operator to change the protocol to P-MIP for S5 and S8 interface.
When weight is used, the weights of the operational P-GW(s) are totaled and then weighted round-robin selection is used to distribute new default bearer contexts among P-GW(s).

Important: A maximum of 16 P-GW addresses can be configured per MME service.

Example

The following command associates the P-GW IP address of *192.168.3.1* to the MME service with S5 and S8 protocol as P-MIP and weight as *90*:

```
pgw-address 192.168.3.1 s5-s8-protocol pmip weight 90
```

The following command removes the above configured P-GW IP address and other parameters:

```
no pgw-address 192.168.3.1 s5-s8-protocol pmip
```

plmn-id

Configures the Public Land Mobile Network (PLMN) identifier for this MME service. The PLMN identifier consists of the Mobile Country Code (MCC) and Mobile Network Code (MNC). A single PLMN ID can be configured per MME service.

Product

MME

Privilege

Administrator

Syntax

plmn-id mcc *mcc_value* **mnc** *mnc_value*

no plmn-id mcc *mcc_value* **mnc** *mnc_value*

no

Removes the configured PLMN identifier for this MME service.

Caution: Removing the PLMN identifier is a disruptive operation; the MME service will be restarted.

mcc *mcc_value*

Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.

mnc *mnc_value*

Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

Usage

Use this command to set the PLMN identifier for this MME service.

Caution: Changing or removing the PLMN identifier is a disruptive operation; the MME service will be restarted.

One PLMN identifier is supported per MME service.

Important: To configure additional PLMN IDs for this MME service, refer to the **network-sharing** command described in this chapter.

Example

The following command configures the PLMN identifier with MCC value as *102* and MNC value as *20* for this MME service:

```
plmn-id mmc 102 mnc 20
```

policy attach

Configures parameters for the UE Attach procedure.

Product

MME

Privilege

Administrator

Syntax

```
policy attach { imei-query-type { imei | imei-sv | none } [ verify-equipment-identity [
allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ] ] | set-ue-
time { disable | enable }

default policy attach { imei-query-type | set-ue-time }
```

default

Returns the command to its default setting of **none** for **imei-query-type** and **disabled** for **set-ue-time**.

imei-query-type { imei | imei-sv | none }

Configures the IMEI query type for UE attach.

- **imei**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity (IMEI).
- **imei-sv**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity - Software Version (IMEI-SV).
- **none**: Specifies that the MME does not need to query for IMEI or IMEI-SV.

verify-equipment-identity [allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency]

Specifies that the identification (IMEI or IMEI-SV) of the UE is to be performed by the Equipment Identity Register (EIR) over the S13 interface.

- **allow-on-eca-timeout**: Configures the MME to allow equipment that has timed-out on ECA during the attach procedure.
- **deny-greylisted**: Configures the MME to deny grey-listed equipment during the attach procedure.
- **deny-unknown**: Configures the MME to deny unknown equipment during the attach procedure.
- **verify-emergency**: Configures the MME to ignore the IMEI validation of the equipment during the attach procedure in emergency cases. This keyword is only supported in release 12.2 and higher.

set-ue-time { disable | enable }

Configures the MME to set the time in the UE during the Attach procedure. Default: **disabled**.

Usage

Use this command to configure various MME settings used during the UE Attach procedure.

Example

The following command configures the MME to query the UE for its IMEI and to verify the UEs equipment identity over the S13 interface with an EIR:

```
policy attach imei-query-type imei verify-equipment-identity
```

policy idle-mode

Configures the user-defined policies of session management for an LTE subscriber in an MME service.

Product

MME

Privilege

Administrator

Syntax

```
policy idle-mode detach { explicit | implicit }

[ default ] policy idle-mode detach
```

default

Sets the policy of idle mode detach for a subscriber to its default behavior as implicit.

idle-mode detach

Configures the IDLE mode Detach behavior of a UE.

detach

Defines the Detach procedure while the UE is in IDLE mode.

explicit

Enables the Explicit Detach while a UE is in IDLE mode. The system will page the UE before Detach procedure is started, and then perform the explicit Detach procedure. Default: disabled

implicit

Enables the Implicit Detach while a UE is in IDLE mode. The system never sends any message to the UE before Detach, and executes the Explicit Detach procedure immediately. Default: Enabled

Usage

Use this command to set the user-defined policies for session management in this MME service.

Example

The following command sets the Idle Mode Detach policy to Explicit for a user in this MME service:

```
policy idle-mode detach explicit
```

policy inter-rat

Enables or disables establishment of indirect data forwarding tunnels for Gn/Gp-based Serving Radio Network Subsystem (SRNS) relocations.

Product

MME

Privilege

Administrator

Syntax

```
policy inter-rat indirect-forwarding-tunnels always

no policy inter-rat indirect-forwarding-tunnels
```

no

Disables the function.

indirect-forwarding-tunnels always

Enables establishment of indirect data forwarding tunnels for Gn/Gp-based SRNS relocations.

Usage

Use this command to enable or disable establishment of indirect data forwarding tunnels for Gn/Gp-based SRNS relocations.

Example

The following command enables establishment of indirect data forwarding tunnels for Gn/Gp-based SRNS relocations:

```
policy inter-rat indirect-forwarding-tunnels always
```

policy network

Configures the MME to indicate to the P-GW that all peer SGSNs support dual-addressing for bearers and, subsequently, dual-addressing must be supported for all IPv4 and IPv6 PDNs. Dual-addressing on SGSNs is based on the UE's capability to support inter-RAT roaming.

Product

MME

Privilege

Administrator

Syntax

```
[ default | no ] policy network dual-addressing-supported
```

default

Returns the command to its default setting of disabled.

no

Removes the ability to send dual-addressing support messaging from the MME to the P-GW.

dual-addressing-supported

Specifies that the MME shall indicate to the P-GW that dual-addressing is supported.

Usage

Use this command to configure the MME to send messaging to the P-GW that indicate that all peer SGSNs support dual-addressing for bearers and, subsequently, dual-addressing must be supported for all IPv4 and IPv6 PDNs.

Important: This command can be used for Pre-release 8 and Release 8 SGSNs.

policy overload

Configures the traffic overload policy to control congestion in this service.

Product

MME

Privilege

Administrator

Syntax

```
policy overload { drop | reject }

default policy overload
```

default

Sets the traffic overload policy action to the fault behavior of Reject.

drop

Specifies that the system is to drop the incoming packets with new session requests to avoid overload on MME node. Default: Disabled

reject

Configures the system to reject the new session/call request and responds with a reject message when the threshold for allowed call sessions is crossed on the MME node. Default: Enabled

Usage

Use this command to set the user-defined policies for new call connection attempts when an MME service is overloaded.
Congestion policies at the service-level can be configured for an individual service. When congestion control functionality is enabled, these policies dictate how services respond when the system detects that a congestion condition threshold has been crossed.

Example

The following command sets the nw call connect policy to reject the new session/call request in an MME service:

```
policy overload reject
```

policy pdn-reconnection

Configures the action by the MME when a PDN connection request to an already connected APN is being processed by the MME service.

Product

MME

Privilege

Administrator

Syntax

```
policy pdn-reconnection { multiple | reject | restart }

[ default ] policy pdn-reconnection
```

default

Sets the policy for PDN reconnection to its default behavior of Reject.

multiple

Allows multiple connections to a PDN with the same APN and PDN Type. In this case, the existing connection is left unchanged, and the MME attempts to establish an additional connection to the PDN. Default: Disabled

reject

Configures the MME to deny or reject the request, by sending a PDN Connection Reject command. This is the default behavior. Default: Enabled

restart

Deletes the existing connection and initiates an attempt to establish a new connection. Default: Disabled

Usage

Use this command to set the user-defined policies for PDN reconnection attempt procedures initiated by a UE in an MME service.
While attached the UE can request connections to PDNs. The PDNs are identified by APN (Access Point Name) and PDN Type (ipv4, ipv6 or ipv4v6).
If the UE requests connection to a PDN for which a connection with the same APN name and PDN type already exists, the MME can: 1) deny or reject the request, by sending a PDN connection reject command; 2) allow multiple connections to a PDN with same APN and PDN Type; or 3) delete the existing connection, and attempt to establish a new connection.

Example

The following command sets the PDN reconnect policy to delete the existing PDN and start the attempt to establish a new connection in an MME service:

```
policy pdn-reconnection restart
```

policy s1-reset

Configures how the MME responds to an S1 interface reset.

Product

MME

Privilege

Administrator

Syntax

```
policy s1-reset { detach-ue | idle-mode-entry }

default policy s1-reset
```

default

Returns the command to its default setting of **idle-mode-entry**.

{ detach-ue | idle-mode-entry }

Specifies the action to perform when the S1 interface is reset.
detach-ue: Specifies that UEs are to be implicitly detached from the service upon S1 interface reset.
idle-mode-entry: Specifies that UEs are to be placed into an idle mode condition during S1 interface reset.

Usage

Use this command to configure how the MME reacts to an S1 interface reset condition.

Example

The following command configures the MME to place UEs into an idle state while the S1 interface is being reset:

```
s1-reset idle-mode-entry
```

policy sctp-down

Configures how the MME responds to a failure of the Stream Control Transmission Protocol (SCTP) connection from the eNodeB.

Product

MME

Privilege

Administrator

Syntax

```
policy sctp-down { detach-ue | idle-mode-entry }

default policy sctp-down
```

default

Returns the command to its default setting of **idle-mode-entry**.

{ detach-ue | idle-mode-entry }

Specifies the action to perform when the SCTP connection from the eNodeB fails.
detach-ue: Specifies that UEs are to be detached from the service upon SCTP failure.
idle-mode-entry: Specifies that UEs are to be placed into an idle mode condition upon SCTP failure.

Usage

Use this command to configure how the MME reacts to an SCTP connection failure condition.

Example

The following command configures the MME to place UEs into an idle state while the SCTP connection from the eNodeB fails:

```
sctp-down idle-mode-entry
```

policy tau

Configures parameters for the tracking area update (TAU) procedure.

Product

MME

Privilege

Administrator

Syntax

```
policy tau { imei-query-type { imei | imei-sv | none } [ verify-equipment-identity [
allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ] ] | set-ue-
time { disable | enable }

default policy tau { imei-query-type | set-ue-time }
```

default

Returns the command to its default setting of **none** for **imei-query-type** and **disabled** for **set-ue-time**.

imei-query-type { imei | imei-sv | none }

Configures the IMEI query type for TAUs.

- **imei**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity (IMEI).
- **imei-sv**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity - Software Version (IMEI-SV).
- **none**: Specifies that the MME does not need to query for IMEI or IMEI-SV.

verify-equipment-identity [allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency]

Specifies that the identification (IMEI or IMEI-SV) of the UE is to be performed by the Equipment Identity Register (EIR) over the S13 interface.

- **allow-on-eca-timeout**: Configures the MME to allow equipment that has timed-out on ECA during the attach procedure.
- **deny-greylisted**: Configures the MME to deny grey-listed equipment during the attach procedure.
- **deny-unknown**: Configures the MME to deny unknown equipment during the attach procedure.
- **verify-emergency**: Configures the MME to ignore the IMEI validation of the equipment during the attach procedure in emergency cases. This keyword is only supported in release 12.2 and higher.

set-ue-time { disable | enable }

Configures the MME to set the time in the UE during the TAU procedure. Default: **disabled**.

Usage

Use this command to configure various MME settings used during the tracking area update (TAU) procedure.

Example

The following command configures the MME to query the UE for its IMEI and to verify the UEs equipment identity over the S13 interface with an EIR:

```
policy tau imei-query-type imei verify-equipment-identity
```

relative-capacity

Configures a relative capacity variable that is sent o the eNodeB for use in selecting an MME in order to load balance the pool.

Product

MME

Privilege

Administrator

Syntax

relative-capacity *number*

default relative-capacity

default

Returns the command to its default setting of 255.

number

Specifies the relative capacity or weight of an MME compared to others in an MME pool as an integer from 0 through 255. Default: 255

Usage

Use this command to configure the relative capacity or weight of this MME in comparison to other MMEs in a pool. This value is sent to the eNodeB in the S1AP S1 SETUP RESPONSE message.
If this value is changed after the S1 interface is initialized, the MME CONFIGURATION UPDATE message is used to update the eNodeB with the change.

Example

The following command sets this MME with a relative capacity or weight of *100*:

```
relative-capacity 100
```

s1-mme ip

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets of a particular 3GPP QoS class over the S1-MME interface.

Product

MME

Privilege

Administrator

Syntax

```
s1-mme ip qos-dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41
| af42 | af43 | be | ef }

default s1-mme ip qos-dscp
```

qos-dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }

Default: **af11**
Specifies the DSCP for the specified QoS traffic pattern. **qos-dscp** can be configured to any one of the following:
af11: Assured Forwarding 11 per-hop-behavior (PHB)
af12: Assured Forwarding 12 PHB
af13: Assured Forwarding 13 PHB
af21: Assured Forwarding 21 PHB
af22: Assured Forwarding 22 PHB
af23: Assured Forwarding 23 PHB
af31: Assured Forwarding 31 PHB
af32: Assured Forwarding 32 PHB
af33: Assured Forwarding 33 PHB
af41: Assured Forwarding 41 PHB
af42: Assured Forwarding 42 PHB
af43: Assured Forwarding 43 PHB
be: Best effort forwarding PHB
ef: Expedited forwarding PHB

Usage

DSCP levels can be assigned to specific traffic patterns to ensure that data packets are delivered according to the precedence with which they are tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the S1-MME interface(s).

Example

The following command sets the DSCP-level for data traffic sent over the S1-MME interface to **af12**:

```
s1-mme ip qos-dscp af12
```

s1-mme sctp port

Configures the source Stream Control Transmission Protocol (SCTP) port that will be used for binding the SCTP socket to communicate with the eNodeB using S1AP with this MME service.

Product

MME

Privilege

Administrator

Syntax

s1-mme sctp port *port_num*

default s1-mme sctp port

default

Sets the SCTP port to the default value of 36412 to communicate with the eNodeBs using S1-MME interface.

port_num

Specifies the SCTP port number to communicate with the eNodeBs using S1-MME interface as an integer from 1 through 65535. Default: 36412

Usage

Use this command to assign the SCTP port with SCTP socket to communicate with the eNodeB using S1AP. Only one SCTP port can be associated with one MME service.

Example

The following command sets the default SCTP port number 699 for to interact with eNodeB using S1AP on S1-MME interface:

```
default s1-mme sctp port
```

setup-timeout

Configures the timeout duration for setting up MME calls in this MME service.

Product

MME

Privilege

Administrator

Syntax

setup-timeout *dur*

default setup-timeout

default

Sets the call setup timeout duration to the default value of 60 seconds.

dur

Specifies the call setup timeout duration (in seconds) for MME calls after which the attempt will be discarded.
dur is an integer from 1 through 10000. Default: 60

Usage

Use this command to configured the timeout duration for setting up an MME call with an MME service. One this timer expires, the call setup procedure will be discarded within this MME service.

Example

The following command sets the default setup timeout duration of 60 seconds for MME calls:

```
default setup-timeout
```

snmp trap

Enables or disables the SNMP trap for S1 interface connection establishment.

Product

MME

Privilege

Administrator

Syntax

```
[ default | no ] snmp trap { s1-initial-establishment | s1-path-establishment }
```

default

Returns the command to its default setting of disabled.

no

Disables the SNMP trap.

s1-initial-establishment

Specifies that the SNMP trap for the initial S1 interface connection establishment is to be enabled or disabled.

s1-path-establishment

Specifies that the SNMP trap for the S1 path establishment is to be enabled or disabled.

Usage

Use this command to enable or disabled the SNMP trap for S1 interface connection establishment.

ue-db

Configures the UE database that is maintained by the MME as a cache of EPS contexts per UE keyed by IMSI/GUTI to allow the UE to attach by a Globally Unique Temporary Identity (GUTI) and reuse previously established security parameters. This cache will be maintained in each session manager where the first attach occurred for the UE.

Product

MME

Privilege

Administrator

Syntax

ue-db purge-timeout *dur_mins*

default ue-db purge-timeout

default

Resets the UE database purge timer timeout to the default value of 10080 minutes.

purge-timeout *dur_mins*

Sets the timeout duration (in minutes) for MME to store the UE database in cache memory. This timer starts when the UE goes dormant.
dur_mins is an integer from 1 through 20160. Default: 10080

Usage

Use this command to set timeout duration for MME to hold UE database information in cache memory. The MME DB acts as a cache for storing subscriber related information. This subscriber related information helps reduce signaling traffic. The MME DB is a part of the Session Manager and interfaces between the Session Manager Application and Evolved Mobility Management Manager to provide access to the cached data.

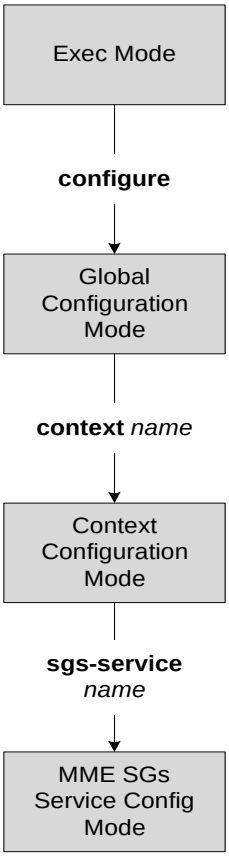
Example

The following command configures the MME database cache timer to hold the UE information up to 7 days (10080 minutes) in the MME Database:

```
default ue-db purge-timeout
```

Chapter 191
MME SGs Service Configuration Mode Commands

The MME SGs Service Configuration Mode is used to create and manage the LTE Mobility Management Entity (MME) SGs services on this system. The SGs service creates an SGs interface between the MME and a Mobile Switching Center/Visitor Location Register (MSC/VLR).



associate

Associates or disassociates a Stream Control Transmission Protocol (SCTP) parameter template with the SGs service.

Product

MME

Privilege

Administrator

Syntax

associate sctp-param-template *template_name*

no associate sctp-param-template

no

template_name

Associates an SCTP parameter template with the SGs service.
template_name specifies the name for a pre-configured SCTP parameter template to associate with this SGs service as an alphanumeric string of 1 through 63 characters. For more information on the SCTP parameter template, refer to the **sctp-param-template** command in the *Global Configuration Mode Commands* chapter and the *SCTP Parameter Template Configuration Mode Commands* chapter.

Usage

Use this command to associate a pre-configured SCTP parameter template with the SGs service.

Important: If no SCTP parameter template is specified, all default settings for the configurable parameters in the SCTP Parameter Template Configuration Mode apply.

Example

The following command associates a pre-configured SCTP parameter template called *sctp-3* to the SGs service:

```
associate sctp-param-template sctp-3
```

bind

Binds the service to a logical IP interface serving as the SGs interface.

Product

MME

Privilege

Administrator

Syntax

bind { ipv4-address *ipv4_address* **[ipv4-address** *ipv4_address* **] | ipv6-address** *ipv6_address* **[ipv6-address** *ipv6_address* **] }**

no bind

no bind

Removes the interface binding from this service.

ipv4-address *ipv4_address* **[ipv4-address** *ipv4_address* **]**

Specifies the IP address of the SGs interface in IPv4 dotted-decimal notation. n.
A secondary IPv4 address can be configured to support SCTP multi-homing.

ipv6-address *ipv6_address* **[ipv6-address** *ipv6_address* **]**

Specifies the IP address of the SGs interface in IPv6 colon-separated notation.
A secondary IPv6 address can be configured to support SCTP multi-homing.

Usage

Associate the SGs service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an SGs interface that provides the session connectivity for circuit switched fallback (CSFB) to/from a Mobile Switching Center/Visitor Location Register (MSC/VLR). Only one interface can be bound to a service. The interface should be configured prior to issuing this command

Example

The following command binds the logical IP interface with the IPv4 address of *192.68.10.22* to the SGs service:

```
bind ipv4-address 192.68.10.22
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

non-pool-area

Configures a non-pool area where a group of Location Area Code (LAC) values use a specific visitor Location Register (VLR).

Product

MME

Privilege

Administrator

Syntax

non-pool-area *name* **use-vlr** *vlr_name* **[lac** *value(s)* **] [plmnid { any | mcc** *mcc_value* **mnc** *mnc_value* **}]**

no non-pool-area *name* **[lac** *value(s)* **]**

no non-pool-area *name* **[lac** *value(s)* **]**

Removes the configured non-pool-area from this service. Optionally, removes a specific LAC or LACs from this non-pool area. *name* is the name of an existing non-pool-area expressed as an alphanumeric string of 1 through 63 characters. *value(s)* is an existing LAC integer value from 1 through 65535.

name

Specifies the name of the non-pool area as an alphanumeric string of 1 through 63 characters.

use-vlr *vlr_name*

Specifies the VLR to be used in this non-pool area configuration as an alphanumeric string of 1 through 63 characters.

lac *value(s)*

Specifies the location area code or codes to be used with the configured VLR in this non-pool area configuration. *value(s)* is an integer(s) from 1 through 65535. A total of 16 area codes can be added in a single line or separately.

plmnid { any | mcc *mcc_value* **mnc** *mnc_value* **}**

Specifies the Public Land Mobile Network (PLMN) identifier to be used with the VLR in this non-pool area configuration.
any: Specifies that any PLMN ID can be used with the VLR in this configuration.
mcc *mcc_value* **mnc** *mnc_value*: Specifies the mobile country code (MCC) and mobile network code (MNC) of the PLMN identifier. *mcc_value* must be an integer from 101 through 998. *mnc_value* must be a 2- or 3-digit integer from 00 through 998.

Usage

Use this command to configure a non-pool area where LAC values and/or PLMN IDs are associated with a specific VLR.

Example

The following command creates a non-pool area named *svlr1* associated with a VLR named *vlr1* and containing LAC values of 1, 2, 3, 4, 5, 6, 7, and 8:

```
non-pool-area svlr1 use-vlr vlr1 lac 1 2 3 4 5 6 7 8
```

pool-area

Creates a location area code (LAC) pool area configuration or specifies an existing pool area and enters the LAC Pool Area Configuration Mode.

Product

MME

Privilege

Administrator

Syntax

[no] pool-area *pool_name* **[-noconfirm]**

no

Removes the selected pool area configuration from the SGs service.

pool_name

Specifies the name of the LAC pool area configuration. If *pool_name* does not refer to an existing pool, a new pool is created. *pool_name* must be an alphanumeric string of 1 through 64 characters.

Important: A total of eight pool areas can be configured per SGs service.

Usage

Use this command to enter the LAC Pool Area Configuration Mode for an existing pool area configuration or for a newly defined pool area configuration. This command is also used to remove an existing pool area configuration.
Entering this command results in the following prompt:

```
[context_name]hostname(config-sgs-pool-area)#
```

LAC Pool Area Configuration Mode commands are defined in the *MME LAC Pool Area Configuration Mode Commands* chapter.

Example

The following command enters the LAC Pool Area Configuration Mode for a new or existing pool area configuration named *pool1*:

```
pool-area pool1
```

sctp

Configures the Stream Control Transmission Protocol (SCTP) port number for this service.

Product

MME

Privilege

Administrator

Syntax

sctp port *port_number*

no sctp

no

Removes the SCTP configuration for this service.

port *port_number*

Specifies the SCTP port number used to communicate with the MSC/VLR using the SGs interface as an integer from 1 through 65535.

Usage

Use this command to assign the SCTP port with SCTP socket to communicate with the MSC/VLR through the SGs interface. A maximum of one SCTP port can be associated with one SGs service.

Example

The following command sets the SCTP port to *29118* for this service:

```
sctp port 29118
```

tac-to-lac-mapping

Maps any Tracking Area Code (TAC) value or a specific TAC value to a LAC value.

Product

MME

Privilege

Administrator

Syntax

```
tac-to-lac-mapping { any-tac | tac value } map-to lac value +

no tac-to-lac-mapping { any-tac | { tac value } + }
```

any-tac | tac *value*

Specifies the TAC to map to the LAC.
any-tac: Specifies that any TAC value is to be mapped to the specified LAC.
tac *value*: Maps a specific TAC value to a LAC value expressed as an integer from 1 through 65535. For specific TAC values, multiple mappings can be entered on the same line (see Example).

map-to lac *value*

Specifies the LAC value that the selected TAC value, or any TAC value is mapped as an integer from 1 through 65535. For specific TAC values, multiple mappings can be entered on the same line (see Example).

Usage

Use this command to map TAC values to LAC values.
Enter up to eight mappings per line. A maximum of 256 mappings can be entered.
If no mapping is entered, the default behavior is TAC equals LAC.

Example

The following command maps a TAC value of 2 to a LAC value of 3, a TAC value of 4 to a LAC value of 5, and a TAC value of 6 to a LAC value of 7:

```
tac-to-lac-mapping tac 2 map-to lac 3 tac 4 map-to lac 5 tac 6 map-to lac
7
```

timer

Configures the SGs-AP Ts6-1 timer value used to guard the Location Update procedure.

Product

MME

Privilege

Administrator

Syntax

timer ts6-1 *value*

default timer ts6-1

default

Returns the command to its default setting of 15.

value

Specifies the Ts6-1 timer value (in seconds) as an integer from 10 through 90. Default: 15

Usage

Use this command to manually set the Ts6-1 timer.

Example

The following command sets the SGs-AP Ts6-1 timer to 20 seconds:

```
timer ts6-1 20
```

vlr

Configures the Visitor Location Register (VLR) to be used by this service.

Product

MME

Privilege

Administrator

Syntax

vlr *vlr_name* **{ ipv4-address** *ipv4_address* **[ipv4-address** *ipv4_address* **] | ipv6-address** *ipv6_address* **[ipv6-address** *ipv6_address* **] } port** *port_number*

no vlr *vlr_name*

no

Removes the configured VLR from this service.

vlr_name

Specifies the name of the VLR as an alphanumeric string of 1 through 63 characters.

ipv4-address *ipv4_address* **[ipv4-address** *ipv4_address* **]**

Specifies the IP address of the VLR in IPv4 dotted-decimal notation.
A secondary IPv4 address can be configured to support SCTP multi-homing.

ipv6-address *ipv6_address* **[ipv6-address** *ipv6_address* **]**

Specifies the IPv6 address of the VLR. *ipv6_address* must be entered in colon-separated notation.
A secondary IPv6 address can be configured to support SCTP multi-homing.

port *port_number*

Specifies the port number of the VLR as an integer from 1 through 65535.

Usage

Use this command to configure the VLR used by this SGs service. A maximum of 32 VLRs can be created.

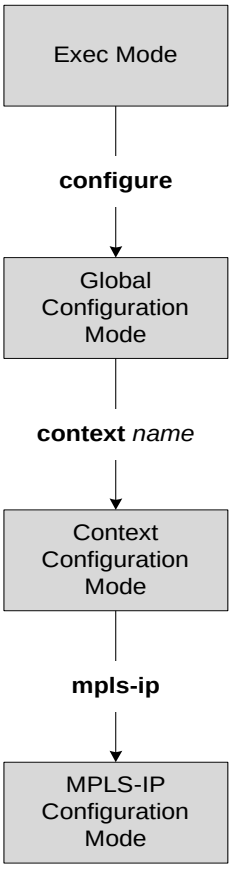
Example

The following command configures a VLR to be used by this service with a name of *vlr1*, an IPv4 address of *10.2.3.4*, and a port number of *29118*:

```
vlr vlr1 ipv4 address 10.2.3.4 port 29118
```

Chapter 192
MPLS-IP Configuration Mode Commands

The MPLS-IP Configuration Mode is used for configuration of Multiprotocol Label Switching (MPLS) IP forwarding specific parameters. This mode is entered from the Context Configuration Mode.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

protocol

This command creates or removes the MPLS protocol family configuration modes, or configures an existing protocol and enters the MPLS-LDP Configuration Mode in the current context. This command configures the protocol parameters for the MPLS protocol family.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] protocol ldp
```

no

Removes the configured MPLS-LDP mode from MPLS-IP Configuration mode.

ldp

Specifies the type of MPLS protocol to LDP and creates/enters the MPLS-LDP Configuration Mode for Label Distribution Protocol (LDP) specific configuration in an MPLS-IP configuration instance.

Usage

Use this command to create/ or remove the MPLS protocol family configuration mode, or configure an existing protocol. If required mode already exists it enters the MPLS-LDP Configuration Mode in the current context.
Entering this command results in the following prompt:

```
[context_name]hostname(config-ldp)#
```

The commands configured in this mode are defined in the *MPLS-LDP Configuration Mode Commands* chapter.

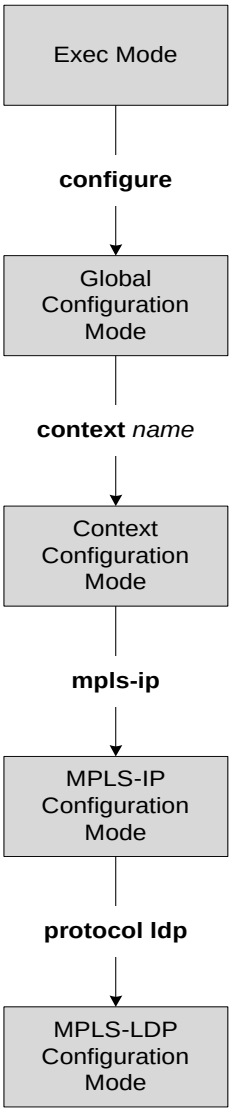
Example

The following command creates and enters the MPLS-LDP Protocol mode for Label Distribution Protocol parameters in MPLS-IP Configuration instance:

```
protocol ldp
```

Chapter 193
MPLS-LDP Configuration Mode Commands

The MPLS-LDP Configuration Mode is used to configure Label Distribution Protocol (LDP) specific parameters for MPLS-IP forwarding.



advertise-labels

Configures the Label Advertisement parameters.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] advertise-labels { explicit-null | implicit-null }

default advertise-labels
```

no

Disables the label advertisement parameters.

default

Advertises the labels from the label space allocated for LDP protocol.

explicit-null

Advertises the Explicit NULL label for all the prefixes.

implicit-null

Advertises the Implicit NULL label for all the prefixes.

Usage

Use this to configure advertisement of the Implicit NULL or Explicit NULL label for all the prefixes advertised by the system in this context.

Example

The following command configures the MPLS-IP forwarding to advertise the Explicit NULL label for all the prefixes:

```
advertise-labels explicit-null
```

The following command configures the MPLS-IP forwarding to advertise the Implicit NULL label for all the prefixes:

```
advertise-labels implicit-null
```

discovery

Configures the Label Distribution Protocol (LDP) neighbor discovery parameters.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
discovery { hello { hello-interval integer_value | hold-interval integer_value } |
transport-address ipv4_addr }

default discovery hello

no discovery transport-address
```

default

Sets the LDP discovery hello interval at 5 seconds and hold interval at 15 seconds.

no

Disables the LDP neighbor discovery.

hello { hello-interval *integer_value* **| hold-interval** *integer_value* **}**

Configures the LDP Hello parameters.
hello-interval configures the frequency of sending the Discovery Hello packets in seconds.
integer_value is an integer from 5 through 21845.
Default: 5
hold-interval configures the Discovery Hold time interval in seconds.
integer_value is an integer from 15 through 65535.
Default: 15

transport-address *ipv4_addr*

Configures the LDP transport address as an IPv4 address entered in dotted-decimal notation. Transport address is the same as the LDP router ID.

Usage

This is an optional command that is used to configure LDP peer discovery parameters. The LDP discovery hold-interval is always set to three times the LDP discovery hello-interval. Transport address is the address used for the TCP session over which LDP is running. If the transport address is not configured, the LDP router-id is used as transport address. Any update to transport address will take effect only if LDP is disabled and re-enabled. The “default” option sets the hello intervals to the default values.

Example

The following command sequence configures the LDP peer discovery parameters:

```
discovery hello hello-interval 10discovery hello hold-interval
30discovery transport-address 10.2.3.4
```

enable

Enables the Label Distribution Protocol (LDP).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] enable
```

no

Disables the LDP protocol.

Usage

This command is used to enable or disable the LDP protocol. By default the LDP protocol is disabled.

Example

Use the following command to enable the LDP protocol:

```
enable
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

router-id

Configures the Label Distribution Protocol Router ID.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

router-id *ipv4_addr*
no router-id

no

Disables the router ID.

ipv4_addr

Must be an IPv4 address entered in dotted-decimal notation.

Usage

This command is used to configure the LDP router-id. This is an optional parameter. If the ID is not configured, the largest operational loopback address is selected as the LDP router ID. If LDP has started, any change will take effect only after disabling and enabling LDP.

Example

The following command sequence configures an LDP router ID:

```
router-id 10.2.3.4
```

session

Configures the LDP session parameters.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
session timers { hold-interval integer_value | keepalive-interval integer_value }
default session timers
```

default

Configures the default values for hold-interval parameter at 45 and keepalive-interval parameter at 15.

timers

Configures the LDP session keepalive parameters.

hold-interval *integer_value*

Configures the session hold time interval in seconds.
integer_value is an integer from 45 through 65535.
Default: 45

keepalive-interval *integer_value*

Configures the frequency of sending keepalive packets in seconds.
integer_value is an integer from 15 through 21845.
Default: 15

Usage

This optional command is used to configure LDP session timers. LDP session hold-interval is always set to three times the LDP session keepalive-interval. The “default” option sets the session keepalive and hold intervals to the default values.

Example

The following command sequence configures the LDP session parameters:

```
session timers keepalive-interval 30

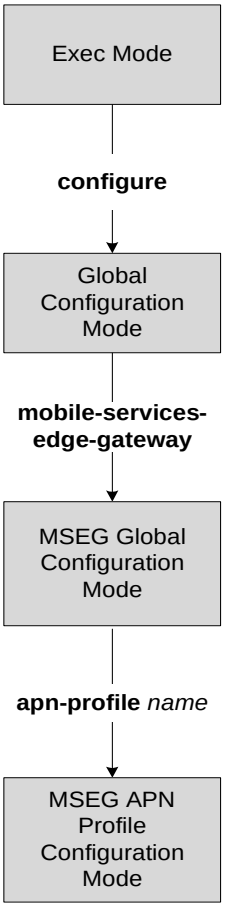
session timers hold-interval 45

default session timers
```

Chapter 194
MSEG APN Profile Configuration Mode Commands

The MSEG APN Profile Configuration Mode allows you to configure Access Point Name(s) (APN) in a Mobile Service Edge Gateway (MSEG) APN profile.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



apn

This command allows you to add/remove APN names from an MSEG APN profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] apn *apn_name*

no

If previously configured, deletes the specified APN name in the current MSEG APN profile.

apn_name

Specifies the APN to add/remove.
apn_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to add/remove APN names from an MSEG APN profile.
The APN names configured in the APN profile are wild-cardable strings that are used to match against the APN name in the incoming CPC requests for offload eligibility. APN names are one of the level-one MSEG filters.
Multiple APN names can be configured in each APN profile to form sets of APN names.

Example

The following command adds the APN named *test* to the current APN profile:

```
apn test
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

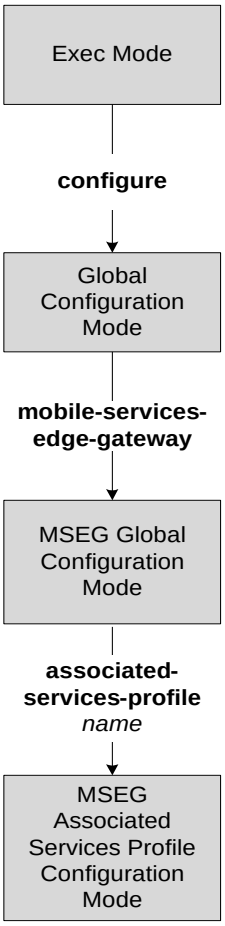
Usage

Use this command to return to the parent configuration mode.

Chapter 195
MSEG Associated Services Profile Configuration Mode Commands

The MSEG Associated Services Profile Configuration Mode enables you to configure the associated services, such as NAT, accounting context, and destination context, that must be applied to an off-loaded session once it is set up.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



active-charging-rulebase

This command allows you to configure an ACS rulebase in the MSEG associated services profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

Privilege

Security Administrator, Administrator

Syntax

active-charging-rulebase *acs_rulebase_name*

no active-charging-rulebase

no

If previously configured, deletes the ACS rulebase from the current MSEG associated services profile.

acs_rulebase_name

Specifies the ACS rulebase.
acs_rulebase_name must be the name of an ACS rulebase, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure an ACS rulebase in the MSEG associated services profile. By default, there is no ACS rulebase configured in a profile.
Rulebase configuration is used in the ACS context for configuring collection of rule definitions and their associated billing policy. Different rulebases can be configured for different set of subscribers by defining appropriate MSEG filters.

Example

The following command configures an ACS rulebase named *test* in the current MSEG associated services profile:

```
active-charging-rulebase test
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fw-nat-policy

This command allows you to configure a Firewall-and-NAT policy in the MSEG associated services profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

fw-nat-policy *fw_nat_policy_name*

no fw-nat-policy

no

If previously configured, deletes the Firewall-and-NAT policy from the current MSEG associated services profile.

fw_nat_policy_name

Specifies the Firewall-and-NAT policy.
fw_nat_policy_name must be the name of a Firewall-and-NAT policy, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure a Firewall-and-NAT policy in the MSEG associated services profile. By default, there is no Firewall-and-NAT policy configured in a profile.
If, in the profile, an ACS rulebase is configured and there is a Firewall-and-NAT policy configured in that rulebase, the Firewall-and-NAT policy configured using this command will take precedence for sessions that are offloaded. If not configured, the MSEG will act as an anchor-proxy for the offloaded calls.

Example

The following command configures a Firewall-and-NAT policy named *test* in the current MSEG associated services profile:

```
fw-nat-policy test
```

ip

This command allows you to configure IP parameters in the MSEG associated services profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

ip { access-group *access_group_name* **{ in | out } | context-name** *context_name* **}**

no ip { access-group { in | out } | context-name }

no

If previously configured, deletes the specified IP configuration from the current MSEG associated services profile.

access-group *access_group_name* **{ in | out }**

Specifies the IPv4/IPv6 access group to use for redirecting traffic to the ACS subsystem.
access_group_name must be the name of an IPv4/IPv6 access group, and must be an alphanumeric string of 1 through 63 characters.
in specifies that the ACL group be applied to inbound traffic.
out specifies that the ACL group be applied to outbound traffic.

context-name *context_name*

Specifies the destination context to use.
context_name must be the name of the destination context, must be an alphanumeric string of 1 through 63 characters.

Important: If the context name is not configured, MSEG service context will be used.

Usage

Use this command to configure IP parameters in an MSEG associated services profile. The IPv4/IPv6 access group is used for redirecting the traffic to ACS Subsystem.

Example

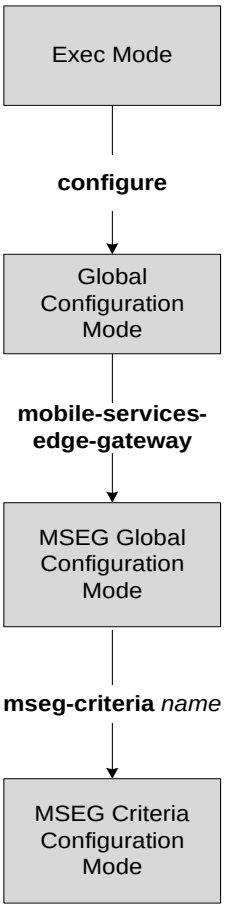
The following command configures the IP access group named *test* to be applied on outbound traffic in the current MSEG associated services profile:

```
ip access-group test out
```

Chapter 196
MSEG Criteria Configuration Mode Commands

The MSEG Criteria Configuration Mode enables you to configure a set of MSEG filters that are applied by an MSEG service. There can be multiple MSEG criteria configured, but only one can be associated with any MSEG service at any given time.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

filter priority

This command allows you to add/configure/delete filters in an MSEG criteria.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

filter priority *priority* **ruleset** *ruleset_name* **action { forward | local-terminate | offload associated-services-profile** *profile_name* **}**

no filter priority *priority*

no

Deletes the specified filter from the current offload criteria.

priority

Specifies the priority of the filter.
priority must be an integer from 1 through 10.

ruleset *ruleset_name*

Specifies the ruleset.
ruleset_name must be the name of a ruleset, and must be an alphanumeric string of 1 through 63 characters.

action { forward | local-terminate | offload associated-services-profile *profile_name* **}**

Specifies the action to apply.

- **forward**: Specifies to forward to GGSN.

  The CPC request will be forwarded to the actual GGSN without any further processing by MSEG. Thus, the MSEG will remove itself from the path for that PDP session. This action is applicable only to the primary PDP context setup.

- **local-terminate**: Specifies to terminate locally at MSEG.

  The CPC request will be forwarded to a co-located GGSN service for anchoring. The MSEG will subsequently not be in the path of the CPC setup. This action is applicable only to the primary PDP context setup.

- **offload associated-services-profile** *profile_name*: Specifies to offload the PDP session at MSEG, the specified associated service profile will be applicable.

profile_name must be the name of an associated service profile, and must be an alpha and/or numeric string of 1 through 63 characters in length.

If the NAT configuration has not been enabled in the associated service profile, only the proxy-anchor mode will be applicable for the call. That is, all data will be tunneled to the anchor GGSN instead of being locally offloaded via NAT. This will be the default behavior for all offloaded calls and can be overridden by specifying local-breakout for the data-plane by associating NAT configuration.

Usage

Use this command to add/configure/remove filters in an offload criteria.
There can be multiple offload criteria configured though only one can be associated with an MSEG service at any given time. The filters will be processed in ascending order of priority, and the action corresponding to the first match will be applied.

Example

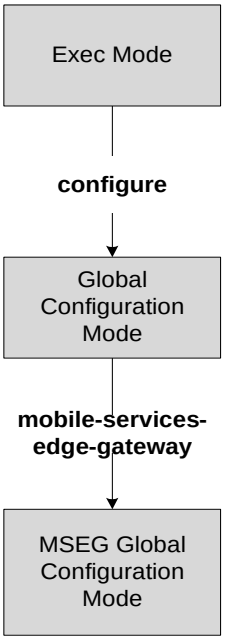
The following command configures an offload filter to offload PDP session with the filter's priority set to *1*, the ruleset named *test_ruleset*, the services profile named *test_profile*:

```
filter priority 1 ruleset test_ruleset action offload associated-
services-profile test_profile
```

Chapter 197
MSEG Global Configuration Mode Commands

The MSEG Global Configuration Mode is used to configure global Mobile Service Edge Gateway (MSEG) parameters.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



apn-profile

This command allows you to create/configure/delete MSEG APN profiles.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

apn-profile *mseg_apn_profile_name* **[-noconfirm]**

no apn-profile *mseg_apn_profile_name*

no

Deletes the specified MSEG APN profile.

mseg_apn_profile_name

Specifies the APN profile to add/configure/delete.
mseg_apn_profile_name must be the name of an MSEG APN profile, and must be an alphanumeric string of 1 through 63 characters.
If the named APN profile does not exist, it is created, and the CLI mode changes to the MSEG APN Profile Configuration Mode wherein the APN profile can be configured.
If the named APN profile already exists, the CLI mode changes to the MSEG APN Profile Configuration mode for that APN profile.

-noconfirm

Executes the command without prompting for confirmation.

Usage

Use this command to create/configure/delete MSEG APN profiles.
Entering this command results in the following prompt:
`[context_name]hostname(config-mseg-apn-profile)#`
MSEG APN Profile configuration commands are described in the *MSEG APN Profile Configuration Mode Commands* chapter.

Example

The following command creates an APN profile named *test*, and changes to the MSEG APN Profile Configuration Mode:

```
apn-profile test
```

associated-services-profile

This command allows you to create/configure/delete MSEG associated-services profiles.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

associated-services-profile *mseg_as_profile_name* **[-noconfirm]**

no associated-services-profile *mseg_as_profile_name*

no

Deletes the specified MSEG associated-services profile.

mseg_as_profile_name

Specifies the MSEG associated services profile to add/configure/delete.
mseg_as_profile_name must be the name of an MSEG associated-services profile, and must be an alphanumeric string of 1 through 63 characters.
If the named associated-services profile does not exist, it is created, and the CLI mode changes to the MSEG Associated Services Profile Configuration Mode wherein the profile can be configured.
If the named associated-services profile already exists, the CLI mode changes to the MSEG Associated Services Profile Configuration Mode for that profile.

-noconfirm

Executes the command without prompting for confirmation.

Usage

Use this command to create/configure/delete MSEG associated-services profiles.
Entering this command results in the following prompt:
`[context_name]hostname(config-mseg-as-profile)#`
MSEG associated-services profile configuration commands are described in the *MSEG Associated Services Profile Configuration Mode Commands* chapter. This mode contains configurations for all the associated services such as NAT, accounting context, destination context, and so on, from other parts of the system, that are to be applied to an offloaded session once it is set up.

Example

The following command creates an associated-services profile named *test*, and changes to the MSEG Associated Services Profile Configuration Mode:

```
associated-services-profile test
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

exit

Usage

Use this command to return to the parent configuration mode.

imei-profile

This command allows you to create/configure/delete MSEG IMEI profiles.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

imei-profile *mseg_imei_profile_name* **[-noconfirm]**

no imei-profile *mseg_imei_profile_name*

no

Deletes the specified MSEG IMEI profile.

mseg_imei_profile_name

Specifies the MSEG IMEI profile to add/configure/delete.
mseg_imei_profile_name must be the name of an MSEG IMEI profile, and must be an alphanumeric string of 1 through 63 characters.
If the named IMEI profile does not exist, it is created, and the CLI mode changes to the MSEG IMEI Profile Configuration Mode wherein the IMEI profile can be configured.
If the named IMEI profile already exists, the CLI mode changes to the MSEG IMEI Profile Configuration Mode for that IMEI profile.

-noconfirm

Executes the command without prompting for confirmation.

Usage

Use this command to create/configure/delete MSEG IMEI profiles.
Entering this command results in the following prompt:
`[context_name]hostname(config-mseg-imei-profile)#`
MSEG IMEI Profile configuration commands are described in the *MSEG IMEI Profile Configuration Mode Commands* chapter.

Example

The following command creates an IMEI profile named *test*, and changes to the MSEG IMEI Profile Configuration Mode:

```
imei-profile test
```

imsi-profile

This command allows you to create/configure/delete MSEG IMSI profiles.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

imsi-profile *mseg_imsi_profile_name* **[-noconfirm]**

no imsi-profile *mseg_imsi_profile_name*

no

Deletes the specified MSEG IMSI profile.

mseg_imsi_profile_name

Specifies the MSEG IMSI profile to add/configure/delete.
mseg_imsi_profile_name must be the name of an MSEG IMSI profile, and must be an alphanumeric string of 1 through 63 characters.
If the named IMSI profile does not exist, it is created, and the CLI mode changes to the MSEG IMSI Profile Configuration Mode wherein the IMSI profile can be configured.
If the named IMSI profile already exists, the CLI mode changes to the MSEG IMSI Profile Configuration Mode for that IMSI profile.

-noconfirm

Executes the command without prompting for confirmation.

Usage

Use this command to create/configure/delete MSEG IMSI profiles.
Entering this command results in the following prompt:
`[context_name]hostname(config-mseg-imsi-profile)#`
MSEG IMSI Profile configuration commands are described in the *MSEG IMSI Profile Configuration Mode Commands* chapter.

Example

The following command creates an IMSI profile named *test*, and changes to the MSEG IMSI Profile Configuration Mode:

```
imsi-profile test
```

mseg-criteria

This command allows you to create/configure/delete MSEG criteria.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

mseg-criteria *mseg_criteria_name* **[-noconfirm]**

no mseg-criteria *mseg_criteria_name*

no

Deletes the specified MSEG criteria.

mseg_criteria_name

Specifies the MSEG criteria to add/configure/delete.
mseg_criteria_name must be the name of the MSEG criteria, and must be an alphanumeric string of 1 through 63 characters.
If the named MSEG criteria does not exist, it is created, and the CLI mode changes to the MSEG Criteria Configuration Mode wherein the MSEG criteria set can be configured.
If the named MSEG criteria already exists, the CLI mode changes to the MSEG Criteria Configuration Mode for that MSEG criteria.

-noconfirm

Executes the command without prompting for confirmation.

Usage

Use this command to create/configure/delete an MSEG criteria — a set of filters that are applied by an MSEG service. There can be multiple MSEG criteria configured though only one can be associated with an MSEG service at any given time.
Entering this command results in the following prompt:
`[context_name]hostname(config-mseg-criteria)#`
MSEG criteria configuration commands are described in the *MSEG Criteria Configuration Mode Commands* chapter.

Example

The following command creates an MSEG criteria named *test*, and changes to the MSEG Criteria Configuration Mode:

```
mseg-criteria test
```

mseg-ruleset

This command allows you to create/configure/delete MSEG rules.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

mseg-ruleset *mseg_ruleset_name* **[-noconfirm]**

no mseg-ruleset *mseg_ruleset_name*

no

Deletes the specified MSEG ruleset.

mseg_ruleset_name

Specifies the MSEG ruleset to add/configure/delete.
mseg_ruleset_name must be the name of an MSEG ruleset, and must be an alphanumeric string of 1 through 63 characters.
If the named MSEG ruleset does not exist, it is created, and the CLI mode changes to the MSEG Ruleset Configuration Mode wherein the MSEG ruleset can be configured.
If the named MSEG ruleset already exists, the CLI mode changes to the MSEG Ruleset Configuration Mode for that MSEG ruleset.

-noconfirm

Executes the command without prompting for confirmation.

Usage

Use this command to create/configure/delete MSEG rulesets — filter combinations to be applied while evaluating whether a session should be offloaded or not.
Entering this command results in the following prompt:
`[context_name]hostname(config-mseg-ruleset)#`
MSEG ruleset configuration commands are described in the *MSEG Ruleset Configuration Mode Commands* chapter.

Example

The following command creates an MSEG ruleset named *test*, and changes to the MSEG Ruleset Configuration Mode:

```
mseg-ruleset test
```

peer-mseg-profile

This command allows you to create/configure/delete MSEG peer profiles.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

peer-mseg-profile *mseg_peer_profile_name* **[-noconfirm]**

no peer-mseg-profile *mseg_peer_profile_name*

no

Deletes the specified MSEG peer profile.

mseg_peer_profile_name

Specifies the MSEG peer profile to add/configure/delete.
mseg_peer_profile_name must be the name of an MSEG peer profile, and must be an alphanumeric string of 1 through 63 characters.
If the named MSEG peer profile does not exist, it is created, and the CLI mode changes to the MSEG Peer Profile Configuration Mode wherein the MSEG peer profile can be configured.
If the named MSEG peer profile already exists, the CLI mode changes to the MSEG Peer Profile Configuration Mode for that peer profile.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete MSEG peer profiles. Configuration of all non-local MSEG instances in the network. Multiple MSEG peer profiles can be configured.
Entering this command results in the following prompt:
`[context_name]hostname(config-mseg-profile)#`
MSEG peer profile configuration commands are described in the *MSEG Peer Profile Configuration Mode Commands* chapter.

Example

The following command creates a peer profile named *test*, and changes to the MSEG Peer Profile Configuration Mode:

```
peer-mseg-profile test
```

rnc-profile

This command allows you to create/configure/delete MSEG Radio Network Controller (RNC) profiles.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

rnc-profile *mseg_rnc_profile_name* **[-noconfirm]**

no rnc-profile *mseg_rnc_profile_name*

no

Deletes the specified MSEG RNC profile.

mseg_rnc_profile_name

Specifies the MSEG RNC profile to add/configure/delete.
mseg_rnc_profile_name must be the name of an MSEG RNC profile, and must be an alphanumeric string of 1 through 63 characters.
If the named RNC profile does not exist, it is created, and the CLI mode changes to the MSEG RNC Profile Configuration Mode wherein the RNC profile can be configured.
If the named RNC profile already exists, the CLI mode changes to the MSEG RNC Profile Configuration Mode for that RNC profile.

-noconfirm

Executes the command without prompting for confirmation.

Usage

Use this command to create/configure/delete MSEG RNC profiles. Multiple RNC profiles can be configured.
Entering this command results in the following prompt:
`[context_name]hostname(config-mseg-rnc-profile)#`
MSEG RNC Profile configuration commands are described in the *MSEG RNC Profile Configuration Mode Commands* chapter.

Example

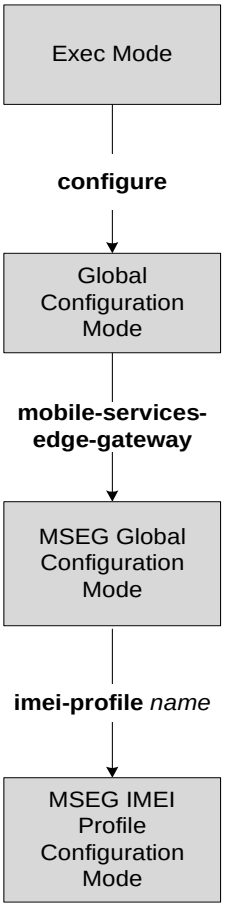
The following command creates an RNC profile named *test*, and changes to the MSEG RNC Profile Configuration Mode:

```
rnc-profile test
```

Chapter 198
MSEG IMEI Profile Configuration Mode Commands

The MSEG IMEI Profile Configuration Mode enables to configure International Mobile Equipment Identifier (IMEI) ranges in Mobile Service Edge Gateway (MSEG) IMEI profiles.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



end

Exits the current configuration mode and returns to the Exec mode.

imei-range

This command allows you to add/remove IMEI ranges in an MSEG IMEI profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] imei-range start *imei_prefix_range_start* **end** *imei_prefix_range_end* **[sv** *imei_sw_version* **]**

no

Deletes the specified IMEI prefix range.

start *imei_prefix_range_start*

Specifies the start of the IMEI prefix range as an integer.

end *imei_prefix_range_end*

Specifies the end of the IMEI prefix range as an integer.

sv *imei_sw_version*

Specifies software version of IMEISV as a 2-digit integer.

Usage

Use this command to add/remove IMEI ranges in an MSEG IMEI profile.
Multiple, non-overlapping, IMEI ranges can be specified in each IMEI profile. IMEI ranges are level-one filters.

Example

The following command adds an IMEI range starting with the IMEI prefix *123* and ending with the IMEI prefix *456*:

```
imei-range start 123 end 456
```

Chapter 199
MSEG IMSI Profile Configuration Mode Commands

The MSEG IMSI Profile Configuration Mode enables you to configure International Mobile Subscriber Identifier (IMSI) ranges, which are level-1 filters, in Mobile Service Edge Gateway (MSEG) IMSI profiles.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] imsi-range mcc *mobile_country_code* **mnc** *mobile_network_code* **msin start** *msin_start* **end** *msin_end*

no

Deletes the specified IMSI range.

mcc *mobile_country_code*

Specifies the Mobile Country Code (MCC) of IMSI as an integer from 100 through 999.
Note that MCC values 000 through 099 are reserved codes.

mnc *mobile_network_code*

Specifies the Mobile Network Code (MNC) of IMSI as a 2- or 3-digit integer from 00 through 999.

msin start *msin_start* **end** *msin_end*

Specifies the Mobile Subscriber International Number (MSIN) range.
msin start *msin_start*: Specifies the start of the MSIN prefix range as an integer.
end *msin_end*: Specifies the end of the MSIN prefix range as an integer.

Usage

Use this command to add/remove IMSI ranges in an MSEG IMSI profile.
Multiple, non-overlapping, IMSI ranges can be specified in each IMSI profile.

Example

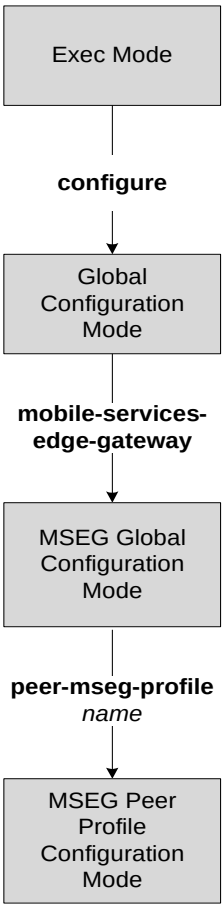
The following command adds an IMSI range to the current IMSI profile with the MCC and MNC set to *111*:

```
imsi-range mcc 111 mnc 111 msin start 123 end 456
```

Chapter 200
MSEG Peer Profile Configuration Mode Commands

This configuration mode enables you to configure non-local Mobile Service Edge Gateway (MSEG) instances in the network. Though this mode is intended to contain peer-MSEG information, there is no restriction on configuring local MSEG instances. Local MSEG service instances will look up this list and the list of local MSEG services whenever necessary.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

mseg-gtpc

This command allows you to add/remove MSEG service control addresses in an MSEG peer profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

mseg-gtpc *ipv4/ipv6_address* **[udp-port** *port_number* **]**

no mseg-gtpc

no

Deletes the previously configured MSEG GTP-C address from the current MSEG peer profile.

ipv4/ipv6_address

Specifies the MSEG GTP-C IP address in IPv4 dotted-decimal or IPv6 colon-separated notation.

udp-port *port_number*

Specifies the UDP port number as an integer from 1 through 65535.

Usage

Use this command to add/remove MSEG service control addresses in an MSEG peer profile.

Example

The following command configures the MSEG GTP-C address *1.1.1.1* and the UDP port *111* in the current MSEG peer profile:

```
mseg-gtpc 1.1.1.1 udp-port 111
```

mseg-gtpu

This command allows you to add/remove MSEG service data addresses in an MSEG peer profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] mseg-gtpu *ipv4/ipv6_address*

no

Deletes the specified MSEG GTP-U address from the current MSEG peer profile.

ipv4/ipv6_address

Specifies the MSEG GTP-U IP address in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to add/remove MSEG service data addresses in an MSEG peer profile. Multiple GTP-U addresses can be associated with an MSEG instance.

Example

The following command configures the MSEG GTP-U address *1.1.1.1* for the current MSEG peer profile:

```
mseg-gtpu 1.1.1.1
```

mseg-id

This command allows you to configure the MSEG instance ID in an MSEG peer profile. Note that the MSEG profile is not activated until this ID is configured.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] mseg-id *mseg_id*

no

Deactivates the specified MSEG peer profile.

mseg_id

Specifies the MSEG instance ID as n integer from 1 through 65535.

Usage

Use this command to configure the MSEG instance ID in an MSEG peer profile.
This ID must be unique across all MSEG installations in an operator's domain. The MSEG profile is not activated until this ID is configured.

Example

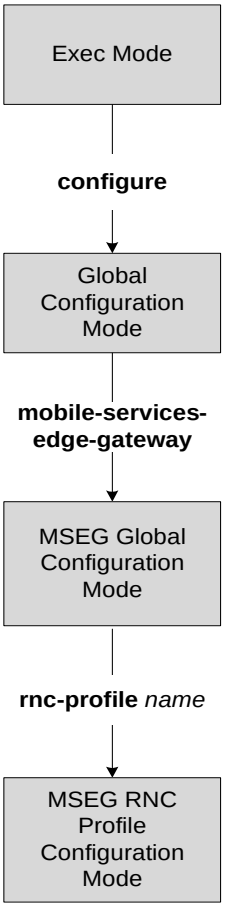
The following command configures the MSEG instance ID in the current MSEG peer profile to *111*:

```
mseg-id 111
```

Chapter 201
MSEG RNC Profile Configuration Mode Commands

The MSEG RNC Profile Configuration Mode enables to configure Mobile Service Edge Gateway (MSEG) Radio Network Controller (RNC) profiles.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



associate

This command allows you to configure the MSEG to associate with/serve the RNC.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

`[ no ] associate mseg-profile` *`mseg_profile_name`*

`no`

Disassociates the specified MSEG filter from the RNC.

`mseg_profile_name`

Specifies the name of an MSEG profile as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the MSEG to associate with/serve the RNC.
Only one MSEG can be associated with an RNC.

Example

The following command associates the MSEG named *`test`* with the RNC:

```
associate mseg-profile test
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

location

This command allows you to add/remove locations that the RNC serves in an MSEG RNC profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

location mcc *mobile_country_code* **mnc** *mobile_network_code* **lac** *location_area_code* **sac** *service_area_code*

no location

no

Deletes the previously configured location address in the current MSEG RNC profile.

mcc *mobile_country_code*

Specifies the Mobile Country Code (MCC) as an integer from 100 through 999.
Note that MCC values from 000 through 099 are reserved codes.

mnc *mobile_network_code*

Specifies the Mobile Network Code (MNC) as a 2- or 3-digit integer fromv00 through 999.

lac *location_area_code*

Specifies the Location Area Code (LAC) as an integer from 1 through 65535.

sac *service_area_code*

Specifies the Service Area Code (SAC) as an integer from 1 through 65535.

Usage

Use this command to add/remove locations that the RNC serves in an MSEG RNC profile.
Multiple locations can be configured in an MSEG RNC profile.

Example

The following command adds a location address to the current RNC profile with the MCC, MNC, LAC, and SAC set to *111*:

```
location mcc 111 mnc 111 lac 111 sac 111
```

rnc-gtpu

This command allows you to add/remove data addresses associated with the RNC.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] rnc-gtpu *ipv4/ipv6_address* **[udp-port** *port_number* **]**

no

Deletes the specified RNC GTP-U address from the current RNC profile.

ipv4/ipv6_address

Specifies the GTP-U address in IPv4 dotted-decimal or IPv6 colon-separated notation.

udp-port *port_number*

Specifies the UDP port number as an integer from 1 through 65535.

Usage

Use this command to add/remove RNC data addresses associated with the RNC in an MSEG RNC profile. Multiple GTP-U addresses can be associated with the RNC.

Example

The following command configures the RNC GTP-U address *1.1.1.1* and the UDP port *111* in the current MSEG RNC profile:

```
rnc-gtpu 1.1.1.1 udp-port 111
```

rnc-id

This command allows you to configure the RNC ID in an MSEG RNC profile.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] rnc-id *rnc_id*

no

Deletes the specified RNC ID from the current MSEG RNC profile.

rnc_id

Specifies the RNC ID as an integer from 1 through 65535.

Usage

Use this command to configure the RNC ID in an MSEG RNC profile.
Only one RNC ID can be configured in an MSEG RNC profile.

Example

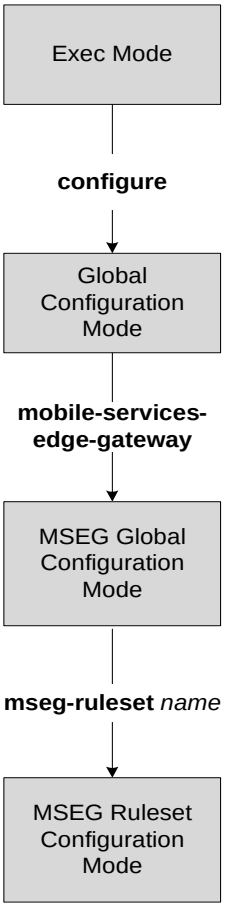
The following command configures the RNC ID *111* in the current MSEG RNC profile:

```
rnc-id 111
```

Chapter 202
MSEG Ruleset Configuration Mode Commands

The MSEG Ruleset Configuration Mode enables you to configure rules to be applied when evaluating whether a session should be offloaded or not.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



apn

This command allows you to associate specified APN profile(s) with the rule.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] apn { if-match-profile *apn_profile_name* **| if-no-match-profile** *apn_profile_name* **}**

no

Removes the specified APN rule from the ruleset.

if-match-profile *apn_profile_name*

Specifies name of the APN profile to be applied on match as an alphanumeric string of 1 through 63 characters.

if-no-match-profile *apn_profile_name*

Specifies name of the APN profile to be applied on no match as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associate APN profile(s) to the rule, and specify which APN profile must be applied if the APN matches/does not match.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

imei

This command allows you to associate specified International Mobile Equipment Identity (IMEI) profile(s) with the rule.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] imei { if-match-profile *imei_profile_name* **| if-no-match-profile** *imei_profile_name* **}**

no

Removes the specified IMEI rule from the ruleset.

if-match-profile *imei_profile_name*

Specifies name of the IMEI profile to be applied on match as an alphanumeric string of 1 through 63 characters.

if-no-match-profile *imei_profile_name*

Specifies name of the IMEI profile to be applied on no match as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associate IMEI profile(s) to the rule, and specify which IMEI profile must be applied if the subscriber IMEI matches/does not match.

imsi

This command allows you to associate specified IMSI profile(s) with the rule.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] imsi { if-match-profile imsi_profile_name | if-no-match-profile imsi_profile_name
}
```

no

Removes the specified IMSI rule from the ruleset.

if-match-profile *imsi_profile_name*

Specifies name of the IMSI profile to be applied on match as an alphanumeric string of 1 through 63 characters.

if-no-match-profile *imsi_profile_name*

Specifies name of the IMSI profile to be applied on no match as an alphanumeric string of 1 through 63 characters.

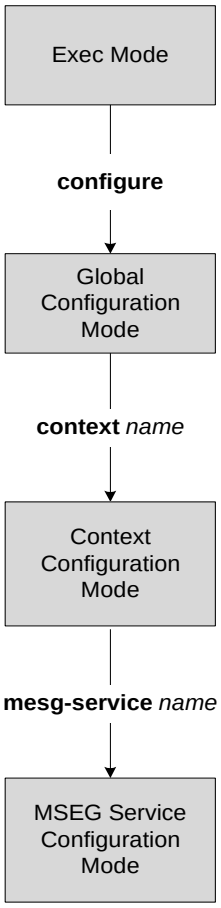
Usage

Use this command to associate IMSI profile(s) to the rule, and specify which IMSI profile must be applied if the subscriber IMSI matches/does not match.

Chapter 203
MSEG Service Configuration Mode Commands

The MSEG Service Configuration Mode allows you to configure Mobile Service Edge Gateway (MSEG) service parameters.

Important: This configuration mode is not supported in this release. For more information please contact your Cisco account representative.



associate

This command allows you to configure accounting policy for the MSEG service.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

associate accounting-policy *accounting_policy_name*

no associate accounting-policy

no

Deletes the specified associate accounting-policy configuration.

accounting_policy_name

Specifies the accounting policy for the current MSEG service.
accounting_policy_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the accounting policy for an MSEG service.

Example

The following command associates the accounting policy named *test* to the current MSEG service:

```
associate accounting-policy test
```

bind gtpc-address

This command allows you to bind specific GTP-C address to the MSEG service.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

bind gtpc-address *ipv4/ipv6_address* **[udp-port** *port_number* **]**

no bind gtpc-address

no

If previously configured, deletes the bind GTP-C address configuration.

ipv4/ipv6_address

Specifies the GTP-C IP address for the service in IPv4 dotted-decimal or IPv6 colon-separated notation.

udp-port *port_number*

Specifies the UDP port number.
port_number must be an integer from 1 through 65535.

Usage

Use this command to configure the GTP-C IP address for an MSEG service.

Example

The following command configures the GTP-C address *1.1.1.1* and the UDP port *111* in the current MSEG service:

```
bind gtpc-address 1.1.1.1 udp-port 111
```

bind gtpu-address

This command allows you to bind specific GTP-U address to the MSEG service.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

[no] bind gtpu-address *ipv4/ipv6_address*

no

Deletes the specified bind GTP-U address configuration.

ipv4/ipv6_address

Specifies the GTP-U IP address for the service in IPv4 dotted-decimal or IPv6 colon-separated notation.
Up to four GTP-U addresses can be configured for each MSEG service instance.

Usage

Use this command to configure the GTP-U IP address for the current MSEG service.
Up to four GTPU addresses can be configured for each MSEG service instance.

Example

The following command configures the GTP-U address *1.1.1.1* for the current MSEG service:

```
bind gtpu-address 1.1.1.1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

gtpc

This command allows you to configure GTP-C transmission-related parameters.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

gtpc { echo-interval *echo_interval* **| max-retransmissions** *max_retransmissions* **| retransmission-timeout** *retransmission_timeout* **}**

{ default | no } gtpc { echo-interval | max-retransmissions | retransmission-timeout }

default

Configures the default setting for the specified parameter.

- **echo-interval**: 60 seconds
- **max-retransmissions**: 4
- **retransmission-timeout**: 5 seconds

no

Deletes the configuration for the specified parameter.

echo-interval *echo_interval*

Specifies the echo interval (in seconds).
echo_interval must be an integer from 60 through 3600.
Default: 60

max-retransmissions *max_retransmissions*

Specifies the maximum number of retries for GTP Control packets.
max_retransmissions must be an integer from 0 through 15.
Default: 4

retransmission-timeout *retransmission_timeout*

Specifies the control packet retransmission timeout duration in GTP (in seconds).
retransmission_timeout must be an integer from 1 through 20.
Default: 5

Usage

Use this command to configure GTP-C transmission related parameters.

Example

The following command configures the GTP-C retransmission-timeout parameter to *11* seconds:

```
gtpc retransmission-timeout 11
```

gtpu

This command allows you to configure GTP-U transmission-related parameters.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

gtpu { echo-interval *echo_interval* **| max-retransmissions** *max_retransmissions* **| retransmission-timeout** *retransmission_timeout* **}**

{ default | no } gtpu { echo-interval | max-retransmissions | retransmission-timeout }

default

Configures the default setting for the specified parameter.

- **echo-interval**: Disabled
- **max-retransmissions**: 4
- **retransmission-timeout**: 5 seconds

no

Deletes the configuration for the specified parameter.

echo-interval *echo_interval*

Specifies the echo interval (in seconds) for MSEG.
echo_interval must be an integer from 60 through 3600.
Default: Disabled

max-retransmissions *max_retransmissions*

Specifies the maximum number of retries for GTP-U packets.
max_retransmissions must be an integer from 0 through 15.
Default: 4

retransmission-timeout *retransmission_timeout*

Specifies the control packet retransmission timeout duration (in seconds) in GTP.
retransmission_timeout must be an integer from 1 through 20.
Default: 5

Usage

Use this command to configure GTP-U transmission related parameters.

Example

The following command configures the GTP-U retransmission-timeout parameter to *11* seconds:

```
gtpu retransmission-timeout 11
```

mseg-criteria

This command allows you to configure MSEG criteria for the MSEG service instance.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

mseg-criteria *mseg_criteria_name*

no mseg-criteria

no

Deletes the MSEG criteria configuration.

mseg_criteria_name

Specifies name of the MSEG criteria.
mseg_criteria_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the MSEG criteria for an MSEG service instance.

Important: If an MSEG criteria is not configured for the MSEG service instance, the service will default to forwarding the calls to the respective GGSNs.

For information on configuring offload criteria, see the *MSEG Offload Criteria Configuration Mode Commands* chapter.

Example

The following command configures the MSEG criteria named *test* for the current MSEG service:

```
mseg-criteria test
```

mseg-id

This command allows you to configure the identifier for the MSEG instance represented by the MSEG service instance.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

mseg-id *mseg_id*

no mseg-id

no

Deletes the MSEG ID configuration for the current MSEG service.

mseg_id

Specifies the MSEG ID.
mseg_id must be an integer from 1 through 65535.

Usage

Use this command to configure the identifier for the MSEG instance represented by the MSEG service.

Example

The following command configures the MSEG ID *111* for the current MSEG service:

```
mseg-id 111
```

path-failure

This command allows you to configure the policy to be used for path failure detection.

Important: This command is not supported in this release. For more information please contact your Cisco account representative.

Product

MSEG

Privilege

Security Administrator, Administrator

Syntax

```
path-failure detection-policy gtp { echo | non-echo + }

{ default | no } path-failure detection-policy
```

default

Configures the default setting – gtpc/gtpu echo message. Path failure is detected on echo.

no

Deletes the path-failure detection-policy configuration.

echo

Specifies echo. Path failure is detected when the retries of echo messages are exceeded.

non-echo

Specifies other than echo. Path failure is detected when the retries of non-echo messages are exceeded.

+

Indicates that more than one of the keywords can be entered in a single command.

Usage

This command configures path failure detection policy.

Example

The following command configures the path failure detection policy to non-echo:

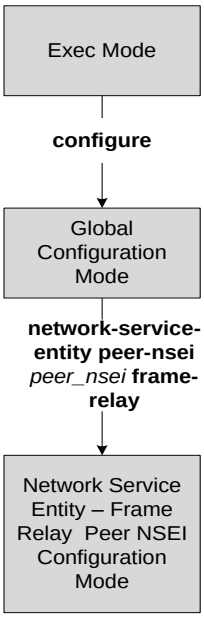
```
path-failure detection-policy gtp non-echo
```

Chapter 204
Network Service Entity - Peer NSEI Configuration Mode Commands

The Network Service Entity (NSE) - Peer NSEI configuration mode configures the Frame Relay parameters for the peer NSE. This mode is a sub-mode of the Global Configuration mode. This sub-mode provides the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS Frame Relay network connection.

Upon accessing this mode, the prompt should be similar to:

```
[local]hostname(nse-fr-peer-nsei-<nse_id>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bssgp-timer

This command has been deprecated.

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

ns-reset-mode

The command configures automatic NS-Reset for a specific Frame Relay peer NSE (network service entity).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ns-reset-mode { active | passive }

default ns-reset-mode
```

default

Resets the configuration to the passive mode.

active

Configures active mode so that the SGSN is enabled to initiate NS-Reset without manual intervention.

passive

Configures passive mode which means the SGSN continues *not* to initiate NS-Reset.
This is the default mode.

Usage

Use this command to configure the SGSN for active mode regarding the peer NSE, so that the SGSN will initiate:

- NS-Reset when NSVC-DLCI binding is done.
- NS-Reset when the link goes down and then comes back.
- NS-Unblock upon receipt of NS-Reset-Ack message.

Active mode is useful in the following scenarios:

- if the SGSN detects LMI down but the BSC does not detect any link failure so does not send NS-Reset.
- if the NS layer can go down and the SGSN will mark the link as 'Blocked-Dead'. If the link comes up later, the NS layer state for that link will remain in the Blocked state.

Example

Configure active mode to perform NS-Reset when the link goes down and comes back up:

```
ns-reset-mode active
```

ns-vc

This command creates a network service virtual circuit (NSVC) for this frame relay NSE and enters the configuration sub-mode to define the NSVC parameters. These parameters are described in the NSVC Configuration Mode chapter elsewhere in this CLI Reference Guide.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] ns-vc id *ns-vc_id*

no

Removes the specified NSVC configuration.

id *ns-vc_id*

This keyword defines the NSVC configuration identifier.
ns-vc_id: Must be an integer from 0 to 65535

Usage

Access the NSVC configuration mode.

Example

Gain access to the NSVC configuration mode to change the 4th instance.

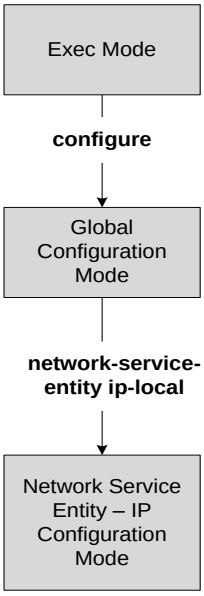
```
ns-vc id 4
```

Chapter 205
Network Service Entity- IP Local Configuration Mode Commands

The Network Service Entity (NSE) - IP Local configuration mode is a sub-mode of the Global Configuration mode. This sub-mode configures the local endpoint for NS/IP with the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS IP network connection.

Upon entering this mode, the prompt will appear in a manner similar to:

```
[local]hostname(nse-ip-local)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

all-nsvc-failure-action

Configure how the SGSN handles the NSE when all NSVCs go down.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
all-nsvc-failure-action clear-nse

default all-nsvc-failure-action
```

default

By default, the NSE is not cleared if all NSVCs go down.

clear-nse

Instructs the SGSN to SGSN to clear NSEs if all NSVCs to the BSC are down.

Usage

Enable the SGSN to clear NSE information when all NSVCs go down.

Example

Use the following command to configure the SGSN to clear NSEs when all NSVCs go down.

```
all-nsvc-failure-action clear-nse
```

bssgp-timer

This command has been deprecated.

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the global configuration mode.

max-ns-retransmissions

This command configures the maximum number of transmission retries counter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[default] max-ns-retransmissions { alive *count* **| sns-proc** *count* **}**

default

Resets the specified counter configuration to the default value.

alive *count*

Sets the maximum number of alive retries.
count: Must be an integer between 0 and 10. Default is 3.

sns-proc *count*

Sets the maximum number of retries for the SNS procedure
count: Must be an integer between 0 and 5. Default is 3.

Usage

Sets the maximum for NS transmission retries.

Example

```
max-ns-retransmission alive 4
```

ns-timer

This command sets the network service (NS) counters for the SNS procedure and testing.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ns-timer { sns-prov *timeout_val* **| test** *timeout_val* **}**

default ns-timer { sns-prov | test }

default

Resets the selected timer configuration to its default value.

sns-prov *timeout_val*

Sets the SNS procedure timeout value in seconds.
timeout_val: Enter an integer from 1 to 10. Default is 5.

test *timeout_val*

Sets the test procedure timeout value in seconds.
timeout_val: Enter an integer from 1 to 60. Default is 30 seconds.

Usage

Set NS timers to help manage the NSE-IP connection.

Example

The following example sets the test timer to 4 seconds:

```
ns-timer test 4
```

nsvc-failure-action

This command enables and disables the sending of an NS-STATUS message with cause ‘ip-test fail’ when NSVC goes down.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nsvc-failure-action send-ns-status

default nsvc-failure-action

default

Resets the command configuration to its default value. The default action is not to send an NS-STATUS message. This is applicable only to NSVCs that are auto-learned and not configured.

send-ns-status

Enables the sending of the NS-STATUS message.

Usage

Use this command to enable or disable sending an NS-STATUS messages when an NSVC goes down.

Example

Enable sending of the message:

```
nsvc-failure-action send-ns-status
```

nsvl

This command creates and instance of a network service virtual link (NSVL) and enters the NSVL configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] nsvl instance *nsvl_id*

no

Removes the identified NSVL definition from the configuration.

instance *nsvl_id*

Identifies a specific NSVL configuration instance.
nsvl_id: Must be an integer from 0 to 3.

Usage

Access the NSVL configuration mode.

Example

Enter the NSVL configuration sub-mode to modify the configuration for NSVL instance 2:

```
nsvl instance 2
```

peer-network-service-entity

This command has been replaced by the Network Service Entity - Peer NSEI Frame Relay configuration mode.

retry-count

This command has been replaced by the **max-ns-retransmissions** command.

timer

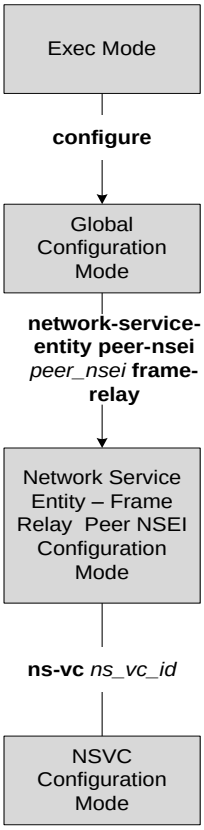
This command has been replaced by the **ns-timer** command.

Chapter 206
Network Service Virtual Connection Configuration Mode Commands

The Network Service Virtual Connection (NSVC) configuration mode is a sub-mode of the Network Service Entity (NSE) - Peer NSEI (for Frame Relay) configuration mode. The NSVC sub-mode creates a configuration instance for a specific NSVC, within the Gb interface, between a BSS and an SGSN in a 2.5G GPRSFrame Relay network connection.

Upon accessing this mode, the prompt will appear similar to:

```
[local]hostname(nse-fr-peer-nsei-<nse_id>-nsvci-<nsvc_id>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

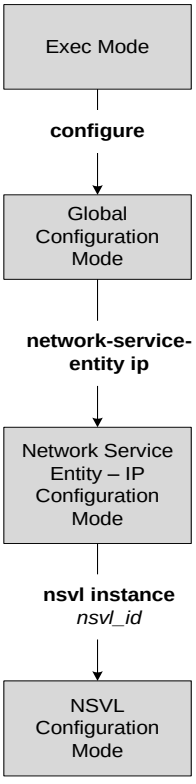
Returns to the network service entity - frame relay configuration mode.

Chapter 207
Network Service Virtual Link Configuration Mode Commands

The Network Service Virtual Link configuration mode is a sub-mode of the Network Service Entity - IP configuration mode. This sub-mode provides the commands and parameters to define the NSVL of the Gb interface between a BSS and an SGSN in a 2.5G GPRS IP network connection.

Upon entering this mode, the prompt should appear similarly to the following:

```
[local]hostname(nse-ip-local-nsvl-<nsvl_id>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the network service entity - IP configuration mode. mode.

nsvl-address

This command configures the IP address of the NSVL. end-point.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nsvl-address ip-address *ip_address* **context** *ctxt_name* **port** *port_num*

ip-address *ip_address*

Identifies the address of the NSVL.
ip_address: Must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.

context *ctxt_name*

Identifies the specific context associated with this NSVL address.
ctxt_name: Enter up to 79 alphanumeric characters.

port *port_num*

Specifies the UDP port to associate with the NSVL end-point.
port_num: Must be an integer from 1 to 65535.

Usage

Use this command to configure the IP address, context name and port number for the NSVL end-point.

Example

nsvl-address ip-address *1.1.1.1* **context** *sgsn2* **port** *3735*

weight

This command configures the signaling or data weight for NSVL.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

weight { data *data_weight* **| signaling** *signaling_weight* **}**

data *data_weight*

Defines the data weight for the NSVL.
data_weight: Must be an integer from 0 to 255. Default is 1.

signaling *signaling_weight*

Defines the signaling weight for the NSVL.
signaling_weight: Must be an integer from 0 to 255. Default is 1.

Usage

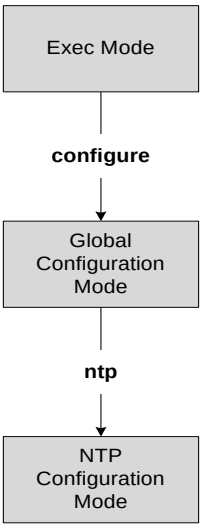
Configure the weight of the signaling or data for the NSVL.

Example

weight data *234*

Chapter 208
NTP Configuration Mode Commands

The NTP Configuration Mode is used to manage the Network Timing Protocol (NTP) options for the entire system.



enable

Enables the use of the network timing protocol for updating the system clock.

Product

All

Privilege

Security Administrator, Administrator

Syntax

enable [*context* **]**

context

Default: local
Specifies the context for which NTP is to be enabled. *name* must refer to a previously configured context expressed as an alphanumeric string of 1 through 79 characters.

Usage

Sets the NTP server to be used for the system. Only one NTP server may be active at any given time. If this command were issued in a different context followed by the current context, the prior context's NTP server would be disabled and the current context's NTP server would be used.
If any NTP server is enabled, the chassis system clock will be synchronized to the active NTP server which covers all contexts for timing synchronization.
The use of a given context for NTP server assignment allows the server to inherit the domain and IP routing options of that context.

Example

```
enable NTPcontext
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

server

Configures an NTP server for use by the local NTP client in synchronizing the system clock.

Product

All

Privilege

Security Administrator, Administrator

Syntax

server *ip_address* **[prefer] [version** *number* **] [minpoll** *poll_period* **] [maxpoll** *poll_period* **]**

no server *ip_address*

no

Indicates the server specified is to be removed from the list of NTP servers for clock synchronization.

ip_address

Specifies the IP address of the NTP server to allow for clock synchronization. *ip_address* must be specified using the IPv4 dotted-decimal notation.

prefer

Indicates the NTP server specified to be the preferred server. Only one server can be set to preferred. The preferred server is the first one contacted for clock synchronization.

Important: Use of the **prefer** keyword is not recommended.

version *number*

Default: 4
Specifies the network timing protocol version to use for server communications. *number* must be an integer from 1 to 4.

minpoll *poll_period*

Default:6
Specifies the minimum polling interval (in seconds) for NTP messages as a power of 2. *poll_period* is the power or exponent. For example, if you specify the number 10, the value is 2^10 and the resultant poll period is 1024 seconds. *poll_period* must be an integer from 6 through 17.

maxpoll *poll_period*

Default: 10
Specifies the maximum polling interval (in seconds) for NTP messages as a power of 2. *poll_period* is the power or exponent. For example, if you specify the number 10, the value is 2^10 and the resultant poll period is 1024 seconds. *poll_period* must be an integer from 6 through 17.

Usage

Configure the network timing protocol servers in the network as changes occur.

Important: Adding, removing, or modifying an NTP server configuration entry causes the NTP client to restart and restart the synchronization process with all configured NTP servers.

Example

The following command adds the NTP server with address *10.2.3.4* to the list of NTP servers.

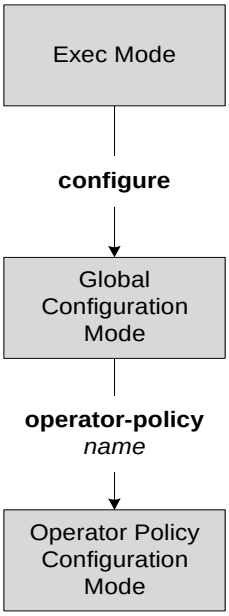
```
server 10.2.3.4
```

Chapter 209
Operator Policy Configuration Mode

Operator Policy configuration mode associates APNs, APN profiles, IMEI ranges, IMEI profiles, an APN remap table and a call control profile to an operator policy. These profiles and tables are created and defined within their own configuration modes to generate sets of rules and instructions that can be reused and assigned to multiple policies.

- A maximum of 1,000 operator policies can be defined, including the "default" operator policy.
- A maximum of 128 APN profiles can be associated with a single operator policy.
- A maximum of 128 IMEI profiles can be associated with a single operator policy.
- Only one APN remap table can be associated with a single operator policy.
- Only one call control profile can be associated with a single operator policy.

Using the Operator Policy feature allows the operator to fine-tune any desired restrictions or limitations needed to control call handling per subscriber or for a group of callers across IMSI ranges.



apn

This command identifies an APN (access point name) and associates it with an APN profile (created separately in the APN Profile Configuration mode).

Product

MME, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

apn { default-apn-profile *apn_profile_name* **| network-identifier** *apn_net_id* **apn-profile** *apn_profile_name* **| operator-identifier** *apn_op_id* **apn-profile** *apn_profile_name* **}**

no apn { default-apn-profile | network-identifier *apn_net_id* **| operator-identifier** *apn_op_id* **}**

no

Disables the specified APN to APN Profile correspondence.

default-apn-profile *apn_profile_name*

Enables the use of a default APN profile comprised of default values for all parameters. this profile will be used when none of the configured APNs match the APN in the incoming Request.
apn_profile_name must be an alphanumeric string of 1 through 64 characters.

apn-profile*apn_profile_name*

apn_profile_name must be an alphanumeric string of 1 through 64 characters.

network-identifier *apn_net_id*

Links the specified APN network ID with the specified APN profile.
apn_net_id must be an alphanumeric string of 1 through 63 characters, including dots (.) and dashes (-).

operator-identifier *apn_op_id*

Links the specified APN operator ID with the specified APN profile.
apn_op_id: must be an alphanumeric string of 1 through 18 characters, including dots (.). The string must be in the following format, where # represents a digit: MNC###.MCC###.GPRS.

Usage

Use this command, to associate APNs with APN profiles. This command can be repeated to associate multiple APNs with profiles.

Example

Associate the APN profile named *apnprof1* to APN network ID *starflash.com*:

```
apn apnprof1 network-identifier starflash.com
```

associate

Associate an APN remap table and a call control profile with the operator policy.

Product

MME, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

associate { apn-remap-table *table_id* **| call-control-profile** *profile_id* **}**

no associate { apn-remap-table | call-control-profile }

no

Removes the association definition from the policy configuration.

apn-remap-table *table_id*

Identifies the APN remap table to be associated with the operator policy.
table_id must be an alphanumeric string of 1 through 65 characters.

call-control-profile *profile_id*

Identifies a call control profile to be associated with the operator policy.
profile_id must be an alphanumeric string of 1 through 64 characters.

Usage

Use this command to associate an APN remap table and/or a call control profile with this Operator Policy. The APN remap table and the call control profile contain the definitions that instruct the SGSN or MME how to handle calls. Only one of each of these can be associated with an operator policy.

Example

Associate the *stardust.net_APNremap1* APN remap table with this operator policy:

```
associate apn-remap-table stardust.net_APNremap1
```

description

Associates a description with or names an operator policy.

Product

MME, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

description *description*

no description

description

Enter an alphanumeric string of 1 through 100 characters. If the string includes spaces, punctuation, and case-sensitive letters, it must be bracketed with double quotation marks (“ “).

no

Removes the existing description from this operator policy.

Usage

Identity this particularly operator policy using descriptive text.

Example

```
description “sgsn1 operator policy carrier1”
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

imei

Defines a range of IMEI (International Mobile Equipment Identity) numbers and associates an IMEI profile with the range definition.

Product

MME, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

imei range *IMEI_number* **to** *IMEI_number* **{ imei-profile** *profile_name* **| sv** *##* **imei-profile** *profile_name* **}**

no imei range *IMEI_number* **to** *IMEI_number* **sv** *##*

no

Removes the IMEI definition from the policy configuration.

range *IMEI_number* **to** *IMEI_number*

Defines the beginning and end of a range of IMEIs.
IMEI_number must be a numerical string of up to 14 digits.

sv *##*

Identifies the software version to fine-tune the IMEI definition. This keyword should only be included if the IMEISV is retrievable.
must be a 2-digit integer.

imei-profile *profile_name*

Identify the IMEI profile that defines the actions appropriate to the devices identified within the specified range.
profile_name must be an alphanumeric string of 1 through 64 characters.

Usage

This command defines the IMEI ranges that will be used by the operator policy to determine if the device is appropriately selected for actions defined in the specified IMEI profile.

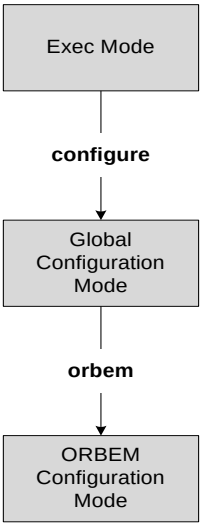
Example

All devices with an IMEI of *123123** requesting Attach shall be subject to actions in the *blacklist_profile1*

```
imei range 1231230 to 1231239 imei-profile name blacklist_profile1
```

Chapter 210
ORBEM Configuration Mode Commands

The ORBEM Configuration Mode is used to manage the Object Request Broker Element Manager (ORBEM) server options for the current context.



activate

Activates/deactivates a Common Object Request Broker Architecture (CORBA) client for the ORBEM interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

active client *id*

no active client *id*

no

Indicates the client specified is to be deactivated. When omitted, the client is activated.

id *name*

Specifies the client to be activated. *name* must refer to a previously configured client expressed as an alphanumeric string of 1 through 10 characters.

Usage

Activates CORBA clients after they have been configured or deactivated by the system or by configuration.

Example

```
active client wem

no active client wem
```

client

Configures/removes a CORBA client from the ORB element manager system interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

client id *name* **[encrypted] password** *pwd*

no client id *name*

no

Indicates the client specified is to be removed from the configuration.

id *name*

Specifies the client to be configured. *name* must be an alphanumeric string of 1 through 10 characters.

encrypted

Indicates password specified is encrypted.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

password *pwd*

Specifies the password for the CORBA client. *pwd* must be an alphanumeric string of 1 through 35 characters.

Usage

ORBEM clients must be configured prior to being activated.

Example

The following commands set the password for client *wem* specifying a plain text password and an encrypted password as well.

```
client id wem password wem1001

client id wem encrypted password f54gj801sd
```

The following deletes *wem* from the configuration.

```
no client id wem
```

default

Restores the system default values for the option specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { event-notif-iiop-port | event-notif-service filter | event-notif-siop-port |
iiop-port | iop-address | max-attempt | session-timeout | siop-port }
```

event-notif-iiop-port

Restores the port number for the inter-ORB event notifications to the system default: 7778.

event-notif-service filter

Restores the ORB Notification Service filter to its default behavior of sending all “error” level and higher events, and “info” level events for the orbs facility, CLI command logs, and license change logs.

event-notif-siop-port

Restores the port to use for secure socket layer inter-ORB event communication to the system default: 7777.

iiop-port

Restores the port number for inter-ORB communications to the system default: 14132.

iop-address

Restores the IP address for inter-ORB communications to the system default: IP address of current context.

max-attempt

Restores the maximum number of failed login attempts before which the client is deactivated to the system default: 3 attempts.

session-timeout

restores the amount of idle time (no activity) before a session is terminated to the system default: 300 seconds.

siop-port

Restores the secure socket layer I/O port for inter-ORB events to the system default: 14131.

Usage

Restore the ORB element manager options to a well known values, the system defaults.

Example

```
default event-notif-iiop-port
```

default max-attempt

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

event-notif-iiop-port

Configures the port number for Internet inter-ORB event notifications.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-notif-iiop-port *number*

number

Default: 7778
Specifies the port number to use as an integer from 1 through 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.
Event notification port configured is only used if the Internet inter-ORB transport is enabled via the **iiop-transport** command with the event notification service being enabled as well.

Example

```
event-notif-iiop-port 25466
```

event-notif-service

Enables or disables the ORB Notification Service and allows the configuration of filters dictating which event notifications are sent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] event-notif-service [filter { event-id *event_id* **[to** *final_event_id* **] | facility** *event_facility* **level** *event_level* **}]**

---

no

Disables the event notification service.

---

filter

Specifies a filter that determines for which events the system sends notifications.

---

event-id *event_id* **[to** *final_event_id* **]**

Specifies an event filter based on event identification (event ID) number.
event_id is a specific event ID to filter or is the initial event ID in range if the **to** keyword is used. It can be configured to an integer from 1 through 100000.
to allows the specification of a range of event IDs to filter. When used, *final_event_id* specifies the last event ID in the range to be filtered. It can be configured to an integer from 1 through 100000, but must be a value greater than the initial event ID.

---

facility *event_facility* **level** *event_level*

Specifies an event filter based on facility type and notification severity level.
event_facility specifies the facility type and can be any one of the following:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **aal2**: AAL2 protocol logging facility
- **acl-log**: Access Control List logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **alcap**: ALCAP protocol logging facility

- **alcapmgr**: ALCAPMgr logging facility
- **all**: All facilities
- **asngwmgr**: ASN Gateway Manager facility
- **asnpcmgr**: ASN Paging Controller Manager facility
- **bfd**: BFD protocol logging facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bindmux**: IPCF BindMux Manager
- **bngmgr**: BNG demuxmgr logging facility
- **bssap+**: Bssap+ logging facility
- **bssgp**: BSSGP Protocol logging facility
- **callhome**: CALLHOME application logging facility
- **cap**: CAP Protocol logging facility
- **cli**: CLI logging facility
- **connproxy**: Connection Proxy logging facility
- **credit-control**: Credit Control facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **cscfrtcp**: CSCF RTCP protocol logging facility
- **cscfrtp**: CSCF RTP protocol logging facility
- **cscfttmgr**: SIP CSCFTT Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **cx-diameter**: Cx Diameter messages
- **dcardctrl**: IPSec Daughter Card Controller logging facility (not used at this time)
- **dcardmgr**: IPSec Daughter Card Manager logging facility (Not used at this time)
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: DHCP facility (GGSN product only)
- **dhcpv6**: DHCPV6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase messages
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-dns**: Diameter DNS subsystem
- **diameter-ecs**: ECS Diameter signaling facility

- **diameter-hdd**: Diameter HDD Interface
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSec Data Path facility
- **drvctrl**: Driver Controller facility
- **eap-diameter**: EAP Diameter messages
- **eap-ipsec**: EAP
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface Logging facility
- **egtpc**: EGTP Control plane
- **egtpmgr**: EGTP Demux manager
- **egtpu**: EGTP User plane
- **epdg**: EPDG logging facility
- **event-notif**: Event Notification Interface logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **fng**: FNG logging facility
- **gmm**: GMM Protocol logging facility
- **gprs-app**: GPRS Application logging facility
- **gprs-ns**: GPRS-NS Protocol logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr**: GTP-C protocol Manager logging facility (GGSN product only)
- **gtpp**: GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu**: GTP-U protocol logging facility (GGSN product only)
- **gtpumgr**: GTPU Demux manager
- **gx-ty-diameter**: Gx/Ty Diameter messages
- **gy-diameter**: Gy Diameter messages
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **hdctrl**: HD Controller logging facility
- **hnb-gw**: HNB-GW (3G Femto GW) logging facility
- **hnbmgr**: HNBMGR (3G Femto GW DemuxMgr) logging facility
- **hss-peer-service**: HSS Peer Service facility
- **igmp**: IGMP
- **ikev2**: IKEv2

- **ims-authorizatn**: IMS Authorization Service facility
- **ims-sh**: HSS SH Service facility
- **imsimgr**: SGSN IMSI Manager facility
- **imsue**: IMSUE
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipms**: IPMS logging facility
- **ipsec**: IP Security logging facility
- **ipsg**: IP Service Gateway interface logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility
- **kvstore**: KV Store facility
- **l2tp-control**: L2TP control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **lagmgr**: LAGMGR logging facility
- **ldap**: LDAP Messages
- **li**: Refer to the *Lawful Intercept Configuration Guide* for a description of this command.
- **linkmgr**: SGSN/SS7 Links Manager facility
- **llc**: LLC Protocol logging facility
- **local-policy**: Local Policy Service facility
- **m3ua**: M3UA Protocol logging facility
- **magmgr**: Mobile Access Gateway logging facility
- **map**: MAP Protocol logging facility
- **megadiameter**: Megadiameter Manager (SLF Service)
- **mme-app**: MME application facility
- **mme-misc**: MME miscellaneous logging facility
- **mmedemux**: MME Demux Manager facility
- **mmemgr**: MME Manager facility
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 control logging facility
- **mseg-app**: MSEG application logging facility
- **mseg-gtpc**: MSEG GTPC application logging facility

- **mseg-gtpu**: MSEG GTPU application logging facility
- **msegmgr**: MSEG demuxmgr logging facility
- **mtp2**: MTP2 Service logging facility
- **mtp3**: MTP3 Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **npumgr-acl**: NPUMGR ACL logging facility
- **npumgr-drv**: NPUMGR DRV logging facility
- **npumgr-flow**: NPUMGR FLOW logging facility
- **npumgr-fwd**: NPUMGR FWD logging facility
- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-lc**: NPUMGR LC logging facility
- **npumgr-port**: NPUMGR PORT logging facility
- **npumgr-recovery**: NPUMGR RECOVERY logging facility
- **npumgr-vpn**: NPUMGR VPN logging facility
- **npusim**: NPUSIM logging facility
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer detection logging facility
- **pccmgr**: IPCF PCC Manager library
- **pdg**: PDG logging facility
- **pdgmgr**: PDG Manager facility
- **pdif**: PDIF logging facility
- **pgw**: PDN Gateway facility
- **phs**: Payload Header Suppression
- **phs-control**: PHS X1/X5 and X2/X6 Interface logging facility
- **phs-data**: PHS Data logging facility
- **phs-eapol**: PHS EAPOL logging facility
- **phsgwmgr**: PHS Gateway Manager facility
- **phspcmgr**: PHS Paging Controller Manager facility
- **pmm-app**: PMM application logging facility
- **ppp**: PPP link and packet facilities
- **pppoe**: PPPOE logging facility
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility

- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: RANAP Protocol logging facility
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Rf Diameter messages
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **rua**: RUA (3G Femto GW - RUA messages) logging facility
- **s1ap**: S1AP Protocol logging facility
- **sccp**: SCCP Protocol logging facility
- **sct**: Shared Configuration Task logging facility
- **sctp**: SCTP Protocol logging facility
- **sess-gr**: SM GR facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstrc**: session trace logging facility
- **sft**: Switch Fabric Task logging facility
- **sgs**: SGs protocol logging facility
- **sgsn-app**: SGSN-APP interface logging facility
- **sgsn-failures**: SGSN call failures logging facility
- **sgsn-gtpc**: SGSNs GTP-C Protocol logging facility
- **sgsn-gtpu**: SGSNs GTP-U Protocol logging facility
- **sgsn-mbms-bearer**: SGSNs MBMS bearer app (SMGR) logging facility
- **sgsn-misc**: SGSN miscellaneous logging facility
- **sgsn-system**: SGSNs System Components logging facility
- **sgsn-test**: SGSN Tests logging facility
- **sgtpmgr**: SGSN GTPC Manager facility
- **sgw**: Serving Gateway facility
- **sh-diameter**: Sh Diameter messages
- **sitmain**: System Initialization Task main logging facility
- **sm-app**: SM Protocol logging facility
- **sms**: SMS Service logging facility
- **sndcp**: SNDCP Protocol logging facility
- **snmp**: SNMP logging facility

- **sprmgr**: IPCF SPR Manager library
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **ssh-ipsec**: SSH IP Security logging facility **stat:** Statistics logging facility
- **ssl**: SSL (Secure socket layer messages) logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **tcap**: TCAP Protocol logging facility
- **threshold**: Threshold logging facility
- **ttg**: TTG logging facility
- **tucl**: TUCL logging facility
- **udr**: Usage Detail Record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **usertcp-stack**: User Tcp Stack
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

event_level

specifies the severity level of the event notification to filter and can be configured to one of the following:

- critical: display critical events
- error: display error events and all events with a higher severity level
- warning: display warning events and all events with a higher severity level
- unusual: display unusual events and all events with a higher severity level
- info: display info events and all events with a higher severity level
- trace: display trace events and all events with a higher severity level
- debug: display all events

Usage

This command is used to enable or disable the ORB Notification Service. Additionally, it can be used to configure filters dictating which events are sent. This service is disabled by default.
Filters can be configured for a specific event identification number (event ID), a range of event IDs, or specific severity levels for events for particular facilities.
When no filters are configured and the service is enabled, the ORB Notification Service sends all “error” level and higher events, and “info” level events for the orbs facility, CLI command logs, and license change logs.
Multiple instance of this command can be executed to configure multiple filters.

Example

The following command enables the ORB Notification service:

```
event-notif-service
```

The following command disables the ORB Notification service:

```
no event-notif-service
```

The following command configures a filter for the ORB Notification Service allowing only event IDs *800* through *805* to be sent:

```
event-notif-service filter event-id 800 to 805
```

The following command configures a filter for the ORB Notification Service allowing only *critical* level notifications for all facilities:

```
event-notif-service filter facility all level critical
```

event-notif-siop-port

Configures the port to use for secure socket layer (SSL) inter-ORB event communication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-notif-siop-port *number*

number

Default: 7777
Specifies the port number to use as an integer from 1 through 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications using SSL.

Example

```
event-notif-siop-port 25466
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

iiop-port

Configures the port number for Internet Inter-ORB Protocol (IIOP) communications.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] iiop-port *number*

no

Disables the IIOP port.

number

Default: 14132
Specifies the port number to use as an integer from 1 through 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.
Internet inter-ORB port is only used if IIOP transport is enabled via the **iiop-transport** command.

Example

```
iiop-port 25466
```

iiop-transport

Enables/disables use of the Internet Inter-ORB Protocol (IIOP) for management across the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
iiop-transport

no iiop-transport
```

no

Disables internet inter-ORB protocol communication across the network.

Usage

Enables the transport of IIOP messages to support remote management across the network.
The default is IIOP transport disabled.

Example

The following commands enable and disable the ORB-based management across the network, respectively.

```
iiop-transport

no iiop-transport
```

iop-address

Sets the IP address used by the ORBEM Server to advertise service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

iop-address *ip_address*

ip_address

Specifies the IP address to use for inter-ORB communications for the current context. *ip_address* must be specified using IPv4 dotted-decimal notation.

Usage

Change the inter-ORB IP address when the IP address of the current context should not be used. The IP address of the local context may not be appropriate when the ORB configuration across nodes would cause conflicts with the IP addresses.
The default inter-ORB IP address is the IP address of the current context.

Example

```
iop-address 10.2.3.4
```

max-attempt

Configures the maximum number of failed login attempts after which the client is deactivated.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max-attempt *count*

count

Default: 3 attempts
Specifies the number of failed login attempts prior to deactivating a client. The value must be an integer from 1 through 10.

Usage

Adjust the maximum number of attempts to a smaller value to increase the security level of the system.

Example

```
max-attempt 3
```

session-timeout

Configures the amount of idle time (no activity) before a client session is terminated.

Product

All

Privilege

Security Administrator, Administrator

Syntax

session-timeout *seconds*

seconds

Default: 300 seconds
Specifies the number of seconds of idle time before a client session is terminated. The value must be must be an integer from 1 through 86400.

Usage

Reduce the session timeout when the maximum number of sessions allowed is frequently being reached. Setting this to a lower value will help release idle sessions faster to allow use by other clients.

Example

```
session-timeout 1800
```

siop-port

Configures the SSL I/O port for inter-ORB events.

Product

All

Privilege

Security Administrator, Administrator

Syntax

siop-port *number*

number

Default: 14131
Specifies the port number to use as an integer from 1 through 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications.

Example

```
siop-port 25466
```

ssl-auth-policy

Configures the SSL peer authentication policy used by the ORBEM server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ssl-auth-policy { auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail }
```

auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail

Default: **auth-none**
auth-none: ORBEM server does not authenticate the peer
auth-once: ORBEM server authenticates the peer once (no fail)
auth-once-fail: ORBEM server authenticates the peer once (fail if no certificate)
auth-peer: ORBEM server authenticates the peer every time (no fail)
auth-peer-fail: ORBEM server authenticates the peer every time (fail if no certificate)

Usage

Use to configure the peer authentication policy used by the SSL transport of ORBEM.

Example

The following command sets the policy to authenticate the peer once without failure.

```
ssl-auth-policy auth-once
```

ssl-certificate

Defines the certificate to be used by the SSL transport of ORBEM.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ssl-certificate { string *certificate* **| file** *url* **}**

string *certificate*

Specifies an ORBEM SSL certificate. *certificate* is an alphanumeric string of up to 4096 characters.

file *url*

Default: /usr/ssl/certs/orbscert.pem
Specifies an ORBEM SSL certificate file and location. *url* is an alphanumeric string of up to 1024 characters.

Usage

Use to configure the certificate to be used by the SSL transport of ORBEM. Note that if the **file** option is used, the certificate content is read from the *url* and converted into a quoted string.

Example

The following command defines the certificate *cert3.pem* file as being located in the **/usr/ssl/certs** directory:

```
ssl-certificate file /usr/ssl/certs/cert3.pem
```

The following command defines the certificate string (the string shown is abbreviated):

```
ssl-certificate string
```

ssl-private-key

Configures the SSL private key used by the ORBEM server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ssl-private-key { string *key* **| file** *url* **}**

string *key*

Specifies an ORBEM SSL private key. *key* is an alphanumeric string of up to 4096 characters.

file *url*

Default: /usr/ssl/certs/orbscert.pem
Specifies the ORBEM SSL private key file location. T*url* is an alphanumeric string of up to 1024 characters.

Usage

Use to configure the private key for the SSL transport of ORBEM. Note that if **file** option is used, the private key is read from the *url* and converted into a quoted string.

Example

The following command defines the private-key *cert3.pem* file as being located in the **/usr/ssl/certs** directory:

```
ssl-private-key file /usr/ssl/certs/cert3.pem
```

The following command defines the private-key string (the string shown is abbreviated):

```
ssl-private-key string
```

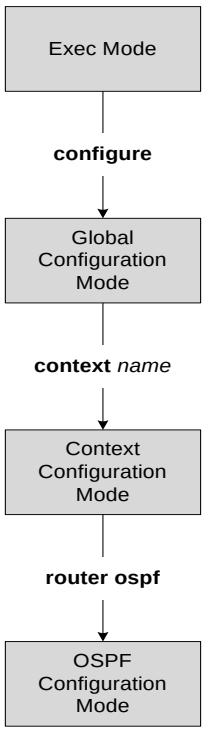
Chapter 211
OSPF Configuration Mode Commands

The OSPF Configuration sub-mode is used to configure the Open Shortest Path First (OSPF) routing protocol. This mode includes commands that configure OSPF routing parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

area authentication

Enables authentication for the specified OSPF area.

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area  { ipaddress | decimal_value } authentication [ message-digest ]
```

no

Disables authentication for the specified area.

ipaddress

Specifies the IP address of the area where authentication will be enabled in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the area where authentication will be enabled. This must be an integer from 0 through 4294967295.

authentication

Sets the OSPF authentication type to use the simple authentication method.

message-digest

Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

Usage

Use this command to enable authentication of OPSF areas.

Example

The following command enables authentication for an OSPF area defined by the IP address *192.168.100.10* and the OSPF authentication type to MD5:

```
area 192.168.100.10 authentication message-digest
```

area default-cost

Configures the default cost for an area.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } default-cost cost_value
```

no

Deletes the default cost for the area.

ipaddress

Specifies the IP address of the area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the area as an integer from 0 through 4294967295.

cost_value

Sets the default cost to be configured for the specified area as an integer from 0 through 16777215.

Usage

Use this command to configure the default cost for an OSPF area.

Example

The following command sets the default cost for an OSPF area defined by the IP address *192.168.100.10* to *300*:

```
area 192.168.100.10 default-cost 300
```

area nssa

Defines an area as an NSSA (Not So Stubby Area) and configures OSPF parameters for it.

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } nssa [ default-information-originate ] [ no-redistribution ] [ no-summary ] [ translate-always ] [ translate-candidate ] [ translate-never ]
```

ipaddress

Specifies the IP address of the NSSA in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the NSSA area as an integer from 0 through 4294967295.

default-information-originate

Originates default information to the NSSA area.

no-redistribution

Does not redistribute external routes to the NSSA area.

no-summary

Does not inject inter-area routes into NSSA.

translate-always

Configures the NSSA-ABR (Area Border Router) to always translate

translate-candidate

Configure NSSA-ABR for translate election. (This is enabled by default.)

translate-never

Configure NSSA-ABR to never translate.

Usage

Use this command to define NSSA areas.

Example

The following command defines the area designated by the IP address *192.168.100.10* as an NSSA area:

```
area 192.168.100.10 nssa
```

area stub

Defines an area as an OSPF stub area.

Product

PDSN, HAGGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } stub [ no-summary ]
```

ipaddress

Specifies the IP address of the stub area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the stub area as an integer from 0 through 4294967295.

no-summary

Disables (stops) the ABR (Area Border Router) from sending summary link state advertisements (LSAs) into the stub area.

Usage

Use this command to define an OPSF area as a stub area.

Example

The following command defines the OSPF area defined by the IP address *192.168.100.10* as a stub area:

```
area 192.168.100.10 stub
```

area virtual-link

Configures a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address
```

no

Disables area virtual-link.

ipaddress

Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

decimal-value

Specifies The identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

Usage

Use this command to create a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command creates a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:

```
area 192.168.100.10 virtual-link 192.168.200.20
```

area virtual link authentication

Configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address authentication { message-digest | null | text }
```

no

Disables area virtual link authentication.

ipaddress

Specifies the IP address of the transit ares in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

authentication

Sets the OSPF authentication type to use the simple authentication method.

message-digest

Sets the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the authentication method for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to use no authentication:

```
area 192.168.100.10 virtual-link 192.168.200.2 null
```

area virtual-link authentication-key

Configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **authentication-key** { **encrypted password** *encrypted_authentication_key* | **password** *authentication_key* }

no area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **authentication-key**

no

Disables the area virtual link authentication key.

ipaddress

Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

encrypted password

encrypted_authentication_key is an alphanumeric string of 1 through 523 characters.
Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is an alphanumeric string of 1 through 16 characters that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to specify the authentication password for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command creates an authentication password of *123456* for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:

```
area 192.168.100.10 virtual-link 192.168.200.20 authentication-key password 123456
```

area virtual link intervals

Configures the interval or delay type, and the delay time in seconds, for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address [ dead-interval
value ] [ hello-interval value ] [ retransmit-interval value ] [ transmit-delay value ]
```

no

Disables the area virtual link intervals.

ipaddress

Specifies the IP address of the area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

dead-interval *value*

Specifies The interval (in seconds) that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

Specifies the interval (in seconds) before sending a hello packet. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

Specifies the interval (in seconds) that router should wait before retransmitting a packet. *value* must be an integer from 1 through 3600.

transmit-delay *value*

Specifies the interval (in seconds) that the router should wait before transmitting a packet. *value* must be an integer from 1 through 3600.

Usage

Use this command to set the intervals or delay types for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to *60* seconds:

```
area 192.168.100.10 virtual-link 192.168.200.20 retransmit-interval 60
```

area virtual link message-digest-key

Enables the use of MD5-based OSPF authentication for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **message-digest-key** *key_id* **md5** { **encrypted password** *encrypted_authentication_key* | **password** *authentication_key* }

no area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **message-digest-key** *key_id*

no

Disables the area virtual link message digest key.

ipaddress

Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPV4 dotted-decimal notation.

message-digest-key *key_id*

Specifies the key identifier number. *key_id* must be an integer from 1 through 255.

encrypted password

Specifies the use of an encrypted password. *encrypted_authentication_key* is an alphanumeric string of 1 through 523 characters.
Used this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

Specifies the password to use for authentication. *authentication_key* is an alphanumeric string from 1 through 16 characters that is entered in clear text format.

Usage

Use this command to enable the use of MD5-based OSPF authentication for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*, sets the MD5 Key ID to *25*, and the password to *123456*:

```
area 192.168.100.10 virtual-link 192.168.200.20 message-digest-key 25 md5 password 123456
```

capability graceful-restart

Configures graceful-restart. By default, this capability is set to enabled.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] capability graceful-restart
```

no

Disables the graceful-restart capability.

default

Enables the graceful-restart capability if it has been disabled.

Usage

Use this command to configure graceful-restart.

Example

The following command configures graceful-restart:

```
capability graceful-restart
```

default-information originate

Creates a default external route into an OSPF routing domain.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-information originate

default-information originate [**always**] [**metric** *metric_value*] [**metric-type** { **1** | **2** }] [**route-map** *route_map_name*]

no default-information originate

no

Disables the default external route.

always

Always advertise the route regardless of whether or not the software has a default route.

metric *metric_value*

Sets the OSPF metric used in creating the default rout as an integer from 1 through 16777214.

metric-type { 1 | 2 }

Sets the default route metric type.
1: Sets the OSPF external link type for default routes to Type 1.
2: Sets the OSPF external link type for default routes to Type 2.

route-map *route_map_name*

Specifies the name of the default route-map to be use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to set the default external route into an OSPF routing domain.

Example

The following command sets the default external route to originate from the route map named *rmap1*:

default-information originate route-map rmap1

default metric

Configures the default metric value for the OSPF routing protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-metric *metric_value*

no default-metric

metric-value

Sets the metric value expressed as an integer from 1 through 16777214. The default metric value setting is 26385.

no

Enables or disables the default metric value for OSPF.

Usage

Use this command to set the default metric for routes.

Example

The following command sets the default metric to *235*:

default-metric 235

distance

Configures the OSPF route administrative distances for all OSPF route types or based on specific route type. Administrative distance is the measure used by Cisco routers to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance defines the reliability of a routing protocol. Each routing protocol is prioritized in order of most to least reliable (believable) using an administrative distance value. A lower numerical value is preferred.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] distance { distance_value | ospf { [ external distance_value ] [ inter-area
distance_value ] [ intra-area distance_value ] } }
```

no

Disables the OSPF route administrative distances for all OSPF route types.

distance_value

Specifies the OSPF route administrative distances as an integer from 1 to 255. The default distance value is 110.

ospf { [external *distance_value* **] [inter-area** *distance_value* **] [intra-area** *distance_value* **] }**

Set the distance value for the specified route type.
external *distance_value*: Set the OSPF route administrative distance for routes from other routing domains, learned by redistribution. This must be an integer from 1 through 255. The default is 110.
inter-area *distance_value*: sets the OSPF route administrative distance for routes from one routing area to another. This must be an integer from 1 through 255. The default is 110.
intra-area *distance_value*: sets the OSPF route administrative distance for all routes within an area. This must be an integer from 1 through 255. The default is 110.

no

Enables or disables the specified option.

Usage

Use this command to set the administrative distance for OSPF routes.

Example

The following command sets the administrative distance for all OSPF route types to *30*:

```
distance 30
```

distribute-list

Enables or disables the filtering of networks in outgoing routing updates.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] distribute-list route_access_list out { connected | rip | static }
```

no

Disables the filtering of networks in outgoing routing updates.

route_access_list

Specifies the name of the OSPF route access list to use for filtering as an alphanumeric string of 1 through 63 characters.

connected

Filters connected routes.

rip

Filters RIP routes. (RIP is not supported at this time.)

static

Filters static routes.

no

Disables the specified option.

Usage

Use this command to enable the filtering of outgoing route updates by using the specified route access list.

Example

The following command uses the route access list named *ral1* to filter outgoing routing updates for all connected routes:

```
distribute-list ral1 out connected
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

ip vrf

Configures the Virtual Routing and Forwarding (VRF) instances for OSPF routing protocol.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip vrf vrf_name
```

no

Disables the VRF instances and removes the configured VRF context association for OSPF routing.

vrf*vrf_name*

Configures Virtual Routing & Forwarding (VRF) parameters.
vrf_name is name of a preconfigured VRF context configured in Context Configuration Mode via the **ip vrf** command. It is an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the IP VRF forwarding also to associate the preconfigured VRF context with the specific tunnel interface.
This command creates and enters the OSPF VRF Configuration Mode if required to configure the VRF context instances for OSPF routing.

Example

The following command enables preconfigured VRF context instance *ospf_vrf1* for OSPF routing and enters the OSPF VRF Configuration mode:

```
ip vrf ospf_vrf1
```

neighbor

Configures OSPF routers that interconnect to non-broadcast networks.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] neighbor  ip_address  [ poll-interval poll_interval_value ] [ priority
priority_value ]
```

no

Disables OSPF routers that interconnect to non-broadcast networks.

ip_address

Specifies the interface IP address of the OSPF neighbor expressed using IPv4 dotted-decimal notation.

poll-interval *poll_interval_value*

Default: 120
Sets the number of seconds in the dead neighbor polling interval as an integer from 1 through 65535

priority *priority_value*

Default: 0
Sets the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the specified IP address. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

Usage

Use this command to configure OSPF routers that connect to non-broadcast networks.

Example

The following command specifies an OSPF router neighbor with the IP address of *192.168.100.10*:

```
neighbor 192.168.100.10
```

network area

Enables OSPF on an interface and defines the OSPF area for that network.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] network network_ip_address / network_mask area { area_id | area_ip_address }
```

no

Disables OSPF on an interface and defines the OSPF area for that network.

network_ip_address/network_mask

Specifies the network address and mask as well as the interface on which OSPF will be enabled. *network_ip_address* in entered in IPv4 dotted-decimal notation, followed by the "/" and the mask (CIDR).

area_id

Specifies the OSPF area identification number for the specified network as an integer from 0 through 4294967295.

area_ip_address

Specifies the IP address of the OSPF area for this network. This must be entered in IPv4 dotted-decimal notation.

Usage

Use this command to specify the IP address of the network interface that the OSPF router will use.

Example

The following command specified that the OSPF router will use the interface at IP address *192.168.1.0* with a netmask of *24*:

```
network 192.168.1.0/24
```

ospf graceful-restart

Configures OSPF graceful-restart settings.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ospf graceful-restart { **grace-period** *grace_period* | **helper** { **never** | **policy** { **only-reload** | **only-upgrade** } } }

grace-period grace-period

Specifies the OSPF graceful restart grace period (in seconds) as an integer from 1 through 1800. Default grace period is 60 seconds.

helper { never | policy { only-reload | only-upgrade } }

Helps configure OSPF helper settings.
never: Do not allow helper mode.
policy { only-reload | only-upgrade }: Allows ospf graceful-restart helper mode.

- **only-reload**: Allows ospf graceful-restart helper mode only for a reload.
- **only-upgrade**: Allows ospf graceful-restart helper mode only for an upgrade.

Default is ospf graceful-restart grace-period.

Usage

Use this command to configure graceful-restart specific settings.

Example

The following command sets the graceful restart grace period to *60* seconds:

```
ospf graceful-restart grace-period 60

ospf graceful-restart helper policy only-reloadL

ospf graceful-restart helper policy only-upgrade
```

ospf router-id

This command configures the router ID for the OSPF process.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ospf router-id  ip_address
```

no

Disables the router ID for the OSPF process.

router-id *ip_address*

Specifies the router ID for the OSPF process. *ip_address* is entered using IPv4 dotted-decimal notation.

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

```
ospf router-id 192.168.200.1
```

passive-interface

Enables or disables the suppression of OSPF routing updates on the specified interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] passive-interface interface_name
```

no

Disables the name assigned to a logical interface within the specific context.

interface_name

Specifies the name assigned to a logical interface within the specific context as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to suppress router updates on an interface in the current context.

Example

The following command suppresses OSPF routing updates on the interface named *Intfc1*:

```
passive-interface Intfc1
```

redistribute

Redistributes routes from other protocols to OSPF neighbors using the OSPF protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

redistribute { **connected** | **rip** | **static** } [**metric** *metric_value*] [**metric-type** { **1** | **2** }] [**route-map** *route_map_name*]

no redistribute { **connected** | **rip** | **static** }

no

Disables the redistributed routes.

connected

Redistributes connected routes.

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Redistributes static routes.

metric *metric_value*

Sets the OSPF metric used in the redistributed route. This must be an integer from 1 through 16777214.

metric-type { 1 | 2 }

Default: 2
Sets route metric type that is applied to redistributed routes.
1: Sets the OSPF external link type for routes to Type 1.
2: Sets the OSPF external link type for routes to Type 2.

route-map *route_map_name*

Filter routes through the specified route map before redistribution. *route_map_name* specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to define what routing protocols should have their routes redistributed into OSPF.

Example

The following command defines that BGP routes should be redistributed:

```
redistribute connected
```

refresh timer

Adjusts settings for the OSPF refresh timer.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] refresh  timer value
```

no

Disables the refresh timer.

value

Default: 10
Specifies the minimum amount of time (in seconds) to wait before refreshing a Link-state Advertisement (LSA). This must be an integer from 10 through 1800.

Usage

Use this command to define the amount of time to wait before refreshing an LSA.

Example

The following command sets the refresh timer to *90* seconds:

```
refresh timer 90
```

router-id

Configures the router ID for the OSPF process.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] router-id ip_address
```

no

Disables the router ID for the OSPF process.

ip_address

Specifies the router ID for the OSPF process in IPv4 dotted-decimal notation.

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

```
router-id 192.168.200.1
```

timers spf

Sets the Shortest Path First (SPF) timers.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

timers spf *delay_value hold_time_value*

no timers spf

no

Disables SPF timers.

delay_value

Default: 5
Specifies the delay time (in seconds) between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

hold_time_value

Default: 10
Specifies the hold time (in seconds) between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

Usage

Use this command to set the SPF delay and hold timers for the current OSPF router process.

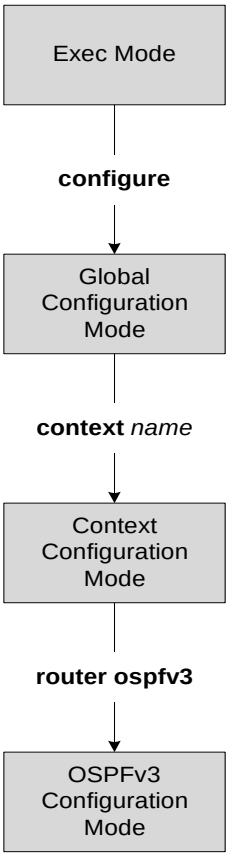
Example

The following command sets the delay timer to *15* and the hold timer to *15*:

```
timers spf 15 15
```

Chapter 212
OSPFv3 Configuration Mode Commands

The OSPFv3 Configuration sub-mode is used to configure the OSPFv3 routing protocol. This mode includes commands that configure OSPFv3 routing parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

area

Configures an Open Shortest Path First Version 3 (OSPFv3) area and enables authentication for that area.

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { decimal_value | ipv4address } default-cost default_integer_value | stub [
no-summary ] | virtual-link virtuallink_neighbour_Ipv4_address [ dead-interval
virtuallink_dead_interval ] [ hello-interval virtuallink_hello_interval ] [ retransmit-
interval virtuallink_retransmit_interval ] [ transmit-delay virtuallink_transmit_delay ]
```

no

Disables authentication for the specified area.

decimal_value|*ipv4address*

decimal_value: Specifies the identification number of the area where authentication will be enabled as an integer from 0 through 4294967295.

ipv4address: Specifies the IP address of the area where authentication will be enabled in IPv4 dotted-decimal notation.

default-cost *default_integer_value*

Sets the OSPFV3 authentication area's default cost as an integer from 1 through 16777215.

stub [no-summary]

Sets the OSPFV3 stub area. Only Router-LSAs, Network-LSAs, Inter-area Prefix-LSAs, Intra-area Prefix-LSAs and Link-LSAs are allowed in a Stub area.

no-summary Does not inject inter-area routes into stub area.

virtual-link *virtuallink_neighbour_Ipv4_address*

Configures a virtual link to the authentication area.

virtuallink_neighbour_Ipv4_address is the IPv4 address for the virtual link of the authenticated area in dotted-decimal notation.

The following interval timers can be set for the virtual link:

- **dead-interval** *virtuallink_dead_interval*: Sets the virtual link dead-interval (in seconds) as an integer from 1 through 65535.
- **hello-interval** *virtuallink_hello_interval*: Sets the virtual link hello interval (in seconds) as an integer from 1 through 65535.
- **retransmit-interval** *virtuallink_retransmit_interval*: Sets the virtual link retransmit interval (in seconds) as an integer from 1 through 3600.

- **transmit-delay** *virtuallink_transmit_delay*: Sets the virtual link transmit delay (in seconds) as n integer from 1 through 3600.

Usage

Use this command to establish OPSFv3 areas and enable authentication.

Example

The following command enables authentication for an OSPFv3 area defined by the IP address *192.168.100.10* with default cost of *256*

```
area 192.168.100.10 default-cost 256
```

default-metric

Configures the default metric value for routes redistributed from another protocol into Open Shortest Path First Version 3 (OSPFv3).

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ]  default-metric default_metric_integer_value
```

no

Disables the default metric.

default_metric_integer_value

Specifies the default metric as an integer from 1 through 16777214.

Usage

Use this command to configure OPSFv3 default metric.

Example

The following command configures OSPFv3 default metric to 256

```
default-metric 256
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

passive Interface

Configures an OSPFv3 passive interface as passive. If a network interface is configured as passive, it will not receive or send any OSPFv3 packets.

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ]  passive-interface passive_interface_name
```

no

Disables the passive interface.

passive-interface *passive_interface_name*

Sets the named interface to be a passive interface as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to configure an OPSFv3 passive interface in this context.

Example

The following command configures an OSPFv3 passive interface.

```
passive-interface OSPF-if1
```

redistribute

Redistributes routes from other protocols to OSPFv3 neighbors using the OSPFv3 protocol.

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] redistribute { connected | static } redistribute connected [**metric** *metric_value* [**metric-type** *external_metric_type*] [**route-map** *route_map_name*]] [**metric-type** *external_metric_type* [**route-map** *route_map_name*]] [**route-map** *route_map_name*] **static** [**metric** *metric_value* [**metric-type** *external_metric_type*] [**route-map** *route_map_name*]] [**metric-type** *external_metric_type* [**route-map** *route_map_name*]] [**route-map** *route_map_name*]

no

Disables the route redistribution.

connected

Redistributes connected routes.

static

Redistributes static routes.

metric *metric_value*

Specifies the OSPFv3 default metric value as an integer from 0 through 16777214.

metric-type *external_metric_type*

Specifies the OSPFv3 external metric type as the integer 1 or 2

route-map *route_map_name*

Specifies a route map as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to configure OPSFv3 redistribution of connected or static routes.

Example

The following command configures OSPFv3 redistribution of connected routes.

```
redistribute connected metric 45 metric-type 1 route-map rt
```

router-id

Sets the OSPFv3 router ID for the Open Shortest Path First Version 3 (OSPFv3) routing process.

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] router-id *router_id_ipaddress*

no

Disables the router-id.

router_id_ipaddress

Specifies the router-id an IPv4 address in dotted-decimal notation.

Usage

Use this command to configure OPSF v3 router id to the given IPv4 address.

Example

The following command configures OSPFv3 router id to the given IPv4 address.

```
router-id 11.22.22.21
```

timers spf

Sets OSPFv3 the delay in the time between the detection of a topology change and when the SPF algorithm actually runs.

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] timers spf spf_delay_timer_value
```

no

Disables the SPF delay timer.

spf *spf_delay_timer_value*

Sets the Shortest Path First (SPF) delay timer (in milliseconds) as an integer from 0 through 4294967295.

Usage

Use this command to configure the OPSFv3 SPF delay timer.

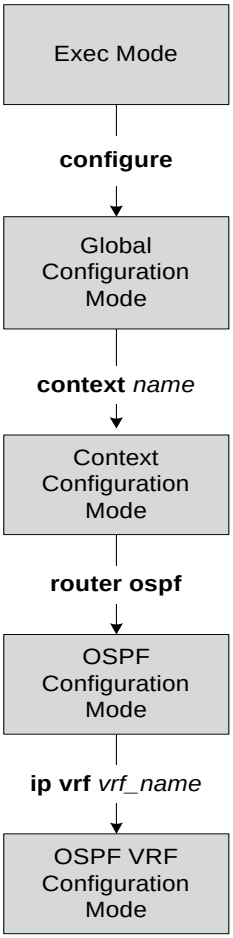
Example

The following command sets OSPFv3 SPF timer.

```
timers spf 256
```

Chapter 213
OSPF VRF Configuration Mode Commands

The OSPF VRF Configuration sub-mode is used to configure the virtual routing and forwarding (VRF) context instances for OSPF routing protocol. This mode includes commands that configure VRF instance for OSPF routing parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

area

Configures various parameters, including authentication, area identification, virtual link ID, and delay/interval values for the specified OSPF area using a specific VRF instance.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] area { *decimal_value* **|** *ip_address* **} {authentication [message-digest] | default-cost** *cost_value* **| nssa [default-information-originate] [no-redistribution] [no-summary] [translate-always] [translate-candidate] [translate-never] | stub [no-summary] | virtual-link** *router_ip_address* **[authentication {message-digest | null | text}| authentication-key {encrypted password** *encrypted_string* **| password** *password_string***}| message-digest-key** *key_id* **md5 [encrypted password** *encrypted_string* **| password** *password_string***]} [dead-interval] [hello-interval] [retransmit-interval] [transmit-delay]**

---

no

Disables or removes configured parameters for the specified OSPF area using a specific VRF instance.

---

ip_address

Specifies the IP address of the area where authentication will be enabled in IPv4 dotted-decimal notation.

---

decimal_value

Specifies the identification number of the area where parameters to be configured as an integer from 0 through 4294967295.

---

authentication

Sets the OSPF authentication type to use the simple authentication method.

---

message-digest

Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

---

default-cost *cost_value*

Sets the default cost for an OSPF area. *cost_value* must be an integer from 0 through 16777215.

---

nssa [default-information-originate] [no-redistribution no-summary] [translate-always] [translate-candidate] [translate-never]

Configures and defines an area as an NSSA (Not So Stubby Area) and configures OSPF parameters for it.
default-information-originate: Configures the OSPF VRF instances to originate default information to the NSSA area.
no-redistribution: Configures the OSPF VRF instance to not to redistribute external routes to the NSSA area.
no-summary: Configures the OSPF VRF instance to not to inject the inter-area routes into NSSA.

translate-always: Configures the NSSA-ABR (Area Border Router) always to translate. By default this is disabled.
translate-candidate: Configures the NSSA-ABR always to translate election. By default this is enabled.
translate-never: Configures the NSSA-ABR never to translate. By default this is disabled.

---

stub [no-summary]

Specifies an OSPF area as an stub area configures the NSSA-ABR never to translate. By default this is disabled.
no-summary: Disables (stops) the ABR from sending summary LSAs into the stub area.

---

virtual-link *router_id*

Specifies the router identifier which provides a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone. *router_id* must be an IP address in IPv4 dotted-decimal notation of the ABR to be linked to.

---

authentication {message-digest | null | text}

Configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.
message-digest: Set the OSPF authentication type to use the message digest (MD) authentication method.
null: Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.
text: Set the OSPF authentication type to use the clear text authentication method.

---

authentication-key

Configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

---

message-digest-key *key_id*

Specifies the MD key identifier number for virtual link connection. *key_id* must be an integer from 1 through 255.

---

md5

Sets the message digest to MD5 for virtual link connection.

[encrypted] password *passwd_string*

Specifies the password required for virtual link connection authentications. The keyword **password** is optional and if specified *passwd_string* must be an alphanumeric string of 1 through 63 characters. The password specified must be in an encrypted format if the optional keyword **encrypted** was specified.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file. *encrypted_string* is an alphanumeric string of 1 through 523 characters.

---

dead-interval *value*

Specifies the dead interval (in seconds) that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

Specifies the hello interval (in seconds) before sending a hello packet. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

Specifies the delay between retransmission (in seconds) that router should wait before retransmitting a packet. *value* must be an integer from 1 through 3600.

transmit-delay *value*

Specifies the interval (in seconds) that the router should wait before transmitting a packet. *value* must be an integer from 1 through 3600.

Usage

Use this command to configure/set the various network/connection/authentication parameters of OPSF areas using specific VRF instance.

Example

The following command enables authentication for an OSPF area defined by the IP address *192.168.100.10* and the OSPF authentication type to MD5:

```
area 192.168.100.10 authentication message-digest
```

The following command defines the area designated by the IP address *192.168.100.10* as an NSSA area where translation of NSSA candidate is enabled by default:

```
area 192.168.100.10 nssa
```

The following command defines the OSPF area defined by the IP address *192.168.100.10* as a stub area:

```
area 192.168.100.10 stub
```

The following command creates a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:

```
area 192.168.100.10 virtual-link 192.168.200.20
```

The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to use no authentication:

```
area 192.168.100.10 virtual-link 192.168.200.20 null
```

The following command creates an authentication password of *123456* for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:

```
area 192.168.100.10 virtual-link 192.168.200.20 authentication-key
password 123456
```

The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*, sets the MD5 Key ID to *25*, and the password to *123456*:

```
area 192.168.100.10 virtual-link 192.168.200.20 message-digest-key 25 md5
password 123456
```

The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to *60* seconds:

```
area 192.168.100.10 virtual-link 192.168.200.20 retransmit-interval 60
```

default-information originate

Creates a default external route into an OSPF routing domain.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default-information originate

default-information originate [ always ] [ metric metric_value ] [ metric-type { 1 | 2 } ] [ route-map route_map_name ]

no default-information originate
```

no

Disables the default external route.

always

Always advertise the route regardless of whether or not the software has a default route.

metric *metric_value*

Sets the OSPF metric used in creating the default rout as an integer from 1 through 16777214.

metric-type { 1 | 2 }

Sets the default route metric type.
1: Sets the OSPF external link type for default routes to Type 1.
2: Sets the OSPF external link type for default routes to Type 2.

route-map *route_map_name*

Specifies the name of the default route-map to be use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to set the default external route into an OSPF routing domain.

Example

The following command sets the default external route to originate from the route map named *rmap1*:

```
default-information originate route-map rmap1
```

default metric

Configures the default metric value for the OSPF routing protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-metric *metric_value*

no default-metric

metric-value

Sets the metric value expressed as an integer from 1 through 16777214. The default metric value setting is 26385.

no

Enables or disables the default metric value for OSPF.

Usage

Use this command to set the default metric for routes.

Example

The following command sets the default metric to *235*:

```
default-metric 235
```

distance

Configures the OSPF route administrative distances for all OSPF route types or based on specific route type. Administrative distance is the measure used by Cisco routers to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance defines the reliability of a routing protocol. Each routing protocol is prioritized in order of most to least reliable (believable) using an administrative distance value. A lower numerical value is preferred.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] distance { distance_value | ospf { [ external distance_value ] [ inter-area
distance_value ] [ intra-area distance_value ] } }
```

no

Disables the OSPF route administrative distances for all OSPF route types.

distance_value

Specifies the OSPF route administrative distances as an integer from 1 to 255. The default distance value is 110.

ospf { [external *distance_value* **] [inter-area** *distance_value* **] [intra-area** *distance_value* **] }**

Set the distance value for the specified route type.
external *distance_value*: Set the OSPF route administrative distance for routes from other routing domains, learned by redistribution. This must be an integer from 1 through 255. The default is 110.
inter-area *distance_value*: sets the OSPF route administrative distance for routes from one routing area to another. This must be an integer from 1 through 255. The default is 110.
intra-area *distance_value*: sets the OSPF route administrative distance for all routes within an area. This must be an integer from 1 through 255. The default is 110.

no

Enables or disables the specified option.

Usage

Use this command to set the administrative distance for OSPF routes.

Example

The following command sets the administrative distance for all OSPF route types to *30*:

```
distance 30
```

distribute-list

Enables or disables the filtering of networks in outgoing routing updates.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] distribute-list route_access_list out { connected | rip | static }
```

no

Disables the filtering of networks in outgoing routing updates.

route_access_list

Specifies the name of the OSPF route access list to use for filtering as an alphanumeric string of 1 through 63 characters.

connected

Filters connected routes.

rip

Filters RIP routes. (RIP is not supported at this time.)

static

Filters static routes.

no

Disables the specified option.

Usage

Use this command to enable the filtering of outgoing route updates by using the specified route access list.

Example

The following command uses the route access list named *ral1* to filter outgoing routing updates for all connected routes:

```
distribute-list ral1 out connected
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

neighbor

Configures OSPF routers that interconnect to non-broadcast networks.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] neighbor  ip_address  [ poll-interval poll_interval_value ] [ priority
priority_value ]
```

no

Disables OSPF routers that interconnect to non-broadcast networks.

ip_address

Specifies the interface IP address of the OSPF neighbor expressed using IPv4 dotted-decimal notation.

poll-interval *poll_interval_value*

Default: 120
Sets the number of seconds in the dead neighbor polling interval as an integer from 1 through 65535

priority *priority_value*

Default: 0
Sets the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the specified IP address. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

Usage

Use this command to configure OSPF routers that connect to non-broadcast networks.

Example

The following command specifies an OSPF router neighbor with the IP address of *192.168.100.10*:

```
neighbor 192.168.100.10
```

network area

Enables OSPF on an interface and defines the OSPF area for that network.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] network network_ip_address / network_mask area { area_id | area_ip_address }
```

no

Disables OSPF on an interface and defines the OSPF area for that network.

network_ip_address/network_mask

Specifies the network address and mask as well as the interface on which OSPF will be enabled. *network_ip_address* in entered in IPv4 dotted-decimal notation, followed by the "/" and the mask (CIDR).

area_id

Specifies the OSPF area identification number for the specified network as an integer from 0 through 4294967295.

area_ip_address

Specifies the IP address of the OSPF area for this network. This must be entered in IPv4 dotted-decimal notation.

Usage

Use this command to specify the IP address of the network interface that the OSPF router will use.

Example

The following command specified that the OSPF router will use the interface at IP address *192.168.1.0* with a netmask of *24*:

```
network 192.168.1.0/24
```

ospf router-id

Configures the router ID for the OSPF process.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ospf router-id *ip_address*

no ospf router-id *ip_address*

no

Disables **ospf router-id**.

ip_address

Specifies the router ID for the OSPF process as an IP address entered using IPv4 dotted-decimal notation

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

```
ospf router-id 192.168.200.1
```

passive-interface

Enables or disables the suppression of OSPF routing updates on the specified interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] passive-interface *interface_name*

no

Disables the name assigned to a logical interface within the specific context.

interface_name

Specifies the name assigned to a logical interface within the specific context as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to suppress router updates on an interface in the current context.

Example

The following command suppresses OSPF routing updates on the interface named *Intfc1*:

```
passive-interface Intfc1
```

redistribute

Redistributes routes from other protocols to OSPF neighbors using the OSPF protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

redistribute { **connected** | **rip** | **static** } [**metric** *metric_value*] [**metric-type** { **1** | **2** }] [**route-map** *route_map_name*]

no redistribute { **connected** | **rip** | **static** }

no

Disables the redistributed routes.

connected

Redistributes connected routes.

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Redistributes static routes.

metric *metric_value*

Sets the OSPF metric used in the redistributed route. This must be an integer from 1 through 16777214.

metric-type { 1 | 2 }

Default: 2
Sets route metric type that is applied to redistributed routes.
1: Sets the OSPF external link type for routes to Type 1.
2: Sets the OSPF external link type for routes to Type 2.

route-map *route_map_name*

Filter routes through the specified route map before redistribution. *route_map_name* specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to define what routing protocols should have their routes redistributed into OSPF.

Example

The following command defines that BGP routes should be redistributed:

```
redistribute connected
```

refresh timer

Adjusts settings for the OSPF refresh timer.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] refresh  timer value
```

no

Disables the refresh timer.

value

Default: 10
Specifies the minimum amount of time (in seconds) to wait before refreshing a Link-state Advertisement (LSA). This must be an integer from 10 through 1800.

Usage

Use this command to define the amount of time to wait before refreshing an LSA.

Example

The following command sets the refresh timer to *90* seconds:

```
refresh timer 90
```

router-id

Configures the router ID for the OSPF process.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] router-id ip_address
```

no

Disables the router ID for the OSPF process.

ip_address

Specifies the router ID for the OSPF process in IPv4 dotted-decimal notation.

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

```
router-id 192.168.200.1
```

timers spf

Sets the Shortest Path First (SPF) timers.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

timers spf *delay_value hold_time_value*

no timers spf

no

Disables SPF timers.

delay_value

Default: 5
Specifies the delay time (in seconds) between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

hold_time_value

Default: 10
Specifies the hold time (in seconds) between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

Usage

Use this command to set the SPF delay and hold timers for the current OSPF router process.

Example

The following command sets the delay timer to *15* and the hold timer to *15*:

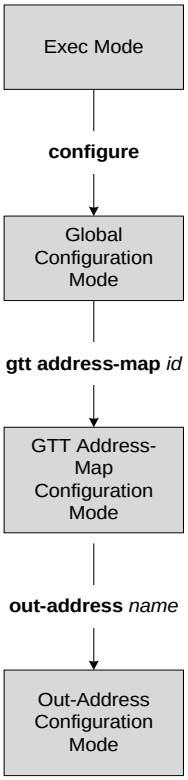
```
timers spf 15 15
```

Chapter 214
Out-Address Configuration Mode Commands

The Out-Address configuration mode provides the commands to configure the outgoing addresses for SCCP entities.

In this mode, the prompt line will appear similar to:

```
[local]hostname(config-gtt-addrmap-outaddr-<name>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gt-address

Configures the SCCP short address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-address *gt_address*

gt_address

A string of 1 to 15 digits to define the GT-address

Usage

Define the GT-address

Example

gt-address *010405525397*

gt-format

The GT-format provides four formats that can be used during GTT.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-format *format_num*

format_num

1: Selects GT-format 1 options which include **nature-of-address** and **odd/even.** Once selected, the system enters GT-Format1 configuration mode.
2: Selects GT-format2 options which include **translation-type**. Once selected, the system enters GT-Format2 configuration mode.
3: Selects GT-format3 options which include **encoding-scheme**, **numbering-plan3** and **translation-type**. Once selected, the system enters GT-Format1 configuration mode.
4: Selects GT-format4 options which include **encoding-scheme**, **nature-of-address**, **numbering-plan**, and **translation-type**. Once selected, the system enters GT-Format4 configuration mode.

Usage

Select the a GT-format that include encoding-scheme as part of the GTT process.

Example

```
gt-format 3
```

ni-indicator

Configures the National and International indicator to use during the GTT process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ni-indicator *ni_ind*

ni_ind

Select one of the following as the appropriate type of national indicator for the address structure:

- **national**
- **international**

Usage

Select the international indicator to be used for out-going addresses.

Example

ni-indicator *international*

point-code

Selects and configures the SS7-type point code for use with the out-going address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

point-code *pt_code*

pt_code

Enter 1 to 11 digits in the point code format predefined during variant selection of GTT association.

Usage

Define an ITU point code to be used for out-going address processing.

Example

point-code *6.255.6*

routing-indicator

Selects the type of routing and the indicator to be included in the out-going message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

routing-indicator *routing_ind*

routing_ind

Select one of the following options:

- **gt**: Inserts an indicator that identifies routing based on global title.
- **ssn**: Inserts an indicator that identifies routing based on the subsystem number.

Usage

Select global title as the appropriate routing indicator.

Example

routing-indicator *gt*

ssf

Selects the subservice field as factor in the out-going address processing. **ssf** sets the network indicator in the subservice field for SS7 Message Signal Units (MSUs). The indicator carried in the message's routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the national - international.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ssf *sub_svc_fld*

sub_svc_fld

Select one of the following options:

- **international:** The network indicator identifies the message as international with a point code structure that does not match the national point code structure,
- **national:** The network indicator identifies the messages as having a national point code structure.
- **reserved:** Provides an alternate network indicator for national messages.
- **spare:** Provides an alternate network indicator for international messages.

Usage

Select the international NI for inclusion in out-going address subservice fields.

Example

ssf *international*

ssn

Selects the subsystem number to be included in the out-going message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ssn *sub_sys_num*

sub_sys_num

Enter an integer from 1 to 255.

Usage

Use subsystem number 44 in the out-going address.

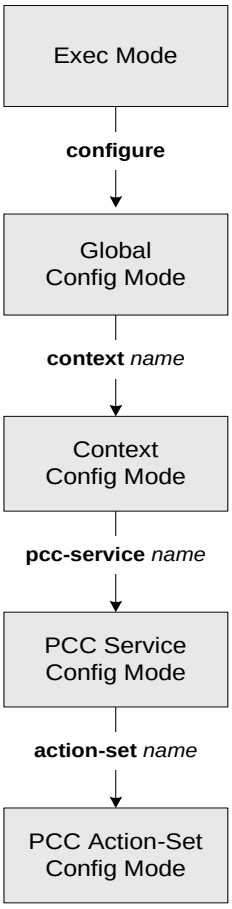
Example

ssn *44*

Chapter 215
PCC-Action-Set Configuration Mode Commands

The PCC- Action-Set Configuration Mode provides the parameters to indicate the policy and charging as well as event generation related decisions that will get activated when the corresponding PCC-Condition-Group is evaluated to TRUE within a profile. A maximum of 32 actions can be configured in an instance of PCC-Action-Set.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



af-media-type

This command is used to set the action to be taken when specific media type is received from Application Function (AF) over Rx interface.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] af-media-type {application | audio | control | data | message | other | text |
video} {qos-profile qos_profile_value [gate-status {disabled | enabled | enabled-downlink
| enabled-uplink]} {gate-status {disabled | enabled | enabled-downlink | enabled-uplink
[qos-profile qos_profile_value]}
```

no

Removes the configured action set for different type of AF media in a PCC-Action-Set configuration instance for PCC-Service configuration.

application

Sets the AF media type to ‘application’ data traffic for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

audio

Sets the AF media type to ‘audio’ data traffic for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

control

Sets the AF media type to ‘control’ signal for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

data

Sets the AF media type to ‘data’ for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

message

Sets the AF media type to ‘message’ data for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

other

Sets the AF media type to ‘other’, out of AF media type configured here, for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

text

Sets the AF media type to 'text' for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration.

video

Sets the AF media type to 'video' for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration.

qos-profile *qos_profile_value*

Associate the pre-defined PCC-QoS-Profile for specific AF media type for various action configured for PCC-Service configuration.
qos_profile_value is name of the pre-defined PCC-QoS-Profile in PCC-Service Configuration instance.

gate-status {disabled | enabled | enabled-downlink | enabled-uplink}

Default: Enabled
Associate the status of Gate for specific AF media type for various action configured for PCC-Service configuration.
disabled: disables the Gate status in downlink and uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.
enabled: Enables the Gate status in downlink and uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance. This is the default status of Gate.
enabled-downlink: Enables the Gate status in downlink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.
enabled-uplink: Enables the Gate status in uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.

Usage

Use this command to set the action to be taken when specific media type is received from Application Function (AF) over Rx interface.
It also associates the pre-defined PCC-QoS-Profile and **Gate** function with specific media type.

Example

The following command sets the AF media type to 'video' with PCC-QoS-Profile named *video_qos1* with gate status enabled in downlink and uplink traffic for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration:

```
af-media-type video qos-profile video_qos1 gate-status enabled
```

associate monitoring-key

This command associates a Monitoring Key id with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] associate monitoring-key mon_key_id usage-monitor usage_mon_name
```

no

Removes the associated Monitoring Key id configuration along with the association to PCC-Usage-Monitor from a PCC-Action-Set configuration instance for PCC-Service configuration.

mon_key_id

Specifies the Monitoring Key identifier to be associated with PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id must be an integer between 1 through 65535.

usage-monitor *usage_mon_name*

Specifies the PCC-Usage-Monitor associated with Monitoring Key *mon_key_id* under PCC-Action-Set configuration instance for PCC-Service configuration.
usage_mon_name is a pre-configured PCC-Usage-Monitor instance in PCC-Service Profile Configuration for PCC-Service configuration.

Usage

Use this command to associate a Monitoring Key with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.
There is a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can change this relationship using required command.
When usage is reported to IPCF for a particular Monitoring Key, the usage is added to all the Usage Monitoring to which the Monitoring Key is associated.
Operator can break the relationship between Monitoring Key and Usage Monitor by **dissociate monitoring-key** command.

Example

The following command associates Monitoring Key id *102* with pre-defined PCC-Usage-Monitor named *usage_mon1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
associate monitoring-key 102 usage-monitor usage_mon1
```

authorize

This command sets an action to change the various authorization parameters used for the IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] authorize {apn-mbr | default-eps-bearer | qci qci_value} qos-profile qos_prof_name
```

no

Removes the configured action for QoS Profile authorization parameters from PCC-Action-Set configuration instance for PCC-Service configuration.

apn-mbr

Sets the action for QoS authorization of Maximum Bit Rate (MBR) at APN through a pre-configured QoS profile name *qos_prof_name* which is to use for the authorization at different level in an PCC-Service instance.
This keyword is applicable only to EPS access type. MBR Download and MBR Upload values of the QoS profile is used with this authorization.

default-eps-bearer

Sets the action QoS authorization of the Default EPS bearer in an EPS access network through a pre-configured QoS profile name *qos_prof_name* which is to use for the authorization at different level in an PCC-Service instance.
This keyword is applicable only to EPS access type. QoS Class Identifier (QCI) and Allocation and Retention Priority (ARP) values of the QoS profile is used with this authorization.

qci *qci_value*

Sets the action QoS authorization per QCI in case of PCEF binding through a pre-configured QoS profile name *qos_prof_name* which is to use for the authorization at different level in an PCC-Service instance. *qci_value* must be an integer value between 1 through 255.

Important: This keyword is applicable only in case of PCEF binding. QCI defined in QoS profile is not used when this keyword is active, so this keyword is repeated per QCI that has to be authorized by IPCF. For each QCI authorization Maximum Bit Rate Upload/Download (MBR DL/MBR UL) or Guaranteed Bit Rate Upload/Download (GBR DL/MBR UL) and ARP values of the QoS profile is used with this authorization.

qos-profile *qos_prof_name*

This keyword associate the action configured for authorization with a pre-configured PCC-QoS-Profile named *qos_prof_name* and uses configured values from specific PCC-QoS-Profile during authorization. *qos_prof_name* specifies the pre-configured QoS profile name which is to use for the authorization at different level in an PCC-Service instance.

Usage

Use this command to define an action for the authorization parameters in PCC-QoS-Profile which is to be used under PCC-Action-Set configuration instance for PCC-Service configuration.

Example

Following command sets the action for QoS authorization for APN MBR with PCC-QoS-Profile *apn_qos_prof1* under PCC-Action-Set configuration instance for PCC-Service configuration.

```
authorize apn-mbr qos-profile apn_qos_prof1
```

dissociate monitoring-key

This command dissociates a Monitoring Key id with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[no] dissociate monitoring-key *mon_key_id* **usage-monitor** *usage_mon_name*

no

Removes the dissociated Monitoring Key id configuration from a PCC-Action-Set configuration instance for PCC-Service configuration.

mon_key_id

Specifies the Monitoring Key identifier to be dissociated with PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id must be an integer between 1 through 65535.

usage-monitor *usage_mon_name*

Specifies the PCC-Usage-Monitor need to be dissociated with Monitoring Key *mon_key_id* under PCC-Action-Set configuration instance for PCC-Service configuration.
usage_mon_name is a pre-configured PCC-Usage-Monitor instance in PCC-Service Profile Configuration for PCC-Service configuration.

Usage

Use this command to dissociate a Monitoring Key with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.
There is a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can change this relationship using required commands.
When usage is reported to IPCF for a particular Monitoring Key, the usage is added to all the Usage Monitoring to which the Monitoring Key is associated.
Operator can reassociate the relationship between Monitoring Key and Usage Monitor by **associate monitoring-key** command.

Example

The following command dissociates a associated pair of Monitoring Key id *102* and PCC-Usage-Monitor named *usage_mon1* under PCC-Action-Set configuration instance for PCC-Service configuration:

dissociate monitoring-key *102* **usage-monitor** *usage_mon1*

dynamic-rule-install

This command sets an action to install a PCC Dynamic rule for the specified PCC-Data-service in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] dynamic-rule-install data-service data_svc_name [qos-profile qos_prof_name]
[precedence preced_value] [monitoring-key mon_key_id [rating-group rating_grp_id] [gate-
status {disabled | enabled | enabled-downlink | enabled-uplink}] [defer-by interval
delayed_dur] [metering-method {both-duration-volume | duration | volume}] [reporting-
level {service-identifier-level | rating-group-level}] [failure-policy { continue |
terminate}]
```

no

Removes the Dynamic Rule install action configured for specific PCC-Data-Service from a PCC-Action-Set configuration instance for PCC-Service configuration.

data-service *data_svc_name*

Specifies the name of the pre-configured PCC-Data-Service for which Dynamic Rules to be installed under PCC-Action-Set configuration instance for PCC-Service configuration.
data_svc_name is a pre-configured PCC-Data-Service instance in PCC-Service Configuration mode.

metering-method {both-duration-volume | duration | volume}

Specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-service instance on IPCF node.

- **both-duration-volume** sets the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-service instance on IPCF node.
- **duration** sets the metering method as based on duration of session usage for offline charging in a PCC-Data-service instance on IPCF node.
- **volume** sets the metering method as based on the volume of data usage for offline charging in a PCC-Data-service instance on IPCF node.

If no metering method is defined, the reporting level preconfigured at PCEF is considered.

monitoring-key *mon_key_id*

Specifies the pre-defined Monitoring Key identifier which is to be used in Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id is a pre-defined Monitoring Key identifier in PCC-Service Configuration mode.

precedence *preced_value*

Specifies the precedence value for the Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.

preced_value must be an integer between 1 through 65535.

qos-profile *qos_prof_name*

Specifies the name of the pre-configured PCC-QoS-Profile which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
qos_prof_name is a pre-configured PCC-QoS-Profile instance in PCC-Service Configuration mode.

rating-group *rating_grp_id*

Specifies the pre-defined Rating Group identifier which is to be used in Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.
rating_grp_id is a pre-defined Rating Group identifier in PCC-Service Configuration mode.

reporting-level {service-identifier-level | rating-group-level

Specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-service instance on IPCF node.

- **service-identifier-level** sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Service Identifier level which is configured in a PCC-Data-service instance on IPCF node.
- **rating-group-level** sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Rating Group level which is configured in a PCC-Data-service instance on IPCF node.

If no reporting level is defined, the reporting level preconfigured at PCEF is considered.

gate-status {disabled | enabled | enabled-downlink | enabled-uplink}

Default: Enabled
Sets the Gate-status which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
disabled: disables the Gate status in downlink and uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
enabled: Enables the Gate status in downlink and uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration. This is the default status of Gate.
enabled-downlink: Enables the Gate status in downlink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
enabled-uplink: Enables the Gate status in uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for dynamic rule installation.
delayed_dur configures the relative delay time by which the corresponding dynamic rule installation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.

- *ss* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

failure-policy { continue | terminate}

Default: Continue
This optional keyword configures the rule failure policy action when failure occurs on PCEF for PCC rules.

- **Continue**: If this option enabled, the IPCF continues even if PCEF reports rule failure through charging rule report. This is the default action.
- **Terminate**: If this option enabled, the IPCF triggers PCC session termination on receiving rule failure through charging rule report.

Usage

Use this command to set an action to install a PCC Dynamic rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance
Operator can override parameters such as, QoS profile, Precedence, Gate-status, Monitoring Key and PCC-Rating-id.
The same command is used to modify already installed PCC Dynamic-rule for the PCC-Data-Service by overriding required parameters only.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding dynamic rule installation is deferred.
IPCF handles operation of PCC Rule and activate/deactivate/install/modify/remove the PCC rules at PCEF through this configuration. PCC rule operation may fail on PCEF due to various reasons. In such failure cases PCEF sends back a Charging Rule Report containing name of the failed PCC rule and corresponding failure cause.
The IPCF handles these charging rule report and take appropriate actions based on configuration done through **failure-policy** keyword.
Charging Rule Report comes through CCA or RAA messages in a call flow used for handling the charging-rule-report.
IPCF supports following charging rule failure codes in report:

- Out-of-credit
- Reallocation-of-credit
- Unknown rule name
- Invalid Rating Group
- Invalid Service Identifier
- GW/PCEF Malfunction
- Limited Resources
- Max No. of Bearers Reached
- Unknown Bearer Id
- Missing Bearer Id
- Missing Flow Description
- Resource Allocation Failure
- QoS Validation Failure

Charging rule status can any one of the following in this scenario:

- Active
- Inactive
- Temporarily Inactive

A charging rule report can occur in CCR message multiple times and maximum of 16 charging rule reports per CCR message is supported by IPCF.

Example

The following command sets the action for PCC-Data-Service named *temp_data1* for Dynamic Rule install with PCC-QoS-Profile named *temp_qos1* having precedence *22* and Gate-status as **Enabled** under PCC-Action-Set configuration instance for PCC-Service configuration:

```
dynamic-rule-install data-service temp_data1 qos-profile temp_qos1
precedence 22
```

dynamic-rule-uninstall

This command sets an action to uninstall a Dynamic Rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] dynamic-rule-uninstall data-service data_svc_name [defer-by interval delayed_dur]
```

no

Removes the Dynamic Rule Uninstall action configured for specific PCC-Data-Service from a PCC-Action-Set configuration instance for PCC-Service configuration.

data-service *data_svc_name*

Specifies the name of the pre-configured PCC-Data-Service for which Dynamic Rules to be uninstalled under PCC-Action-Set configuration instance for PCC-Service configuration.
data_svc_name is a pre-configured PCC-Data-Service instance in PCC-Service Configuration mode.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for dynamic rule removal.
delayed_dur configures the relative delay time by which the corresponding dynamic rule uninstallation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to uninstall a PCC Dynamic rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding dynamic rule uninstallation is deferred.

Example

The following command sets the action of Dynamic Rule uninstall for PCC-Data-Service named *temp_data1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
dynamic-rule-uninstall data-service temp_data1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

log-event

This command allows operator to specify a string to be logged at Subscriber Service Controller (SSC) when the corresponding action set is triggered under PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] log-event msg-text message_string
```

no

Removes the notification message configured for specific action under a PCC-Action-Set configuration instance for PCC-Service configuration.

msg-text *message_string*

Specifies the message notification text string to be logged at the SSC when a particular PCC-Action-Set triggered for PCC-Service instance.
message_string is a string of alphanumerical characters of 1 through 255 characters

Usage

Use this command to allow operator to specify a string to be logged at Subscriber Service Controller (SSC) when the corresponding action set is triggered under PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets the notification message for an action under PCC-Action-Set configuration instance for PCC-Service configuration:

```
log-event msg-text "This Action is Applicable for EPS Session Only."
```

notify-user

This command allows operator to specify a string template-id at SSC under PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] notify-user message-id message_id [parameter value_pair]
```

no

Removes the user notification message id configured for specific action under a PCC-Action-Set configuration instance for PCC-Service configuration.

message-id *message_id*

Specifies the message template id stored at SSC to be used for user notification for action under PCC-Action-Set configuration for PCC-Service instance.
message_id is a string of alphanumerical characters of 1 through 255 characters

parameter *value_pair*

Specifies the parameters in the form of name value pairs separated by comma. A maximum of 16 name value pairs can be defined for action under PCC-Action-Set configuration for PCC-Service instance.
The name value pairs is encoded into **xml** data like other parameters and sent out to SSC for user notification.
value_pair is a string of alphanumerical characters of 1 through 255 characters which can accommodate up to 16 name value pair separated by comma (,).

Usage

Use this command to allow operator to specify a string template-id under PCC-Action-Set configuration for PCC-Service instance.
The template description exists at SSC and when the corresponding action set is hit, the subscriber is notified with the specified template configured via this command.
The action set makes a XML remote procedure call towards SSC. The XML contains information like IMSI, template-id of the SMS/E-mail template and other details like MSISDN, NAI if available. To give more flexibility to the operator, now the this command accepts name value pairs, which are also sent along with the said data.

Example

The following command sets the message id *"Invalid User."* for user notification message to an action under PCC-Action-Set configuration instance for PCC-Service configuration:

```
notify-user message-id "Invalid User."
```

offline-charging-server

This command sets the action to change the offline charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[no] offline-charging-server primary *pri_serv_address* [**secondary** *sec_serv_address*]

no

Removes the action set to change the offline charging server under PCC-Action-Set configuration instance for PCC-Service configuration.

primary *pri_serv_address*

Identifies the name of the primary offline charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
The *pri_serv_address* must be the address of an offline charging server in Diameter URI format (*FQDN* [*port*] [*transport*] [*protocol*]).

secondary *sec_serv_address*

Identifies the name of the secondary offline charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
The *sec_serv_address* must be the address of an offline charging server in Diameter URI format (*FQDN* [*port*] [*transport*] [*protocol*]).

Usage

Use this command to set an action to change the offline charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Example

Following command configures an action change the offline charging server to primary server *aaa://host.abc.com:6666;transport=tcp;protocol=diameter* and secondary server *aaa://host.xyz.com:6666;transport=sctp;protocol=radius* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
offline-charging-server primary
aaa://host.abc.com:6666;transport=tcp;protocol=diameter secondary
aaa://host.xyz.com:6666;transport=sctp;protocol=radius
```

online-charging-server

This command sets the action to change the online charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[**no**] **online-charging-server primary** *pri_serv_address* [**secondary** *sec_serv_address*]

no

Removes the action set to change the online charging server under PCC-Action-Set configuration instance for PCC-Service configuration.

primary *pri_serv_address*

Identifies the name of the primary online charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
The *pri_serv_address* must be the address of an online charging server in Diameter URI format (*FQDN* [*port*] [*transport*] [*protocol*]).

secondary *sec_serv_address*

Identifies the name of the secondary online charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
The *sec_serv_address* must be the address of an online charging server in Diameter URI format (*FQDN* [*port*] [*transport*] [*protocol*]).

Usage

Use this command to set an action to change the online charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Example

Following command configures an action change the online charging server to primary server *aaa://host.abc.com:6666;transport=tcp;protocol=diameter* and secondary server *aaa://host.xyz.com:6666;transport=sctp;protocol=radius* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
online-charging-server primary
aaa://host.abc.com:6666;transport=tcp;protocol=diameter secondary
aaa://host.xyz.com:6666;transport=sctp;protocol=radius
```

request-usage-report monitoring-key

This command configures the action to allow operator to explicitly request usage report for the specified Monitoring Key or all Monitoring Keys under PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] request-usage-report monitoring-key {mon_key_id | any}
```

no

Removes the usage request action configuration for Monitoring Key id from a PCC-Action-Set configuration instance for PCC-Service configuration.

mon_key_id

Specifies the Monitoring Key identifier for which usage report action is to be set under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id must be an integer between 1 through 65535.

any

Specifies the Monitoring Key identifier to "ANY" value for which usage report action is to be set under PCC-Action-Set configuration instance for PCC-Service configuration.

Usage

Use this command to configure the action to allow operator to explicitly request usage report for the specified Monitoring Key or all Monitoring Keys under PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets an action to request the usage report for Monitoring Key id *102* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
request-usage-report monitoring-key 102
```

rule-activate

This command sets an action to activate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] rule-activate rule_name[defer-by interval delayed_dur]
```

no

Removes the action to activate a pre-configured Rule from a PCC-Action-Set configuration instance for PCC-Service configuration.

rule_name

Specifies the name of the pre-configured Rule on PCEF for an activation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rule_name is a pre-configured Rule in PCEF.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for rule activation.
delayed_dur configures the relative delay time by which the corresponding rule activation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to activate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding rule activation is deferred.

Example

The following command sets an action to activate for Rule *rule1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rule-activate rule1
```

rule-deactivate

This command sets an action to deactivate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] rule-deactivate rule_name [defer-by interval delayed_dur]
```

no

Removes the action to deactivate a pre-configured Rule from a PCC-Action-Set configuration instance for PCC-Service configuration.

rule_name

Specifies the name of the pre-configured Rule on PCEF for a deactivation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rule_name is a pre-configured Rule in PCEF.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for rule deactivation.
delayed_dur configures the relative delay time by which the corresponding rule deactivation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to deactivate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding rule deactivation is deferred.

Example

The following command sets an action to deactivate for Rule *rule1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rule-deactivate rule1
```

rulebase-activate

This command sets an action to activate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] rulebase-activate rulebase_name [defer-by interval delayed_dur]
```

no

Removes the action to activate a pre-configured Rulebase from a PCC-Action-Set configuration instance for PCC-Service configuration.

rulebase_name

Specifies the name of the pre-configured Rulebase on PCEF for an activation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rulebase_name is a pre-configured Rulebase in PCEF.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for Rulebase activation.
delayed_dur configures the relative delay time by which the corresponding Rulebase activation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to activate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding Rulebase activation is deferred.

Example

The following command sets an action to activate for Rulebase *rulebase1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rulebase-activate rulebase1
```

rulebase-deactivate

This command sets an action to deactivate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[no] rulebase-deactivate *rulebase_name* [**defer-by interval** *delayed_dur*]

no

Removes the action to deactivate a pre-configured Rulebase from a PCC-Action-Set configuration instance for PCC-Service configuration.

rulebase_name

Specifies the name of the pre-configured Rulebase on PCEF for a deactivation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rule_name is a pre-configured Rulebase in PCEF.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for Rulebase deactivation.
delayed_dur configures the relative delay time by which the corresponding Rulebase deactivation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to deactivate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding Rulebase deactivation is deferred.

Example

The following command sets an action to deactivate for Rulebase *rulebase1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rulebase-deactivate rulebase1
```

service-tag

This command sets an action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] service-tag svc_tag {activate-rule | activate-rule}
```

no

Removes the action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

svc_tag

Specifies the name of the pre-configured Service Tag rule for an activation/deactivation is set under PCC-Action-Set configuration instance for PCC-Service configuration.
svc_tag is a pre-configured Service Tag name.

activate-rule

Specifies that action to be set for Service Tag activation rule under PCC-Action-Set configuration instance for PCC-Service configuration.

deactivate-rule

Specifies that action to be set for Service Tag deactivation rule under PCC-Action-Set configuration instance for PCC-Service configuration.

Usage

Use this command to set an action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets the an activation rule for Service Tag named *service_1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
service-tag service_1 activate-rule
```

terminate-session

This command sets an action to terminate a Bearer based on **bearer-id** or unique combination of QCI and ARP received through current CCR message in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] terminate-session
```

no

Removes the action to terminate a Bearer based on **bearer-id** from a PCC-Action-Set configuration instance for PCC-Service configuration.

Usage

Use this command to set an action to terminate a Bearer based on **bearer-id** or unique combination of QCI and ARP received through current CCR message in PCC-Action-Set configuration for PCC-Service instance. Termination of Bearer is possible only in case of PCRF binding and limited to Dynamic rules.

Important: This action is only applicable to IP-CAN sessions with access type as GPRS. When terminate Bearer is initiated, IPCF triggers **Bearer Termination Procedure** for the **bearer-id** received through current CCR message.

Caution: This command triggers termination of **Gx** and SPR sub session active under PCC-Service instance.

Example

The following command sets an action to terminate a Bearer based on **bearer-id** received through current CCR message under PCC-Action-Set configuration instance for PCC-Service configuration:

```
terminate-session
```

usage-monitor

This command sets an action to allow operator to stop, reset or start the counting for a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] usage-monitor usage_mon_name {reset-counter | start-counter | stop-counter}
```

no

Removes the action to allow operator to stop, reset or start the counting for a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

usage_mon_name

Specifies the name of the pre-configured PCC-Usage-Monitor for which counter action is configured under PCC-Action-Set configuration instance for PCC-Service configuration.
usage_mon_name is a pre-configured PCC-Usage-Monitor.

reset-counter

Resets the usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

start-counter

Starts the accumulation of usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

stop-counter

Stops the accumulation of usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

Usage

Use this command to set an action to allow operator to stop, reset or start the counting for a usage monitor in PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets the an action to stop the accumulation of usage counts for PCC-Usage-Monitor named *usage_1* under PCC-Action-Set configuration instance for PCC-Service configuration:

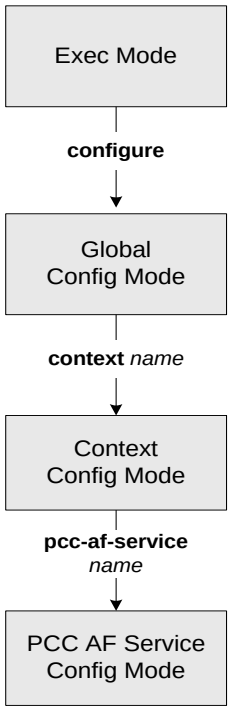
```
usage-monitor usage_1 stop-counter
```

Chapter 216
PCC-AF-Service Configuration Mode Commands

The PCC-AF-Service Configuration mode provides a mechanism to IPCF to manage the external interfaces required for media and application function management. The PCC-AF-Service manages **Rx** interface which would be based on the dictionary used.

An Application Function (AF) provides Application (layer 7) proxies for client server applications. It also provides enforcement of operator and subscriber QoS, Charging, and Security policies to subscriber session and represents the network element that supports applications that require dynamic policy and/or charging control. In the IMS model, the AF is implemented by the Proxy Call Session Control Function (P-CSCF).

Important: This configuration mode is supported from StarOS Release 12.1 onward.



associate pcc-service

This command is used to associate a pre-configured PCC-Service with a PCC-AF-Service for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

associate pcc-service *pcc_svc_name*

[**no**] **associate pcc-service**

no

Removes/disassociate the configured PCC-service from this PCC-AF-Service instance configured for IPCF configuration.

pcc_svc_name

Specifies the name of a pre-configured PCC-service configured in Context Configuration mode for IPCF configuration.
The *pcc_svc_name* is name of a predefined PCC-Service instance and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to associate a pre-configured PCC-Service instance for IPCF configuration.

Important: For more information on PCC-Service configuration, refer *PCC-Service Configuration Mode Commands*.

Example

Following command binds a PCC-Service named *pcc_svc1* with in a PCC-AF-Service.

```
associate pcc-service pcc_svc1
```

Following command removes an associated PCC-Service named *pcc_svc1* from a PCC-AF-Service.

```
no associate pcc-service pcc_svc1
```

diameter dictionary

This command is used to assign a Diameter dictionary for **Rx** messaging with a PCC-AF-Service for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter dictionary {**r8-standard** | **standard**}

default diameter dictionary

default

Sets the Diameter **Rx** dictionary to default dictionary **r8-standard** (3GPP Rel. 8 standard) for a PCC-AF-Service instance configured for IPCF configuration.

r8-standard

Default: Enabled
Sets the Diameter **Rx** dictionary to be used by a PCC-AF-Service instance configured for IPCF configuration over **Rx** interface to 3GPP Rel. 8 standard.

standard

Default: Disabled
Sets the Diameter **Rx** dictionary to be used by a PCC-AF-Service instance configured for IPCF configuration over **Rx** interface to 3GPP Rel. 7 standard.

Usage

Use this command to configure the PCC-AF-Service to determine which of the 3GPP dictionary to be used for **Rx** interface messaging for media and application function management.

Example

Following command sets the PCC-AF-Service to use 3GPP Rel. 8 standard dictionary for **Rx** interface and application function management related messaging in a PCC-AF-Service.

```
default diameter dictionary
```

diameter origin end-point

This command is used to bind/associate a pre-configured Diameter host/realm (AF) over **Rx** interface with a PCC-AF-Service to be used for subscriber service control and AF profile management.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *dia_endpoint_name*

no diameter origin endpoint

no

Removes the associated Diameter Origin Endpoint configuration from PCC-AF-Service instance configured for IPCF configuration.

any

Sets the PCC-AF-Service instance to use any available AF node over **Rx** interface for AF support.

dia_endpoint_name

The *dia_endpoint_name* is a predefined Diameter origin endpoint node and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to bind the AF node over **Rx** interface by associating a pre-configured Diameter Origin Endpoint with a PCC-AF-Service.
The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter.

Example

Following command associates a pre-configured Diameter endpoint node configuration named *af_pcscf1* with a PCC-AF-Service for AF profile management.

```
diameter origin endpoint af_pcscf1
```

Following command removes the pre-associated Diameter endpoint node configuration named *af_pcscf1* with a PCC-AF-Service.

```
no diameter origin endpoint
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

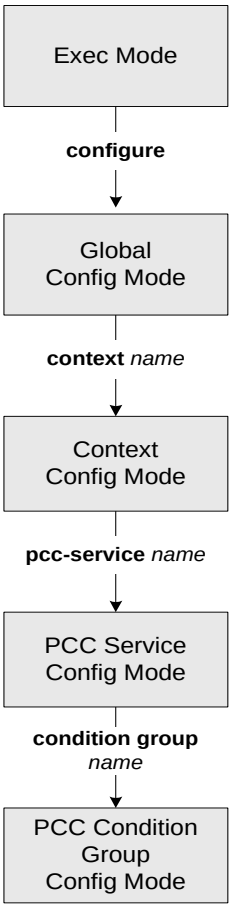
Usage

Use this command to return to the parent configuration mode.

Chapter 217
PCC-Condition-Group Configuration Mode Commands

The PCC-Condition-Group Configuration Mode is used to configure the various rating parameters under a logical identifier name in the PCC-Service. A PCC-Condition-Group is a collection of conditions that identify a network or state constraint represented as a logical expression. A maximum of 128 conditions can be configured in one PCC-Condition-Group.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



af-application-id

This command defines a condition based on the application id of an Application Function service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] af-application-id operator af_app_id
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the AF-Application id.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

af_app_id

Specifies the identity string for AF-Application identifier over **Rx** interface.
af_app_id must be an alphanumeric string of 1 to 256 characters.

Usage

Use this command to define a condition based on the application id of an Application Function service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF Application id is not equal to *pcc_af_1*:

```
af-application-id != pcc_af_1
```

af-media-codec

This command defines a condition based on the media Codec used by AF application in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] af-media-coded *operator* {**g722** | **g726** | **ilbc** | **pcma** | **pcmu**}

no

Removes the specified condition definition.

operator

Specifies how to logically match the AF-media Codec.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

g722

Specifies the media Codec as G.722 used for user traffic from AF server over **Rx** interface.
G.722 is a ITU-T standard 7 kHz wideband speech codec operating at 48, 56 and 64 kbit/s.

g726

Specifies the media codec as G.726 used for user traffic from AF server over **Rx** interface.
G.726 is an ITU-T ADPCM speech codec standard covering the transmission of voice at rates of 16, 24, 32, and 40 kbit/s.

ilbc

Specifies the media codec as Internet Low Bitrate Codec (iLBC) used for user traffic from AF server over **Rx** interface.
iLBC is a narrowband speech codec suitable for VoIP applications, streaming audio, archival and messaging. The encoded blocks encapsulated in Real-time Transport Protocol (RTP) protocol for transport.

pcma

Specifies the media codec as Pulse Code Modulation A-law scaling (PCMA) used for user traffic from AF server over **Rx** interface.
PCMA is an ITU-T Recommendation G.711 audio data encoding in eight bits per sample, after A-law logarithmic scaling.

pcmu

Specifies the media codec as Pulse Code Modulation mu-law scaling (PCMU) used for user traffic from AF server over **Rx** interface.

PCMU is an ITU-T Recommendation G.711 audio data encoding in eight bits per sample, after mu-law logarithmic scaling.

Usage

Use this command to define a condition based on the media codecs used by AF service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF Media codec is equal to PCMA:

```
af-media-codec = pcma
```

af-media-type

This command defines a condition based on the media type used by AF application in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] af-media-type *operator* {**application** | **audio** | **control** | **data** | **message** | **other** | **text** | **video**}

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

application

Specifies the media type as Application in user traffic from AF server over **Rx** interface.

audio

Specifies the media type as Audio in user traffic from AF server over **Rx** interface.

control

Specifies the media type as Control in user traffic from AF server over **Rx** interface.

data

Specifies the media type as Data in user traffic from AF server over **Rx** interface.

message

Specifies the media type as Message in user traffic from AF server over **Rx** interface.

text

Specifies the media type as Text in user traffic from AF server over **Rx** interface.

video

Specifies the media type as Video in user traffic from AF server over **Rx** interface.

Usage

Use this command to define a condition based on the media type used by AF service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF Media type is equal to Video:

```
af-media-type = video
```

af-service-urn

This command defines a condition based on the service Uniform Resource Names (URNs) used by AF application in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] af-service-urn *operator urn_string*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

urn_string

Specifies the URN in user traffic from AF server over **Rx** interface.
urn_string must be an alphanumeric string of 1 through 256 characters.

Usage

Use this command to define a condition based on the URN used by AF service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.
Uniform Resource Names (URNs) serves as persistent, location-independent resource identifiers and are designed to make it easy to map other namespaces into URN-space.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF service URN is equal to *ietf:rfc:4003*:

af-service-urn = *ietf:rfc:4003*

an-gw-address

This command defines a condition based on the IP address of Access Node Gateway (AN-GW) on which subscriber is attached in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] an-gw-address {*operator angw_ip/mask* | {**in-range** | **!in-range**} *range_start_ip* **to** *range_end_ip*}

---

no

Removes the specified condition definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

in-range

Specifies the condition to accept the IP address which are in range as argument to define the Access Node Gateway address which is used by subscriber in IP-CAN session.

!in-range

Specifies the condition to accept the IP address which are NOT in range as argument to define the Access Node Gateway address which is used by subscriber in IP-CAN session.

---

range_start_ip

Specifies the starting IP address which is used for defining the range of AN-GW IP addresses which is used by subscriber in IP-CAN session.
range_start_ip is an IP address and must be lesser than *end_start_ip* address.

---

range_end_ip

Specifies the ending IP address which is used for defining the range of AN-GW IP addresses which is used by subscriber in IP-CAN session.
range_end_ip is an IP address and must be greater than *end_start_ip* address.

---

angw_ip/mask

Specifies the IP address of the Access Node Gateway which is used by subscriber in IP-CAN session along with IP mask as well.
angw_ip must be an IP address in IPv4 or IPv6 notation.

mask Specifies the IP address mask bits to determine the number of IP addresses of AN-GW in condition. *mask* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to define a condition based on the AN-GW IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on AN-GW IP address *1.2.3.4* in an IP-CAN session:

```
an-gw-address = 1.2.3.4
```

authorized-qci

This command defines a condition based on the authorized QoS Class Identifier used in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] authorized-qci operator qci
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

qci

Specifies the authorized QoS class identifier in user traffic for condition validation.
qci must be an integer between 1 through 255.

Usage

Use this command to define a condition based on the authorized QCI used by the subscriber in an IP-CAN session.
The condition evaluates to TRUE, if Bearer Control Mode is UE and network (PCEF bearer binding) and IPCF has authorized the specified QCI earlier.
QCI is a number which describes the error rate and delay that are associated with the service. It includes bearer parameters including scheduling weights and queue management thresholds.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the authorized QCI is greater than or equal to *4*:

```
authorized-qci >= 4
```

base-station-id

This command defines a condition based on the various parameters used in base-station id by subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over **Gx** interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] base-station-id {[sid operator sys_identifier] | range start_range to end_range]]
[nid operator netwrk_identifier ] | range start_range to end_range ]] [ cellid operator
cell_identifier ] | range start_range to end_range ]]}
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<**: Lesser than
- **<=**: Lesser than or equals
- **=**: Equals
- **>**: Greater than
- **>=**: Greater than or equals

sid *operator sys_identifier*

Specifies the system identifier in base-station id of subscriber for condition validation in an IP-CAN session.
sys_identifier must be an integer between 0 through 65535.

nid *operator netwrk_identifier*

Specifies the network identifier in base-station id, which is used by subscriber, for condition validation in an IP-CAN session.
netwrk_identifier must be an integer between 0 through 65535.

cellid *operator cell_identifier*

Specifies the cell identifier in base-station id, which is used by subscriber, for condition validation in an IP-CAN session.
cell_identifier must be an integer between 0 through 65535.

range *start_range* **to** *end_range*

This optional keyword specifies range of the identifiers (SID, Cell id, Network Id) to be used for condition validation in an IP-CAN session.

start_range is the start value of range having integer between 0 through 65535 and it must be lesser than *end_range*.
end_range is the end value of range having integer between 0 through 65535 and it must be greater than *start_range*.

Usage

User this command to define a condition based on the parameters used in base-station id of subscriber, which is composition of SID, Cell Id, and/or Network Id, in an IP-CAN session between PCEF (PDSN) and IPCF over **Gx** interface.
This condition is defined for PCC functionality support to CDMA users over **Gx** interface.

Example

The following command creates a condition definition to analyze the condition based on base-station id of subscriber where SID is *1001* and cell id is in range of *2001* to *2069* in an IP-CAN session between PDSN and IPCF having network id as *3989*:

```
base-station-id sid = 1001 nid = 3989 cellid = range 2001 to 2069
```

bearer-count

This command defines a condition based on the number of bearers allowed in a subscriber session on IPCF to accept bearer-count in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer-count *operator num_bearer*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

num_bearer

Specifies the number of bearers in user traffic for condition validation.
num_bearer indicates a condition based on the number of bearer established in a IP-CAN session and must be an integer between 1 through 11.

Usage

Use this command to define a condition based on the number of bearers allowed for a subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for bearers allowed in a subscriber session is equal to *4*:

```
bearer-count = 4
```

connectivity-access-network

This command defines a condition based on the access network type used by subscriber in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] connectivity-access-network operator {3gpp-gprs | 3gpp2 | 3gpp2-eps | docsis | wimax | xdsl}
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

3gpp-gprs

Specifies the network access connectivity type as 3GPP-GPRS for user traffic in condition definition.

3gpp2

Specifies the network access connectivity type as 3GPP2 (CDMA) for user traffic in condition definition.

3gpp2-eps

Specifies the network access connectivity type as 3GPP2-EPS for user traffic in condition definition.

docsis

Specifies the network access connectivity type as Data Over Cable Service Interface Specification (DOCSIS) for user traffic in condition definition.

wimax

Specifies the network access connectivity type as Wi-MAX for user traffic in condition definition.

xdsl

Specifies the network access connectivity type as xDSL (ADSL/SDSL) or user traffic in condition definition.

Usage

Use this command to define a condition based on the type of connectivity used for network access by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the network type is equal to Wi-MAX:

```
connectivity-access-network = wimax
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

eval-condition-group

Defines a condition based on the TRUE or FALSE setting of a configured PCC-Condition-Group for subscriber in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] eval-condition-group *cond_grp_name operator* **{ FALSE | TRUE }**

no

Removes the specified condition definition.

cond_grp_name

Specifies the name of the configured PCC-Condition-Group which is used for evaluation with in this PCC-Condition-Group for user traffic.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

FALSE

Sets the evaluation condition for specified PCC-Condition-Group to FALSE.
With this keyword system rejects all conditions defined in specific PCC-Condition-Group and match the same in user traffic.

TRUE

Sets the evaluation condition for specified PCC-Condition-Group to TRUE.
With this keyword system accepts all conditions defined in specific PCC-Condition-Group and match the same in user traffic.

Usage

Use this command to define a condition based on the acceptance or rejection of specific pre-configured PCC-Condition-Group for user traffic in an IP-CAN session.
This command allows the operator to use configured PCC-Condition-Group in another PCC-Condition-Group as subset of PCC-Condition-Group.

Important: A maximum of 3 level of recursion depth is allowed for PCC-Condition-Group evaluation in a PCC-Condition-Group.

Example

The following command creates a condition definition to accept the all conditions defined in PCC-Condition-Group named *af_1*:

```
eval-condition-group af_1 = TRUE
```

eval-condition-group

This command defines a condition based on the TRUE or FALSE setting of a configured PCC-Condition-Group for subscriber in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] eval-condition-group cond_grp_name operator {FALSE | TRUE}
```

no

Removes the specified condition definition.

cond_grp_name

Specifies the name of the configured PCC-Condition-Group which is used for evaluation with in this PCC-Condition-Group for user traffic.
cond_grp_name must be a pre-configured PCC-Condition-Group in this configuration mode.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

FALSE

Sets the evaluation condition for specified PCC-Condition-Group to FALSE.
With this keyword system rejects all conditions defined in specific PCC-Condition-Group and match the same in user traffic.

TRUE

Sets the evaluation condition for specified PCC-Condition-Group to TRUE.
With this keyword system accepts all conditions defined in specific PCC-Condition-Group and match the same in user traffic.

Usage

Use this command to define a condition based on the acceptance or rejection of specific pre-configured PCC-Condition-Group for user traffic in an IP-CAN session.
This command allows the operator to use configured PCC-Condition-Group in another PCC-Condition-Group as subset of PCC-Condition-Group.

Important: A maximum of 3 level of recursion depth is allowed for PCC-Condition-Group evaluation in a PCC-Condition-Group.

Example

The following command creates a condition definition to accept the all conditions defined in PCC-Condition-Group named *af_1*:

```
eval-condition-group af_1 = TRUE
```

event-time

This command defines a condition based on the event-trigger time as per the time specified by the named Time definition (Timedef) configured for subscriber session in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] event-time *operator timedef_name*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

timedef_name

Specifies the name of the configured time definition (start and end timer of session) which is used for evaluation with this PCC-Condition-Group for user traffic.
timedef_name must be a pre-configured Time definition in *PCC-Service Configuration Mode*.

Usage

Use this command to define a condition based on the start and end time defined in a Time Definition configuration in *PCC-Service Configuration Mode* for user traffic in an IP-CAN session.
Event trigger in this command indicates a condition when the event-trigger time was as per the time specified by the named Time Definition.
This command allows the operator to use configured time period as event trigger for this PCC-Condition-Group.

Example

The following command creates a condition definition to trigger the condition based on the start and end time defined in Timedef named *timedef_night*:

```
event-time = timedef_night
```

event-trigger

This command defines a condition based on the event triggers due to various conditions for subscriber in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] event-trigger *operator event_trigger*

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

event_trigger

Specifies the network events as condition definition for user traffic in an IP-CAN session.
Following event triggers are supported with this command:

- **an-gw-change**
- **bearer-qos-change**
- **bearer-setup**
- **bearer-termination**
- **default-eps-bearer-qos-change**
- **ip-can-change**
- **loss-of-bearer**
- **out-of-credit**
- **pgw-trace-control**
- **plmn-change**
- **qos-change**
- **qos-change-exceeding-authorization**
- **rai-change**
- **rat-change**
- **reallocation-of-credit**

- **recover-of-bearer**
- **resource-modification-request**
- **revalidation-timeout**
- **session-setup**
- **session-termination**
- **sgsn-change**
- **successful-resource-allocation**
- **tft-change**
- **ue-ip-address-allocate**
- **ue-ip-address-release**
- **ue-time-zone-change**
- **user-location-change**

Usage

Use this command to define a condition based on the event triggered in network for user traffic.

Example

The following command creates a condition definition when there is a change in traffic flow template for subscriber:

```
event-trigger = tft-change
```

imsi

This command defines a condition based on the International Mobile Station Identification number (IMSI) of a subscriber in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] imsi operator imsi
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imsi

Specifies the IMSI of subscriber to be used for condition validation in an IP-CAN session.
imsi must be a string of between 8 to 15 digits which starts with 3 digit of MCC then 2 to 3 digit of MNC. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

Usage

Use this command to define a condition based on the IMSI of a subscriber used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on subscriber IMSI as *12334566434* in an IP-CAN session:

```
imsi = 12334566434
```

msisdn

This command defines a condition based on the Mobile Station International Subscriber Directory Number (MSISDN) of a subscriber in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] msisdn operator msisdn
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imsi

Specifies the MSISDN of subscriber to be used for condition validation in an IP-CAN session.
msisdn must be a string of between 1 to 16 digits which contains CC + NDC/NPA + SN.
Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

Usage

Use this command to define a condition based on the MS ISDN of a subscriber used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on subscriber MSISDN as *380561234567* in an IP-CAN session:

```
msisdn = 380561234567
```

multi-line-or

This command enables/disables the “OR” relation across all conditions exist in PCC-Condition-Group Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] multi-line-or
```

no

Sets the PCC-Condition-Group to “AND” relation across all conditions exist in a PCC-Condition-Group Configuration Mode.

Usage

Use this command to enable the “OR” relation across all conditions exist in PCC-Condition-Group Configuration Mode.
In absence of this command the default relation of “AND” applies across all conditions exist in PCC-Condition-Group Configuration Mode.

Example

The following command enables the “OR” relation across all conditions exist in *PCC-Condition-Group Configuration Mode*:

```
multi-line-or
```

The following command enables the default “AND” relation across all conditions exist in *PCC-Condition-Group Configuration Mode*:

```
no multi-line-or
```

nai

This command defines a condition based on the Network Access Identifier (NAI) of a subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over **Gx** interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] nai operator {username user_name [domain domain] | domain domain}
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

username *user_name*

Specifies the subscriber user name to be used for condition validation in an IP-CAN session.
user_name must be an alpha and/or numeric string of 1 through 128 characters in length. The user name can contain all special characters.

domain *domain*

Specifies the domain (Realm) of subscriber to be used for condition validation in an IP-CAN session.
domain must be an alpha and/or numeric string of 1 through 128 characters in length. The domain name can contain all special characters.

Usage

User this command to define a condition based on the NAI, which contains of user name and domain name, of a subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over **Gx** interface.
This condition is defined for PCC functionality support to CDMA users over **Gx** interface.

Example

The following command creates a condition definition to analyze the condition based on subscriber user name as *cdma2000_subs1* in an IP-CAN session between PDSN and IPCF having *xyz.com* as domain:

```
nai = username cdma2000_subs1 domain xyz.com
```

out-of-credit rulename

This command defines a condition based on the exhaustion of credit for subscriber Rulename at PCEF in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] out-of-credit rulename operator rule_name
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

rule_name

Specifies the name of the Rulename for which out of credit condition is to match in an IP-CAN session.
rule_name is a pre-configured Rulename on PCEF and must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the exhaustion of credit for subscriber Rulename at PCEF in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on the exhaustion of credit for subscriber Rulename *rule_101* at PCEF in an IP-CAN session:

```
out-of-credit rulename = rule_101
```

out-of-credit rulebase-name

This command defines a condition based on the exhaustion of credit for subscriber Rulebase name at PCEF in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] out-of-credit rulebase-name *operator rulebase_name*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

rulebase_name

Specifies the name of the Rulebase for which out of credit condition is to match in an IP-CAN session. *rulebase_name* is a pre-configured Rulebase on PCEF and must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the exhaustion of credit for subscriber Rulebase name at PCEF in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on the exhaustion of credit for subscriber Rulebase name *rulebase_101* at PCEF in an IP-CAN session:

```
out-of-credit rulebase-name = rulebase_101
```

pcef-address

This command defines a condition based on the IP address of Policy and Charging Enforcement Function (PCEF) which is served by IPCF and through which subscriber is attached to an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[**no**] **pcef-address** {*operator pcef_ip/mask* | {**in-range** | **!in-range**} *range_start_ip* **to** *range_end_ip*}

---

no

Removes the specified condition definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

in-range

Specifies the condition to accept the IP address which are in range as argument to define the PCEF address which is used by subscriber in IP-CAN session.

!in-range

Specifies the condition to accept the IP address which are NOT in range as argument to define the PCEF address which is used by subscriber in IP-CAN session.

---

range_start_ip

Specifies the starting IP address which is used for defining the range of PCEF IP addresses which is used by subscriber in IP-CAN session.
range_start_ip is an IP address and must be lesser than *end_start_ip* address.

---

range_end_ip

Specifies the ending IP address which is used for defining the range of PCEF IP addresses which is used by subscriber in IP-CAN session.
range_end_ip is an IP address and must be greater than *end_start_ip* address.

---

pcef_ip/mask

Specifies the IP address of the PCEF which is used by subscriber in IP-CAN session along with IP mask as well.
pcef_ip must be an IP address in IPv4 or IPv6 notation.

mask Specifies the IP address mask bits to determine the number of IP addresses of PCEF in condition. *mask* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to define a condition based on the PCEF IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on PCEF P address *1.2.3.4* in an IP-CAN session:

```
pcef-address = 1.2.3.4
```

pdn-id

This command defines a condition based on the PDN or calling station id in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pdn-id [case-insensitive] *operator pdn_id*

no

Removes the specified condition definition.

case-insensitive

This optional keyword sets the condition to not to consider the case of argument phrase for condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals
- **contains**: Contains
- **!contains**: Does not contain
- **starts-with**: Starts with
- **!starts-with**: Does not start with
- **ends-with**: Ends with
- **!ends-with**: Does not end with

pdn_id

Specifies the PDN or calling station id to be used for condition validation in an IP-CAN session.
pdn_id must be an alphanumeric string of between 1 to 128 characters.

Usage

Use this command to define a condition based on the PDN or calling station id used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on calling station id *ggsn_all_102* in an IP-CAN session:

pdn-id = *ggsn_all_102*

profile-attribute

This command defines a condition based on the matching between subscriber profile attribute value and SPR attribute value in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] profile-attribute parameter *subs_prof_attr_value operator spr_attr_value*

no

Removes the specified condition definition.

parameter *subs_prof_attr_value*

Specifies the attribute parameter value to match with SPR attribute for condition validation in an IP-CAN session.
subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

spr_attr_value

Specifies the attribute value in SPR to match with Subscriber profile attribute for condition validation in an IP-CAN session.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the matching parameters between subscriber profile attribute and SPR attribute parameters used in an IP-CAN session and provides a generic way of specifying and triggering actions based on any of the subscriber profile attribute received from SPR interactions.

Example

The following command creates a condition definition to analyze the condition based on matching of subscriber profile attribute value *subs_gold_102* with SPR attribute value *spr_gold_102*in an IP-CAN session:

```
profile-attribute parameter subs_gold_102 = spr_gold_102
```

radio-access-technology

This command defines a condition based on the radio access technology used by subscriber in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] radio-access-technology operator RAT
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

RAT

Specifies the radio access technology used by subscriber to access the network as condition definition for user traffic in an IP-CAN session.
Following RAT are supported with this command:

- **cdma2000-1x**: 3GPP2 CDMA 2000 - 1x RTT
- **eutran**: Evolved Universal Terrestrial Radio Access Network (eUTRAN)
- **gan**: Generic Access Network (GAN)
- **geran**: GSM Edge Radio Access Network (GERAN)
- **hrpd**: High Rate Packet Data (CDMA 2000 1xEV-DO)
- **hspa-evolution**: Evolved High-Speed Packet Access (eHSPA/HSPA+)
- **umb**: Ultra-Mobile Broadband
- **utran**: Universal Terrestrial Radio Access Network (UTRAN)
- **wlan**: Wireless Local Area Network (WLAN/xDSL)

Usage

Use this command to define a condition based on the type of radio technology used for network access by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the radio access technology type as WLAN:

```
radio-access-technology = wlan
```

sgsn-ip

This command defines a condition based on the IP address of SGSN on which subscriber is attached in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] sgsn-ip {operator sgsn_ip/mask | {in-range | !in-range} range_start_ip to
range_end_ip}
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

in-range

Specifies the condition to accept the IP address which are in range as argument to define the SGSN address which is used by subscriber in IP-CAN session.

!in-range

Specifies the condition to accept the IP address which are NOT in range as argument to define the SGSN address which is used by subscriber in IP-CAN session.

range_start_ip

Specifies the starting IP address which is used for defining the range of SGSN IP addresses which is used by subscriber in IP-CAN session.
range_start_ip is an IP address and must be lesser than *end_start_ip* address.

range_end_ip

Specifies the ending IP address which is used for defining the range of SGSN IP addresses which is used by subscriber in IP-CAN session.
range_end_ip is an IP address and must be greater than *end_start_ip* address.

sgsn_ip/mask

Specifies the IP address of the SGSN which is used by subscriber in IP-CAN session along with IP mask as well.
sgsn_ip must be an IP address in IPv4 or IPv6 notation.

mask Specifies the IP address mask bits to determine the number of IP addresses of SGSN in condition. *mask* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to define a condition based on the SGSN IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on SGSN IP address *1.2.3.4* in an IP-CAN session:

```
sgsn-ip = 1.2.3.4
```

sgsn-mcc-mnc

This command defines a condition based on the PLMN (MCC+MNC) of SGSN on which subscriber is attached in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] sgsn-mcc-mnc operator {mcc mcc_value [mnc mnc_value] | [mcc mcc_value] mnc
mnc_value}
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

mcc *mcc_value*

Specifies the Mobile Country Code in PLMN of SGSN which is used by subscriber in IP-CAN session.
mcc_value must be an integer between 101 and 998.

mnc *mnc_value*

Specifies the Mobile Network Code in PLMN of SGSN which is used by subscriber in IP-CAN session.
mnc_value must be an integer between 1 and 998.

Usage

Use this command to define a condition based on the PLMN of SGSN used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on PLMN of SGSN with MCC as *102* and MNC as *99*in an IP-CAN session:

```
sgsn-mcc-mnc = mcc 102 mnc 99
```

subscription-attribute

This command defines a condition based on the matching between subscriber subscription attribute value and SPR attribute value in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] subscription-attribute *subsription_attr_value operator spr_attr_value*

no

Removes the specified condition definition.

subsription_attr_value

Specifies the subscriber subscription attribute value to match with SPR attribute for condition validation in an IP-CAN session.
subsription_attr_value must be an alphanumeric string of from 1 through 31 characters.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

spr_attr_value

Specifies the attribute value in SPR to match with subscriber subscription attribute for condition validation in an IP-CAN session.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the matching parameters between subscriber subscription attribute and SPR attribute value used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on matching of subscriber subscription attribute value *subs_gold_102* with SPR attribute value *spr_gold_101*in an IP-CAN session:

subscription-attribute *subscribe_gold_102* **=** *spr_gold_101*

spr-profile-not-found

This command defines a condition based on the availability of SPR profile for s subscriber in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] spr-profile-not-found
```

no

Removes the specified condition definition.

Usage

Use this command to define a condition based on the availability of SPR profile for a subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition if SPR profile is not available for a subscriber in an IP-CAN session:

```
spr-profile-not-found
```

threshold-condition usage-monitor

This command defines a condition based on the threshold conditions in usage of traffic by subscriber session in an IP-CAN session. It is used to support usage tracking and dynamic Policy control based on subscriber usage.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] threshold-condition usage-monitor *usage_mon_name* **usage** *operator* {**absolute value** *volume* | **subscription-limit** | **subscription-threshold** *subs_thres_limit*}

no

Removes the specified condition definition.

usage_mon_name

Specifies a unique name for configured usage monitor condition which is used for evaluation with this condition group for user traffic in IP-CAN session.
usage_mon_name must be an alphanumeric string of 1 through 63 characters.

usage

This keyword specifies the condition as usage for threshold condition which is used for evaluation with this condition group for user traffic in IP-CAN session.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

absolute value *volume*

Specifies the threshold limit condition definition based on absolute usage volume *volume* in Kilo Bytes which is used for evaluation with this condition group for user traffic in IP-CAN session.
volume must be an integer between 1 through 4294967295.

subscription-limit

Specifies the threshold limit condition based on Subscriber's subscription limit which is used for evaluation with this condition group for user traffic in IP-CAN session.
In this condition the system takes Subscriber's subscription limit as defined in subscriber subscription policy for threshold limit monitoring.

subscription-threshold *subs_thres_limit*

Specifies the condition definition for threshold limit based on a configured usage monitor threshold named *subs_thres_limit* in IP-CAN session.
subs_thres_limit is a pre-configured subscription limit in this configuration mode.
This command allows the operator to use configured subscription limit as subset of a threshold condition.

Usage

Use this command to define a condition based on the duration of usage of service in seconds or volume usage in Bytes for user traffic in an IP-CAN session. This usage monitor is used to support usage tracking and dynamic Policy control based on subscriber usage.
IPCF supports the concept of Monitoring Key. PCEF, when instructed by PCRF, keeps track of usage per Monitoring Key. PCEF reports the usage when thresholds are reached or requested by PCRF.
To allow operator to have dynamic Policy control, IPCF uses Usage Monitor. This Usage Monitor has single attribute of volume-limit. Operator can "associate" different Monitoring Keys to these usage monitors. It can be a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can use Usage conditions on Usage Monitors instead of Monitoring Keys directly.
IPCF tracks usage per usage-monitor. Different monitoring keys associated to a Usage-Monitor. When monitoring key is associated to a Usage-Monitor, the usage reported for that particular monitoring key is added to all the usage monitoring to which it is associated.
IPCF supports 2 types of usage monitors; it can be defined on IPCF or SSC supplied usage monitors. The name *usage_mon_name* identifies an usage-monitor, which is locally defined or received from SSC. The **absolute** value applies to both types of usage monitors.
This command allows the operator to use configured threshold condition with another threshold condition as subset.
A maximum of 8 thresholds can be configured per usage monitor.

Example

The following command creates a threshold condition with usage monitor name *threshold1* as usage monitor to trigger the condition based on the **subscription limit** as provide in Subscriber policy:

```
threshold-condition usage-monitor threshold1 usage = subscription-limit
```

user-access-network

This command defines a condition based on the access location type of the subscriber in an IP-CAN session as received on **Gx** interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] user-access-network operator {home | roaming | visiting}
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

home

Specifies the subscriber network access type as Home for condition validation in an IP-CAN session. This condition contains all subscribers active in Home networks in this condition.

roaming

Specifies the subscriber network access type as Roaming for condition validation in an IP-CAN session. This condition contains all subscribers active in Roaming networks in this condition.

visiting

Specifies the subscriber network access type as Visiting for condition validation in an IP-CAN session. This condition contains all subscribers active in Visiting networks in this condition.

Usage

Use this command to define a condition based on the location of the user in access type (Home/Roaming/Visiting) in an IP-CAN session as received on **Gx** interface.

Example

The following command creates a condition definition to analyze the condition based on location of the subscribes as **roaming** in an IP-CAN session:

```
user-access-network = roaming
```

user-equipment-info esn

This command defines a condition based on the Electronic Serial Number (ESN) used for the identification of mobile device (UE) in a Non-3GPP IP-CAN session received over **Gx** interface between PDSN and IPCF.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] user-equipment-info esn operator esn
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

esn

Specifies the Electronic Serial Number used for the identification of UE in 64 bit format as condition value for UE information received over **Gx** interface in a Non-3GPP IP-CAN session.
esn must be a 15 character long string of Hexadecimal numbers only.

Usage

Use this command to define a condition based on the ESN of the UE received over **Gx** interface in a Non-3GPP IP-CAN session between PDSN and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the ESN of the UE as *1234567890120AF* in a Non-3GPP IP-CAN session:

```
user-equipment-info esn = 1234567890120AF
```

user-equipment-info eui64

This command defines a condition based on the Extended Unique Identifier in 64 bit (EUI-64) used for the identification of mobile device (UE) in an IP-CAN session received over **Gx** interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] user-equipment-info eui64 operator eui64
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

eui64

Specifies the Extended Unique Identifier in 64 bit format as a condition value for UE information received over **Gx** interface in an IP-CAN session.
eui64 is a 16 character long string of Hexadecimal numbers only.

Usage

Use this command to define a condition based on the EUI-64 value of the UE received over **Gx** interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the EUI-64 of the UE as *0012989099832345* in an IP-CAN session:

```
user-equipment-info eui64 = 0012989099832345
```

user-equipment-info imeisv

This command defines a condition based on the International Mobile Equipment Identity Software Version (IMEI-SV) used for the identification of mobile device (UE) in an IP-CAN session received over **Gx** interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-equipment-info imeisv *operator imei_sv*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imei_sv

Specifies the International Mobile Equipment Identity Software Version (IMEI-SV) as a condition value for UE information received over **Gx** interface in an IP-CAN session.
eui64 is a 16 digit long string of decimal numbers only.

Usage

Use this command to define a condition based on the IMEI-SV value of the UE received over **Gx** interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the IMEI-SV of the UE as *0012989099832345* in an IP-CAN session:

user-equipment-info eui64 = *0012989099832345*

user-equipment-info mac

This command defines a condition based on the Media Access Control (MAC) address used for the UE information in an IP-CAN session as received over **Gx** interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-equipment-info mac *operator mac_value*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

mac_value

Specifies the Media Access Control (MAC) address as condition value for UE information received over **Gx** interface in an IP-CAN session.
mac_value is a 17 character long string of Hexadecimal numbers in *xx:xx:xx:xx:xx:xx* format only.

Usage

Use this command to define a condition based on the MAC address value as UE information received over **Gx** interface in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on the MAC value of the UE as *00:12:98:90:99:83* in an IP-CAN session:

```
user-equipment-info mac = 00:12:98:90:99:83
```

user-equipment-info meid

This command defines a condition based on the Mobile Equipment Id (MEID) used for the identification of CDMA mobile device (UE) in a Non-3GPP IP-CAN session received over **Gx** interface between PDSN and IPCF.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] user-equipment-info meid operator me_id
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

me_id

Specifies the Mobile Equipment identifier used for the identification of UE in 64 bit format as condition value for UE information received over **Gx** interface in a Non-3GPP IP-CAN session.
me_id must be a 14 character long string of Hexadecimal numbers only.

Usage

Use this command to define a condition based on the MEID of the CDMAUE received over **Gx** interface in a Non-3GPP IP-CAN session between PDSN and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the MEID of the CDMA UE as *123456780120AF* in a Non-3GPP IP-CAN session:

```
user-equipment-info meid = 123456780120AF
```

user-equipment-info modified-eui64

This command defines a condition based on the modified-Extended Unique Identifier in 64 bit (EUI-64) used for the identification of mobile device (UE) in an IP-CAN session received over **Gx** interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] user-equipment-info modified-eui64 operator meui64
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

meui64

Specifies the modified Extended Unique Identifier (EUI) in 64 bit format as condition value for UE information received over **Gx** interface in an IP-CAN session.
meui64 is a 16 character long string of Hexadecimal numbers only.

Usage

Use this command to define a condition based on the modified EUI-64 value of the UE received over **Gx** interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the EUI-64 of the UE as *0012989099832345* in an IP-CAN session:

```
user-equipment-info modified-eui64 = 0012989099832345
```

user-location-info

This command defines a condition based on the UE location used in an IP-CAN session as received on **Gx** interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] user-location-info {cgi operator mcc mcc_value mnc mnc_value lac lac_value ci
ci_value | ecgi operator mcc mcc_value mnc mnc_value ecgi ecgi_value | rai operator mcc
mcc_value mnc mnc_value lac lac_value rai rai_value| sai operator mcc mcc_value mnc
mnc_value lac lac_value sac sac_value| tai operator mcc mcc_value mnc mnc_value tai
tai_value}
```

no

Removes the specified condition definition.

cgi

Specifies the Cell Global Identifier in UE location received over **Gx** interface in an IP-CAN session.

ecgi

Specifies the E-UTRAN Cell Global Identifier in UE location received over **Gx** interface in an IP-CAN session.

rai

Specifies the Routing Area Identifier in UE location received over **Gx** interface in an IP-CAN session.

sai

Specifies the Service Area Identifier in UE location received over **Gx** interface in an IP-CAN session.

tai

Specifies the Tracking Area Identifier in UE location received over **Gx** interface in an IP-CAN session.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

mcc *mcc_value*

Specifies the Mobile Country Code used in UE location information received over **Gx** interface in IP-CAN session.
mcc_value must be an integer between 101 through 998.

mnc *mnc_value*

Specifies the Mobile Network Code used in UE location information received over **Gx** interface in IP-CAN session.
mnc_value must be an integer between 1 through 998.

lac *lac_value*

Specifies the Location Area Code used in UE location information received over **Gx** interface in IP-CAN session.
lac_value must be an integer between 1 through 65535.

ci *ci_value*

Specifies the Cell Identifier used in UE location information received over **Gx** interface in IP-CAN session.
ci_value must be an integer between 1 through 65535.

ecgi *ecgi_value*

Specifies the E-UTRAN Cell Global Identifier used in UE location information received over **Gx** interface in IP-CAN session.
ecgi_value must be an integer between 1 through 1048575.

rai *rai_value*

Specifies the Routing Area Identifier used in UE location information received over **Gx** interface in IP-CAN session.
rai_value must be an integer between 1 through 65535.

sac *sac_value*

Specifies the Service Area Code used in UE location information received over **Gx** interface in IP-CAN session.
sac_value must be an integer between 1 through 65535.

tai *tai_value*

Specifies the Tracking Area Code used in UE location information received over **Gx** interface in IP-CAN session.
tai_value must be an integer between 1 through 65535.

Usage

Use this command to define a condition based on the UE location information received over **Gx** interface in an IP-CAN session.

Example

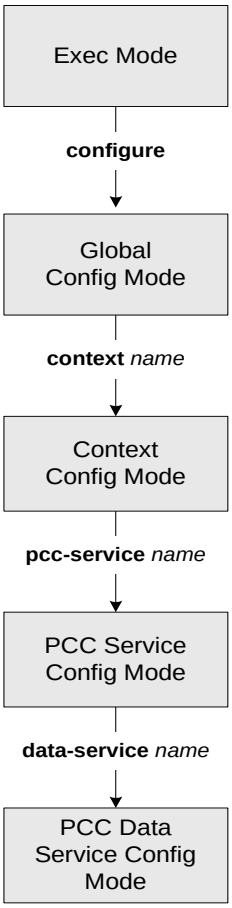
The following command creates a condition definition to analyze the condition based on the RAI received for UE location in an IP-CAN session:

```
user-location-info rai  = mcc 102 mnc 99 lac 1003 rai 3521
```

Chapter 218
PCC-Data-Service Configuration Mode Commands

The PCC-Data-Service Configuration Mode is used to configure the data flow parameters for the media data, as well as corresponding attributes that are necessary for charging and policy enforcement decisions for the media parameters represented by its service flows in the PCC-service. A maximum of ten service data flows can be configured in a PCC-Data-Service instance.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

flow direction in

This command configures the flow service parameters for incoming data flow in PCC-Data-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] flow direction in protocol {ip | tcp | udp} from {src_ip_addr | any} port
{src_port_num | any} to {dest_ip_addr | any} port {dest_port_num | any}
```

no

Removes the configured data service flow parameters from PCC-Data-Service instance for IPCF configuration.

protocol {ip | tcp | udp}

This keyword configures the data flow parameters for specific protocol.
Following protocols are supported through this keyword:

- **ip**: Sets the parameters for IP traffic.
- **tcp**: Sets the parameters for TCP traffic.
- **UDP**: Sets the parameters for UDP traffic.

from {*src_ip_addr* | any} port {*src_port_num* | any}

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- *src_ip_addr*: specifies the specific IP address in IPv4/IPv6 notation as source of flow.
- **any**: specifies that flow from any source IP address/port can be analyzed or considered.
- **port** *src_port_num*: specifies the specific source port parameter for flow.

  src_port_num is the source port number of flow and must be an integer from 1 through 65535.

to {*dest_ip_addr* | any} port {*dest_port_num* | any}

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- *dest_ip_addr*: specifies the specific IP address in IPv4/IPv6 notation as destination of flow.
- **any**: specifies that flow to any destination IP address/port can be analyzed or considered.
- **port** *dest_port_num*: specifies the specific destination port parameter for flow.

dest_port_num is the destination port number of flow and must be an integer from 1 through 65535.

Usage

Use this command to configure the flow service parameters for incoming data flow in PCC-Data-Service instance for IPCF Configuration.

Example

Following command sets the data service parameters for **tcp** type protocol from **any** IP/port source to **any** IP/port in incoming direction with in a PCC-Data-Service.

```
flow direction in protocol tcp from any port any to any port any
```

flow direction out

This command configures the flow service parameters for outgoing data flow in PCC-Data-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] flow direction in protocol {ip | tcp | udp} from {src_ip_addr | any} port
{src_port_num | any} to {dest_ip_addr | any} port {dest_port_num | any}
```

no

Removes the configured data service flow parameters from PCC-Data-Service instance on IPCF node.

protocol {ip | tcp | udp}

This keyword configures the data flow parameters for specific protocol.
Following protocols are supported through this keyword:

- **ip**: Sets the parameters for IP traffic.
- **tcp**: Sets the parameters for TCP traffic.
- **UDP**: Sets the parameters for UDP traffic.

from {*src_ip_addr* | any} port {*src_port_num* | any}

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- *src_ip_addr*: specifies the specific IP address in IPv4/IPv6 notation as source of flow.
- **any**: specifies that flow from any source IP address/port can be analyzed or considered.
- **port** *src_port_num*: specifies the specific source port parameter for flow.

  src_port_num is the source port number of flow and must be an integer from 1 through 65535.

to {*dest_ip_addr* | any} port {*dest_port_num* | any}

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- *dest_ip_addr*: specifies the specific IP address in IPv4/IPv6 notation as destination of flow.
- **any**: specifies that flow to any destination IP address/port can be analyzed or considered.
- **port** *dest_port_num*: specifies the specific destination port parameter for flow.

  dest_port_num is the destination port number of flow and must be an integer from 1 through 65535.

Usage

Use this command to configure the flow service parameters for outgoing data flow in PCC-Data-Service instance on IPCF node.

Example

Following command sets the data service parameters for **tcp** type protocol from **any** IP/port source to **any** IP/port in outgoing direction with in a PCC-Data-Service.

```
flow direction out protocol tcp from any port any to any port any
```

metering-method

This command specifies the metering method to be used by PCEF for offline charging in a PCC-Data-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] metering-method {both-duration-volume | duration | volume}
```

no

Removes the configured metering method from PCC-Data-Service instance on IPCF node.
In such scenario, the metering method pre-configured at PCEF is considered.

both-duration-volume

Specifies the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-Service instance on IPCF node.

duration

Specifies the metering method as based on the duration of session usage for offline charging in a PCC-Data-Service instance on IPCF node.

volume

Specifies the metering method as based on the volume of data usage for offline charging in a PCC-Data-Service instance on IPCF node.

Usage

Use this command to define the metering method to be used for offline charging in a PCC-Data-Service instance on IPCF node.
If no metering method is defined, the metering method preconfigured at PCEF is considered.

Example

Following command sets the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-Service instance on IPCF node.

```
metering-method both-duration-volume
```

monitoring-key

This command defines the monitoring key under which data is monitored for the PCC-Data-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

monitoring-key *mon_key_value*

[**no**] **monitoring-key**

no

Removes the configured monitoring-key from PCC-Data-Service instance on IPCF node.

mon_key_value

Specifies the monitoring key value under which data usage is monitored for the PCC-Data-Service instance and must be an integer from 1 through 65535.

Usage

Use this command to define the monitoring key under which data is monitored for the PCC-Data-Service instance on IPCF node.

Example

Following command sets the monitoring key *123* for data monitoring in PCC-Data-Service instance on IPCF node.

```
monitoring-key 123
```

precedence

This command defines the precedence that is assigned to the Dynamic PCC rule created for a PCC-Data-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

precedence *preced_value*

[**no**] **precedence**

no

Removes the configured precedence value from PCC-Data-Service instance on IPCF node.

preced_value

Specifies the precedence that is assigned to the dynamic PCC rule created for a PCC-Data-Service instance and must be an integer from 1 through 65535.

Usage

Use this command to define the precedence value that is assigned to the Dynamic PCC rule created for a PCC-Data-Service instance on IPCF node.

Example

Following command sets the precedence value*2* to assign to the dynamic PCC rule created for a PCC-Data-Service instance on IPCF node.

```
precedence 2
```

qos-profile

This command defines the PCC-QoS-Profile which is to use for the PCC-Data-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

qos-profile *qos_prof_name*

[**no**] **qos-profile**

no

Removes the configured PCC-QoS-Profile from PCC-Data-Service instance on IPCF node.

qos_prof_name

Specifies the pre-configured PCC-QoS-Profile name which is to use for the PCC-Data-Service instance.

Usage

Use this command to define the PCC-QoS-Profile for a PCC-Data-Service instance on IPCF node.

Example

Following command sets the PCC-QoS-Profile *ipcf_qos_prof1* for PCC-Data-Service instance on IPCF node.

```
qos-profile ipcf_qos_prof1
```

rating-group

This command defines the PCC-Rating-Group that is assigned for a PCC-Data-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

rating-group *rating_grp_id*

[**no**] **rating-group**

no

Removes the configured PCC-Rating-Group Id from PCC-Data-Service instance on IPCF node.

rating_grp_id

Specifies the PCC-Rating-Group Id that is assigned to the PCC-Data-Service instance and must be an integer from 1 through 99.

Usage

Use this command to define the PCC-Rating Id value for a PCC-Data-Service instance on IPCF node.

Example

Following command sets the Rating Group id *11* for a PCC-Data-Service instance on IPCF node.

```
rating-group 11
```

reporting-level

This command specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] reporting-level {service-identifier-level | rating-group-level}
```

no

Removes the configured usage reporting level from PCC-Data-Service instance on IPCF node.
In such scenario, the reporting level configured at PCEF is considered.

service-identifier-level

Sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the service identifier level in a PCC-Data-Service instance on IPCF node.

rating-group-level

Sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Rating-group level in a PCC-Data-Service instance on IPCF node.

Usage

Use this command to define the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node.
If no reporting level is defined, the reporting level preconfigured at PCEF is considered.

Example

Following command sets the reporting level at 'Rating-group' level which is to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node.

```
reporting-level rating-group-level
```

service-identifier

This command defines the service identifier for a PCC-Data-Service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

service-identifier *svc_id*

[**no**] **service-identifier**

no

Removes the configured Service Identifier from PCC-Data-Service instance on IPCF node.

svc_id

Specifies the Service Identifier that is assigned to the PCC-Data-Service instance and must be an integer from 1 through 65535.

Usage

Use this command to define the Service Identifier for a PCC-Data-Service instance on IPCF node.

Example

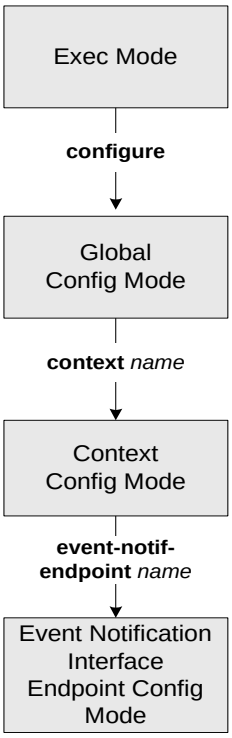
Following command sets the Service Identifier *1011* for a PCC-Data-Service instance on IPCF node.

service-identifier *1011*

Chapter 219
PCC-Event-Notification-Interface-Endpoint Configuration Mode Commands

The PCC-Event-Notification-Interface-Endpoint configuration mode is used to enable the event notification interface mechanism for the Intelligent Policy Control Function (IPCF) and to configure the Event Notification collection server endpoint related parameters.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



address

This command binds an IP address to the local IPCF node which is to be used for event notification processing with remote event collection server endpoint during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

address *ip_address*

ip_address

Specifies the IP address bind with local IPCF node to be used by the event collection server endpoint for event message processing during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Usage

Use this command to bind an IP address to interact with the remote event notification collection server endpoint to which the event messages are sent for IP-CAN session events.

Example

Following command binds the *1.2.3.4* for event notification message with remote event notification endpoint.

address*1.2.3.4*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

peer name

This command binds/associates a remote Event Notification collection server as peer having specified IP address and optionally port for event notification during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

peer name *peer_name* **address** *ip_address* [**port** *port_num*]

name *peer_name*

Sets the in PCC-Event-Notification-Interface-Endpoint instance to use a particular peer node configured by a peer name *peer_name* for event notification interface.
The *peer_name* is name of the peer node to be sued for event collection and must be an alphanumerical string from 1 through 31 characters. *peer_name* allows punctuation marks.

ip-address *ip_address*

Sets the PCC-Event-Notification-Interface-Endpoint instance to bind the particular peer node name with IP address *ip_address* in IPv4 or IPv6 notation for event notification message processing.
The *ip_address* is an IP address in IPv4/IPv6 notation.

port *port_num*

This optional keyword sets a particular port number to be used with in the PCC-Event-Notification-Interface-Endpoint instance to configure a particular peer node having a pre assigned IP address *ip_address* in IPv4 or IPv6 notation for event notification message processing.
The *port_num* must be an integer between 1 and 65535.

Usage

Use this command to bind/associate a remote Event Notification collection server as peer having specified IP address and optionally port for event notification during IP-CAN session in the PCC-Event-Notification-Interface-Endpoint instance.
Multiple peers can be configured using this command and peer selection methods, **primary-secondary** or **round-robin** can be applied using **peer select-algorithm** command for event notification during IP-CAN session in this configuration mode.

Example

Following command configures and associates an Event Notification peer node named *event_peer_1* having an IP address *1.2.3.4* with port number as *2345* in an PCC-Event-Notification-Interface-Endpoint instance.

```
peer name event_peer_1 ip-address 1.2.3.4 port 2345
```

peer select-algorithm

This command applies the peer selection algorithm to select the configured remote Event Notification collection server during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
peer select-algorithm {primary-secondary | round-robin}
```

primary-secondary

Sets the PCC-Event-Notification-Interface-Endpoint peer selection algorithm to select the configured remote peer servers in primary and secondary method during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.
This mode is applicable only when multiple peers are configured and primary and secondary peer is defined using **peer select-peer** command in this configuration mode.

round-robin

Sets the PCC-Event-Notification-Interface-Endpoint peer selection algorithm to select the configured remote peer servers in round-robin method mode during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.
This mode is applicable only when multiple peers are configured in this configuration mode.

Usage

Use this command apply the peer selection algorithm to select the configured remote Event Notification collection server during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Example

Following command configures the peer selection algorithm to select the configured remote peer in **round-robin** method in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-algorithm round-robin
```

Following command configures the peer selection algorithm to select the configured primary and secondary remote peers in **primary-secondary** method in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-algorithm primary-secondary
```

peer select-peer

This command sets the configured remote Event Notification collection server as primary and secondary servers for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

peer select-peer *pri_peer_name* **secondary** *sec_peer_name*

pri_peer_name

Sets the configured remote PCC-Event-Notification-Interface-Endpoint peer as primary peer for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. *pri_peer_name* must be a pre-configured peer name configured with **peer name** command in this configuration mode.

secondary *sec_peer_name*

Sets the configured remote PCC-Event-Notification-Interface-Endpoint peer as secondary peer for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. *sec_peer_name* must be a pre-configured peer name configured with **peer name** command in this configuration mode.

Usage

Use this command to set the configured remote Event Notification collection server as primary and secondary node for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.
This configuration is used when peer selection algorithm is set to **primary-secondary** using **peer select-algorithm** command in this configuration mode.

Example

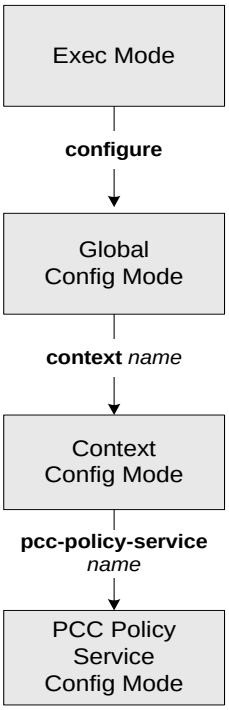
Following command configures the specified peer *event1* as primary and *event2* as secondary node for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-peer event1 secondary event2
```

Chapter 220
PCC-Policy-Service Configuration Mode Commands

The PCC-Policy-Service Configuration mode provides a mechanism for the Intelligent Policy Control Function (IPCF) to manage the external interfaces required for policy authorization purpose between IPCF and PCEF Bearer Binding and Event Reporting Function (BBERF). The PCC-Policy-Service manages **Gx**/**Gx** based on the Diameter dictionary used.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



associate pcc-service

This command associates a pre-configured PCC-Service with a PCC-Policy-Service for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

associate pcc-service *pcc_service_name*

[**no**] **associate pcc-service**

no

Removes/disassociate the configured PCC-Service from this PCC-Policy-Service instance configured for IPCF configuration.

pcc_service_name

Specifies the name of a pre-configured PCC-Service configured in Context Configuration mode for IPCF configuration.
The *pcc_service_name* is name of a predefined PCC-Service instance and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to associate a pre-configured PCC-Service instance for IPCF configuration.

Important: For more information on PCC-Service configuration, refer *PCC-Service Configuration Mode Commands*.

Example

Following command binds a PCC-Service named *pcc_svc1* with in a PCC-Policy-Service.

associate pcc-service *pcc_svc1*

Following command removes an associated PCC-Service named *pcc_svc1* from a PCC-Policy-Service.

no associate pcc-service *pcc_svc1*

diameter dictionary

This command assigns a Diameter dictionary for **Gx**/**Gxa** messaging with a PCC-Policy-Service for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter dictionary {**gxa-standard** | **r7-standard** | **standard**}

default diameter dictionary

default

Sets the Diameter **Gx** dictionary to default dictionary **standard** (3GPP Rel. 8 standard) for a PCC-Policy-Service instance configured for IPCF configuration.

gxa-standard

Default: Disabled
Sets the Diameter **Gxa** dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over **Gxa** interface to 3GPP Rel. 8 standard.

r7-standard

Default: Disabled
Sets the Diameter **Gx** dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over **Gx** interface to 3GPP Rel. 7 standard.

standard

Default: Enabled
Sets the Diameter **Gx** dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over **Gx** interface to 3GPP Rel. 8 standard.

Usage

Use this command to configure the PCC-Policy-Service to determine which of the 3GPP dictionary to be used for **Gx** or **Gxa** interface messaging for policy and/or quota management.

Example

Following command sets the PCC-Policy-Service to use 3GPP Rel. 8 standard dictionary for **Gx** interface and policy management related messaging in a PCC-Policy-Service.

```
default diameter dictionary
```

diameter origin end-point

This command binds/associates a pre-configured Diameter host/realm (PCEF/BBERF) over **Gx/Gxa** interface with a PCC-Policy-Service to be used for subscriber service control and policy profile management.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *dia_endpoint_name*

no diameter origin endpoint

no

Removes the associated Diameter Origin Endpoint configuration from PCC-Policy-Service instance configured for IPCF configuration.

any

Sets the PCC-Policy-Service instance to use any available PCEF/BBERF node for policy interfaces (**Gx**/**Gx**-like) support.

dia_endpoint_name

The *dia_endpoint_name* is a predefined Diameter origin endpoint node and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to bind the PCEF/BBERF node over **Gx**/**Gx**-like interface by associating a pre-configured Diameter Origin Endpoint with a PCC-Policy-Service.
The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter.

Example

Following command associates a pre-configured Diameter endpoint node configuration named *pcef_1* with a PCC-Policy-Service for policy profile management.

```
diameter origin endpointpcef_1
```

Following command removes the pre-associated Diameter endpoint node configuration named *pcef_1* with a PCC-Policy-Service.

```
no diameter origin endpoint
```

ehrpd-access-bcm

This command configures the PCC-Policy-Service to accept the applicable Bearer-Control-Mode for eHRPD access over **Gxa** interface on IPCF.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

ehrpd-access-bcm {**as-requested** | **ue-nw** | **ue-only**}

default ehrpd-access-bcm

default

Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for eHRPD access over **Gxa** interface on IPCF node.

as-requested

Default: Enabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for eHRPD access over **Gxa** interface on IPCF node.

ue-nw

Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE and/or network element for eHRPD access over **Gxa** interface on IPCF node.

ue-only

Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE only for eHRPD access over **Gxa** interface on IPCF node.

Usage

Use this command to set the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS or UE or Network for eHRPD access over **Gxa** interface on IPCF node.

Example

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS for eHRPD access over **Gxa** interface on IPCF node.

```
default ehrpd-access-bcm
```

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request only from UE for eHRPD access over **Gxa** interface on IPCF node.

```
ehrpd-access-bcm ue-only
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

gprs-access-bcm

This command configures the PCC-Policy-Service to accept the applicable Bearer-Control-Mode for GPRS access over **Gx** interface on IPCF.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
gprs-access-bcm {as-requested | ue-nw | ue-only}

default gprs-access-bcm
```

default

Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for GGSN access over **Gx** interface on IPCF node.

as-requested

Default: Enabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for GGSN access over **Gx** interface on IPCF node.

ue-nw

Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE and/or network element for GGSN access over **Gx** interface on IPCF node.

ue-only

Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE only for GGSN access over **Gx** interface on IPCF node.

Usage

Use this command to set the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS or UE or Network for GGSN access over **Gx** interface on IPCF node.

Example

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS for GGSN access over **Gx** interface on IPCF node.

```
default gprs-access-bcm
```

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request only from UE for GGSN access over **Gx** interface on IPCF node.

```
gprs-access-bcm ue-only
```

max policy-sessions

This command configures the maximum limit of the policy sessions allowed in a PCC-Policy-Service instance on IPCF.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

max policy-sessions *max_session*

default max policy-sessions

default

Sets the maximum policy sessions allowed in PCC-Policy-Service instance to default value of 10000 sessions.

max_session

Default: 10000
Specifies the maximum number of policy sessions configured in PCC-Policy-Service to allow to be connected in PCC-Quota service instance.
max_session must be an integer between 0 and 4000000.

Usage

Use this command to set the maximum number of policy sessions allowed by a PCC-Policy-Service instance on IPCF.

Example

Following command sets the maximum number of policy sessions allowed in PCC-Policy-Service instance to 10000.

```
default max policy-sessions
```

subscriber-binding-identifier

This command specifies the subscriber binding identifier to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

subscriber-binding-identifier {**imsi** | **msisdn** | **nai** | **sip-uri**}

default subscriber-binding-identifier

default

Sets the subscriber binding identifier to default value; i.e. IMSI, to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

imsi

Default: Enabled.
Sets the subscriber binding identifier as IMSI to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

msisdn

Default: Disabled.
Sets the subscriber binding identifier as MSISDN to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

nai

Default: Disabled.
Sets the subscriber binding identifier as Network Access Identifier (NAI) to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

sip-uri

Default: Disabled.
Sets the subscriber binding identifier as SIP URI (Uniform Resource Identifier) to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

Usage

Use this command to configure the **bindmux** in PCC-Policy-Service instance on IPCF node to use specific subscriber identifier for binding different subscriber session to IP-CAN session.

Example

The following command sets the PCC-Policy-Service to use IMSI as subscriber binding identifier for IP-CAN session on an IPCF node.

```
default subscriber-binding-identifier
```

subscription-id-absence-action

This command configures the PCC-Policy-Service instance to handle the Initial Credit Control Request (CCR-I) messages during initial authentication over **Gx** interface when CCR-I message received by IPCF node is without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.).

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
{default} subscription-id-absence-action initial-auth {continue | reject}
```

default

Sets the PCC-Policy-Service instance to reject the CCR-I message during initial authentication over **Gx** interface if received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.

continue

Default: Disabled.
Sets the PCC-Policy-Service instance to accept the CCR-I message and continue with the session if CCR-I is received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.
In this case, IPCF accepts the CCR-I message and will do the PCC provisioning as per the operator configuration in associated PCC-Service.

reject

Default: Enabled.
Sets the PCC-Policy-Service instance to reject the CCR-I message and continue with the session if CCR-I is received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.
In this case, IPCF will send CCA-I message with Result-code as **Permanent Error** and rejects the session establishment with PCEF.

Usage

Use this command to configure the PCC-Policy-Service instance to handle the Initial Credit Control Request (CCR-I) message processing during the initial authentication over **Gx** interface if CCR-I message received by IPCF node has no valid Subscription-Id AVP.

Example

The following command sets the PCC-Policy-Service to reject the CCR-I request and terminations the session establishment with PCEF.

```
default subscription-id-absence-action initial-auth
```

unsolicited-provisioning

This command is used to enable/disable the support for unsolicited time-of-day-based procedures to PCC-Policy-Service on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] unsolicited-provisioning time-of-day
```

default

Sets the support for unsolicited time-of-day-based procedures to default mode; i.e. disabled, in PCC-Policy-Service instance on IPCF node.

no

Removes the configured support for unsolicited time-of-day-based procedures in PCC-Policy-Service instance on IPCF node.

Usage

Use this command to enable/disable the support for unsolicited time-of-day-based procedures to PCC-Policy-Service on IPCF node.
By default this command is disabled.

Example

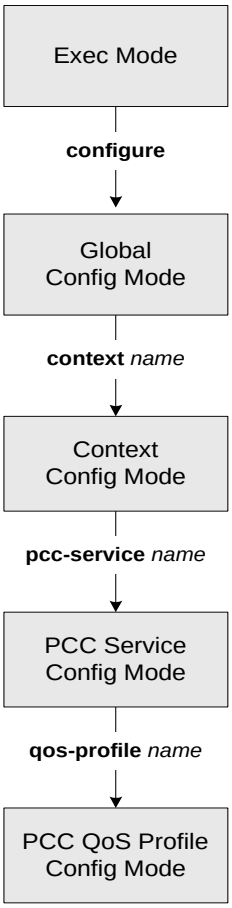
The following command enables the unsolicited time-of-day-based procedures to PCC-Policy-Service on an IPCF node.

```
unsolicited-provisioning time-of-day
```

Chapter 221
PCC-QoS-Profile Configuration Mode Commands

The PCC-QoS-Profile Configuration Mode is used to define the QoS logic used by the operator for managing the QoS policy requirements and objectives for the network specific to a group of subscribers in the network. A QoS Profile represents a resource requirement identified by means of the corresponding QoS attributes like QCI, MBR, GBR, ARP etc.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



arp-priority

This command is used to define the Allocation and Retention Priority (ARP) values of the QoS profile in PCC-QoS-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] arp-priority arp_priority pre-emption {capable | not-capable} {not-vulnerable | vulnerable}
```

no

Removes the configured ARP priority set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

arp_priority

Specifies the priority value for ARP in a PCC-QoS-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.
arp_priority must be an integer from 1 through 15.

pre-emption {capable | not-capable}

Sets the Pre-emption capability related parameters with ARP priority in PCC-QoS-Profile name which is to use in Subscriber profile in PCC-Service instance on IPCF node.
Pre-emption capability determines whether a bearer with a lower ARP priority level should be dropped to free up the required resources.
capable: This keyword indicates that the service data flow is allowed to get resources that were already assigned to another service data flow with a lower priority level.
non-capable: This keyword indicates that the service data flow is not allowed to get resources that were already assigned to another service data flow with a lower priority level.

{not-vulnerable | vulnerable}

Sets the Pre-emption vulnerability related parameters with ARP priority in PCC-QoS-Profile name which is to use in Subscriber profile in PCC-Service instance on IPCF node.
Pre-emption vulnerability determines whether a bearer is applicable for dropping by a pre-emption capable bearer with a higher ARP priority value.
not-vulnerable: This keyword indicates that the resources assigned to the service data flow shall not be pre-empted and allocated to a service data flow with a higher priority level.
vulnerable: This keyword indicates that the resources assigned to the service data flow can be pre-empted and allocated to a service data flow with a higher priority level.

Usage

Use this command to define the ARP priority and pre-empt parameters in PCC-QoS-Profile which is to be used in Subscriber profile in PCC-Service instance on IPCF node.
ARP controls how the IPCF reacts when there are insufficient resources to establish the new RAB. Typically it manages it by; 1) Deny the RAB request and 2) Preempt an existing RAB and accept the new RAB request.

Example

Following command sets the ARP Priority *2* with preemption capability and vulnerability in PCC-QoS-Profile instance on IPCF node.

```
arp-priority 2 pre-emption capable vulnerable
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

guaranteed-bitrate

This command defines the Guaranteed Bit Rate (GBR) value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] guaranteed-bitrate downlink downlink_gbr uplink uplink_gbr
```

no

Removes the configured GBR value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

downlink *downlink_gbr*

Sets the Guaranteed Bit Rate allowed in downlink direction (from PCEF to UE) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
downlink_gbr must be an integer from 0 through 104857600. A 'zero' value disables the downlink in specified PCC-QoS-Profile.

uplink *uplink_gbr*

Sets the Guaranteed Bit Rate allowed in uplink direction (from PCEF to PDN) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
uplink_gbr must be an integer from 0 through 104857600. A 'zero' value disables the uplink in specified PCC-QoS-Profile.

Usage

Use this command to define the Guaranteed Bit Rate value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Example

Following command sets the *1024* bits per seconds as uplink GBR and *2048* bits per second as downlink GBR in PCC-QoS-Profile instance on IPCF node.

```
guaranteed-bitrate downlink 2048 uplink 1024
```

max-bitrate

This command defines the Maximum Bit Rate (MBR) value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[no] max-bitrate downlink *downlink_mbr* **uplink** *uplink_mbr*

no

Removes the configured Maximum Bit Rate value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

downlink *downlink_mbr*

Sets the Maximum Bit Rate allowed in downlink direction (from PCEF to UE) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
downlink_mbr must be an integer from 0 through 104857600. A 'zero' value disables the downlink in specified PCC-QoS-Profile.

uplink *uplink_mbr*

Sets the Maximum Bit Rate allowed in uplink direction (from PCEF to PDN) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
uplink_mbr must be an integer from 0 through 104857600. A 'zero' value disables the uplink in specified PCC-QoS-Profile.

Usage

Use this command to define the Maximum Bit Rate value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Example

Following command sets the *1024* bits per seconds as uplink MBR and *2048* bits per second as downlink MBR in PCC-QoS-Profile instance on IPCF node.

```
max-bitrate downlink 2048 uplink 1024
```

qci

This command sets the QoS Class Identifier (QCI) for PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] qci qci_id
```

no

Removes the configured QCI value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

qci *qci_id*

Sets the QoS Class Identifier for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
qci_id must be an integer from 1 through 255.

Usage

Use this command to set the QoS Class Identifier for PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Example

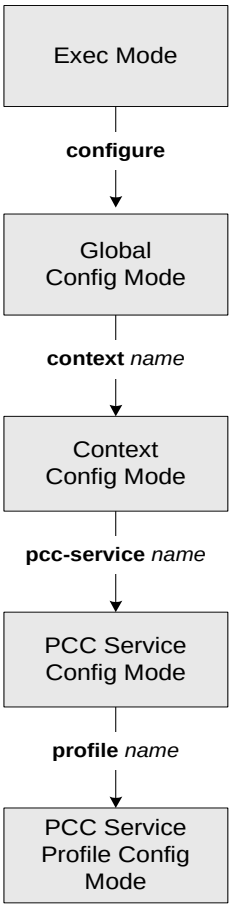
Following command sets the QCI *101* for PCC-QoS-Profile instance on IPCF node.

```
qci 101
```

Chapter 222
PCC-Service-Profile Configuration Mode Commands

The PCC-Service-Profile Configuration Mode is used to define the business logic used by the operator for managing the policy requirements and objectives for the network specific to a group of subscribers in the network. A PCC-Service-Profile manages multiple PCC-Conditions-Groups and associated PCC-Action-Sets pairs in an ordered manner. A maximum of 32 PCC-Service-Profile can be configured in a PCC-Service instance.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



default-rulebase-name

This command is used to associate the default PCC-Rulebase with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[**no**] **default-rulebase-name** *rulebase_name*

no

Removes the configured default PCC-Rulebase from PCC-Service-Profile instance on IPCF node.

rulebase_name

This keyword specifies the default PCC-Rulebase name to be associated with PCC-Service-Profile instance. *rulebase_name* is the Rulebase name configured at PCEF and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associate the default PCC-Rulebase configured on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Example

Following command associates the PCC-Rulebase named *pcc_rulebase1* for PCC-Profile instance on IPCF node.

```
default-rulebase-name pcc_rulebase1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

eval-priority

This command sets the priority for evaluation of PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] eval-priority last action-set actionset_name

[no] eval-priority priority_value timedef timedef_name [condition-group cond_grp_name]
action-set actionset_name

[no] eval-priority priority_value condition-group cond_grp_name action-set actionset_name
```

no

Removes the configured evaluation priority for PCC-Condition-Group with corresponding PCC-Action-Set from PCC-Service-Profile instance on IPCF node.

last

Sets last evaluation priority action-set configured for the PCC-Service-Profile instance.
no removes the last evaluation priority action-set.

priority_value

Specifies the priority to be set for PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile instance.
priority_value must be an integer from 1 through 1023.

timedef *timedef_name*

Specifies a pre-configured time definition in *PCC-Timedef Configuration mode* and to be set for evaluation priority in a PCC-Service-Profile instance.
timedef_name is a pre-configured PCC-Timedef and must be an alphanumerical string of 1 through 63 characters.

condition-group *cond_grp_name*

Specifies a pre-configured PCC-Condition-Group to be set for evaluation priority in a PCC-Service-Profile instance.
cond_grp_name is a pre-configured PCC-Condition-Group and must be an alphanumerical string of 1 through 63 characters.

Important: An special PCC-Condition-Group “none” can be used to set the default PCC-Condition-Group for **any-match** typically used for a default condition for a session which does not match any of the conditions specified with higher evaluation priority.

action-set *actionset_name*

Specifies a pre-configured PCC-Action-Set for PCC-Condition-Group to be set for evaluation priority in a PCC-Service-Profile instance.
actionset_name is a pre-configured PCC-Action-Set and must be an alphanumerical string of 1 through 63 characters.

Usage

Use this command to set the priority for evaluation of PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.
Additionally **timedef** is used to accept the Timedefs to support the time-of-day-based procedures to trigger an evaluation priority. The action is triggered only when the time of session lies in the time span defined in specific PCC-Timedef *timedef_name*.
Default **eval-priority** has the lowest priority in the PCC-Service-Profile and as default **eval-priority** does not have any PCC-Condition-Group associated with it, all the actions in the **action-set** always be applied.
A maximum of 64 PCC-Evaluation-Priorities can be configured in a PCC-Service-Profile.

Example

Following command sets the evaluation priority value as *1* for PCC-Condition-Group *cond_1* along with PCC-Action-Set *act_cond1* for PCC-Service-Profile instance on IPCF node:

```
eval-priority 1 condition-group cond_1 action-set act_cond1
```

Following command sets the evaluation priority value as *2* for PCC-Condition-Group *none* for **any-match** typically used for a default condition for a session which does not match any of the conditions specified with higher evaluation priority.along with PCC-Action-Set *act_cond1* for PCC-Service-Profile instance on IPCF node:

```
eval-priority 1 condition-group none action-set act_cond1
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

service-tag

This command configures the PCC-Service Tags to be used for PCC-Rulename or PCC-Rule-base in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[no] service-tag *svc_tag* {**rule-name** *rule_name* | **rulebase-name** *rulebase_name*}

no

Removes the configured PCC-Service Tags for PCC-Rulename and PCC-Rulebase from PCC-Service-Profile instance on IPCF node.

svc_tag

Specifies the name of the PCC-Service Tag to be used for PCC-Rulename and PCC-Rulebase in a PCC-Service-Profile instance.
svc_tag must be an alphanumerical string of 1 through 63 characters.

rule-name *rule_name*

Specifies a pre-defined PCC-Rulename on PCEF to be used with PCC-Service Tag *svc_tag* in a PCC-Service-Profile instance.
rule_name is a pre-defined PCC-Rulename on PCEF and must be an alphanumerical string of 1 through 63 characters.

rulebase-name *rulebase_name*

Specifies a pre-defined PCC-Rulebase name pre-defined on PCEF to be used with PCC-Service Tag *svc_tag* in a PCC-Service-Profile instance.
rulebase_name is a pre-defined PCC-Rulebase name on PCEF and must be an alphanumerical string of 1 through 63 characters.

Usage

Use this command to set the PCC-Service Tag for PCC-Rulename and PCC-Rulebase which are defined on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance.

Example

Following command sets the PCC-Service Tag named *Rule1* for PCC-Rulebase named *pcc_rulebase1* for PCC-Service-Profile instance on IPCF node:

```
service-tag Rule1 rulebase-name pcc_rulebase1
```

Following command sets the PCC-Service Tag named *Rule11* for PCC-Rulename *pcc_rule1* for PCC-Service-Profile instance on IPCF node:

service-tag *Rule11* **rule-name** *pcc_rule1*

usage-monitor

This command creates/modifies/deletes the PCC-Usage-Monitor Configuration instance to track the usage volume across the PCC-services based on the usage monitor settings in a PCC-service instance for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] usage-monitor usage_mon_name [-noconfirm]
```

no

Removes the configured PCC-Usage-Monitor from PCC-Service-Profile instance for IPCF configuration.

usage_mon_name

Identifies the name of the PCC-Usage-Monitor instance which is to be created or modified through this command.
The *usage_mon_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no usage-monitor** *usage_mon_name* command, the PCC-Usage-Monitor instance named *usage_mon_name* is deleted with all configured parameters without prompting any warning or confirmation.

Usage

Use this command to create and configure a PCC-Usage-Monitor for PCC-Service-Profile in a PCC-service instance of IPCF configuration.
A maximum number of 8 PCC-Usage-Monitors can be configured per PCC-Service-Profile.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-profile-usage-mon)#
```

The commands configured in this mode are defined in the *PCC-Usage-Monitor Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-Usage-Monitor for volume usage can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command configures the PCC-Usage-Monitor named *pcc_usage1* to track the usage of service with in a PCC-Service-Profile instance.

usage-monitor *pcc_usage1*

unknown-services-treatment

This command configures the PCC-Service for handling of unknown services at IPCF which is to be used in Subscriber profile in PCC-Service instance on IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[default] unknown-services-treatment {not-allowed | qos-profile qos_prof_name precedence
from start_preced to end_preced order {ascending | descending}}
```

default

Sets the configured PCC-Service for handling of unknown services at IPCF to default value of "**Not allowed**" which is to be used in Subscriber profile in PCC-Service instance on IPCF node.

not-allowed

Sets the PCC-Service-Profile instance to reject the packet filters and does not installs any dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.

qos-profile *qos_prof_name*

Specifies a pre-defined PCC-QoS profile name to be used to create dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.
qos_prof_name is a pre-defined PCC-QoS Profile and must be an alphanumerical string of 1 through 63 characters.

precedence from *start_preced* **to** *end_preced*

Specifies the precedence parameters to install dynamic rules for selection of QoS profile when QoS profile is configured to create dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.
start_preced is an integer between 1 through 65535 and must be less than *end_preced* value where *end_preced* is an integer between 1 through 65535 and must be more than *start_preced* value

order {ascending | descending}

Specifies the order of precedence for QoS profile to be used to install dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.

- **ascending** sets the precedence setting in ascending order.
- **descending** sets the precedence setting in descending order.

Usage

Use this command to set the PCC-Service Tag for PCC-Rulename and PCC-Rulebase which are defined on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance.

Whenever IPCF receives any request to authorize Packet Filters from PCEF, it does a lookup in data service list to find a match. If **No** service flow is found matching then the requested filters are treated as **unknown service request** and handled as per the mentioned configuration.
When unknown-service-treatment is set to **not-allowed**, then Packet Filters are rejected and no dynamic rule is installed. Otherwise, dynamic rule is created using the requested packet filters, data rates mentioned in the QoS profile name *qos_prof_name* and precedence value derived from the configured values.
The precedence configuration works in following manner:

- If precedence limits are configured as 1000 to 2000 with order **ascending** then precedence of subsequent dynamic rules will go from 1000 to 2000.
- If precedence limits are configured as 1000 to 2000 with order **descending** then precedence of subsequent dynamic rules will go from 2000 to 1000.

Example

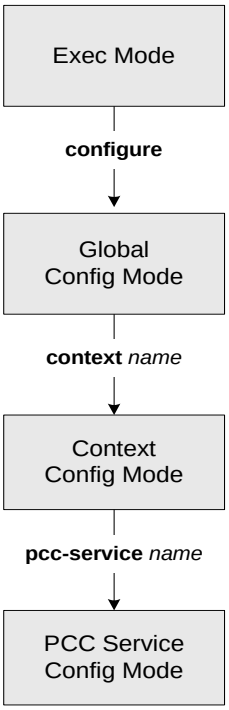
Following command sets the PCC-Service for handling of unknown services for PCC-Service-Profile instance on IPCF node to default action of **not allowed**:

```
default unknown-services-treatment
```

Chapter 223
PCC-Service Configuration Mode Commands

The PCC-Service Configuration Mode is used to link, consolidate and manage the policy logic for the network. It defines the authorization of resources for a subscriber's data usage under various conditions and policies in the PCC-service.

Important: This configuration mode is supported from StarOS Release 12.1 onward



action-set

This command is used to create a new set of action, action-set, or modify a previously configured action set and enters the PCC-Action-Set Configuration Mode. This command can also be used to delete an existing PCC-Action-Set.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

action-set *act_set_name* [**-noconfirm**]

no action-set *act_set_name*

no

Removes the configured PCC-Action-Set from this PCC-service instance for IPCF configuration.

act_set_name

Identifies the name of the PCC-Action-Set which is to be created or modified through this command.
The *act_set_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/remove/configure an action-set in a PCC-service instance for IPCF Configuration.
An Action-set indicates the policy and charging as well as event generation related decisions that will get activated when the corresponding *Condition-Group* is evaluated to *TRUE* within a subscriber policy/profile.
A maximum of 512 PCC-Action-Sets can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-action-set)
```

Important: For more information on PCC-Action-Set configuration, refer *PCC-Action-Set Configuration Mode Commands*.

Example

Following command creates a PCC-action-set named *pcc_act1* with in a PCC-service.

action-set *pcc_act1*

Following command removes a pre-configured PCC-action-set named *pcc_act1* from a PCC-service.

no action-set *pcc_act1*

charging method

This command defines the charging method selection parameters in a PCC-service instance for IPCF.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
charging method {both-offline-and-online | offline | online}

[default | no] charging method
```

default

Sets the charging method to "no" in a PCC-service instance on IPCF node.

no

Removes the configured charging method from a PCC-service instance on IPCF node.

both-offline-and-online

Default: Disabled.
Defines that this PCC-service instance is configured for both, online and offline, charging method for IPCF configuration.

offline

Default: Disabled.
Defines that this PCC-service instance is configured only for offline charging method for IPCF configuration.

online

Default: Disabled.
Defines that this PCC-service instance is configured only for online charging method for IPCF configuration.

Usage

Use this command to define the charging method selection parameters in a PCC-service instance for IPCF. Charging method used can be online, offline or both.

Example

Following command defines the charging method for a PCC-service instance as both, online and offline:

```
default charging method
```

charging server

This command defines the charging server parameters in a PCC-service instance for IPCF.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

charging server *server_name* **function** {**offline** | **online**} {**primary** | **secondary**}

no charging server {**all** | **function** {**offline** | **online**} {**primary** | **secondary**}

no

Removes/disables the charging server parameters in a PCC-service instance for IPCF configuration.

server_name

Identifies the name of the charging server which is to be configured with these parameters in a PCC-service instance for IPCF configuration.
The *server_name* must be an alphanumerical string from 1 through 63 characters.

offline

Sets the specific charging server to be used as offline server in a PCC-service instance for IPCF configuration.

online

Sets the specific charging server to be used as online server in a PCC-service instance for IPCF configuration.

primary

Sets the specific charging server to be used as primary charging server for offline or online charging method in a PCC-service instance for IPCF configuration.

secondary

Sets the specific charging server to be used as secondary charging server for offline or online charging method in a PCC-service instance for IPCF configuration.

all

This keyword is used with **no** keyword only. It removes the all configured charging server parameters from a PCC-service instance for IPCF configuration.

Usage

Use this command to configured the online or offline charging servers to be used as primary or secondary in a PCC-service instance for IPCF configuration.

Example

Following command configures the **online** charging server named *Gx1* as **primary** for online charging method for a PCC-service instance:

```
charging server Gx1 function online primary
```

Following command removes the all, online/offline/primary/secondary, type of charging servers from a PCC-service instance:

```
no charging server function all
```

condition-group

This command creates a new group of conditions, condition-group, or modify a previously configured condition-group and enters the PCC-Condition-Group Configuration Mode. This command can also be used to delete an existing PCC-Condition-Group.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

condition-group *cond_grp_name* [**-noconfirm**]

no condition-group *cond_grp_name*

no

Removes the configured PCC-condition-group from a PCC-service instance for IPCF configuration.

cond_grp_name

Identifies the name of the PCC-condition-group which is to be created or modified through this command. The *cond_grp_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/remove/configure a group of condition, condition-group, in a PCC-service instance for IPCF configuration.
A Condition-group is a collection of conditions that identify a network or state constraint represented as an logical expression. A condition-group may use another **condition-group** within with the nesting level limited to 3.
Within a condition-group the conditions and condition-groups can either be linked with an **AND** or an **OR** relation. A Condition is built using predefined keywords representing unique service conditions such as *user-location*, *app-service* etc.
A maximum of 1024 PCC-Condition-Groups can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-condition-group))#
```

The commands configured in this mode are defined in the *PCC-Condition-Group Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-Condition Group can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command creates a PCC-condition-group named *cond_grp1* with in a PCC-service instance.

```
condition-group cond_grp1
```

Following command removes a pre-configured PCC-condition-group named *cond_grp1* from a PCC-service instance.

```
no condition-group cond_grp1
```

data-service

This command creates a new service for data, data-service, or modify a pre-configured data-service and enters the PCC-Data-Service Configuration Mode. This command can also be used to delete an existing PCC-Data-Service.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

data-service *data_svc_name* [**-noconfirm**]

no data-service *data_svc_name*

no

Removes the configured PCC-Data-Service from a PCC-service instance for IPCF configuration.

data_svc_name

Identifies the name of the PCC-Data-Service which is to be created or modified through this command. The *data_svc_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create and configure a PCC-data-service in a PCC-service instance for IPCF configuration.
A PCC-Data-Service defines the flows for the media data as well as corresponding attributes that are necessary for the charging as well as policy enforcement decisions for the kind of media represented by its Service-Flows.
A maximum of 256 PCC-Data-Services can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-data-service))#
```

The commands configured in this mode are defined in the *PCC-Data Service Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-Data-service can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command defines a PCC-data-service named *pcc_data_svc1* in a PCC-service instance without any confirmation prompt.

```
data-service pcc_data_svc1 -noconfirm
```

Following command removes a pre-configured PCC-data-service named *pcc_data_svc1* from a PCC-service instance without any confirmation prompt.

no data-service *pcc_data_svc1* **-noconfirm**

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

map-profile priority

This command defines the parameter and key priorities to match the profile condition for a subscriber in a PCC-service instance for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] map-profile priority map_prio_value  apn [apn_name profile-policy name
pcc_prof_name]

[no] map-profile priority map_prio_value profile-policy name pcc_prof_name]

[no] map-profile priority map_prio_value subscription-attribute name subs_attrib_name
[value] subs_attrib_value profile-policy name pcc_prof_name]
```

no

Removes/disables the set priority value of specific profile mapping parameters.

map_prio_value

Identifies the priority value of specific profile mapping parameters.
The *map_prio_value* must be an integer value from 1 through 1024.

apn *apn_name*

This keywords associates a pre-configured/defined APN name to map with specific profile mapping priority.
The *apn_name* specifies the name of the APN configured for subscriber session to which a priority value is set for profile mapping and must be an alphanumerical string from 1 through 63 characters.

condition-group *cond_grp_name*

This keywords associates a pre-configured/defined PCC-Condition-Group configured in PCC-Service Configuration mode to map with specific profile making priority.
The *cond_grp_name* is pre-configured PCC-Condition-Group and must be an alphanumerical string from 1 through 63 characters.

Important: For more information on PCC-Condition-Group configuration, refer **condition-group** command in this chapter.

spr-profile-not-found

This keyword set the condition based on unavailability of subscriber profile on SSC.
This support is provided to select a pre-configured profile policy *pcc_prof_name* if subscriber's SPR profile is not available and to allow operator to have different policies for such Subscribers.
If operator does not want to map a separate profile but treat such Subscribers differently, then a condition based on this criteria can be configured in *PCC-Condition-Group Configuration Mode*.

subscription-attribute name *subs_attrib_name*

This keywords associates a pre-configured/defined subscription attributes to map with specific profile making priority.
The *subs_attrib_name* specifies the subscription attribute name set/configured for the subscriber to which a priority value is set for profile mapping and must be an alphanumerical string from 1 through 63 characters.

value *subs_attrib_value*

This keywords associates a pre-configured/defined subscription attributes value associated with a subscription attribute name to map with specific profile making priority.
The *subs_attrib_value* specifies the subscription attribute value associated with a subscription attribute name set/configured for the subscriber to which a priority value is set for profile mapping and must be an alphanumerical string of 1 through 63 characters.

profile-policy *pcc_prof_name*

This keywords associates a pre-configured/defined PCC-Service-Profile configured in PCC-Service Configuration mode to map with specific profile making priority.
The *pcc_prof_name* is pre-configured PCC-Service-Profile and must be an alphanumerical string from 1 through 63 characters.

Important: For more information on PCC-Service-Profile configuration, refer **profile-policy** command in this chapter.

Usage

Use this command to identify the keys used to match the profile for a subscriber in a PCC-service instance for IPCF configuration.
The profile map is used when the subscriber session established. It is based on the priority of map and condition matches the corresponding named profile is used for the subscriber session.

Important: For a subscriber session, only a single profile will match.

Example

Following command configures the profile mapping priority to *2* for an APN named *apn_ipcf1* with PCC-Service-Profile named *pcc_prof1* with in a PCC-service instance.

```
map-profile priority 2 apn apn_ipcf1 profile-policy name pcc_profile1
```

Following command configures the profile mapping priority to *0* for all sessions with PCC-Service-Profile named *pcc_prof2* with in a PCC-service instance.

```
map-profile priority 2 profile-policy name pcc_profile2
```

monitoring-key

This command creates a monitoring key and sets the threshold to provide the facility for tracking and dynamic Policy control based on subscriber usage in a PCC-service instance for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

monitoring-key {**any** | *mon_key_value* **grant-size** *grant_volume*

[**no**]**monitoring-key** *mon_key_value*

[**default**] **monitoring-key any**

no

Removes/disables the configured Monitoring Key in IPCF.

any

Default: Enabled
This keywords sets the threshold size for ANY monitoring key to configured grant volume size. IPCF uses the configured grant size while installing a Monitoring Key in PCEF.

mon_key_value

This keywords configures the Monitoring Key with a configurable grant volume size. IPCF installs this Monitoring Key in PCEF for usage tracking.
mon_key_value must be an integer between 1 through 65535.

grant-size *grant_volume*

Default: 1024
This keywords associates a configurable grant size volume in Kilo Bytes for specific usage Monitor Key on IPCF to install on PCEF.
The *grant_volume* specifies the threshold volume in Kilo Bytes for any usage Monitoring Key and must be an integer between 1 through 4294967296.

Usage

Use this command to allow operator to configure the threshold size for a monitoring key in a PCC-service instance in IPCF. IPCF uses the configured grant size while installing a Monitoring Key in PCEF. The configured grant size value is configurable to reduce the amount of usage over shooting any of the usage conditions.
PCEF when instructed by IPCF keeps track of usage per Monitoring Key and also reports the usage when either thresholds reached or requested by IPCF.
To allow operator to have dynamic Policy control, the IPCF uses objects called as Usage Monitor. Currently an Usage Monitor has single attribute of Volume-limit only. Operator can “associate” different Monitoring

Keys to these usage monitors. It can be a Many-To-Many relationship between Usage-Monitor and Monitoring-Key.
Operator has option to set usage conditions on Usage Monitors instead of Monitoring Keys directly.

Example

Following command configures the Monitoring Key *2* for a grant size of *2048* Kilo Bytes with in a PCC-service instance.

```
monitoring-key 2 grant-size 2048
```

multiple-pcef-per-subscriber

This command enables the IPCF to support more than one **Gx**-session for single subscriber session coming from multiple PCEF in a PCC-service instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] multiple-pcef-per-subscriber
```

no

Default: Disabled
Removes the multiple **Gx** session for a single subscriber from a PCC-service instance for IPCF configuration.

default

Sets the PCC-service instance to default setting to accept the multiple **Gx** session for a single subscriber for IPCF configuration.

Usage

Use this command to enable multiple **Gx** session and multiple PCEF support for a single subscriber in a PCC-service instance for IPCF configuration.
By default this feature is enabled.

Example

Following command sets the IPCF to accept multiple **Gx** sessions from multiple PCEFs for a single subscriber with in a PCC-service instance.

```
multiple-pcef-per-subscriber
```

profile

This command creates a new PCC-Service-Profile or modifies a previously configured policy profile and enters the PCC-Service-Profile Configuration Mode. This command can also be used to delete an existing PCC-Service-Profile.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

profile *pcc_prof_name* [**-noconfirm**]

no profile *pcc_prof_name*

no

Removes the configured PCC-Service-Profile from a PCC-service instance for IPCF configuration.

pcc_prof_name

Identifies the name of the PCC-Service-Profile which is to be created or modified through this command. The *pcc_prof_name* must be an alphanumerical string from 1 through 63 characters. A maximum of 32 profiles can be configured in a PCC-service instance.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/remove/configure a PCC-Service-Profile for managing the policy requirement and objectives for network specific to a group of subscribers in the network in a PCC-service instance for IPCF configuration.
A profile manages multiple *Condition-Groups* and associated *Action-Sets* pairs in an ordered manner. On internal or external triggers that cause the profile evaluation, the PCC-rules-engine, evaluates the conditions within the *Condition-Groups* in the specified priority. Corresponding actions performed for *Condition-Groups* that evaluates to *TRUE*. Once a *TRUE* match found the evaluation of *Condition-Groups* does not continue further.
A maximum of 32 PCC-Service-Profiles can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-profile))#
```

The commands configured in this mode are defined in the *PCC-Service-Profile Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-Service-Profile can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command creates a PCC-Service-Profile named *pcc_prof1* with in a PCC-service instance.

```
profile pcc_prof1
```

Following command removes a pre-configured PCC-Service-Profile named *pcc_prof1* from a PCC-service instance.

```
no profile pcc_prof1
```

qos-profile

This command creates a new PCC-QoS-Profile for QoS parameters or modify a pre-configured PCC-QoS-Profile and enters the PCC-QoS-Profile Configuration Mode. This command can also be used to delete an existing PCC-QoS-Profile.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

qos-profile *qos_prof_name* [**-noconfirm**]

no qos-profile *qos_prof_name*

no

Removes the configured PCC-QoS-Profile from a PCC-service instance for IPCF configuration.

qos_prof_name

Identifies the name of the PCC-QoS-Profile which is to be created or modified through this command. The *qos_prof_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create and configure a PCC-QoS profile in a PCC-service instance for IPCF configuration.
A PCC-QoS-Profile represents a resource requirement identified by means of the corresponding QoS attributes such as:

- QoS class identifier
- Maximum Requested bandwidth for uplink (UL)
- Maximum Requested bandwidth downlink (DL)
- Guaranteed bandwidth for uplink (UL)
- Guaranteed bandwidth downlink (DL)
- Allocation and Retention Priority (ARP)

A maximum of 256 PCC-QoS-Profiles can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-qos-profile))#
```

The commands configured in this mode are defined in the *PCC-QoS-Profile Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-QoS-Profiles can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command creates a PCC-QoS-Profile named *qos_profile1* with in a PCC-service instance.

```
qos-profile qos_profile1
```

Following command removes a pre-configured PCC-QoS-Profile named *qos_profile1* from a PCC-service instance.

```
no qos-profile qos_profile1
```

spr-failure

This command defines SSC session failure handling policies in a PCC-service instance on an IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
spr-failure after-auth {continue | terminate}

[default] spr-failure after-auth
```

default

Sets the configured SSC session failure handling parameters and actions to default action of **continue** with a PCC-service instance for IPCF configuration.

after-auth {continue | terminate}

This keyword is used to set the PCC-service to take decision on SSC communication failure after authorization of session.
Following actions are initiated on SSC session failure after authorization:

- **continue**: IPCF allows session to continue.
- **terminate**: IPCF terminates the session for subscriber.

Usage

Use this command to set the PCC-service to take decision on SSC communication failure after authorization of session.

Example

Following command sets the session failure handling policy with SSC to **terminate** the session on failure of communication with SSC after authorization in a PCC-service instance.

```
spr-failure after-auth terminate
```

ssc-usage-update-policy

This command provides the configuration to manage the SSC update frequency over **Sp** interface for usage reports received from PCEF over **Gx** interface in a PCC-service instance for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[default] ssc-usage-update-policy {always | average-tps tps | on-terminate}
```

default

Sets the PCC-service to configure the SSC update frequency to **always** over **Sp** interface for usage reports received from PCEF over **Gx** interface in a PCC-service instance for IPCF configuration.

always

Default: Enabled
This keyword sets the PCC-service instance to generate SSC usage update every time PCC-service instance received Usage Report from PCEF over **Gx** interface for IPCF configuration.

average-tps *tps*

Default: Disabled
This keyword generates the SSC usage update towards the SSC over **Sp** interface for Usage Reports received by IPCF from PCEF over **Gx** interface only when average transaction-per-second exceeds the configured threshold *tps*.
The *tps* specifies the average transactions-per-second on IPCF and must be an integer from 1 through 5000.

on-terminate

Default: Disabled
This keyword generates the SSC usage update towards the SSC over **Sp** interface for Usage Reports received by IPCF from PCEF over **Gx** interface only when IP-CAN session terminates.

Usage

Use this command to configure the PCC-service to manage the SSC update frequency over **Sp** interface for Usage Reports received from PCEF over **Gx** interface in a PCC-service instance for IPCF configuration.

Example

Following command configures the SSC usage update over **Sp** interface every time when a usage report is received over **Gx** interface in a PCC-service instance.

```
default ssc-usage-update-policy
```

timedef

This command creates a new Time Definition (TimeDef), or modify a pre-configured Timedef and enters the PCC-TimeDef Configuration Mode. This command can also be used to delete an existing PCC-TimeDef.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] timedef timedef_name [-noconfirm]
```

no

Removes the configured PCC-TimeDef from a PCC-service instance for IPCF configuration.

timedef_name

Identifies the name of the PCC-TimeDef which is to be created or modified through this command.
The *timedef_name* must be an alphanumerical string from 1 through 127 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create and configure a PCC-Time Definition (TimeDef) in a PCC-service instance for IPCF configuration.
The PCC-TimeDefs can be used to configured date and time for triggering the event for policy related procedures as well.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-timedef))#
```

A maximum of 512 PCC-TimeDefs can be configured in 1 instance of PCC-Service.
The commands configured in this mode are defined in the *PCC-TimeDef Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-TimeDefs can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command creates a PCC-TimeDef named *time_day1* with in a PCC-service instance.

```
timedef time_day1
```

Following command removes a pre-configured PCC-TimeDef named *time_day1* from a PCC-service instance.

no timedef*time_day1*

timeout idle

Configures the idle timeout duration for subscriber session and also sets the action to be taken by system on expiry of timeout duration .

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

timeout idle *idle_dur* [**action reauthorize**]

no timeout idle

default timeout idle

no

Removes the configured idle timeout value and action set in in PCC Service instance.

default

Sets the the idle timeout duration to the default value of '0' which disables the idle timeout configuration in PCC Service instance.

idle_dur

Default: 0
Designates the maximum duration of the session, in seconds, after the expiry of which the system considers the session as dormant or idle and invokes the reauthorization of session action, if configured.
idle_dur must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

action reauthorize

This optional keyword sets the system to trigger the reauthorization of session after expiry of the timeout duration configured through *idle_dur* value.

Usage

Use this command to set the idle time duration for subscriber session to determine the dormant session.
This is configuration sets the time in seconds for idle session (sessions with no activity/signaling). On expiry of this timeout duration action of reauthorization of session shall be triggered. In case of reauthorization request failure, session termination shall be triggered.
Refer to the **timeout long-duration** command in this chapter for additional information.

Important: Reduce the timeout duration to free session resources faster for use by new requests.

Example

Following command sets the idle timeout duration to *450* seconds.

```
timeout idle 450
```

timeout setup

Configures the timeout duration for IPCF setup session.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

timeout setup *setup_dur*

no timeout setup

default timeout setup

no

Removes the configured setup timeout value and action set in in PCC Service instance.

default

Sets the the setup timeout duration to the default value of 60. The special value of '0' disables the setup timeout configuration in PCC Service instance.

setup_dur

Default: 60
Designates the maximum duration for the IPCF session setup, in seconds, after the expiry of which the system considers the IPCF session setup as failure and terminates the setup process.
setup_dur must be a value in the range from 0 through 120.
The special value 0 disables the setup timeout specified.

Usage

Use this command to set the time duration for IPCF session setup to determine the failure of IPCF setup process.

Example

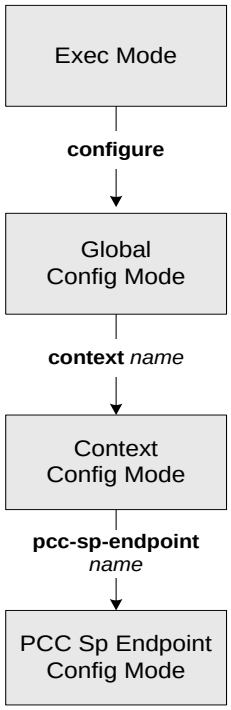
Following command sets the IPCF session timeout duration to *30* seconds.

```
timeout setup 30
```

Chapter 224
PCC-Sp-Endpoint Configuration Mode Commands

The PCC-Sp-Endpoint Configuration mode provides a mechanism for Intelligent Policy Control Function (IPCF) to support the **Sp** interface endpoint. It represents a client end for SSC interactions. The PCC-Sp-Endpoint configuration mode facilitates the configuration of **Sp** interface, and manages the connection and operational parameters related to its peer.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



access-type

This command is used to define the type of access protocol to be used with a PCC-Sp-Endpoint instance for IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
access-type {diameter | ldap}

default access-type
```

default

Sets access type protocol to be used by endpoints to default protocol of **Diameter** protocol in a PCC-Sp-Endpoint instance for IPCF configuration.

diameter

Default: Enabled
Sets access type protocol to be used by endpoints to Diameter protocol in a PCC-Sp-Endpoint instance for IPCF configuration.

ldap

Default: Disabled
Sets access type protocol to be used by endpoints to Lightweight Directory Access Protocol (LDAP) in a PCC-Sp-Endpoint instance for IPCF configuration.

Usage

Use this command to define the type of access protocol to be used with a PCC-Sp-Endpoint instance for IPCF configuration.

Example

Following command sets the access type of protocol to **Diameter** for a PCC-Sp-Endpoint instance.

```
default access-type
```

diameter dictionary

This command is used to assign a Diameter dictionary for interaction with SSC and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter dictionary {**sh-custon-starent** | **sh-standard**}

default diameter dictionary

default

Sets the Diameter **Sh** dictionary to default dictionary **sh-custon-starent** (3GPP Rel. 8 Sh standard) for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

sh-custom-starent

Default: Enabled
Sets the Diameter **Sh** dictionary to default dictionary **sh-custom-starent** for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

sh-standard

Default: Disabled
Sets the Diameter **Sh** dictionary to default dictionary **sh-standard** (3GPP Rel. 8 standard) for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

Usage

Use this command to assign a Diameter dictionary for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

Example

Following command sets the Diameter dictionary for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration to 3GPP Rel. 8 standard.

```
diameter dictionary sh-standard
```

diameter origin end-point

This command is used to bind/associate a pre-configured Diameter host/realm (SSC) over **Sp** interface for SPR interactions with a PCC-Sp-Endpoint instance to be used for subscriber profile and policy management.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *ssc_node_name*

no diameter origin endpoint

no

Removes the associated Diameter Origin Endpoint configuration from PCC-Sp-Endpoint instance configured for IPCF configuration.

ssc_node_name

The *ssc_node_name* is a predefined Diameter origin endpoint node (SSC) and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to bind the SSC node over **Sp** interface by associating a pre-configured Diameter Origin Endpoint configuration with a PCC-Sp-Endpoint instance.
The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter.

Example

Following command associates a pre-configured Diameter endpoint node configuration named *ssc_1* with a PCC-Sp-Endpoint instance for subscriber policy profile management.

```
diameter origin endpoint ssc_1
```

Following command removes the pre-associated Diameter endpoint node configuration named *ssc_1* from a PCC-Sp-Endpoint instance.

```
no diameter origin endpoint
```

diameter peer-select

This command nominates primary and secondary Diameter peers amongst the peers configured under Diameter Endpoint Configuration instance which is associated with a PCC-Sp-Endpoint configuration.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter peer-select peer *pri_peer_name* [**realm** *realm_name*] [**secondary peer** *sec_peer_name* [**realm** *sec_realm_name*]]

no diameter peer-select

no

Removes the configured Diameter peer from peer-select process which are configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configured for IPCF configuration.

peer *pri_peer_name*

Sets a configured Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, as **primary** in Diameter peer selection process for IPCF configuration.
The *pri_peer_name* is a pre-configured Diameter peer in Diameter Endpoint configuration which is associated with a PCC-Sp-Endpoint configuration and must be an alphanumerical string from 1 through 63 characters. *pri_peer_name* allows punctuation marks.

realm *realm-name*

This keyword optionally defines the realm (domain) of a configured **primary** Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, in Diameter peer selection process for IPCF configuration.
realm_name is the realm (domain) of the associated primary Diameter peer in Diameter Endpoint configuration which associated with a PCC-Sp-Endpoint configuration. The *realm_name* must be an alpha and/or numeric string of from 1 to 127 characters. The realm may typically be a company or service name and it allows punctuation marks.

secondary peer *sec_peer_name*

Sets a configured Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, as **secondary** in Diameter peer selection process for IPCF configuration.
The *sec_peer_name* is a pre-configured Diameter peer in Diameter Endpoint configuration which is associated with a PCC-Sp-Endpoint configuration and must be an alphanumerical string from 1 through 63 characters. *sec_peer_name* allows punctuation marks.

realm *sec_realm-name*

This keyword optionally defines the realm (domain) of a configured **secondary** Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, in Diameter peer selection process for IPCF configuration.
sec_realm_name is the realm (domain) of the associated primary Diameter peer in Diameter Endpoint configuration which associated with a PCC-Sp-Endpoint configuration. The *sec_realm_name* must be an alpha and/or numeric string of from 1 to 127 characters. The realm may typically be a company or service name and it allows punctuation marks.

Usage

Use this command to nominate primary and secondary Diameter peers amongst the peers configured under Diameter Endpoint Configuration instance which is associated with a PCC-Sp-Endpoint configuration. When both primary and secondary are down, the remaining Diameter peers are chosen based on their configured weight in round robin manner.
Multiple Diameter peers can be configured in a PCC-Sp-Endpoint instance by entering this command multiple times.

Example

Following command nominates a pre-configured Diameter peer *dia1* as primary and *dia2* as secondary for Diameter peer selection process in a PCC-Sp-Endpoint configuration instance.

```
diameter peer-select peer dia1 secondary peer dia2
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

profile-data

This command allows the operator to specify data-reference and service indication AVP values used in UDR/SNR message for profile data sent over **Sp** endpoint when access type is set to Diameter.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

profile-data key data-reference *data_ref_value* [**service-indication** *svc_ind_value*]

default profile-data key

default

Specifies the data-reference value used in UDR/SNR message for profile data sent over **Sp** endpoint to default value of '*0*' (zero) and service indication AVP value to *profile data* when access type is set to Diameter in PCC-Sp-Endpoint instance.

data-reference *data_ref_value*

Default: 0
Specifies the data-reference values used in UDR/SNR message for profile data sent over **Sp** endpoint when access type is set to Diameter in PCC-Sp-Endpoint instance.
The data reference value *data_ref_value* must be an integer from 1 through 65535.

service-indication *svc_ind_value*

Specifies the service indication AVP value used in UDR/SNR message for profile data sent over **Sp** endpoint when access type is set to Diameter in PCC-Sp-Endpoint instance.

Important: The Service-Indication values are set as per application logic and are supposed to be used only with SSC.

The service indication value *svc_ind_value* must be a string of alpha and/or numeric characters from 1 to 32 characters.

Usage

Use this command to allow the operator to specify data-reference and service indication AVP values used in UDR/SNR message for profile data sent over **Sp** endpoint when access type is set to Diameter in PCC-Sp-Endpoint configuration instance.
Default service-indication value varies as per other interface configuration **default profile-data key** is used to set the service indication value.

Example

Following command set the data-reference value used in UDR/SNR message for profile data sent over **Sp** endpoint to default value of '*0*' (zero) and service-indication value as per application logic when access type is set to Diameter in PCC-Sp-Endpoint instance.

```
default profile-data key
```

profile-update-notification

This command sets the system to indicate whether SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
profile-update-notification {allow | disallow}

default profile-update-notification
```

default

Set the PCC-Sp-Endpoint instance default mode for supporting profile update notifications in a PCC-Sp-Endpoint instance and also to use the same in a PCC-Sp-Endpoint configuration instance.

allow

Default: Enabled
Set the PCC-Sp-Endpoint instance to support the profile update notifications and also allow to use the same in **Sp** interaction.

disallow

Default: Disabled
Set the PCC-Sp-Endpoint instance to not to support the profile update notifications and also does not allow to use the same in **Sp** interaction.

Usage

Use command to set to indicate whether SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance. It also sets that whether profile update notification should be used or not for a PCC-Sp-Endpoint configuration instance.

Example

Following command indicates that SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance and also allow to use it for a PCC-Sp-Endpoint configuration instance.

```
default profile-update-notification
```

spr subscriber identifier

This command sets the PCC-Sp-Endpoint instance to indicate how a subscriber is uniquely identified in SPR database while requesting subscriber data from SSC.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

spr subscriber identifier {**imsi** | **msisdn** | **nai**}

default spr subscriber identifier

default

Sets the PCC-Sp-Endpoint instance to use subscriber IMSI to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

imsi

Default: Enabled
Sets the PCC-Sp-Endpoint instance to use subscriber IMSI to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

msisdn

Default: Disabled
Sets the PCC-Sp-Endpoint instance to use subscriber MSISDN to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

nai

Default: Disabled
Sets the PCC-Sp-Endpoint instance to use Network Address Identifier as token to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.
This token facilitates CDMA users for Policy Control and Charging functions.

Usage

Use command to set the PCC-Sp-Endpoint instance to indicate how a subscriber is uniquely identified in SPR database on SSC while requesting subscriber data. By default it uses Subscriber IMSI for identification in SPR database.
For IP-CAN session between PDSN and IPCF the subscriber token NAI facilitates the Policy Control and Charging functions to subscribers.

Example

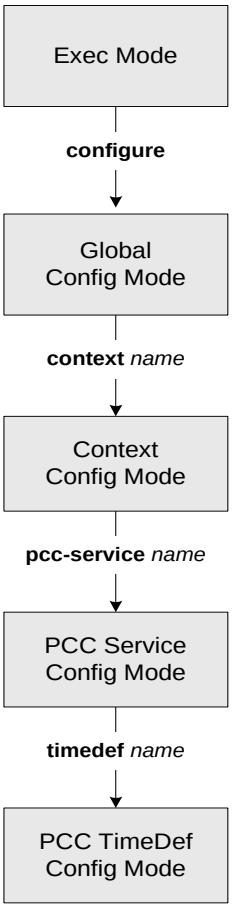
Following command sets the PCC-Sp-Endpoint instance to use a subscriber IMSI to uniquely identified in SPR database at SSC.

```
default spr subscriber identifier
```

Chapter 225
PCC-TimeDef Configuration Mode Commands

The PCC-TimeDef Configuration Mode is used to configure various time definitions (TimeDefs) in the PCC-service instance. A PCC-TimeDef specifies the start and end time for triggering policy-related procedures or conditions.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

start date

This command defines PCC-TimeDefs with a start and end dates with time for an event to trigger a procedure or condition in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] start date *start_date* **time** *start_time* **end date** *end_date* **time** *end_time*

no

Removes the specified time definition.

date *start_date*

Specifies the start date *start_date* in *MM*/*DD*/*YY* format.
Following format is used for *MM*/*DD*/*YY* in *start_date*:

- *MM* specifies the month of the start date from January through December and must be an integer between 1 through 12.
- *DD* specifies the date of month of the start date 1 through 31 and must be an integer between 1 through 31.
- *YY* specifies the year of the start date from 2010 through 2037 and must be an integer between 10 through 37.

time *start_time*

Specifies the start time *start_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *start_time*:

- *HH* specifies the hour of the start date in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the start date must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the start date must be an integer between 00 through 59.

end date *end_date*

Specifies the end date *end_date* in *MM*/*DD*/*YY* format.
Following format is used for *MM*/*DD*/*YY* in *end_date*:

- *MM* specifies the month of the end date from January through December and must be an integer between 1 through 12.
- *DD* specifies the date of month of the end date 1 through 31 and must be an integer between 1 through 31.
- *YY* specifies the year of the end date from 2010 through 2037 and must be an integer between 10 through 37.

time *end_time*

Specifies the end time *end_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *end_time*:

- *HH* specifies the hour of the end date in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the end date must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the end date must be an integer between 00 through 59.

Usage

Use this command to define a PCC-TimeDef with a start and end dates with time for an event to trigger a procedure or condition in an IP-CAN session.

Example

The following command defines a PCC-TimeDef with start date as December 31st 2010 at 00 Hrs. 30 mins. and 00 seconds and end date as January 31st 2011 at 23 Hrs. 59 mins. and 59 seconds:

start date *12/31/10* **time** *00 30 00* **end date** *01/31/11* **time** *23 59 59*

start day

This command defines PCC-TimeDefs with a start and end week days with time for an event to trigger a procedure or condition in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] start day *start_weekdays* **time** *start_time* **end day** *end_weekdays* **time** *end_time*

no

Removes the specified time definition.

day *start_weekdays*

Specifies the start day as week days.
Following days are used as *start_weekdays*:

- **friday** specifies Friday of the week as start day.
- **monday** specifies Monday of the week as start day.
- **saturday** specifies Saturday of the week as start day.
- **sunday** specifies Sunday of the week as start day.
- **thrusday** specifies Thursday of the week as start day.
- **tuesday** specifies Tuesday of the week as start day.
- **wednesday** specifies Wednesday of the week as start day.

time *start_time*

Specifies the start time *start_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *start_time*:

- *HH* specifies the hour of the start day in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the start day must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the start day must be an integer between 00 through 59.

end day *end_weekdays*

Specifies the end day as week days.
Following days are used as *end_weekdays*:

- **friday** specifies Friday of the week as end day.
- **monday** specifies Monday of the week as end day.
- **saturday** specifies Saturday of the week as end day.

- **sunday** specifies Sunday of the week as end day.
- **thrusday** specifies Thursday of the week as end day.
- **tuesday** specifies Tuesday of the week as end day.
- **wednesday** specifies Wednesday of the week as end day.

time *end_time*

Specifies the end time *end_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *end_time*:

- *HH* specifies the hour of the end day in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the end day must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the end day must be an integer between 00 through 59.

Usage

Use this command to define a PCC-TimeDef with a start and end weekdays with time for an event to trigger a procedure or condition in an IP-CAN session.

Example

The following command defines a PCC-TimeDef with start day as Friday at 00 Hrs. 30 mins. and 00 seconds and end day as Sunday at 23 Hrs. 59 mins. and 59 seconds:

```
start day friday time 00 30 00 end day sunday time 23 59 59
```

start time

This command defines PCC-TimeDefs with a start and end time of a day for an event to trigger a procedure or condition in an IP-CAN session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] start time start_time end time end_time
```

no

Removes the specified time definition.

time *start_time*

Specifies the start time *start_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *start_time*:

- *HH* specifies the hour of the day in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the day must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the day must be an integer between 00 through 59.

end time *end_time*

Specifies the end time *end_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *end_time*:

- *HH* specifies the end hour of the day in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the end hour of the day must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the end hour must be an integer between 00 through 59.

Usage

Use this command to define a PCC-TimeDef with a start and end time for an event to trigger a procedure or condition in an IP-CAN session.

Example

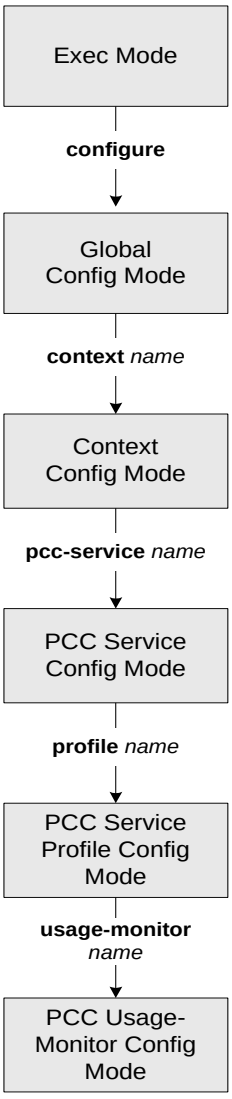
The following command defines a PCC-TimeDef with start at 00 Hrs. 30 mins. and 00 seconds and end at 23 Hrs. 59 mins. and 59 seconds:

```
start time 00 30 00 end time 23 59 59
```

Chapter 226
PCC-Usage-Monitor Configuration Mode Commands

The PCC-Usage-Monitor Configuration mode provides a mechanism to set the usage threshold limit in a PCC-Service-Profile to trigger a required condition and action set in PCC-Service instance.

Important: This configuration mode is supported from StarOS Release 12.1 onward.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

usage-limit volume

Sets the usage limit by volume for a subscriber profile for a PCC-Service-Profile on an IPCF node.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[**default usage-limit volume** [**downlink** *dlink_volume* | **total** *total_volume* | **uplink** *uplink_volume*]

default

Sets the usage limit volume to "0" for downlink, uplink and total bucket in a PCC-Service-Profile.

downlink *dlink_volume*

Specifies the usage volume (in kilobytes) in the downlink direction (from PCEF to UE) as an integer from 1 through 4294967296. A "0" (zero) value disables the downlink volume usage. Default: 0

total *total_volume*

Specifies the usage volume (in kilobytes) in the downlink and uplink directions (from PCEF to UE and PCEF to PDN) as an integer from 1 through 4294967296. A "0" (zero) value disables the downlink volume usage. Default: 0

uplink *uplink_volume*

Specifies the usage volume (in kilobytes) in the uplink direction (from PCEF to PDN) as an integer from 1 through 4294967296. A "0" (zero) value disables the downlink volume usage. Default: 0

Usage

Use this command to set the usage limit in volume for subscriber profile for a PCC-Service-Profile on IPCF node.

Example

The following command sets the usage limit volume to 20000 kilobytes in the upload direction within a PCC-Service-Profile.

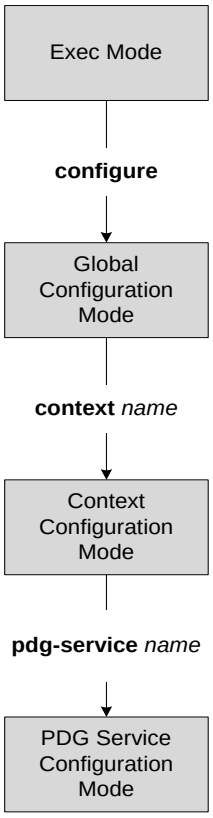
```
usage-limit volume uplink 20000
```

The following command sets the usage limit volume to 400000 kilobytes in the download direction within a PCC-Service-Profile.

```
usage-limit volume downlink 400000
```

Chapter 227
PDG Service Configuration Mode Commands

The PDG Service Configuration Mode is used to specify the properties required for the UEs in the WLAN (Wireless Local Access Network) to interface with the Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG).



aaa attribute

Sets the attributes that the system uses in AAA messages.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
aaa attribute { 3gpp-negotiated-qos-profile string }

no aaa attribute
```

3gpp-negotiated-qos-profile *string*

Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling as an alphanumeric string of 1 through 31 characters.

no aaa attribute

Removes a previously configured AAA attribute.

Usage

Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling.

Example

The following command specifies the 3GPP negotiated QoS profile to use during IMS emergency call handling:

```
aaa attribute 3gpp-negotiated-qos-profile 100
```

associate sgtp-service

Identifies the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG. TTG functionality supports GTP-C (GTP control plane) messaging and GTP-U (GTP user data plane) messaging between the TTG and the GGSN over the Gn' interface.

Important: This command can be used before the associated service instance is created and configured but care should be used to match the service names.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

`[ no ] associate sgtp-service` *`sgtp_service_name`* **`[ context`** *`sgtp_context_name`* **`]`**

`no`

Removes the service association definition from the configuration.

`sgtp-service` *`sgtp_service_name`*

Specifies which SGTP service configuration, by naming the SGTP service instance, to associate with this PDG service.
`sgtp_service_name` is an alphanumeric string of 1 through 63 characters with no spaces.

`context` *`sgpt_context_name`*

Defines the context in which the SGTP service was created. If no context is specified, the current context is used.
`sgtp_context_name` is an alphanumeric string of 1 through 63 characters with no spaces.

Usage

Use this command to associate the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG.

Example

The following command associates SGTP service *`sgtp_service_1`* with this PDG service:

```
associate sgtp-service sgtp_service_1 context sgtp_context_1
```

certificate-selection

Configures the PDG/TTG to select the trusted certificate (and the private key for calculating the AUTH payload) to be included in the first IKE_AUTH message from the PDG/TTG based on the APN (Access Point Name). The selected certificate is associated with the APN included in the IDr payload of the first IKE_AUTH message from the UE.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] certificate-selection apn-based

default certificate-selection
```

certificate-selection apn-based

Selects a trusted certificate for the first IKE-AUTH message based on the APN.

no certificate-selection

Disables APN-based certificate selection and resumes sending a certificate bound to a crypto template.

default certificate-selection

Sets the default certificate selection method to a certificate bound to a crypto template.

Usage

Configures the PDG/TTG to select the trusted certificate to be included in the first IKE_AUTH message based on the APN.

Example

Use the following example to enable APN-based certificate selection:

```
certificate-selection apn-based
```

bind

Binds the PDG service IP address to a crypto template and specifies the maximum number of sessions the PDG service supports.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bind address` *`ipv4_address`* **`{ crypto-template`** *`string`* **`} mode { ttg | pdg } [ max-sessions`** *`number`* **`]`**

`no`

Removes a previously configured binding.

`bind address` *`ipv4_address`*

Specifies the IPv4 address of the PDG service with which the UE attempts to establish an IKEv2/IPSec tunnel. This address must be a valid IP address within the context.
This is a mandatory parameter.

`crypto-template` *`string`*

Specifies the name of the crypto template to be bound to the PDG service. This is the name of the IPSec policy to be used as a template for PDG/TTG subscriber session IPSec policies. The crypto template includes most of the IPSec and IKEv2 parameters for keepalive, lifetime, NAT-T, and cryptographic and authentication algorithms. There must be one crypto template per PDG service.
This is a mandatory parameter.
`string` is an alphanumeric string of 0 through 127 characters.

`mode { ttg | pdg }`

Default: There is no default value.
Specifies whether the PDG service provides TTG or PDG functionality, as follows:

- In TTG mode, PDN connectivity is provided through the GGSN. PDG functionality is provided by the combined TTG and GGSN.
- In PDG mode, PDN connectivity and PDG functionality are provided directly through the PDG service.

This is a mandatory parameter.

Important: PDG mode is not supported in this software release.

Dependencies:
When you configure the PDG service to be in TTG mode, you must also configure the SGTP service using the **`associate sgtp-service`** command, as the TTG needs to connect with the GGSN to complete the PDG functionality.
The following behaviors occur when the PDG service operates in TTG mode:

- If the SGTP service associated with PDG service is not configured, the PDG service is not started.

- If the SGTP service associated with PDG service is not started, the PDG service is not started.
- If the SGTP service associated with PDG service is stopped, the PDG service is stopped.
- If the SGTP service associated with PDG service is re-started, the PDG service is re-started.
- If the SGTP service is not yet configured, whenever the SGTP service is started, the PDG service is started.

Note that starting or stopping the PDG service has no impact on the SGTP service.

---

max-sessions *number*

Specifies the maximum number of sessions to be supported by the PDG service as an integer from 0 through 1000000. Default: 1000000
If the max-sessions value is changed on an existing system, the new value takes effect immediately if it is higher than the current value. If the new value is lower than the current value, existing sessions remain established, but no new sessions are permitted until usage falls below the newly-configured value.

Usage

Use this command in PDG Service Configuration Mode to bind the IP address used as the connection point for establishing IKEv2/IPSec sessions to a crypto template. You can also use it to define the maximum number of sessions the PDG service supports.

Example

The following command binds a PDG service with an IP address of *10.2.3.4* to the crypto template *crypto_template_1*, sets the mode to TTG, and sets the maximum number of sessions to *500000*:

```
bind address 10.2.3.4 crypto-template crypto_template_1 mode ttg max-
sessions 500000
```

ip gnp-qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Gn' interface in the uplink direction.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ip gnp-qos-dscp {  background` *`dscp`* **`| conversational`***`dscp`* **`| interactive`** *`dscp`* **`| streaming`** *`dscp`* **`| interactive [ traffic-handling-priority`** *`traffic_priority`* **`] { allocation-retention-priority`** *`allocation_retention_priority`* **`} } +`**

`default ip gnp-qos-dscp`

`no`

Disables the overriding of the ToS (Type of Service) field and enables the pass-through option.

`background` *`dscp`*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP background class, in which the data transfer is not time-critical (for example, in e-mail exchanges). This traffic class is the lowest QoS.
`dscp`: Sets the DSCP for the specified traffic class. See the *`dscp`* section below.

`conversational` *`dscp`*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP conversational class, in which there is a constant flow of traffic in both the uplink and downlink direction. This traffic class is the highest QoS.
`dscp`: Sets the DSCP for the specified traffic pattern. See the dscp section below.

`interactive [ traffic-handling-priority` *`traffic_priority`* **`]`**

Specifies the DSCP marking to be used for packets of sessions subscribed to three possible traffic priorities in the 3GPP interactive class, in which there is an intermittent flow of packets in the uplink and downlink direction. This traffic class has a higher QoS than the background class, but not as high as the streaming class.
`traffic_priority` is the 3GPP traffic handling priority and can be the integers 1, 2 or 3.

`allocation-retention-priority` *`allocation_retention_priority`*

Specifies the DSCP for the interactive class if the allocation priority is present in the QoS profile.
`allocation-retention-priority` can be the integers 1, 2, or 3.
DSCP uses the values in the following table based on the traffic handling priority and allocation/retention priority if the allocation priority is present in the QOS profile.

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef

Allocation Priority	1	2	3
2	af21	af21	af21
3	af21	af21	af21

Important: If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

`streaming` *`dscp`*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP streaming class, in which there is a constant flow of data in either in the uplink or downlink direction. This traffic class has a higher QoS than the interactive class, but not as high as the conversational class.
dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

`dscp`

Default:

- background: be
- interactive
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming: af11
- conversational: ef

Specifies the DSCP for the specified traffic pattern. *`dscp`* can be configured to any one of the following:

• af11: Assured Forwarding 11 per-hop-behavior (PHB)	• af33: Assured Forwarding 33 PHB
• af12: Assured Forwarding 12 PHB	• af41: Assured Forwarding 41 PHB
• af13: Assured Forwarding 13 PHB	• af42: Assured Forwarding 42 PHB
• af21: Assured Forwarding 21 PHB	• af43: Assured Forwarding 43 PHB
• af22: Assured Forwarding 22 PHB	• be: Best effort forwarding PHB
• af23: Assured Forwarding 23 PHB	• ef: Expedited forwarding PHB
• af31: Assured Forwarding 31 PHB	

• af32: Assured Forwarding 32 PHB	

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Gn' interface(s).
The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Precedence (low to high)	DSCP
1	Best Effort (be)
2	Class 1
3	Class 2
4	Class 3
5	Class 4
6	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for the streaming traffic pattern to be ef:**`ip gnp-qos-dscp streaming ef`**
The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, af22, and af41, respectively:**`ip gnp-qos-dscp conversational ef streaming ef interactive af22 background af41`**

ip qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Wu interface in the downlink direction.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

ip qos-dscp { **qci** { **1** { *dscp-pt* } | **2** { *dscp-pt* } | **3** { *dscp-pt* } | **4** { *dscp-pt* } | **5** { *allocation-retention-priority 1..3* | *dscp-pt* } | **6** { *allocation-retention-priority 1..3* | *dscp-pt* } | **7** { *allocation-retention-priority 1..3dscp* | *dscp-pt* } | **8** { *allocation-retention-priority 1..3* | *dscp-pt* } | **9** { *dscp-pt* } *+* }

no ip qos-dscp { **qci** { 1 | 2 | 3 | 4 | 5 { *allocation-retention-priority 1..3* | *dscp-pt* } | 6 { *allocation-retention-priority 1..3* | *dscp-pt* } | 7 { *allocation-retention-priority 1..3* | *dscp-pt* } | 8 { *allocation-retention-priority 1..3* | *dscp-pt* } | 9 {*+*

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile.
allocation-retention-priority can be the integers 1, 2, or 3.
DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile.
The following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 29. Default DSCP Value Matrix

	Allocation Priority 1	Allocation Priority 2	Allocation Priority 3
Traffic Handling Priority			
1	ef	ef	ef
2	af21	af21	af21
3	af21	af21	af21

qci

Configures the QCI attribute of QoS. Here the *qci_val* is the QCI for which the negotiate limit is being set, it ranges from 1 to 9.

dscp

Default QCI:
- 1: ef

- 2: ef
- 3: af11
- 4: af11
- 5: ef
- 6: ef
- 7: af21
- 8: af21
- 9: be

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• **af11:** Assured Forwarding 11 per-hop-behavior (PHB)	• **af32:** Assured Forwarding 32 PHB
• **af12:** Assured Forwarding 12 PHB	• **af33:** Assured Forwarding 33 PHB
• **af13:** Assured Forwarding 13 PHB	• **af41:** Assured Forwarding 41 PHB
• **af21:** Assured Forwarding 21 PHB	• **af42:** Assured Forwarding 42 PHB
• **af22:** Assured Forwarding 22 PHB	• **af43:** Assured Forwarding 43 PHB
• **af23:** Assured Forwarding 23 PHB	• **be:** Best effort forwarding PHB
• **af31:** Assured Forwarding 31 PHB	• **ef:** Expedited forwarding PHB

+

More than one of the above keywords can be entered within a single command.

Usage

You can assign DSCP to specific traffic patterns to ensure that data packets are delivered according to the precedence with which they are tagged. The diffserv markings are applied to the outer IP header of every GTP data packet. The diffserv marking of the inner IP header is not modified.
The traffic patterns are defined by QCI (1 to 9). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

Table 30. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Table 31. DSCP Precedence

Precedence (low to high)	DSCP
0	Best Effort (be)
1	Class 1
2	Class 2
3	Class 3
4	Class 4
5	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command. The no ip qos command can be issued to remove a QOS setting and return it to it's default setting.

Example

The following command configures the DSCP level for QCI to be Expedited Forwarding,**ef**:

```
ip qos-dscp qci 1 ef
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected, or for verifying packet routing and labeling within the network.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { clear-on-valid-packet | drop-limit *num* **period** *secs* **}**

default ip source-violation { drop-limit *num* **period** *secs* **}**

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Configures the service to reset the drop-limit counters upon receipt of a properly addressed packet. Default: disabled

drop-limit *num*

Sets the maximum number of allowed IP source violations within the detection period before dropping a call. If *num* is not specified, the value is set to the default value.
num is an integer from 1 to 1000000. Default: 10

period *secs*

Sets the detection period (in seconds) for IP source violations as an integer from 1 through 1000000. If *secs* is not specified, the value is set to the default value. Default: 120

default ip source-violation { drop-limit *num* **period** *secs* **}**

Sets or restores the IP source violation detection defaults, as follows:

- **drop-limit**: Sets or restores the maximum number of IP source violations within the detection period before dropping the call to the default value of 10.
- **period**: Sets or restores the detection period for IP source violations to the default value of 120 seconds.

no ip source-violation clear-on-valid-packet

The drop-limit counters are not reset upon receipt of a properly addressed packet.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.
Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

This function operates in the following manner: When a subscriber packet is received with a source IP address violation, the system increments the IP source violation drop-limit counter and starts the timer for the IP source violation period. Every subsequent packet received with a bad source address during the IP source violation period causes the drop-limit counter to increment. For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The detection period timer continues to count throughout this process.

Example

The following command sets the drop limit to 15 and leaves the other values at their default values:

```
ip source-violation drop-limit 15
```

max-tunnels-per-ue

Specifies the maximum number of IKEv2/IPSec tunnels allowed per UE by the PDG/TTG. This maximum number is specified per PDG service.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

max-tunnels-per-ue *integer*

default max-tunnels-per-ue

integer

Specifies the maximum number of IKEv2/IPSec tunnels allowed per UE as an integer from 1 to 11. Default: 11

default max-tunnels-per-ue

Sets the maximum number of IKEv2/IPSec tunnels allowed per UE to its default value, which is 11.

Usage

Use this command to set the maximum number of IKEv2/IPSec tunnels allowed per UE.

Example

Use the following command to set the maximum number of IKEv2/IPSec tunnels allowed per UE to *2*:

```
max-tunnels-per-ue 2
```

plmn id

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_number* **mnc** *mnc_number*

no plmn id mcc *mcc_number* **mnc** *mnc_number*

---

mcc *mnc_number*

Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 200 through 999.

---

mnc *mnc_number*

Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 2-digit integer from 00 through 999.

---

no plmn id mcc *mcc_number* **mnc** *mnc_number*

Removes a previously configured PLMN identifier for the PDG service.

Usage

The PLMN ID is included in the RAI (Routing Area Identity) field of the PDP Create Request messages sent to the GGSN. Multiple PDG services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each PDG service.

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *2*:

```
plmn id mcc 462 mnc 02
```

setup-timeout

Specifies the maximum time allowed to set up a session.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *integer*

default setup-timeout

setup-timeout integer

Sets the session setup timeout value (in seconds) as an integer from 2 through 300. Default: 60

default setup-timeout

Sets or restores the default session setup timer value to 60 seconds.

Usage

The PDG/TTG clears both the user session and tunnels if a call does not initiate successfully before the session setup timer expires.

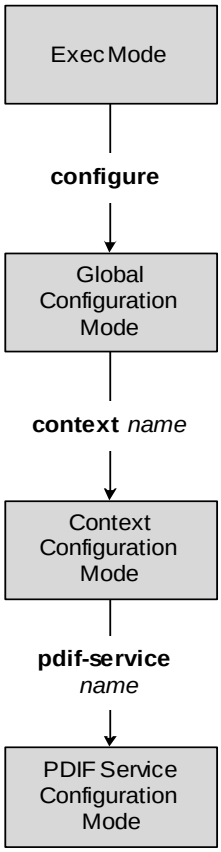
Example

The following command sets the session setup timeout value to the default value of 60 seconds:

```
default setup-timeout
```

Chapter 228
PDIF Service Configuration Mode Commands

The PDIF Service Configuration Mode is used to configure the properties required for a mobile station to interface with a Packet Data Interworking Function (PDIF).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa attribute

Sets the system attributes for AAA messages.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

aaa attribute { 3gpp2-bsid *string* **| 3gpp2-service-option** *integer* **| calling-station-id** *integer* **| 3gpp2-serving-pcf** *ip-address* **}**

no aaa attribute

default aaa attribute 3gpp2-service-option *integer*

no

Removes a previously configured AAA attribute.

default

Returns the specified aaa attribute to the original default system settings.

3gpp2-bsid *string*

Specifies the base-station ID and consists of the SID + NID + CELLID.
string must contain 12 hexadecimal upper-case ASCII characters.

3gpp2-service-option *integer*

Specifies the radius attribute value when sending authentication and accounting messages as an integer from 0 through 32767. Default: 4095

calling-station-id *integer*

Specifies the calling station phone number as a sequence of 1 through 15 digits.

3gpp2-serving-pcf *ip-address*

Use this command to generate attribute values without creating a new ASR 5000 image.

Usage

If the RADIUS protocol is being used, accounting messages can be sent over a AAA interface to the RADIUS server.
3gpp2-serving-pcf attribute value (if configured) is sent in both RADIUS authentication and accounting messages. If the attribute value is not configured (or explicitly "not configured" using the **no** keyword), RADIUS attributes are still included with just type and length. This is because inclusion/exclusion of RADIUS attributes are still controlled through the dictionary, not via the CLI.

Example

The following command identifies the base station ID:

```
aaa attribute 3gpp2-bsid 0ab2389acb3
```

aaa authentication

Sets the aaa authentication for first and second phase authentication when multiple authentication is configured on the system.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

aaa authentication { { first-phase | second-phase } | { context-name *name* **aaa-group** *name* **} }**

no aaa authentication { first-phase | second-phase }

no aaa authentication { first-phase | second-phase }

Removes any existing authentication configuration.

first-phase context-name *name* **aaa-group** *name*

Specifies the context name and the aaa group name configured in the context for the first authentication phase.

Important: First phase authentication is mandatory when multiple authentication is configured on the system.

- **context-name** *name*: Specifies the context where the aaa server group is defined as an alphanumeric string of 1 through 79 characters.
- **aaa-group** *name*: Specifies the name of the aaa-group to be used for authentication as an alphanumeric string of 1 through 79 characters.

second-phase context-name *name* **aaa-group** *name*

Specifies the context name and the aaa group name configured in the context for the second authentication phase.

- **context-name** *name*: Specifies the context where aaa server group is defined as an alphanumeric string of 1 through 79 characters.
- **aaa-group** *name*: Specifies the name of the aaa-group to be used for authentication as an alphanumeric string of 1 through 63 characters.

Usage

Two phase-authentication happens in IKEv2 setup for setting up the IPSec session. The first authentication uses Diameter AAA EAP method and second authentication uses RADIUS AAA authentication. The same AAA context may be used for both authentications. PDIF service allows you to specify only a single AAA group, which could normally be used for the first authentication method.

A given AAA group only supports either Diameter or RADIUS authentication. If the NAI in the first authentication is different from NAI in the second authentication each NAI can point to a different domain profile in the PDIF. Each domain profile may be configured with each AAA group, one for Diameter and the other for RADIUS.

Example

Use the following to configure first-phase authentication for an aaa group named *aaa-10* in the PDIF context:

```
first-phase context-name pdif aaa-group aaa-10
```

bind

Binds the service IP address to a crypto template and configures the number of sessions the PDIF can support.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
bind address address { crypto-template string } [ max-sessions number ]

no bind
```

no

Removes a previously configured binding.

address

Specifies the IP address of the service.

crypto-template *string*

Specifies the name of the crypto template to be bound to the service as an alphanumeric string of 0 through 127 characters.

max-sessions *number*

Specifies the maximum number of sessions to be supported by the service as an integer from 0 to 3000000. Default: 3000000

Usage

Binds the IP address used as the connection point for establishing the IKEv2 sessions to the crypto template. It can also define the number of sessions the PDIF can support.

Example

The following command binds a service with the IP address *13.1.1.1* to the crypto template *T1* and sets the maximum number of sessions to *2000000*:

```
bind address 13.1.1.1 crypto-template T1 max-sessions 200000
```

default

Sets or restores the default condition for the selected parameter.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

default { { aaa attribute 3gpp2-service-option } | duplicate-session-detection | hss { failure-handling mac-address-validation-failure | mac-address-validation | update-profile } | ip source-violation { drop-limit | period } | setup-timeout | subscriber *name* **| username mac-address-stripping } }**

---

aaa attribute 3gpp2-service-option

Configures the default value 4095.

---

duplicate-session-detection

Configures the default to be NAI-based.

---

hss { failure-handling mac-address-validation-failure | mac-address-validation | update-profile }

Configures the HSS server defaults:
failure-handling mac-address-validation-failure: By default, the MAC address is validated by IMS-Sh interface.

- **mac-address-validation**: By default, validating the MAC address is disabled.
- **update-profile**: By default, updating the PDIF profile is disabled.

---

ip source-violation (drop-limit | period }

Configures IP source-violation detection defaults.

- **drop-limit**: Default number of ip source violations permitted in detection period before the call is dropped is 10.
- **period**: Default detection period is 120 seconds.

---

setup-timeout

Default call setup time limit is 60 seconds.

---

subscriber *name*

Configures the default subscriber name. *name* is a string of 1-127 characters.

---

username mac-address-stripping

Default is to disable stripping the MAC address from the username.

Usage

Configures the default settings for a given parameter.

Example

Use the following example to configure the default call setup time limit:

```
default setup-timeout
```

duplicate-session-detection

Configures the PDIF to detect duplicate call sessions using old IMSI or NAI addresses and clear old call information.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] duplicate-session-detection { imsi-based | nai-based }
```

no

Stops duplicate session detection.

default

Configures the default setting, which is NAI-based detection.

imsi-based

Configures the PDIF to detect duplicate call sessions based on the IMSI address.

nai-based

Configures the PDIF to detect duplicate call sessions based on the NAI address. This is the default setting.

Usage

If an MS leaves the Wi-Fi coverage area and subsequently comes back online, it may initiate a new session setup procedure. After both the device authentication with HSS and the subscriber authentication with AAA server are completed, PDIF runs the internal mechanism to see whether there was any other session bound with the same IMSI. If an old session is detected, PDIF starts clearing this old session by sending a proxy-MIP Deregistration request to the HA. PDIF resumes new session setup by sending a proxy-MIP registration request. When the old session is aborted, PDIF sends Diameter STR messages and RADIUS Acct STOP messages to corresponding AAA servers.
PDIF allows duplicate session detection based on either the NAI or IMSI addresses. When detecting based on NAI, it is the first-phase (device authentication) NAI that is used.

Example

The following command configures duplicate session detection to use IMSI addressing:

```
duplicate-session-detection imsi
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

hss

Configures the Home Subscriber Server (HSS) parameters.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
hss { failure-handling { { mac-address-validation-failure | update-profile } action {
terminate | continue } } | update-profile | mac-address-validation }

[ no | default ] hss { failure-handling | update-profile | mac-address-validation }
```

no

Removes a previously configured HSS profile.

default

Resets the defaults for this command.

failure-handling mac-address-validation-failure

Configures how the HSS is to handle errors.
If HSS returns a list of MAC addresses and if PDIF fails to match the subscriber MAC address against the list, the session is always terminated.

action { continue | terminate }

Configures the action to be performed depending on the failure type.

- **continue**: Ignores a mac-address-validation-failure and continue the session.
- **terminate**: Terminates the session on a mac-address-validation-failure.

mac-address-validation

If mac-address-validation is enabled, the PDIF queries the HSS for a list of MAC addresses associated with the Mobile Directory Number (MDN). Default: Disabled

update-profile

Update the HSS with the subscriber profile. Default: Disabled

Usage

An HSS provides MAC address validation and store part of the subscriber profile. This command enables or disables validation and profile updates, and configures how the system responds to failures: terminate or continue a session.
An ims-sh-service and Diameter interface need to be configured to communicate with the HSS.

Example

The following example enables *mac-address* validation:

```
hss mac-address-validation
```

ims-sh-service

Associates the IMS-Sh-service parameters.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

ims-sh-service name *name*

no ims-sh-service name *name*

no

Removes a previously configured IMS-Sh-service.

name

Names the IMS-Sh-service in the pdif-service context.

Usage

This command is used to name the IMS-Sh-service.

Example

The following command names the IMS-Sh-service ims1:

```
ims-sh-service name imsi1
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires that the source address of the received packets matches the IP address assigned to the subscriber (either statically or dynamically) during the session.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { **clear-on-valid-packet** | **drop-limit** *num* | **period** *secs* }

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet. Default: disabled

drop-limit *num*

Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.
num is an integer from 1 to 1000000. Default: 10

period *secs*

Sets the length of time (in seconds) for a source violation detection period to last.
If *secs* is not specified, the value is set to the default.
secs is an integer from 1 to1000000. Default: 120

Usage

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs a number of times during a handoff scenario.
This function operates in the following manner:
When a subscriber packet is received with a source address violation, the system increments the IP source-violation drop-limit counter and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the drop-limit counter to increment.
For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The period timer continues to count throughout this process.

Example

The following command sets the drop limit to *15* and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```

mobile-ip

Sets the MIP FA context for the specific PDIF service.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

mobile-ip foreign-agent context *string* **[fa-service** *string* **]**

no mobile-ip

no

Removes previously configured parameters.

foreign-agent context *string*

Specifies the context name in which the FA is configured as an alphanumeric string of 1 through 79 characters.

fa-service *string*

Specifies the name of the FA service in the FA context as an alphanumeric string of 1 through 79 characters.

Usage

Shows in which context the FA is located and names the FA service.

Example

This command configures MIP for the FA context named *fa1*:

```
mobile-ip foreign-agent context fa1
```

setup-timeout

Configures the maximum time allowed to set up a session.

Product

PDIF

Privilege

Security-Administrator, Administrator

Syntax

setup-timeout *integer*

default setup-timeout

setup-timeout *integer*

Specifies the session setup timer (in seconds) as an integer from 2 through 300. Default: 60

default setup-timeout

Defaults the session setup timer to 60 seconds.

Usage

PDIF clears both user session and tunnels if a call does not initiate successfully before the timer expires.

Example

The following command sets the setup-timeout to the default 30 seconds:

```
default setup-timeout
```

username

Configures mac-address-stripping on a username coming in from a mobile station session.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
username mac-address-stripping

[ default | no ] username mac-address-stripping
```

username mac-address-stripping

Configures mac-address stripping from the Network Access Identifier (NAI).

default

Configures the default parameter which is **disabled**.

no

Returns the configuration to the default condition.

Usage

When enabled, PDIF strips the MAC address from a mobile username NAI before sending to the RADIUS AAA server.

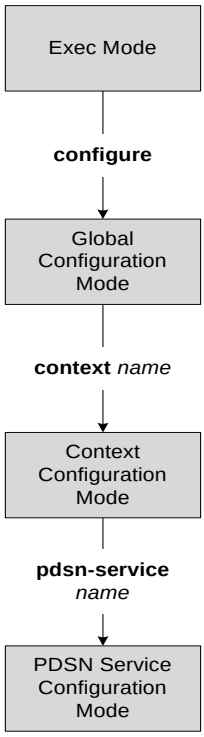
Example

The following example disables mac-address-stripping.

```
no username mac-address-stripping
```

Chapter 229
PDSN Service Configuration Mode Commands

The PDSN Service Configuration Mode is used to create and manage PDSN service instances for the current context.



a11-signalling-packets

Applies DSCP marking for IP header carrying outgoing A11-signalling packets.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

a11-signalling-packetsip-header-dscp *hexa_number*

[**no** | **default**] **a11-signalling-packetsip-header-dscp**

no

Disables the **a11-signalling-packets ip-header-dscp** option configuration.

default

Sets / Restores default value assigned for specified parameter **a11-signalling-packets ip-header-dscp**.

hexa_number

a Hexa decimal number between 0x0 and 0x3F.

Usage

Use this command to configured value of DSCP to be set for all outgoing A11 signaling msg.
By default the CLI is disabled and DSCP is marked as 0 in ip-header.

Example

The following command configures value of DSCP to be set for all outgoing to A11 signaling message *0x3F*:

a11-signalling-packets ip-header-dscp *0x3F*

aaa 3gpp2-service-option

Specifies the value for the 3gpp2-service option.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

aaa 3gpp2-service-option *number*

no aaa 3gpp2-service-option

default aaa 3gpp2-service-option

no

Disables the aaa 3gpp2-service option configuration.

default

Sets / Restores default value assigned for specified parameter **aaa 3gpp2-service-option**.

number

Service option *number* is integer and should be between *0* to *32767*.

Usage

Allows the configuration of a default service option value to be sent in accounting when service option values are not received from PCF. The PDSN will default the service option value to the configured value if the value is not specified by the PCF.

Example

The following command sets the service option to be *40*:

```
aaa 3gpp2-service-option 40
```

aaa nas-ip-address

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

aaa nas-ip-address*IPv4 address*

no aaa nas-ip-address

default aaa 3nas-ip-address

no

Disables the aaa nas-ip-address option configuration.

default

Sets / Restores default value assigned for specified parameter **aaa nas-ip-address** by default this is disabled.

ipv4 address

Specifies the IPv4 addresses to be used.

Usage

Allows the configuration.

Example

The following command configures *1.2.3.4*:

aaa as-ip-addres *1.2.3.4*

access-flow traffic-validation

If **access-flow traffic-validation** is enabled for the service and the subscriber then the flows are checked against the filter rules. If the packets does not match the filter rules, and N violations occur in K seconds, the rp connection is downgraded to best-effort flow, if it is not already a best-effort flow.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

access-flow traffic-validation [**threshold** { **interval** *seconds* | **violations***limit* }]

no access-flow traffic-validation

default access-flow traffic-validation [**threshold** { **interval** | **violations** }]

no

Disable traffic validation for the service.

default

Traffic validation configuration for the service is set to the default value.

threshold { [violations *limit* **] [interval** *seconds* **] }**

violations *limit*: Sets the parameters that determine traffic access violations. This is determined by setting the maximum number of violations within a set time period. must be an integer from *1* through *100000*.
interval *seconds* Sets the time interval, in seconds. must be an integer from *1* through *100000*.

Usage

Use this command to enable traffic validation for the current PDSN service.

Example

The following command enables traffic validation for the current PDSN service and sets the limit allowed to *100* **violations** within *5* seconds:

```
access-flow traffic-validation threshold violations 100 interval 5
```

access-network

Configures access network parameters.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

access-network { **accounting identifier** *identifier_name* | **realm** *realm_name* }

no access-network { **accounting identifier** | **realm** } }

no

Disables the **access-network**.

accounting identifier

Configures accounting for the access-network. This value must be a string from 1 to 128 characters in length.

realm *realm_name*

Configures the realm for the access-network. *realm_name* must be a string from 1 to 128 characters in length.

Usage

Use this command to configure access-network parameters for accounting and realms.

Example

The following command creates an **access-network realm** named *realm2*.

access-networkrealm *realm2*

airlink bad-sequence-number

Configures PDSN behavior for airlink related parameters.

Product

PDSN

Privilege

Security Administrator, Administrator

```
airlink bad-sequence-number { accept | deny [use-deny-code { poorly-formed-request |
unsupported-vendor-id}]}

[ no | default ] airlinkbad-sequence-number
```

no

Disables the deny of bad-sequence number and accept it.

---

default

It is the default behavior.

---

accept

Accepts the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
It is the default behavior.

---

deny

Rejects the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
It uses **poorly-formed-request** option by default to deny a request.

---

use-deny-code { poorly-formed-request | unsupported-vendor-id }

These are optional keywords that used with **deny** sub-command to deny the A11 RRQ messages that have either an unsupported vendor Id or A11 Requests with bad/poor formation.
unsupported-vendor-id denies request on the basis of vendor Id.
poorly-formed-request will deny the A11 request on the basis of request formation or structure. It is the default deny code for **deny** sub-command.

Usage

This command is used to configure the airlink parameters for A11 RRQs.
When configured it denies the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.

Example

The following command would configure the system to deny all A11 RRQ messages having unsupported vendor Id or bad structure of message, including those having arilink sequence number less than or equal to a previously received sequence number:

```
airlinkbad-sequence-number deny
```

allow alt-ppp

Allows proprietary modified versions of PPP type sessions to connect this PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
allowalt-ppp

no allow alt-ppp

default allow alt-ppp
```

no

Disables the allowed alternate PPP feature.

default

Sets the specified parameter to default.

Usage

This command is used to deviate from standard PPP protocol and use a proprietary modified version of PPP with a pre-defined non-negotiable PPP parameters.
It is a vendor-specific licensed feature command.

Example

```
allow alt-ppp
```

always-on-indication

Enables/disables the inclusion of 3GPP2 Always On Indicators in messages to the PCF.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
always-on-indication

no always-on-indication
```

no

Disables the sending of 3GPP2 Always On Indication messages.

Usage

This command is available when the 3GPP2 Always-On RP Extensions feature-use license is installed. When enabled, this command causes the PDSN service to include the Always On Indicators in the Normal Vendor Specific Extension (NVSE) part of an A11 Session Update message to the PCF. The indicator will only be sent for those subscriber sessions in which Always On functionality is enabled as determined after a successful authentication: the 3GPP2-Always-On attribute is set to a value of *1* (Active) for subscribers configured on a AAA server, or the always-on parameter is set for locally configured subscribers.
This functionality is enabled by default.

Example

use the following command to Enables the inclusion of 3GPP2 Always On Indicators in messages to the PCF.

```
always-on-indication
```

associate

Associates a PDSN-service with a Quality of Service (QoS) policy.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

associate qci-qos-mapping *string*

no associate qci-qos-mapping

no

Disables the configuration to associate PDSN-serivce with qos policy.

qci-qos-mapping *string*

qci-qos-mapping configures QCI to QoS mapping for this PDSN service.

string a string of size 1 to 63.

Usage

The following is used for configuration to associate PDSN-serivce with qos policy.

Example

associate qci-qos-mapping *sample*

authentication

Configures authentication parameters for specific PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

authentication { [**allow-noauth**] [**chap** *chap_priority*] [**mschap** *mschap_priority*] [**pap** *pap_priority*] } | [**msid-auth**]

default authentication

---

default

Configures authentication parameters for specific PDSN service.

---

allow-noauth

Default: Disabled
This option configures the system to provide subscribers with network access even though they have not been authenticated. This command issued by itself would cause the system to not attempt to authenticate subscribers.
When the allow-noauth option is used in conjunction with commands specifying other authentication protocols and priorities to use, then if attempts to use those protocols fail, the system will treat the allow-noauth option as the lowest priority.
If no authentication is allowed, then NAI construct will be implemented in order to provide accounting records for the subscriber.

---

chap *chap_priority*

Default: 1
This option configures the system to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the subscriber.
A *chap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
chap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.
CHAP is enabled by default as the highest preference.

---

mschap *mschap_priority*

Default: Disabled
This option configures the system to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the subscriber.
A *mschap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
mschap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.

---

pap *pap_priority*

Default: 2

This option configures the system to attempt to use the Password Authentication Protocol (PAP) to authenticate the subscriber.
A *pap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
pap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.
PAP is enabled by default as the second highest preference.

msid-auth

Default: Disabled
This option configures the system to attempt to authenticate the subscriber based on their Mobile Station Identity (MSID).

Usage

Use to specify how the PDSN service should handle authentication and what protocols to use. The flexibility is given to configure this option to accommodate the fact that not every mobile will implement the same authentication protocols.
The chassis is shipped from the factory with the authentication options set as follows:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

Important: At least one of the keywords must be used to complete the command.

Example

The following command would configure the system to allow no authentication for subscribers and would perform accounting using the default NAI-construct of *username@domain*:

```
authentication allow-noauth
```

The following command would configure the system to attempt subscriber authentication first using CHAP, then MSCHAP, and finally PAP. If the allow-noauth command was also issued, if all attempts to authenticate the subscriber using these protocols fail, then the subscriber would be allowed access:

```
authentication chap 1 mschap 2 pap 3
```

bcmcs

Sets the BCMCS (Broadcast Multicast Service) group username and password for RADIUS access.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bcmcs { **customptt** | **encrypted grppasswd** *group_passwd* | **flow-id** *value* [**flow-id-type** { **flow-id** | **program-id** }] | **grppasswd** *group_password* | **grpusrname***group_name* | **ptt** { **destination-context** *dest_name* | **disconnect-dscp-label** *dscp_label* | **mtu** *transmission_unit* | **rohc-profile-name** *rohc_profile_name* } }

default bcmcs [**custom ptt** | **ptt** { **disconnect-dscp-label** | **mtu** | **rohc-profile-name** }]

no bcmcs { **custom ptt** | **flow-id value** [**flow-id-type** { **flow-id** | **program-id** } | **grppasswd** | **grpusrname** | **ptt** { **destination-context** | **disconnect-dscp-label** | **mtu** | **rohc-profile-name** } }

custom

Customise the BCMCS configuration.

flow-id *value*

Set the BCMCS flow-id. This value must be a hex string between *0x1000* and *0xFFFFFFFF*.
Making this entry opens a new mode: bcmcs-flow-id.
rohc-profile name : Configure ROHC parameters name, name should be string of size *1* to *63*.

grpusrname *group_name*

Sets the BCMCS group name for RADIUS access requests. This value must be a string from *1* to *127* characters in length.

encrypted grppasswd *group_passwd*

Set the BCMCS group password for RADIUS access requests. This value must be a string from *1* to *63* characters in length.
Password can be encrypted or clear.

ptt {destination-context *dest_name* **| disconnect-dscp-label** *dscp_label***| mtu** *transmission_unit* **| rohc-profile-name** *rohc_profile_name* **}**

destination-context: Specify the intended destination context name. This value must be string of *1* to *79* characters in length.
disconnect-dscp-label: Configures the DSCP label to be present in the In Call Signalling packet based on which In Call Signalling and Media Flows will be disconnected. This value must be a Hexadecimal number between *0x0* and *0xFF*.
mtu *transmission_unit*: Configures maximum transmission unit, This value must be ranging from *100* to *2000*. Default is *1500*.

rohc_profile_name *rohc_profile_name*: Profile name of the ROHC compressor and decompressor. This value should be a string of *1* to *63*.

Usage

Use this command to set the BCMCS group username and password for RADIUS access requests.

Example

bcmcsgrpusername *group_name***bcmcsgrppasswd** *group_password*

bind

Binds the PDSN service to a logical IP interface serving as the R-P interface. Specifies the maximum number of subscribers that can access this service over the interface.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bindaddress*address* [**max-subscribers** *count*]

no bind address

no

Removes a previously configured binding.

address

Specifies the IP address (address) of the interface configured as the R-P interface. *address* is specified in dotted decimal notation.

max-subscribers *count*

Default: *500000*
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to any integer value between *0* and *2500000*.

Important: The maximum number of subscribers supported is dependant on the license key and the number of active PACs/PSCs installed in the system. A fully loaded system with *13* active PACs/PSCs can support *2500000* total subscribers. Refer to the license key command for additional information.

Usage

Associate or tie the PDSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an R-P interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces that you will configure for use as R-P interfaces
- The maximum number of subscriber sessions that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-Tx or 1000Base-T) to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the PDSN service and specifies that a maximum of *600* simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
nobind address
```

data-available-indicator

Enables sending Data Available Indicator extension in R-P Registration Reply.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no | default] data-available-indicator

no

Default: Disabled
Disable the sending of the Data Available Indicator extension in R-P Registration Reply.

default

Sets / Restores default value assigned for specified parameter for **data-available-indicator**.

Usage

Use this command to enable or disable the sending of the Data Available Indicator extension in R-P Registration Reply

Example

Use the following command to enable sending the Data Available Indicator extension in R-P Registration Reply:

```
data-available-indicator
```

Use the following command to disable sending the Data Available Indicator extension in R-P Registration Reply

```
no data-available-indicator
```

data-over-signaling

Enables the data-over-signaling marking feature for A10 packets.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] data-over signaling
```

default

Sets / Restores default value assigned for specified parameter for **data-over signaling**

no

Default: Enabled
Disable the data-over signaling feature for A10 packets.

Usage

Use this command to enable or disable the data-over signaling feature for A10 packets.

Important: This is a customer-specific command.

Example

```
no data-over-signaling
```

default subscriber

Specifies the name of a subscriber profile configured within the same context as the PDSN service from which to base the handling of all other subscriber sessions handled by the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

defaultsubscriber *profile_name*

no default subscriber

no

Enables/Disables the option **default subscriber** *profile_name*

profile_name

Specifies the name of the configured subscriber profile. *profile_name* can be between *1* and *127* alpha and/or number characters and is case sensitive.

Usage

Each subscriber profile specifies "rules" such as permissions, PPP settings, and timeout values.
By default, the PDSN service will use the information configured for the subscriber named default within the same context. This command allows for multiple PDSN services within the same context to apply different "rules" to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.
Use the **no default subscriber** *profile_name* command to delete the configured default subscriber.

Example

To configure the PDSN service to apply the rules configured for a subscriber named *user1* to every other subscriber session it processes, enter the following command:

default subscriber *user1*

direct-lte-indicator

Enables sending Direct LTE Indicator VSA in Access Request.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] direct-lte-indicator
```

default

Sets / Restores default value assigned for specified parameter for **data-over signaling**

no

Default: Enabled
Disables sending Direct LTE Indicator VSA in Access Request.

Usage

Use this command to enable or disable sending Direct LTE Indicator VSA in Access Request.

Important: This is a customer-specific command.

Example

```
nodirect-lte-indicator
```

dormant-transition

Configures the PDSN behavior to terminate A10 session, when the PDSN receives the A11-RRQ (Type 4) before the session for the original MN is established completely.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] dormant-transition initial-session-setup
```

no

Terminates the A10 session, when PDSN receives the A11-RRQ (Type 4) before the original session established completely.

default

Keeps the A10 session live in case of A11-RRQ (Type 4) is received before the original session is established completely.

Usage

When the status of A10 session goes to dormant before the session for the original MN is established completely, the different MN may possibly send the A11-RRQ (Type 4) to the PDSN and PPP renegotiation may start.
This command is used to terminate the A10 session when the PDSN receives the A11-RRQ (Type 4) before the session for original MN is established completely.

Example

Following command is used to release the A10 session in case of receiving A11-RRQ (Type 4) before the original session is established completely

```
no dormant-transition  initial-session-setup
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fragment

Enables or disables PPP payload fragmentation.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] fragment ppp-data
```

no

Disables the fragmentation of ppp data.

default

Default enables ppp data fragmentation.

Usage

This command is to indicate to the RP module to NOT fragment PPP payloads being sent to the PCF, if the total packet size (PPP+GRE+IP) exceeds *1500* bytes.
Disabling fragmentation may cause the **sessmgr** to perform outer IP fragmentation of the outgoing packet, if the resulting packet exceeds the MED MTU.

Example

The following command enables PPP payload fragmentation.

```
fragment ppp-data
```

gre

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

gre { **checksum** | **checksum-verify** | **ip-header-dscp** *value* { **all-control-packets** | **setup-packets-only** } | **protocol-type** {**any** | **byte-stream** | **ppp** } | **reorder-timeout** *value* | **segmentation** |**sequence-mode** { **none** | **reorder** } | **sequence-numbers** | **threegppp2-ext-header qos-marking** }

no gre { **checksum** | **checksum-verify** | **ip-header-dscp** | **segmentation** | **sequence-numbers** | **threegppp2-ext-headers qos-marking** }

default gre { **checksum** | **checksum-verify** | **ip-header-dscp** | **protocol-type** | **reorder-timeout** | **segmentation** | **sequence-mode** | **sequence-numbers** | **threegppp2-ext-headers qos-marking** }

---

no

Disables the specified functionality.

---

default

Restores the specified parameter to its default setting.

---

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

---

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

---

ip-header-dscp *value* **{ all-control-packets | setup-packets-only }**

Default: Disabled
Used to configure the QoS Differentiated Services Code Point (DSCP) marking for GRE packets.

- *value* : Represents the DSCP setting. It represents the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F.
- **all-control-packets** : Dictates that the DSCP marking is to be provided in all GRE control packets.
- **setup-packets-only** : Dictates that the DSCP marking is to be provided only in GRE setup packets.

protocol-type { any | byte-stream | ppp }

Specifies the protocol used fro GRE encapsulation that is acceptable to
any: Specifies that the PDSN service will accept GRE packets encapsulated using any protocol.
byte-stream: Specifies that the PDSN service will accept GRE packets only encapsulated using byte stream. Using byte stream encapsulation, PPP packets are framed at different intervals and sent.
ppp: Specifies that the PDSN service will accept GRE packets only encapsulated using the Point-to-Point Protocol (PPP). Using PPP encapsulation, PPP packets are framed at regular intervals and sent.

reorder-timeout

Default: *100*
Configures max number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *milliseconds* must be an integer from *0* through *5000*.

segmentation

Default: disabled
Enables GRE Segmentation for the PDSN service.

sequence-mode { none | reorder }

Default: none
Configures handling of incoming out-of-sequence GRE packets.
none: Specifies that sequence numbers in packets are ignored and all arriving packets are processed in the order they arrive.
reorder: Specifies that out of sequence packets are stored in a sequencing queue until one of the conditions is met:

- The reorder timeout occurs: All queued packets are sent for processing and the accepted sequence number is updated to the highest number in the queue.
- The queue is full (five packets): All packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number in the queue.
- An arriving packet has a sequence number such that the difference between this and the packet at the head of the queue is greater than five. All the packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number that arrived.
- A packet arrives that fills a gap in the sequenced numbers stored in the queue and creates a subset of packets whose sequence numbers are continuous with the current accepted sequence number. This subset of packets in the queue is sent for processing. The reorder timer continues to run and the accepted sequence number is updated to the highest number in the subset delivered.

sequence-numbers

Enables insertion of GRE sequence numbers in data that is about to be transmitted over the A10 interface. Data coming into the system containing sequence numbers but that is out of sequence is not re-sequenced.

threegppp2-ext-headers qos-marking

When threegppp2-ext-headers qos-marking is enabled and the PCF negotiates capability in the A11 RRQ, the PDSN will include the qos optional data attribute in the GRE 3gpp2 extension header.
The **no** keyword, enables qos-marking in the gre header based on the tos value in the header.

Usage

The **gre protocol-type** command can be used to prevent the PDSN service from servicing PCFs that use a specific form of encapsulation.

Use the **no gre sequence-numbers** command to disable the inclusion of GRE sequence numbers in the A10 data path.

The chassis is shipped from the factory with the authentication options set as follows:

- **protocol-type any**
- sequence-numbers enabled

Example

Use this command to configure the PDSN service to exclude byte stream encapsulated GRE traffic:

gre protocol-type *ppp*

inter-pdsn-handoff mobility-event-indicator

Configures the PDSN to support the Mobility Event Identifier (MEI) during inter-PDSN handoffs. The presence of the Mobility Event Indicator (MEI) and Access Network Identifier (ANID) elements in a A11 handoff request represents an Inter-PDSN handoff.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

inter-pdsn-handoff mobility-event-indicator

no inter-pdsn-handoff mobility-event-indicator

default inter-pdsn-handoff mobility-event-indicator

no

Disables support for the MEI during inter-PDSN handoffs.

default

Sets / Restores default value assigned for **inter-pdsn-handoff mobility-event-indicator**. By default it is disabled.

Usage

Use this command to configure support for the MEI during inter-PDSN handoffs.

Example

Use the following command to enable support for the MEI during inter-PDSN handoffs

```
inter-pdsn-handoff  mobility-event-indicator
```

inter-pdsn-handover

Configures Inter-PDSN handoff related parameters.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

inter-pdsn-handover use-canid-panid

no inter-pdsn-handover use-canid-panid

default inter-pdsn-handover use-canid-panid

no

Disables support for the MEI during inter-PDSN handoffs parameters.

default

Sets / Restores default value assigned for **inter-pdsn-handoff mobility-event-indicator**. By default it is disabled.

Usage

Use this command to configure Inter-PDSN handoff related parameters.

Example

Use the following command to econfigure Inter-PDSN handoff related parameters.

```
inter-pdsn-handover use-canid-panid
```

ip header-compression rohc

Enters PDSN Service ROHC Configuration Mode and allows you to configure ROHC parameters that the PDSN conveys to the PCF in the initial A11 RRP message before PPP authentication.

By default, ROHC is disabled for a PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
ipheader-compression rohc

default ipheader-compression rohc

no ipheader-compression rohc
```

default

Sets all PDSN Service ROHC Configuration Mode values back to the defaults and disable ROHC for this PDSN service.

no

Disable IP header compression for this PDSN Service.

Usage

Use this command to enter the PDSN Service ROHC Configuration Mode or disable ROHC for the current PDSN service.

Example

The following command disables ROHC for the current PDSN service and sets all of the values for commands in PDSN Service ROHC Configuration Mode back to their default settings:

```
no ip header-compression rohc
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the R-P interfaces' IP socket.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
ip local-port number

default ip local-port
```

number

Default: *699*
Specifies the UDP port number.
number can be any integer value between *1* and *65535*.

default

Designates UDP port, default value as *699*.

Usage

Specify the UDP port that should be used for communications between the Packet Control Function (PCF) and the PDSN.

Important: The UDP port setting on the PCF must match the local-port setting for the PDSN service on the system in order for the two devices to communicate.

Example

Use the following command to specify a UDP port of *3950* for the PDSN service to use to communicate with the PCF on the R-P interface:

```
iplocal-port 3950
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Product

PDSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { **clear-on-valid-packet** | **drop-limit** *num* | **period** *secs* | **reneg-limit** *num* }

no ip source-violation clear-on-valid-packet

defaultip source-violation { **drop-limit** | **period** | **reneg-limit** }

no

Enables/Disables **ip source-violation clear-on-valid-packet**.

default

Configure default settings related to **ip source-violation**.

clear-on-valid-packet

Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

drop-limit *num*

Default: *10*
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.
num can be any integer value from *1* to *1000000*.

period *secs*

Default: *120*
The length of time, in seconds, for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.
The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If *secs* is not specified, the value is set to the default.
secs can be any integer value from *1* to *1000000*.

reneg-limit *num*

Default: *5*
Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If *num* is not specified, the value is set to the default.
num can be any integer value from *1* to *1000000*.

Usage

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs PDSNs a number of times during a handoff scenario.
This function operates in the following manner:
When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.
For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.
If the drop-limit is set to *10*, the above process of receiving *5* source violations and renegotiating PPP occurs only once. After the second *5* source violations, the call is dropped. The period timer continues to count throughout this process.
If the configured source-violation period is exceeded at any time before the call is dropped, the reneg-limit counter is checked. If the reneg-limit counter is greater than zero (0), the reneg-limit is decremented by *1*. If the reneg-limit counter equals zero, the drop-limit is decremented by half.

Example

The following command sets the drop limit to *15* and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```

lifetime

Specifies the time that an A10 connection can exist before its registration is considered expired.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

lifetime *time*

no lifetime

default lifetime

no lifetime

Specifies that an A10 connection can exist for an infinite amount of time.

default lifetime

Sets / Restores default value assigned for **lifetime** as 1800.

time

Default: 1800
Specifies the time that an A10 connection can exist before its registration is considered expired.
time is measured in seconds and can be configured to any integer value between *1* and *65534*.

Usage

Set a limit to the amount of time that a subscriber session can remain up whether or not the session is active or dormant. If the lifetime timer expires before the subscriber terminates the session, their connection will be terminated automatically.
Use the **no lifetime** command to delete a previously configured lifetime setting. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default lifetime** command.

Example

The following command specifies a time of *3600* seconds (1 hour) for subscriber sessions on this PDSN service:

```
lifetime 3600
```

max-retransmissions

Configures the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

max-retransmissions *count*

default max-retransmissions

default

Sets / Restores default value assigned for **max-retransmissions** as *5*.

count

Specifies the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.
count can be configured to any integer value between *1* and *1,000,000*.

Usage

If the value configured for the max-retransmissions is reached the call will be dropped.
The chassis is shipped from the factory with the Internet maximum number of retransmissions set to *5*.

Example

The following command configures the maximum number of retransmissions for the PDSN service to *3*:

```
max-retransmissions 3
```

mobile-ip foreign-agent context

For Mobile IP support, specifies the context in which the FA service(s) are configured.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip foreign-agent context context_name [  fa-service name  ]
no mobile-ip foreign-agent context
```

no

Enables/Disables **mobile-ip foreign-agent context**

context_name

Specifies the name of the previously configured context that facilitates the FA service(s). context_name must be between *1* and *79* alpha or numeric characters and is case sensitive.

[fa-service *name* **]**

This optional keyword allows you to link the PDSN service to a particular FA service in the specified context. *name* is the name of the FA service to link to. *name* is a string of size *1* to *63*

Usage

FA services on the system can be configured either in the same or different contexts from those facilitating PDSN services. When they are configured in separate contexts, this command configured with a PDSN service instructs the PDSN service to route traffic to the context facilitating the FA service.
Use the **no mobile-ip foreign-agent context** to delete a previously configured destination context.

Example

The following command instructs the PDSN service to use the context named FA-destination for FA functionality:

```
mobile-ip foreign-agent context fa-destination
```

mobile-ipv6

Configures Mobile IPv6 parameters within specific PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

mobile-ipv6 mobile-access-gateway context *context_name* [**mag-service** *name*]

mobile-access-gateway

Configures Mobile Access Gateway (MAG) parameters within specific PDSN service.

context *context_name*

Designates name of the context in which the MAG service is configured. Must be followed by context name of MAG service.

context_name is a string of size 1 to 79.

mag-service *name*

Designates name of the MAG service in that context. Must be followed by MAG service name.

name is a string of size 1 to 63.

Usage

This command is used to configure Mobile IPv6 parameters and Mobile Access Gateway (MAG) parameters within specific PDSN service.

Example

The following command configures Mobile IPv6 parameters and Mobile Access Gateway (MAG) parameters within specific PDSN service.

mobile-ipv6 mobile-access-gateway context *pdsn1* **mag-service** *serv1*

msid length

Configures checking the length of the A11 MSID in A11 Session Specific Extn and airlink records.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
msid length { [ min min_length ] | max max_length }

default msid length
```

default

Specifies the default length of MSID (*10* to *15*) as per standard. By default **msid** is disabled.

min *min_length*

Specifies the minimum length for MSID.
min_length is any Integer value between *10* to *15*, but should be less than *max_length* specified with **max**. Default is *10*.

max *max_length*

Specifies the maximum length for MSID.
max_length is any Integer value between *10* to *15*, but should be more than *min_length* specified with **min**. Default is *15*.

Usage

MSID length can be configured either in the standard length or different customized length form. This command is used to specify the allowed length of MSID.

Example

The following command specifies an MSID length between *12* and *15*:

```
msid length min 12 max 15
```

nai-construction

Specifies a domain alias that will be used to represent the context which the PDSN service should use for AAA functionality.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

nai-construction domain *alias*

no nai-construction domain

domain *alias*

alias represents the "domain" name that you would like to associate with the context in which AAA functionality is configured. alias can be between *1* and *79* alpha and/or numeric characters and is case-sensitive.

Usage

Enabling NAI will be constructed for the subscriber in the event that their mobile station (MS) does not negotiate CHAP, PAP, or MSCHAP. If this option is selected, no further attempts will be made to authenticate the user. Instead, the constructed NAI will be used for accounting purposes.
The context specified by this command would be used to provide the communication with the RADIUS accounting server.
Use the **no nai-constructed** domain command to deleted a configured alias.

Important: This command should only be used if the PDSN service is configured to allow no authentication using the authentication allow-noauth command.

Additionally, the **aaa constructed-nai** command in the Context Configuration mode can be used to configure a password for constructed NAIs.

Example

The following command configured a domain alias of aaa_context for the PDSN service to use when an NAI is constructed for a subscriber session:

```
nai-construction domain aaa_context
```

new-call conflict

Enable or disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] new-call conflict terminate-session-old-pcf
```

no

Disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

default

Enable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Usage

This configuration supports to enable or disable to send A11-RUPD to current PCF, when the system receives the A11-RRQ(Type1) from new PCF during the session exists.
If the configuration is **no new-call conflict terminate-session-old-pcf** system will not send registration update to old PCF on receiving a new call (A11-RRQ(Type1)) request for an existing active/dormant session.
The default behavior is to send registration updates.

Example The following command configured a system to send a registration update on receiving an A11-RRQ (Type 1) request for an existing active/dormant session:

```
new-call conflict terminate-session-old-pcf
```

pcf-monitor

Enables the monitoring of all the PCFs that have sessions associated with it. The PDSN stops monitoring a PCF if it is determined to be down. Once a PCF is determined to be down, the PDSN tears down all sessions that correspond to the PCF and generates AAA Accounting Stop messages. All the PCFs that are connected to the PDSN service are monitored.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

pcf-monitor [**interval** *seconds* | **max-inactivity-time** *seconds* | **num-retry** *num* | **timeout** *seconds*]

[**no** | **default**] **pcf-monitor**

pcf-monitor

Entering the command with no keywords enables the PCF monitoring function with all parameters set to the defaults.

no

Disables the pcf monitoring function.

default

Sets / Restores default value assigned for **pcf-monitor**.

interval *seconds*

Default: 60 seconds
Sets the amount of time to wait between ping request messages.
seconds must be an integer in the range from 1 through 3600.

max-inactivity-time *seconds*

Default: 120 seconds
The maximum amount of time (seconds) with no A10 traffic from a PCF before the ICMP-ping mechanism is triggered.
seconds must be an integer from 1 through 3600.

num-retry *num*

Default: 5
Sets the number of times that the PDSN retries to ping the PCF. When num-retry for a given PCF has been exhausted with no response, sessions that correspond to the non-responsive PCF are terminated and Accounting Stop records for each terminated session are generated.
num must be an integer in the range from 0 through 100.

timeout *seconds*

Default: 3 seconds
The amount of time to wait for a response before retrying.
seconds must be in the range from 1 through 10.

Usage

Use this command to enable the PDSN service to monitor the PCFs that have sessions associated with the PDSN service.

Example

The following command enables PCF monitoring with parameters set to the defaults:

```
pcf-monitor
```

The following command enables PCF monitoring and sets the timeout to *10* seconds:

```
pcf-monitor timeout 10
```

The following command disables pcf-monitoring:

```
no pcf-monitor
```

pcf-session-id-change restart-ppp

Manages current session and PPP renegotiation on GRE-key change without any change in PCF/PANID/CANID. This command disables or enables the PPP renegotiation restart on receiving an RP registration request from the current PCF with GRE key (PCF session Id) change. With this command the PDSN aborts and restarts the call causing PPP renegotiation.

This is enabled by default.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] pcf-session-id-change restart-ppp
```

no

Disables the pcf-session-id-change restart-ppp function.
With this option PDSN does not restart the PPP renegotiation on GRE key change from current PCF in an RP registration request, unless it indicates change in PCF/PANID/CANID.

default

Set the pcf-session-id-change function to the default state on enabled.

Usage

GRE key (PCF session ID) is sued to identify the data packet for a session and is negotiated through the A11 signaling messages between PCF and PDSN. By default PDSN aborts and restart the PPP renegotiation on receipt of any RP registration request with change in GRE key or PCF session Id.
With use of no pcf-session-id-change restart-ppp command PDSN is configured to disable the restart of call or PPP renegotiation on receipt of any RP registration request with changed GRE key, unless it has any PCF/ANID/CANID change. PDSN silently switches the GRE key for the session, retaining the existing PPP session.

Example

The following command disables the PPP renegotiation restart action on receipt of any RP RRQ with changed GRE key from same PCF/PANID/CANID.

```
no pcf-session-id-change  restart-ppp
```

pdsn type0-tft attempt-inner-match

Configures a type0 traffic flow template (tft) to a type1 traffic flow template.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no | default] pdsn type0-tft attempt-inner-match

no

Disables **pdsn type0-tft attempt-inner-match**.

default

Sets / Restores default value assigned for **pdsn type0-tft attempt-inner-match.**

Usage

This CLI is used make PDSN match inner IP packets for an AIMS call. When enabled, the PDSN tries to match a type-0 tft to match both outer and inner packet, so that MN can use a Type-0 filter for HoA traffic which are tunneled.
This is disabled by default.

Example

The following command enables type0 tft:

pdsn type0-tft attempt-inner-match

peer-pcf

Configures settings for any PCF that has a connection with this PDSN.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

peer-pcf { *ip_address* | *ip_address/mask* } **bcmcs-framing** { **hdlc-like** | **segment-based** }

ip_address **|** *ip_address/mask*

ip_address must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.
ip_address/mask must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6, followed by the mask.

bcmcs_framing { hdlc-like | segment-based }

Specifies the type of bcmcs_framing to use for this PCF connection.

- hdlc-like: applies HDLC-like framing for all BCMCS flows
- segment-based: applies segment-based framing for all BCMCS flows

Usage

Use this command to configure the settings for any PCF that is connected to this PDSN. You can also specify bcmcs framing settings to use for the connection.

Example

The following command configures the peer-pcf for an IP address of *131.2.3.4*:

```
peer-pcf 131.2.3.4
```

pma-capability-indicator

Enables sending PMIP Capability Indicator VSA in Access Request.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
pma-capability-indicator  [ 3gpp2 ]

[ no | default ] pma-capability-indicator
```

3gpp2

Use 3GPP2 defined VSA. Default is to use Custom1 VSA.

no

Enables/Disables sending PMIP Capability Indicator VSA in Access Request.

default

Sets / Restores default value assigned for PMIP Capability Indicator.

Usage

Use this command to enable sending PMIP Capability Indicator VSA in Access Request.

Example

The following command enables sending PMIP Capability Indicator using 3GPP2 defined VSA in Access Request.

```
pma-capability-indicator 3gpp2
```

policy

Configures PDSN service policies.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

policy msid-match *msid_with_wildcards* **redirect** *address* [**weight** *weight_num*] [*address2* [**weight** *weight_num*]... *address16* [**weight** *weight_num*]] [**weight** *weight_num*]

no policy msid-match *msid_with_wildcards*

policy overload { **redirect** *address* [**weight** *weight_num*] [*address2* [**weight** *weight_num*] ... *address16* [**weight** *weight_num*]] | **reject** [**use-reject-code** { **admin-prohibited** | **insufficient-resources** }] }

no policy overload [**redirect** *address* [*address2* ... *address16*]]

default policy overload

policy pcf-zone-match *zone_number* **redirect** *address* [**weight** *weight_num*] [*address2* [**weight***weight_num*] ... *address16* [**weight** *weight_num*]]

no policy pcf-zone-match*zone_number*

[**default** | **no**] **policy rrq mei-from-current-pcf suppress-ppp-restart**

policy service-option enforce

[**default** | **no**] **policy service-option**

policy unknown-cvse enforce

[**default** | **no**] **policy unknown-cvse**

no

Enables/Disables the PDSN service policies.

default

Sets / Restores default value assigned for specified PDSN service policies.

policy msid-match *msid_with_wildcards* **redirect** *address* **[weight** *weight_num* **][** *address2* **[weight** *weight_num* **]...** *address16* **[weight** *weight_num* **]][weight** *weight_num* **]**

Specifies how a PDSN service should handle an incoming call that matches a list of wildcard MSIDs.

msid_with_wildcards: An MSID in which up to 16 digits have been replaced with the wildcard '$'. This defines the list of possible matches for incoming calls.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

policy overload { redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ... address16 [weight** *weight_num* **]] | reject [use-reject-code { admin-prohibited | insufficient-resources }] }**

Specifies how a PDSN service should handle an overload condition.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

reject: This option will cause any overload traffic to be rejected. The PDSN will send an A11 Registration Reply Code of 82H (insufficient resources).

use-reject-codeadmin-prohibited: When this keyword is specified and traffic is rejected, the error code admin prohibited is returned instead of the error code insufficient resources. This is the default behavior.

use-reject-codeinsufficient-resources: When this keyword is specified and traffic is rejected, the error code insufficient resources is returned instead of the error code admin prohibited.

policy pcf-zone-match *zone_number* **redirect** *address* **[weight** *weight_num* **] [** *address2* **[weight***weight_num* **]** *... address16* **[weight** *weight_num* **]]**

Specifies how a PDSN service should handle an incoming call that matches a predefined zone number.

zone_number: An integer between 1 and 32 that defines the zone incoming calls must match for redirection.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

policy rrq mei-from-current-pcf suppress-ppp-restart

rrq configures policy for PPP restart after getting mei in rrq.

mei-from-current-pcf mei is received in rrq from current pcf.

suppress-ppp-restart suppresses ppp restart when mei is received in rrq from current pcf

policy service-option enforce

service-option configures R-P service-option to use for specific PDSN service. Must be followed by valid service-option number, ranging from 0 to 1000.

enforce designates enforcement of R-P service-option number.

policy unknown-cvse enforce

unknown-cvse configures PDSN service unknown cvse policy.

enforce enforces unknown cvse policy where unknown CVSEs in RRQs will cause Deny

Usage

Policies can be implemented to dictate PDSN service behavior for various conditions such as overloading. The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system.
The system automatically invokes the overload policy when an on-line software upgrade is started.
Use the **no policy** { **overload** | **service-option** } command to delete a previously configured policy. If after deleting the policy setting you desire to return the policy parameter to its default setting, use the **default policy** command.
The chassis is shipped from the factory with the policy options set as follows:

- overload disabled
- sequence-numbers enforced enabled

Caution: Incorrect configuration of the **policy msid-match** and **policy pcf-zone-match** keywords could result in sessions failing to be established. For example, if PDSN1 is configured to redirect sessions to PDSN2 while PDSN2 is configured to redirect sessions to PDSN1, a loop is created in which all sessions would fail to be connected. In addition, sessions will not be established if the PDSN to which the sessions are being redirected is unavailable.

Example

The following command configures the PDSN service to redirect traffic to two different destinations with weights of *1* and *10* respectively:

```
policy overload redirect 192.168.1.100 weight 1 192.168.1.200 weight 10
```

ppp

Sets PPP tunneling parameters for subscribers in the current PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
ppp { tunnel-context context_name | tunnel-type { l2tp | none } }

 [ no | default ] ppp tunnel-type
```

no

Enables/Disables the PPP tunneling parameters for subscribers in the current PDSN service.

default

Sets / Restores default value assigned for PPP tunneling parameters for subscribers in the current PDSN service.

tunnel-context *context_name*

The name of the context that has a LAC service configured to handle all tunnels from this PDSN service.

tunnel-type { l2tp |none }

l2tp: Force all subscriber sessions in this PDSN service to use L2TP tunneling.
none: Do not force L2TP tunneling. This is the default.

Important: If the context specified by the **ppp tunnel-context** *context_name* command does not have a LAC service configured and **tunnel-type** is set to **l2tp** or the call is rejected.

Important: If the PPP tunnel context has not been set or has been cleared with the **no ppp tunnel-context** command and **tunnel-type** is set to **l2tp**, the context where the current PDSN service resides is used. If that context does not have a LAC service configured the call is rejected.

Usage

Use this command to enable or disable forced L2TP tunneling for all subscribers using this PDSN service. Also use this command to define which context defines the L2TP tunneling parameters.

Example

To set the tunnel context to the context named *context1* and enable forced L2TP tunneling, use the following commands;

```
ppp tunnel-context context1ppp tunnel-type l2tp
```

To enable forced L2TP tunneling with IPSEC security, use the following commands;

```
ppp tunnel-type l2tp-secure
```

To disable forced tunneling, use the following command;

```
ppp tunnel-type none
```

To clear the setting for the tunnel context, use the following command;

```
no ppp tunnel-context
```

qos-profile-id-mapping

Creates the customized QoS profile identifier to QoS mapping for IMS authorization support.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
qos-profile-id-mapping profile-idid_num { [ description desc ] | [ downlink-bw dl_bw] | [
drop-rate drop_percentage ] | [ latency latency_duration ] | [ qos-class { class-A |
class-B | class-C | class-D | class-E | calss-F } ] | [ uplink-bwul_bw ] } +

[ default | no ] qos-profile-id-mappingprofile-id id_num
```

default

Configures the specified QoS profile ID for QoS mapping with default values in this PDSN service.

no

Removes the configured QoS profile ID mapping in this PDSN service.

profile-id *id_num*

Specifies the profile identifier for QoS parameters to be used as the customized profile ID or modifies the QoS parameters in a profile ID (*id_num*) coming from RAN.
id_num must be an integer between 0 and 65535.

description *desc*

Specifies the user defined description for profile identifier.
desc must be an alpha and/or numeric string between 1 and 32 characters.

downlink-bw *dl_bw*

Default: 32
Specifies the downlink (towards the MN) data traffic bandwidth in kilo-bits per second for this QoS profile.
dl_bw must be an integer value between 0 and 100000.

drop-rate *drop_percentage*

Default: 0
Specifies the permitted packet drop rate in percentage for traffic flow to this QoS profile.
drop_percentage must be an integer value between 0 and 1000.

latency *latency_duration*

Default: 1000
Specifies the permitted latency duration in milli-seconds for this QoS profile.
latency_duration must be an integer value between 0 and 1000.

qos-class {class-A | class-B | class-C | class-D | class-E | class-F }

Default: Class-C
Specifies the type of QoS class associated with this QoS profile
class-A: Specifies the A type of QoS class.
class-B: Specifies the B type of QoS class.
class-C: Specifies the C type of QoS class.
class-D: Specifies the D type of QoS class.
class-E: Specifies the E type of QoS class.
class-F: Specifies the F type of QoS class.

uplink-bw *ul_bw*

Default: 32
Specifies the uplink (from the MN) data traffic bandwidth in kilo-bits per second for this QoS profile.
ul_bw must be an integer value between 0 and 100000.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to define the values associated with the profile ID on the PDSN. This profile ID is used during the mapping to and from the authorized QoS to the QoS parameters for the A10 link. This mapping is required because the PDSN only knows the profile IDs and not the actual configured values for the profile ID in the RAN. Also this configuration allows the use of custom profile IDs for the subscribers.
If no values are defined with a QoS profile ID, the values from matching QoS profile ID from RAN will be applicable to the subscriber traffic.

Example

The following command sets the downlink bandwidth to *32* kbps, latency duration as *1000* ms, uplink bandwidth to *32* kbps, and QoS class to Class-C for the QoS profile ID *11* in a PDSN service:

```
default qos-profile-id-mapping profile-id 11
```

qos update

Sets QoS update parameters for policy mismatches or wait timeouts.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
qos-update { policy-mismatch | wait-timeout seconds action { disconnect-session |
downgrade-to-best-effort | drop-packets } }

 [ no | default ] qos-update { policy-mismatch | wait-timeout }
```

no

Enables/Disables the **qos-update** [**policy-mismatch** | **wait-timeout**].

default

Sets / Restores default value for **qos-update** [**policy-mismatch** | **wait-timeout**].

policy-mismatch

PDSN raises a TFT violation if there is a QoS policy mismatch.

wait-timeout *seconds* **action { disconnect-session | downgrade-to-best-effort | drop-packets }**

Sets the wait time for A11 RRQ for QoS changes. *seconds* must be an integer from 1 through 1000.
action: configures the action on the wait-timeout

- **disconnect-session**: Drops the call if the A11 RRQ has not been received for the QoS update. This includes all of the IP flows for the session.
- **downgrade-to-best-effort**: Drops packets if the A11 RRQ has not been received for the QoS update. Sends the forward traffic over best effort (flow FF or FE if available).
- **drop-packets**: Drops packets if the A11 RRQ has not been received for the QoS update.

Usage

This command provides a PDSN service level configurable to configure an action, if the PCF ignores the QoS Update request from PDSN. It sets the amount of time to wait and the action to take, if no RRQ is received before the timeout. The action can be to drop packets for the flow, disconnect the session or to downgrade to best effort.

Example

```
qos-update policy-mismatch
```

The following command sets **wait-timeout** to *60* seconds and invokes **downgrade-to-best-effort** if the A11 RRQ has not been received for the QoS update:

```
qos-update wait-timeout 60 actiondowngrade-to-best-effort
```

registration-accept

Allows the PDSN to accept registration requests when a handoff disconnect is in progress. When the PDSN is tearing down a session and the MN moves over to a new PCF and initiates a new session, the PDSN by default does not accept the handoff until it tears down the old session.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ]registration-accept handoff session-disconnect-in-progress
```

no

Disable accepting of registration requests when a handoff disconnect is still in progress.

default

Default is disabled.
Sets / Restores default value assigned for **registration-accept handoff session-disconnect-in-progress**.

Usage

Use this command to allow the PDSN service to accept registration requests when a handoff disconnect is still in progress.

Example

```
registration-accept handoffsession-disconnect-in-progress
```

registration-ack-deny terminate-session-on-error

Configures the PDSN service to terminate an A11 session when a Registration ACK received from the PCF has an error status.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ]registration-ack-deny terminate-session-on-error
```

no

Disable terminating A11 sessions on a Registration ACK error from the PCF.

default

Sets / Restores default value assigned to **registration-ack-deny terminate-session-on-error**.

Usage

Use this command to enable the PDSN service to terminate A11 sessions on a Registration ACK error from the PCF.

Example

Use the following command to enable this functionality in the PDSN:

```
registration-ack-deny terminate-session-on-error
```

registration-deny

Configures parameters related to registration rejection.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

registration-deny { **handoff** { **closedrp-rp handoff-in-progress** | **connection-setup-record-absent** [**use-deny-code** { **poorly-formed-request** | **reason-unspecified** } | **max-deny-reply-limit** *num* | **mismatched-coa-source-address** | **new-call** { **connection-setup-record-absent** | **reverse-tunnel-unavailable** } | **session-already-active** | **session-already-closed** | **session-already-dormant** | **terminate-session-on-error** | **use-zero-gre-key**}

[**default** |**no**] **registration-deny** { **handoff** { **closedrp-rp handoff-in-progress** | **connection-setup-record-absent** } | **mismatched-coa-source-address** | **new-call** { **connection-setup-record-absent** | **reverse-tunnel-unavailable** } | **session-already-active** | **session-already-closed** | **session-already-dormant** | **terminate-session-on-error** | **use-zero-gre-key**}

default

Sets / Restores default value for **registration-deny**.

no

Disables the specified option.

handoff { closedrp-rp handoff-in-progress | connection-setup-record-absent [use-deny-code { poorly-formed-request | reason-unspecified }

This command configures the handoff behavior.
closedrp-rp handoff-in-progress: Configures parameters related to denying handoffs from Closed-RP to RP systems. When enabled the PDSN rejects retransmitted handoff R-P requests when a handoff is already in progress from Closed RP to RP. The deny code used is 'Reason Unspecified'. The default is disabled meaning that the PDSN simply discards such requests.
connection-setup-record-absent [**use-deny-code** { **poorly-formed-request** | **reason-unspecified** }]: When enabled the PDSN denies or discards handoff R-P sessions that do not have an Airlink Connection Setup record in the A11 Registration Request. Default is disabled. Default PDSN behavior is to accept such requests.
[**use-deny-code** { **poorly-formed-request** | **reason-unspecified** }: Sets the specified Registration Deny Code when denying a handoff because of a missing connection setup record.

max-deny-reply-limit *num*

Default: 3
Configures max number of retries of erroneous registration request message from PCF for a session before PDSN terminates the session. *num* can be from 1 to 10.

mismatched-coa-source-address

Default: disabled

Denies RP requests which have a care-of-address field that is different from the request source address.

---

new-call { connection-setup-record-absent [use-deny-code { poorly-formed-request | reason-unspecified } | reverse-tunnel-unavailable }

connection-setup-record-absent: Configures the PDSN to reject calls that do not have the airlink connection setup record in the RRQ.
use-deny-code { **poorly-formed-request** | **reason-unspecified** } When rejecting calls that do not have the airlink setup record, use the specified deny code.
reverse-tunnel-unavailable: Configures the PDSN to reject calls if the GRE key for a user collides with that of another user.

---

session-already-active

PDSN denies Registration requests for sessions that are already active with the error code “poorly formed request” .

---

session-already-closed

PDSN denies RP renew and dereg requests with error code 0x8E for absent R-P sessions.

---

session-already-dormant

PDSN denies Registration requests for sessions that are already dormant with the error code “poorly formed request” .

---

terminate-session-on-error

Default: Disabled.
Configures PDSN to terminate session if erroneous registration request message is received for the session.

---

use-zero-gre-key

Configures the PDSN to set the GRE key to zero (0) when denying a new R-P session.

Usage

Use this command to configure parameters relating to the rejection of registration requests.

Example

To reject calls that do not have the airlink setup record in the RRQ, enter the following command:

```
registration-deny new-call connection-setup-record-absent
```

To reject calls if the GRE key collides with that of another user, enter the following command:

```
registration-deny new-call reverse-tunnel-unavailable
```

To set the GRE key to 0 (zero) when a new R-P session is denied, enter the following command:

```
registration-deny new-call use-zero-gre-key
```

registration-discard

Configures the PDSN service to discard any Registration Request message containing multiple information elements of the same type or a different GRE key for existing IMSI session.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] registration-discard { bad-extension | gre-key-change |
handoffconnection-setup-record-absent }
```

default

Sets / Restores default value assigned for **registration-discard** .

no

Disables the discarding of Registration request messages containing multiple information elements or different GRE keys.

bad-extension

Default: Disabled
Configures the PDSN to discard Registration Request message containing multiple information elements of same type.

gre-key-change

Default: Disabled
Configures PDSN to discard Registration Request message containing different GRE key for existing IMSI session. Default is disable

handoff connection-setup-record-absent

Default: Disabled
When enabled, discards A11 Handoff requests that do not contain the Airlink Setup record.

Usage

Use this command to configure the PDSN service to discard and Registration Requests that contain multiple information elements of the same type or discard Registration Requests that contain GRE keys that have different GRE keys for the existing IMSI session.

Example

To configure the PDSN service to discard of Registration Requests that have multiple information elements of the same type, enter the following command:

```
registration-discard bad-extension
```

To configure the PDSN service to discard registration Requests that contain a GRE key that is different than the existing one for the existing IMSI session, enter the following command:

```
registration-discard gre-key-change
```

registration-update

Configures registration update related parameters for the PDSN.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

registration-update { **pdsn-code-nvse** | **wait-timeout** *secs* **}**

[**default** | **no**] **registration-update** { **pdsn-code-nvse** | **wait-timeout }**

no

If this option is used with the **pdsn-code-nvse** keyword, then pdsn-code-nvse configuration is disabled.
If this option is used with the **wait-timeout** keyword, a separate A11 timer is not used. The PDSN waits for the ppp retransmit-timeout and then sends the A11 Update. If a value is provided, then the "ppp retransmit-timeout" is ignored and a separate A11 timeout is started immediately upon sending the LCP Term-Ack. The A11 Update is then sent when the timer expires.
A value of 0 sends the A11 Update immediately after sending the LCP Term-Ack.

default

Sets / Restores default value assigned for **registration-update** { **pdsn-code-nvse** | **wait-timeout }**

pdsn-code-nvse

Adds the PDSN code NVSE in all A11 registration update messages.

secs

The number of seconds to wait. *secs* must be an integer in the range from 0 through 16.

wait-timeout

After the Mobile Node terminates a PPP session between the PDSN and the Mobile Node, the PDSN service waits for the specified time period to receive an A11 RRQ from the PCF before it sends out a Registration-Update to clear the Session from the PCF.

Usage

Use this command to configure registration update related
The **wait-tiimeout** keyword configures the PDSN to wait the specified amount of time before sending out a Registration-Update to clear the Session from the PCF.

Example

Use the following command to set the registration wait-timeout to *16* seconds:

```
registration-update wait-timeout 16
```

retransmission-timeout

Configures the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout *time*

[**default** | **no**] **retransmission-timeout**

no

Enables/Disables the **retransmission-timeout**.

default

Sets / Restores default value assigned for **retransmission-timeout**.

time

Specifies the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.
time is measured in seconds and can be configured to any integer value between 1 and 1,000,000.

Usage

Use the retransmission timeout command in conjunction with the **max-retransmissions** command in order to configure the PDSN services behavior when it does not receive a response from a particular PCF.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example

The following command configures a retransmission timeout value of *5* seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

```
noretransmission-timeout
```

service-option

If the service option policy is enabled, this command specifies the service options supported by the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

service-option *number*

no service-option *number*

no

Enables/Disables the **service-option** *number*

default

Sets / Restores default value assigned for **service-option**.

number

Default: 7, 15, 22, 23, 24, 25, 33, 59, 67
Specifies a specific Service Option (SO) number that this PDSN service is allowed to support.
number can be configured to any integer value between 1 and 1000.

Usage

Use the service option command in conjunction with the policy service option enforce command to configure specific SO numbers that are supported. If a particular SO number is not configured, then any subscriber session received with that SO number will be rejected and an A11 Registration Reply Code of 86 (poorly formed request) will be sent.
By default, PDSN services are configured to support the following service option numbers:

- 7: PCF specific
- 15: PCF specific
- 22: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS1 reverse)
- 23: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS2 reverse)
- 24: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS1 reverse)
- 25: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS2 reverse)
- 33: 3G High Speed Packet Data
- 59: High Rate Packet Data
- 67: RP A10 connection

Important: Option 67 is used for auxiliary connections for Rev-A calls. PPP encapsulation of data packets does not flow over this service option connection. ROHC can be performed without PPP for this service option.

Use the **no service-option** *number* command to delete a previously configured service option. If after deleting the service option setting you desire to return the service option parameter to its default setting, use the **default service-option command**.

Example

The following command enables a service option of *12*:

```
service-option 12
```

The following command disables the default service option *59* :

```
no service-option 59
```

setup-timeout

Specifies the maximum amount of time allowed for session setup.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no]setup-timeout *seconds*

default setup-timeout

default

Sets / Restores default value assigned for **setup-timeout**.

seconds

Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session. *seconds* must be an integer from 1 through 1000000

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

Use the following command to set the maximum time allowed for setting up a session to *300* seconds:

setup-timeout *300*

simple-ip allow

Enables or disables Simple-IP sessions from making a connection before authorization takes place.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[no | default ] simple-ip allow
```

no

When a session attempts PPP authentication, it is assumed that it is a Simple-IP session and it is disconnected before the user is authenticated (RADIUS or local authentication). Also, if **allow-noauth** is enabled and PPP authentication is not performed, after IPCP the session is disconnected if it is discovered that it is a Simple-IP session.

default

Reset this command to allow Simple-IP sessions to connect.

Usage

Use this command to prevent Simple-IP sessions from connecting to a PDSN service.

Example

The following command configures the PDSN service so that it will reject any Simple-IP sessions:

```
nosimple-ip allow
```

The following command configures the PDSN service to allow Simple-IP sessions:

```
simple-ip allow
```

spi

Configures the security parameter index (SPI) between the PDSN service and the PCF. This command also configures the redirection of call based on PCF zone.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
spiremote-address { pcf_ip_address | ip_addr_mask_combo } spi-number number {
encrypted secret enc_secret | secret secret } [ description string ] [ hash-
algorithm { md5 | rfc2002-md5 } ] [ replay-protection { nonce | timestamp } ] [
timestamp-tolerance tolerance ] [ zone zone_id ]

no spi remote-address pcf_ip_address spi-number number
```

remote-address { *pcf_ip_address* | *ip_addr_mask_combo* }

pcf_ip_address: Specifies the IP address of the PCF. pcf_ip_address is an IP address expressed in IP v4 dotted decimal notation.
ip_addr_mask_combo: Specifies the IP address of the PCF and specifies the IP address network mask bits. *ip_addr_mask_combo* must be specified using the form 'IP Address/Mask Bits' where the IP address must either be an IPv4 address expressed in dotted decimal notation or an IPv6 address expressed in colon notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

spi-number *number*

Specifies the SPI (number) which indicates a security context between the PCF and the PDSN in accordance with IOS 4.1 and RFC 2002.
number can be configured to any integer value between 256 and 4294967295.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the PDSN service and the PCF. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key (enc_secret) between the PCF and the PDSN service. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.
secret *secret*: Specifies the shared key (secret) between the PCF and the PDSN services. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

description *string*

This is a description for the SPI. *string* must be an alpha and or numeric string of from 1 through 31 characters.

hash-algorithm { md5 | rfc2002-md5 }

Default: md5
Specifies the hash-algorithm used between the PDSN service and the PCF.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

replay-protection { nonce | timestamp }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the PDSN service.
nonce: Configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: Configures replay protection to be implemented using timestamps per RFC 2002.

timestamp-tolerance *tolerance*

Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

zone *zone_id*

Specifies the different PCF zones to configure in PDSN service. Mapping of a zone-number to a set of PDSNs can be done per PDSN service basis.
zone_id must be an integer value between 1 and 32. A maximum of 32 PCF zones can be configured for a PDSN service.

Usage

An SPI is a security mechanism configured and shared by the PCF and the PDSN service. Please refer to IOS 4.1 and RFC 2002 for additional information.
Multiple SPIs can be configured if the PDSN service is communicating with multiple PCFs.

Important: The SPI configuration on the PCF must match the SPI configuration for the PDSN service on the system in order for the two devices to communicate properly.

Use the **no** version of this command to delete a previously configured SPI.
This command used with **zone** *zone_id* redirects all calls on the basis of PCF zone to the specific PDSN on the basis of parameters configured at policy pcf-zone-match command.

Example

The following command configures the PDSN service to use an SPI of 256 when communicating with a PCF with the IP address 192.168.0.2. The key that would be shared between the PCF and the PDSN service is q397F65.

```
spi remote-address 192.168.0.2 spi-number 256 secret q397F65
```

The following command deletes the configured SPI of *400* for an PCF with an IP address of *172.100.3.200*:

```
no spi remote-address 172.100.3.200 spi-number 400
```

The following command creates the configured SPI of *400* for an PCF with an IP address of *172.100.3.200* and zone id as 11:

spi remote-address *172.100.3.200* **spi-number** *400* **zone** *11*

tft-validation wait-timeout

Configures the TFT validation wait timeout value for QoS changes. The QoS update timer triggers automatic QoS updates based on dynamic policies.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

tft-validation wait-timeout *seconds*

[**default** | **no**] **tft-validation wait-timeout**

no

Removes the wait-timeout timer.

default

Sets / Restores default value assigned for **tft-validation wait-timeout**.

Usage

Configures the TFT validation wait time value for A11 RRQ for QoS changes. *seconds* must be an integer from 1 through 65535.

Example

Use the following command to set the TFT validation wait-timeout to *5* seconds:

```
tft-validation wait-timeout 5
```

threshold a11-ppp-send-discard

Sets an alarm or alert for the PDSN service based on the number of packets that the PPP protocol processing layer internally discarded on transmit for any reason.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
threshold a11-ppp-send-discard high_thresh [ clear low_thresh ]

no threshold a11-ppp-send-discard
```

no

Deletes the alert or alarm.

high_thresh

Default: *0*
The high threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between *0* and *100000*.

clear *low_thresh*

Default:*0*
The low threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between *0* and *100000*.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of discarded PPP send packets is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of discarded PPP send packets is based on the following rules:

- **Enter condition:** Actual number of discarded PPP send packets > High Threshold
- **Clear condition:** Actual number of discarded PPP send packets £ Low Threshold

Example

The following command configures a number of discarded PPP send packets threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-ppp-send-discard 1000 clear 500
```

threshold a11-rac-msg-discard

Sets an alarm or alert based on the number of Discarded A11 Registration Acknowledgements for the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
threshold a11-rac-msg-discard high_thresh [  clear low_thresh ]

no threshold a11-rac-msg-discard
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default: *0*
The low threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between *0* and *100000*.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Acknowledgements is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Acknowledgements based on the following rules:

- **Enter condition:** Actual number of Discarded A11 Registration Acknowledgements > High Threshold
- **Clear condition:** Actual number of Discarded A11 Registration Acknowledgements £ Low Threshold

Example

The following command configures a number of Discarded A11 Registration Acknowledgements threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-rac-msg-discard 1000 clear 500
```

threshold a11-rrp-failure

Sets an alarm or alert based on the number of A11 Registration Response failures for the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold a11-rrp-failure *high_thresh* [**clear** *low_thresh*]

no threshold a11-rrp-failure

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of A11 Registration Response failures that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of A11 Registration Response failures that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of A11 Registration Response failures is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of A11 Registration Response failures based on the following rules:

- **Enter condition:** Actual number of A11 Registration Response failures > High Threshold
- **Clear condition:** Actual number of A11 Registration Response failures £ Low Threshold

Example

The following command configures a number of A11 Registration Response failures threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-rrp-failure 1000 clear 500
```

threshold a11-rrq-msg-discard

Sets an alarm or alert based on the number of Discarded A11 Registration Requests for the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold a11-rrq-msg-discard*high_thresh* [**clear** *low_thresh*]

no threshold a11-rrq-msg-discard

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Requests is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Requests based on the following rules:

- **Enter condition:** Actual number of Discarded A11 Registration Requests > High Threshold
- **Clear condition:** Actual number of Discarded A11 Registration Requests £ Low Threshold

Example

The following command configures a number of Discarded A11 Registration Requests threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-rrq-msg-discard 1000 clear 500
```

threshold init-rrq-rcvd-rate

Sets an alarm or alert based on the average number of calls setup per second for the context.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold init-rrq-rcvd-rate *high_thresh* [**clear** *low_thresh*]

no threshold init-rrq-rcvd-rate

---

no

Deletes the alert or alarm.

---

high_thresh

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between *0* and *1000000*.

---

clear *low_thresh*

Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between *0* and *1000000*.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second > High Threshold
- **Clear condition:** Actual number of calls setup per second £ Low Threshold

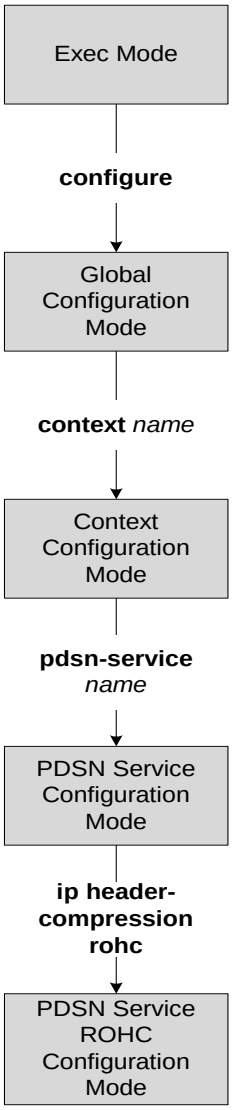
Example

The following command configures a number of calls setup per second threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold init-rrq-rcvd-rate 1000 clear 500
```

Chapter 230
PDSN Service RoHC Configuration Mode Commands

The PDSN Service RoHC Configuration Mode is used to configure RoHC (Robust Header Compression) parameters the PDSN service conveys to the PCF in the initial A11 RRP message before PPP authentication.



Important: The commands, keywords and variables in this mode are available dependent on platform type, product version, and installed license(s).

cid-mode

Enters the RoHC Profile Compression Options Configuration mode.and configures options that apply during RoHC compression for the current RoHC profile.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

cid-mode { large | small } max-cid *integer*

default cid-mode

default

Reset all options in the RoHC Profile Compression Configuration mode to their default values.

large

Use large packets with optional information for RoHC

small

This is the default packet size.
Use small RoHC packets.

max-cid *integer*

Default: 15
The highest context ID number to be used by the compressor. *integer* must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.

Usage

Use this command to set the RoHC packet size and define the maximum

Example

The following command sets large RoHC packet size and sets the maximum CID to 100:

```
cid-mode large max-cid 100
```

The following command sets the cid-mode to the default settings of small packets and max-cid 0:

```
default cid-mode
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

mrru

Sets the size of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments. The size includes the CRC. If MRRU is negotiated to be 0, no segment headers are allowed on the channel.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

mrru *num_octets*

default mrru

default

reset the value of this command to its default setting

num_octets

Default: 0
This is the number of octets for the maximum size of the largest reconstructed reception unit allowed. *num_octets* must be an integer from 0 through 65535.

Usage

Use this command to set the size, in octets, of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments.

Example

The following command sets the largest reconstructed reception unit to 1024 octets:

```
mrru 1024
```

The following command resets the mrru size to its default of 0 octets:

```
default mrru
```

profile

Specifies the header compression profiles to use. A header compression profile is a specification of how to compress the headers of a specific kind of packet stream over a specific kind of link. At least one profile must be specified.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
profile { [ esp-ip ] [ rtp-udp ] [ udp-ip ] [ uncompressed-ip ] }

default profile
```

default

Default: esp-ip rtp-udp udp-ip uncompressed-ip
This command sets the RoHC profile configuration back to its default setting.

esp-ip

This enables RoHC Profile 0x0003 which is for ESP/IP compression, compression of the header chain up to and including the first ESP header, but not subsequent subheaders.

rtp-udp

This enables RoHCProfile 0x0001 which is for RTP/UDP/IP compression

udp-ip

This enables RoHC Profile 0x0002 which is for UDP/IP compression, compression of the first 12 octets of the UDP payload is not attempted.

uncompressed-ip

This enables RoHC Profile 0x0000 which is for sending uncompressed IP packets.

Usage

Us this command to specify the RoHC header compression profiles to use.

Example

The following command sets the profiles to use as esp-ip and rtp-udp:

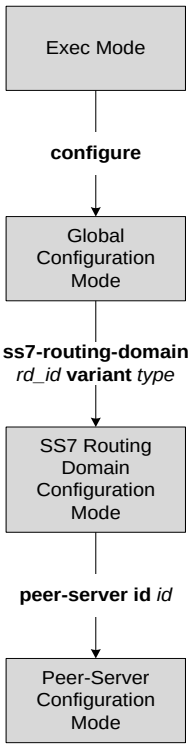
```
profile esp-ip rtp-udp
```

Chapter 231
Peer-Server Configuration Mode Commands

The Peer-Server configuration mode provides the commands to define and manage the peer server configuration part of the SS7 routing on an SGSN.

In this mode, the prompt line usually appears similar to:

```
[local]hostname(config-ss7-rd-<ss7rd_id>-ps-id-<ps_id>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

mode

Configures the operational mode of the peer-server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
mode ( loadshare | standby )
```

loadshare

Sets the peer-server to load share. This is the default.

standby

Sets the peer-server to be in standby mode.

Usage

Configure the operational mode of the peer-server.

Example

Configure the peer-server for standby mode.

```
mode standby
```

name

Defines the unique identification - the name - of the peer-server in the SS7 routing domain.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

name *name*

no name

no

Removes the peer server's name from this configuration instance.

name

name: Must be a string of 1 to 64 alphanumeric characters to define a unique identification for the peer-server within the specific SS7 routing domain. Double quotes must be used to create a name that includes spaces.

Usage

Create peer server names that are easy to remember and uniquely identify the PSP.

Example

Use this command to create an easily remembered alphanumeric name for the peer-server:

```
name "Berlin West"
```

psp

Creates the peer-server-process (PSP) instance and enters the PSP configuration mode. See the PSP Configuration Mode chapter in this guide for information on the configuration commands.

Important: This command configures a mandatory parameter in the configuration of the peer server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] psp instance id
```

no

Removes the PSP instance from the peer server configuration.

id

id Uniquely identifies the specific peer-server-process configuration. The Id must be an integer from 1 to 4.

Usage

Use this command to define the peer-server-process (PSP) instance ID number for the SGSN configuration.

Example

Use this command to create instance #3 for the PSP configuration:

```
psp instance 3
```

routing-context

Defines the ID of the routing context for the peer-server to use.

Important: This command configures a mandatory parameter in the configuration of the peer server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

routing-context *id*

no routing-context

id

id Uniquely identifies a specific routing context for the peer-server-process to use. The Id must be an integer from 1 to 65535.

no

Removes the routing-context definition from the peer server configuration.

Usage

Use this command to define routing contexts for the peer server.

Example

Define routing-context instance 15:

```
routing-context 15
```

self-point-code

This command defines the point-code to identify the SGSN as a peer server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point-code*

no self-point-code

point-code

Point-code is an SS7-type address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

no

Removes the self-point-code configuration for this linkset in the peer server.

Important: Removing the self-point-code will result in the termination of all traffic on this link.

Usage

Use this command to define the point-code to identify the SGSN.

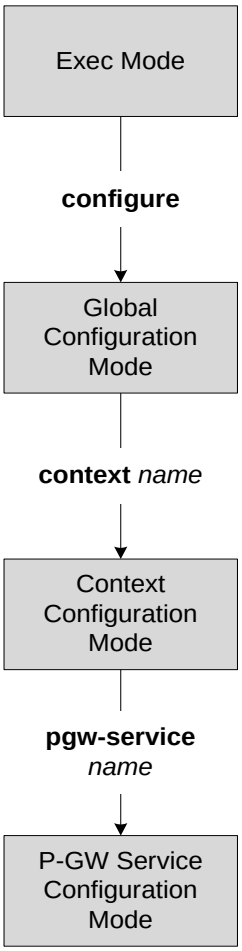
Example

Use the following command to remove the self-point-code definition from the peer-server configuration:

```
no self-point-code
```

Chapter 232
P-GW Service Configuration Mode Commands

The P-GW (PDN Gateway) Service Configuration Mode is used to create and manage the relationship between specified services used for either GTP or PMIP network traffic.



associate

Associates the P-GW service with specific pre-configured services and/or policies configured in the same context.

Product

P-GW

Privilege

Administrator

Syntax

```
associate { egtp-service name [ lma-service name ] | ggsn-service name | lma-service name
[ egtp-service name ] | qci-qos-mapping name }

no associate { egtp-service | lma-service | qci-qos-mapping }
```

no

Removes the selected association from this service.

{ egtp-service *name* **[lma-service** *name* **] | lma-service** *name* **[egtp-service** *name* **] }**

egtp-service *name* **[lma-service** *name* **]**: Specifies that the P-GW service is to be associated with an existing eGTP service within this context.
name must be an alphanumeric string of 1 through 63 characters and be an existing eGTP service.
Configure an associated LMA service name to support handoffs between PMIPv6 and GTP. *name* must be an alphanumeric string of 1 through 63 characters and be an existing LMA service.
lma-service *name* **[egtp-service** *name* **]**: Specifies that the P-GW service is to be associated with an existing LMA service within this context.
name must be an alphanumeric string of 1 through 63 characters and be an existing LMA service.
Configure an associated eGTP service name to support handoffs between PMIPv6 and GTP. *name* must be an alphanumeric string of 1 through 63 characters and be an existing eGTP service.

ggsn-service *name*

Specifies that the P-GW service is to be associated with an existing GGSN service within this context.
name must be an alphanumeric string of 1 through 63 characters and be an existing GGSN service.

qci-qos-mapping *name*

Specifies that the P-GW service is to be associated with an existing QCI-QoS mapping configuration within this context.
name must be an alphanumeric string of 1 through 63 characters and be an existing QCI-QoS mapping configuration.
QCI-Qos mapping is typically configured in a AAA context. Refer to the *QCI-QoS Mapping Configuration Mode Commands* chapter for more information.

Usage

Use this command to associate the P-GW service with other pre-configured services and/or policies configured in the same context.

Example

The following command associates this service with an eGTP service called *egtp1*:

```
associate egtp-service egtp1
```

authorize-with-hss

This command enables or disables subscriber session authorization via a Home Subscriber Server (HSS) over an S6b Diameter interface. This feature is required to support the interworking of GGSN with P-GW and HA.

Product

P-GW

Privilege

Administrator

Syntax

```
authorize-with-hss [ report-ipv6-addr ]

[ default | no ] authorize-with-hss
```

[default | no]

Disables the default authorization of subscriber over S6b interface. Resets the command to the default setting of "authorize locally" from an internal APN authorization configuration.

report-ipv6-addr

Enables the IPv6 address reporting through Authorization-Authentication-Request (AAR) towards the S6b interface.

Usage

Use this command to enable/disable the authorization support for subscriber over S6b interface, which is used between P-GW and the 3GPP AAA to exchange the information related to charging, GGSN discovery, etc.

dns-client

Specifies the DNS client context to use for sending DNS queries.

Product

P-GW

Privilege

Administrator

Syntax

dns-client context *name*

[default | no] dns-client context

default

Returns the command to the default setting of targeting the DNS client in the context where the P-GW service resides.

no

Disables DNS queries.

context *name*

Specifies the name of the context where the DNS client is used for the resolution of PCSCF-FQDN received from S6b interface.
name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify the context where the DNS client resides to perform P-CSCF-FQDN resolution from the S6b interface.

Example

The following command identifies the *egress1* context as the context where the DNS client resides:

```
dns-client context egress1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

fqdn

Configures a Fully Qualified Domain Name for this P-GW service used in messages between the P-GW and a 3GPP AAA server over the S6b interface.

Product

P-GW

Privilege

Administrator

Syntax

fqdn host *domain_name* **realm** *realm_name*

[default | no] fqdn

default

Returns the command to the default setting of "null".

no

Removes the configured FQDN from this service configuration.

host *domain_name*

Specifies the domain name of the P-GW service.
domain_name must be an alphanumeric string of 1 through 255 characters.

realm *realm_name*

Specifies the realm name of the P-GW service.
realm_name must be an alphanumeric string of 1 through 255 characters.

Usage

Use this command to identify the P-GW service using an FQDN required when sending messages over the S6b interface to a 3GPP AAA server.

Important: In order to properly interact with other nodes in the network, the FQDN should be less than or equal to 96 alphanumeric characters.

Topology Matching (eHRPD only)

You may specify which P-GW you wish an HSGW interface to connect with by enabling topology matching within the FQDNs for both the HSGW service and P-GW service. Topology matching selects geographically closer nodes and reduces backhaul traffic for a specified interface.

The following optional keywords enable or disable topology matching when added to the beginning of an FQDN:

- **topon.***interface_name*.

Beginning an FQDN with **topon** initiates topology matching with available HSGWs in the network. Once this feature is enabled, the rest of the FQDN is processed from right to left until a matching regional designator is found on a corresponding HSGW FQDN.

- **topoff.***interface_name*.

  By default, topology matching is disabled. If you enable topology matching for any interfaces within a node, however, all interfaces not using this feature should be designated with **topoff**.

Example

The following command configures the FQDN for this P-GW service as *123abc.all.com* with a realm name of *all.com*:

```
fqdn host 123abc.all.com realm all.com
```

The following command configures this P-GW service with an FQDN that enables topology matching:

```
fqdn host topon.interface_name.pgw01.bos.ma.node.epc
.mnc<value>.mcc<value>.3gppnetwork.org realm
node.epc.mnc.mcc.3gppnetwork.org
```

Important: The associated HSGW service must have a corresponding FQDN similar to the following:

```
topon.interface_name.hsgw01.bos.ma.node.epc.mncvalue.mccvalue.3gppnetwork
.org
```

gx-li

Refer to the *Lawful Intercept Configuration Guide* for a description of this command.

newcall

Configures the P-GW to accept or reject requests for a static IP address if the address is already in use by another session.

Product

P-GW

Privilege

Administrator

Syntax

```
newcall duplicate-subscriber-requested-address { accept | reject }

no newcall duplicate-subscriber-requested-address
```

no

Returns the command to the default setting of "reject".

duplicate-subscriber-requested-address { accept | reject }

Default: **reject**
accept: Specifies that the old session with the requested address will be ended to accept the new session with the same address.
reject: Specifies that the new session requesting the same address will be rejected.

Usage

Use this command to configure the behavior of the P-GW service when receiving requests for static IP address already in use by other sessions.

Important: This command is only applicable to sessions using services supporting duplicate address abort. These services include HA, GGSN, and P-GW.

Example

The following command allows for the acceptance of requests for static IP addresses already in use by other sessions:

```
newcall duplicate-subscriber-requested-address accept
```

plmn

Configures Public Land Mobile Network identifiers used to determine if a mobile station is visiting, roaming, or belongs to this network.

Product

P-GW

Privilege

Administrator

Syntax

plmn id mcc *number* **mnc** *number* **[primary]**

id mcc *number* **mnc** *number*

mcc *number*: Specifies the mobile country code (MCC) portion of the PLMN identifier.
number is the PLMN MCC identifier and must be an integer from 100 through 999.
mnc *number*: Specifies the mobile network code (MNC) portion of the PLMN identifier.
number is the PLMN MNC identifier and can be configured to a 2- or 3-digit integer from 00 through 999.

primary

When multiple PLMN IDs are configured, the **primary** keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute.

Usage

The PLMN identifier is used to aid the P-GW service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple P-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each P-GW Service.

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *02*:

```
plmn id mcc 462 mnc 02
```

session-delete-delay

Configures a delay in terminating a session.

Product

P-GW

Privilege

Administrator

Syntax

session-delete-delay timeout [*msec* **]**

[default | no] session-delete-delay timeout

default

Resets the command to the default setting of 10000 milliseconds.

no

Disables the feature.

timeout *msec*

Default: 10000
Specifies the time to retain the session (in milliseconds) before terminating it.
msec must be an integer from 1000 to 60000.

Usage

Use this command to set a delay to provide session continuity in break-before-make scenarios.

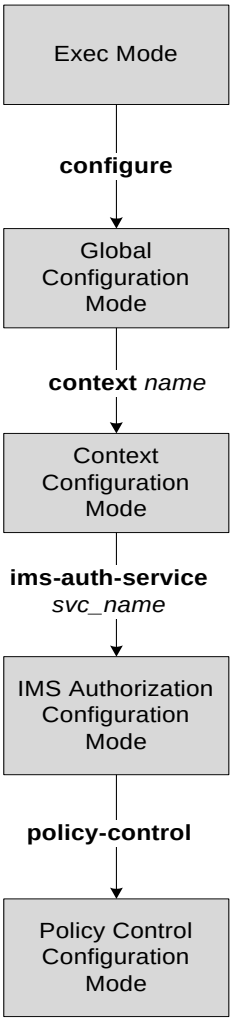
Example

The following command sets the session delete delay to the default setting of 10,000 milliseconds:

```
session-delete-delay timeout
```

Chapter 233
Policy Control Configuration Mode Commands

Policy Control Configuration mode is used to configure the Diameter dictionary, origin host, host table entry and host selection algorithm for IMS Authorization service.



apn-name-to-be-included

This command configures the APN name to be included in CCR Gx messages.

Product

GGSN, IPSG, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
apn-name-to-be-included { gn | virtual }

default apn-name-to-be-included
```

gn | virtual

Specifies which APN name must be sent in the Gx messages.
gn: Specifies to send the real APN name.
virtual: Specifies to send the virtual APN name if present, else to send the real APN name.

default

Applies the default setting for this command.
Default: **gn**

Usage

Use this command to configure the APN name to be included in the CCR Gx messages to the PCRF — the real APN name or the virtual APN name.

Example

The following command configures sending the real APN name in Gx messages:

```
apn-name-to-be-included gn
```

arp-priority-level

This command enables mapping of the ARP priority-level value received from PCRF to inter-user-priority value and be sent in A11 session update.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
arp-priority-level map-to inter-user-priority

[ default | no ] arp-priority-level map-to
```

default

Configures the default setting for this command.
Default: arp-priority-level to inter-user-priority mapping not applicable

no

Disables arp-priority-level to inter-user-priority mapping.

Usage

Important: This command is for a customer-specific implementation to support IP-CAN policy control via Gx interface in PDSN, wherein the PCRF informs the subscriber's subscription level (such as gold, silver, bronze) to PDSN/PCEF via Priority-Level AVP, then PDSN maps the subscriber's subscription level to inter-user-priority and transmits it to PCF via A11 session update message. For more information on the use of this command contact your Cisco account representative.

cc-profile

This command configures the value of the **Offline** AVP sent to the PCRF based on the Charging Characteristics (CC) profile received from the SGSN.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
cc-profile cc_profile_number [ to cc_profile_number_range_end ] map-to offline-avp { 0 |
1 }

{ default | no } cc-profile
```

default

Configures the default setting for this command.
Default: Deletes all previously configured mappings.

no

Deletes all previously configured mappings.

cc_profile_number

Specifies the CC profile number to map.
For example, 1 for Hot Billing.
cc_profile_number must be an integer from 0 through 15.

cc_profile_number_range_end

Specifies, for a range of CC profile numbers to map, the end number. That is, from *cc_profile_number* through *cc_profile_number_range_end*.
cc_profile_number_range_end must be an integer from 1 through 15.

map-to offline-avp { 0 | 1 }

Specifies to map the CC profile number(s) to the **Offline** AVP value sent to the PCRF.

- **0**: Corresponds to the value DISABLE_OFFLINE (0).
- **1**: Corresponds to the value ENABLE_OFFLINE (1).

Usage

Use this command to configure the CC Profile to **Offline** AVP value mapping. The **Offline** AVP's value (DISABLE_OFFLINE (0), ENABLE_OFFLINE (1)) is derived based on the CC profile received from the SGSN as specified by this mapping.
The following example shows how this command can be configured multiple times:

```
cc-profile 1 to 2 map-to offline-avp 1
```

```
cc-profile 4 map-to offline-avp 0

cc-profile 8 map-to offline-avp 1
```

On configuring the above set of commands, the Offline AVP value is sent as 1 (Offline enabled) for the CC profiles 1 (Hot Billing), 2 (Flat Rate), and 8 (Post-Paid). And, as 0 (Offline disabled) for the CC profile 4 (Pre-paid).
When configuring this command, overlapping of CC profile numbers is not permitted. In the following example, after configuring the first command, which specifies to send the **Offline** AVP's value as 1 (Offline enabled) for the CC profiles 1 through 15, the second command, which specifies to map CC profile 7, is not permitted:

```
cc-profile 1 to 15 map-to offline-avp 1

cc-profile 7 map-to offline-avp 0
```

Example

The following command specifies to send **Offline** AVP value as 1 (Offline enabled) for the CC profile 1 (Hot Billing):

```
cc-profile 1 map-to offline-avp 1
```

The following command specifies to delete all previously configured mappings:

```
no cc-profile
```

custom-reauth-trigger

This command enables custom reauthorization event triggers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
custom-reauth-trigger { none | { preservation-changed | reactivation-changed } + }

default custom-reauth-trigger
```

none

Disables all custom event triggers.
This is the default setting.

preservation-changed

Enables preservation-changed event trigger.

Important: This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

reactivation-changed

Enables reactivation-changed event trigger.

Important: This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

default

Configures the default setting for this command.

Usage

Use this command to enable/disable custom reauth event triggers.
It is recommended that the preservation-changed and reactivation-changed triggers both be enabled. As, when the bearer goes into preservation mode with the preservation-changed trigger, the reactivation-changed trigger must also be enabled for the bearer to get reactivated subsequently.
If only the preservation-changed trigger is enabled, and the bearer goes into preservation mode, the bearer will never get reactivated. The reactivation triggers will be ignored. If only the reactivation-changed trigger is enabled, reactivation of the already active bearer does not take place, and the reactivation triggers are ignored.

Example

The following command disables all custom event triggers:

```
custom-reauth-trigger none
```

diameter dictionary

This command specifies the Diameter Policy Control Application dictionary to be used by the IMS Authorization Service for the policy control application.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter dictionary { Standard | dpca-custom1 | dpca-custom10 | dpca-custom11 | dpca-custom12 | dpca-custom13 | dpca-custom14 | dpca-custom15 | dpca-custom16 | dpca-custom17 | dpca-custom18 | dpca-custom19 | dpca-custom2 | dpca-custom20 | dpca-custom3 | dpca-custom4 | dpca-custom5 | dpca-custom6 | dpca-custom7 | dpca-custom8 | dpca-custom9 | gx-wimax-standard | gxa-3gpp2-standard | gxc-standard | pdsn-ty | r8-gx-standard | std-pdsn-ty | ty-plus | ty-standard }

default diameter dictionary

dpca-custom1

Custom-defined Diameter dictionary for the Gx interface.

dpca-custom2

Custom-defined Diameter dictionary for Rel. 7 Gx interface.

dpca-custom3

Custom-defined Diameter dictionary for the Gx interface in conjunction with IP Services Gateway (IPSG).

dpca-custom4

Standard Diameter dictionary for 3GPP Rel. 7 Gx interface.

dpca-custom5

Custom-defined Diameter dictionary for Rel. 7 Gx interface.

dpca-custom6 ... dpca-custom20

Custom-defined Diameter dictionaries.

gx-wimax-standard

Gx WiMAX standard dictionary.

gxa-3gpp2-standard

Gxa 3GPP2 standard dictionary.

gxc-standard

Gxc standard dictionary.

pdsn-ty

This keyword is restricted.

r8-gx-standard

R8 Gx standard dictionary.

standard

Standard Diameter dictionary for the 3GPP Rel. 6 Gx interface.
Default: Enabled for Gx support in 3GPP networks.

std-pdsn-ty

This keyword is restricted.

ty-plus

This keyword is restricted.

ty-standard

This keyword is restricted.

default

Sets the default Diameter dictionary.
Default: **standard**

Usage

Use this command to specify the Diameter dictionary for IMS Authorization Service.

Example

The following command sets the **standard** dictionary for Diameter Policy Control functions in 3GPP network:

```
diameter dictionary standard
```

diameter host-select reselect

This command controls pacing of the reselection or switching of the PCRF after a change occurs in the table configuration for an IMS Authorization Service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter host-select reselect subscriber-limit *subs_limit* **time-interval** *duration*

[default | no] diameter host-select reselect

subscriber-limit *subs_limit*

Specifies the limit of subscribers to switch or reselect the PCRF for subscribers not more than *subs_limit* in time duration of *duration* second(s).
subs_limit must be an integer from 1 through 10000000.

time-interval *duration*

Specifies the time duration, in seconds, to reselect PCRF for subscribers not more than *subs_limit* in time duration of *duration* second(s).
duration must be an integer from 1 through 3600.

default

Applies the default setting for this command.
Sets the PCRF reselection or switching to default state.

no

Removes the configured PCRF reselection method and disables the reselection or switching of PCRF.

Usage

Use this command to specify the pacing of reselection or switching of the PCRF in an IMS authorization service..
In case IMS authorization session have been opened on certain PCRF on the basis of the current selection table, and the current active table configuration is changed, the IMSA starts selection procedure for the PCRF. Existing sessions on current PCRF from earlier table is required to close and reopened on the selected PCRF from the new table. This reselection periodicity is controlled by this command and it indicates the number of subscriber sessions *subs_limit* to be reselected or moved in *duration* seconds.
For example, if this command is configured with *100* subscribers and *2* seconds, then the system reselects the PCRF for no more than *100* subscribers per *2* seconds.

Example

The following command sets the system to reselect the new PCRF for no more than *1000* subscriber in *15* seconds:

diameter host-select reselect subscriber-limit *1000* **time-interval** *15*

diameter host-select row-precedence

This command adds/appends rows with precedence to a Diameter host table or MSISDN prefix range table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter host-select row-precedence *precedence_value* **table { { { 1 | 2 } host** *host_name* **[realm** *realm_id* **] [secondary host** *host_name* **[realm** *realm_id* **]] } | { prefix-table { 1 | 2 } msisdn-prefix-from** *msisdn_prefix_from* **msisdn-prefix-to** *msisdn_prefix_to* **host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **] algorithm { active-standby | round-robin }] } } [-noconfirm]**

no diameter host-select row-precedence *precedence_value* **table { { 1 | 2 } | prefix-table { 1 | 2 } }**

---

diameter host-select row-precedence *precedence_value* **table { 1 | 2 } host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **]]**

This command adds/appends a row in the specified Diameter host table.
In 8.0, a maximum of 16 rows can be added to a table. In 8.1 and later releases, a maximum of 128 rows can be added per table.
row-precedence *precedence_value*: Specifies precedence of the row in the Diameter host table.

Important: In 8.1 and later releases, *precedence_value* must be an integer from 1 through 128. In 8.0 and previous releases, *precedence_value* must be an integer from 1 through 100.

table { 1 | 2 }: Specifies the Diameter host table to add/append the primary and secondary Diameter host addresses.
host *host_name*: Specifies the primary host name. *host_name* must be an alphanumeric string of 1 through 127 characters in length.
realm *realm_id*: Specifies the primary realm ID. *realm_id* must be an alphanumeric string of 1 through 127 characters in length.
secondary host *sec_host_name* **[realm** *sec_realm_id* **]**: Specifies the secondary host name and realm ID:
host *sec_host_name*: Specifies the secondary host name. *host_name* must be an alphanumeric string of 1 through 127 characters in length.
realm *sec_realm_id*: Specifies the secondary realm ID. *realm_name* must be an alphanumeric string of 1 through 127 characters in length.

---

no diameter host-select row-precedence *precedence_value* **table prefix-table { 1 | 2 } }**

Removes the row with the specified precedence from the specified MSISDN prefix range table.

diameter host-select row-precedence *precedence_value* **table prefix-table { 1 | 2 } msisdn-prefix-from** *msisdn_prefix_from* **msisdn-prefix-to** *msisdn_prefix_to* **host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **] algorithm { active-standby | round-robin }] [-noconfirm]**

Use this command to configure the MSISDN prefix range based PCRF selection mechanism for Rel. 7 Gx interface support, wherein the PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation.
This command adds a row in the specified MSISDN prefix range table. A maximum of 128 rows can be added per prefix range table.
row-precedence *precedence_value*: Specifies precedence of the row in the table.

Important: In 8.1 and later releases, *precedence_value* must be an integer from 1 through 128. In 8.0 and previous releases, *precedence_value* must be an integer from 1 through 100.

prefix-table { 1 | 2 }: Specifies the MSISDN prefix range table to add the primary and/or secondary Diameter host addresses.
msisdn-prefix-from *msisdn_prefix_from*: For a range of MSISDNs, specifies the starting MSISDN.
msisdn-prefix-to *msisdn_prefix_to*: For a range of MSISDNs, specifies the ending MSISDN.

Important: To enable the Gx interface to connect to a specific PCRF for a range of MSISDNs/subscribers configure *msisdn_prefix_from* and *msisdn_prefix_to* with the starting and ending MSISDNs respectively. The MSISDN ranges must not overlap between rows. To enable the Gx interface to connect to a specific PCRF for a specific MSISDN/subscriber, configure both *msisdn_prefix_from* and *msisdn_prefix_to* with the same MSISDN.

host *host_name*: Specifies the primary host name. *host_name* must be an alphanumeric string of 1 through 127 characters in length.
realm *realm_id*: Specifies the primary realm ID. *realm_id* must be an alphanumeric string of 1 through 127 characters in length.
secondary host *sec_host_name* **[realm** *sec_realm_id* **]**: Specifies the secondary host name and realm ID: **host** *sec_host_name*: Specifies the secondary host name. *sec_host_name* must be an alphanumeric string of 1 through 127 characters in length.
realm *sec_realm_id*: Specifies the secondary realm ID. *sec_realm_id* must be an alphanumeric string of 1 through 127 characters in length.
algorithm { active-standby | round-robin }: Specifies the algorithm for selection between primary and secondary servers in the MSISDN prefix range table.
Default: **active-standby**
active-standby: Specifies selection of servers in the Active-Standby fashion.
round-robin: Specifies selection of servers in the Round-Robin fashion.

Important: The Round Robin algorithm for PCRF selection is effective only over a large number of PCRF selections, and not at a granular level.

-noconfirm

Specifies that the command is to execute without any additional prompt and confirmation from the user.

no diameter host-select row-precedence *precedence_value* **table { 1 | 2 }**

Removes the row with the specified precedence from the specified Diameter host table.

Usage

Use this command to add, update, or delete rows specified with a precedence from a Diameter host table or MSISDN prefix range table.
In the Rel. 7 Gx implementation, when the Gateway interworks with multiple PCRFs, the Gateway can configure the primary and secondary server based on the MSISDN-prefix range in the MSISDN prefix range table. Using this command, you can add a new prefix row into the MSISDN prefix table.
If a row with the precedence that you add already exists in a table, the existing prefix row is removed and the new row is inserted with the same precedence.

Example

The following command adds a row with precedence *12* in table **2** with primary host name as *star_ims1* and secondary host name as *star_ims2* to Diameter host table.

```
diameter host-select row-precedence 12 table 2 host star_ims1 secondary
host star_ims2
```

diameter host-select table

This command selects the Diameter host table or the MSISDN prefix range table, and the algorithm to select rows from the Diameter host table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter host-select table { { 1 | 2 } algorithm { ip-address-modulus [ prefer-ipv4 |
prefer-ipv6 ] | msisdn-modulus | round-robin } | prefix-table { 1 | 2 } }

[ default | no ] diameter host-select table
```

`diameter host-select table { 1 | 2 } algorithm { ip-address-modulus | msisdn-modulus | round-robin }`

`table { 1 | 2 }`: Specifies the Diameter host table to obtain the primary and secondary host name for PCRF.

`algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin }`: Specifies the algorithm to select row from the Diameter host table.

Default: **`round-robin`**

- **`ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ]`**: This algorithm divides the IP address, in binary, of the subscriber by the number of rows in the table, and the remainder is used as an index into the specified table to select the row.
- prefer-ipv4: Specifies that IPv4 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.
- prefer-ipv6: Specifies that IPv6 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.
- **`msisdn-modulus`**: This algorithm divides the MSISDN value in binary without the leading "+" of the subscriber by the number of rows in the table, and the remainder is used as an index in the specific table to select the row.
- **`round-robin`**: This algorithm rotates all rows in the active table for selection of the row in round-robin fashion. If no algorithm is specified this is the default behavior.

Important: The Round Robin algorithm is effective only over a large number of selections, and not at a granular level.

`diameter host-select table prefix-table { 1 | 2 }`

Specifies the MSISDN Prefix Range table to be used in case of MSISDN prefix range based PCRF discovery mechanism.

`default`

Applies the default setting for this command.

no

Removes previous configuration.
When no table is selected, the system will not communicate with any PCRF for new sessions.

Usage

Use this command to configure the Diameter host table and row selection methods to select host name or realm for PCRF.
When this command is used to change which table the system should be using, user must re-determine which E-PDF the system should be using for each subscriber. If a different E-PDF results from the configuration change in the table, the system will wait for all of the IMS sessions for the subscriber to be no longer active and then the system either closes/opens Gx sessions with the old/new PDFs respectively, or the system deactivates the PDP contexts of the subscriber.
Here is an example of how row selection is configured for three hosts that the system will use for load-balancing. Operator can configure six rows in a table, as follows.

Modulo 6	Primary Host	Secondary Host
0	1	2
1	1	3
2	2	1
3	2	3
4	3	1
5	3	2

In the above table, the three hosts are named 1, 2, and 3. When all hosts are working, the load will be distributed among all the three hosts. If host 1 fails, then the load will be distributed between the remaining two hosts. In this scenario, the modulo 6 results of 2 and 4 will return rows that have primary hosts but no working back-up host.
In the Rel. 7 Gx implementation, the GGSN/PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation. The ip-address-modulus, msisdn-modulus, and round-robin algorithms are supported by the GGSN/PCEF for PCRF discovery. In addition, the active/standby and round-robin algorithms are used for selection between primary and secondary servers based on the MSISDN Prefix Range Table.

Example

The following command specifies **table 1** with **round-robin** algorithm to select the rows with host name for E-PDF in Diameter host table.

```
diameter host-select table 1 algorithm round-robin
```

diameter origin endpoint

This command binds the origin endpoint configured in Context Configuration mode to the IMS Authorization service for Diameter Policy Control Application (DPCA).

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *endpoint_name*

no diameter origin

endpoint *endpoint_name*

endpoint_name is the Diameter endpoint configured in Context Configuration Mode to bind with IMS authorization service, and must be an alpha/numeric string of 1 through 63 characters in length.

no

Removes the binding of Diameter origin endpoint with IMS Authorization service.

Usage

Use this command to bind a configured Diameter origin endpoint to the IMS Authorization service for DPCA. This IMS authorization service searches all system contexts until it finds one with a matching Diameter origin endpoint name specified.

Example

The following command binds a configured endpoint named test to the IMS authorization service:

```
diameter origin endpoint test
```

diameter request-timeout

This command configures the request-timeout setting for Diameter-IMSA Gx interface.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

diameter request-timeout *timeout*

default diameter request-timeout

timeout

Specifies the timeout period in seconds.
timeout must be an integer from 1 through 300.
Default: 10 seconds

default

Applies the default setting for this command.

Usage

Use this command to configure the request-timeout setting for Diameter-IMSA Gx interface.

Example

The following command configures the Diameter request-timeout setting to *20* seconds:

```
diameter request-timeout 20
```

diameter update-dictionary-avps

This command enables dictionary control of the AVPs that need to be added based on the version of the specification to which the PCEF is compliant with.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter update-dictionary avps { 3gpp-r8 | 3gpp-r9 }

{ default | no } diameter update-dictionary avps
```

default | no

Configures this command with the default setting.
The default behavior is that R9 support will not be indicated as part of Supported-Features AVP in a R7/R8 dictionary and R8 support will not be indicated as part of Supported-Features AVP in a R7 dictionary.

3gpp-r8

Specifies to select the 3GPP Rel. 8 AVPs for encoding.

3gpp-r9

Specifies to select the 3GPP Rel. 9 AVPs for encoding.

Usage

Important: This command is applicable only to Diameter dictionaries that support standard based volume reporting over Gx feature.

Use this command to encode the AVPs in the dictionary based on the release version of the specification to which the PCEF is compliant with.
Release 12.0 onwards, if a 3GPP Rel. 7 based dictionary is already configured with **diameter dictionary dpca-custom4** command, and then if the **diameter update-dictionary-avps 3gpp-r9** command is applied, the Supported-Features AVP with feature bit 1 being set will be sent in the CCR-I to indicate that 3GPP Rel. 9 AVPs are also supported.
Both **default** and **no** command have the same behavior, as if the CLI command is not configured. Hence, in the output of **show configuration verbose** command, the **default** and **no** command is shown as **no diameter update-dictionary-avps**.
This CLI command when configured results in behavioral changes as indicated in the following table.

Possible Upgrade Scenarios	Behavior
3GPP Rel. 7 based dictionary upgraded to 3GPP Rel. 9 For example: **diameter dictionary dpca-custom4** **diameter update-dictionary-avps 3gpp-r9**	In the CCR-I, Supported-Features AVP will be encoded with value 2 for the Feature-List AVP. [V] [M] Supported-Features: [M] Vendor-Id: 10415 [V] [M] Feature-List-ID: 1 [V] [M] Feature-List: 2 The Feature-List AVP value suggest that it is 3GPP Rel. 9 compliant. But, it is not fully complaint to 3GPP Rel. 9. In the current release, for this upgrade scenario (3GPP Rel. 7 to 3GPP Rel. 9), only volume reporting related AVPs mentioned in the 3GPP Rel. 9 will be supported.
3GPP Rel. 7 based dictionary upgraded to 3GPP Rel. 8 For example: **diameter dictionary dpca-custom4** **diameter update-dictionary-avps 3gpp-r8**	In the CCR-I, Supported-Features AVP will be encoded with value 1 for the Feature-List AVP. [V] [M] Supported-Features: [M] Vendor-Id: 10415 [V] [M] Feature-List-ID: 1 [V] [M] Feature-List: 1 The Feature-List AVP value suggest that it is 3GPP Rel. 8 compliant. But, it is not fully complaint to 3GPP Rel. 8. In the current release, for this upgrade scenario (3GPP Rel. 7 to 3GPP Rel. 8), none of the features mentioned in 3GPP Rel. 8 will be supported.
3GPP Rel. 8 based dictionary upgraded to 3GPP Rel. 9 For example: **diameter dictionary r8-gx-standard** **diameter update-dictionary-avps 3gpp-r9**	In the CCR-I, value for the Feature-List AVP in the Supported-Features AVP will be 2. [V] [M] Supported-Features: [M] Vendor-Id: 10415 [V] [M] Feature-List-ID: 1 [V] [M] Feature-List: 2 The Feature-List AVP value suggest that it is 3GPP Rel. 9 compliant. But, it is not fully complaint to 3GPP Rel. 9. Currently for this upgrade scenario (3GPP Rel. 8 to 3GPP Rel. 9), only volume reporting related AVPs mentioned in 3GPP Rel. 9 will be supported.

Example

The following command enables encoding of AVPs in the dictionary based on 3GPP Rel. 9:

```
diameter update-dictionary-avps 3gpp-r9
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

event-report-indication

This command enables event report indication.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

```
event-report-indication { all | pgw-trace-control | qos-change | rai-change | rat-change
| sgsn-change | ue-timezone-change | user-loc-change } [ pgw-trace-control ] [ qos-change
] [ rai-change ] [ rat-change ] [ sgsn-change ] [ ue-timezone-change ] [ user-loc-change
]

[ default | no ] event-report-indication
```

all | pgw-trace-control | qos-change | rai-change | rat-change | sgsn-change | ue-timezone-change | user-loc-change

Specifies which types of changes will trigger an event report from the PCRF.

- **all**: all triggers
- **pgw-trace-control**: P-GW trace control change trigger
- **qos-change**: QoS change trigger
- **rai-change**: RAI change trigger
- **rat-change**: RAT change trigger
- **sgsn-change**: SGSN change trigger
- **ue-timezone-change**: UE time zone change trigger
- **user-loc-change**: User location change trigger

default | no

Disables event report indication.

Usage

Use this command to determine what type of event changes are reported from the PCRF.

Example

The following command enables event report indication for all triggers.

```
event-report-indication all
```

event-update

This command configures sending usage information in event updates.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
event-update send-usage-report [ reset-usage ]

[ default | no ] event-update
```

default

Configures the default setting for this command.
Default: Usage report is not sent in event update.

no

Disables sending usage report in event update.

send-usage-report

Specifies to send volume usage report in event update.

reset-usage

Specifies to reset the usage at PCEF after reporting in event update.

Usage

Use this command to send volume usage information when an event change is reported to the PCRF in a CCR-U message.

Example

The following command specifies to send volume usage report in event updates to the PCRF:

```
event-update send-usage-report
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

failure-handling

This command configures Diameter failure handling behavior.

Product

All

Privilege

Security Administrator, Administrator

Syntax

In Release 8.0:

failure-handling { continue | retry-and-terminate | terminate | diameter-result-code { any-error | *result_code* } ccfh { continue | retry-and-terminate | terminate } [cc-request-type { initial-request | terminate-request | update-request }] }

no failure-handling diameter-result-code { any-error | integer *result_code* } [cc-request-type { initial-request | terminate-request | update-request }]

In 8.1 and later releases:

failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } { diameter-result-code { any-error | *result_code* [to *end_result_code*] } } { continue | retry-and-terminate | terminate }

no failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } [diameter-result-code { any-error | *result_code*[to *end_result_code*] }]

no

Disables previous failure-handling configuration.

continue

Specifies that in the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.

retry-and-terminate

Specifies that in the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

terminate

Specifies that in the event of a failure the user session be terminated.

diameter-result-code { any-error | *result_code* [to *end_result_code*] }

Specifies failure handling behavior for any/specific result-code(s) to identify the type of failure and failure handling action for specific credit control request type.

any-error: Specifies failure handling behavior for those result-codes for which failure-handling behavior has not been specified.
result_code: Specifies a Diameter failure result code. *result_code* is the code returned for a failure handling action and must be an integer from 3000 through 4999.
to *end_result_code*: Use to specify a range of Diameter failure result codes. *end_result_code* must be an integer from 3000 through 4999, and must be greater than *result_code*.

continue | retry-and-terminate | terminate

As in 8.1 and later releases.
Specifies the credit control failure handling action.

- **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.
- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.
- **terminate**: In the event of a failure the user session is terminated.

ccfh { continue | retry-and-terminate | terminate }

As in 8.0 release:
Specifies the credit control failure handling (CCFH) action with or without credit control request type.

- **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.
- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.
- **terminate**: In the event of a failure the user session is terminated.

cc-request-type

As in 8.0 release:
This optional keyword defines the type of credit control request with failure result code and credit control failure handling action for a session.

- **any-request**: Specifies the request type as any request for a new session.
- **initial-request**: Specifies the request type as initial request for a new session.
- **terminate-request**: Specifies the request type as terminate request for a session.
- **update-request**: Specifies the request type as update request for an active session.

Usage

Use this command to configure the Diameter Policy Control Application (DPCA) failure handling behavior. When an unknown rulebase comes in CCA, changing of rulebase and failure handling is managed in the following manner:

- If the new and existing rulebases have the same CCA policy, then switch to the new rulebase is successful.
- If the new rulebase is valid and has CCA-enabled, in CCA-Initial/Update request, switch to the new rulebase is successful.

- If the new rulebase is valid and does NOT have CCA enabled, whereas the existing rulebase has credit enabled, or vice versa, in CCA-Initial/Update request:
  - CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-RETRY&TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
- If the new rulebase is invalid, in CCA-Initial/Update request:
  - CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-RETRY&TERMINATE: Terminates on successful CCA-T, or terminates after successful/failed retry to secondary.
  - CCFH-TERMINATE: Terminates on successful/failed CCR-T to Primary.

The default failure handling behavior is:
failure-handling diameter-result-code any-error ccfh terminate

Example

The following command sets the DPCA failure handling to **retry-and-terminate** and return a result code of *3456* for credit control request type **initial-request**:
As in 8.0 release:

```
failure-handling diameter-result-code 3456 ccfh retry-and-terminate cc-request-type initial-request
```

As in 8.1 and later releases:

```
failure-handling cc-request-type initial-request diameter-result-code 3456 retry-and-terminate
```

li-secret

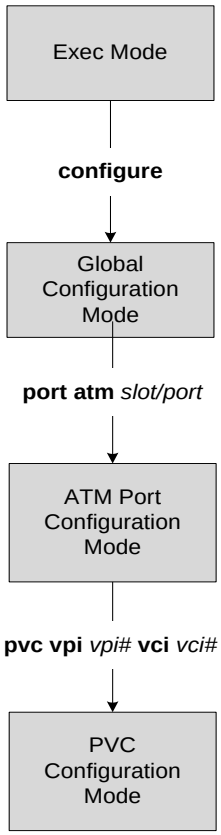
Refer to the *Cisco ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

Chapter 234
PVC Configuration Mode Commands

The Permanent Virtual Connection (PVC) configuration mode commands bind IP interfaces or SS7-Frame Relay links a PVC as well as configure PVC operational parameters for a specific port.

In this mode, the prompt line should appear similar to:

```
[local]hostname(config-port-<slot#>/<port#>-pvc-<pvc_num>/<vci_num>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, version, and installed license(s).

bind

This command binds an IP interface or an SS7 link to the PVC.

Important: Prior to attempting the binding, the interface and context or the SS7 routing information and link must have been configured.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bind { interface *interface_name context_name* **| link ss7-routing-domain** *rd_id* **linkset-id** *id* **link-id** *id* **}**

no

Removes the binding from the configuration.

interface_name

Defines the name of the virtual interface to be bound to the PVC. *interface_name:* Must be a unique string consisting of 1 to 79 alphanumeric characters.

context_name

Specifies the name of the context to be bound to the virtual interface. *context_name:* Must be a unique string consisting of 1 to 79 alphanumeric characters.

ss7-routing-domain *rd_id*

Identifies a specific SS7 routing domain. *rd_id* must be an integer from 1 to 12

linkset-id *id*

Identifies a specific linkset within the routing domain. *id*: must be an integer from 1 to 33

link-id *id*

Identifies a specific link within the linkset. *id*: must be an integer value 1 - 16

Usage

Use this command to bind the PVC to an interface or a specific link.

Example

Use a command similar to the following to bind a PVC to a link ID #2:

```
bind ss7-routing-domain 1 linkset-id 23 link-id 2
```

encapsulation aal5

Specify the data encapsulation type for the ATM adaptation layer 5 (AAL5) frames for the PVC.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
encapsulation aal5 { llc-snap | vc-mux }
```

llc-snap

Frames protocol is identified in the AAL5 using logical link control (LLC) encapsulation.

vc-mux

Frames are not encapsulated and use virtual circuit multiplexing (VC-MUX) to identify the protocols used for the AAL5 frames.

Usage

Use this command to identify the protocol type for the circuit.

Example

```
encapsulation aal5 vc-mux
```

end

Exits the PVC configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the PVC configuration mode and returns to the ATM port configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the port configuration mode.

shaping

Specify the type of traffic shaping (rates) for this PVC.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shaping { cbr pcr *prc_num* **| ubr pcr** *prc_num* **| ubr+ pcr** *prc_num* **mrc** *mrc_num* **| vbr pcr** *prc_num* **scr** *src_num* **mbs** *mbs_num* **}**

cbr

Constant bit rate
pcr - peak cell rate = cells per second
prc_num: Must be an integer from 75 to 1412830

ubr

Unspecified Bit Rate
pcr - peak cell rate = cells per second
prc_num: Must be an integer from 75 to 1412830

ubr+

Unspecified Bit Rate with Minimum Cell Rate.
The PCR and MCR values should be set to maintain the following relationship: PCR >= (MCR + minRate), where the current recomment minRate is 75.
pcr - peak cell rate = cells per second
prc_num: Must be an integer from 75 to 1412830
mcr - minimum cell rate
mrc_num: Must be an integer from 75 to 1412830

vbr

Variable Bit Rate, NRT (not real time) type.
The PCR and MCR values should be set to maintain the following relationship: PCR >= (MCR + minRate), where the current recomment minRate is 75.
pcr - peak cell rate = cells per second
prc_num must be an integer from 75 to 1412830
scr - sustained cell rate
src_num must be an integer from 75 to 1412830
mbs - maximum burst size
mbs_num must be an integer from 75 to 1412830

Usage

Use this command to configure the shaping for egress traffic on this PVC.

Example

shaping cbr pcr *56000*

shutdown

Disables/enables traffic over the current VLAN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
shutdown

no shutdown
```

no

Enables the VLAN. When omitted the VLAN is non-functional.

Usage

Enables/ Disables specified VLAN.
This command is necessary to bring a VLAN into service by enabling it via the **no** keyword.

Example

To disable a VLAN from sending or receiving network traffic use the following command:

```
shutdown
```

To enable a VLAN use the following command:

```
no shutdown
```

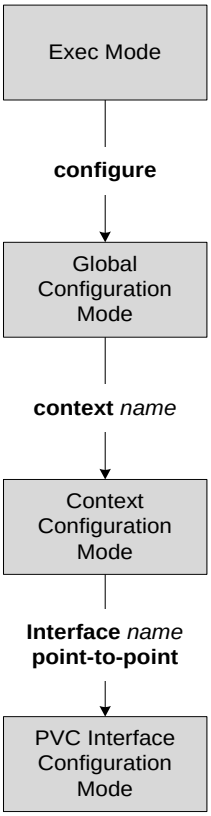
Chapter 235
PVC Interface Configuration Mode Commands

The PVC (permanent virtual connection) Interface configuration mode is used to create and manage the IP parameters for PVC interface(s) associated with an OLC (ATM-type) for a specific context.

In this mode, the prompt line should appear similar to:

```
[<context_name>]hostname<config-if-pvc)#
```

All configuration information specified with these commands is displayed using the Exec mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

description

Defines descriptive text to provide useful information about the current interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text: Must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters, 79.

Example

description *"PVC12 connects server 1 to home office."*

end

Exits the PVC interface configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the interface configuration mode and returns to the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

ip

The commands in this section are used to configure the IP parameters for the PVC interface.

Important: Before configuring the OSPF parameters in this section, you need to enable OSPF using the router command and OSPF configuration sub-mode commands accessed in the Context configuration mode and documented in the Context Configuration Mode chapter of this Command Line Interface Reference.

ip access-group

This command identities the access control list (ACL to be associated with this PVC interface in this context.

Important: Prior to using this command, the access list must be created for this context with the **ip access-list** command in the Context configuration mode and then the ACL must be configured using the commands described in CLI chapter ACL Configuration Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip access-group *name* **{ in | out }**

no ip access-group *name* **{ in | out }**

no

Indicates the specified access group to be removed from the access list.

name

Specifies the access control list (ACL) rule to be added or removed from the group.
name: Must be a string of 1 to 79 alphanumeric characters with no spaces.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

in | out

in: Specifies list is for in-bound access control.
out: Specifies the list is for out-bound access control.

Important: Even though "in" or "out" can be specified, context-level ACL rules are automatically applied to both directions.

Usage

Use this command to add IP access lists configured for the same context to an IP access-group. The list can be configured to apply to all inbound and/or outbound traffic.

Example

The following adds ACL access-list-1 to the IP access-group associated with this PVC for this context.

```
ip access-group access-list-1 in
```

ip address

Defines the primary IP address and the network mask to be associated with this PVC interface for this context. This command can also be used to configure the secondary IP address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip address *ip_address ip_mask* **[secondary]**

no ip address *ip_address*

no

Removes the IP address information for this PVC from the configuration. It is not necessary to include the subnet mask with the command.
The command must first be issued with the secondary IP address if one exists and then re-issued with the primary IP address.

address *ip_address ip_mask*

Configures the IP address and the network mask for this PVC interface. The first time this command is entered, it automatically defines the primary IP address for this interface.
ip_address and *ip_mask* must be specified using the standard IPv4 or IPv6 dotted decimal notation.

secondary

secondary: Including this keyword indicates the IP address and subnet mask being defined are to be used as the secondary IP address for this PVC interface. This is referred to as multi-homing of the interface.

Usage

Configures or deletes the IPv4 or IPv6 addresses and subnet mask to be associated with this PVC.

Example

The following configures the secondary IP address to associate with the interface.

```
ip address 131.2.3.4 255.255.255.0  secondary
```

The following set of commands removes the primary IP address from the PVC interface configuration for this context.

```
no ip address secondary address

no ip address primary address
```

ip mtu

Configures the maximum transmission unit (MTU) to be supported on this interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip mtu *value*

no ip mtu

no

Disables and/or restores the option to the system default.

mtu *value*

Configures the maximum transmission unit in octets.
value: Enter an integer between 576 and 1600. Default is 1500.

Usage

Change the maximum transmission unit size to 1300.

Example

ip mtu *1300*

ip ospf authentication-key

This command configures the password or key to be used for OSPF (Open Shortest Path First) authentication with neighboring routers.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf authentication-key [encrypted] password *auth_key*

no ip ospf authentication-key

no

Deletes the authentication key.

encrypted

Enter this keyword if you are pasting a previously encrypted authentication key into the **password** *auth_key* for this command.

password*auth_key*

auth_key is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication key (password). This variable is entered in clear text format.

Usage

Use this command to set the authentication key used when authenticating with neighboring routers.

Example

To set the authentication key to 123abc, use the following command;

```
ip ospf authentication-key password 123abc
```

Use the following command to delete the authentication key;

```
no ip ospf authentication-key
```

ip ospf authentication-type

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf authentication-type { message-digest | null | text }

no ip ospf authentication-type { message-digest | null | text }
```

no

Disable this function.

message-digest

Set the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the type of authentication to use when authenticating with neighboring routers.

Example

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```

ip ospf cost

This command configures the cost associated with sending a packet over this logical interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf cost *value*

no ip ospf cost

no

Disable this function.

value

Default: 10
The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

Usage

Use this command to set the cost associated with routes from the interface.

Example

Use the following command to set the cost to 20;

```
ip ospf cost 20
```

Use the following command to disable the cost setting;

```
no ip ospf cost
```

ip ospf dead-interval

This command configures the dead-interval and the delay time in seconds, for OSPF communications.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf dead-interval *value*

no ip ospf dead-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, that the router should wait. During this interval, if no packets are received then the system considers the neighboring router to be off-line. This interval is typically 4 times the duration of the hello-interval.
value must be an integer from 1 through 65535. Default: 40

Usage

Use this command to set the dead-intervals or delays for OSPF communications.

Example

To set the dead-interval to 100, use the following command;

ip ospf dead-interval *100*

To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command'

no ip ospf dead-interval

ip ospf hello-interval

This command configures the delay time in seconds, for OSPF hello interval.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf hello-interval *value*

no ip ospf hello-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, between sending hello packets. This value is typically set to be 1/4 of the value of the **dead-interval**.
value must be an integer from 1 through 65535. Default: 10

Usage

Use this command to set the delays for the hello-interval.

Example

To set the hello-interval to 25, use the following command;

```
ip ospf hello-interval 25
```

To delete the setting for the hello-interval and reset the hello-interval value to its default of 10, use the following command'

```
no ip ospf hello-interval
```

ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf message-digest-key *key_id* **md5 [encrypted] password** *authentication_key*

no ip ospfmessage-digest-key *key_id*

no

Deletes the key.

message-digest-key key_id

Specifies the key identifier number. key_id must be an integer from 1 through 255.

encrypted

Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example

To create a key with the ID of 25 and a password of 123abc, use the following command;

```
ip ospf message-digest-key 25 md5 password 123abc
```

To delete the same key, enter the following command;

```
no ip ospf message-digest-key 25
```

ip ospf network

Configures the OSPF network type.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }

no ip ospf network

no

Disable this function.

broadcast

Sets the network type to broadcast.

non-broadcast

Sets the network type to non-broadcast multi access (NBMA).

point-to-multipoint

Sets the network type to point-to-multipoint.

point-to-point

Sets the network type to point-to-point.

Usage

Use this command to specify the OSPF network type.

Example

To set the OSPF network type to broadcast, enter the following command;

```
ip ospf network broadcast
```

To disable the OSPF network type, enter the following command;

```
no ip ospf network
```

ip ospf priority

This command designates the OSPF router priority.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf priority *value*

no ip ospf priority *value*

no

Disable this function.

value

The priority value to assign. This must be an integer from 0 through 255.

Usage

Use this command to set the OSPF router priority.

Example

To set the priority to 25, enter the following command:

```
ip ospf priority 25
```

To disable the priority, enter the following command:

```
no ip ospf priority
```

ip ospf retransmit-interval

This command configures the retransmit-interval and the delay time in seconds, for OSPF communications.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf dead-interval *value*

no ip ospf dead-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, between LSA (Link State Advertisement) retransmissions.
value must be an integer from 1 through 65535. Default: 5

Usage

Use this command to set the retransmit-intervals or delays for OSPF communications.

Example

To set the dead-interval to 25, use the following command;

ip ospf retransmit-interval *25*

ip ospf transmit-delay

This command configures the transmit-delay the OSPF communications parameters.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf transmit-delay *value*

no ip ospf transmit-delay

no

Deletes the value set and returns the value to its default.

transmit-delay *value*

The interval, in seconds, that the router should wait before transmitting a packet.
value must be an integer from 1 through 65535. Default: 1

Usage

Use this command to set the transmit-delay.

Example

To set the transmit delay to 5 seconds, use the following command;

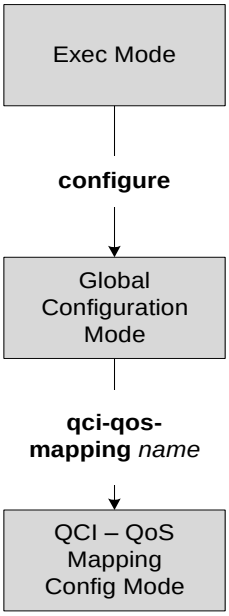
```
ip ospf transmit-delay 5
```

To delete the setting for the transmit-delay or reset the transmit-delay value to its default of 1, use the following command'

```
no ip ospf transmit-delay
```

Chapter 236
QCI - QoS Mapping Configuration Mode Commands

The QoS Class Index (QCI) to QoS Mapping Configuration Mode is used to map QoS Class Indexes to enforceable QoS parameters. Mapping can occur between the RAN and the Serving Gateway (S-GW), the Mobility Management Entity (MME), and/or the PDN Gateway (P-GW) in an LTE network or between the RAN and the eHRPD Serving Gateway (HSGW) in an eHRPD network.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

qci

Creates and maps QCI values to enforceable QoS parameters.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

qci *num* **[delay-class** *num* **precedence-class** *num* **reliability-class** *num* **[downlink | uplink]]**

qci *num* **[downlink { encaps-header { copy-inner | dscp-marking** *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }]**

qci *num* **[gbr [delay-class | downlink | max-packet-delay | traffic-policing | uplink]]**

qci *num* **[max-packet-delay** *num* **max-error-rate** *num* **[downlink | uplink]]**

qci *num* **[non-gbr [delay-class | downlink | max-packet-delay | traffic-policing | uplink]]**

qci *num* **[traffic-policing interval** *interval* **[delay-class | downlink | max-packet-delay | uplink]]**

qci *num* **[uplink { encaps-header { copy-inner | dscp-marking** *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }]**

[default | no] qci *num*

Important: The optional keywords associated with each of the initial optional keywords are abbreviated in the syntax examples above for clarity. Refer to the definitions below for the full keyword paths and associated descriptions for each keyword string in this command.

default

Resets the default values for the select QCI value.

no

Disables the selected QCI value.

num

Specifies the QCI value to be enabled. *num* must be an integer from 1 through 32.
QCI values of 1 through 9 are standard values. Only undefined values (10 through 32) can be defined.

Important: QCI values 1 through 9 are defined in *3GPP Specification TS 23.203 "Policy and charging control architecture"*.

delay-class *num* **precedence-class** *num* **reliability-class** *num*

delay-class *num*: Specifies the pre-release 8 value for configuring packet delay.
num must be an integer from 1 and 32.
precedence-class *num*: Specifies the pre-release 8 value for configuring packet precedence.
num must be an integer from 1 through 32.
reliability-class *num*: Specifies the pre-release 8 value for configuring packet reliability.
num must be an integer from 1 through 32.

downlink { encaps-header { copy-inner | dscp-marking *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }**

Configures parameters for downlink traffic.
encaps-header: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.
user-datagram dscp-marking *hex*: Specifies that the UDP DSCP marking is to be defined by this keyword.
hex is expressed as a hexadecimal number from 0x00 through 0x3F.
{ copy-inner | dscp-marking *hex* **}**

- **copy-inner**: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.
- **dscp-marking** *hex*: Specifies that the DSCP marking is to be defined by this keyword.

  hex ia expressed as a hexadecimal number from 0x00 through 0x3F.

gbr

Specifies that this QCI type is Guaranteed Bit Rate (GBR).

max-packet-delay *num* **max-error-rate** *num*

max-packet-delay *num*: Specifies the maximum packet delay (in milliseconds) that can be applied to the data with the QCI.
num must be an integer from 10 through 1000. Default is 10ms for QCI values greater than 9.
max-error-rate *num*: Specifies the maximum error loss rate of non-congestion related packet loss.
num must be an integer from 1 through 6, specifying 10-1 through 10-6. Default is 3 (or 10-3) for QCI values greater than 9.

Important: Defaults for QCI values less than 9 are defined in *3GPP Specification TS 23.203 "Policy and charging control architecture"*.

non-gbr

Specifies that this QCI type is non-Guaranteed Bit Rate (non-GBR).

traffic-policing interval *interval*

Specifies the traffic policing interval associated with the this QCI.
interval must be an integer from 1 through 100.

uplink { encaps-header { copy-inner | dscp-marking *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }**

Configures parameters for uplink traffic.

encaps-header: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.

user-datagram dscp-marking *hex*: Specifies that the UDP DSCP marking is to be defined by this keyword.

hex is expressed as a hexadecimal number from 0x00 through 0x3F.

{ copy-inner | dscp-marking *hex* **}**

- **copy-inner**: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.
- **dscp-marking** *hex*: Specifies that the DSCP marking is to be defined by this keyword.

  hex is expressed as a hexadecimal number from 0x00 through 0x3F.

Usage

Use this command to create and map QCI values to enforceable QoS parameters.

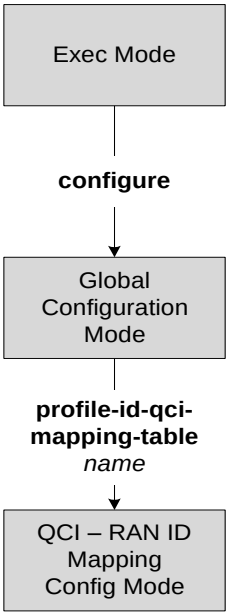
Example

The following command creates a QCI value of *15* and defines the uplink encapsulation header as using the DSCP marking from the encapsulated UDP header:

```
qci 15 uplink encaps-header copy-inner
```

Chapter 237
QCI - RAN ID Mapping Configuration Mode Commands

The QoS Class Index (QCI) Mapping Configuration Mode is used to map RAN profile IDs to QoS Class Indexes via the HRPD Serving Gateway (HSGW) in an eHRPD network.



end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

profile-id

Maps a QCI ID to a RAN profile ID and modifies data flow bit rate ranges.

Product

HSGW

Privilege

Administrator

Syntax

```
profile-id id qci num [ uplink { gbr rate [ mbr rate ] | mbr rate [ gbr rate ] } downlink
{ gbr rate [ mbr rate ] | mbr rate [ gbr rate ] ]

no profile-id id
```

no

Removes the specified profile ID entry from this map.

id

Specifies the profile ID to which a QCI ID will be mapped. *id* must be an integer value from 1 to 65535.

qci *num*

Specifies the QCI number to which the profile ID will be mapped. *num* must be an integer value from 1 to 255.

uplink

Specifies that the guaranteed bit rate (GBR) and/or maximum bite rate (MBR) setting that follow this keyword will be applied to the uplink data flow.

downlink

Specifies that the guaranteed bit rate (GBR) and/or maximum bite rate (MBR) settings that follow this keyword will be applied to the downlink data flow.

gbr *rate*

Specifies the guaranteed bit rate for the uplink or downlink data flow. *rate* must be an integer value from 0 to 4294967295.

mbr *rate*

Specifies the maximum bit rate for the uplink or downlink data flow. *rate* must be an integer value from 0 to 4294967295.

Usage

Use this command to map a QCI ID to a RAN profile ID and, optionally, modify data flow bit rate ranges.

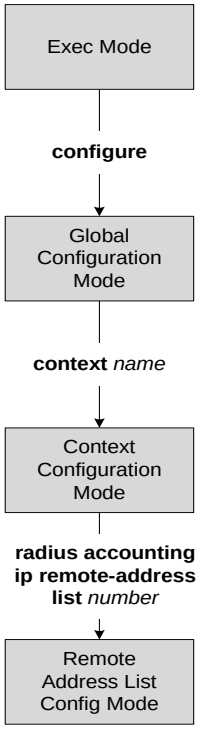
Example

The following command maps a QCI ID (*1*) to a profile ID (*10*) and sets the uplink guaranteed bite rate to *10000* and the downlink guaranteed bit rate to *20000*:

```
profile-id 10 qci 1 uplink gbr 10000 downlink gbr 20000
```

Chapter 238
Remote Address List Configuration Mode Commands

The Remote Address List Configuration Mode is used to configure address lists for the Remote Address-based Accounting feature on a per-context basis.



address

Configures addresses within a Remote Address List.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

[no] address *ip_address* **netmask** *subnet*

no

Removes a previously configured address.

ip_address

Specifies the IP address of the remote device.
ip_address is entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

netmask *subnet*

Specifies the subnet mask of the remote device.
subnet is the netmask expressed in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to configure remote address lists for use with the Remote Address-based accounting feature. A maximum of 10 address can be configured per list.

Example

The following command adds an IP address of *192.168.100.1* with a subnet mask of *255.255.255.0* to the list:

```
address 192.168.100.1 netmask 255.255.255.0
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

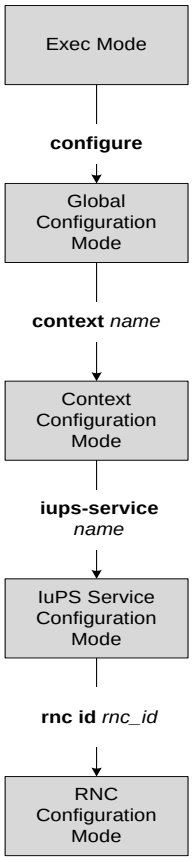
Use this command to return to the parent configuration mode.

Chapter 239
RNC Configuration Mode Commands

The RNC (radio network controller) configuration mode defines the parameters related to the SGSN connection with an RNC.

This mode is accessed from the IuPS Service configuration mode and the command prompt for this mode will appear similar to:

```
[<context_name>]hostname(config-ctx-iups-service-rnc)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate-gtpu-bind-address

This command defines the GTP-U loopback address and associates (binds) this address with a particular interface (non-loopback) address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] associate-gtpu-bind-address *ip_address* **to-interface-address** *ip_address*

no

Removes the loopback address definition and interface association from the current RNC configuration.

ip_address

ip_address: Must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to setup associations between loopback GTP-U addresses and a non-loopback addresses.

Example

Bind the GTP-U loopback address of *123.1.1.1* to interface address *222.1.1.1*:

```
associate-gtpu-bind-address 123.1.1.1 to-interface-address 222.1.1.1
```

description

This command defines an alphanumeric string that is intended to provide descriptive information about the radio network controller (RNC). This is used for operator reference only.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

no

Removes the description string from the current RNC configuration.

string

Specifies the alphanumeric string that is stored. must be from 1 through 255 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a particular RNC and carrier in Uganda *"RNC1 Carrier2 Uganda"*:

```
description "RNC1 Carrier2 Uganda"
```

direct-tunnel

This command enables/disables the direct tunnel feature through the interface to the radio network controller (RNC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
direct-tunnel not-permitted-by-rnc

default direct-tunnel
```

default

Sets the direct tunnel support on RNC to default mode; i.e. enabling direct tunnel.

not-permitted-by-rnc

Default: enabled
Disables the direct-tunnel support on radio network controller (RNC).

Usage

Use this command to disable/enable the direct-tunnel function through the interface to the RNC.

Example

Following command disables the direct tunnel support to the RNC:

```
direct-tunnel not-permitted-by-rnc
```

dual-address-pdp

This command enables the SGSN to work with an RNC with functioning dual address (IPv4v6) bearer support capability. By default, it is assumed that the RNC does not support dual PDP-type addressing.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
dual-address-pdp { not-supported | supported }

default dual-address-pdp
```

default

Resets the SGSN to function with an RNC that is not supporting dual PDP addressing.

not-supported

Default
Enables the SGSN to work with an RNC that does not support dual PDP-type addressing. It allows a single address bearer PDP-type to be activated with a configured PDP-type.

supported

Enables the SGSN to work with an RNC that does support dual PDP-type addressing.

Usage

This command enables the SGSN to support dual PDP-type addressing (IPv4v6) per RNC.
For a dual PDP context to be activated, the RNC should support the PDP-type IPv4v6 in the RAB assignment request. For an RNC that does support the dual PDP-type addressing, use this command to change the default configuration and to configure the SGSN to work with the RNC's dual address bearer support capability.
If the RNC does not support this functionality, then the **default** form of this command should be configured to enable the SGSN to activate a single-address bearer PDP context even if (1) the UE requests PDP type IPv4v6 and if (2) the subscription allows this PDP type. The single address bearer PDP type will be activated with a configured PDP type.
When a UE moves from an RNC that supports dual PDP-type addressing to another RNC that does not support dual PDP-type addressing, then the SGSN will deactivate the PDP context. This is done because, even if we preserve the PDP contexts, the UE would be unaware of the preserved PDP context. This would lead to non-synchronized behavior in the network. So the SGSN deactivates the PDP context with cause code "reactivation-required" to ensure the UE, RNC, SGSN, and GGSN are in synch. As well, this gives the UE the opportunity to activate a PDP context again without dual bearers.
The **sgsn-rnc-no-dual-pdp-init-pdp-deact** disconnect reason is used to indicate that a PDP context has been deactivated because of roaming into an RNC that does not support this feature.

Important: For this configuration to function, support for dual PDP-type addressing must be enabled at the global level (the default). To confirm the functionality is enabled, issue the **show sgsn-mode** command from the Exec

mode. If the PDP-type addressing is not enabled, then refer to the instructions for the **dual-address-pdp** command in the *SGSN Global Configuration Mode Commands* section.

Example

Use the following command to enable dual PDP-type addressing with a supporting RNC:

```
dual-address-pdp supported
```

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode to the Exec mode.

exit

Exits the current configuration mode and returns to the IuPS Service configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous configuration mode.

lac

This command identifies a Local Area Concentrator (LAC) and a Remote Area Concentrator (RAC) and associates them with this RNC definition.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] lac lac_id rac rac_id
```

no

Deletes the LAC and RAC information from the system configuration.

lac_id

A unique numeric identifier for the LAC associated with the RNC.
lac_id must be an integer between 1 and 65535.

rac_id

A unique numeric identifier for the RLAC associated with the RNC.
rac_id must be an integer between 1 and 255.

Usage

Creates an association with a specific LAC and RAC.

Example

Associate LAC *545* and RAC *23* with this RNC:

```
lac 545 rac 23
```

mbms

Configures RNC options for multimedia broadcast multicast service.

Important: This feature and command are currently under development and are not supported.

Product

SGSN

overload-action disable

This command maps an action to be taken if traffic reaches or exceeds defined levels.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

overload-action disable { activate | attach | auth-challenge | modify-request | paging-downlink-data | ptmsi-reallocation | service-request-data | sms } traffic-level *traffic-level*

[no | default] overload-action disable { activate | attach | auth-challenge | modify-request | paging-downlink-data | ptmsi-reallocation | service-request-data | sms }

no

Removes the defined overload action from configuration.

default

Resets the traffic level to the default level for the associated overload action.

activate traffic-level *traffic-level*

The system rejects new requests to activate PDP contexts if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 14

attach traffic-level *traffic-level*

The system rejects new requests for GPRS attach if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 15

auth-challenge traffic-level *traffic-level*

The system skips performing authentication challenges if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 4

modify-request *traffic-level*

The system rejects requests to modify a PDP context if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 12

paging-downlink-data traffic-level *traffic-level*

If the defined traffic-level is exceeded, then paging is not performed for data during downlinks if RABs are not available.

traffic-level: An integer 1 to 15.
Default: 11

ptmsi-reallocation traffic-level *traffic-level*

The system skips performing ptmsi-reallocation if the defined traffic-level is reached or exceeded.
traffic-level: An integer from 1 to 15.
Default: 4

service-request-data traffic-level *traffic-level*

The system rejects service requests to accept data and establish new RABs if the defined traffic-level is reached or exceeded.
traffic-level: An integer from 1 to 15.
Default: 10

sms traffic-level *traffic-level*

The system rejects SMS signaling if the defined traffic-level is reached or exceeded.
traffic-level: An integer 1 to 15.
Default: 8

Usage

This command defines traffic levels and the actions to take if traffic exceeds the defined levels. The command can be re-entered multiple times to create individual definitions for each type of traffic level and action.

Example

Use the following to instruct the system to reject service requests to establish new RABs if the traffic level reaches *3*:

```
overload-action disable service-request-data traffic-level 3
```

paging-non-searching-indication

This command instructs the SGSN to include the non-searching indicator flag in the page-request message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
paging-non-searching-indication { non-searching | searching }

[ no | default ] paging-non-searching-indication
```

no | default

This is the default. Entering no or default with this command disables the inclusion of the flag.

non-searching

Set the non-searching-indication to non-searching in the page-request message.

searching

Set the non-searching-indication to searching in the page-request message.

Usage

Use this command to determine which type of search indicator flag will be included in the page-request message.

Example

Use this command to include the non-searching flag in page-request messages:

```
paging-non-searching-indication non-searching
```

pointcode

Configures the point code of the RNC.

The access protocol that is part of the IuPS Service configuration mode must be configured prior to defining the RNC's point code.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

pointcode *pt_code*

no pointcode

no

Deletes the RNC's point code information from the system configuration.

pt_code

Point code in dotted-decimal format :

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- string of 1 to 11 characters

Usage

Use this command to identify the point code of the associated RNC.

Example

Identify the pointcode for this RNC as *1.234.2*:

```
pointcode 1.234.2
```

pooled

Configure an RNC as either ‘pooled’ or ‘non-pooled’.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

pooled

[default | no] pooled

default | no

Entering either **default** or **no** returns the RNC configuration to the default ‘non-pooled’ state.

Usage

Each RNC, one-at-a-time, can be identified as ‘pooled’ -- as participating within an SGSN pool -- or ‘non-pooled’. Pooled RNCs can co-exist with non-pooled RNCs.

Example

Identify this RNC as being part of an SGSN pool:

```
pooled
```

rab-modify-procedure

This command configures how the RAB (radio access bearer) assignment procedure will be modified

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
rab-modify-procedure { normal-modify | release-and-establish }

default rab-modify-procedure
```

default

Returns the configuration to the default setting for this command parameter.

normal-modify

Selects the normal RAB modify procedure.

release-and-establish

Instructs the system to release and establish the RAB procedure.

Usage

Set the procedure to establish the radio access bearer (RAB).

Example

```
rab-modify-procedure normal-modify
```

ranap global-cn-id

This command configures the SGSN to use include the Global Core Network ID IE in the various messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ranap global-cn-id { paging-request | relocation-request | reset-procedure | reset-resource-procedure } [ network-sharing selected-plmn ]

[ default | no ] ranap global-cn-id { paging-request | relocation-request }
```

default

Returns the configuration to the default setting and sends the common-plmn in the Global CN ID IE.

no

Disables sending the Global CN ID IE.

paging-request

Instructs the SGSN to send the Global CN ID IE in the Paging Request message.

relocation-request

Instructs the SGSN to send the Global CN ID IE in the Relocation Request message.

reset-procedure

Instructs the SGSN to send the Global CN ID IE in the Reset/Ack message.

reset-resource-procedure

Instructs the SGSN to send the Global CN ID IE in the Reset-Resource/Ack message.

network-sharing selected-plmn

Instructs the SGSN to send the selected-plmn in the Global CN ID IE *if* network sharing has been enabled.

Usage

Use this command to configure the SGSN to use 'selected-plmn' in the Global Core Network ID IE in various messages when network sharing is enabled.

Example

Use the following command to include the global-cn-id IE in a Paging Request with the common PLMN when network sharing is enabled :

```
default ranap global-cn-id paging-request
```

Use the following command to include global-cn-id IE in Relocation Request with the selected-plmn (assumes network sharing has been enabled):

```
ranap global-cn-id relocation-request network-sharing selected-plmn
```

ranap paging-area-id

This command configures the SGSN to use include the Paging Area ID IE in the Paging Request message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ranap paging-area-id paging-request [ network-sharing selected-plmn ]

[ default | no ] ranap paging-area-id paging-request [ network-sharing selected-plmn ]
```

default

Returns the configuration to the default setting and sends the common-plmn in the Paging Area ID IE.

no

Disables sending the Paging Area ID IE.

paging-request

Instructs the SGSN to send the Paging Area ID IE in the Paging Request message.

network-sharing selected-plmn

Instructs the SGSN to send the selected-plmn in the Paging Area ID IE *if* network sharing has been enabled.

Usage

Use this command to configure the SGSN to use 'selected-plmn' in the Paging Area ID IE in the Paging Request message when network sharing is enabled.

Example

Use the following command to include the paging-area-id IE in a Paging Request with the common PLMN when network sharing is enabled :

```
default ranap paging-area-id paging-request
```

Use the following command to include global-cn-id IE in Paging Request with the selected-plmn (assumes network sharing has been enabled):

```
ranap global-cn-id paging-request network-sharing selected-plmn
```

ranap paging-cause-ie

This command sets the paging cause value and either includes or suppresses the Paging Cause IE in responses to Paging Requests due to various sources. This command is available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ranap { paging-cause-ie { all | background-data [*value* **] | conversational-data [** *value* **] | gmm-signalling [** *value* **] | gs-signalling [** *value* **] | interactive-data [** *value* **] | sm-signalling [** *value* **] | sms-signalling [** *value* **] | streaming-data [** *value* **] }**

[default | no] ranap { paging-cause-ie { all | background-data | conversational-data | gmm-signalling | gs-signalling | interactive-data | sm-signalling | sms-signalling | streaming-data }

default

Resets the specific parameters value to default.

no

Suppresses the Paging Cause IE so that it is not included in responses to Paging Requests from respective sources.

all

Using **all** sets the action for the Paging Cause IE value for all paging due to all sources.

background-data [*value* **]**

Default: 3 (terminating background call)
Set the Paging Cause IE value for paging due to background data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

conversational-data [*value* **]**

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to conversational data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

gmm-signalling [*value* **]**

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to gmm-signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

gs-signalling [*value* **]**

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to VLR Paging Request.

value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

interactive-data [*value*]

Default: 2 (terminating interactive call)
Set the Paging Cause IE value for paging due to interactive data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

sm-signalling [*value*]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to SM signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

sms-signalling [*value*]

Default: 4 (terminating low priority signaling)
Set the Paging Cause IE value for paging due to SMS signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

streaming-data [*value*]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to streaming data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

Usage

This command can be used to set the value (meaning) of the Paging Cause IE included in responses to Paging Requests or it can be used to suppress the inclusion of the Paging Cause IE in the responses. These actions can be configured for paging for all sources or for a specified source.
The following values are applicable to all Paging Cause IEs:

- **0** - Terminating conversational call
- **1** - Terminating streaming call
- **2** - Terminating interactive call
- **3** - Terminating background call
- **4** - Terminating low priority signaling
- **5** - Terminating high priority signaling

Example

Use the following command to set Paging Cause value to *3* for paging due to GMM signaling without affecting cause values for other sources:

```
ranap paging-cause-ie gmm-signalling 3
```

Use the following command to suppress the Paging Cause IE from all Paging Requests to the RNC:

```
no ranap paging-cause-ie all
```

Either of the following commands will cause the Paging Cause IE to be included in Paging Requests with the default value for SM signaling without affecting the cause for other sources:

```
ranap paging-cause-ie sm-signalling
```

```
default ranap paging-cause-ie sm-signalling
```

ranap signalling-indication-ie

This command enables/disables the inclusion of the Signaling Indication IE in either or both the RAB Assignment Request and/or the Relocation Request RANAP messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ranap signalling-indication-ie { rab-assignment-request [ relocation-request ] |
relocation-request [ rab-assignment-request ] }

no ranap signalling-indication-ie

default ranap signalling-indication-ie
```

no

Sets the configuration so that the SGSN never includes the IE.

default

Resets the configuration to the default - the SGSN includes the IE in the messages if preconditions are met (see Usage section).

rab-assignment-request | relocation-request

Including one or both of these keywords configures what type of RANAP message will include the IE.

Usage

The command enables the operator to determine whether the signalling indication information element is included in either or both the RAB Assignment Request and Relocation Request messages during the PDP context setup procedure.

For this command configuration to work so that the IE is included, two preconditions must be met:

- Received QoS traffic class for the context must be interactive
- Received QoS has a signalling indication value as optimized

When an RNC receives this IE, the RNC assumes that the customer is using IMS signaling and allocates massive amounts of bandwidth, potentially causing cell congestion. This command enables the operator to determine the usage of this IE which provides the operator with additional session management control.

Example

Use the following command to include the signalling indication IE in the RAB Assignment Request:

```
ranap signalling-indication-ie rab-assignment-request
```

ran-information-management

Use this command to inform the SGSN which RNC are capable of handling RAN information management (RIM) messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ran-information-management
```

default

Resets the default so RIM is disabled.

no

Disables the RIM support in the configuration file.

Usage

By default, handling of RAN information management (RIM) messages is disabled. This command informs the SGSN which RNC are capable of handling RIM messages. This configuration only becomes 'operational' if the **ran-information-management** command is enabled in the SGSN global configuration mode. When RIM support is enabled on both the SGSN and the destination node, then all RIM PDUs are forwarded to the BSC/RNC. If RIM message handling is not enabled on both nodes, then the RIM PDUs are dropped silently.

Example

Use the following command to enable RIM support:

```
ran-information-management
```

Use the following command to disable RIM support that has been added to the configuration:

```
no ran-information-management
```

release-compliance

This command allows the SGSN to set support based on the RNC's 3GPP release compliance and to define per RNC QoS overrides.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

release-compliance { pre-release-7 | release-7 } [gbr-down *gbr_dn_val* **| gbr-up** *gbr_up_val* **| mbr-down** *mbr_dn_val* **| mbr-up** *mbr_up_val* **] +**

default release-compliance

default

Returns the configuration to the default value, **release-7**.

pre-release-7

Enables support for an RNC with capabilities compliant with releases prior to Release 7, such as HSPA in R6.

release-7

Enables support for RNC with capabilities compliant with 3GPP Release 7 or later, such as HSPA+ available in R7.

gbr-down *gbr_dn_val*

Defines a guaranteed kbps bit rate for downlink direction,

- options for **pre-release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.
- options for **release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

gbr-up *gbr_up_val*

Defines a guaranteed kbps bit rate for uplink direction,

- options for **pre-release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.
- options for **release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

mbr-down *mbr_dn_val*

Defines a maximum kbps bit rate for downlink direction,

- options for **pre-release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.

- options for **release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

mbr-up *mbr_up_val*

Defines a maximum kbps bit rate for uplink direction,

- options for **pre-release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.
- options for **release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

Usage

Use this command to match the 3GPP release support by the RNC. As the 3GPP releases each support differing data rate options - R6 supports HSPA and R7 supports HSPA+ - then selecting the compliance is a method of preforming data rate management on a per RNC basis.
Also use this command to set QoS capping overrides for each RNC separately. Default caps for Release 7 RNC will vary depending upon which overrides are set.

Important: Once caps are set for an RNC, if the RNC release level changes the capping remains the same until the QoS override values are changed for that RNC. Values do not automatically change to the default values appropriate for that release .

Example

Enable HSPA fallback to R6 compliance:

```
release-compliance pre-release-7
```

reset-resource

This command enables the operator to control message length by configuring the number of IuConIDs sent in each RANAP Reset Resource messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

reset-resource max-iuconid-per-msg *number*

default reset-resource max-iuconid-per-msg

default

Resets the number of Iu connection Ids included in the Reset Resource messages. Default is 250.

max-iuconid-per-msg *number*

Sets the number of Iu connection Ids to be included in the Reset Resource messages.
number: Integer from 1 to 250.
Default: 250

Usage

Id numbers for each Iu connection are included in the RANAP Reset Resource messages. Including this potentially long stream of numbers can make the message very long. With this command, the operator can control the size of the messages by controlling the number of Id messages included in the messages.

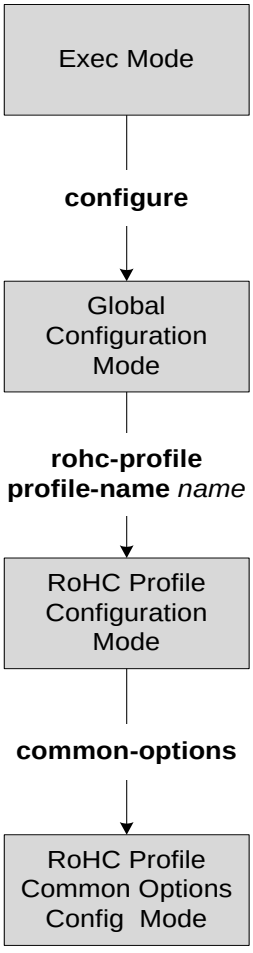
Example

Limit the number of Iu connection IDs to *30*:

```
reset-resource max-iuconid-per-msg 30
```

Chapter 240
RoHC Profile Common Options Configuration Mode Commands

The RoHC Profile Common Options Configuration Mode is used to set timers that, upon expiration, release robust header compression contexts.



delay-release-hc-context-timer

Sets a delay in releasing Robust Header Compression (RoHC) contexts allowing for context continuation during intra-gateway handoffs.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

delay-release-hc-context-timer *seconds*

no delay-release-hc-context-timer

no

Removes previously configured value for this command. No value disables the feature.

seconds

Specifies the number of seconds the system delays before releasing the header compression context as an integer from 0 to 65535.

Usage

Use this command to set a delay in releasing a header compression context. THis command is necessary when employing RoHC and mobility. Typically, when an RP connection is released, the header compression context is also released immediately. However, in mobility situations, such as intra-PDSN handoffs, the header compression context should be preserved. Adding a delay to cover the handoff time allows the context to be maintained.
A header compression context contains the compression/decompression configuration and statistics for the session.

Example

The following command sets the header compression release delay to 20 seconds:

```
delay-release-hc-context-timer 20
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

inactive-traffic-release-hc-context-timer

Sets an inactivity timer that is checked when inactivity is detected on an SO67 A10 bearer connection with negotiated RoHC parameters. When this timer expires, the header compression context is released.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

inactive-traffic-release-hc-context-timer *seconds*

no inactive-traffic-release-hc-context-timer

no

Removes previously configured value for this command. No value disables the feature.

seconds

Specifies the time, in seconds, the system waits for activity on the bearer channel before releasing the header compression context as an integer from 1 through 65535.

Usage

Use this command to set a timer that is started upon detecting inactivity on the bearer channel. Upon expiry, the header compression context is released. Enable this feature for more efficient memory utilization.

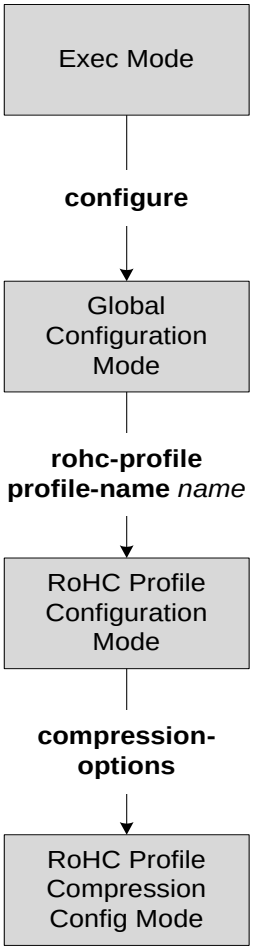
Example

The following command sets the bearer channel inactivity timer to 60 seconds:

```
inactive-traffic-release-hc-context-timer 60
```

Chapter 241
RoHC Profile Compression Configuration Mode Commands

The RoHC Profile Compression Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor parameters. RoHC is not supported on GGSN.



Important: The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).

context-timeout

Context timeout in seconds.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

context-timeout *seconds*

default context-timeout

default

Returns the command to its default value.

seconds

Specifies the context timeout value (in seconds) as an integer from 0 through 100.
Default: 20

Usage

Use this command to set the context timeout.

Example

The following command sets the context timeout to 10 seconds:

```
context-timeout-period 10
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ipid-history-size

Specifies the number of IP-IDs of previously sent packets to store. An IP ID is a 16-bit header field that stores IPv4 Identification information.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

ipid-history-size *number*

default ipid-history-size

default

Returns the command to its default value.

number

Specifies the number of IP IDs to store as an integer from 1 through 32.
Default: 8

Usage

Use this command to set the number of IP IDs to store in the history.

Example

The following command sets the history size to 24 IP-IDs:

```
ipid-history-size 24
```

max-jitter-cd

Specifies the upper boundary of jitter expected on the communication channel between the compressor and decompressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

max-jitter-cd *num_ms*

default max-jitter-cd

default

Returns the command to its default value.

num_ms

Specifies the number of milliseconds for the maximum jitter setting as an integer from 0 through 999999999.
Default: 150

Usage

Use this command to set the maximum amount of jitter allowed on the communication channel between compressor and decompressor.

Example

The following command sets the jitter limit to 1000 ms (1 second):

```
max-jitter-cd 1000
```

max-sliding-window

Specifies the width of the sliding window for W-LSB (Windows-based Least Significant Bits) encoded values.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

max-sliding-window *size*

default max-sliding-window

default

Returns the command to its default value.

size

Specifies the size of the sliding window as an integer from 1 through 1000.
Default: 6

Usage

Use this command to set the size of the sliding window used to compute jitter for W-LSB encoded values.

Example

The following command sets the sliding window size to 500:

```
max-sliding-window 500
```

multiple-ts-stride

Enables or disables the use of repeated transmission of RTS_STRIDE for timer-based compression.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ no ] multiple-ts-stride
```

no

Disables the use of repeated transmission of RTS_STRIDE for time-based compression.

Usage

Use this command to enable or disable a gateway's ability to repeatedly transmit RTS_STRIDE for timer-based compression.

new-context-blocking-time

Specifies the time period in seconds for blocking the establishment of new contexts after the compressor has received a feedback reject.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

new-context-blocking-time *seconds*

default context-timeout

default

Returns the command to its default value.

seconds

Specifies the context blocking time (in seconds) as an integer from 0 through 100.
Default: 20

Usage

Use this command to set the context blocking time after the compressor has received a feedback reject.

Example

The following command sets the context blocking time to 10 seconds:

```
new-context-blocking-time 10
```

num-pkts-ts

Specifies the number packets per RTP timestamp (TS).

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-pkts-ts *num_pkts*

default num-pkts-ts

default

Returns the command to its default value.

num_pkts

Specifies the number of packets for the timestamp as an integer from 0 through 999.
Default: 6

Usage

Use this command to set the number of packets for each RTP timestamp (TS).

Example

The following command sets the number of packets per timestamp to 50:

```
num-pkts-ts 50
```

num-pkts-u-mode

Specifies the number of packets sent when operating in U-Mode (unidirectional mode).

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-pkts-u-mode *num_pkts*

default num-pkts-u-mode

default

Returns the command to its default value.

num_pkts

Specifies the number of packets sent in U-Mode as an integer from 0 through 999.
Default: 1

Usage

Use this command to set the number of packets sent when in U-Mode.

Example

The following command sets the number of packets for U-Mode to 50:

```
num-pkts-u-mode 50
```

num-updates-ir

Configures the number of IR (Initiation and Refresh state) updates.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-updates-ir *num_pkts*

default num-updates-ir

default

Returns the command to its default value of 4.

num_pkts

Specifies the number of IR updates as an integer from 0 through 999.
Default: 4

Usage

Use this command to set the number of IR updates.

Example

The following command sets the number of IR updates to 30:

```
num-updates-ir 30
```

optimistic-repeats

Specifies the number of repeated packets to send to the decompressor. For transition from the FO (First Order) to the SO (Second Order) state, the compressor should be confident that the decompressor has all the parameters needed to decompress according to a fixed pattern.The compressor obtains its confidence about decompressor status by sending several packets with the same information according to the lower compression state. If the decompressor receives any of these packets, it is in sync with the compressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

optimistic-repeats *num_pkts*

default optimistic-repeats

default

Returns the command to its default value.

num_pkts

Specifies the number of packets to repeat with the same information to assure synchronization with the decompressor.
num_pkts must be an integer from 0 through 10.
Default: 6

Usage

Use this command to set the number of packets to repeat to the decompressor to assure synchronization before transition states.

Example

The following command sets the number of repeated packets to 5:

```
optimistic-repeats 5
```

rtp-sn-p

Specifies the value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

f(v_ref, k). Let f(v_ref, k) = [v_ref - p, v_ref + (2^k - 1) - p]

Where p is an integer.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-sn-p *p_value*

default rtp-sn-p

default

Returns the command to its default value.

p_value

Specifies the value of p in the RTP SN calculation as an integer from 0 through 999.
Default: 6

Usage

Use this command to set the value for p when performing the RTP SN calculation.

Example

The following command sets the value of p to 100:

```
rtp-sn-p 100
```

rtp-sn-p-override

Enables an override of p in the RTP SN calculation. This is disabled by default.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] rtp-sn-p-override
```

default

Returns the command to its default value of disabled.

no

Disables overriding p in RTP SN calculation.

Usage

Use this command to enable an override of p in RTP SN calculation.

Example

The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```

rtp-time-stride

Sets the time interval used for one TS (RTP Time Stamp) stride. This interval is used when timer-based encoding is enabled.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-time-stride *num_ms*

default rtp-time-stride

default

Returns the command to its default value.

num_ms

Specifies the number of milliseconds to use for TS_STRIDE as an integer from 0 through 999999999.
Default: 20

Usage

Use this command to set the length of the TS_STRIDE in milliseconds.

Example

The following command sets TS_STRIDE to 100ms:

```
rtp-time-stride 100
```

rtp-ts-deviation

Sets the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-ts-deviation *percentage*

default rtp-ts-deviation

default

Returns the command to its default value of 25.

percentage

Specifies the maximum percentage of deviation allowed for input RTP packets for timer-based compression as an integer value from 0 through 100.
Default: 25

Usage

Use this command to set the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Example

The following command sets the percentage to 30:

```
rtp-ts-deviation 30
```

rtp-ts-stride

Specifies the amount by which TS (RTP time stamp) is incremented. This value is used for Scaled RTP TS encoding.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-ts-stride *num_ms*

default rtp-ts-stride

default

Returns the command to its default value of 160.

num_ms

Specifies the number of milliseconds to use incrementing TS as an integer from 0 through 999999999.
Default: 160

Usage

Use this command to set the amount by which TS is incremented for Scaled RTP TS encoding.

Example

The following command sets amount by which TS is incremented to 100ms:

```
rtp-ts-stride 100
```

sliding-window-ts

Sets the sliding window used to compute jitter.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

sliding-window-ts *size*

default sliding-window-ts

default

Returns the window to its default value of 4.

size

Specifies the size of the sliding window as an integer from 1 through 1000.
Default: 4

Usage

Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example

The following command sets the sliding window size to 500:

```
sliding-window-ts 500
```

total-jitter-ipv4

Specifies the total jitter allowed after compression for IPv4.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

total-jitter-ipv4 *time*

default total-jitter-ipv4

default

Returns the command to its default value of 270.

time

Specifies the time interval to use (in milliseconds) as an integer from 0 through 999999999.
Default: 270

Usage

Use this command to set the jitter limit after compression.

Example

The following command sets the jitter after compression limit to 900 ms:

```
total-jitter-ipv4 900
```

total-jitter-ipv6

Specifies the total jitter allowed after compression for IPv6.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

total-jitter-ipv6 *time*

default total-jitter-ipv6

default

Returns the command to its default value 580.

time

Specifies the total jitter interval allowed (in milliseconds) as an integer from 0 through 999999999.
Default: 580

Usage

Use this command to set the jitter limit after compression.

Example

The following command sets the jitter after compression limit to 900 ms:

```
total-jitter-ipv6 900
```

unimode-timeout-to-fo-state

Specifies the time period in seconds before falling back to the FO (First Order) state.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

unimode-timeout-to-fo-state *num_ms*

default unimode-timeout-to-fo-state

default

Returns the command to its default value of 3.

num_ms

Specifies the timeout period (in seconds) as an integer from 0 through 10.
Default: 3

Usage

Use this command to set the timeout before falling back to the FO state when in Unimode.

Example

The following command sets the fall back timeout to 2 seconds:

```
unimode-timeout-to-fo-state 2
```

unimode-timeout-to-ir-state

Specifies the time period in seconds before falling back to the IR (Initiation and Refresh) state.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

unimode-timeout-to-ir-state *num_ms*

default unimode-timeout-to-ir-state

default

Returns the command to its default value of 5.

num_ms

Specifies the timeout period in seconds as an integer from 0 through 20.
Default: 5

Usage

Use this command to set the timeout before falling back to the IR state when in Unimode.

Example

The following command sets the fall back timeout to 3 seconds:

```
unimode-timeout-to-ir-state 3
```

use-calculated-rtp-time-stride

Overrides the configured value of rtp-time-stride with a calculated value.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-calculated-rtp-time-stride
```

default

Returns the command to its default value of enabled.

no

Disables the use of calculated RTP time stride override.

Usage

This command overrides the configured value of rtp-time-stride with a calculated value.

Example

The following command overrides the configured value of rtp-time-stride.

```
use-calculated-rtp-time-stride
```

use-calculated-rtp-ts-stride

Overrides the configured value of rtp-ts-stride with a calculated value.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

[default | no] use-calculated-rtp-ts-stride

default

Returns the command to its default value of enabled.

no

Disables the use of calculated RTP TS time stride override.

Usage

This command overrides the configured value of rtp-ts-stride with a calculated value.

Example

The following command overrides the configured value of rtp-ts-stride.

use-calculated-rtp-ts-stride

use-ipid-override

Enables or disables overriding the IP-ID (IPv4 Identification header field).

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-ipid-override
```

default

Returns the command to its default value of disabled.

no

Disables the IP-ID override.

Usage

Use this command to enable overriding of the IP-ID.

Example

The following command enables the IP-ID override feature:

```
use-ipid-override
```

The following command disables the IP-ID override feature:

```
no use-ipid-override
```

The following command also disables the IP-ID override feature:

```
default use-ipid-override
```

use-optimized-talkspurt

Enables or disables the use of optimized talkspurt.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-optimized-talkspurt
```

default

Returns the command to its default value of enabled.

no

Disables the use of optimized talkspurt.

Usage

Use this command to enable and disable the use of optimized talkspurt

Example

The following command enables the use of optimized talkspurt:

```
use-optimized-talkspurt
```

The following command disables the use of optimized talkspurt:

```
no use-optimized-talkspurt
```

use-optimized-transience

Enables or disables the use of optimized transience.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-optimized-transience
```

default

Returns the command to its default value of enabled.

no

Disables the use of optimized transience.

Usage

Use this command to enable or disable the use of optimized transience.

Example

The following command enables the use of optimized transience.

```
use-optimized-transience
```

The following command disables the use of optimized transience.

```
no use-optimized-transience
```

use-timer-based-compression

Enables or disables timer-based compression of the RTP time stamp (TS) at the compressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-timer-based-compression
```

default

Returns the command to its default value of enabled.

no

Disables the use of timer-based compression.

Usage

Use this command to enable or disable the use of timer-based compression.

Example

The following command enables the use of timer-based compression.

```
use-timer-based-compression
```

The following command disables the use of timer-based compression.

```
no use-timer-based-compression
```

use-uncomp-profile

Enables or disables the use of the Uncompressed Profile (0x0000) if required at the compressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[default | no ] useS-uncomp-profile
```

default

Returns the command to its default value of disabled.

no

Disables the use of the Uncompressed Profile.

Usage

Use this command to enable or disable the use of the Uncompressed Profile.

Example

The following command enables the use of the Uncompressed Profile.

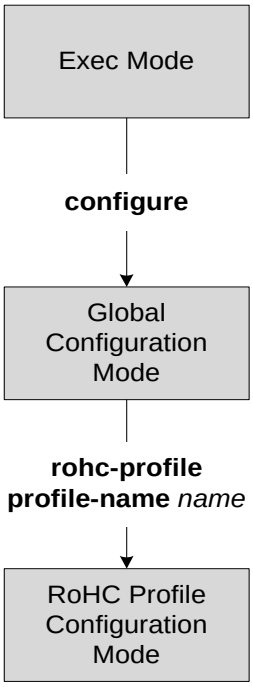
```
use-uncomp-profile
```

The following command disables the use of the Uncompressed Profile.

```
no use-uncomp-profile
```

Chapter 242
RoHC Profile Configuration Mode Commands

The RoHC Profile Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor and Decompressor parameters. The profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured. RoHC is not supported on GGSN.



Important: The availability of commands, keywords and variables in this mode is dependent on platform type, product version, and installed license(s).

common-options

Enters the RoHC Profile Common Options Configuration Mode where inactivity and delay timers are set to support dynamic header compression contexts and context preservation during handoffs.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] common-options
```

default

Reset all parameters in the RoHC Profile Common Options Configuration Mode to default values.

Usage

Use this command to enter the RoHC Profile Common Options Configuration Mode where parameters for maintaining header compression contexts and inactivity timers can be configured.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-common)#
RoHC Profile Common Options Configuration Mode commands are defined in the RoHC Profile Common Options Configuration Mode Commands chapter.

compression-options

Enters the RoHC Profile Compression Options Configuration Mode allowing configuration of options applied during RoHC compression for the current RoHC profile.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] compression-options
```

default

Reset all options in the RoHC Profile Compression Configuration Mode to their default values.

Usage

Use this command to enter RoHC Profile Compression Configuration Mode to set the compression options that are used for subscriber sessions using the current RoHC profile.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-comp)#
RoHC Profile Compression Options Configuration Mode commands are defined in the RoHC Profile Compression Configuration Mode Commands chapter.

Example

The following command enters RoHC Profile Compression Options Configuration Mode:

```
compression-options
```

The following command sets all compression options to their default values:

```
default compression-options
```

decompression-options

Enters the RoHC Profile Decompression Options Configuration Mode allowing configuration of options applied during RoHC decompression for the current RoHC profile.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[default ] decompression-options
```

default

Reset all options in the RoHC Profile Decompression Options Configuration Mode to their default values.

Usage

Use this command to enter RoHC Profile Decompression Options Configuration Mode to set the decompression options used for subscriber sessions using the current RoHC profile.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-decomp)#
RoHC Profile Decompression Options Configuration Mode commands are defined in the RoHC Profile Decompression Configuration Mode Commands chapter.

Example

The following command enters RoHC Profile Decompression Options Configuration Mode:

```
decompression-options
```

The following command sets all decompression options to their default values:

```
default decompression-options
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

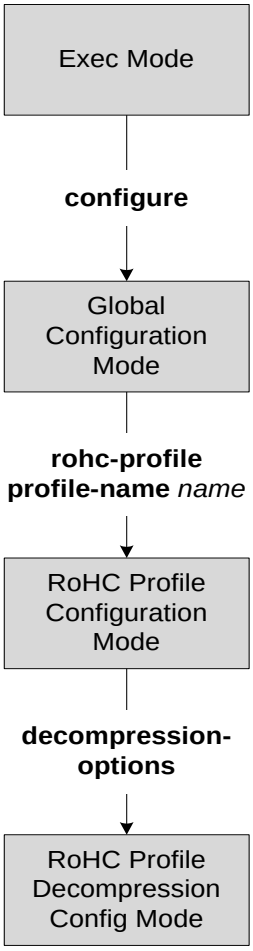
```
exit
```

Usage

Use this command to return to the parent configuration mode.

Chapter 243
RoHC Profile Decompression Configuration Mode Commands

The RoHC Profile Decompression Configuration Mode is used to configure RoHC (Robust Header Compression) Decompressor parameters.



Important: The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).

accept-delayed-pkts

Accepts delayed packets

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] accept-delayed-pkts
```

default

Returns the command to its default value of disabled.

Usage

This command helps reduce packet loss during context repair.

Example

Use the following command to enable the system to accept delayed packets:

```
accept-delayed-pkts
```

context-timeout

Ensures that no expired contexts are used for data compression.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

context-timeout *seconds*

default context-timeout

default

Returns the command to its default value.

seconds

Specifies the context timeout value (in seconds) as an integer from 0 through 100.
Default: 20

Usage

The RoHC stack should periodically clean up expired contexts and release memory in case there is no data activity for the call on this context. The context cleanup period is internally calculated to be set to half of the value of the context-timeout value. This will ensure that no expired contexts are used for data compression.

Example

The following command sets the context-timeout parameter to 30 seconds:

```
context-timeout 30
```

crc-errors-fo

Sets the limits for when a NACK message is sent while in the FO (First Order) state. A NACK is sent whenever CRC errors are detected within a specified number of packets.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

crc-errors-fo-k *num_errors*

crc-errors-fo-n *num_packts*

default crc-errors-fo-k

default crc-errors-fo-n

default

Returns the command to its default value.

crc-errors-fo-k *num_errors*

Specifies the number of received packets that trigger the sending of a NACK as an integer from 1 through 10.
Default: 1

Important: *num_errors* must be less than or equal to the value specified with the **crc-errors-fo-n** command.

crc-errors-fo-n *num_packts*

Specifies the number of packets to check for CRC errors as an integer from 1 through 10.
Default: 1

Usage

Use this command to set the parameters that trigger sending a NACK message when in the FO state.

Example

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the FO state, use the following commands:

```
crc-errors-fo-k 4

crc-errors-fo-n 10
```

crc-errors-so

Sets the limits for when a NACK message is sent while in the SO (Second Order) state. A NACK is sent whenever CRC errors are detected within a specified number of packets.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

crc-errors-so-k *num_errors*

crc-errors-so-n *num_packets*

default crc-errors-so-k

default crc-errors-so-n

default

Returns the command to its default value.

crc-errors-so-k *num_errors*

Specifies the number of received packets that trigger the sending of a NACK as an integer from 0 through 10.
Default: 1

Important: *num_errors* must be less than or equal to the value specified with the **crc-errors-so-n** command.

crc-errors-so-n *num_packets*

Specifies the number of packets to check for CRC errors as an integer from 1 through 10.
Default: 1

Usage

Use this command to set the parameters that trigger sending a NACK message when in the SO state.

Example

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the SO state, use the following commands:

```
crc-errors-so-k 4

crc-errors-so-n 10
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

nack-limit

Sets the number of unsuccessful decompressions allowed before a NACK is sent.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

nack-limit *limit*

default nack-limit

default

Returns the command to its default value.

limit

Specifies the number of unsuccessful decompressions allowed as an integer from 0 through 20.
Default: 0

Usage

Use this command to set the maximum number of unsuccessful decompressions before a NACK message is sent.

Example

The following command sets the number of unsuccessful decompressions allowed to 10:

```
nack-limit 10
```

optimistic-mode-ack

When this command is enabled and a type 2 IR-DYN packet is successfully decompressed, an optional ACK is sent in U-mode.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] optimistic-mode-ack
```

default

Returns the command to its default value of enabled.

no

Disables the sending of the optional ACK.

Usage

Use this command to enable and disable the sending of an optional ACK in U-mode when a type 2 IR-DYN packet is successfully decompressed.

Example

To enable the sending of the optional ACK, enter the following command:

```
optimistic-mode-ack
```

To disable the sending of the optional ACK, enter the following command:

```
no optimistic-mode-ack
```

optimistic-mode-ack-limit

Sets the number of packets for which to send ACKs.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

optimistic-mode-ack-limit *num_pkts*

default optimistic-mode-ack-limit

default

Returns the command to its default value.

num_pkts

Specifies the number of packets for which to send ACKs as an integer from 0 through 20.
Default: 3

Usage

Use this command to set the number of packets to send the optional ACK for when a type 2 IR-DYN packet is successfully decompressed.

Example

Enter the following command to set the number of packets to send and ACK for to 6:

```
optimistic-mode-ack-limit 6
```

Use the following command to set the number of packets to send an ACK for back to the default of 3:

```
default optimistic-mode-ack-limit
```

piggyback-wait-time

Specifies the time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

piggyback-wait-time *m_secs*

default piggyback-wait-time

default

Returns the command to its default value.

m_secs

Specifies the time (in milliseconds) to wait for a feedback packet to be picked up as an integer value from 0 through 1000.
Default: 80

Usage

Use this command to set the time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Example

The following command sets the wait time to 120 ms:

```
piggyback-wait-time 120
```

preferred-feedback-mode

Specifies the preferred feedback mode to use between the compressor and the decompressor

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
preferred-feedback-mode { bidirectional-optimistic | bidirectional-reliable |
unidirectional }

default preferred-feedback-mode
```

default

Returns the command to its default setting of bidirectional-optimistic.

bidirectional-optimistic

This mode is similar to the Unidirectional mode, with the exception of a feedback channel used to send error recovery requests from the decompressor to compressor.
This is the default mode.

bidirectional-reliable

Reliable mode makes extensive use of a feedback channel to avoid packet loss from context invalidation. A secure reference model is used instead of the optimistic approach used in the other modes. With the secure reference model, the confidence of the compressor depends on acknowledgements from the decompressor for every context updating packet.
Periodically the compressor sends context updating packets repeatedly until an acknowledgement is received from the decompressor.

unidirectional

Packets are sent in only one direction, from the compressor to the decompressor.

Usage

Use this command to specify the preferred feedback method to use between the compressor and the decompressor for the current RoHC profile.

Example

Use the following command to set the preferred feedback mode to bidirectional-reliable:

```
preferred-feedback-mode bidirectional-reliable
```

rtp-sn-p

Specifies the value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

f(v_ref, k). Let f(v_ref, k) = [v_ref - p, v_ref + (2^k - 1) - p]

Where p is an integer.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-sn-p *value*

default rtp-sn-p

default

Returns the command to its default value.

value

Specifies the number the value of p in the RTP SN calculation as an integer from 0 through 999.

Usage

Use this command to set the value to use for p when performing the RTP SN calculation.

Example

The following command sets the RTP Sequence Number integer “p” value to 100:

```
rtp-sn-p 100
```

rtp-sn-p-override

Allows an override of p in RTP SN calculation. This is disabled by default.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] rtp-sn-p-override
```

default

Returns the command to its default value of disabled.

no

Disables overriding p in RTP SN calculation.

Usage

Use this command to allow an override of p in RTP SN calculations.

Example

The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```

sliding-window-ts

Computes jitter as described in RFC 3095,[4.5.4]

Product

HSGW, PDSN

Privilege

Administrator

Syntax

sliding-window-ts *size*

default sliding-window-ts

default

Returns the command to its default value of 4.

size

Sets the size of the sliding window. *size* must be an integer from 1 through 1000.
Default: 4

Usage

Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example

The following command sets the sliding window size to 500:

```
sliding-window-ts 500
```

use-clock-option

Controls usage of the RoHC clock option. The clock option informs the compressor of the clock resolution of the decompressor. This allows the compressor to estimate the jitter introduced by the clock of the decompressor when doing timer-based compression of the RTP timestamp.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-clock-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the RoHC clock option.

Usage

Use this command to enable and disable the use of the RoHC clock option.

Example

The following command enables RoHC clock option usage:

```
use-clock-option
```

The following command disables RoHC clock option usage:

```
no use-clock-option
```

use-crc-option

Controls usage of the RoHC cyclic redundancy check (CRC) option. The CRC option contains an 8-bit CRC computed over the entire feedback payload, without the packet type and code octet, but including any CID fields,

Product

HSGW, PDSN

Product

Administrator

Syntax

```
[ default | no ] use-crc-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the CRC option.

Usage

Use this command to enable and disable the use of the RoHC CRC option.

Example

The following command enables RoHC CRC option usage:

```
use-crc-option
```

The following command disables RoHC CRC option usage:

```
no use-crc-option
```

use-feedback

Controls use of the feedback channel. A feedback channel sends error recovery requests and (optionally) acknowledgments of significant context updates from the decompressor to the compressor.

Product

HSGW, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] use-feedback
```

default

Returns the command to its default value of disabled.

no

Disables use of the feedback channel.

Usage

Use this command to enable and disable the use of the RoHC feedback channel.

Example

The following command enables RoHC feedback channel usage:

```
use-feedback
```

The following command disables RoHC feedback channel usage:

```
no use-feedback
```

use-jitter-option

Controls usage of RoHC jitter option. The jitter option allows the decompressor to report the maximum jitter it has observed

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-jitter-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the jitter option.

Usage

Use this command to enable and disable the use of the RoHC jitter option.

Example

The following command enables RoHC jitter option usage:

```
use-jitter-option
```

The following command disables RoHC jitter option usage:

```
no use-jitter-option
```

use-reject-option

Controls usage of RoHC reject option. The reject option informs the compressor that the decompressor does not have sufficient resources to handle the flow.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-reject-option
```

default

Returns the command to its default value of disabled.

no

Disables use of the reject option.

Usage

Use this command to enable and disable the use of the RoHC reject option.

Example

The following command enables RoHC reject option usage:

```
use-reject-option
```

The following command disables RoHC reject option usage:

```
no use-reject-option
```

use-sn-not-valid-option

Controls usage of the RoHC SN not valid option. The sn-not-valid option indicates that the SN of the feedback is not valid. A compressor must not use the SN of the feedback to find the corresponding sent header when this option is present.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-sn-not-valid-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the sn-not-valid option.

Usage

Use this command to enable and disable the use of the RoHC sn not valid option.

Example

The following command enables RoHC sn not valid option usage:

```
use-sn-not-valid-option
```

The following command disables RoHC sn not valid option usage:

```
no use-sn-not-valid-option
```

use-sn-option

Controls usage of RoHC sn option. The sn option provides eight additional bits of SN (Sequence Number, usually the RTP Sequence Number.)

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-sn-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the SN option.

Usage

Use this command to enable and disable the use of the RoHC SN option.

Example

The following command enables RoHC SN option usage:

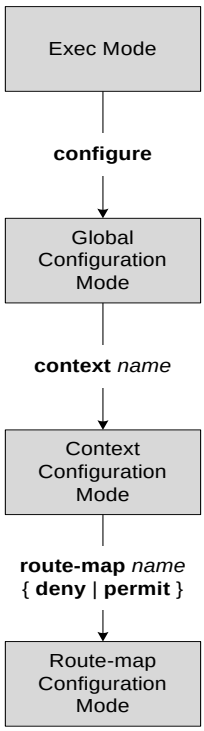
```
use-sn-option
```

The following command disables RoHC SN option usage:

```
no use-sn-option
```

Chapter 244
Route-map Configuration Mode Commands

The Route-Map Configuration sub-mode is used for the OSPFv2 and BGP-4 routing protocols. This mode includes commands that configure matching rules and set actions to perform on matched routes.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

match as-path

Matches an Autonomous System (AS) path access list

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] match as-path *AS_list*

no

Disables matching the specified AS path access list.

AS_list

Specifies the name of an AS path access list for matching as an alphanumeric string of 1 through 79 characters.

Usage

This command is used for BGP-4 routing to specify an AS path access list to be matched. Refer to the **ip as-path access-list** command for more information.

Example

To match entries in an AS path access list named *ASlist1*, enter the following command;

```
match as-path ASlist1
```

match interface

Specifies the next-hop interface name of a route to be matched.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match interface *interface-name*

no

Disables matching the specified interface name.

interface-name

Specifies the name of the virtual interface for matching as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify the next hop interface name for routes to be matched.

Example

To match routes that have the next hop interface specified as *Interface123*, enter the following command:

```
match interface Interface123
```

To disable matching routes that have the next hop interface specified as *Interface123*, enter the following command:

```
no match interface Interface123
```

match ip address

Matches routes with entries in a route-access-list or prefix-list.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match ip address { prefix-list | route-access-list } *list_name*

no

Disables matching from the specified prefix list or route access list.

prefix-list

Matches any routes with entries in a prefix-list.

route-access-list

Matches any routes with entries in a route-access-list

list_name

Specifies the name of the IP prefix list or IP route access-list as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to match routes specified in a route-access-list or prefix-list.

Example

To match routes that are specified in a prefix list named *Prefix100*, enter the following command:

```
match ip address prefix-list Prefix100
```

To disable matching routes that are specified in a prefix list named *Prefix100*, enter the following command:

```
no match ip address prefix-list Prefix100
```

match ip next-hop

Matches next-hop IP addresses with entries in specified standard prefix-list or route-access-list.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match ip address next-hop { prefix-list | route-access-list }*list_name*

prefix-list

Matches any routes that have a next-hop router address that has an entry in the specified prefix list.

route-access-list

Matches any routes that have a next-hop router address that has an entry in the specified route-access-list.

list_name

Specifies the name of the IP prefix-list or IP route-access-list as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to match next-hop IP addresses that have entries in the specified prefix-list or route-access-list.

Example

To match next-hop addresses with entries in a prefix-list named *Prefix100*, enter the following command:

```
match ip address next-hop prefix-list Prefix100
```

To disable matching next-hop addresses with entries in a prefix-list named *Prefix100*, enter the following command:

```
no match ip address next-hop prefix-list Prefix100
```

match metric

Matches routes that have the specified route metric.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match metric *metric_value*

no

Disables matching of the specified route metric.

metric_value

Specifies the route metric to match as an integer from 0 through 4294967295.

Usage

Use this command to match routes that have the specified route metric.

Example

To match routes with the route metric of *1200*, enter the following command:

```
match metric 1200
```

To disable matching routes with a route metric of *1200*, enter the following command:

```
no match metric 1200
```

match origin

Matches the origin code learned from BGP. This command is for route maps that are used with BGP routing only.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match origin { egp | igp | incomplete }
```

no

Disables matching of the origin code.

egp

Matches origins learned via the External Gateway Protocol (EGP)

igp

Match origins learned via the local Interior Glittery Protocol (IGP)

incomplete

Match origins with unknown heritage.

Usage

Use this command to match origin codes for BGP routing.

Example

To match origin codes learned from EGP, enter the following command:

```
match origin egp
```

match route-type external

Match external Open Shortest Path First (OSPF) routes of the specified type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match route-type external { type-1 | type-2 }
```

type-1

Only matches type-1 external routes.

type-2

Only matches type-2 external routes.

Usage

Use this command to match external routes of a specific type.

Example

The following command matches all external routes that are type-2:

```
match route-type external type-2
```

The following command disables matching external routes that are type-2:

```
no match route-type external type-2
```

match tag

Matches routes with the specified route tag value.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match tag *tag_value*

no

Disables matching routes with the specified route tag value.

tag_value

Specifies the route tag value to match as an integer from 0 through 4294967295.

Usage

Use this command to match routes that have the specified route tag value.

Example

Use the following command match routes that have a route tag value of *1234*:

```
match tag 1234
```

Use the following command to disable matching routes that have a route tag value of *1234*:

```
no match tag 1234
```

set as-path

Modifies an Autonomous System (AS) path for a route by adding the specified AS numbers to the front of the path.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] set as-path prepend *ASN*

no

Disables prepending the AS path. Any previously set prepends are removed.

prepend

Prepends the AS path.

ASN

AS number(s) to be prepended to the AS path. You can specify up to 16 different AS numbers to be prepended in the order specified. Each AS number must be separated by a space. *ASN* must be an integer from 1 through 65535.

Usage

Use this command to add up to 16 specified AS numbers to the front of the AS path.

Example

The following command prepends the AS numbers *100*, *200*, and *1000* to matching AS paths:

```
set as-path prepend 100 200 1000
```

set ip next-hop

Sets the IP address that is applied as the next hop for routes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] set ip next-hop *ip_address*

no

Disables the specified next hop address.

ip_address

Specifies the IP address of the next hop to which packets are output, entered using IPv4 dotted-decimal notation.

Usage

Use this command to set the IP address that is used as the next hop for routes.

Example

To set the next hop for routes to the IP address *192.168.2.100*, use the following command:

```
set ip next-hop 192.168.2.100
```

To disable setting the next hop for routes to the IP address *192.168.2.100*, use the following command:

```
no set ip next-hop 192.168.2.100
```

set metric

Sets the route metric for matching routes to a specified value.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] set metric *metric_value*

metric_value

Specifies the metric value that is set for routes as an integer from 1 through 16777214.

Usage

Use this command to set the route metric for matched routes.

Example

To set the route metric to *12345*, use the following command;

```
set metric 12345
```

To disable setting the route metric to *12345*, enter the following command;

```
no set metric 12345
```

set metric-type

This command sets the route metric type to either Type-1 or Type-2 in the AS-external-LSA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] set metric-type { type-1 | type-2 }
```

type-1

Sets the route metric to external type-1.

type-2

Sets the route metric to external type-2

Usage

Use this command to set the route metric to either external type-1 or external type-2.

Example

To set the route metric to type-1, enter the following command:

```
set metric type-1
```

To disable setting the metric to type, enter the following command:

```
no set metric type-1
```

set origin

Sets the Border Gateway Protocol (BGP) origin code to a specified value. This command is for route maps that are used with BGP routing only.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] set origin { egp | igp | incomplete }
```

no

Disables setting the origin code.

egp

Sets the origin code to specify that the path is from a remote External Gateway Protocol (EGP) system.

igp

Sets the origin code to specify that the path is from a local Interior Gateway Protocol (IGP) system.

incomplete

Sets the origin code to specify that the path is from an unknown system.

Usage

Use this command to set a specified origin code for BGP.

Example

To set the origin code to be from an External Gateway Protocol (EGP) system, enter the following command:

```
set origin egp
```

set tag

Sets the route tag value for matched routes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] set tag *tag_value*

no

Disable setting the route tag to the specified value.

tag_value

Specifies the route tag value as an integer from 0 through 4294967295.

Usage

Use this command to set the route tag value that is applied to all matched routes.

Example

To set the route tag value to *12345*, enter the following command:

```
set tag 12345
```

To disable setting the route tag value to *12345*, enter the following command:

```
no set tag 12345
```

set weight

Sets the weight in the routing table for matching routes to the specified value.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] set weight value
```

no

Disable setting the routing weight value.

value

Specifies the weight in the routing table as an integer from 1 through 4294967295.

Usage

Use this command to set the routing table weight on matched routes.

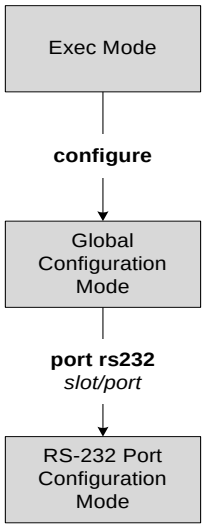
Example

The following command sets the routing table weight for matched routes to *1000*:

```
set weight 1000
```

Chapter 245
RS-232 Port Configuration Mode Commands

The RS-232 Port Configuration Mode is used to manage the RS-232 ports on the SPIO cards.



default

Restores the port's default speed and communication mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { preferred slot | terminal { all | databits | flowcontrol | parity | speed |
stopbits }
```

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a **port switch to** command to return service to the original port.

terminal { all | databits | flowcontrol | parity | speed | stopbits }

Sets the terminal settings for the RS-232 port to their default settings.
all: Restores all settings to their default values.
databits: Restores the databits setting to its default value of 8.
flowcontrol: Restores the flowcontrol setting to its default value of none.
parity: Restores the parity setting to its default value of none.
speed: Restores the speed setting to its default value of 9600.
stopbits: Restores the stopbits setting to its default value of 1.

Usage

Restores port-level parameters to their default values.

Example

The following command restores all terminal settings to their default values:

```
default terminal all
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery.

Default: non-revertive operation

Product

PDSN, FA, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

no preferred slot *slot#*

no

Disables revertive, or auto-recovery, operation for selected port.

slot#

Identifies the physical chassis slot where the SPIO card is installed.

Usage

This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (such as link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.
This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual line cards or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the line card in slot 17, while ports 5 through 8 are "preferred" on the line card in slot 33. In this scenario, both line cards would be in an Active operational state while still providing LC and port redundancy for the other.

Important: This command is not supported on all platforms.

Example

```
preferred slot 24
```

snmp trap link-status

Enables or disables the generation of an SNMP trap for link status changes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp trap link-status

no snmp trap link-status
```

no

Disables the sending of traps for link status changes.

Usage

Enable link status change traps when a monitoring facility can use the information or if there are trouble shooting activities are in progress.

Example

```
snmp trap link-status

no snmp trap link-status
```

terminal

Configures the console port on the SPIO.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
terminal { carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol { hardware |
none } | parity { even | none | odd } | speed { 115200 | 19200 | 38400 | 57600 | 9600 } |
stopbits { 1 | 2 } }
```

carrierdetect { off | on }

Default:
Specifies whether or not the console port is to use carrier detect when connecting to a terminal.

databits { 7 | 8 }

Default: 8
Specifies the number of data bits used to transmit and receive characters.

flowcontrol { hardware | none }

Default: none
Specifies how the flow of data is controlled between the SPIO and a terminal.

parity { even | none | odd }

Default: none
Specifies the type of error checking used on the port.
even: Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.
none: Disables error checking.
odd: Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

speed { 115200 | 19200 | 38400 | 57600 | 9600 }

Default: 9600
Specifies the flow of data in bits per second between the console port and terminal.

stopbits { 1 | 2 }

Default: 1
Specifies the number of stop bits between each transmitted character.

Usage

Sets the SPIO console port parameters for communication with the terminal device.

Example

The following command sets the SPIO's console port. The terminal must support these values.

```
terminal carrierdetect off databits 7 flowcontrol hardware parity even
speed 115200 stopbits 1
```

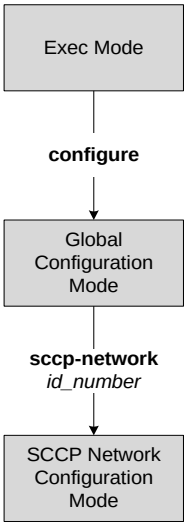
Chapter 246
SCCP Network Configuration Mode Commands

The SCCP Network Configuration Mode is used to configure properties for Signaling Connection Control Part (SCCP) services for SS7.

In this mode, the command prompt should be similar to:

```
[local]hostname(config-sccp-network-<sccp_id>)#
```

Signaling Connection Control Part (SCCP) is a routing protocol in the SS7 protocol suite in layer 4, which provides end-to-end routing for TCAP messages to their proper database.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

Associates an SS7 routing domain with the SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate ss7-routing-domain *rd_id*

no associate

no

Removes the association with the SS7 routing domain from the system configuration.

rd_id

This number identifies an already defined SS7 routing domain.
rd_id: enter an integer from 1 through 12.

Usage

Use this command to associate SS7 routing domain configurations with SCCP network configurations.

Example

The following command associates the SCCP network with SS7 routing domain 2:

associate ss7-routing-domain *2*

description

This command defines a string that describes the SCCP network. The description is used for operator reference.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

string

This is a string to describe the SCCP network.
string must be an alphanumeric string from 1 through 127 characters in length. If there are spaces in the string the string must be enclosed in double-quotes. For example; “This is a Description”.

no

Removes the description from the system configuration.

Usage

Use this command to configure a description of this SCCP service for operator reference.

Example

The following command sets the description to “This is the SCCP Service Number 1”:

```
description ”This is the SCCP Service Number 1.”
```

destination

This command configures the SCCP network destination information. Use this command multiple times to set all of the destination information required.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

destination dpc *pt_code* **{ name** *route_name* **| next-hop** *pt_code* **[priority** *priority* **] | ssn** *subsys_num* **| version** *sccp_ver* **}**

no destination dpc *p_code* **[name** *route_name* **| ssn** *ssn_num* **| version** *sccp_ver* **]**

no

Deletes the specified destination information from the SCCP network configuration.

dpc *pt_code*

Specifies the SCCP destination point code.
pt_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ######## format.

name *route_name*

The name of the SCCP destination route.
route_name: enter an alphanumeric string from 1 through 64 characters in length.

next-hop *pt_code* **[priority** *priority*

Associates the next destination defined in the SS7 routing domain and assigns the next-hop a priority for use.
pt_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ######## format.
priority: Must be an integer from 0 to 15, with 0 setting the highest priority.

ssn *subsys_num*

The destination subsystem number.
subsys_num: enter an integer from 1 through 255.

version *sccp_ver*

sccp_ver: enter one of the following to select the SCCP variant:

- ANSI88
- ANSI92
- ANSI96
- BELL05
- CHINA
- GSM0806
- ITU88

- ITU92
- ITU96

Usage

Use this command to configure the destination information for the SCCP network.

Example

The following commands set the name of the destination route to default_route, the subsystem number to 1, and the variant version to ITU96, all with a destination point code of 1:

```
destination dpc 1 name default_routedestination dpc 1 ssn 1destination
dpc version ITU96
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN , HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

global-title-translation

This command associates a GTT address-map with this SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

global-title-translation address-map instance *instance*

no global-title-translation address-map instance *instance*

no

Deletes the GTT address-map instance associated with this SCCP network.

instance

This value uniquely identifies a specific previously defined instance of a GTT address-map.
instance: enter an integer from 1 to 4096.

Usage

Use this command to link a GTT address-map, configured with the GTT Address Map configuration mode, to a specific SCCP network configuration.

Example

global-title-translation address-map instance *gtt-map1*

hop-count

This command specifies the hop count for this SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hop-count *hop_cnt*

default hop-count

default

Resets the hop-count value to the system default of 5.

hop_cnt

The hop count to assign to this SCCP network.
hop_cnt: enter an integer from 1 to 15.

Usage

Use this command to define the hop count for this SCCP network.

Example

The following command sets the hop count to 3:

hop-count *3*

self-point-code

This command specifies the SS7 point code for this SCCP service.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point_code*

no self-point-code

no

Deletes the configured self point code.

point_code

Defines the point code to assign to this SCCP network service.
point_code: value entered must adhere to the point code variant selected when the SCCP network instance was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits ad period.

Usage

Use this command to assign the self point code to use for this SCCP service.

Example

The following command sets an ITU-based point code for this SCCP service:

self-pointcode *4.121.5*

The following command removes the configured self-point code:

no self-pointcode

timeout

This command configures the timeout parameters for this SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
timeout { attack-timer | congestion-timer | conn-est-timer | crd-timer | decay-timer |
iar-timer | ias-timer | interval-timer | reassembly-timer | release-timer | repeat-
release-timer | reset-timer | sst-timer } +

default timeout

no timeout timer
```

attack-timer *time*

Defines the time before the attack timer expires.
time: enter an integer between 1 and 10.

congestion-timer *time*

Defines the time before the congestion timer expires.
time: enter an integer between 1 and 10.

conn-est-timer *time*

Defines the time before the connection timer expires.
time: enter an integer between 6 and 12.

crd-timer *time*

Defines the time before the coordinated-state-change timer expires.
time: enter an integer between 60 and 120.

decay-timer *time*

Defines the time before the decay timer expires.
time: enter an integer between 1 and 10.

iar-timer *time*

Defines the time before the inactivity-receive timer expires.
time: enter an integer between 60 and 120.

ias-timer *time*

Defines the time before the inactivity-send timer expires.
time: enter an integer between 30 and 60.

interval-timer *time*

Defines the time before the interval timer expires.
time: enter an integer between 6 and 12

reassembly-timer *time*

Defines the time before the reassembly-timer expires.
time: enter an integer between 10 and 20.

release-timer *time*

Defines the time before the release-assembly timer expires.
time: enter an integer between 1 and 2.

repeat-release-timer *time*

Defines the time before repeat-release timer expires.
time: enter an integer between 1 and 2

reset-timer *time*

Defines the amount of time before the reset timer expires.
time: enter an integer between 1 and 2

sst-timer *time*

Defines the amount of time before the subsystem status test timer expires.
time: enter an integer between 5 and 1200.

default

Resets the timeout parameter to the system default.

no

Deletes the specified timer configuration.

Usage

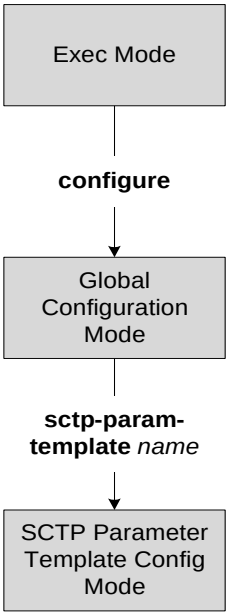
Use this command to assign timeout timers and timeout values for this SCCP service.

Example

timeout reset-timer *75*

Chapter 247
SCTP Parameter Template Configuration Mode Commands

This chapter provides information about commands used to configure parameters for Stream Control Transmission Protocol (SCTP) associations. The commands become part of a template that can be associated with services running on the system.



sctp-alpha

Configures the SCTP retransmission timeout (RTO) alpha value.

Product

MME

Privilege

Administrator

Syntax

sctp-alpha *value*

default sctp-alpha

default

Returns the command to its default setting of 5.

value

Default: 5
Specifies the SCTP retransmission timeout alpha value. *value* must be an integer from 0 through 65535.

Usage

Use this command to configure the SCTP RTO alpha value. The RTO alpha value is used in calculating the smoothed round-trip time (SRTT) and the round-trip time variation (RTTVAR) for new round trip time (RTT) measurements.

Example

The following command sets the SCTP RTO alpha value to *10*:

```
sctp-alpha 10
```

sctp-alt-accept-flag

Configures the SCTP alternate accept flag for additional life time for the association.

Product

MME

Privilege

Administrator

Syntax

```
sctp-alt-accept-flag { disable | enable }

default sctp-alt-accept-flag
```

default

Returns the command to its default setting of enable.

disable | enable

Specifies if the alternate accept flag is enabled or disabled.

Usage

Use this command to configure the SCTP alternate accept flag for additional life time for the association.

Example

The following command disables the alternate accept flag for the SCTP association:

```
sctp-alt-accept-flag disable
```

sctp-beta

Configures the SCTP retransmission timeout (RTO) beta value.

Product

MME

Privilege

Administrator

Syntax

sctp-beta *value*

default sctp-beta

default

Returns the command to its default setting of 10.

value

Specifies the SCTP retransmission timeout beta value as an integer from 0 through 65535. Default: 10

Usage

Use this command to configure the SCTP RTO beta value. The RTO beta value is used in calculating the smoothed round-trip time (SRTT) and the round-trip time variation (RTTVAR) for new round trip time (RTT) measurements.

Example

The following command sets the SCTP RTO beta value to *20*:

```
sctp-beta 20
```

sctp-checksum-type

Configures the checksum type used to increase the integrity of the SCTP packets during transmission.

Product

MME

Privilege

Administrator

Syntax

```
sctp-checksum-type { adler32 | crc32 }

default sctp-checksum-type
```

default

Returns the command to its default setting of CRC32.

adler32 | crc32

Specifies the type of checksum used to increase data integrity of SCTP packets.
adler32: Specifies that the Adler-32 checksum algorithm is used to increase data integrity for SCTP packets.
crc32: Specifies that a 32-bit cyclic redundancy check is used to increase data integrity of SCTP packets.

Usage

Use this command to select the checksum for data integrity of SCTP packets.

Example

The following command enables the Adler-32 checksum algorithm used to increase data integrity of SCTP packets:

```
sctp-checksum-type adler32
```

sctp-cookie-life

Configures the lifetime of the SCTP cookie.

Product

MME

Privilege

Administrator

Syntax

sctp-cookie-life *value*

default sctp-cookie-life

default

Returns the command to its default setting of 600 (60000 milliseconds).

value

Default: 600 (60000 milliseconds)
Specifies the lifetime of the SCTP cookie. *value* is an integer from 50 through 1200. The range translates to 5000 milliseconds to 120000 milliseconds, as the granularity is in 100-millisecond increments.

Usage

Use this command to configure the lifetime of the SCTP cookie.

Example

The following command configures the lifetime of the SCTP cookie to 80000 milliseconds:

```
sctp-cookie-life 800
```

sctp-max-assoc-retx

Configures the maximum number of retransmissions for SCTP associations.

Product

MME

Privilege

Administrator

Syntax

sctp-max-assoc-retx *value*

default sctp-max-assoc-retx

default

Returns the command to its default setting of 10.

value

Specifies the maximum number of retransmissions allowed by this template for SCTP associations as an integer from 0 through 255. Default: 10

Usage

Use this command to configure the maximum number of retransmissions allowed by this template for SCTP associations.

Example

The following command configures the maximum number of retransmissions to 7:

```
sctp-max-assoc-retx 7
```

sctp-max-in-strms

Configures the maximum number of incoming SCTP streams allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-max-in-strms *value*

default sctp-max-in-strms

default

Returns the command to its default setting of 16.

value

Specifies the maximum number of incoming SCTP streams allowed by the template as an integer from1 through 16. Default: 16

Usage

Use this command to configure the maximum number of incoming SCTP streams allowed by the template.

Example

The following command configures the maximum number of incoming SCTP streams allowed by the template to *5*:

```
sctp-max-in-strms 5
```

sctp-max-init-retx

Configures the maximum number of retransmissions of SCTP initiations allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-max-init-retx *value*

default sctp-max-init-retx

default

Returns the command to its default setting of 5.

value

Specifies the maximum number of retransmissions of SCTP initiations allowed by the template as an integer from 0 through 255. Default: 5

Usage

Use this command to configure the maximum number of retransmissions of SCTP initiations allowed by the template.

Example

The following command configures the maximum number of retransmissions of SCTP initiations allowed by the template to *10*:

```
sctp-max-init-retx 10
```

sctp-max-mtu-size

Configures the maximum transmission unit (MTU) size (in bytes) for SCTP streams allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-max-mtu-size *bytes*

default sctp-max-mtu-size

default

Returns the command to its default setting of 1500 bytes.

bytes

Specifies the maximum MTU size (in bytes) for SCTP streams allowed by the template as an integer from 508 through 65535. Default: 1500

Usage

Use this command to configure the maximum MTU size, in bytes, for SCTP streams allowed by the template.

Example

The following command configures the maximum MTU size for SCTP streams allowed by the template to *3000*:

```
sctp-max-mtu-size 3000
```

sctp-max-out-strms

Configures the maximum number of outgoing SCTP streams allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-max-out-strms *value*

default sctp-max-out-strms

default

Returns the command to its default setting of 16.

value

Specifies the maximum number of outgoing SCTP streams allowed by the template as an integer from 1 through 16. Default: 16

Usage

Use this command to configure the maximum number of outgoing SCTP streams allowed by the template.

Example

The following command configures the maximum number of outgoing SCTP streams allowed by the template to *5*:

```
sctp-max-out-strms 5
```

sctp-max-path-retx

Configures the maximum number of retransmissions of SCTP paths allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-max-path-retx *value*

default sctp-max-path-retx

default

Returns the command to its default setting of 5.

value

Specifies the maximum number of retransmissions of SCTP paths allowed by the template as an integer from 0 through 255. Default: 5

Usage

Use this command to configure the maximum number of retransmissions of SCTP paths allowed by the template. An SCTP path is a connection between an endpoint address and a peer endpoint address.

Example

The following command configures the maximum number of retransmissions of SCTP paths allowed by the template to *10*:

```
sctp-max-path-retx 10
```

sctp-min-mtu-size

Configures the minimum maximum transmission unit (MTU) size (in bytes) for SCTP streams allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-min-mtu-size *bytes*

default sctp-min-mtu-size

default

Returns the command to its default setting of 508 bytes.

bytes

Specifies the minimum MTU size (in bytes) for SCTP streams allowed by the template as an integer from 508 through 65535. Default: 508

Usage

Use this command to configure the minimum MTU size, in bytes, for SCTP streams allowed by the template.

Example

The following command configures the minimum MTU size for SCTP streams allowed by the template to *1000*:

```
sctp-min-mtu-size 1000
```

sctp-rto-initial

Configures the initial time for SCTP retransmission timeouts (RTOs) allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-rto-initial *value*

default sctp-rto-initial

default

Returns the command to its default setting of 30 (3000 milliseconds).

value

Specifies the initial time for SCTP RTO as an integer from 1 through 1200. The granularity is in 100ms increments (20 = 2000ms). Default: 30 (3000 milliseconds)

Usage

Use this command to configure the initial time for SCTP RTOs allowed by the template.

Example

The following command configures the initial SCTP RTO to 6000ms:

```
sctp-rto-initial 60
```

sctp-rto-max

Configures the maximum time for SCTP retransmission timeouts (RTOs) allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-rto-max *value*

default sctp-rto-max

default

Returns the command to its default setting of 600 (60000 milliseconds).

value

Specifies the maximum time for SCTP RTOs allowed by the template as an integer from 50 through 1200. The granularity is in 100ms increments (120 = 12000ms). Default: 600 (60000 milliseconds)

Usage

Use this command to configure the maximum time for SCTP RTOs allowed by the template.

Example

The following command configures the maximum time for SCTP RTOs allowed by the template to 120000ms:

```
sctp-rto-max 120
```

sctp-rto-min

Configures the minimum time for SCTP retransmission timeouts (RTOs) allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-rto-min *value*

default sctp-rto-min

default

Returns the command to its default setting of 10 (1000 milliseconds).

value

Specifies the minimum time for SCTP RTOs allowed by the template as an integer from 1 through 500. The granularity is in 100ms increments (20 = 2000ms). Default: 10 (1000 milliseconds)

Usage

Use this command to configure the minimum time for SCTP RTOs allowed by the template.

Example

The following command configures the minimum time for SCTP RTOs allowed by the template to 2000ms:

```
sctp-rto-min 20
```

sctp-sack-frequency

Configures the frequency of SCTP selective acknowledgements allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-sack-frequency *value*

default sctp-sack-frequency

default

Returns the command to its default setting of 2.

value

Specifies the frequency of SCTP selective acknowledgements allowed by the template as an integer from 1 through 20. Default: 2

Usage

Use this command to configure the frequency of SCTP selective acknowledgements allowed by the template.

Example

The following command configures the frequency of SCTP selective acknowledgements allowed by the template to 10:

```
sctp-sack-frequency 10
```

sctp-sack-period

Configures the period for SCTP selective acknowledgements allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-sack-period { *value* | units-10ms *value* }

default sctp-sack-period

default

Returns the command to its default setting of 2 (200 milliseconds).

value

Specifies the period for SCTP selective acknowledgements allowed by the template as an integer from 0 through 5. The granularity is in 100ms increments (3 = 300ms). Default: 2 (200 milliseconds)

units-10ms *value*

Specifies that the integer added as *value* is to be calculated using 10ms granularity for this command. *value* is an integer from 0 through 50.

Usage

Use this command to configure the period for SCTP selective acknowledgements allowed by the template.

Example

The following command configures the period for SCTP selective acknowledgements allowed by the template to 400ms (using the 10ms granularity):

```
sctp-sack-period units-10ms 40
```

sctp-start-mtu-size

Configures the start maximum transmission unit (MTU) size (in bytes) for SCTP streams allowed by the template.

Product

MME

Privilege

Administrator

Syntax

sctp-start-mtu-size *bytes*

default sctp-start-mtu-size

default

Returns the command to its default setting of 1500 bytes.

bytes

Specifies the start MTU size (in bytes) for SCTP streams allowed by the template as an integer from 508 through 65535. Default: 1500

Usage

Use this command to configure the start MTU size, in bytes, for SCTP streams allowed by the template.

Example

The following command configures the start MTU size for SCTP streams allowed by the template to *3000*:

```
sctp-start-mtu-size 3000
```

timeout

Configures timeouts for SCTP data chunk bundle transmissions and/or SCTP heartbeat request responses.

Product

MME

Privilege

Administrator

Syntax

timeout { sctp-bundle *value* **| sctp-heart-beat** *value* **}**

[default | no] timeout { sctp-bundle | sctp-heart-beat }

default

Returns the command to its default setting of disabled for **sctp-bundle** and 30 seconds for **sctp-heart-beat**.

no

Removes the selected configuration.

sctp-bundle *value*

Specifies that SCTP data chunks are to be queued until this timer expires at which time the data chunks are bundled and committed for transmission. *value* is an integer from 1 through 65535. The granularity is in 100ms increments (10 = 1000ms or 1 second). Default: disabled

sctp-heart-beat *value*

Default: 30 seconds
Specifies the SCTP heartbeat timeout (in seconds) as an integer from 1 through 300. An SCTP heartbeat is sent o a peer to determine reachability. If an acknowledgement is not received before this timer runs out, heartbeat requests are no longer sent and the peer is considered unreachable.

Usage

Use this command to configure timeouts for SCTP data chunk bundle transmissions and/or SCTP heartbeat request responses.

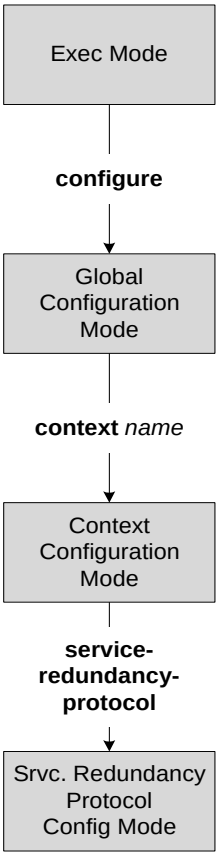
Example

The following command enables the SCTP data chunk bundle timeout value and configures it to 2 seconds:

```
timeout sctp-bundle 20
```

Chapter 248
Service Redundancy Protocol Configuration Mode Commands

The Service Redundancy Protocol Mode is used to configure properties for Interchassis Session Recovery (ICSR) services.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind

Binds the service to the IP address of the local chassis.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

bind address { *ipv4 _address* | *ipv6_address* }

no bind address

no

Removes the IP bind address.

ipv4 _address | ipv6_address

Specifies the system IP address using IPv4 dotted-decimal or IPv6 colon-separated notation.

Important: Both peers must be using the same address family (IPv4 or IPv6) or the Service Redundancy Protocol (SRP) connection will not be established.

Usage

Defines the IP address of the local chassis defined as part of the ICSR configuration.

Example

The following example binds the service to the IP address *10.1.1.1*:

```
bind address 10.1.1.1
```

chassis-mode

Defines the chassis's operational mode - primary or backup - for ICSR.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

```
chassis-mode { backup | primary }

default chassis-mode
```

default

Resets the chassis mode to the default setting of backup.

backup

(Default) Configures the system as the backup chassis operating in standby state.

primary

Configures the system as the primary chassis operating in active state.

Usage

Sets the chassis mode (primary or backup) for the system within the framework of ICSR.

Example

The following example configures the system as the primary chassis operating in active state

```
chassis-mode primary
```

checkpoint

Configures check pointing for ICSR. With check pointing enabled, the system stores a snapshot of the current application state use it for restarting the execution in case of failure.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

checkpoint session duration *duration*

default checkpoint session duration

default

Resets the checkpoint session duration to the default setting of 60 seconds.

duration

Specifies the amount of time (in seconds) that a call must be active before it is check pointed. *duration* must be an integer from 1 through 65535.
Default: 60

Usage

Sets the amount of time the chassis waits before check pointing an existing call session.

Example

The following example configures sets the checkpoint session duration to 6500 seconds:

```
checkpoint session duration 6500
```

configuration-interval

Defines the configuration validation interval.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

configuration-interval *interval*

default configuration-interval

default

Resets the configuration interval to the default setting of 3600 seconds.

interval

Specifies the amount of time (number of seconds) between one configuration validation and the next configuration validation.
interval must be an integer from 1 through 65535.
Default: 3600

Usage

This configures the interval between configuration validations of the primary and backup chassis.

Example

The following example sets the configuration interval to 34 seconds:

```
configuration-interval 34
```

dead-interval

Defines the timeout interval before a peer is determined to be down.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

dead-interval *interval*

default dead-interval

default

Resets the dead interval to the default setting of 30 seconds.

interval

Specifies the amount of time (in seconds) for the dead interval. *interval* must be an integer from 1 through 65535.
Default: 30

Usage

This command specifies the amount of time that one chassis waits to receive a communication from a peer before the listening chassis determines that the peer chassis is down.

Example

The following example sets the dead interval to 65 seconds:

```
dead-interval 65
```

delay-interval

Configures the delay time for starting the dead timer after configuration files are loaded.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

delay-interval*interval*

default delay-interval

default

Sets or restores the default value assigned for the specified parameter.

interval

Specifies the amount of time (in seconds) for the delay interval. *interval* must be an integer from 1 through 65535.

Usage

This configures interval for starting the dead timer after configuration files are loaded.

Example

The following example sets the delay interval to 65 seconds after the configuration files are loaded:

```
delay interval 65
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

hello-interval

Defines the lapse time between sending the hello message.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

hello-interval *interval*

default hello-interval

default

Resets the hello interval to the default setting of 10 seconds.

interval

Specifies the lapse time (in seconds) between sending the hello message. *interval* must be an integer from 1 through 65535.
Default: 10

Usage

This command configures the hello interval - the amount of time that lapses between the sending of each hello message. Each chassis sends the other chassis a hello message at the expiration of every hello interval.

Example

The following example sets the hello interval to 35 seconds:

```
hello-interval 35
```

internal-switchover-retry-interval

Defines the interval between internal switchover retries.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

internal-switchover-retry-interval *interval*

default internal-switchover-retry-interval

default

Resets the internal switchover retry interval to the default setting of 60 seconds.

interval

Specifies the amount of time (in seconds) between internal switchover retries. *interval* must be an integer from 10 through 120.
Default: 60

Usage

This configures the interval between internal switchover retries. The system only initiates internal switchovers if Service Redundancy Protocol (SRP) monitoring is configured.

Important: See the **monitor authentication-probe**, **monitor bgp**, or **monitor diameter** commands for more information on associated SRP monitoring.

Example

The following example sets the internal switchover retry interval to 34 seconds:

```
internal-switchover-retry-interval 34
```

monitor authentication-probe

Enables SRP monitoring of the connection between the specified AAA server and the primary chassis.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] monitor authentication-probe context context_name { ipv4_address | ipv6_address }
[ port port_number ]
```

no

Turns off the monitoring.

context *context_name*

Identifies the context being used.
context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

ipv4 _address **|** *ipv6_address*

Defines the IP address of the AAA server to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

port *port_number*

Identifies a specific port for the authentication probe. *port_number* must be the port for the AAA server expressed as an integer from 1 through 65535.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified AAA server through the use of authentication probe packets. If the connection drops, the standby chassis becomes active.

Example

The following example initiates the connection monitoring between the primary chassis and AAA server *10.2.3.4* at port *1025*:

```
monitor authentication-probe context test1 10.2.3.4 port 1025
```

monitor bfd

Enables SRP monitoring of the connection between the specified Bidirectional Forwarding Detection (BFD) neighbor and the primary chassis.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

[no] monitor bfd context *context_name* **{** *ipv4_address* **|** *ipv6_address* **} { chassis-to-chassis | chassis-to-router }**

no

Disables monitoring.

context *context_name*

Identifies the context being used.
context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

ipv4 _address **|** *ipv6_address*

Defines the IP address of the BFD neighbor to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated notation

chassis-to-chassis | chassis-to-router

chassis-to-chassis: BFD runs between primary and backup chassis on non-SRP links.
chassis-to-router: BFD runs between chassis and router.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified BFD neighbor in the specified context. If the connection drops, the standby chassis becomes active.

Important: BFD monitoring must run between chassis-to-chassis or chassis-to-router.

Example

The following example initiates the chassis-to-chassis connection monitoring between the primary chassis and BFD neighbor *12.2.1.54*:

```
monitor bfd context test 12.2.1.54 chassis-to-chassis
```

monitor bgp

Enables SRP monitoring of the connection between the specified Border Gateway Protocol (BGP) peer and the primary chassis.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

[no] monitor bgp context *context_name* **{** *ipv4_address* **|** *ipv6_address* **} [vrf** *vrf_name* **]**

no

Disables monitoring.

context *context_name*

Identifies the context being used.
context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

ipv4 _address **|** *ipv6_address*

Defines the IP address of the BGP peer to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated notation

vrf *vrf_name*

Defines the VPN Routing/Forwarding instance.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified BGP peer in the specified context. If the connection drops, the standby chassis becomes active.

Example

The following example initiates the connection monitoring between the primary chassis and BGP peer *125.2.1.56*:

```
monitor bgp context test 125.2.1.56
```

monitor diameter

Enables SRP monitoring of the connection between the specified Diameter server and the primary chassis.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

[no] monitor diameter context *context_name* **endpoint** *endpoint_name* **[fqdn** *fqdn* **| peer {** *ipv4_address* **|** *ipv6_address* **}] [port** *port_number* **]**

no

Turns off the monitoring.

context *context_name*

Identifies the context being used.
context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

endpoint *endpoint_name*

Identifies the endpoint being used.
endpoint_name must be for the Diameter server expressed as an alphanumeric string of 1 through 63 characters.

fqdn *fqdn*

Identifies a Fully Qualified Domain Name (FQDN).
fqdn must be for the Diameter server expressed an alphanumeric string of 1 through 127 characters.

peer { *ipv4 _address* **|** *ipv6_address* **}**

Defines the IP address of the Diameter server to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

port *port_number*

Identifies a specific port to monitor.
port_number must be the port for the Diameter server and an integer from 1 through 65535.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified Diameter server in the specified context. If the connection drops, the standby chassis becomes active.

Important: Endpoint name, FQDN, IP address, and port must all match the Diameter protocol configured values for the peer state to be updated.

Example

The following example initiates the connection monitoring between the primary chassis and the Diameter server on context *test1* and endpoint *end2*:

```
monitor diameter context test1 10.6.7.8 endpoint end2
```

num-internal-switchover-retry

Defines the number of times an internal switchover would be retried.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

num-internal-switchover-retry *retries*

default num-internal-switchover-retry

default

Resets the configuration interval to the default setting of 3 retries.

retries

The number of times an internal switchover would be retried in case of standby chassis. *retries* must be an integer from 1 through 10.
Default: 3

Usage

This configures the number of times an internal switchover would be retried in case of standby chassis failure to respond or become active.

Example

The following example sets the retry number to *5*:

```
num-internal-switchover-retry 5
```

peer-ip-address

Specifies the IP address for the peer chassis.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

```
peer-ip-address { ipv4_address | ipv6_address }

no peer-ip-address
```

no

Removes the peer IP address of the backup chassis.

ipv4_address | *ipv6_address*

Specifies the IP address of the backup chassis, entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

Important: Both peers must be using the same address family (IPv4 or IPv6) or the Service Redundancy Protocol (SRP) connection will not be established.

Usage

This command is used to identify the peer chassis in the ICSR configuration. From the primary's perspective, the peer is the backup and from the backup's perspective, the peer is the primary.

Example

The following example specifies *10.2.3.4* as a backup peer system to the primary system:

```
peer-ip-address 10.2.3.4
```

priority

Sets the initial ICSR priority of each peer chassis.

Important: **priority** takes affect only during simultaneous initializing of all chassis in an ICSR configuration, and only if a misconfiguration has both chassis in the same mode (both Primary or both Backup).

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

priority *priority_value*

default priority

default

Resets the priority to the default setting of 125.

priority_value

Specifies the priority for the chassis.
priority_value must be an integer from 1 through 255, where 1 is the highest priority.
Default: 125

Usage

This command determines which chassis transitions to the Active state when all chassis have the same mode configuration. **priority** acts as a tie breaker for the state determination only when all chassis initialize simultaneously. The chassis with the higher priority (lower number) becomes Active, while the chassis with the lower priority (higher number) becomes Standby.
Once chassis become operational (after initialization), if there is an event requiring a chassis change of state, then each chassis returns to its previous state (Active or Standby) after both chassis recover.

Example

The following example sets the priority value to *5*:

```
priority 5
```

route-modifier

Sets the route modifier for the peer chassis.

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

route-modifier threshold *threshold_value*

default route-modifier

default

Resets the route modifier to the default setting of 16.

threshold_value

Specifies the value that causes the route-modifier counter to be reset to the initial value. *threshold_value* must be an integer from 2 through 32.
Default: 16

Usage

This command is used to determine when the route modifier should be reset to its initial value to avoid rollover.

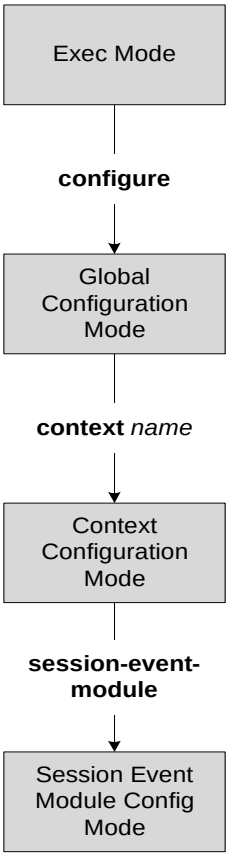
Example

The following example sets the route modifier threshold to *10*:

```
route-modifier threshold 10
```

Chapter 249
Session Event Module Configuration Mode Commands

The Session Event Module Configuration Mode is used to configure how subscriber-specific event data is handled on the S-GW. As users attach, detach, and move through the network, they trigger signaling events that need to be recorded. To provide a per-subscriber level of reporting, the S-GW sends a stream of user event data to an event reporting server over SFTP.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

event

Sets the method and destination for transferring event files.

Product

S-GW

Privilege

Administrator

Syntax

event { purge { storage-limit *bytes* **| time-limit** *seconds* **} | push-interval** *value* **| push-trigger space-usage-percent** *trigger_percentage* **| remove-file-after-transfer | transfer-mode { pull [module-only] | push primary { encrypted-url** *encrypted_url* **| url** *url* **} [max-files** *files* **] [module-only] [secondary { encrypted-secondary-url** *url* **| secondary-url** *url* **}] [via local-context] } | use-harddisk }**

default event [purge | push-interval | push-trigger space-usage-percent | remove-file-after-transfer | transfer-mode | use-harddisk]

no event [purge | remove-file-after-transfer | use-harddisk]

---

default

Configures the default setting for the specified keyword(s):

- **purge**: Not enabled.
- **push-interval**: 60 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Push
- **use-harddisk**: Disabled

---

no

Disables the configured event file storage and processing in this mode:

- **purge**: Disables the deleting of record files on the hard disk based on a storage limit or a time limit.
- **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.
- **use-harddisk**: Disables data storage on the system's hard disk.

---

purge { storage-limit *bytes* **| time-limit** *seconds* **}**

Configures parameters for deleting event records from the hard drive. This command is not enabled by default.
storage-limit *bytes*: Specifies that event records are to be deleted from the hard drive upon reaching a storage limit defined in bytes. *bytes* must be an integer value from 10485760 to 146800640.
time-limit *seconds*: Specifies that event records are to be deleted from the hard drive upon reaching a time limit defined in seconds. *seconds* must be an integer value from 600 to 2592000.

push-interval *value*

Default: 60
Specifies the transfer interval (in seconds) when event files will be pushed to an external file server. *value* must be an integer from 30 through 3600.

push-trigger space-usage-percent *trigger_percentage*

Default: 80
Specifies the disk space utilization percentage threshold at which an automatic push is triggered and files are transferred to the external server. *trigger_percentage* must be an integer from 10 through 80.

remove-file-after-transfer

Default: Disabled
Specifies that the system must delete event files after they have been transferred to the external file server.

transfer-mode { pull [module-only] | push primary { encrypted-url *encrypted_url* **| url** *url* **} [max-files** *files* **] [module-only] [secondary { encrypted-secondary-url** *url* **| secondary-url** *url* **}] [via local-context] }**

Specifies the transfer mode to be used when transferring event files to an external file server.

- **pull**: Specifies that the destination server will pull the event files.
- **push**: Specifies that the system will push event files to the destination server. This is the default mode.
- **primary encrypted-url** *encrypted_url*: Specifies the primary URL location to which the system pushes the files in encrypted format. *encrypted_url* must be an alphanumeric string of 1 through 8192 characters.
- **primary url** *url*: Specifies the primary URL location to which the system pushes the event files. *url* must be an alphanumeric string of 1 through 1024 characters in the format: *//user:password@host:[port]/direct*.
- **max-files** *number*: Specifies the maximum number of files that can be transferred per push. *number* must be an integer from 4 to 4000.
- **module-only**: Specifies that the transfer of event records is to be applied only to the module type for which the configuration was originally created. If this option is not enabled, the transfer will occur for all record types.
- **secondary encrypted-secondary-url** *url*: Specifies the secondary URL location to which the system pushes the files in encrypted format. *url* must be an alphanumeric string of 1 through 8192 characters.
- **secondary-url** *url*: Specifies the secondary URL location to which the system pushes the event files. *url* must be an alphanumeric string of 1 through 1024 characters in the format: *//user:password@host:[port]/direct*
- **via local-context**: Specifies that the local context, and, subsequently, the SPIO management ports, will be used to pull or push event files from/to the event server.

use-harddisk

Default: Disabled
Specifies that the hard disk drive on the SMC is to be used to store S-GW event records.

Usage

Use this command to configure how the S-GW event records are moved and stored. By default, records are stored in the PSC RAM where the CDRMOD instance is running.

The **event use-harddisk** command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message "Failure: Please Check if CDRMOD is running in this context or not."

If push transfer mode is configured, the server URL to which the event files will be transferred must be specified.

When changing the transfer-mode from pull to push, disable the pull setting before changing the transfer mode to push. The push to server URL must be accessible from the local context. Also, make sure that its base directory contains an **event** subdirectory.

After changing the transfer mode from push to pull, enable pull on the destination server. Any ongoing push activity will continue until all the file transfers are completed. If there is no ongoing push activity at the time of this configuration change, the push-related configuration is nullified immediately.

Example

The following command sets the space usage trigger for pushing files to the event server to 60%:

```
event push-trigger space-usage-percent 60
```

The following command specifies that the event files are to be transferred to a server with the URL of user:password@event-server.com:

```
event transfer-mode push primary url //user:password@event-server.com
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

file

Sets the format and handling characteristics of event files.

Product

S-GW

Privilege

Administrator

Syntax

file [compression { gzip | none }] [current-prefix *string* **] [delete-timeout** *seconds* **] [directory** *directory_name* **] [exclude-checksum-record] [field-separator { hyphen | omit | underscore }] [file-sequence-number rulebase-seq-num] [headers] [name** *file_name* **] [reset-indicator] [rotation [num-records** *number* **| time** *seconds* **| volume** *bytes* **]] [sequence-number { length** *length* **| omit | padded | padded-six-length | unpadded }] [storage-limit** *limit* **] [time-stamp { expanded-format | rotated-format | unix-format }] [trailing-text** *string* **] [trap-on-file-delete] [xor-final-record] +**

default file [compression] [current-prefix] [delete-timeout] [directory] [field-separator] [file-sequence-number] [headers] [name] [reset-indicator] [rotation { num-records | time | volume }] [sequence-number] [storage-limit] [time-stamp] [trailing-text] +

default

Configures the default setting for the specified keyword(s).

compression { gzip | none }

Specifies compression of S-GW event files.

- **gzip**: Enables GNU zip compression of the event file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

current-prefix *string*

Specifies a string to add to the beginning of the event file that is currently being used to store records. *string* must be an alphanumeric string of 1 through 31 characters. Default: **curr**

delete-timeout *seconds*

Specifies a time period, in seconds, after which event files are deleted. By default, files are never deleted. *seconds* must be an integer from 3600 through 31536000. Default: Disabled

directory *directory_name*

Specifies a subdirectory in the default directory in which to store event files. *directory_name* must be an alphanumeric string of 1 through 191 characters. Default: **/records/event**

exclude-checksum-record

Excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic Redundancy Check (CRC) of all preceding records from the event file.

Default: Disabled, a checksum record is included in the event file header.

field-separator [hyphen | omit | underscore]

Specifies the type of separators between two fields of an event file name:

- **hyphen**: Specifies the field separator as a "-" (hyphen) symbol between two fields.
- **omit**: Removes or omits the field separator between two fields.
- **underscore**: Specifies the field separator as an "_" (underscore) symbol between two fields.

file-sequence-number rulebase-seq-num

Specifies that the file name sequence numbers be unique per rulebase and event format name combination.

headers

Includes a file header summarizing the record layout.

name *file_name*

Specifies a string to be used as the base file name for event files. *file_name* must be an alphanumeric string of 1 through 31 characters. The file name format is as follows:
base_sequencenum_timestamp Default: **event**

- *base*: Specifies type of record in file or contains the operator-specified string. Default: **event**
- *sequencenum*: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all event files on the system.
- *timestamp*: Adds a file creation timestamp (UTC time) in MMDDYYYYHHMMSS format.

reset-indicator

Specifies the inclusion of the reset indicator counter (value from 0 through 255) in the event file name. The counter is incremented whenever any of the following conditions occur:

- A peer chassis has taken over in compliance with Interchassis Session Recovery (ICSR).
- The sequence number (see **sequence-number** keyword) has rolled over to zero.

rotation { num-records *number* **| time** *seconds* **| volume** *bytes* **}**

Specifies when to close an event file and create a new one.

- **num-records** *number*: Specifies the maximum number of records that should be added to an event file. When the number of records in the file reaches this value, the file is complete. *number* must be an integer 100 through 10240. Default: 1024
- **time** *seconds*: Specifies the period of time to wait (in seconds) before closing the current event file and creating a new one. *seconds* must be an integer from 30 through 86400. Default: 3600
- **volume** *bytes*: Specifies the maximum size of the event file (in bytes) before closing it and creating a new one. *bytes* must be an integer from 51200 through 62914560. Note that a higher setting may improve the compression ratio when the compression keyword is set to gzip. Default: 102400

sequence-number { length *length* **| omit | padded | padded-six-length | unpadded }**

Includes with a specified format or excludes the sequence number in the file name.

- **length** *length*: Includes the sequence number with the specified length. *length* must be the file sequence number length with preceding zeroes in the file name, and must be an integer from 1 through 9.

- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

Default: **padded**

---

storage-limit *limit*

Files will be deleted when the specified amount of space (in bytes0 is reached.
limit must be an integer from 10485760 through 536870912. Default: 33554432

---

time-stamp { expanded-format | rotated-format | unix-format }

Specifies the format of the file creation timestamp to be included in the file name.

- **expanded-format**: Specifies the UTC (Universal Time Coordinated) MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the time stamp format to YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of *x.y*, where *x* is the number of seconds since 1/1/1970 and *y* is the fractional portion of the current second that has elapsed.

---

trailing-text *string*

Specifies the inclusion of an arbitrary text string in the file name as an alphanumeric string of 1 through 30 characters.

---

trap-on-file-delete

Instructs the system to send an SNMP notification (trap) when an event file is deleted due to lack of space. Default: Disabled

---

xor-final-record

Specifies inserting an exclusive OR (XOR) checksum (instead of a CRC checksum) into the event file header if the **exclude-checksum-record** is left at its default setting. Default: Disabled

---

+

More than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure event file characteristics.

Example

The following command sets the prefix of the current active event file to *Current*:

```
file current-prefix Current
```

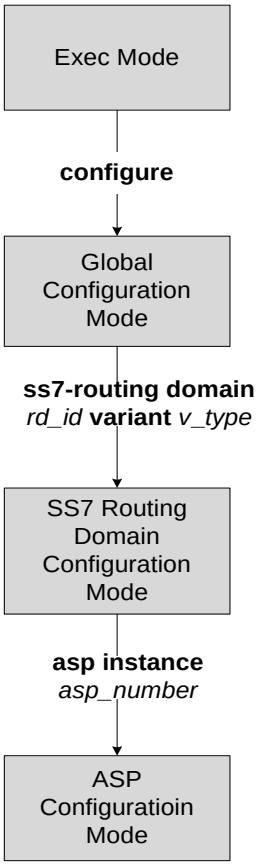
The following command sets the base file name to *Eventfile*:

```
file name Eventfile
```

Chapter 250
SGSN ASP Configuration Mode Commands

The ASP (application server process) configuration mode defines the M3UA end-point parameters for a specific SS7 routing domain instance. The ASP instance is generated and accessed via the SS7 routing domain configuration mode commands.

`[local]`*`hostname`*`(config-ss7-rd-<`*`ss7rd_id`*`>-asp-inst-<`*`asp_inst`*`>)#`



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

end-point

This command defines or deletes the IP address and/or port number to be associated with the local SCTP end-point for this ASP. At least one address needs to be configured before the end-point can be activated.

When using the **bind** keyword, this command also activates the end-point once the address has been defined. Once bound, it cannot be reconfigured until it is unbound with the **no end-point bind** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end-point { address ip_address context context_id | bind | port port_number }

no end-point { address ip_address context context_id | bind }
```

address ip_address context context_id:

Specifies the IP address and the context associated with the address for this end-point.
ip_address**:** must be defined using the standard IPv4 dotted decimal notation or the colon notation of IPv6.
context context_id: a string of 1 to 79 alphanumeric characters to identify the specific context associated with the end-point address.

bind

Activates (binds) the end-point.

Important: Only use **bind** after you have configured other parameters.

port port_number

Identifies the M3UA's SCTP port associated with this end-point.
port_number: must be an integer fom 1 to 65535. Default is 2905.

no

Removes the end-point configuration or deactivates the end-point.

Caution: Entering this command will terminate all current subscriber sessions for associated peers.

Usage

Use this command to manage the ASP end-point. Once the ASP end-point is bound the end-point configuration can not be changed until it is unbound.

Example

Activate the end-point with the following command:

```
end-point bind
```

Deactivate or unbind the end-point with the following command:

```
no end-point bind
```

Set the end-point port to default for ASP 1 with the following command:

```
default asp instance 1 end-point port
```

exit

Exits the current mode and returns to the previous mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Returns to the previous mode.

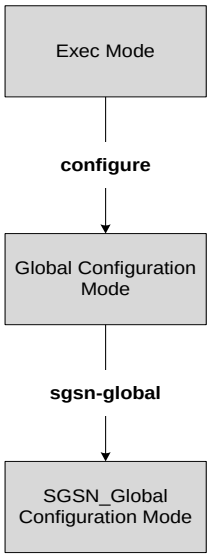
Chapter 251
SGSN Global Configuration Mode Commands

The commands in this mode configure SGSN-specific parameters impact the entire SGSN and that are independent of the GPRS or the IuPS services.

In this mode, your prompt will look similar to:

```
[local]hostname(config-sgsn-global)#
```

The SGSN Global configuration mode is a sub-mode derived from the Global configuration mode.



aggregate-ipc-msg

Enables/disables aggregation of inter-process communication (IPC) messages in the link manager (linkmgr) and session manager (sessmgr).

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

aggregate-ipc-msg { linkmgr | sessmgr } { flush-frequency *frequency* **| num-msgs** *number_msgs* **}**

default aggregate-ipc-msg { linkmgr | sessmgr }

default

Resets the managers to default values for flushing.

linkmgr

Selects the linkmgr to configure the number of IPC messages to be aggregated and frequency of flushing.

sessmgr

Selects the sessmgr to configure the number of IPC messages to be aggregated and frequency of flushing.

flush-frequency *frequency*

Configure the frequency, in 100-millisecond intervals, that the aggregated IPC messages will be flushed.
frequency : Enter an integer from 1 to 3. Default is 1.

num-msgs *number_msgs*

Configure the number of IPC messages to aggregate before flushing.
number_msgs : Enter the integer 1 (to disable aggregation) or an integer from 2 to 164 to define the number of messages. Default is 10.

Usage

Use this command to enable/disable aggregation of IPC messages in the linkmgr and/or the sessmgr. This command includes options to configure the frequency of aggregated message flushing and the number of packets to be buffered before the flush.
At the HNB-GW node this command provides the solution to reduce the latency while sending the IPC messages towards core network (CN).
In default scenario on HNB-GW the Link manager buffers the packets and then send it over SCCP link if there are events to be sent SCCP Connection Request (SCCP CR) towards Core node side. It aggregate packets for 100 msec and send it with whatever aggregation it has done in those 100 msecs.
At the HNB-GW this command can be used to reduce the processing of sending every individual events out on the wire towards core node side from HNB-GW in following manner:

- If this aggregation is enabled, then there could be time delay seen on the wire for sending SCCP CR depending on configuration of HNB-GW.
- If this aggregation is reduced to 1 (that means as soon as there is event to send out namely SCCP CR is available to send out on the wire), it will be immediately seen on the wire and SCCP connection setup time is reduced because of immediate sending of SCCP CR and not waiting for aggregation.

To view aggregate IPC message statistics, use command **show config | grep aggregate-ipc-msg**.

Example

Configure the linkmgr to buffer *45* messages before flushing the linkmgr IPC messages:

```
aggregate-ipc-msg linkmgr flush-frequency 45
```

On HNB-GW the following command configures the *linkmgr* to flush the IPC messages towards CN without aggregation:

```
aggregate-ipc-msg linkmgr1
```

On HNB-GW the following command configures the *sessmgr* to flush the IPC messages towards CN without aggregation:

```
aggregate-ipc-msg sessmgr 1
```

apn-resolve-dns-query snaptr

Enable/disable sending of SNAPTR DNS query to resolve an APN for a subscriber with an EPS (evolved packet system)-capable handset.

Important: This command is no longer available in all 12.0 and 12.2 releases. If you do not see this command in your release, look for the **apn-resolve-dns-query snaptr** command in the APN Profile configuration mode to accomplish the same task.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] apn-resolve-dns-query snaptr

default apn-resolve-dns-query
```

default

Resets the default, the ability to send SNAPTR DNS query is disabled.

no

Disables the ability to send SNAPTR DNS query.

Usage

By default, sending the SNAPTR DNS query is disabled. Use this command to send SNAPTR DNS query when resolving an APN for an EPS-capable subscriber.
At PDP context activation, the SGSN will use the UE capabilitly as input to select either a GGSN or a P-GW for the EPS-capable subscriber. The SNAPTR DNS query will be used for P-GW resolution. Enabling this feature will give priority to P-GW selection for E-UTRAN-capable UEs.

Example

Use the following command to enable sending of SNAPTR DNS query for APN resolution:

```
apn-resolve-dns-query
```

Use the following command to disable the use of SNAPTR DNS query for APN resolution:

```
no apn-resolve-dns-query
```

bssgp-message ms-flow-control-from-unknown-ms

This command determines the SGSN response to MS-Flow-Control messages received from an unknown MS.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
bssgp-message ms-flow-control-from-unknown-ms { discard-message | send-ack | send-status
}

default bssgp-message ms-flow-control-from-unknown-ms
```

default

Including **default** with the command configures the SGSN to use default behavior so that the SGSN sends BSSGP-Status messages whenever the SGSN receives an MS-Flow-Control message from an unknown MS.

discard-message

This keyword instructs the SGSN to discard the received BSSGP message. With this option, the SGSN does not send any response to the MS after discarding the received BSSGP message.

send-ack

This keyword instructs the SGSN to send an acknowledgement message (MS-Flow-Control-ACK) after receiving an MS-Flow-Control message.

send-status

Default
This keyword instructs the SGSN to send a BSSGP-Status message to the MS whenever the SGSN receives an MS-Flow-Control message from an unknown MS.

Usage

This command allows the operator to specify the action the SGSN needs to take whenever the SGSN receives an MS-Flow-Control message from an unknown mobile station. This configuration determines the response for the SGSN globally.
The list of possible actions are:

- send a BSSGP-Status response message
- send an ACK message (MS-Flow-Control-ACK)
- discard the BSSGP message

To see the statistics for the number of MS-Flow-Control messages that have been discarded, use the **show bssgp statistics** command from the Exec mode.

Example

Change the default configuration and have the SGSN acknowledge receipt of the MS-Flow-Control message:

```
bssgp-message ms-flow-control-from-unknown-ms send-ack
```

bssgp-message ptp-bvc-reset

This command determines the SGSN response, per BVCI, to receipt of a peer-to-peer BVC Reset.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
bssgp-message ptp-bvc-reset { frc-subscriber-standby | retain-current-state }

default bssgp-message ptp-bvc-reset
```

default

Including **default** with the command configures the SGSN to use default behavior so that the SGSN continues with the current state once a peer-to-peer BVC Reset is received.

frc-subscriber-standby

This keyword instructs the SGSN to change the state of the subscribers to standby when the peer-to-peer BVC Reset is received.

retain-current-state

Default
This keyword instructs the SGSN to continue the current state of the subscribers when the BVC Reset message is received.

Usage

This command allows the operator to specify the action the SGSN needs to take whenever the SGSN receives a peer-to-peer BVC Reset message for a specific BVCI.
To confirm the configuration for the response to the BVC Reset, use the **show sgsn-mode** command from the Exec mode.

Example

Change the default configuration and have the SGSN change subscriber states to standby:

```
bssgp-message ptp-bvc-reset frc-subscriber-standby
```

bssgp-timer

Configures the T2 and TH timers for the BVCs (BSSGP virtual connections) of the NSE (network service entities).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
bssgp-timer { t2 T2_time | th TH_time }

default bssgp-timer { t2 | th }
```

default

Resets the specified timers to default settings.

t2 *T2_time*

Configures the BVC reset guard timer (at the BSSGP layer) in units of 1 second.
T2_time : Enter an integer from 1 to 120. Default is 30 seconds.

th *TH_time*

Configures, at the BSSGP layer, the MS flow control parameter validity timeouts in units of 1 second.
TH_time : Enter an integer from 6 to 5999. Default is 500 seconds.

Usage

Use this command to configure timer timeout values for MS flow control and BVC reset timers that control BVCs for the NSEs.

Example

Set the TH timeout for *20* seconds:

```
bssgp-timer th 20
```

bvc-unblock

This command enables (disabled by default) or disables the SGSN to unblock blocked BVCs based on the receipt of uplink packets from the BSC.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
bvc-unblock { data-or-flow-control | flow-control | ul-data }

[ default | no ] bvc-unblock
```

default

Include **default** with the command to disable the function.

no

Include **no** with the command to disable this function.

data-or-flow-control

Enables the BVC-Unblock function when the SGSN receives either a FLOW-CONTROL-BVC packet or a UL-UNITDATA packet.

flow-control

Enables the BVC-Unblock function when the SGSN receives a FLOW-CONTROL-BVC packet.

ul-data

Enables the BVC-Unblock function when the SGSN receives a UL-UNITDATA packet.

Usage

Configurations defined with this command are common to all NSE defined for the SGSN.
This command is useful if there is a BVC status mismatch across different SGSN managers (such as the sessmgr and the linkmgr) when the BSC sends BVC-Block (SGSN should move to BLOCKED) followed by a BVC-Reset (SGSN should move to UNBLOCKED). Such mismatches can easily occur, particularly on Gb-IP network connection, when one link receives the BVC-Block and a different link receives the BVC-Reset with little delay between the two.
If BVC-Unblock function is enabled, the SGSN ensures that BVCs which are in the BLOCKED state move to the UNBLOCKED state upon receipt of the configured packet type(s).

Example

Instruct the SGSN to perform BVC-Unblock when a mismatch occurs and the SGSN receives a FLOW-CONTROL-BVC packet:

```
bvc-unblock flow-control
```

dscp-template

Creates and/or deletes DSCP templates that can be configured for use for all GPRS services on the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

dscp-template *template_name* **[-noconfirm]**

no dscp-template *template_name*

no

Deletes the template instance from the SGSN Global configuration.

template_name

Enter 1 to 64 alphanumeric characters, including dots (.), dashes (-), and forward slashes (/). to identify a unique instance of a DSCP template.
There is no known limit to the number of templates that can be created.

Usage

This command enables the operator to create or delete an instance of a DSCP template. The DSCP templates are used to define the DSCP configuration for control packets and data packets for the GPRS services.
Related commands:

- This command provides access to the mode containing all the configuration commands used to define DSCP markings for the control packets and data packets for a particular GPRS service (see the *DSCP Template Configuration Mode Commands* section).
- To associated a specpific DSCP template with a specific GPRS service configuration, use the **associate-dscp-template downlink** documented in the *GPRS Service Configuration Mode Commands* section.
- To check the list of DSCP templates configured, use the **show sgsn-mode** command documented in the *Exec Mode Commands* section.

Example

Use a command similar to the following to create a DSCP template with ID *dscp_london* that can be used specifically for Gb/IP calls from subscribers in London:

```
dscp-template dscp_london
```

dual-address-pdp

This command makes it possible for the operator to enable (default) / disable SGSN support for MS requests for dual PDP type (IPv4v6) addressing.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] dual-address-pdp
```

default

Enables dual PDP type address support.

no

Disables the default behavior so that the SGSN does not honor requests for dual PDP type addresses.

Usage

With release 12.2 and in accordance with 3GPP Release 9.0 specifications, by default the SGSN honors the MS/UE request for dual PDP type addressing (IPv4v6) for PDP context association with one IPv4 address and one IPv6 address/prefix. This support can be disabled by configuration.

Important: For the dual PDP addressing feature to function, **common-flags** must be enabled with the **gptc send** command in the SGTP service configuration mode *prior* to enabling the feature with the **dual-address-pdp** command.

With this default behavior, the operator has multiple options to refine the level of support for dual PDP type addressing through the use of several related commands.

- **dual-address-pdp** command in the RNC configuration mode disables SGSN support for dual PDP type addressing for a specific RNC that either does or does not support this type of addressing..
- **pdp-type-ipv4v6-override** in the APN profile configuration mode allows the SGSN to override the MS/UE request for dual PDP type addressing.
- Using the **dual-ipv4v6** keyword with the **wildcard-apn pdp-type** command in the APN remap table configuration mode enables the operator to configure a default APN with a wildcard subscription with PDP type IPv4v6.

Example

Use the following command to disable support for dual PDP type addressing (IPv4v6):

```
no dual-address-pdp
```

If dual PDP addressing has been disabled, to renable the feature, move to the SGTP service configuration mode, in the appropriate context, to perform the following as the *first* command needed to re-enable support for dual PDP type addressing in the configuration:

```
gtpc send common-flags
```

Now in the SGSN global configuration mode, use the following as the second command required to re-enable support for dual PDP type addressing in the configuration:

```
dual-address-pdp
```

end

Exits the current mode and returns to the Exec Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode to the Global Configuration Mode.

gmm-message

This command configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] gmm-message attach-with-tlli-in-use discard-message
```

default

Resets the default function allowing multiple MS, using the same random TLLI, to attempt to Attach simultaneously and disables discarding the Attach-Request message for random TLLI already in use.

Usage

Working with the two related commands (noted below), this command is part of a procedure for handling multiple MS Attaches all with the Same Random TLLI. Use this command to configure the SGSN to allow only one subscriber at a time to attach using a fixed random TLLI.

Related Commands:

- The **old-tlli invalidate tlli** command configures a list of random TLLI to be invalidated from the GMM after the invalidate old-TLLI timer expires.
- The **old-tlli hold-time** command configures the old-TLLI expiry timer.

Example

Configure the SGSN to drop Attach Request containing TLLI already in use:

```
gmm-message attach-with-tlli-in-use discard-message
```

imsi-range

Configure an IMSI range or a PLMN ID to associate with an Operator Policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

imsi-range mcc *mcc_num* **mnc** *mnc_num* **{ msin first** *start_number* **last** *stop_number* **[operator-policy** *policy_name* **[description** *description* **]] | plmnid** *plmn_id* **operator-policy** *policy_name* **[description** *description* **] } +**

no imsi-range mcc *mcc_num* **mnc** *mnc_num* **{ msin first** *start_number* **last** *stop_number* **| plmnid** *plmn_id* **}**

---

no

Using **no** in the command deletes the definition from the SGSN Global configuration.

---

mcc *mcc_num*

mcc defines the mobile country code (MCC) of an IMSI.
mcc_num: Enter a 3-digit number from 100 to 999 - 000 to 099 are reserved.

---

mnc *mnc_num*

mnc defines the mobile network code (MNC) of an IMSI.
mnc_num: Enter a 2 or 3-digit number from 00 to 999.

---

msin

MSIN (mobile subscriber international number) portion of the IMSI.
first *start_num:* Defines first MSIN prefix number in a range
last *stop_num:* Defines the last or final MSIN prefix number in a range.

---

operator-policy *policy_name* **description** *description*

Identify the operator policy that the IMSI range definition and/or the PLMN-ID is to be associated.
policy_name : Enter a string of 1 to 64 alphanumeric characters.
description: Enter a string of 1 to 100 alphanumeric characters to provide range clarification for converted Release 9.0 configurations.
If a PLMN-ID is to be included in the definition, enter the **plmnid** before entering the operator policy name.

---

plmnid *plmn_id*

The 5-6 digit PLMN-ID consists of the MCC (mobile country code) plus the MNC (mobile network code) to identify the public land mobile network (PLMN) for a specific operator. This keyword associates a specific PLMN with this specific SGSN operator policy.
plmn_id : Enter 5 to 6 digits.

+

This symbol indicates that command can be repeated to create repeated definitions.

Usage

An IMSI = maximum of 15 digits. An IMSI consists of the MCC (3 digits) + the MNC (2 or 3 digits) + the MSIN (the remaining 10 or 9 digits depending on the length of the MNC).
MCC and MNC are the minimum amount of information required to identify a unique operator policy with IMSI filtering. The MCC and MNC combine uniquely to identify the country and the network operator, for example: Cingular Wireless in the United States = **mcc** *311***mnc** *180*
To improve the granularity of call handling, an operator policy with additional IMSI filtering parameters can be defined, to include filtering based on the MSIN, by defining a MSIN range - first (or start-of-range) MSIN and last (or end-of-range) MSIN. The range numbers do not include the maximum allowed for the MSIN but should include a sufficient number to enable the operator policy to filter effectively.
For the most efficient IMSI filter, the operator policy should include all of the above parameters and the PLMN ID which defines the current location of the MS -- this parameter is particularly useful for highlighting which calls are roaming.
And if none of the operator policies contain useful filtering information, then the default operator policy will be applied as the information in this command is never defined for the default operator policy.
The following table will illustrate how these filtering parameters determine which operator policy will govern a call:

Operator Policy ID	MCC	MNC	MSINfirst	MSINlast	PLMN ID
OpPol-1	123	45	67890	67898	
OpPol-2	123	45			
OpPol-3	123	45	67890	67898	23232
OpPol-4	123	45			23232
OpPol-5	123	45	6789012	6789019	
OpPol-6	123	45	6789012	6789019	23232
default					

The filtering selects which operator policy will be used to determine how a call is handled - the operator policy that best matches the IMSI. So, a call with IMSI 123456789012345 PLMNID 23232 is best matched with OpPol-6.
In most cases, the operator policy with the most information defined will be used as a combination of PLMNID and IMSI provides the best match. But OpPol-6 won't always be the best match. Using the table above:
OpPol-1 is the best match for IMSI 123456789011111
OpPol-2 is the best match for IMSI 123456789099999
OpPol-5 is the best match for IMSI 123456789012345 if the PLMNID is 12344

Example

The following associates operator policy *oppol1* with country code *310*, mobile network code of *33*, and IMSI range *1231234 - 1231244*:

```
imsi-range mcc 310 mnc 33 msin first 1231234 last 1231244 operator-policy
oppol1
```

map-message

This command instructs the SGSN to ignore the CAMEL subscription when there is no CAMEL service associated or in existence.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
map-message insert-subscriber-data csi-handling when-camel-not-associated ignore-subscription

default map-message insert-subscriber-data csi-handling
```

default

Resets the SGSN's default behavior. By default, the SGSN validates the CAMEL subscription and rejects an Attach Request when there is no CAMEL service association.

Usage

By default, the SGSN updates the the CAMEL subscription included in the INSERT-SUBSCRIBER-DATA (ISD) messages received from the HLR. While processing the ATTACH request from the CAMEL subscriber, the SGSN checks whether it has a CAMEL service associated with the corresponding service (either GPRS service or SGN service). It drops the ATTACH request if there is no CAMEL service associated with a corresponding service.
Also by default, the SGSN does not allow establishment of a Direct Tunnel (DT) for a CAMEL subscriber. It strictly validates the subscriber against the CAMEL subscription during the Direct Tunnel setup procedure. This command enables the operator to control the behavior of the SGSN by configuring the SGSN to ignore the CAMEL subscription. This allows the SGSN to successfully complete an ATTACH procedure when there is an ATTACH Request from a CAMEL subscriber and there is no CAMEL service association in the SGSN. As well, during the Direct Tunnel establishment, validation of the CAMEL subscription is ignored to allow the DT to setup when there is no CAMEL service association in the SGSN.

Example

Instruct the SGSN to validate the CAMEL subscription:

```
default map-message insert-subscriber-data csi-handling
```

max-pending-attaches

Configure the maximum length of the pending attach queue.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-pending-attaches *limit*

default max-pending-attaches

default

Resets the SGSN's Attach queue to a maximum pending value of 10,000.

limit

Set the a maximum limit to the pending Attach/RAU messages queue in the LinkMgr. When the limit is reached a message is sent to the IMSIMgr.
limit : Enter an integer from 5000 - 50000. Default is 10000.

Usage

With this command, configure the maximum limit to the pending ATTACH/RAU messages queue in the LinkMgr. When the limit is reached, the LinkMgr sends the Query/Forward messages to the IMSIMgr.
As the IMSIMgr gets busier and does not responded to Query/Forward requests, the response to the requests will get slower and slower and the queue size continues inflating if the incoming message rate is high. To avoid this situation, set the **max-pending-attaches** for the pending queue for Attach and RAU messages. All other messages from the HLR will be added to the queue as they cannot be dropped. High and low watermarks are set to the queue at 80% of **max-pending-attaches** " and 60% of **max-pending-attaches** respectively.
Once a high watermark is reached, the new Attach and RAU requests are dropped and relevant statistics are incremented. Once a low watermark is hit, the new Attach/RAU requests are accepted and added to the pending queue. The entries are added to the pending queue only when the window-size between IMSIMgr and LinkMgr becomes zero. This is a very rare occurrence and will not affect the current behavior in normal circumstances.

Example

Set the queue length to a maximum of *15000* requests:

```
max-pending-attaches 15000
```

old-tlli invalidate tlli

This command configures a list of random TLLI to be invalidated (removed) from the GMM after the invalidate old-TLLI timer expires.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

`[ no ] old-tlli invalidate tlli` *`< hexadecimal >`*

`no`

Removes a single random TLLI from the configured list.

`< hexadecimal >`

Identifies a single random TLLI to be removed from the GMM after the old-TLLI timer expires.

Usage

Use this command to create a list of up to 50 random TLLI to be dropped from the GMM after the old-TLLI timer expires. This command also starts the invalidate old-TLLI timer.

Important: If the old-TLLI expiry timer is not configured with the **`old-tlli hold-time`** command, then the SGSN will only drop second Attach Requests using the same random TLLI already in use.

Related Commands:

- The **`gmm-message`** configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use
- The **`old-tlli hold-time`** command configures the old-TLLI expiry timer.

Example

Add random TLLI *`0x7f05a30a`* to the Invalidate List:

```
old-tlli invalidate tlli 0x7f05a30a
```

old-tlli hold-time

This command configures the old-TLLI expiry timer to be started in GMM when anyone of the listed random TLLI are received.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] old-tlli hold-time < seconds >
```

default

Resets the timer to 5 seconds

< seconds >

Sets the numbers of seconds before the timer expires; range 1 to 125.

Usage

Use this command to configure the old-TLLI expiry timer to be started in GMM when anyone of the listed random TLLI are received. If the timer expires prior to receiving Attach-Complete then the SGSN invalidates (removes) the TLLI from the GMM.

Important: For this configuration to work, the list of random TLLI to be removed (invalidated) from the GMM must be defined with the **old-tlli invalidate tlli** command.

Related Commands:

- The **gmm-message** configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use
- The **old-tlli invalidate tlli** command configures the random invalidate TLLI list.

Example

Set the timer for *2* seconds:

```
old-tlli hold-time 2
```

pdp-deactivation-rate

Set the rate the SGSN deactivates PDP connections per second per SessMgr when GPT-C path failure is detected.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pdp-deactivation-rate { connected-ready rate | idle-standby rate }

default pdp-deactivation-rate { connected-ready | idle-standby }
```

default

If this keyword is used with the command, then the default deactivation rates are used.

connected-ready *rate*

Subscribers that are in the PMM-Connected / GPRS-Ready state and actively using the SGSN service need to be deactivated at a faster rate to facilitate the deactivation/re-activation process.
rate -sets the number of subscribers to be deactivated per second per SessMgr and the valid range is 1 to 1000 and the default is 760 connected-ready subscribers deactivated per second.

idle-standby *rate*

Subscribers that are in the PMM-Idle / GPRS-Standby state are not actively using the SGSN service and can be deactivated at a slower rate. The deactivation process for idle-standby subscribers includes paging before the Deactivate Request is sent.
rate - sets the number of subscribers to be deactivated per second per SessMgr and the valid range is 1 to 1000 and the default is 240 idle-standby subscribers deactivated per second.

Usage

Use this command to define a rate at which the SGSN processes PDP deactivations when a GTP-C path failure is detected (and confirmed according to the SGSN's default behavior). The operator can use this command to set a deactivation rate that ensures radio network congestion is avoided.
Related commands:

- **max-remote-restart-counter-change** - allows the operator to set a maximum variance between stored and received values for restart counter changes coming from the GGSN. For details, refer to the SGSN Global configuration mode documentation.
- **disable-remote-restart-counter-verification** - allows the operator to disable the default behavior. For details, refer to this command in the SGSN Global configuration mode documentation.

Example

Use the following command to deactivate PDP connections for *600* PMM-Connected / GPRS-Ready subscribers per second:

```
pdp-deactivation-rate connected-ready 600
```

Use the following command to deactivate PDP connections for *320* PMM-Idle / GPRS-Standby subscribers per second:

```
pdp-deactivation-rate idle-standby 320
```

Use the following command to reset the default *760* per second deactivation rate for PMM-Connected / GPRS-Ready subscribers:

```
default pdp-deactivation-rate connected-ready
```

ranap excess-len ignore

Configure the SGSN to ignore excess length of received RANAP messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ranap excess-len ignore
```

default

Resets the default behavior - a decode error is generated when received RANAP messages are more than an extra octet in length.

no

Disables the configuration to ignore overly long RANAP messages.

Usage

By default, the SGSN issues a decode error when the RANAP messages include extra octets. Use this command to ignore RANAP messages that have excess octets.

Example

Use the following command to enable the SGSN to ignore overly long RANAP messages:

```
ranap excess-len ignore
```

Use the following command to disable ignoring of RANAP messages that are excessive in length:

```
no ranap excess-len ignore
```

ran-information-management

Enable/disable RAN information management (RIM) support for the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ran-information-management
```

default

Resets the default so RIM is disabled.

no

Disables the RIM support in the configuration file.

Usage

By default, handling of RAN information management (RIM) messages is disabled. This command enables the SGSN to handle RIM messages. When this command is enabled and RIM message handling is enabled on the destination node, then RIM PDUs will be forwarded to the BSC/RNC. If RIM message handling is not enabled on both nodes, then the RIM PDUs will be dropped silently.
Confirm RIM configuration with the **show sgsn-mode** command in the Exec mode.

Example

Use the following command to enable RIM support:

```
ran-information-management
```

Use the following command to disable RIM support that has been added to the configuration:

```
no ran-information-management
```

target-offloading

Selects the subscriber offloading algorithm to be applied to the SessMgr and the IMSIMgr.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
target-offloading algorithm [ optimized-for-speed | optimized-for-target-count ]

default target-offloading algorithm
```

default

Resets the configuration to default values.

optimized-for-speed

Enables faster algorithm to achieve the target count.

optimized-for-target-count

Enables a reliable algorithm to achieve the target count.
Default.

Usage

With the SGSN's distributed architecture, there are many SessMgrs and offloading will happen in parallel at all SessMgrs. This command enables the operator to control the total number of subscribers being offloaded.

Important: The value for this command can not be altered once dynamic offloading has begun - refer to the command description for the **sgsn-offload** command in the *Exec Mode* chapter..

Example

Set the SGSN to use the faster algorithm for offloading:

```
target-offloading algorithm optimized-for-speed
```

tlli-cb-audit

This command enable (default is disabled) or disables a periodic (hourly) audit of TLLI-CBs in the BSSGP layer.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
tlli-cb-audit

[ default | no ] tlli-cb-audit
```

default

Include **default** with the command to disable the audit function.

no

Include **no** with the command to disable the audit function.

Usage

This command is used to clean-up hanging or unassociated TLLI in the BSSGP layer. This configuration defined with this command will be common to all NSE configured for this SGSN.
Independent of this command configuration, the SGSN triggers and audit when the number of TLLI-CBs reaches 35,000.

Example

Use the following command to enable the hourly audit for unassociated TLLl-CBs:

```
tlli-cb-audit
```

umts-aka-r99

This command enables the operator to authenticate mobile equipment (MEs) with R99+ USIMs and capable of UMTS AKA.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
umts-aka-r99

no umts-aka-r99
```

no

Including **no** with the command disables the authentication.

Usage

This command enables operators to authenticate MEs that are attempting to connect to a 2.5G network with R99+ USIMs if the MEs are UMTS AKA capable. For R99 mobiles, the SGSN will continue to perform GSM AKA even if quintuplets are received fromthe HLR.

Example

Use the following command to disable UMTS AKA authentication for MEs with R99+ USIMs:

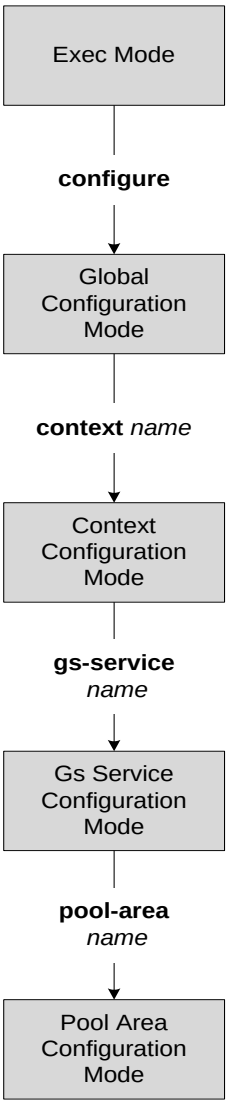
```
no umts-aka-r99
```

Chapter 252
SGSN Pool Area Configuration Mode Commands

The Pool Area configuration mode configures the parameters used to setup the VLRs to use with a pool area in a Gs service.

With this mode, the command prompt will be similar to:

```
[ctx_name]hostname(config-gs-pool-area)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous configuration mode.

hash-value

This command configures the load distribution for the VLRs that service this pool area.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

hash-value { *hash_value* | non-configured-values | range *start_value* to *end_value* } use-vlr *vlr_name*

no hash-value { *hash_value* | non-configured-values | range *start_value* to *end_value* }

no

Removes the configured Gs procedures from this Gs service.

hash_value

Specifies the specific hash value for VLR(s).
hash_value must be an integer value from 0 through 999.

range *start_value* **to** *end_value*

Specifies the range of hash values for a VLR.
start_value specifies the start value for range of hash and is an integer value from 0 through 999.
start_value must be lower than *end_value.*
end_value specifies the end value for range of hash and is an integer value from 0 through 999. *end_value* must be higher than *start_value*.

non-configured-values

This keyword assign all non-configured hash values to use the named VLR.

use-vlr *vlr_name*

Specifies the name of the VLR to be associated with this pool area.
vlr_name is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.

Usage

Use this command to command configures the load distribution for the VLRs that service this pool area as defined in TS 23.236.
The algorithm for selection of VLR from a pool area is based on the hash value computed on the IMSI digits. The SGSN derives a hash value (V) using procedure as defined in TS 23.236. Every hash value from the range 0 to 999 corresponds to a single MSC/VLR node. Typically many hash values may point to the same MSC/VLR node.
This command can be entered multiple times for different hash value.

Example

Following command configure the all non configured hash values to use VLR named *starvlr1* in this pool area:

hash-value non-configured-values use-vlr *starvlr1*

lac

This command defines a set of location area code (LAC) values for a pool area.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lac *lac_id* **+**

no lac *lac_id*

no

Removes the configured LAC value from this pool area configuration.

lac *lac_id*

Specifies the subscribers' location area code (LAC) to be associated with this pool area and a specific VLR. This LAC is obtained from the radio area identity (RAI).
lac_id: Must be an integer from 1 through 65535.

+

More than one *lac_id*, separated by a space, can be entered within a single command.

Usage

Use this command to specify a set of LACs to use for a pool area.
This command can be entered multiple times, subject to a limit of 32 LAC definitions (total for **non-pool-area** and **pool-area** configuration) per Gs service.

Important: LAC values across multiple pool areas and non-pool-areas must be unique within the Gs service.

Example

The following command configures LACs *101, 301,* and *222* for the pool area.

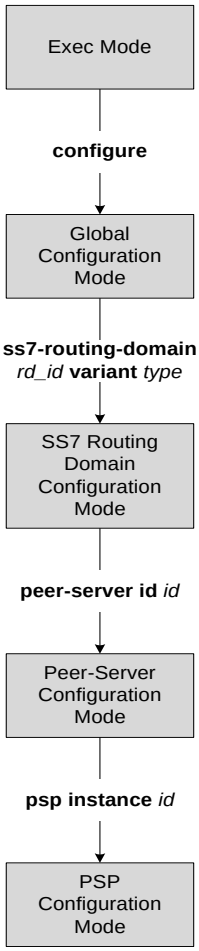
```
lac 101 301 222
```

Chapter 253
SGSN PSP Configuration Mode Commands

The Peer-Server Process (PSP) configuration mode provides the commands to create, configure, bind, and manage a specific PSP instance included in an SS7 routing domain configuration.

In this mode, where information in italics is customer-defined, the command prompt should appear similar to:

```
[local]hostname(config-ss7-rd-1-ps-1-psp-1)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

Defines an association between the PSP instance and an application server process (ASP) instance.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
associate asp instance asp_num

no associate
```

no

Removes the association between the PSP and the ASP from the routing domain configuration.

Important: Using the **no associate** command will probably result in the termination of all current subscriber sessions active through the peer-server.

asp_num

Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.
asp_num must be an integer from 1 through 4.

Usage

Use this command to create an association between a specific peer-server process (PSP) and a specific application server process (ASP) instance.
Before using the **associate** command, the values for the **psp-mode** and **end-point** commands must be configured.
Before using the **associate** command, the M3UA end-point of the ASP must be configured. Use the commands defined in the *ASP Configuration Mode* chapter of the *Command Line Interface Reference*.

Example

Associate this PSP instance with an ASP configuration instance:

```
associate asp instance 2
```

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

end-point

This command defines or deletes the IP address to be associated with the local SCTP end-point for the application server process (ASP).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end-point { address ip_address | port port_number }

no end-point [ address ip_address ]
```

port *port_number*

Configures the M3UA's SCTP port number for the end-point.
port_number: Must be an integer from 1 to 65535.
Default: 2905.

no

Removes the ASP end-point association configuration from the PSP configuration.

Important: This command can not be used as long as the PSP and the ASP are associated. Use the **no associate** command when entering any form of this command, including **no end-point**. When the change is made, re-enter the ASP association with the **association** command.

Usage

Use this command to manage the ASP end-point. At least one address needs to be configured for the ASP before the end-point can be associated with the PSP.

Example

Set the ASP end-point to IP address 192.168.1.1 with the following command:

```
end-point address 192.168.1.1
```

exchange-mode

Configures the exchange-mode for the PSP communication.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exchange-mode [ double-ended | single-ended ]
```

Usage

Important: Before using this command to set a value or reset the default, you must disassociate the PSP instance with the **no associate** command. When you have modified your configuratioin with this command, then use the **associate** command to setup a new ASP association.

Use this command to toggle the exchange modes for the PSP to match the exchange mode supported by the ASP. The exchange mode specifies what type of ASP messages exchange is used in an IPSP communication. The **exchange-mode** must be configured for 'single-ended' if the **psp-mode** has been configured for 'client'.

Example

Change the exchange mode from the standard double-ended to single-ended:

```
exchange-mode single-ended
```

exit

Exits the current configuration mode and moves to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Peer-Service configuration mode.

psp-mode

Configures either client-mode or server-mode as the PSP's operational mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
psp-mode { client | server }
```

client

The PSP operates as a client.

server

The PSP operates as a server.

Usage

Important: Before using this command to change the configuration, you must disassociate the PSP instance with the **no associate** command. When you have modified your configuratioin with this command, then use the **associate** command to setup a new ASP association.

Example

Instruct the peer-server process to operate in either client or server mode.

Configure the PSP to operate in server mode:

```
psp-mode server
```

routing-context

Configures the behavior of the routing context in M3UA messages.

Important: This keyword function is only available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
routing-context { discard-inbound | process-inbound { insert-outbound | suppress-outbound
}
```

```
default routing-context
```

default

Include this keyword with the command, to reset the configuration to the system default for routing-context which is a combination of process-inbound and insert-outbound.

discard-inbound

Sets the routing context received in M3UA messages to be discarded.

process-inbound

Sets the routing context received in M3UA messages to be processed.

insert-outbound

Sets the routing context so that it is added in the M3UA messages.

suppress-outbound

Sets the routing context so that it is suppressed in the M3UA messages.

Usage

Important: Before using this command to change the configuration or reset the default, you must disassociate the PSP instance with the **no associate** command. When you have modified your configuratioin with this command, then use the **associate** command to setup a new ASP association.

In PSP (singled-ended) configuration mode, the settings for both the local routing context (the SGSN's routing context) and the peer routing context (the RNC's routing context) should be the same. If the routing contexts created at the SGSN and on the peer are different then this can cause the M3UA link to fail. Routing context is an optional parameter when an M3UA association has only one associated peer-server.

Example

If the peer does not support routing context, then disable the routing context feature:

```
routing-context discard-inbound suppress-outbound
```

sctp-alpha

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines the RTO-Alpha value.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-alpha *value*

default sctp-alpha

value

Defines a percentage (%) that represents the RTO portion of the round-trip time (RTT) calculation. This percentage value must be an integer between 0 and 65535.

default

Resets the **sctp-alpha** to the default value of 5%.

Usage

sctp-alpha is used in conjunction with other commands, such as the **sctp-beta** command, to determine the round-trip time (RTT) calculations. The Alpha parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Important: Before using this command to set a value or reset the default, you must disassociate the PSP instance with the **no associate** command. When you have modified your configuratioin with this command, then use the **associate** command to setup a new ASP association.

Example

Set the SCTP RTO-Alpha value to 256% of the RTT calculation:

sctp-alpha *256*

sctp-beta

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines the RTO-Beta value.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-beta *value*

default sctp-beta

value

Defines a percentage (%) that represents the RTO portion of the round-trip time (RTT) calculation. This percentage value must be an integer between 0 and 65535.

default

Resets the **sctp-beta** to the default value of 10%.

Usage

Use this command in conjunction with other commands, such as the **sctp-alpha** command, to determine the round-trip time (RTT) calculations. The Beta parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set the SCTP RTO-Alpha value to 512% of the RTT calculation:

sctp-beta *512*

sctp-checksum-type

This command selects the type of checksum algorithm to be used.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sctp-checksum-type { adler32 | crc32 }

default sctp-checksum-type
```

adler32

Selects the Adler-32 type of algorithm as a faster checksum function.

crc32

Selects the CRC-32, a slower but more reliable 32-bit cyclic redundancy check.

default

Resets the **sctp-checksum-type** to the default of CRC-32.

Usage

Use this command to set which type of checksum algorithm the SGSN is to use to validate SCTP packets.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

```
sctp-checksum-type crc32
```

sctp-cookie-life

This command sets the SCTP valid cookie life.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-cookie-life *value*

default sctp-cookie-life

value

Sets the valid cookie life value in increments of 100 milliseconds. The range is 50 to 1200 .

default

Resets the **sctp-cookie-life** value to the default, 600 (= .6 seconds).

Usage

Use this command to set the SCTP cookie life.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set the SCTP cookie life to 1 second (1000 milliseconds):

sctp-cookie-life *1000*

sctp-init-rwnd

This command sets the size of the SCTP receiver window .

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-init-rwnd *window_size*

default sctp-init-rwnd

window_size

Sets an integer to configure the window size. The range is 32768 to 1048576.

default

Resets the **sctp-init-rwnd** window size to the default, 1048576.

Usage

Use this command to set the receiver window size in the configuration. Configuring this parameter enables the SCTP client to send configured 'sctp-init_rwnd' as a_rwnd parameter in the INIT message. For the SCTP server, the INIT ACK will be populated with sctp-init_rwnd as a_rwnd parameter per RFC 4960.
The command enables the operator to configure a reduced priority for LinkManager Control messages, thereby giving Timer messages the highest priority. The Timer messages are retained at the highest priority and Data messages are kept at a lower priority.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Use the following command to set the SCTP window size to 32786:

sctp-init-rwnd *32768*

sctp-max-assoc-retx

This command sets the maximum number of datagram retransmissions to be associated with this peer server configuration.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-assoc-retx *value*

default sctp-max-assoc-retx

value

Defines the maximum number of datagram retransmissions for an association. The value must be an integer between 0 and 255.

default

Resets the default for **sctp-max-assoc-retx** to 10.

Usage

Use this command to configure the maximum number of datagram retransmissions for an association. The endpoint will be declared unreachable after **sctp-max-assoc-retx** number of consecutive retransmissions to an endpoint on any transport address.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

sctp-max-assoc-retx *3*

sctp-max-init-retx

This command sets the maximum number of retries to send the INIT datagram.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-init-retx *value*

default sctp-max-init-retx

value

Sets the maximum number of retries. This value must be an integer between 0 and 255.

default

Resets the default for **sctp-max-init-retx** to 5.

Usage

Use this command to set the maximum number of retries the SCTP layer should make to send the INIT datagram to the peer to open an association.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

sctp-max-init-retx *3*

sctp-max-mtu size

This command sets the number of bytes that comprise the maximum MTU size.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-mtu-size *value*

default sctp-max-mtu-size

value

Sets the maximum number of bytes for the SCTP MTU size. This value must be an integer between 508 and 65535.

default

Resets the default for **sctp-max-mtu-size** to 1500 bytes.

Usage

Use this command to configure the size of the MTU.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set the maximum size of the MTU to 3000 bytes:

sctp-max-mtu-size *3000*

sctp-max-out-strms

This command sets the maximum number of outgoing streams through the PSP going towards the peer server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-out-strms *max#_out_streams*

default sctp-max-out-strms

default

Resets the SGSN's **sctp-max-out-strms** value to the default of 16.

max#_out_streams

The value must be an integer between 1and 65535. The value should match the peer node's (STP/SG/RNC/HLR) number of in-bound streams.

Usage

Use this command to balance the stream throughput from the PSP to the peer server. The value for this command is used to validate the incoming packets in the SCTP layer.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

sctp-max-out-strms *3500*

sctp-max-path-retx

This command sets the maximum number of datagram retransmissions for this path.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-path-retx *value*

default sctp-max-path-retx

value

Sets the maximum number of datagram retransmission to a destination transport address. This value must be an integer from 0 to 255.

default

Resets the **sctp-max-path-retx** default to 5.

Usage

Use this command to set the maximum number of datagram retransmissions to a destination transport address. The destination transport address will be declared unreachable after the SGSN exhausts the **sctp-max-path-retx** number of consecutive retransmissions to a destination transport address.
Depending upon network conditions, lower values typically means faster detection of SCTP-Path failure.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

sctp-max-path-retx *10*

sctp-rto-initial

This command sets the initial retransmission timeout for the SCTP.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-initial *value*

default sctp-rto-initial

default

Resets the system to the **sctp-rto-initial** default of 30 (3 seconds).

value

The value must be an integer between 1 and 50.

Usage

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Use this command to define the initial retransmission timer.
The value set for **sctp-rto-initial** should be greater than or equal to the minimum value set with **sctp-rto-min** (**sctp-rto-initial**=> **sctp-rto-min**).
The value set for **sctp-rto-initial** should be less than or equal to the maximum value set with **sctp-rto-max** (**sctp-rto-initial** <= **sctp-rto-max**).

Example

sctp-rto-initial *240*

sctp-rto-max

This command sets the maximum retransmission timeout value for the SCTP.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-max *value*

default sctp-rto-max

default

Resets the system to the **sctp-rto-max** default of 600 (60 seconds).

value

Set the maximum retransmission timeout value in increments of 100 milliseconds (0.1 seconds) and the value must be an integer between 5 and 1200.

Usage

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Use this command to configure the maximum time for retransmissions.
The value set for **sctp-rto-max** should be greater than or equal to the value set for **sctp-rto-initial** (**sctp-rto-max** => **sctp-rto-initial**).

Example

The following sets the timeout for 45 seconds:

sctp-rto-max *450*

sctp-rto-min

This command sets the minimum retransmission timeout (RTO) value for the SCTP.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-min [units-10ms] *value*

default sctp-rto-min

default

Resets the **sctp-rto-min** to the default of 10 (1 second).

units-10ms

Including this keyword, before entering a value, enables configuration with finer granuality - in 10 millisecond units.

value

If the **units-10ms** keyword is included, then set the timeout in increments of 10 milliseonds. The value must be an integer between 1 and 500.
If the **units-10ms** keyword is not included then set the timeout in increments of 100 milliseconds. The value must be an integer between 1 and 50.

Usage

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Use this command to set the minimum time for retransmission before timeout.
The value set for **sctp-rto-min** should be less than or equal to the value set for **sctp-rto-initial** (**sctp-rto-min** <= **sctp-rto-initial**)

Example

The following sets the timeout for 2 seconds:

```
sctp-rto-min 20
```

sctp-sack-frequency

This command sets the frequency of transmission of SCTP selective acknowledgements (SACK).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-sack-frequency [units-10ms] *value*

default sack-frequency

value

Sets the maximum number of datagrams to be received prior to sending a SACK to the peer. The value must be an integer between 1 and 5.

default

Resets the **sctp-sack-frequency** default value of 2.

Usage

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Use this command to set the maximum number of datagrams to be received before a SACK must be sent to the peer. The **sctp-sack-frequency** is used in conjunction with the **sctp-sack-period** to control the generation of SACK, depending on which one occurs first.

Example

sctp-sack-frequency *3*

sctp-sack-period

This command sets the delay before sending an SCTP selective acknowledgement (SACK).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-sack-period [units-10ms] *value*

default sack-period

units-10ms

Including this keyword, before entering a value, enables configuration with finer granuality - in 10 millisecond units.

value

If the **units-10ms** keyword is included, then set the timeout in increments of 10 milliseonds. The value must be an integer between 0 and 50.
If the **units-10ms** keyword is not included then set the timeout in increments of 100 milliseconds. The value must be an integer between 0 and 5.

default

Resets the system to the **sctp-sack-period** default value, 2 (=200 milliseconds).

Usage

Use this command to set the time the SCTP waits to send a SACK.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

sctp-sack-period *3*

sctp-suppress-alarm

This command enables/disables the suppression of alarms for SCTP path failure between two peer endpoints.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] sctp-suppress-alarm path-failure self-end-point-address *orig_ipv4_address***peer-end-point-address** *peer_ipv4_address*

no

Disables the pre-configured alarm suppression for SCTP path failure.

path-failure

This keyword specifies that the alarm suppression is for SCTP path failure between two peer nodes.

self-end-point-address *orig_ipv4_address*

This keyword specifies the IP address of the originating endpoint.
orig_ipv4_address is the IP address of originating endpoint in IPv4 dotted decimal notation.

peer-end-point-address *peer_ipv4_address*

This keyword specifies the IP address of the peer endpoint.
peer_ipv4_address is the IP address of peer endpoint in IPv4 dotted decimal notation.

Usage

Use this command to configure the path failure alarm suppression. This command ignores the alarms generated on SCTP path failure.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

The following command suppresses the path failure alarms occurred in SCTP path between originating peer address *1.2.3.4* and peer endpoint *6.7.8.9*:

sctp-suppress-alarm path-failure self-end-point-address *1.2.3.4* **peer-end-point-address** *6.7.8.9*

timeout

This command sets the times for various timeout timers.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout {**m3ua-periodic-dest-audit** *dest_timeout* | **sctp-bundle** *bundle_time* | **sctp-heart-beat** *hrt_bt_timeout*}

default timeout sctp-heart-beat

default

Resets the system to the default value for the SCTP heartbeat interval.

m3ua-periodic-dest-audit *dest_timeout*

Sets the period (in increments of seconds) between the DAUD messages while auditing a destination state.
dest_timeout: Must be an integer from 1 to 65535. Default is 2.

sctp-bundle *bundle_time*

Enables SCTP bundling and sets the SCTP bundle timeout value in incremenets of 100 milliseconds. SCTP bundling provides better bandwidth utilization and less traffic, however, there is a 100 millisecond packet transmission delay.

Important: Peer end should also be configured to support SCTP bundling.

Default: SCTP bundling is disabled.
bundle_time : Enter an integer from 1 to 65535.

sctp-heart-beat *hrt_bt_timeout*

Sets the number of seconds in the SCTP heart-beat timer
hrt_bt_timeout: This value is an integer between 1 and 300. Default is 30.

Usage

Use this command to configure timers. Repeat the command with each of the keywords to set values for each.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

timeout m3ua-periodic-dest-audit *120*

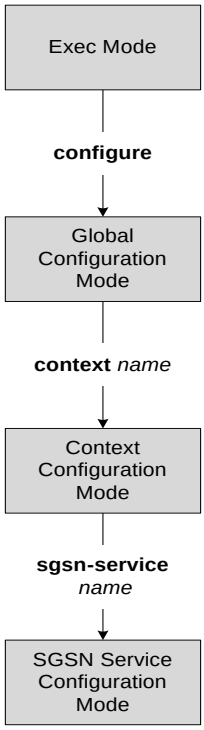
Chapter 254
SGSN Service Configuration Mode Commands

The SGSN Service configuration mode is used within the global configuration mode to specify the 3G operations of the SGSN and the available SGSN services for a specific context.

SGSN Service works with MAP Service, SGTP Service, GTPP Group, and IuPS Service. All five of these services must be configured to enable a 3G SGSN to communicate with other elements within a UMTS network.

In this mode, the command prompt should appear like:

```
[<ctx_name>]hostname(config-sgsn-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

This command defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

accounting (cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } } + | context *cntx_name* **}**

default accounting cdr-types

no accounting (cdr-types | context }

default

Returns the system to default settings for the selected type of CDR.

no

Removes the pre-configured type of CDR generation for accounting from the SGSN service.

cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } +

Default: enabled
Defines the types of CDRs to be generate:d within the specified SGSN service for accounting:

- **mcdr** Enables generation of M-CDRs.
- **scdr** : Enables generation of S-CDRs.
- **sms** : Enables generation of SMS-type CDRs based on one of the following:
- **mo-cd:** : SMS CDRs orignates from the mobile.
- **mt-cdr:** SMS CDRs terminates at the mobile.

+

Specifies that the specified keywords with in the group can be entered multiple times with a single command.

context *cntx_name*

Specifies an accounting context to be associated with the SGSN service.
cntx_name: Define a string of 1 to 79 alphanumeric characters.

Usage

Use this command to define the type of CDRs to generate for SGSN service. By default all type of CDRs are generated. Note that change of this configuration will be applied to new call and/or to new PDP contexts only.
By default, generation of the S-CDR, M-CDR, SMS-MT-CDR, and SMS MO-CDR types is enabled.

Example

The following command configures the system to generate CDRs of M-CDR type for accounting in the current SGSN service:

accounting cdr-types *mcdr*

admin-disconnect-behavior

This command defines some of the actions the SGSN will take during an Admin-Disconnect procedure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
admin-disconnect-behavior { clear-subscription | detach-type { reattach-not-required |
reattach-required } }

[ default | no ] admin-disconnect-behavior { clear-subscription | detach-type }
```

clear-subscription

Including this keyword in the configuration instructs the SGSN to clear subscriber contexts and the subscription data database whenever the **clear subscribers all** command is issued (from the Exec mode) for attached subscribers. As well, the SGSN will issue an appropriate Map-Purge-MS-Req to the HLR if needed.
Default: disabled

detach-type

Including this keyword defines which type of detach instruction to include in the Detach-Request message during an Admin-Disconnect procedure. One of the following options must be included when this command is entered:

- **reattach-not-required**
- **reattach-required**

Default: reattach-required

default | no

Including either **default** or **no** keyword in the command, instructs the SGSN to use the default value for the specified parameter.

Usage

Include the **clear-subscription** keyword with this command configuration to ensure that more than attached MM-context and active PDP-contexts are cleared when the clear **subscribers all** command is issued for attached subscribers.
To clear subscription data for detached subscribers, refer to the **sgsn clear-detached-subscriptions** command described in the *Exec* mode chapter.
Including the **detach-type** keyword with this command instructs the SGSN to include either a 'reattach-required' or a 'reattach-no-required' instruction in the Detach-Request message.

Example

Configure the SGSN to clear data such as PTMSI allocated, auth-vectors received, and NGAF flag values stored in the subscriber database for attached subscribers:

```
admin-disconnect-behavior clear-subscription
```

cc profile

Configures the charging characteristic (CC) profile with the triggers for generating various types of CDR as defined with the **accounting** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

cc profile *profile_bits* **[buckets** *number* **| interval** *time* **| tariff time1** *mins hours* **[time2** *mins hours* **] [time3** *mins hours* **] [time4** *mins hours* **] | volume { downlink** *down_vol* **uplink** *up_vol* **| total** *total_vol* **}] +**

[no | default] cc profile *profile_bits* **[buckets | interval | tariff | volumne]**

no

Removes a previously configured CC profile.

default

Returns the specified CC profile to the original default system settings.

profile_bits

Defines the value of the profile bits for the SGSN service.
index can be configured to any integer value from 0 to 15. Some of the values have been predefined according to 3GPP standard:

- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

buckets *number*

Specifies the number of statistics container changes in the CDR due to QoS changes or tariff times that can occur before an accounting record (CDR) is closed
Default: 4
number : Must be integer from 1 to 4.

interval *time*

Specifies the normal time duration (in seconds) that must elapse before closing an accounting record (CDR) provided that any or all of the following conditions occur:
time : Enter any integer from 60 to 40000000.

tariff time1 *mins hours* **[time2** *mins hours* **time3** *mins hours* **time4** *mins hours* **]**

Specifies the time-of-day (based on a 24-hour clock) to close the current statistics container in the CDR, but not necessarily the CDR itself. One tariff time must be defined and up to four tariff times can be specified.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

- *mins*: The minutes of the hour. Enter an integer from 0 to 59.
- *hours*: The hour of the day. Enter an integer from 0 to 23.

volume { downlink *down_vol* **uplink** *up_vol* **| total** *total_vol* **}**

Specifies the downlink, uplink, and total volumes octet counts that must be met for the closure of the CDR.
down_vol : Enter any integer from 100000 to 1345294336.
up_vol : Enter any integer from 100000 to 400000000.
total_vol : Enter any integer from 100000 to 400000000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures the profile index for the SGSN's charging characteristics. The SGSN supports up to 16 profile indexes.

Example

The following command configures a profile index of 10 with tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10  tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
```

check-imei

This command configures the action the SGSN will take if the route towards the EIR is down.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
check-imei { gf-failure-action | gf-timeout-action } { continue | reject }

default check-imei { gf-failure-action | gf-timeout-action }
```

default

Resets the default function to reject the Attach.

gf-failure-action

Coupled with either **continue** or **reject**, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and if the EIR is temporarily unreachable due to associated DPC/SSN inaccessible/out-of-service.

gf-timeout-action

Coupled with either **continue** or **reject**, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and the route to the EIR is available, but no response is received from the EIR.

continue

Instructs the SGSN to continue the Attach process.

reject

Instructs the SGSN to reject the Attach process.

Usage

Typically, the Attach process will be continued when there is an IMEI check timeout based on the configuration under the SGSN service configuration and/or the GPRS service configuration. But this works only if the route towards the EIR is UP and the IMEI request timer expires. This command configures the SGSN to allow the Attach process to continue in the case the route towards the EIR is down, that is the DPC / SSN is out-of-service.

Example

Use the following command to reset the default and reject Attach:

```
default check-imei gf-failure-action
```

check-imei-timeout-action

In Releases 12.0 and higher, this command has been replaced with enhanced functionality in the **check-imei** command, also available in this configuration mode.

core-network

This command specifies the numeric ID for a core network to identify which CN is to be used by the SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
core-network id cn_id

no core-network id
```

no

Removes the currently configured core network ID from the current SGSN configuration.

id *cn_id*

This number identifies the core network to connect the SGSN service.
cn_id : Must be an integer from 0 through 65535.

Usage

Use this command to set a global ID to identify this SGSN in the core network.

Example

The following command sets the core network ID for the current SGSN service to 127:

```
core-network id 127
```

disable/enable super-charger

This command has been deprecated and replaced by the **super-charger** command. For the commands to configure the SuperCharger feature, refer to the *Call-Control Profile Configuration Mode* chapter.

dns israu-mcc-mnc-encoding

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query which is sent during the ISRAU.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
dns israu-mcc-mnc-encoding { decimal | hexidecimal }

default dns israu-mcc-mnc-encoding
```

default

Resets the SGSN to send the MCC and MNC values in decimal format for DNS queries.

decimal

Default.
Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.

hexadecimal

Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.

Usage

Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query sent during the inter-SGSN RAU (ISRAU). The choice must match the format of the DNS server. For example:
In decimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc310.mcc722.gprs
```

In hexadecimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc0136.mcc02d2.gprs
```

Example

Use hexadecimal values for the MCC/MNC in the DNS query.

```
dns israu-mcc-mnc-encoding hexadecimal
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

gmm

This command defines the GPRS mobility management parameters for the SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gmm { T3302-timeout *t3302_dur* **| T3312-timeout** *t3312_dur* **| T3313-timeout initial** *t3313_init* **[decrease** *t3313_decrement* **| increase** *t3313_increment* **]** | **T3322-timeout** *t3322_dur* **| T3350-timeout** *t3350_dur* **| T3360-timeout** *t3360_dur* **| T3370-timeout** *t3370_dur* **| implicit-detach-timeout** *impli_detach_dur* **| max-auth-retransmission** *auth_retrans* **| max-identity-retransmission** *id_retrans* **| max-page-retransmission** *page_retrans* **| max-ptmsi-reloc-retransmission** *ptmsi_reloc_retrans* **| mobile-reachable-timeout** *ms_reach_dur* **| perform-identity-on-auth-failure | purge-timeout** *purge_dur* **| trau-timeout** *trau_dur* **}**

default gmm { T3302-timeout | T3312-timeout | T3313-timeout | T3322-timeout | T3350-timeout | T3360-timeout | T3370-timeout | implicit-detach-timeout | max-auth-retransmission |max-identity-retransmission | max-page-retransmission | max-ptmsi-reloc-retransmission | mobile-reachable-timeout | perform-identity-on-auth-failure | purge-timeout | trau-timeout }

no gmm { implicit-detach-timeout | max-auth-retransmission | max-identity-retransmission | perform-identity-on-auth-failure }

default

Sets the default value for the specified parameter.

T3302-timeout *t3302_dur*

Default: 10
Specifies the retransmission timer value to guard the GPRS attach or RAU procedure on MS side. *t3302_dur* is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3312-timeout *t3312_dur*

Default: 54
Specifies the retransmission timer value to guard the RAU procedure initiation on network side. *t3312_dur* is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3313-timeout initial *t3313_init* **[decrease** *t3313_decrement* **| increase** *t3313_increment* **]**

Default: 5
Specifies the retransmission timer value to guard the for paging request procedure initiation on network side.
initial *t3313_init* - Specifies the initial wating duration in seconds before retransmitting the specific message. *t3313_init* must be an integer from 1 through 60.

decrease *t3313_decrement* - Specifies the decrement of the initial timer value in seconds. *t3313_decrement* must be an integer from 1 through 5.
increase *t3313_increment* - Specifies the increment of the initial timer value in seconds. *t3313_decrement* must be an integer from 1 through 5.

T3322-timeout *t3322_dur*

Default: 6
Specifies the retransmission timer value to guard the GPRS detach request procedure on network side. *t3322_dur* is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3350-timeout *t3350_dur*

Default: 6
Specifies the retransmission timer value to guard the GPRS attach accept/RAU accept/realloc request procedure sent with P-TMSI and/or TMSI on network side.
t3350_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3360-timeout *t3360_dur*

Default: 6
Specifies the retransmission timer value to guard the authentication and cipher request procedure on network side.
t3360_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3370-timeout *t3370_dur*

Default: 6
Specifies the retransmission timer value to guard the identity request procedure on network side.
t3370_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

---

implicit-detach-timeout *impli_detach_dur*

Default: 3600
Specifies the retransmission timer value to guard the implicit detach procedure on network side.
impli_detach_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 3600.

---

max-auth-retransmission *auth_retrans*

Default: 4
Specifies the maximum retransmission of authentication requests allowed.
auth_retrans is the number of retries before declaring the authentication failure and must be an integer from 1 through 10.

---

max-identity-retransmission *id_retrans*

Default: 4
Specifies the maximum retransmission of identity requests allowed.
id_retrans is the number of retries before declaring the identity failure and must be an integer from 1 through 10.

max-page-retransmission *page_retrans*

Default: 5
Specifies the maximum retransmission of page requests allowed.
id_retrans is the number of retries before declaring the paging request failure and must be an integer from 1 through 5.

max-ptmsi-reloc-retransmission *ptmsi_reloc_retrans*

Default: 5
Specifies the maximum retransmission for P-TMSI relocation procedure allowed.
id_retrans is the number of retries before declaring the P-TMSI relocation procedure failure and must be an integer from 1 through 10.

mobile-reachable-timeout *ms_reach_dur*

Default: 58
Specifies the retransmission timer value to guard the mobile reachability procedure on network side.
impli_detach_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 4 through 1440.

perform-identity-on-auth-failure

Default: Enabled
Configures the SGSN service to perform an identity check to ascertain the IMSI after an authentication failure on a PTMSI-based message.

purge-timeout *purge_dur*

Default: 10080 (7 days)
Specifies the timer value to guard the detach of MM context procedure on network side.
impli_detach_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 20160.
Define the purge timer to hold detached mm-contexts. Default is 10080 mins (7 days).

trau-timeout *trau_dur*

This timer is available in releases 9.0 and higher.
Default: 30
Specifies the number of seconds the “old” 3G SGSN waits to purge the MS’s data. This timer is started by the “old” SGSN after completion of the inter-SGSN RAU.
trau_dur : Must be an integer from 5 to 60.

Usage

Repeat this command as needed to configure multiple parameters for GPRS mobility management in a UMTS network. This command provides the configuration of timers for mobility procedures and retries for different messages. GMM layer is defined in the 3GPP TS 24.008 (Release 7).

Example

Following command configures the timer to wait for *5* mins before retransmitting the message for GPRS attach or RAU procedure on MS side with maximum number of retries as *6* for authentication:

```
gmm T3302-timeout 5 max-auth-retransmission 6
```

gs-service

This command associates a previously defined Gs service interface to MSC/VLR along with its associated context with an SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gs-service *gs_srvc_name* **context** *ctx_name*

no gs-service *gs_srvc_name*

no

Removes/disassociates the named Gs service from this SGSN service.

gs_srvc_name

Specifies the name of a specific Gs service for which to display information.
svc_name is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

context *ctx_name*

Specifies the specific context name where Gs service is configured. If this keywork is omitted, the named Gs service must be exist in the same context as the SGSN service.
ctx_name is name of the configured context of Gs service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to associate a specific Gs service interface with this SGSN service instance.

Important: A single Gs service can be used with multiple SGSN and/or GPRS service.

Example

Following command associates a Gs service instance named *stargs1*, which is configured in context named *star_ctx*, with an SGSN service:

```
gs-service stargs1 context star_ctx
```

lac

This command defines the location area code (LAC) in hexadecimal format.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lac *hex*

no lac

no

Erases the **lac** configuration statement.

hex

Enter a hexadecimal number between 0x0 and 0xFFFF

max-pdp-contexts

Configures the maximum number of PDP contexts for a MS (mobile station) that will be supported on this SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-pdp-contexts per-ms *number*

default max-pdp-contexts per-ms

default

Resets the maximum number of PDP contexts per mobile station to the default of 11 for the Gs service configuration

per-ms *number*

Default: 11
Defines the combined total number of primary and secondary PDP contexts for the SGSN service.
number can be an integer from 2 to 11.

Usage

The following example defines 5 as the maximum number of primary and secondary PDP contexts that this SGSN will support for any connected MS.

Example

max-pdp-contexts per-ms *5*

mobile-application-part

This command identifies an already defined MAP service (Mobile Application Part service) to associate with the SGSN service. Although the MAP service does not need to be defined in the same context as the SGSN service, there is a one-to-one relationship between a MAP service and an SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mobile-application-part service *map_srvc* **[context** *ctx_name*]

no mobile-application-part service

no

Remove the MAP service association from the SGSN service configuration.

service *map_srvc*

Specifies the name of the MAP service to be associated with this SGSN service.
map_srvc must be the name of a MAP service previously configured on the system.

context *ctx_name*

Specifies the name of the context where the MAP service is configured. If the MAP service is not configured in the current context, then the context where it is configured must be specified to enable the SGSN to reach the MAP service.
If this keyword is not specified, the current context is used.
ctxt_name: Must be the name of the context where the specified MAP service is configured.

Usage

Use this command to identify the MAP service configuration to be used by the SGSN service configuration. Also use this command to specify the context in which the MAP service configuration was created.
If the MAP service is not identified or if the correct context is not identified, then the SGSN service will not START.

Example

The following command specifies a MAP service named map1 that is configured in the same context as the current SGSN service:

```
mobile-application-part service map1
```

network-sharing cs-ps-coordination

Enables/disables the SGSN service to perform a CS-PS coordination check.

Important: This command is no longer available in all 12.0 and 12.2 releases. If you do not see this command in your release, look for the **network-sharing cs-ps-coordination** command in the IuPS Service configuration mode to accomplish the same task. Configuring in the IuPS Service configuration mode allows for the possibility of multiple IuPS services with network-sharing and differing CS-PS coordination requirements.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-sharing cs-ps-coordination

default network-sharing cs-ps-coordination

no network-sharing cs-ps-coordination
```

default

Including this keyword resets the SGSN service to allow the check to be performed.

no

Disables this feature for the SGSN service.

Usage

Use this command to facilitate the network sharing functionality. With this command, the SGSN can be instructed to perform a check to determine if CS-PS coordination is needed.
3GPP TS 25.231 section 4.2.5 describes the functionality of the SGSN to handle CS-PS (circuit-switching/packet-switching) coordination for attached networks not having a Gs-interface. In compliance with the standard, the SGSN rejects an Attach in a MOCN configuration with cause 'CS-PS coordination required', after learning the IMSI, to facilitate the RNC choosing the same operator for both CS and PS domains.

Example

Use the following syntax to disable the CS-PS coordination check:

```
no network-sharing cs-ps-coordination
```

nri length

This command defines the Network Resource Identifier (NRI) of the SGSN that is stored in the P-TMSI (bits 23 to 18).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
nri length  nri_length { nri-value nri_value | null-nri-value null_nri_value non-
broadcast mcc mcc mnc mnc lac lac_id rac  rac_id [ nri-value value }

no nri
```

no

Removes the configured NRI value and location in P-TMSI for retrieval by this operator policy.

nri length *nri_length*

Specifies the number of bits to be used in the P-TMSI, bits 23 to 18. to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.
nri_length : Must be an integer from 1 to 6 to identify the number of bits.

null-nri-value *null_nri_value*

This keyword is only available in releases 8.1 and higher.
Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the **sgsn offloading** command, see the Exec Mode chapter).
null_nri_value : 0 (zero) indicates the keyword is not to be used and 1 to 63 are used to identify the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.

non-broadcast mcc *mcc* **mnc** *mnc* **lac** *lac_id* **rac** *rac_id*

This keyword set is only available in releases 8.1 and higher.
Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure. Including the MCC and MNC to specify the PLMN because the Iu-Flex feature supports multiple IuPS Services.
mcc identifies the mobile country code, the first part of the PLMN ID. Must be an integer between 100 and 999.
mnc identifies the mobile network code portion of the PLMN ID. Must be a 2- or 3-digit integer between 01 and 999.
lac_id defines a location area code associated with an RNC. Must be an integer between 1 and 65535.
rac_id defines the remote area code to be associated with an RNC. Must be an integer between 1 and 255.

nri-value *nri_value*

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.

nri_value must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.
Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: **nri length** *6* **nri-value** *29 43 61*

Usage

Use this command to identify the SGSN identified with the NRI in the MS generated P-TMSI.
This command adds or removes the Iu Flex configuration for this SGSN service. When using Iu Flex, all keywords must be defined. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.
Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.
When using MOCN mode for network sharing without SGSN pooling, the NRI length and the NRI value should both be used.

Example

The following command specifies the the NRI length as 5 bits, identifies SGSN 23 with LAC 222 and RAC 12 for offloading procedure with NRIs 6 and 41:

```
nri length 5 null-nri-value 34 non-broadcast lac 222 rac 12 nri-value 6
41
```

override-lac-li

Refer to the *ASR 5000 Lawful Intercept Guide* for a description of thsi command.

override-rac-li

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

rac

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

ran-protocol

This command specifies the IuPS service for the SGSN service to use for communication with the RAN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ran-protocol iups-service *iups_srvc* **[context** *ctx_name*]

no ran-protocol iups-service

no

Removes the IuPS service information from the SGSN service configuration.

iups-service *iups_srvc*

Specifies the name of an IuPS service already configured on the system.
iups_srvc : Enter an alphanumeric string of 1 to 63 characters.

ctx_name

ctx_name : Enter the name of the IuPS context, an alphanumeric string of 1 to 63 characters.

Usage

Use this command to configure the IuPS service context that the current SGSN service will use to communicate with the RAN. Up to 8 definitions can be defined for a single SGSN service to allow for multiple PLMNs support.

Example

The following command configures the SGSN service to use an IuPS service named **iups1** that has been configured. in the same context as the SGSN service:

```
ran-protocol iups-service iups1
```

reporting-action event-record

This command enables the SGSN to log GMM/SM events in EDR files for 3G services.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
reporting-action event-record

[ default | no ] reporting-action event-record
```

default

Disables the logging function.

no

Removes the logging function from the configuration file.

Usage

This command is one of the steps needed to enable the SGSN to create a log for events such as Attach, RAU, and Activations. The log is an EDR (event data record) in CSV format. For details about how this feature works, refer to the *GMM-SM Event Logging* chapter in the *SGSN Administration Guide*.

Related Commands:

- To enable GMM/SM event logging for 2G services, the **reporting-action event-record** command must be configured in the GPRS service configuration.
- To enable a log to be generated in an EDR file, the **edr-module active-charging-service** command must be enabled in the Context configuration mode.
- To configure parameters for the logging file characteristics and for file transfer, use the commands in the EDR Module Configuration Mode.

Example

Enable GMM/SM event logging for 3G services:

```
reporting-action event-record
```

sgsn-number

This command defines the E.164 number that identifies this particular SGSN service context.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *E.164_number*

no sgsn-number

no

Removes the SGSN number configuration from the SGSN service configuration.

E.164_number

Enter a maximum of 15 digits to define the 'phone' number associated with this SGSN service in the specified context.

Usage

The SGSN supports multiple SGSN numbers – different numbers in the 2G GPRS service configuration and the the 3G SGSN service configuration. If an HLR-initiated dialog is received, the SGSN will perform a lookup based on the IMSI and find the correct SGSN number with which the MS is associated. Subsequent messaging will use this address.

Example

To delete the sgsn-number associated with this SGSN service context, enter:

```
no sgsn-number
```

sgtp-service

This command creates an instance of an SGTP service.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

sgtp-service *sgtp_srvc_name*

no sgtp-service

sgtp_srvc_name

Enter the name of an SGTP service that will be used by this SGSN service
sgtp_srvc_name : Enter a string of 1 to 63 alphanumeric characters.

Usage

Use this command to access the SGTP Service configuration mode to configure SGTP parameters.

Example

sgtp-service *sgtp1*

sm

This command configures session management parameters for this SGSN service. This command can be repeated multiple times to configure each parameter individually.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sm { T3385-timeout *time* **| T3386-timeout** *time* **| T3395-timeout***time* **| max-actv-retransmission** *number* **| max-deactv-retransmission** *number* **| max-modf-retransmission** *number* **}**

default sm *timer*

default

Resets the selected timer to the system default value.

T3385-timeout

Retransmission timer for network-initiated Activate Request. Default is 8 sec

T3386-timeout

Retransmission timer for network-initiated Modify Request. Default is 8 sec

T3395-timeout

Retransmission timer for network-initiated Deactivate Request. Default is 8 sec

max-actv-retransmission

Configures maximum retries for activate PDP ctxt request. Default is 4

max-deactv-retransmission

Configures maximum retries for deactivate PDP ctxt request. Default is 4

max-modf-retransmission

Configures maximum retries for modify PDP ctxt request. Default is 4

Usage

Repeat the command to configure multiple session management parameters for the SGSN service.

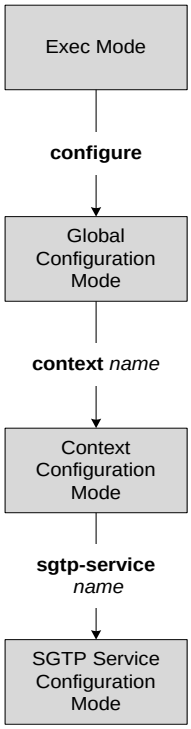
Example

```
sm T3385-timeout 5
```

Chapter 255
SGTP Service Configuration Mode Commands

The SGSN GPRS Tunneling Protocol (SGTP) Service configuration mode provides the configuration of GTP-C and GTP-U related parameters.

[<*ctx_name*>]*hostname*(config-sgtp-service)#



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

direct-tunnel-disabled-ggsn

This command makes it possible for the operator to disable direct tunneling on the basis of a GGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

direct-tunnel-disabled-ggsn *IPv4/IPv6_address*

no direct-tunnel-disabled-ggsn [*IPv4/IPv6_address* **]**

no

Deletes the direct-tunnel-disabled-ggsn configuration which results in re-enabling direct tunneling to the GGSN.

- Including an IPv4 or IPv6 address for a specific GGSN, re-enables direct tunneling for that specific GGSN.
- Excluding any IPv4 or IPv6 address from this command removes all direct-tunnel-disabled-ggsn definitions from the SGTP service configuration.

Usage

By default, GGSNs and RNCs are assumed to be capable of direct tunneling.
This command disables direct tunneling for a specified GGSN. The command can be repeated to disable direct tunneling for multiple GGSNs, thereby creating a 'disabled GGSN' list. Checking for a direct-tunnel-disabled GGSN is actually the last step in the PDP Activation procedure.
Restricting direct tunneling by a GGSN for an entire APN would be configured with the appropriate command in the APN profile configuration mode.
Restricting direct tunneling at the RNC level would be configured with the appropriate command in the IuPS service configuration mode.
This command can only be used if:

- The Direct Tunnel license has been purchased and applied.
- The Direct Tunnel feature is appropriately enabled via configurations of the IMEI profile and/or the Call-Control and APN profiles.
- The RNC does not restrict direct tunnel.
- The subscriber is not requesting CAMEL services.

Example

Use the following command to disable direct tunnel for the GGSN with the IP address of *141.21.4.20*:

```
direct-tunnel-disabled-ggsn 141.21.4.20
```

disable-remote-restart-counter-verification

This command disables the SGSN's default behavior for verification of the remote peer's (GGSN) restart counter change values.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
disable-remote-restart-counter-verification

[ default | no ] disable-remote-restart-counter-verification
```

default

Enables the default behavior for verification of the GGSN's restart counter change values.

no

Disables the command configuration and enables the default behavior of verification.

Usage

This command disables the default behavior used to minimize PDP deactivations resulting from path failure detection due to erroneous restart counter change messages.

With the execution of this command, the SGSN stops verifying restart counters received in Create PDP Context Response or Update PDP Context Response or Update PDP Context Request (CPCR, CPCR, and UPCQ) messages. When the SGSN detects GTP-C path failure between the SGSN and the GGSN, the SGSN assumes PDP sessions at the GGSN are lost and the SGSN deactivates those PDP sessions towards the UE with an indication that the UE should activate the PDP session again. Potentially, this scenario could cause unnecessary traffic increases within the operator's network.

The SGSN default behavior provides the ability to manage GTP-C path failures detected as a result of spurious restart counter change value messages received from the GGSN. With the default behavior, path failure detection is based on receipt of restart counter change values in CPCR, CPCR, and UPCQ messages. The session manager informs the SGTPC manager about a changed restart counter value. The SGTPC manager verifies the PDP context status by performing an echo request and echo response with the GGSN. Only then is the path failure confirmed if the echo response contains a new restart counter value. Then the SGTPC manager informs all session managers about the path failure and the session managers begin deactivation of the PDP contexts.

Related commands:

- **max-remote-restart-counter-change**, also part of the SGTP service configuration mode, allows the operator to set a maximum variance between stored and received values for restart counter changes coming from the GGSN.
- **pdp-deactivation-rate**, in the SGSN Global configuration mode, allows the operator to modify the rate the SGSN deactivates PDP connections when GPT-C path failure is detected.
- **ignore-remote-restart-counter**, also part of the SGTP service configuration mode.

Example

Disable the default behavior and stop verification with echo request/response process:

```
disable-remote-restart-counter-verification
```

Use either of the following commands to enable the default verification behavior:

```
no disable-remote-restart-counter-verification
```

```
default disable-remote-restart-counter-verification
```

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Changes the mode to the Exec mode.

exit

Exits the SGTP Service configuration mode and returns to the Context configuration mode.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

ggsn-fail-retry-timer

This command sets the amount of time that a GGSN will be unavailable.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ggsn-fail-retry-timer *value*

no ggsn-fail-retry-timer

no

Removes the timer setting and disables the Local DNS feature.

value

Defines the amount of time, in seconds, that the GGSN is to be considered unavailable.
Enter an integer from 60 to 600. Default is 300.

Usage

Setting this timer to a valid value enables the Local DNS feature - described in the *SGSN Administration Guide*. Setting this timer marks a GGSN in the primary GGSN pool as unavailable for PDP context creation and causes the SGSN to forward a PDP Context Activation Request to a remote pool GGSN, identified via a local (on the SGSN) DNS check. Marking a GGSN unavailable can be done if there is a reason to believe the GGSN is unavailable; for example, lack of response to GTP messages. Marking a GGSN as unavailable is usually done for a limited period to allow the GGSN time to recover.

Example

Enable the Local DNS feature and mark the GGSNs in the primary pool as unavailable for 4 minutes (*240 seconds*):

```
ggsn-fail-retry-timer 240
```

gn-delay-monitoring

This command configures monitoring of Gn/Gp interface to check for the delay of packets between the SGSN and the GGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gn-delay-monitoring [num-delay *number_delayed* **| num-no-delay-for-clear** *number_normal* **| tolerance-seconds** *number_seconds* **]**

default gn-delay-monitoring [num-delay | num-no-delay-for-clear | tolerance-seconds]

no gn-delay-monitoring

default

Resets the specified parameter to the default value.

no

Disables Gn/Gp monitoring for delayed GTP-C packets.

num-delay *number_delayed*

Defines the number of response messages, coming from the GGSN, that can be delayed (delay time defined by tolerance-seconds parameter) before the delay is flagged to generate an SNMP trap.
number_delayed: Enter an integer from 1 to 500, default is 30.

num-no-delay-for-clear *number_normal*

Defines the number of consecutive response messages, coming from the GGSN, that must be received without delay (in normal response time) to clear the flag towards the GGSN.
number_normal: Enter an integer from 1 to 500, default is 15.

tolerance-seconds *number_seconds*

Defines the 'normal' number of seconds the SGSN should wait for a response from the GGSN. After this time, the response would be considered 'delayed'.
number_seconds: Enter an integer from 1 to 20, default is 4 seconds.

Important: The value for this parameter should be less than the value set for the **retransmission-timeout** parameter of the **gtpc** command, also in this configuration mode.

Usage

With this command, the SGSN can monitor the control plane packet delay for GTP-C signaling messages on the SGSN's Gn/Gp interface towards the GGSN. If the delay crosses this configurable threshold, an alarm will be generated to prompt the operator.
A delay trap is generated when the GGSN response to an ECHO message request is delayed more than a configured amount of time and for a configured number of consecutive responses. When this occurs, the GGSN will be flagged as experiencing delay.
A clear delay trap is generated when successive ECHO Response (number of successive responses to detect a delay clearance is configurable), are received from a GGSN previously flagged as experiencing delay.
This functionality can assist with network maintenance, troubleshooting, and early fault discovery.

Example

Enable Gn/Gp monitoring for GTP-C packets that arrive from the GGSN with a delay greater than *5* seconds:

```
gn-delay-monitoring tolerance-seconds 5
```

gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) settings for the SGTP service.

Product

SGSN

MME

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

gtpc { bind address *ip_address* **| dns-sgsn context** *cntxt_name* **| echo-interval** *seconds* **| guard-interval** *seconds* **| ignore response-port-validation | ip qos-dscp** *<dscp_marking>* | max-retransmissions *num* **| retransmission-timeout** *seconds* **| send { common flags | rab-context | target-identification-preamble } }**

no gtpc { bind address ip_address | dns-sgsn context *cntxt_name* **| echo-interval** *seconds* **| send { common- flags | rab-context | target-identification-preamble } }**

default gtpc { echo-interval | guard-interval | ignore response-port-validation | ip qos-dscp | max-retransmissions | retransmission-timeout | send { common-flags | rab-context | target-identification-preamble } }

---

no

Disables the configured GTPC setting.

---

default

Resets the specified parameter to its default value.

---

bind address *ip_address*

Binds SGTP service to the IP address of the interface.
The bind address for the **gtpc** and **gtpu** commands should be the same.
ip_address: Enter a standard dotted-quad IPv4 address.

---

dns-sgsn context *cntxt_name*

Enter a string of 1 to 79 alphanumeric characters to identify the context.

---

echo-interval *seconds*

Configures the duration between echoes.
seconds: Enter an integer from 0 through 3600.
Default: 60

guard-interval *seconds*

Configures the interval (in seconds) for which the SGTP maintains responses sent to SGSN. This optimizes the handling of retransmitted messages. This value should be configured to be greater than the SGSN's configuration for max-retries multiple by retry-interval.
seconds: Enter an integer from 10 to 3600.
Default: 100

ignore response-port-validation

This keyword instructs the SGSN to ignore the response port validation.
For the SGSN to process incoming GTP responses to an *incorrect* port,

- this keyword must be entered, and
- the same **bind address** must be configured for GTPC and GTPU in the SGTP service.

Default: disabled. To reset the default for this parameter, you must enter the following command: **no gtpc ignore response-port-validation**.

ip qos-dscp *<dscp_marking>*

Configures the diffserv code point marking to be used when sending GTP-C messages originating from the session manager and SGTPC manager.
<dscp_marking>: Enter one of the following values:

- **af11**: Marks traffic as Assured Forwarding 11 PHB (high throughput data)
- **af12**: Marks traffic as Assured Forwarding 12 PHB (high throughput data)
- **af13**: Marks traffic as Assured Forwarding 13 PHB (high throughput data)
- **af21**: Marks traffic as Assured Forwarding 21 PHB (low latency data)
- **af22**: Marks traffic as Assured Forwarding 22 PHB (low latency data)
- **af23**: Marks traffic as Assured Forwarding 23 PHB (low latency data)
- **af31**: Marks traffic as Assured Forwarding 31 PHB (multimedia streaming)
- **af32**: Marks traffic as Assured Forwarding 32 PHB (multimedia streaming)
- **af33**: Marks traffic as Assured Forwarding 33 PHB (multimedia streaming)
- **af41**: Marks traffic as Assured Forwarding 41 PHB (multimedia conferencing).
- **af42**: Marks traffic as Assured Forwarding 42 PHB (multimedia conferencing)
- **af43**: Marks traffic as Assured Forwarding 43 PHB (multimedia conferencing)
- **be** : Designates use of Best Effort forwarding PHB. This is the default value.
- **ef** : Designates use of Expedited Forwarding PHB

Default: **be** (best effort)

max-retransmissions *num*

Configures the maximum number of retries for packets.
num: Enter an integer from 0 to 15.
Default: 4

retransmission-timeout *seconds*

Configures the control packet retransmission timeout in GTP, in seconds.
seconds: Enter an integer value from 1 through 20.

Default: 5

send { common-flags | rab-context | target-identification-preamble }

common-flags : This option configures the SGTP service to include or exclude the common flags IE during an Inter-SGSN RAU. When selected, the default is to send the common flags IE.
rab-context : This option configures the SGTP service to include/exclude the radio access bearer (RAB) context IE in SGSN 'context response' message during Inter-SGSN Routing Area Update procedure. Default is to send the RAB context IE.
Default: RAB context IE.
target-identification-preamble : This option configures the SGTP service to include the preamble byte in the target-id of Relocation Requests that it sends. By default, the preamble is not included.

Important: Sending of common flags must be enabled to configure dual PDP type (IPv4v6) addressing with the **dual-address-pdp** command in the SGSN global configuration mode.

Usage

Use this command to configure GTP-C settings for the current SGTP service.

Example

Following command excludes the radio access bearer (RAB) context IE in the SGSN Context Response message during the inter-SGSN RAU procedure:

```
no gtpc send rab-context
```

Configure the SGSN to send *common flags* with all GTP-C messages:

```
gtpc send common-flags
```

gtpu

This command configures the GPRS Tunneling Protocol user data plane parameters (GTP-U) for this SGTP service.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
gtpu { bind address ip_address | echo-interval | max-retransmissions | retransmission-
timeout } +

no gtpu { bind | echo-interval }

default gtpu { echo-interval | max-retransmissions | retransmission-timeout }
```

no

Removes the configuration for the specified parameter from the current SGTP service configuration.

default

Resets the specified GTP-U parameter to its factory default.

bind address *ip_address*

Defines the GTP-U Gn interface IP address that binds to this SGTP service.
The **gtpu** and the **gtpc** commands should be configured with the same bind address.
ip_address: Enter a standard dotted-quad IPv4 address.

echo-interval *seconds*

Configures the echo interval.
seconds: Enter an integer from 60 through 3600.
Default: 60

max-retransmissions *num*

Configures the maximum number of retries for retransmitting packets.
num: Enter an integer from 0 through 15.
Default: 4

retransmission-timeout *seconds*

Configures the retransmission timeout of packets, in seconds.
seconds: Enter an integer from 1 through 20.
Default: 5

Usage

Use this command to configure the GTP-U settings for the SGTP service.

Example

Set the GTPU echo-interval for *5* seconds:

```
gtpu echo-interval 5
```

ignore-remote-restart-counter-change

With the inclusion of the **disable-remote-restart-counter-verification** command, this command has been deprecated.

max-remote-restart-counter-change

Use this command to set a restart counter change window to avoid service deactivations and activations that could cause large bursts of network traffic if the restart counter change messages from the GGSN are erroneous

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-remote-restart-counter-change *variance*

default max-remote-restart-counter-change

default

If this keyword is used or if a variance window is not configured, then the default value will be 255 and the default behavior of the SGSN will be to detect a restart on any change.

variance

Set a number (an 8-bit value) that will define the variance range for restart counter change values compared between the SGSN's stored value and the value received in messages from the GGSN. Valid entry is an integer from 1 to 255; default is 255.
Value of 32 is recommended as it provides a sufficient window to allow the SGSN to handle delayed messages with old restart counters.

Usage

When the SGSN detects GTP-C path failure between the SGSN and the GGSN, the SGSN assumes PDP sessions at the GGSN are lost and the SGSN deactivates corresponding PDP sessions towards the UE with an indication that the UE should activate the PDP session again. Detection is based on receipt of restart counter change values in Create PDP Context Response or Update PDP Context Response or Update PDP Context Request (CPCR/UPCR/UPCQ) messages. Potentially, this scenario can cause major traffic increases within the operator's network. It is possible that the messages received from the GGSN are spurious.
The SGSN default behavior provides the ability to verify possible GTP-C path failures detected as a result of spurious restart counter change messages received from the GGSN. With the default behavior, the session manager informs the SGTPC manager about a changed restart counter value. The SGTPC manager responds by verifying the PDP context status by performing an Echo Request / Echo Response with the GGSN. If the Echo Response includes a new restart counter change value, then the session manager considers the path failure confirmed and begins the PDP context deactivation sequence.
Use this command to avoid unnecessary path failures and deactivations by setting a restart counter change value ‘window’ or range of values. With this window, the SGSN only accepts linearly increasing values for restart counter change values that are within the specified range of accepted changes before the SGTPC manager verifies. For example, if the allowed window for restart counter change value is set to 32 and the last learnt restart counter change value from the GGSN is 15, then the SGSN should detect a restart only if the new restart counter value is between 16 and 47 (range of 32) and then the SGSN would verify with the Echo Request/Response. If the received restart counter change value was 200 and the current learnt value was 15 with a window of 32, then the 200 would be ignored as a spurious value.

Also, use this command to set a restart counter change values window to avoid possible 'race conditions' (as defined in 3GPP TS 23.007 v8.7.0) where a new message arrives prior to an older message. This 'race condition' occurs when the SGSN's stored restart counter value for the GGSN is larger than the restart counter value received in the messages received from the GGSN.

Related commands:

- **`disable-remote-restart-counter-verification`** - also part of the SGTP service configuration mode, this command allows the operator to disable the default behavior.
- **`pdp-deactivation-rate`**, in the SGSN Global configuration mode, this allows the operator to modify the rate the SGSN deactivates PDP connections when GPT-C path failure is detected.
- **`ignore-remote-restart-counter`**, also part of the SGTP service configuration mode.

Example

Use the following command to configure an allowed restart counter change value window of *32*:

```
max-remote-restart-counter-change 32
```

mbms

Enables / disables the Multimedia Broadcast Multicast Service

Important: The **mbms** command and parameter-configuring keywords are under development for future release and should not be used or included in your configuration at this time.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mbms

Usage

path-failure

This command specifies the method for determining if path failure has occurred.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

path-failure detection-policy gtp *type*

[default | no] path-failure detection-policy

default

Resets the specified path failure parameter to default.

no

Deletes the path-failure definition from the configuration.

detection-policy gtp *type*

Specifies the policy to be used, value options include:

- **echo** - When set to 'echo', path failure is detected when the retries of echo messages time out.
- **non-echo** - When set to 'non-echo', path failure is detected when the retries of non-echo messages time out.

Default: echo (for both GTPC and GTPU)

Usage

Use this command to define the policy to detect gtp path failure.

Example

Set *echo* as the polity detection type:

```
path-failure detection-policy gtp echo
```

pool

This command enables the default SGSN functionality for (flex) pooling and enables inclusion of the configured pool hop-counter count in new SGSN context/identify request messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pool { default-sgsn | hop-counter count }

no pool { default-sgsn | hop-counter }

default pool hop-counter
```

no

Disables the default SGSN pooling functionality or removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

default

Removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

default-sgsn

Enables default SGSN pooling functionality.

hop-counter *count*

Enables and configures the SGSN pool hop-counter to set the number of hops and to include the configured count in the **new** SGSN Context Requests or the **new** SGSN Identify Requests.
If **default-sgsn** is enabled, then any messages relayed will have the default value of 4 for the counter if the message does not include this hop-counter ID.
count: Enter an integer from 1 to 255.
Default: 4

Usage

Use this command to enable the default flex functionality without exposing the pool (flex) structure. This functionality provides a means for SGSNs outside of the pool to reach a pooled SGSN on the basis of its NRI. Once the pooling has been enabled. Repeat the command using the **hop-counter** keyword to enable inclusion of the hop-counter IE in SGSN context/identify request messages and to configure the count for the pooling hop-counter. If the SGSN is behaving as the 'default SGSN', this SGSN will forward (relay) requests with the hop-count included to the target SGSN.

Example

Enable the default pooling functionality which allows an outside SGSN to reach a pooled SGSN:

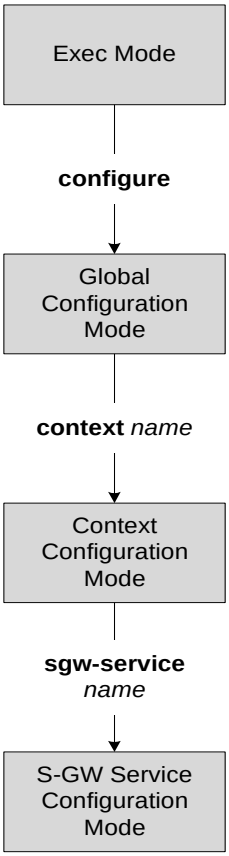
```
pool default-sgsn
```

Set the hop-count to be included in messages to *25*:

pool hop-count

Chapter 256
S-GW Service Configuration Mode Commands

The S-GW (Serving Gateway) Service Configuration Mode is used to create and manage the relationship between an eGTP service used for either ingress or egress control plane and user data plane network traffic.



accounting context

Configures the GTPP accounting context and group selection for S-GW service.

Product

S-GW

Privilege

Administrator

Syntax

accounting context *name* **[gtpp group** *name* **]**

no accounting context

---

no

Removes the configured accounting context from this service.

---

context *name*

Specifies the context where GTPP accounting is performed. *name* must be an existing context configured on the system expressed as an alphanumeric string of 1 through 79 characters.
If an accounting context name is not configured in the S-GW service, the context where the S-GW service resides is considered the accounting context and the default GTPP group is used.

---

gtpp group *name*

Specifies a GTPP group used to perform GTPP accounting. *name* must be an existing GTPP group configured on the system expressed as an alphanumeric string of 1 through 79 characters.
If a GTPP group is not configured, the system will use the default GTPP group in the specified accounting context. If the accounting context is not specified, the system will use default GTPP group in the context where the S-GW service resides.

Usage

Use this command to specify the accounting context and/or GTPP accounting group the S-GW service will use to perform GTPP accounting.

Example

The following command specifies a GTPP accounting context named *acct-2* and a GTPP accounting group named *gtpp-grp-3* as the context and group the S-GW service will use:

```
accounting context acct-2 gtpp group gtpp-grp-3
```

accounting mode

Configures the mode to be used for accounting – GTPP (default), RADIUS/Diameter or None for S-GW service.

Product

S-GW

Privilege

Administrator

Syntax

```
[ default ] accounting mode { gtpp | none | radius-diameter }
```

default

Sets the accounting mode to GTPP.

gtpp

Specifies that GTPP accounting is performed. This is the default mode.

none

Specifies that no accounting will be performed for the S-GW service.

radius-diameter

Specifies that RADIUS/Diameter will be performed for the S-GW service.

Usage

Use this command to specify the accounting mode for the S-GW service. However, an accounting mode configured for the call-control profile will override this setting. For additional information on accounting mode and its relationship to operator policy, refer to the *Serving Gateway Administration Guide*.

Example

The following command specifies that RADIUS/Diameter accounting will be used for the S-GW service:

```
accounting mode radius-diameter
```

associate

Associates the S-GW service with QoS and policy control and charging configurations.

Product

S-GW

Privilege

Administrator

Syntax

associate { accounting-policy *name* **| egress-proto { gtp | gtp-pmip | pmip } [egress-context** *name* **[egtp-service** *name* **] [mag-service** *name* **]] | ims-auth-service** *name* **| ingress egtp-service** *name* **| qci-qos-mapping** *name* **| subscriber-map** *name*

no associate { accounting-policy | egress-proto [egress-context [egtp-service] [mag-service]] | ims-auth-service | ingress egtp-service | qci-qos-mapping | subscriber-map }

no

Removes the specified association form the S-GW service.

accounting-policy *name*

Associates the S-GW service with an accounting policy configured in the same context. *name* must be an existing accounting policy expressed as an alphanumeric string of 1 through 63 characters.
Accounting policies are configured through the **policy accounting** command in the Context Configuration Mode.

egress-proto { gtp | gtp-pmip | pmip } [egress-context *name* **[egtp-service** *name* **] [mag-service** *name* **]]**

Associates and configures the egress protocol for this S-GW service.
gtp: Specifies that GTP is to be used for the S-GW service egress.
gtp-pmip: Specifies that either GTP or PMIP is to be used for the S-GW service egress.
pmip: Specifies that PMIP is to be used for the S-GW service egress.
egress-context *name*: Specifies that the context in this keyword is to be used for the S-GW service egress. *name* must be an existing context on this system expressed as an alphanumeric string of 1 through 63 characters.
egtp-service *name*: Specifies that the service in this keyword is to be used for the S-GW service egress. *name* must be an existing eGTP service on this system expressed as an alphanumeric string of 1 through 63 characters.
mag-service *name*: Specifies that the service in this keyword is to be used for the S-GW service egress. *name* must be an existing MAG service on this system expressed as an alphanumeric string of 1 through 63 characters.

ims-auth-service *name*

Associates the S-GW service with an IMS authorization service configured in the same context. *name* must be an existing IMS auth service and be from 1 to 63 alphanumeric characters.
IMS authorization services are configured through the **ims-auth-service** command in the Context Configuration Mode.

ingress egtp-service *name*

Associates and configures the eGTP service ingress for this S-GW service. *name* must be an existing eGTP service on this system expressed as an alphanumeric string of 1 through 63 characters.

qci-qos-mapping *name*

Associates the S-GW service with QCI to QoS mapping parameters. *name* must be an existing QCI-QoS mapping configuration expressed as an alphanumeric string of 1 through 63 characters.
QCI-QoS mapping is configured through the **qci-qos-mapping** command in the Global Configuration Mode.

subscriber-map *name*

Associates the S-GW service with subscriber map parameters. *name* must be an existing subscriber map configuration expressed as an alphanumeric string of 1 through 63 characters.
Subscriber maps are configured through the **subscriber-map** command in the LTE Policy Configuration Mode.

Usage

Use this command to select a pre-configured QoS mapping and/or policy control and charging configuration to be used by the S-GW service.

Example

The following command associates the S-GW service with an IMS authorization service named *ims-23*:

```
associate ims-auth-service ims-23
```

ddn

Configures a timer that determines how long the S-GW will discard downlink data packets so the MME has enough time to receive the Modify Bearer Request and prevent further errors being sent to the S-GW in the DDN Ack message.

Product

S-GW

Privilege

Administrator

Syntax

ddn failure-action pkt-drop-time *seconds*

default ddn failure-action pkt-drop-time

default

Resets the command to its default setting of 300 seconds.

failure-action pkt-drop-time *seconds*

Default: 300
Specifies the time, in seconds, to multiply with the delay value IE sent from the MME. *seconds* must be an integer value from 1 to 300.

Usage

Use this command to set a timer value to delay the sending of excessive Downlink Data Notification messages to the MME (and receiving excessive DDN Ack message with errors from the MME) in cases when downlink data is arriving before the Modify Bearer Request is received. During the delay, downlink data packets are discarded until the timer has expired. This timer is triggered upon receiving the first error in a DDN Ack message from the MME.

Example

The following command sets the base factor used to calculate the packet drop timer to *200* seconds:

```
ddn failure-action pkt-drop-time 200
```

egtp-service

Configures an eGTP service to use as either an ingress (S1-U) or egress (S5/S8) service for the S-GW.

Product

S-GW

Privilege

Administrator

Syntax

```
egtp-service { egress { context name | service name } | ingress service name }

no egtp-service { egress { context | service } | ingress service }
```

no

Removes the selected EGTP service from this service.

egress { context *name* **| service** *name* **}**

Specifies the egtp-service to be used as the egress eGTP service on a GTP-based S5/S8 interface.
context *name*: Specifies the name of the context where the eGTP service resides. *name* must be an existing context name where an eGTP service resides expressed as an alphanumeric string of 1 through 63 characters.

Caution: **context** *name* is not supported in this release.

service *name*: Specifies the name of the egress eGTP service. *name* must be an existing eGTP service name expressed as an alphanumeric string of 1 through 63 characters.

ingress service *name*

Specifies the egtp-service to be used as the ingress eGTP service on the S11 interface. *name* must be an existing eGTP service name expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the eGTP service to use with this S-GW service. The eGTP service must be existing and be configured with the appropriate parameters supporting the intended service type.

Example

The following command configures the S-GW service to use an eGTP service named *s1u-egtp* as its ingress service:

```
egtp-service ingress service slu-egtp
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

gtpu-error-ind

Configures the actions to be taken upon receiving a GTP-U error indication from an RNC, eNodeB, SGSN, or P-GW.

Product

S-GW

Privilege

Administrator

Syntax

```
gtpu-error-ind { { s12 | s1u } { local-purge | page-ue [ custom1-behavior ] } | { s4u |
s5u } { local-purge | signal-peer } }

default gtpu-error-ind { s12 | s1u | s4u | s5u }
```

default

Resets the command to the default action for the specified interface. For S12 and S1-U, **page-ue** is the default action. For S4-U and S5-U, **local-purge** is the default action.

{ s12 | s1u } { local-purge | page-ue [custom1-behavior] }

Specifies the action to take when a GTP-U error indication is received from a Radio Network Controller (RNC) over an S12 interface or from an eNodeB over the S1-U interface.
local-purge: The S-GW clears the affected bearer (or PDN if error-indication is received on default bearer) locally without informing peer.
page-ue [custom1-behavior]: The S-GW moves the complete UE state to S1-Idle and starts paging for this UE. If the custom1-behavior option is specified, the S-GW will guard the paging attempt with a timer of 60 seconds. Within this time the bearer must have the eNodeB TEID refreshed by an MME. Otherwise, the S-GW will clear the affected bearer with signaling. This is the default action for GTP-U error indication messages received on the S12 and S1-U interfaces.

{ s4u | s5u } { local-purge | signal-peer }

Specifies the action to take when a GTP-U error indication is received from an SGSN over an S4-U interface or from a P-GW over the S5-U interface.
local-purge: The S-GW clears the affected bearer (or PDN if error-indication is received on a default bearer) locally without informing the peer. This is the default action for GTP-U error indication messages received on the S4-U and S5-U interfaces.
signal-peer: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:

- For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
- For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.
- The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

Usage

Use this command to specify the action to taken upon receiving a GTP-U error indication from an RNC over an S12 interface, an eNodeB across an S1-U interface, an SGSN over an S4-U interface, or from a P-GW across an S5-U interface.

Example

The following command sets the action to take upon receipt of a GTP-U error indication from the eNodeB to clear affected bearer:

```
gtpu-error-ind s1u local-purge
```

mag-service

Identifies the Mobile Access Gateway (MAG) egress service through which calls are to be routed for this S-GW service.

Product

S-GW

Privilege

Administrator

Syntax

mag-service egress service *name*

no mag-service egress service

no

Removes the configured MAG egress service from this service.

egress service *name*

Specifies the MAG service name to be used as the egress MAG service on a Proxy Mobile IPv6 (PMIP) based S5/S8 interface. *name* must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the name of the MAG service where calls are to be routed.

Example

The following command specifies that an existing MAG service named *mag3* is to be used to route call through for this S-GW service:

```
mag-service egress service mag3
```

path-failure

Configures the action to take upon the occurrence of a path failure between the S-GW and the MME, P-GW, RNC, SGSN, or eNodeB.

Product

S-GW

Privilege

Administrator

Syntax

```
path-failure { s11 | s12 | s1u | s4 | s4u | s5 | s5u } ( local-purge | signal-peer }

default path-failure { s11 | s12 | s1u | s4 | s4u | s5 | s5u }
```

default

Returns the command to the default setting of "local purge" for the selected interface.

{ s11 | s12 | s1u | s4 | s4u | s5 | s5u }

Specifies the interface to which the action will be applied.
s11: Applies the path failure action to the S11 interface between the S-GW and the MME.
s12: Applies the path failure action to the S12 interface between the S-GW and the RNC.
s1u: Applies the path failure action to the S1-U interface between the S-GW and the eNodeB.
s4: Applies the path failure action to the S4 control plane interface between the S-GW and the SGSN.
s4u: Applies the path failure action to the S4-U user plane interface between the S-GW and the SGSN.
s5: Applies the path failure action to the S5 interface between the S-GW and the P-GW.
s5u: Applies the path failure action to the S5-U user plane interface between the S-GW and the P-GW.

{ local-purge | signal-peer }

Specifies the action to apply to the selected interface.
local-purge: The S-GW clears the affected bearer (or PDN if path failure is received on a default bearer) locally without informing the peer. This is the default action for all interface.
signal-peer: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:

- For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
- For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.
- The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

Usage

Use this command to specify the type of action to take when a path failure occurs on one of the supported interfaces.

Example

The following command sets the path failure action for the S5 interface to "signal peer":

```
path-failure s5 signal-peer
```

plmn

Configures the public land mobile network (PLMN) identifier for this S-GW service

Product

S-GW

Privilege

Administrator

Syntax

plmn id mcc *number* **mnc** *number* **[primary]**

no plmn id mcc *number* **mnc** *number*

no

Removes the configured PLMN ID for this S-GW service.

mcc *number*

Configures the Mobile Country Code for this PLMN ID. *number* must be an integer from 100 through 999.

mnc *number*

Configures the Mobile Network Code for this PLMN ID. *number* must be a 2- or 3-digit integer from 00 through 999,

primary

Specifies that this is the primary PLMN ID for this S-GW service.

Usage

Use this command to configure PLMN IDs for this S-GW service

Example

The following command configures a “primary” PLMN ID for this S-GW service with an MCC of *123* and an MNC of *12*:

```
plmn id mcc 123 mnc 12 primary
```

reporting-action

Configures the system to start reporting session events.

Product

S-GW

Privilege

Administrator

Syntax

```
[ no ] reporting-action event-record [ trigger active-idle ]

default reporting-action event-record
```

default

Returns the command to its default setting of disabled.

no

Disables session event reporting.

trigger active-idle

Specifies that the event is only to be reported upon the going from active to idle.

Usage

Use this command to enable the session event reporting feature on the S-GW.

Example

The following command enables event reporting but does not limit it to events triggered by going active to idle:

```
reporting-action event-record
```

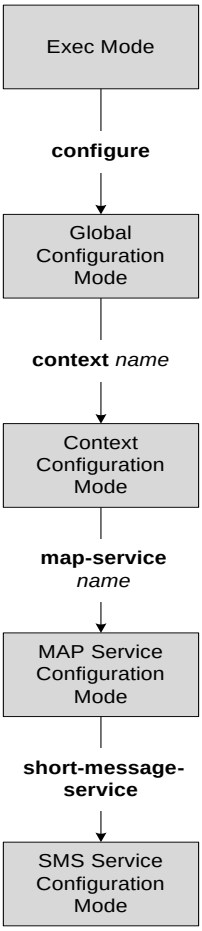
Chapter 257
SMS Service Configuration Mode Commands

The SMS (short message service) Service configuration mode is used to create and manage properties of the SMS Service configuration.

The SGSN uses the SMS Service component to communicate via the Gd interface with a gateway message service controller (GMSC) to send short text messages (up to 140 octets in length) to a mobile (SMS-MT) and/or receive messages from a mobile (SMS-MO) .

When this mode is accessed, the command line will appear similar to

```
[<ctx_name>]asr5000(config-map-service-<map_service_name>-sms-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cp-data

Enables the SGSN to send and/or receive cp-data (text messages).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

cp-data max-retransmission *retries_num*

default cp-data max-retransmissions

default

This keyword resets the SGSN's max-retransmission to the default number of retries.

max-retransmission *retries_num*

retries_num: enter an integer from 1 to 3.

Usage

Use this command to configure the number of times the SGSN will attempt to retransmit a message.

Example

cp-data max-retransmission *2*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

mo-message-forwarding-destination

This command defines the SGSN's handling policy for MO (mobile originating) message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] mo-message-forwarding-destination { gmsc-selected-from-imsi | smsc-supplied-by-subscriber }
```

default

Resets the SMS service configuration to the default message forwarding technique.

gmsc-selected-from-imsi

Entering this keyword enables SMS-MO messages to be forwarded on the basis of their IMSI prefix.

smsc-supplied-by-subscriber

Entering this keyword enables SMS-MO messages to be forwarded on the basis of the SMSC (SMS controller) address provided by the subscriber.

Usage

Use this command to define how the mobile originated SMS are to be routed.

Example

```
mo-message-forwarding-destination gmsc-selected-from-imsi
```

smsc-address-restiction-list

Define the list of SMS-C addresses to be screened.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

smsc-address-restriction-list *isdn-no +*

no smsc-address-restriction-list *isdn-no*

no

Delete an SMS-C address (ISDN number) from the list.

isdn-no +

Enter up to 10 ISDN numbers, each up to 15 digits. Put a single space, without a comma, between each ISDN number being added to the list with one command.

Usage

Use this command to identify a list of SMS-C that are to be screened and restricted from receiving forwarded SMS. This list is part of the SMS-C address denial mechanism. For the mechanism to actually function, a second command must be configured, the **smsc-address-restriction-list** command.

Example

Add 3 ISDN numbers to the list of restricted SMS-C addresses.

```
smsc-address-restriction-list 443719933751427 422311198977765
901231445513131
```

Remove an ISDN number from the list of restricted SMS-C addresses.

```
no smsc-address-restriction-list 443719933751427
```

smsc-address-restiction-type

Define the list of SMS-C addresses to be screened.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
smsc-address-restriction-type { mo-mt-sms | mo-sms | mt-sms }

default smsc-address-restriction-type
```

default

Resets the restriction type to the default of both MT and MO types.

mo-mt-sms

Sets the restriction for both types of messages - mobile-originated (MO-SMS) and mobile-terminated (MT-SMS).

mo-sms

Sets the restriction for the mobile-originated (MO-SMS) messages.

mo-mt-sms

Sets the restriction for the mobile-terminated (MT-SMS) messages.

Usage

Use this command to identify the types of messages that are to be denied to the SMS-C identified in the **smsc-address-restriction-type**. Both commands must be configured for the SMS-C address denial mechanism to function.

Example

Restrict MO-SMS messages from being forwarded to the SMS-C listed in the restriction list:

```
smsc-address-restriction-type mo-sms
```

Reset the restriction to both types of messages:

```
default smsc-address-restriction-type
```

smsc-address-selection-prioritization

Define the routing selection priority for the SMSC (short message service center) address to be used for all MO-SMS.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

smsc-address-selection-prioritization from-ms *priority* **imsi-prefix** *priority* **msisdn-prefix** *priority*

default smsc-address-selection-prioritization

from-ms *priority*

Configures a priority for the SMSC address send from the MS.
priority : Value must be a single digit, range 1-3.

imsi-prefix *priority*

Configures a priority for the SMSC address that is based on the IMSI-prefix.
priority : Value must be a single digit, range 1-3.

msisdn-prefix *priority*

Configures a priority for the SMSC address that is based on the MSISDN-prefix.
priority : Value must be a single digit, range 1-3.

default

By including the **default** keyword with the command, the SGSN knows to use the encoded default priorities for SMSC address selection for SMSC routing:

- *from-ms* priority 1,
- *imsi-prefix* priority 2,
- *msisdn-prefix* priority 3.

Usage

Use this command to define SMSC address routing priorities. Priorities must be defined for all parameters, all keywords, but they can be entered in any order. The addresses for the SMSCs are defined with the smsc-routing command.

An operator can use this configuration to prevent subscribers from using unauthorized SMSC addresses, for example, an unauthorized international SMSC.

Example

The keywords can be entered in any order but all keywords must be included in the command:

```
smsc-address-selection-prioritization msisdn-prefix 3 from-ms 1 imsi-prefix 2
```

smsc-routing

This command configures the routing to the short message service center (SMSC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] smsc-routing { { any | imsi-starts-with | msisdn-starts-with } { isdn *isdn_number* **| mobile-global-title** *mgt_number* **[max-gt-address-len** *max_gt_length* **] | point-code** *pt_code* **} }**

any

Configures routing according to any IMSI prefix.

imsi-starts-with *IMSI_prefix*

Defines the IMSI prefix. Enter a string of up to 15 digits.

msisdn-starts-with *msisdn_prefix*

Defines the MSISDN prefix. Enter a string of up to 15 digits.

isdn *isdn_number*

Defines the ISDN E.164 number (up to 15 digits) of the SMSC.

mobile-global-title *mgt_number* **[max-gt-address-len** *max_gt_length* **]**

Defines the mobile global title (MGT) E.214 address to be used for IMSI conversion.
Optionally, the maximum length of the GT address can be defined. If the length of the MGT string is greater than the defined max, then the least significant digits will be omitted.
mgt_number is a string of digits, up to 18 digits.
max_gt_address is an integer from 1 to 32.

point-code *pt_code*

Defines the point code for the SMSC. Enter a string of up to 11 digits in SS7 dotted decimal or decimal format

Usage

This command defines the address format (IMSI, point code, mobile global title) and the address for SMSC routing.

Example

Use this command to define routing to the SMSC based on any point code.

```
smsc-routing any point-code 1.222.1
```

timeout

This command defines the SMS service timers.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout { tc1n-timer*time* **| tr1n-timer** *time* **| tr2n timer** *time* **}**

default timeout { tc1n-timer | tr1n-timer | tr2n timer }

default

Resets the configuration to the default value for the specified timer.

tc1n-timer *time*

Configures the TC1N timer in seconds.
time: Must an integer from 1 to 255. The default is 5 seconds.

tr1n-timer *time*

Configures the TR1N timer in seconds.
time: Must an integer from 1 to 255. The default is 30 seconds.

tr2n-timer *time*

Configures the TR2N timer in seconds.
time: Must an integer from 1 to 255. The default is 30 seconds.

Usage

Use this command to set SMS service timers. The command can be repeated to set all of the timers, one-at-a-time.

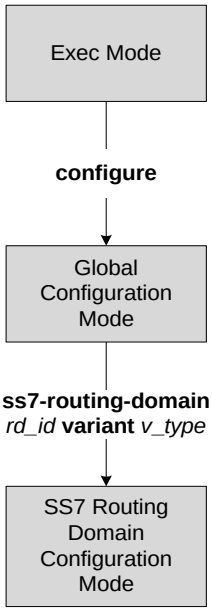
Example

tr1n-timer *25*

Chapter 258
SS7 Routing Domain Configuration Mode Commands

The SS7 Routing Domain configuration mode is used to configure Signaling System 7 (SS7) parameters. For convenience in configuration management, all SS7 parameters have been collected into a proprietary grouping called an *SS7 routing domains*.

`[local]`*`hostname`*`(config-ss7-routing-domain-<`*`ss7rd_id`*`>)#`



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

asp

This command creates or removes an M3UA Application Server Process (ASP) instance and enters the ASP configuration mode. See the *SGSN ASP Configuration Mode* chapter in the *Command Line Interface Reference* for command details.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

asp instance *asp_inst*

no asp instance *asp_inst*

default asp instance *asp_inst* **end-point port**

no

Deletes the ASP instance for the SS7 routing domain configuration.

default

Sets the ASP instance parameters to the end-point port value of 2905.

instance *asp_inst*

Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.
asp_inst : Must be an integer from 1 through 4.

Usage

Use this command to create an ASP instance or enter the ASP configuration mode.

Example

The following command enters the ASP configuration mode for a specific ASP.

```
asp instance 1
```

description

This command defines an alphanumeric string that describes the current SS7 routing domain. This is used for operator reference only.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

no

Removes the description string from the current SS7 routing domain configuration.

string

Specifies the alphanumeric string that is stored. Strings with spaces must be enclosed in double-quotes (see the example below).
string: Must be from 1 to 255 alphanumeric characters.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

```
description "National Service Routing Domain"
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

inbound-asp-identifier validate

This command enables validation of ASP identifiers inbound to the SGSN via routes defined with this SS7 routing domain.

Important: This command is only available in Release 8.1 and higher releases.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
inbound-asp-identifier validate

default inbound-asp-identifier validate

no inbound-asp-identifier validate
```

default

Validates the inbound ASP Id.

no

Disables validation of the inbound ASP Id.

Usage

The standard is to validate the ASP Id. However, in some circumstances it is necessary to skip such validation. For example, if the same ASP Id is assigned to more than one RNC (peer-server).

Example

Use the following command to skip validation of inbound ASP Ids:

```
no inbound-asp-identifier validate
```

Use either of the following commands to enable validation if it has been disabled:

```
default inbound-asp-identifier validate

inbound-asp-identifier validate
```

linkset

This command creates an instance of an MTP3 linkset and enters the Linkset configuration mode. See the Linkset configuration mode chapter for the commands to configure the linkset.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

linkset id *id*

no linkset id *id*

no

Removes the identified linkset definition from the system configuration.

id

This value uniquely identifies a linkset for the specific SS7 routing domain.
id : Must be an integer of 1 to 49.

Usage

This command creates instances of linkset configurations and provides access to the linkset configuration mode.

Example

Use the following command to create the 12th linkset:

```
linkset id 12
```

MTU-size

This command has been deprecated.

peer-server

This command creates a peer-server instance to setup a SIGTRAN peer for sending and receiving M3UA traffic. Completing the command automatically enters the peer- server configuration mode. To define 1 or more (up to 145) peer servers, use the commands documented in the *Peer-Server Configuration Mode* chapter in this reference.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

peer-server id *srvr_id*

no peer-server id *srvr_id*

no

Removes the identified peer-server definition from the system configuration.

srvr_id

srvr_id uniquely identifies a peer-server. The id must be an integer from 1 to 144.

Usage

Use the following command to create a definition for peer-server 2 and enter the configuration mode to configure the communication parameters for peer-server 12.

Example

```
peer-server id 12
```

route

This command configures SS7 routes for the current SS7 routing domain.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
route destination-point-code dp_code { linkset id id [ priority pri_value ] | peer-server-id srvr_id }

no route destination-point-code dp_code { linkset id id | peer-server-id srvr_id }
```

no

Removes the SS7 route from the current SS7 routing domain configuration.

destination-point-code *dp_code*

Specifies the SS7 destination point code for this route.
Reminder: the point-code structure must match the variant defined for the SS7 routing domain when the SS7RD was configured in the global configuration mode.

linkset id *id*

This keyword identifies a linkset instance, created and configured with the **linkset** command.
This keyword identifies a linkset instance, created and configured with the **linkset** command.
id : Must be an integer from 1 to 49.

peer-server-id *srvr_id*

This keyword identifies a peer-server configuration instance, created and configured with the **peer-server** command.
srvr_id must be an integer from 1 to 49.

Usage

This command associates the previoiusly configured linksets and peer servers and the destination point codes with a specified SS7 route.

Example

Define a route setting an ITU-type destination point-code address for the linkset Id 12:

```
route destination-point-code 6.211.6 linkset id 12
```

routing-context

Identifies the routing context for this SS7 routing domain.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

routing-context *value*

default routing-context

default

Resets the local routing context value to the index (instance ID) for this SS7 routing domain.

value

An integer that uniquely identifies the routing context for this SS7 routing domain.
value : Must be integers from 1 to 65535 (for releases 8.0) or 1 to 4294967295 (for releases 8.1 and higher) .

Usage

Use this command to set the routing context IDs for a specific SS7 routing domain configuration.

Example

routing-context *2355*

ssf

This command sets the network indicator in the subservice field for SS7 message signal units (MSUs).

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
ssf ( international | national | reserved | spare }
```

international

The network indicator identifies the message as international with a point code structure that does not match the national point code structure,

national

The network indicator identifies the messages as having a national point code structure.

reserved

Provides an alternate network indicator for national messages.

spare

Provides an alternate network indicator for international messages.

Usage

In SS7 signaling, the Message Transfer Part (MTP) Level 2 message signal units (MSUs) contain a service information octet (SIO). The SIO field in an MSU contains a 4-bit subservice field (SSF) followed by a 4-bit service indicator. The indicator carried in the message's routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the nation - international. As well, the 4-bit SSF determines the point code structure of the messages transmitted from the SGSN.

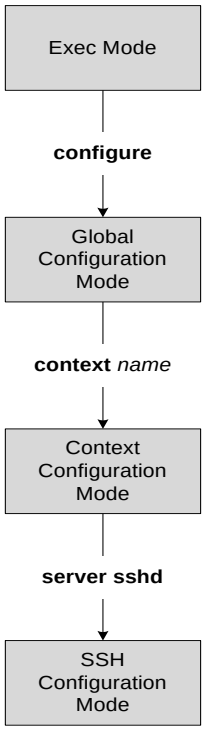
Example

For messages being transmitted within a country, set the indicator to national with the following command.

```
ssf national
```

Chapter 259
SSH Configuration Mode Commands

The Secure Shell Configuration Mode is used to manage the SSH server options for the current context.



Important: You must use the **`ssh generate key`** command in Context Configuration Mode to generate the sshd keys before you can configure the sshd server

authorized-key

Sets or removes a user name having authorized keys for access to the sshd server in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

authorized-key username *user_name* **host** *host _name* **[type { v2-dsa | v2-rsa }]**

default

Resets the parameter to the default value.

username

Sets a username as having authorized keys for access to the sshd server.

user_name

Specifies the username entered as an alphanumeric string of 1 through 255 characters.

host

Associates an SSH host having the authorization keys for the username.

host_name

Specifies the host name entered as an alphanumeric string of 1 through 255 characters.

[type { v2-dsa | v2-rsa }]

Specifies which type of SSH authorization key will be accepted instead of all key types. The options are: **v2-dsa** (SSHv2 Digital Signature Algorithm), or **v2-rsa** (SSHv2 Rivest, Shamir and Adleman).

Usage

Use this command to set a username with authorized keys for access to the sshd server within the current context.

Example

The following command specifies that username *dbailey* with authorization keys at *sshserver* can access the system with all types of authorization keys:

```
authorized-key username dbailey host sshserver
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

listen

Configures the SSH server in the current context to only listen for connections from the interface with the specified IP address. The default behavior is to listen on all interfaces.

Product

All

Privilege

Security Administrator, Administrator

Syntax

listen *ip_address*

no listen

no

Disable listening for a specific interface address and enable listening on all interfaces.

ip_address

Enables listening only on the interface with the specified IP address. *ip_address* must be entered using IPv4 dotted-decimal notation.

Usage

Use this command to configure the SSH server for the current context to only listen for connections from the interface with the specified IP address. Only one IP address may be set for listening.

Example

The following command specifies that the Server should only listen for connections in the interface with the IP address of *192.168.0.10*:

```
listen 192.168.0.10
```

max servers

Configures the maximum number of SSH servers that can be started within any 60-second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *number*

number

Default: 40
Specifies the maximum number of servers that can be spawned in any 60-second interval. *number* must be an integer from 1 through 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

Example

```
max servers 50
```

subsystem

Configures the system to perform file transfers using secure FTP (SFTP) over ssh v2. Administrator users must be configured with the FTP attribute privilege to issue this command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] subsystem { cli | sftp }
```

no

Disables either the SFTP ssh file transfer method or disables access to the CLI via ssh.

cli

Default: Enabled
Configures the SSH system for the current context to allow access to the CLI.

sftp

Default: Disabled
Enables the SSH system for the current context to perform file transfers using secure FTP (SFTP) over ssh v2.

Usage

Use this command to enable or disable file transfers using secure ftp over an ssh v2 tunnel.
Also use this command to enable or disable access to the CLI over an SSH connection.

Example

The following command enables SFTP for the current context:

```
subsystem sftp
```

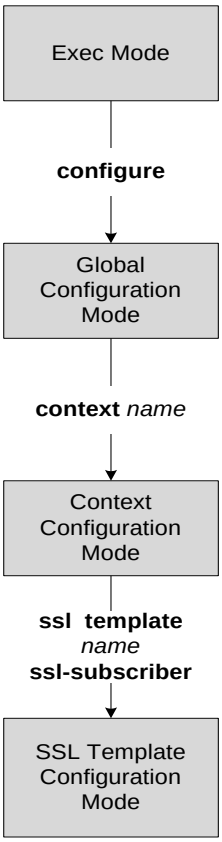
The following command disables access to the CLI through an SSH session for the current context:

```
no subsystem cli
```

Chapter 260
SSL Template Configuration Mode Commands

The SSL Template Configuration Mode is used to configure an SSL cryptographic policy. It includes most of the SSL parameters for cryptographic and authentication algorithms.

A P-CSCF service for SSL access will not function without a configured SSL template. Only one SSL template can be configured per P-CSCF service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

ca-certificate

Specifies a list of ca-certificates.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

ca-certificate list *name*

list *name*

Specifies the name(s) of ca-certificate(s), which can be an alpha and/or numeric string of 1 to 129 characters.

Usage

Use this command to specify a list of ca-certificates for the SSL template.

Example

The following command specifies the ca-certificate *ca_certificate_1* for the SSL template:

ca-certificate list *ca_certificate_1*

certificate

Used to bind an X.509 trusted certificate to the SSL template.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

certificate *name*

name

Specifies the name of a certificate, which can be an alpha and/or numeric string of 1 to 127 characters.

Usage

Use this command to bind an X.509 certificate to the SSL template.

Example

The following command binds the X.509 certificate *certificate_1* to the SSL template:

certificate *certificate_1*

cipher-suites

Specifies a list of SSL cipher suites.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

cipher-suites list *name*

list *name*

Specifies the name of an SSL cipher suite, which can be an alpha and/or numeric string of 1 to 127 characters.

Usage

Use this command to specify an SSL cipher suite for the SSL template.

Important: Currently, the system supports only one SSL cipher suite per SSL template.

Example

The following command specifies the SSL cipher suite *cipher_suite_1* for the SSL template:

```
cipher-suites list cipher_suite_1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

version

Specifies the supported version(s) of SSL protocol on the P-CSCF/A-BG.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
version list { tlsv1 }

default version
```

list { tlsv1 }

Specifies the supported version of SSL protocol to be TLS v0.1.

default

Sets the supported version of SSL protocol to its default value of TLS v0.1.

Usage

Use this command to specify the supported version(s) of SSL protocol on the P-CSCF/A-BG. Currently, there is only one supported version of SSL protocol, which is TLS v0.1.

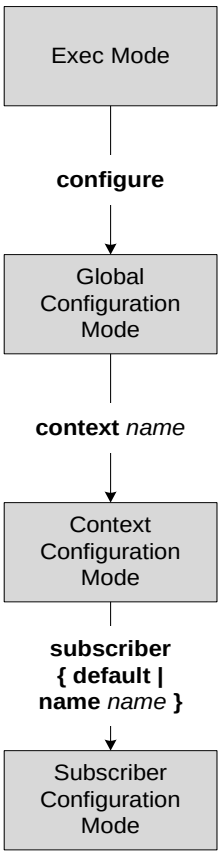
Example

The following command sets the supported version of SSL protocol to TLS v0.1:

```
version list tlsv1
```

Chapter 261
Subscriber Configuration Mode Commands

The Subscriber Configuration Mode is used to create local subscribers as well as to set default subscriber options for the current context.



aaa

This command configures authentication, authorization and accounting (AAA) functionality at the subscriber level.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] aaa { accounting interim { interval-timeout *interval_timeout* **| normal | suppress } | group** *aaa_group_name* **| secondary-group** *aaa_secondary_group_name* **}**

default aaa { accounting interim [interval-timeout] | group | secondary-group }

no aaa { accounting interim [interval-timeout] | group [*aaa_group_name* **] | secondary-group }**

---

default

Configures the default setting for the specified parameter.

- **accounting**: Enables AAA accounting for subscribers.
- **group**: Uses the default AAA group—the one specified at the context level or in the default subscriber profile.
- **secondary-group**: Removes the secondary AAA group from the subscriber configuration.

---

no

- **accounting**: Disables AAA accounting for subscribers.
- **group**: Uses the default AAA group—the one specified at the context level or in the default subscriber profile.
- **secondary-group**: Removes the secondary AAA group from the subscriber configuration.

---

accounting interim { interval-timeout *interval_timeout* **| normal | suppress }**

Specifies when system should send an interim accounting record to the server.

- **interval-timeout**: Specifies the time interval (in seconds) at which to send an interim accounting record.

  interval_timeout must be an integer from 50 through 40000000.

- **normal**: If RADIUS accounting is enabled, send this Acct-Status-Type message when normally required by operation.
- **suppress**: If RADIUS accounting is enabled, suppress the sending of Acct-Status-Type message.

---

group *aaa_group_name*

Specifies the AAA server group for the subscriber for authentication and/or accounting.
aaa_group_name must be an alphanumeric string of 1 through 63 characters.

secondary-group *aaa_secondary_group_name*

Specifies the secondary AAA server group for the subscriber.
aaa_secondary_group_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure AAA functionality at the subscriber level.
Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual server group for subscribers in that context. Each server group consists of a list of AAA servers for each AAA function (accounting, authentication, charging, etc.).
The AAA secondary server group supports the No-ACK RADIUS Targets feature in conjunction with PDSN/HA for secondary accounting (with different RADIUS accounting group configuration) to the RADIUS servers without expecting the acknowledgement from the server, in addition to standard RADIUS accounting. This secondary accounting will be an exact copy of all the standard RADIUS accounting message (RADIUS Start/Interim/Stop) sent to the standard AAA RADIUS server.
If the same AAA group is configured with both the **aaa group** *aaa_group_name* and the **aaa secondary-group** *aaa_group_name* commands, then this configuration will have no effect and secondary accounting will not happen.
The AAA secondary server group configuration takes effect only when used with subscriber accounting-mode set to radius-diameter. The RADIUS accounting triggers for both standard RADIUS accounting and secondary accounting will be taken from the AAA group configured with the **aaa group** *aaa_group_name* command. On the fly change of this configuration is not supported. Any change to the configuration will have effect only for new calls.

Example

The following command applies the AAA server group *star1* to subscribers:

```
aaa group star1
```

access-link ip-fragmentation

Configures IP fragmentation processing over the Access-link.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
access-link ip-fragmentation { normal | df-ignore | df-fragment-and-icmp-notify }
```

df-ignore

Default: Enabled
Ignores the DF (Don’t Fragment) bit setting. Fragments and forwards the packet over the access link.

df-fragment-and-icmp-notify

Default: Disabled
Partially ignores the DF bit. Fragments and forwards the packet, but also returns an ICMP error message to the source of the packet. The number of ICMP errors sent like this is rate-limited to one ICMP error packet per second per session.

normal

Default: Disabled
Normal processing. Drops the packet and sends an ICMP unreachable message to the source of packet. This is the default behavior.

Usage

If the IP packet to be forwarded is larger than the access-link MTU and if the DF (Don't Fragment) bit is set for the packet, then the fragmentation behavior configured by this command is applied. Use this command to fragment packets even if they are larger than the access-link MTU.

Example

Set fragmentation so that the DF bit is ignored and the packet is forwarded anyway by entering the following command:

```
access-link ip-fragmentation df-ignore
```

accounting-mode

Sets the accounting mode for the current local subscriber configuration.

Product

PDSN, HA, ASN-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-mode { flow-based | gtpp [ radius-diameter ] | none | radius-diameter [ gtpp ]
| rf-style }

default accounting-mode
```

default

Sets the type of accounting to be performed for the current local subscriber to the default setting.
Default: **radius-diameter**

flow-based

Diameter flow-based accounting is enabled for the current local subscriber.

gtpp [radius-diameter]

GTPP CDR RADIUS accounting is enabled for the current local subscriber. The **radius-diameter** keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

none

Accounting is disabled for the current local subscriber and no charging records will be generated.

radius-diameter [gtpp]

RADIUS-Diameter accounting is enabled for the current local subscriber. The **gtpp** keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

rf-style

Diameter Rf interface accounting is enabled for the current local subscriber.

Usage

This command specifies which protocol, if any, will be used to provide accounting for PDP contexts accessing the APN profile.
Use this command to enable or disable RADIUS/Diameter accounting for any subscribers that use the current local subscriber configuration.
If the **gtpp** option is used, then GTPP RADIUS is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode and GTPP charging records will be enabled.
If the **radius-diameter** option is used, either the RADIUS or the Diameter protocol is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode.

RADIUS accounting can also be enabled and disabled at the context level with the **aaa accounting** command in the Context Configuration Mode. If RADIUS accounting is enabled at the context level, the accounting-mode command can be used to disable RADIUS accounting for individual local subscriber configurations.
If the accounting mode is set to **rf-style**, then BM will generate accounting records corresponding to AIMS RF.

Example

To disable accounting for the current subscriber, enter the following command:

```
accounting-mode none
```

active-charging bandwidth-policy

Configures the bandwidth policy to be used for the subscriber.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

active-charging bandwidth-policy *bandwidth_policy_name*

{ default | no } active-charging bandwidth-policy

default

Specifies that the default bandwidth policy configured in the rulebase be used for this subscriber.

no

Disables bandwidth control for this subscriber.

active-charging bandwidth-policy *bandwidth_policy_name*

Specifies name of the bandwidth policy.
bandwidth_policy_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure bandwidth policy to be used for subscribers.

Example

The following command configures a bandwidth policy named *standard* for the subscriber:

```
active-charging bandwidth-policy standard
```

active-charging link-monitor tcp

Enables the TCP link monitoring feature on the Mobile Video Gateway. This command can be configured in either APN Configuration Mode or Subscriber Configuration Mode.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] active-charging link-monitor tcp [ log [ rtt [ histogram | time-series ]
[ bitrate [ histogram | time-series ] ] | bitrate [ histogram | time-series ] [ rtt [
histogram | time-series ] ] ] ][ -noconfirm ]
```

default

Sets TCP link monitoring to its default value, which is the same as **[no]**.

no

Deletes the TCP link monitoring settings and disables TCP link monitoring if previously configured.

active-charging link-monitor tcp

Enables the TCP link monitoring feature on the Mobile Video Gateway. Note that TCP link monitoring is not enabled by default. Also note that when this command is configured without the **log** option, TCP link monitoring is enabled without logging, and the output from TCP link monitoring is only used by the dynamic translating feature.

log [rtt [histogram | time-series] [bitrate [histogram | time-series]] | bitrate [histogram | time-series] [rtt [histogram | time-series]]]

This option enables statistical logging for TCP link monitoring.
The **rtt** option can be used to enable either **histogram** or **time-series** logging for round-trip time (RTT).
Similarly, the **bitrate** option can be used to enable either **histogram** or **time-series** logging for bit rate.
When **rtt** and **bitrate** options are used without additional options, histogram and time-series logging are enabled for round-trip time (RTT) and/or bit rate respectively.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to enable TCP link monitoring on the Mobile Video Gateway.

Examples

The following command enables TCP link monitoring with statistical logging, with histogram and time-series logging enabled for both RTT and bit rate:

```
active-charging link-monitor tcp log
```

The following command enables TCP link monitoring with statistical logging, with histogram and time-series logging enabled for RTT:

```
active-charging link-monitor tcp log rtt
```

The following command enables TCP link monitoring with statistical logging, with histogram logging enabled for RTT:

```
active-charging link-monitor tcp log rtt histogram
```

The following command enables TCP link monitoring with statistical logging, with histogram logging enabled for RTT and time-series logging enabled for bit rate:

```
active-charging link-monitor tcp log rtt histogram bitrate time-series
```

active-charging rulebase

Specifies the rulebase to be used for this subscriber.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

active-charging rulebase *rulebase_name*

no active-charging rulebase

no

Removes the previously configured rulebase for the subscriber.

active-charging rulebase *rulebase_name*

Specifies name of the ACS rulebase.
rulebase_name must be the name of an ACS rulebase expressed as an alphanumeric string of 1 through 63 characters.

Usage

This command specifies the name of the rulebase for specific subscriber (reals).
If the specified rulebase does not exist in the Active Charging service, the call will be rejected.

Example

The following command configures the ACS rulebase named *rule1* for the subscriber:

```
active-charging rulebase rule1
```

always-on

Once the idle timeout limit is reached, keeps the current subscriber session connected as long as the subscriber is reachable.

Caution: When always-on is enabled, the subscriber must have an idle time-out period configured (default is 0, no time-out). Failure to configure an idle time-out results in a subscriber session that is indefinite.

Two timers and a counter are associated with this feature. Refer to the **timeout** command in this chapter and the **ppp echo-retransmit-timeout msec** and **ppp echo-max-retransmissions num_retries** commands.

Default: Disabled.

Product

PDSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
always-on

no always-on
```

always-on

Specifies that the user will remain connected after the idle time expires.

no

Disables **always-on**. The user is disconnected after the idle time expires.

Usage

If this parameter is enabled for a subscriber, when the idle time-out limit is reached the subscribers IP/PPP session remains connected as long as the subscriber is reachable. This is true even if the airlink between the mobile device and the RN (Radio Node) is moved from active to dormant (inactive) status. When the idle timeout limit is reached, the PDSN determines availability using link control protocol (LCP) keepalive messages. A response to these messages indicates that the "always-on" status should be maintained. Failure to respond to a predetermined number of LCP keepalive messages causes the PDSN to tear-down (disconnect) the subscriber session.

Example

Enable always on for the current subscriber by entering the following command:

```
always-on
```

asn-header-compression-rohc

Negotiates Robust Header Compression (ROHC) support for subscriber calls with AAA and WiMAX. This configuration indicates the type of header compression supported and enabled on the ASN.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] asn-header-compression rohc
```

no

Removes or disables the configured identifiers for ROHC in ASN-GW service.

default

The default is *disabled*.

Usage

Network Attached Storage (NAS) uses this configuration to indicate and pack ROHC support the subscriber TLV in the WiMAX-capability attribute in the Access Request. The ROHC header compression is applied only when the ROHC is supported on the ASNGW and ROHC support is indicated by the AAA.

asn nspid

Specifies the network service provider (NSP) associated with a WiMAX subscriber in an ASN-GW service. When configured, the NSP ID is sent in the Access-Request and Accounting messages.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] asn nspid *nsp_id*

no

Removes or disables the configured identifiers for this network service provider in ASN-GW service.

asn nspid *nsp_id*

Specifies the network service provider for this subscriber. This enables the MS to discover all accessible NSPs, and to indicate the NSP selection during connectivity to the ASN.

Usage

Use this command to specify the NSP associated with a subscriber in an ASN-GW service.
nsp_id is three bytes in hexadecimal format. For example: FF-EE-01

Example

The following command specifies the NSP for a subscriber in an ASN service:

```
asn nspid 0F-01-FE
```

asn-pdfid

Configures the identifiers for packet data flow, service data flow, and service profile in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] asn-pdfid *pdf_id* **asn-service-profile-id** *svc_profile_id* **asn-sdfid** *sdf_id*

no

Removes/disables the configured identifiers for this subscriber in ASN-GW service.

asn-pdfid *pdf_id*

Specifies the an unique ASN Packet Data Flow identifier for this subscriber.
pdf_id must be an integer from 1 through 65535.

asn-service-profile-id *svc_profile_id*

Specifies a unique ASN Service Profile Identifier for this subscriber.
svc_profile_id is a Service Profile Identifier configured in the Context Configuration Mode.

asn-sdfid *sdf_id*

Specifies the an unique ASN Service Data Flow identifier for this subscriber.
sdf_id must be an integer from 1 through 65535.

Usage

Use this command to configure subscriber profile for QoS parameters in an ASN-GW service.
A maximum of four QoS profiles can be configured for a subscriber.

Example

The following command configures the QoS profile for a subscriber as PDF id 1, Service Profile id 3, and Service Data Flow id 2:

```
asn-pdfid 1 asn-service-profile-id 3 asn-sdfid 2
```

asn-policy

Configures the identifiers for packet data flow, service data flow, and service profile in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
asn-policy [classifiers downlink { strict | loose} | idle-mode { allow | disallow } |
notification-idle-mode {allow | disallow} | notification-handoff { allow | disallow
}auth-only {allow | disallow } | ms-requested-classifiers {allow | dissalow}]

[ default ] asn-policy classifiers downlinkidle-mode
```

no

Removes or disables the configured policy for this subscriber in ASN-GW service.

default

Sets the ASN policy to default for this subscriber.
For downlink traffic classifier default policy is “loos” and for idle mode policy the default action is to allow idle mode operation in an ASN-GW service.

idle-mode

Sets the idle mode policy for this subscriber in an ASN-GW service. If enabled, Interim-Update is sent with the BSID and WiMAX-Idle_Mode Transition as Idle. If disabled, the Interim can be sent when the call is in the idle mode based on the interim timer. At this point, the last known BSID is reported to the RADIUS server.

notification-idle-mode

Default: allow
Use to enable or disable Idle-Mode-Notification capabilities. When you enable this command, when the call moves from active to idle, or idle to active, Accounting Interim is sent.

notification-handoff

Default: allow
If enabled, the Interim-Update is sent with the BSID and SN-Handoff-Indicator as Active Handoff.

allow

Default: enabled
Enables the policy for this subscriber to allow idle mode operation in an ASN-GW service.

disallow

Default: disabled
Enable the policy for this subscriber to disallow idle mode operation in an ASN-GW service.

classifiers downlink

Sets the classifier policy for all service flows coming from HA to FA for this subscriber's matching classifier.

strict

Default: disabled
This option discards all the service flows coming from HA to FA and any other packets not matching to any of the classifiers set for this subscriber.

loose

Default: enabled
This option allows all the service flows coming from HA to FA and any other packet does not matching to any of the classifiers set for this subscriber and sent to the BS/MS over downlink flow

auth-only

Specifies whether the call is Auth only or not.

allow

Enables the policy for this subscriber to allow auth-only in an ASN-GW service.

disallow

Default
Disables the policy for this subscriber to allow auth-only in an ASN-GW service.

ms-requested classifiers

Default: allow
By default ASNGW allows dynamic addition of classifiers by the MS during MS-initiated service flow creation or modification.

Usage

Use this command to configure subscriber policy to allow/disallow the idle mode operation or the downlink traffic flow for a subscriber in an ASN-GW service.
For authentication configuration, the ASN-GW supports the Initial Network Entry (INE) for Ethernet CS calls. The base station supports Ethernet CS traffic to the network. The INE procedure includes the Authentication of the service flows and IP-Address allocation through DHCP. Authentication is based on the Extensible Authentication Protocol (EAP).
This command allows MS to transition to idle mode with an ASN-GW.

Example

The following command configures the policy to allow the idle mode for an MS with an ASN-GW:

```
default asn-policy idle-mode
```

authorized-flow-profile-id

When a profile ID is requested by the Mobile Node (MN), this command sets the value that is authorized by the Access Gateway (AGW).

Product

PDSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

authorized-flow-profile-id *profile_id* **direction { bidirectional | forward | reverse }**

no authorized-flow-profile-id *profile_id*

no

Removes the existing profile ID setting specified by *profile_id*. *profile_id* must be an integer from 0 through 65535.

authorized-flow-profile-id *profile_id*

The profile ID number that is authorized for the current subscriber. *profile_id* must be an integer from 0 through 65535.

direction { bidirectional | forward | reverse }

This specifies in which data direction the profile ID should be applied.

- **bidirectional**: This profile ID pertains to both the forward and reverse directions.
- **forward**: This profile ID pertains to data going to the MN.
- **reverse**: This profile ID pertains to data coming from the MN.

Usage

Use this command to set the profile ID that the AGW will authorize for a subscriber.

Example

Set the profile ID for both directions to 3 for the current subscriber by entering the following command:

```
authorized-flow-profile-id 3 direction bidirectional
```

content-filtering category

Enables or disables the specified preconfigured Category Policy Identifier for policy-based Content Filtering support to the subscriber.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id*

no content-filtering category policy-id

no

Disables the configured category policy ID for content filtering support to the subscriber. This is the default setting.

content-filtering category policy-id *cf_policy_id*

Applies the content filtering category policy ID, configured in ACS Configuration Mode, to this subscriber.
cf_policy_id must be a category policy ID expressed as an integer from 1 through 4294967295.
If the specified category policy ID is not configured in the ACS Configuration Mode, all packets will be passed regardless of the categories determined for such packets.

Important: Category Policy ID configured through this mode overrides the Category Policy ID configured using the **content-filtering category policy-id** command in the ACS Rulebase Configuration Mode.

Usage

Use this command to enter the Content Filtering Policy Configuration Mode and enable or disable the Content Filtering Category Policy ID for a subscriber.

Important: If Content Filtering Category Policy ID is not specified here, the similar command in the ACS Rulebase Configuration Mode determines the policy.

Up to 64 different policy identifier can be defined in a Content Filtering support service.

Example

The following command enters the Content filtering Policy Configuration Mode and enables the Category Policy ID *101* for Content Filtering support:

```
content-filtering category policy-id 101
```

credit-control-group

Configures the credit-control group for this subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

credit-control-group *cc_group_name*

no credit-control-group

no

Removes the credit-control group from the subscriber configuration, if configured.

credit-control-group *cc_group_name*

Specifies name of the credit-control group.
cc_group_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the credit-control group for the subscriber.

Example

The following command configures the credit-control group named *test12* for the subscriber:

```
credit-control-group test12
```

credit-control-service

Configures the credit-control service for this subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] credit-control-service *cc_service_name*

no

Disables the credit-control service, if configured.

credit-control-service *cc_service_name*

Specifies the name of the credit-control service.
cc_service_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the credit-control service for subscribers.

Example

The following command configures the credit-control service named *test12* for the subscriber:

```
credit-control-service test12
```

cscf core-service

CSCF/A-BG core service that maps to the current domain.

Product

SCM (CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

cscf core-service name *name*

no cscf core-service

cscf core-service name *name*

Specifies the name of the CSCF/A-BG core service.
name must be an alphanumeric string of 1 through 63 characters.

no cscf core-service

Removes the CSCF/A-BG core service from the domain.

Usage

Use this command to map a CSCF/A-BG core service to the current domain.

Example

The following command creates a CSCF core service named *cs1*:

```
cscf core-service name cs1
```

The following command removes the CSCF core service from this domain:

```
no cscf core-service
```

cscf county-name

Assigns a Last Routing Option (LRO) profile county name to the subscriber for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

Product

SCM (S-CSCF)

Privilege

Security Administrator, Administrator

Syntax

[no] cscf county-name *name*

cscf county-name *name*

Specifies the LRO profile county name of the subscriber.
name must be an existing LRO profile county name expressed as an alphanumeric string of 1 through 127 characters.

no

Removes the LRO profile county name from the subscriber.

Usage

Use this command to assign an LRO profile county name to the subscriber.

Example

The following command assigns county name *norfolk* to the subscriber:

```
cscf county-name norfolk
```

The following command removes county name *norfolk* from the subscriber:

```
no cscf county-name norfolk
```

cscf nat-applicable

Indicates if NAT (Network Address Translation) processing is required for this domain.

Product

SCM (CSCF/A-SBC)

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] cscf nat-applicable
```

no

Disables NAT processing for this domain.

cscf nat-applicable

Enables NAT processing for this domain.

Usage

Use this command to indicate whether NAT processing is required for this domain.

Example

The following command indicates NAT processing is required for this domain:

```
cscf nat-applicable
```

The following command disables NAT processing for this domain:

```
no cscf nat-applicable
```

cscf private-user-id

Assigns a private user identity to the subscriber.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Security Administrator, Administrator

Syntax

[no] cscf private-user-id *user_id*

no

Removed the private user identity of the subscriber.

cscf private-user-id *user_id*

Specifies the private user identity of the subscriber.
user_id must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to assign a private user identity to the subscriber.

Example

The following command assigns a private user identity named *user007* to the subscriber:

```
cscf private-user-id user007
```

The following command removes private user identity named *user007* from the subscriber:

```
no cscf private-user-id user007
```

cscf session-template

Assigns a CSCF session template to the subscriber profile.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Security Administrator, Administrator

Syntax

cscf session-template name *name*

no cscf session-template

cscf session-template name *name*

Specifies the name of the CSCF session template.
name must be an existing CSCF session template name expressed as an alphanumeric string of 1 through 79 characters.

no cscf session-template

Removes the assignment of a session template to the subscriber profile.

Usage

Use this command to bind a CSCF session template to a subscriber profile.

Example

The following command assigns a CSCF session template named *template4* to the subscriber profile:

```
cscf session-template name template4
```

The following command removes the assignment of a session template to the subscriber profile:

```
no cscf session-template
```

data-tunneling ignore df-bit

Controls the handling of the DF (Don't Fragment) bit present in the user IPv4/IPv6 packet for GRE, IP-in-IP tunneling used for the MIP data path. If this feature is enabled, and fragmentation is required for the tunneled user IPv4/IPv6 packet, then the DF bit is ignored and the packet is fragmented. Also the DF bit is not copied to the outer header. Default is enabled.

Product

PDSN, HA, FA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
data-tunneling ignore df-bit

no data-tunneling ignore df-bit
```

no

Disables this option. The DF bit in the tunneled IP packet header is not ignored during tunneling.

data-tunneling ignore df-bit

Ignores the DF bit in the tunneled IP packet header.

Usage

Use this command to configure a user so that during Mobile IP tunneling the DF bit is not ignored and packets are not fragmented.

Example

To disable fragmentation of a subscribers packets over a MIP tunnel even when the DF bit is present, enter the following command:

```
no data-tunneling ignore df-bit
```

dcca origin host

This command is obsolete. Refer to the **dcca origin endpoint** command.

dcca origin endpoint

This command is obsolete. To configure the Diameter Credit Control Origin Endpoint, in the Credit Control Configuration Mode, use the **diameter origin endpoint** command.

dcca peer-select

Specifies the Diameter credit control primary and secondary peer for credit control.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

dcca peer-select peer *host_name* **[realm** *realm_name* **] [secondary-peer** *host_name* **[realm** *realm_name* **]]**

no dcca peer-select

no

Removes the previously configured Diameter credit control peer selection.

peer *host_name*

Specifies a unique name for the peer. *peer_name* must be an alphanumeric string of 1 through 63 characters that allows punctuation marks.

secondary-peer *host_name*

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an available route, the secondary host performs a fail-over processing. *host_name* must be an alphanumeric string of 1 through 63 characters that allows punctuation marks.

realm *realm_name*

The *realm_name* must be an alphanumeric string of 1 through 63 characters that allows punctuation marks. The realm may typically be a company or service name.

Usage

Use this command to select a Diameter credit control peer and realm.

WARNING: This configuration completely overrides all instances of **diameter peer-select** that have been configured with in the Credit Control Configuration Mode for an Active Charging service.

Example

The following command selects a Diameter credit control peer named *test* and a realm of *companyx*:

```
dcca peer-select peer test realm companyx
```

default

Restores the default value for the option specified for the current subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { access-link ip-fragmentation | accounting-mode | data-tunneling ignore df-bit |
idle-timeout-activity dormant-downlink-data | inter-pdsn-handoff | ip { alloc-method |
allowed-dscp | header-compression | hide-service-address | multicast discard | qos-dscp |
source-validation } | loadbalanace-tunnel-peers | long-duration-action | mobile-ip {
home-agent | mn-aaa-removal-indication | mn-ha-hash-algorithm | reverse-tunnel |
security-level | send { dns-address | terminal-verification } } | permission | ppp {
always-on-vse-packet | data-compression { mode | protocols } | keepalive | min-
compression-size | mtu } | radius accounting interim interval-timeout | timeout {
absolute | idle } }
```

access-link ip-fragmentation

Sets the method for fragmenting packets over the MN access link to its default of normal. Drop the packet and send ICMP unreachable to the source of packet.

accounting-mode

Enables Radius accounting for the current local subscriber configuration.

data-tunneling ignore df-bit

Sets this option to the default behavior, which is to send an *ICMP unreachable - need to frag* message back to the sender and drop the packet, in the case that fragmentation is required but the DF bit is set.

idle-timeout-activity dormant-downlink-data

Sets this option to the default behavior. When downlink data packets are transmitted to the Mobile node and the session is in dormant mode the session idle timer is reset.

inter-pdsn-handoff

During a handoff from one PDSN to another, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address the PDSN will not disconnect the session immediately. The PDSN tries to assign the proposed address of the session in the IPCP configuration NAK.

ip { | allowed-dscp | dhcp-relay | header-compression | hide-service-address | multicast discard | qos-dscp | source-validation | user-datagram-tos copy }

allowed-dscp: resets the allowed DSCP parameters to the system defaults: class none, max-class be.
hide-service-address: specifies the default setting for hide the ip-address of the service from the subscriber. Default is Disabled

dhcp-relay: Configured with the DHCP server address during MS authentication. The AAA server sends the address of the DHCP server in the Access-Accept message. The DHCP relay uses this address to relay the DHCP messages from the MS to the DHCP server.
multicast discard: Configures the default multicast settings which is to discard PDUs
qos-dscp: Sets the quality of service setting to the system default.
source-validation: Specifies the default IP source validation. Default is Enabled.
user-datagram-tos copy: Disables copying of the IP TOS octet value to all tunnel encapsulation IP headers.

---

loadbalance-tunnel-peers

Sets the tunnel load balancing algorithm to the system default.

---

long-duration-action

Sets the action that is taken when the long duration timer expires to the default: detection.

---

mobile-ip { home-agent | mn-aaa-removal-indication | mn-ha-hash-algorithm | reverse-tunnel | security-level | send { dns-address | terminal-verification } }

allow-aaa-address-assignment: Disables the FA from accepting a home address assigned by an AAA server.
home-agent: Sets home agent IP address to its default of 0.0.0.0.
match-aaa-assigned-address: Disables the FA validating the home address in the RRQ against the one assigned by AAA server.
mn-aaa-removal-indication: Sets this parameter to its default of disabled.
mn-ha-hash-algorithm: Sets the encryption algorithm to the default of hmac-md5.
reverse-tunnel: Sets this parameter to its default of enabled.
security-level: Sets this parameter to its default of none.
send dns-address: Disables the HA from sending the DNS address NVSE in the RRP.
send terminal-verification: Disables the FA from sending the terminal verification NVSE in the RRQ.

---

permission

Restores the subscriber's service usage defaults.

---

ppp { always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation | keepalive | min-compression-size | mtu }

Sets the point-to-point protocol option defaults.
always-on-vse-packet: Re-enables the PDSN to send special 3GPP2 VSE PPP packets to the Mobile Node with a max inactivity timer value for always on sessions. This configuration is applicable only for PDSNsessions.
data-compression { **mode** | **protocols** }: restores the default value for either the data compression **mode** or compression **protocols** as follows:

- mode stateless
- all protocols enabled

ip-header-compression negotiation: Sets the IP header compressions negotiation to the system default: force.
keepalive: sets the subscriber's PPP keep alive option to the system default: 30 seconds.
min-compression-size: Restores the PPP minimum packet size for compression: 128 octets.

mtu: Sets the maximum message transfer unit packet size to the system default: 1500 octets.

radius accounting interim interval-timeout

Disables the RADIUS accounting interim interval for the current subscriber.

timeout [absolute | idle | long-duration]

When a keyword is entered, this command resets the specified timeout to the system default: 0. When no keyword is specified, all timeouts are reset to the system defaults: 0.

Usage

Use this keyword to reset subscriber data to the system defaults. This is useful in setting the subscriber back to the basic values to possibly aid in trouble shooting or tuning a subscriber's access and options.

Example

```
default ip qos-dscp

default permission

default data-compression mode
```

dns

Configures the domain name servers for the current subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns { primary | secondary } *ip_address*

no

Indicates the IP address is to be removed as either a primary or secondary domain name server.

dns primary | secondary

dns primary: Updates the primary domain name server for the subscriber.
dns secondary: Updates the secondary domain name server for the subscriber.

ip_address

Specifies the IP address of the domain name server using IPv4 dotted-decimal notation.

Usage

Set the subscriber DNS server lists as not all users will have the same set of servers.

Example

```
dns primary 10.2.3.4

no dns primary 10.2.3.4

dns secondary 10.2.5.6

no dns secondary 10.2.5.6
```

eap

Specifies the lifetime for a master session key (MSK) for extensible authentication protocol (EAP) authentication.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[default] eap msk-lifetime *dur*

default

Sets the lifetime duration to default value of 3600 seconds for master session key.

msk-lifetime *dur*

Specifies the lifetime duration (in seconds) on Master Session Key (MSK) in seconds for a WiMAX subscriber EAP authentication.
dur is an integer from 60 through 65535.

Usage

This command is used to set the lifetime for MSK in EAP authentication for WiMAX subscriber.

Example

The following command sets the lifetime for MSK key to *4800* seconds for a WiMAX subscriber through EAP authentication:

```
eap msk-lifetime 4800
```

encrypted password

Designates use of password encryption.

Product

All

Privilege

Security Administrator, Administrator

Syntax

encrypted password *password*

encrypted password *password*

password is the encrypted password and must be an alphanumeric string of 1 through 132 characters.

Usage

This command is normally used only inside configuration files.

Example

The following command sets an encrypted password of *qsdf12d4*:

```
encrypted password qsdf12d4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

external-inline-server

This is a restricted command.

firewall policy

Important: This command is only available in StarOS 8.0. In StarOS 8.1 and later releases, this configuration is available in the ACS Rulebase Configuration Mode.

This command enables or disables Stateful Firewall support for the subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

{ default | no } firewall policy
```

no

Disables Stateful Firewall support for this subscriber.

default

Configures the default setting for Stateful Firewall support.
Default: Disabled

firewall-required

Enables Stateful Firewall support for this subscriber.

Usage

Use this command to enable or disable Stateful Firewall support for this subscriber.

Important: Unless Stateful Firewall support for this subscriber is enabled using this command, firewall processing for this subscriber is disabled.

Important: If firewall is enabled, and the rulebase has no firewall configuration, Stateful Firewall will cause all packets to be discarded.

Example

The following command enables Stateful Firewall support for this subscriber:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support for this subscriber:

```
no firewall policy
```

fw-and-nat policy

Important: This command is only available in StarOS 8.1. This customer-specific command must be used to configure the Policy-based Firewall-and-NAT feature.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat policy *fw_nat_policy*

{ default | no } fw-and-nat policy

default

Specifies that the default Firewall-and-NAT policy configured in the rulebase be used for the subscriber.

no

Disables Firewall and NAT processing for the subscriber.

fw_nat_policy

Specifies the Firewall-and-NAT policy for the subscriber.
fw_nat_policy must be an alphanumeric string of 1 through 63 characters. Note that this policy will override the **default Firewall-and-NAT policy** configured in the ACS rulebase.

Usage

Use this command to configure the Firewall-and-NAT policy for subscribers. Note that the policy configured in the subscriber mode will override the default policy configured in the ACS rulebase. If a policy is not configured in the subscriber mode, the default policy configured in the ACS rulebase will be applied.

Example

The following command configures a Firewall-and-NAT policy named *standard* for the subscriber:

```
fw-and-nat policy standard
```

idle-timeout-activity

Defines whether downlink (towards Mobile Node) data packets transmitted when the session is dormant are treated as activity for the idle-timer (inactivity timer).

By default, downlink data transmitted over a dormant session restarts the idle-timer for that session; it is treated as activity for the session.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] idle-timeout-activity dormant-downlink-data
```

no

Dormant mode downlink data is not treated as activity for the session idle-timer. The session idle timer is not reset.

idle-timeout-activity dormant-downlink-data

Treats dormant mode downlink data as activity for the session idle-timer. The session idle timer is reset.

Usage

Use this command to disable or re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode.

Example

Use the following command to disable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

```
no idle-timeout-activity dormant-downlink-data
```

Use the following command to re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

```
idle-timeout-activity dormant-downlink-data
```

ims application-manager

Specifies the IP Multimedia Subsystem (IMS) application manager for the subscriber.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no] ims application-manager { domain-name *domain-name* **| ipv4-address** *ipv4_address* **}**

no

Disables the IMS application manager for this subscriber.

ims application-manager

Enables the IMS application manager for this subscriber.

domain-name *domain-name*

Specifies the domain name of the application manager.
domain-name must be an alphanumeric string of 1 through 63 characters.

ipv4-address *ipv4_address*

Specifies the IP address of the application manager using IPv4 dotted-decimal notation.

Usage

The IMS application manager address is returned by HA to MN in DHCP Ack when it receives the DHCP inform from an AIMS subscriber.

Example

```
ims application-manager domain-name domain23ims application-manager ipv4-
address 192.168.23.1
```

ims-auth-service

Enables IP Multimedia Subsystem (IMS) authorization support for subscriber. The specified IMSA service will be used for performing IMS authorization and flow-based charging procedures.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

[default | no] ims-auth-service *auth_svc_name*

default

Configures default setting.
Default: Disabled or as specified at the context or network access service level or in subscriber template.

no

Removes the specified IMS authorization service from the subscriber configuration.

ims-auth-service *auth_svc_name*

Specifies name of the IMS authorization service.
auth_svc_name must be an alphanumeric string of 1 through 63 characters preconfigured within the same context of this subscriber.

Usage

This feature provides the IMS authorization service configuration for Gx interface in IMS service node.

Example

Following command applies a previously configured IMS authorization service named *ims_interface1* to a subscriber within the specific context.

```
ims-auth-service ims_interface1
```

inter-pdsn-handoff

Configure the system to force the MN to use its assigned IP address during Internet Protocol Control Protocol (IPCP) negotiations resulting from inter-PDSN handoffs.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] inter-pdsn-handoff require ip-address
```

no

Disables the rejecting of sessions when the MN uses a non-allocated IP address during IPCP re-negotiations.

inter-pdsn-handoff require ip-address

Rejects sessions when the MN uses a non-allocated IP address during IPCP re-negotiations.

Usage

This command is used to configure the system to reject sessions that are re-negotiating IPCP after an inter-PDSN handoff if the IP address they propose does not match the one initially provided by the PDSN. The session would be rejected even if the proposed address was 0.0.0.0.
If this parameter is disabled, the PDSN will attempt to re-assign the IP address initially provided.

Example

To set the PDSN to not allow a mismatched IP address during a PDSN to PDSN handoff of a MIP call, use the following command:

```
inter-pdsn-handoff require ip-address
```

To set the PDSN so that it will not disconnect the session immediately, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address after inter-pdsn handoff, use the following command:

```
no inter-pdsn-handoff require ip-address
```

ip access-group

Configures IP access group for the current subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip access-group *group_name* **[in | out]**

no

Indicates the access group specified is to be cleared from the subscribers configuration.

ip access-group *group_name*

Specifies the name of the IPv4/IPv6 access group. *acl_group_name* is a configured ACL group expressed as an alphanumeric string of 1 through 79 characters.

in | out

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **in** and **out**, respectively. If neither of these key words is specified, the command associates the *group_name* access group with the current subscriber for both inbound and outbound access.

Usage

Set the subscriber access group to manage the access control for subscribers as a logical group.

Example

The following command associates the *sampleGroup* access group with the current subscriber for both inbound and outbound access:

```
ip access-group sampleGroup
```

The following removes the outbound access group flag for *sampleGroup*:

```
no ip access-group sampleGroup out
```

ip address

Configures a static IPv4 address for use by the subscriber.

Product

PDSN, GGSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ip address *ip_address netmask*

no

Removes a previously configured IP address assignment.

ip address *ip_address*

Specifies the IP address assigned to the subscriber using IPv4 dotted-decimal notation.

netmask

The subnet mask that corresponds to the assigned IPv4 address.

Usage

Use this command to assign a static IPv4 address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example

The following command configures a static IP address of *192.168.1.15* with a subnet mask of *255.255.255.0* to the subscriber:

```
ip address 192.168.1.15 255.255.255.0
```

ip address pool

Configures IP address pool properties for the subscriber.

Product

PDSN, GGSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ip address pool name *pool_name*

no

Removes a previously configured static address.

ip address pool name *pool_name*

Specifies the IP address pool or IP address pool group from which the subscribers IP address is assigned. *pool_name* must be the name of an existing IP pool or IP pool group expressed as an alphanumeric string of 1 through 31 characters.

Usage

Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to sessions from this subscriber.
This command can be issued multiple times to specify multiple address pools for the subscriber. If multiple pools are specified, addresses are assigned for subscriber sessions from the pools based on the order in which the pools were configured.
If an address cannot be provided from the first-specified pool for whatever reason, the system attempts to assign an address from the second-specified pool, and so on. This operation is independent of the priorities configured for the pools. For example, if pool1 was specified for the subscriber first, and pool2 second, the system always attempts to assign addresses from pool1. If an address can not be assigned from pool1 (i.e. all addresses are in use), the system then attempts to assign an address from pool2.

Example

The following command configures the subscriber to receive IP addresses from an IP address pool named *public1*:

```
ip address pool name public1
```

ip address secondary-pool

Configures secondary IP address pool properties for the subscriber to provide multiple IP host configuration behind one WiMAX Customer Premise Equipment (CPE).

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ip address secondary-pool name *aux_pool_name*

no

Removes a previously configured auxiliary pool named *aux_pool_name* for multiple host support in ASN-GW service.

ip address secondary-pool name *aux_pool_name*

Specifies the secondary/auxiliary IP address pool or IP address pool group from which the IP address is assigned to host behind a WiMAX CPE having primary IP address.
pool_name must be the name of an existing IP pool or IP pool group expressed as an alphanumeric string of 1 through 31 characters.

Usage

Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to host behind a WiMAX CPE for multiple host session support. This command designates the IP address to secondary hosts from locally configured secondary IP address pool. To enable multiple host support behind a WiMAX CPE and configure maximum number of supported hosts use **secondary-ip-host** command in ASN Gateway Service Configuration mode.

Example

The following command configures the subscriber to receive IP addresses from a secondary IP address pool named *auxiliary1* for secondary hosts behind the WiMAX CPE:

```
ip address secondary-pool name auxiliary1
```

ip allowed-dscp

Sets the Quality of Service (QoS) Differentiated Services (DiffServ) marking that a subscriber session is allowed. The DSCP is disabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip allowed-dscp class *class* **max-class maxclass [rt-marking** *marking* **]**

no ip allowed-dscp class

---

no

Resets the parameters to the defaults: class none, max-class **be**. This indicates that all packets are let through without any dscp checking

---

ip allowed-dscp class *class*

Specifies the Differentiated Services Codepoint (DSCP) class with which the subscriber session may mark its packets. If the subscriber sessions packets request a code point class higher than the code point class specified, the PDSN service re-marks the packets with the QOS-DSCP value specified by the **ip qos-dscp** command.
Default: none
class must be one of the following;
a: allow packets with AF DSCPs
e: allow packets with EF DSCP
o: allow packets for experimental or local use
ae: allow packets with AF and EF DSCPs
ao: allow packets with AF DSCPs or packets for experimental or local use
eo: allow packets with EF DSCPs or packets for experimental or local use
aeo: allow packets with AF or EF DSCPs or packets for experimental or local use
none: allow only the **be** and **sc1** through **sc7** code points

---

max-class *maxclass*

This parameter specifies the maximum code point with which a subscriber session may mark its packets. The subscriber sessions packets must be marked with a code point equal to or less than the code point specified. If the subscriber sessions packets request a code point higher than the code point specified, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the max-class and the **ip qos-dscp** command.
The list below identifies the code points from lowest to highest precedence. For example, if the **maxclass** is set to af22, that becomes the maximum code point that the subscriber session may mark it's packets with and only **be, af13, af12, af11,af23**, and **af22** are allowed. If a subscriber session marks its packets with anything after af22 in this list, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the maxclass and the **ip qos-dscp** command.
If class is set to none only the be and sc1 through sc7 codepoints are allowed. For example; if **class** is set to none and you set **max-class** to **sc1**, only the **sc1** and **be** codepoints are allowed.
Default: **be**

maxclass must be one of the following;
be: best effort forwarding
af13: assured Forwarding 13
af12: assured Forwarding 12
af11: assured Forwarding 11
af23: assured Forwarding 23
af22: assured Forwarding 22
af21: assured Forwarding 21
af31: assured Forwarding 31
af32: assured Forwarding 32
af33: assured Forwarding 33
af41: assured Forwarding 41
af42: assured Forwarding 42
af43: assured Forwarding 43
ef: expedited forwarding
sc1: selector class 1
sc2: selector class 2
sc3: selector class 3
sc4: selector class 4
sc5: selector class 5
sc6: selector class 6
sc7: selector class 7

---

rt-marking *marking*

This parameter is used for Mobile IP (MIP) reverse tunnels. When MIP session packets do not have a DSCP marking, the Foreign Agent (FA) marks the packets with the value specified by **rt-marking** *marking*.
If MIP sessions packets have a DSCP marking, the marking is subjected to the conformance rules for the values of class and max-class; the final DSCP marking is then copied from the inner IP header to the outer IP header.
Default: **be**
marking must be one of the following;
be: best effort forwarding
af11: assured Forwarding 11
af12: assured Forwarding 12
af13: assured Forwarding 13
af21: assured Forwarding 21
af22: assured Forwarding 22
af23: assured Forwarding 23
af31: assured Forwarding 31
af32: assured Forwarding 32
af33: assured Forwarding 33
af41: assured Forwarding 41
af42: assured Forwarding 42
af43: assured Forwarding 43
ef: expedited forwarding
sc1: selector class 1
sc2: selector class 2
sc3: selector class 3
sc4: selector class 4
sc5: selector class 5
sc6: selector class 6

sc7: selector class 7

Usage

Use this command to configure Quality of Service (QoS) for a subscriber session to allow a Differentiated Services (DiffServ) Code Point (DSCP) marker in the header of each IP packet that prompts network routers to apply differentiated grades of service to various packet streams.
This command uses **class** and type of marker (**rt-marking** for reverse tunnels) for configuration with **max-class** maximum code point that a subscriber session may mark its packets with.

Example

The following command will allow *o* packets for experimental or local use with best effort forwarding *be*:

```
ip allowed-dscp class o max-class be
```

ip context-name

Configures the context to which the subscriber is assigned upon authentication. The assigned context is considered the destination context that provides the configuration options for the services the subscriber is allowed to access.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip context-name *name*

no

Removes the current assigned context from the subscriber's data.

ip context-name *name*

Specifies the name of the context to assign the subscriber to once authenticated. *name* must be an alphanumeric string of 1 trough 79 characters.

Usage

Set the subscriber IP context to a common context when all subscribers from one or more contexts will use the same egress context.

Example

```
ip context-name sampleName

no ip context-name sampleName
```

ip header-compression

Configures the IP packet header compression options for the current subscriber. Although this command configures IP header compression algorithms, the Internet Protocol Control Protocol (IPCP) negotiations determine when the header compression algorithm is applied.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip header-compression { rohc [ any [ mode { optimistic | reliable | unidirectional } ] |
cid-mode { { large | small } [ marked-flows-only | max-cid | max-hdr value | mrru value ]
} | marked flows-only | max-hdr value | mrru value | downlink | uplink ] | vj } +

[ default | no ] ip header-compression
```

default

Restores this command's default setting to the Van Jacobsen (VJ) header compression algorithm.

no

Disables all IP header compression.

ip header-compression { rohc [any [mode { optimistic | reliable | unidirectional }] | cid-mode { { large | small } [marked-flows-only | max-cid | max-hdr *value* | mrru *value*] } } | marked flows-only | max-hdr *value* | mrru *value* | downlink | uplink] | vj }

Specifies that the Robust Header Compression (ROHC) algorithms is used for data.

Important: ROHC is only supported for use with the PDSN.

any: Apply ROHC header compression in both the uplink and downlink directions.
mode { optimistic | reliable | unidirectional }:

- **optimistic**: Sets the ROHC mode to Bidirectional Optimistic mode (O-mode). In this mode packets are sent in both directions. A feedback channel is used to send error recovery requests and (optionally) acknowledgments of significant context updates from decompressor to compressor. Periodic refreshes are not used in the Bidirectional Optimistic mode.
- **reliable**: Sets the ROHC mode to Bidirectional Reliable mode (R-mode). This mode applies an intensive usage of a feedback channel and a strict logic at both the compressor and the decompressor that prevents loss of context synchronization between the compressor and the decompressor. Feedback is sent to acknowledge all context updates, including updates of the sequence number field.
- **unidirectional**: Sets the ROHC mode to Unidirectional mode (U-mode). With this mode packets are sent in one direction only, from the compressor to the decompressor. This mode therefore makes ROHC usable over links where a return path from the decompressor to the compressor is unavailable or undesirable.

cid-mode { { large | small } [marked-flows-only | dm | max-hdr *value* **| mrru** *value* **] }**: Specifies the ROHC packet type to be used.

- **large | small [marked-flows-only | max-cid | max-hdr** *value* **| mrru** *value* **]**: Defines the ROHC packet type as large or small and optionally sets the following parameters for the packet type selected:
- **marked-flows-only**: Specifies that ROHC is to be applied only to marked flows.
- **max-cid** *integer*: Default: 0 The highest context ID number to be used by the compressor. *integer* must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.
- **max-hdr** *value*: Specifies the maximum header size to use. Default: 168. *value* must be an Integer from 0 through 65535.
- **mrru** *value*: Specifies the maximum reconstructed reception unit to use. Default: 65535. *value* must be an Integer from 0 through 65535.

marked-flows-only: Specifies that ROHC is to be applied only to marked flows.
max-hdr *value*: Specifies the maximum header size to use. Default: 168. *value* must be an Integer from 0 through 65535.
mrru *value*: Specifies the maximum reconstructed reception unit to use. Default: 65535. *value* must be an Integer from 0 through 65535.
downlink: Apply the ROHC algorithm only in the downlink direction.
uplink: Apply the ROHC algorithm only in the uplink direction.

Important: When ROHC is enabled for downlink or uplink only the operational mode is Unidirectional.

vj

Specifies that the VJ algorithm is used for header compression.

+

Either one or both of the keywords may be entered in a single command.
If both **vj** and **rohc** are specified, **vj** must be specified first.

Important: If both VJ and ROHC header compression are specified, the optimum header compression algorithm for the type of data being transferred is used for data in the downlink direction.

Usage

Header compression can be used to provide a higher level of security in IP traffic enhance bandwidth usage and lower bit errors.
By default the header compression algorithm is set to **vj**.

Example

The following command disables all IP packet header compression:

```
no ip header-compression
```

The following command sets IP header compression to default vj algorithm:

```
default ip header-compression
```

The following command also sets the IP header compression to the vj algorithm:

```
ip header-compression vj
```

The following command enables the Internet Protocol Control Protocol (IPCP) to determine which protocol is the optimum algorithm for data in the downlink direction and use either VJ or ROHC as needed:

```
ip header-compression vj rohc
```

The following command enables ROHC for the downlink direction only:

```
ip header-compression rohc downlink
```

The following command enables ROHC in any direction using Bidirectional Optimistic mode:

```
ip header-compression rohc any mode Optimistic
```

ip hide-service-address

Hide the IP address of the service from the subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip hide-service-address
```

no

Does not hide the IP address of the service from the subscriber. This is the default behavior.

ip hide-service-address

Hides the IP address of the service from the subscriber.

Usage

Use this command to prevent subscribers from using traceroute to discover the network addresses that are in the public domain and configured on services. This prevent users from pinging such addresses.

ip local-address

Configures the local-side IP address of the subscriber's point-to-point connection.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip local-address *ip_address*

no ip local-address

no

Removes a previously configured IP local-address.

ip_address *ip_address*

Specifies an IP address configured in a destination context on the system through which a packet data network can be accessed. *ip_address* is entered using IPv4 dotted-decimal notation.

Usage

This parameter specifies the IPv4 address on the system that the MS uses as the remote-end of the PPP connection. If no local address is configured, the system uses an "unnumbered" scheme for local-side addresses.

Example

The following command configures a local address of 192.168.1.23 for the MS:

```
local-address 192.168.1.23
```

ip multicast discard

Configures the IP multicast discard packet behavior.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip multicast discard
```

no

Does not discard IP multicast packets.

ip multicast discard

Discards IP multicast packets.

Usage

This command specifies if IP multicast packets will be discarded.

ip qos-dscp

Configures quality of service (QoS) options for the current subscriber using the differentiated services code point (DSCP) method. This functionality is disabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip qos-dscp *option*

no ip qos-dscp

no

Sets the quality of service option to its default value.

ip qos-dscp *option*

Default: be (Best Effort)
Specifies the subscriber's per hop quality of service setting as one of:

- **af11**: assured Forwarding 11
- **af12**: assured Forwarding 12
- **af13**: assured Forwarding 13
- **af21**: assured Forwarding 21
- **af22**: assured Forwarding 22
- **af23**: assured Forwarding 23
- **af31**: assured Forwarding 31
- **af32**: assured Forwarding 32
- **af33**: assured Forwarding 33
- **af41**: assured Forwarding 41
- **af42**: assured Forwarding 42
- **af43**: assured Forwarding 43
- **be**: best effort forwarding
- **ef**: expedited forwarding

Usage

Set the quality of service for a subscriber based upon the service level agreements.

Example

```
ip qos-dscp ef
```

```
no ip qos-dscp
```

ip route

Configures the static route to use to reach the subscriber's network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip route *ip_address ip_mask* **[** *gateway_address* **]**

no

Removes the configured route information from the subscriber data.

ip route *ip_address*

Specifies the target IP address for which the route information applies using IPv4 dotted-decimal notation.

ip_mask

Specifies the networking mask for the route.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, such as the bit can be either a 0 or a 1.
For example, if the IP address and mask were specified as 172.168.10.0 and 255.255.255.224, respectively, the network mask will be 172.168.0.0 (obtained by logically ANDing the IP address with the IP mask).

gateway_address

Default: assigned remote IP address will be used as the gateway address.
Specifies the IP address of the next hop gateway for the route using IPv4 dotted-decimal notation.

Usage

The static routes are also known as framed IP routes for subscribers. Static routes are typically applicable for subscribers connecting via other networks or when the mobile device acts as a gateway to a network on the far side of the device.
For example, if the mobile device is assigned IP address 10.2.3.4 and it acts as a gateway for the network 10.2.3.0 (with a network mask of 255.255.255.0) a static route would be configured with the *ip_address* being 10.2.3.0, *ip_mask* being 255.255.255.0, and *gateway_address* being 10.2.3.4.

Example

```
no ip route 10.2.3.4 255.255.255.0
```

ip source-validation

Enables or disables packet source validation for the current subscriber. Source validation requires that the source address of the received packets match the IP address assigned to the subscriber (either statically or dynamically) during the session.

If an incorrect source address is received from the mobile node, the system attempts to renegotiate the PPP session. The parameters for IP source validation can be set by the **ip source-violation** command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip source-validation

no

Disables source validation.

ip source-validation

Enables source validation.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Example

The following command enables IP source validation:

```
ip source-validation
```

The following command disables IP source validation:

```
no ip source-validation
```

ip user-datagram-tos copy

Controls copying of the IP TOS octet value from IPv4/IPv6 datagrams to the IP header in tunnel encapsulation. This is disabled by default.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
ip user-datagram-tos copy [ access-link-tunnel | both | data-tunnel ]

no ip user-datagram-tos copy
```

no

Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers.

ip user-datagram-tos copy

Enables copying of the IP TOS octet value to all tunnel encapsulation IP headers.

access-link-tunnel

Copies the IP TOS octet value to the tunnel encapsulation IP header on the access side (RP) tunnel.

both

Uses both the access-link-tunnel and data-tunnel.

data-tunnel

Copies the IP TOS octet value to the tunnel encapsulation IP header on the MIP data tunnel or L3 tunnel (IP-in-IP, GRE).

Usage

Use this command to enable the copying of the IP TOS octet value to the tunnel encapsulation IP header. This functionality allows PCF to detect special TOS marking in the outer IP header of A11 packets and to identify certain packets as QChat control messages. The Base Station Controller/Packet Control Function (BSC/PCF) must give higher priority to QChat control messages.

Example

The following command enables copying of the IP TOS octet value to the tunnel encapsulation IP header for the access side tunnel:

```
ip user-datagram-tos copy access-link-tunnel
```

The following command disables copying of the IP TOS octet value to all tunnel encapsulation IP headers:

```
no ip user-datagram-tos copy
```

ip vlan

Configures subscriber-to-Virtual LAN (VLAN) associations.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

ip vlan *vlan-id*

[default | no] ip vlan

default

Resets the VLAN ID to the default setting.

no

Disables the VLAN ID for the subscriber.

ip vlan *vlan-id*

Specifies the VLAN ID that is associated with the IP address for that session. *vlan-id* is an integer from 1 through 4094.

Usage

This command configures the subscriber vlan ID which is used with the assigned address for the subscriber session to receive packets. If the IP pool from which the address is assigned is configured with a VLAN ID, this subscriber configured VLAN ID overrides it.
Subscriber traffic can be routed to specific VLANs based on the configuration of their user profile. Using this functionality provides a mechanism for routing all traffic from a subscriber over the specified VLAN. All packets destined for the subscriber must also be sent using only IP addresses valid on the VLAN or they will be dropped.

Example

Set the vlan ID to the default setting by entering the following command:

```
default ip vlan
```

ipv6 access-group

Configures the IPv6 access group for a subscriber.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 access-group *name* **[in | out]**

ipv6 access-group *name*

Defines the access group name. *name* is an alphanumeric string of 1 through 47 characters.

in

Defines the access group as inbound.

out

Defines the access group as outbound.

Usage

Used to create an access group for a subscriber.

Example

The following command provides an example of an IPv6 access group with the name *list_1*:

```
ipv6 access-group list_1
```

ipv6 address

Configures a static IP address for use by the subscriber.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 address { prefix *address* **| prefix-pool** *name* **}**

no

Deletes a previously configured ipv6 address.

ipv6 address *address*

Specifies an IPv6 address. *address* is entered using IPv6 colon-separated notation.

prefix

Specifies a static IPv6 address.

prefix-pool *name*

Specifies an IPv6 prefix pool name. *name* is an alphanumeric string of 1 through 31 characters.

Usage

Use this command to assign a static IPv6 address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example

The following command configures a static IP address of *2001:4A2B::1f3F* with a mask length of *24* to the subscriber:

```
ipv6 address 2001:4A2B::1f3F/24
```

ipv6 dns

Configures the IPv6 Domain Name Service (DNS) servers.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 dns { primary | secondary } { *ipv6_dns_address* **}**

no

Deletes a previously configured DNS server.

ipv6 dns *ipv6_dns_address*

Specifies an IP address for the DNS server. *ipv6_dns_address* is entered using IPv6 colon-separated notation.

primary

Configures the primary DNS server for the subscriber.

secondary

Configures the secondary DNS server for the subscriber. Only one secondary DNS server can be configured.

ipv6_dns_address

Configures the IP address of the DNS server.

Usage

DNS servers are configured on a per subscriber basis. This allows each subscriber to use specific servers.

Example

The following command provides an example of setting the primary IPv6 DNS server:

```
ipv6 dns primary fe80::c0a8:a04
```

ipv6 dns-proxy

Configures the system to act as a domain name server proxy for the current subscriber.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ipv6 dns-proxy
```

default

Disables IPv6 DNS proxy functionality for a subscriber.

no

Removes the pre-enabled functionality of IPv6 DNS proxy for a subscriber.

ipv6 dns-proxy

Enables IPv6 DNS proxy functionality for a subscriber. If enabled, the system will act as a proxy DNS server. Default: disabled.

Usage

Used to enable or disable IPv6 DNS proxy for the subscriber. When enabled, the PDSN acts as a proxy DNS server for DNS IPv6 queries coming from the mobile station to the PDSN's local PPP link address.

Example

The following command disables the IPv6 DNS proxy function for the subscriber:

```
no ipv6 dns-proxy
```

ipv6 egress-address-filtering

Configures the system to perform egress address filtering for the subscriber.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 egress-address-filtering
```

no

Disables IPv6 egress address filtering.

ipv6 egress-address-filtering

Enables IPv6 egress address filtering.

Usage

Used to enable the filtering of packets that arrive from the Internet to a particular site.

Example

The following command disables egress address filtering:

```
no ipv6 egress-address-filtering
```

ipv6 initial-router-advt

Creates an IPv6 initial router advertisement interval for the subscriber.

Product

PDSN, GGSN, ASN-GW, HSGW, P-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 initial-router-advt { interval *value* **| num-advts** *value* **| router-solicit-wait-timeout** *value* **}**

default ipv6 initial-router-advt { interval | num-advts | router-solicit-wait-timeout }

no ipv6 initial-router-advt router-solicit-wait-timeout

default

Resets the command to its default settings.

no ipv6 initial-router-advt router-solicit-wait-timeout

Disables running timer to wait for router solicit and sends the initial router advertisement immediately once session is up.

ipv6 initial-router-advt

Enables an initial router advertisement interval in milliseconds.

interval *value*

Default: 3000
The time interval the initial IPv6 router advertisement is sent to the mobile node in milliseconds.
value is an integer between 100 and 16000 milliseconds.

num-advts value *value*

Default: 3
The number of initial IPv6 router advertisements sent to the mobile node. *value* is an integer between 1 to 16.

router-solicit-wait-timeout *value*

Default: 3000
The time interval to wait for router solicit before sending the initial IPv6 router advertisement.
value is an integer between 1 and 30000 milliseconds.

Usage

This command is used to set the advertisement interval and the number of advertisements. Using a smaller advertisement interval increases the likelihood of router being discovered more quickly when it first becomes available.

If timer is enabled and router solicit is received before timeout, then RA will be sent in response to RS and no further RA will be sent. If timer is enabled and no router solicit is received after timeout, initial RAs will be sent as configured and IPv6 capability indication will be sent in S2a to P-GW to indicate that P-GW should drop any IPv6 traffic for this PDN.

Example

The following command specifies the initial ipv6 router interval to be 2000ms:

```
ipv6 initial-router-advt interval 2000
```

ipv6 interface-id

Provides an IPv6 interface identifier for the subscriber.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 interface-id *ifid*

[default | no] ipv6 interface-id

default

No interface ID set for IPv6CP negotiation to subscriber.

no

Deletes a previously configured IPv6 interface ID.

interface-id *ifid*

Specifies the interface ID assigned to the Mobile during IPv6 Control Protocol (IPv6CP) negotiation. *ifid* is a 64-bit unsigned integer.

Usage

Used to provide a IPv6 ifid for the subscriber when using IPv6-to-IPv4 (6to4)routing.

Example

The following command provides an example of assigning an IPv6 interface ID of *00-00-00-05-47-00-37-44* to the subscriber:

```
ipv6 interface-id 00-00-00-05-47-00-37-44
```

ipv6 minimum-link-mtu

Configures the IPv6 minimum link maximum transmission unit (MTU) value.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 minimum-link-mtu *value*

default ipv6 minimum-link-mtu

default

Resets minimum link MTU to its default setting: 1280.

ipv6 minimum-link-mtu *value*

Specifies the MTU (in bytes) as a minimum link value. *value* is an integer between 100 and 2000.

Usage

Used to override the IPv6 minimum link MTU values recommended by the standard.

Example

The following command provides an example of assigning an IPv6 minimum link MTU to *1580* to the subscriber:

```
ipv6 minimum-link-mtu 1580
```

ipv6 secondary-address

Configures additional IPv6 4-bit prefixes to the subscriber session.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 secondary-address { prefix *ipv6_address_prefix* **| prefix-pool** *pool_name* **}**

no

Deletes a previously configured ipv6 secondary address.

ipv6 secondary-address *ipv6_address_pref*

Specified the secondary IPv6 address using IPv6 colon-separated notation.

pool_name

Specifies the name given to the secondary address prefix pool as an alphanumeric string of of 1 through 31 characters.

Usage

An IPv6 prefix pool name may be configured for a dynamic prefix, while the prefix is static. This command may be executed multiple times to configure multiple prefixes.

Example

The following command assigns an IPv6 secondary address prefix-pool name of *eastcoast* to the subscriber:

```
ipv6 secondary-address prefix-pool eastcoast
```

l2tp send accounting-correlation-info

Enables the sending of accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) by the L 2TP Access Concentrator (LAC) in L2TP control messages (ICRQ) during session setup to an L2TP Network Server (LNS).

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] l2tp send accounting-correlation-info
```

no

Disables the sending of accounting correlation information by the LAC.

default

Sets the setting to default mode: disable.

l2tp send accounting-correlation-info

Enables the sending of accounting correlation information by the LAC.

Usage

Use this command to enable the LAC to send accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) in L2TP control message (ICRQ) during session setup to LNS for this subscriber. LNS can be configured to include this information in ACS billing records, so that billing servers can easily correlate accounting records from PDSN/LAC and LNS.
By default, this mode is disabled.

Example

The following command disables the inclusion of accounting correlation information in control messages during session setup to an LNS for a subscriber:

```
default l2tp send accounting-correlation-info
```

l3-to-l2-tunnel address-policy

Configure the subscriber address allocation/validation policy, when subscriber Layer 3 (IPv4) sessions are tunneled using Layer 2 tunneling protocol (L2TP).

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
l3-to-l2-tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default l3-to-l2-tunnel address-policy
```

default

Restores the default value for Layer 3-to-Layer 2 tunnel addressing: **no-alloc-validate**.

l3-to-l2-tunnel address-policy

Sets the policy for Layer 3-to-Layer 2 sessions to one of the following options.

alloc-only

Only allocates an address in the case of dynamic address assignment. Does not validate static addresses.

alloc-validate

Locally allocates and validates the subscriber addresses.

no-alloc-validate

Does not allocate or validate subscriber addresses locally for current subscribers sessions. Passes the address between the remote tunnel terminator and the Mobile Node. This is the default behavior.

Usage

Use this command to configure the L3 to L2 tunnel address policy for MIP HA sessions tunneled from the system using L2TP tunnels or for GGSN IP Context sessions tunneled using L2TP to a remote LNS. Also refer to the **resource** keyword of the Context Configuration mode **ip pool** command.

Example

the following command sets the L3-to-L2 tunnel address policy so that the current subscriber must have IP addresses allocated and validated locally on the system:

```
l3-to-l2-tunnel address-policy alloc-validate
```

loadbalance-tunnel-peers

Configures the load balancing of traffic bound for L2TP tunnels configured on the system for the selected subscriber.

Product

L2TP

Privilege

Security Administrator, Administrator

Syntax

```
loadbalance-tunnel-peers { balanced | prioritized | random }
```

loadbalance-tunnel-peers

Enables load balancing of L2TP traffic using one of the methods described below.

balanced

Enables the equal use of all configured tunnel peers (LNSs) for the selected subscriber.

prioritized

Enables the use of all configured tunnel peers (LNSs) for the selected subscriber based on the preference number assigned to the peer address.

random

Default: Enabled
Enables the random use of all configured tunnel peers (LNSs) for the selected subscriber.

Usage

Use to manage traffic loads on L2TP Access Concentrator (LAC) ports and their respective L2TP Network Servers (LNSs).

Example

Use the following command to randomly use all configured tunnel peers (LNSs):

```
loadbalance-tunnel peers random
```

long-duration-action

Specifies what action is taken when the long duration timer expires.

Product

All

Privilege

Administrator

Syntax

```
long-duration-action { detection | disconnection [ dormant-only ] [ suppress-notification ] }
```

detection

Default: Enabled
Detects long duration sessions and sends SNMP TRAP and CORBA notification. This is the default behavior. Use this command to detect a session exceeding the limit set by the long duration timer.

disconnection [dormant-only] [suppress-notification]

Default: Disabled
Detects a long duration session and disconnects the session after sending SNMP trap and CORBA notification.
suppress-notifiaction: Suppresses the SNMP trap and CORBA notification after detecting and disconnecting a long duration session. Default: Disabled
dormant only: Disconnects the dormant sessions after long duration timer and inactivity time with idle time-out duration expires. If the long duration timeout is fired and the call is not dormant, the call is disconnected when the call later moves to dormancy.

Important: For HA calls, the inactivity-time is considered as gauge for dormancy.

It sends the SNMP trap and CORBA notification after disconnecting a long duration session. Default: Disabled

Usage

Use this command to determine what action is taken when a session exceeds the limit set by the long duration timer.

Example

Use the following command to enable disconnecting sessions that exceed the long duration timer:

```
long-duration-action disconnection
```

Use the following command to disconnect the session that exceed the long duration timer without sending SNMP trap and CORBA notification:

```
long-duration-action disconnection suppress-notification
```

Use the following command to disconnect the session that is in dormant and exceed the long duration timer and send SNMP trap and CORBA notification:

long-duration-action disconnection dormant-only

Note that in case of HA calls, the inactivity-time is considered as gauge for dormancy.

max-pdn-connections

Specifies the maximum number of connections to packet data networks (PDNs) supported per eHRPD session.

Product

HSGW

Privilege

Security Administrator, Administrator

Syntax

max-pdn-connections *eHRPD_PDNs*

default max-pdn-connections

default

Resets the maximum number of PDN connections supported per eHRPD session to 3.

max-pdn-connections *eHRPD_PDNs*

Specifies the maximum number of PDN conceitedness allowed per eHRPD session. *eHRPD_PDNs* must be an integer from 1 to 14. Default is 3.

Usage

This command is used to specify the maximum number of PDN connections supported per eHRPD session.

Example

The following command specifies a maximum of *5* PDNs per eHRPD session:

```
max-pdn-connections 5
```

mediation-device

Enables the use of a mediation device for subscribers, and specifies the system context to use for communicating with the device. A mediation device can be the initial point of contact for all IT systems that need to receive Charging Data Records (CDRs). Mediation devices can also be deep-packet inspection servers or transaction control servers.

Product

GGSN, P-GW PDG, TTG

Privilege

Security Administrator, Administrator

Syntax

mediation-device context-name *<context-name>* **[no interims]**

[no | default] mediation-device

no

Deletes the mediation-device configuration.

default

Changes the mediation device to no context-name configured and restores the mediation device's default properties.

mediation-device context-name *context-name*

Default: The subscriber's destination context.
Configures the mediation VPN context for the subscriber.
context-name must be an alphanumeric string of 1 through 79 characters that is case sensitive. If not specified, the mediation context is same as the destination context of the subscriber.

no-interims

Disables sending of Interim messages to the mediation device.
Default: Disabled

Usage

This command is used to enable mediation device support for subscribers.
Keywords to this command can be used in combination to each other, depending on configuration requirements.

Example

The following command enables mediation device support for the subscriber and uses the protocol configuration located in an system context called *ggsn1*:

```
mediation-device context-name ggsn1
```

mobile-ip

Enables or disables access to mobile IP services by the subscriber.

Product

HA, FA

Privilege

Security Administrator, Administrator

Syntax

[no] mobile-ip { allow-aaa-address-assignment | dns-address source-priority { aaa | home-agent } | gratuitous-arp aggressive | home-agent *ip_address* **[alternate] | match-aaa-assigned-address | mn-aaa-removal-indication | mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 } | mn-ha-shared-key** *key* **| mn-ha-spi** *spi_num* **| reverse-tunnel | security-level { ipsec | none } | send { accounting-correlation-info | dns-address | imsi | terminal-verification } }**

no

Disables the mobile IP option specified.

allow-aaa-address-assignment

Default: Disabled.
Enables the FA to accept a home address assigned by an AAA server. This should only be configured on the FA side.

dns-address source-priority { aaa | home-agent }

Sets the priority behavior on the FA to use either the DNS IP address information from the HA or the AAA server to include in the RRP to the MN.
When the **no** keyword is used in conjunction with the **dns-address** keyword, information received from both the home-agent and the AAA server is sent if available.
DNS IP address information from the HA comes from the DNS Normal Vendor/Organization Specific Extension (NVSE) in the Registry Registrar Protocol (RRP).
DNS IP address information from the AAA server is in the access accept message.
home-agent: If the DNS address is received from the home-agent only that information is sent to the MN. Otherwise the DNS address received from the AAA server is sent.
aaa: If the DNS address is received from the AAA server only that information is sent to MN. Otherwise the DNS address received from the home-agent is sent.

gratuitous-arp aggressive

Default: Disabled.
When enabled, this mode will cause the HA to send out gratuitous ARP (Address Resolution Protocol) messages for all Mobile IP (MIP) registration renewals and handoffs.
To disable this mode, use the **no** form of this command.

Important: This mode will only work for IP addresses that have been assigned from a static IP address pool.

home-agent *ip_address* **[alternate]**

Specifies the IP address of the mobile IP user's home agent. *ip_address* must be entered using IPv4 dotted-decimal or IPv6 colon -separated notation.
alternate - Specifies the secondary, or alternate, Home Agent to use when Proxy Mobile IP HA Failover is enabled.

match-aaa-assigned-address

Default: Disabled.
Enables the FA to validate the home address in the RRQ against the one assigned by AAA server. This should only be configured on the FA side.

mn-aaa-removal-indication

Default: Disabled.
When enabled, the MN-FA challenge and MN-AAA Authentication extensions are removed when relaying a Registration Request (RRQ) to the Home Agent (HA)

mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Speechifies the encryption algorithm to use.
Default: **hmac-md5**
hmac-md5: Uses HMAC-MD5 hash algorithm, as defined in RFC-2002bis. This is the default algorithm.
md5: Uses the MD-5 hash algorithm.
rfc2002-md5: Uses the MD-5 hash algorithm variant as defined in RFC-2002.

mn-ha-shared-key *key*

Verifies the MN-HA Authentication for a local subscriber in the current context. *key* is an alphanumeric string or a hexadecimal number beginning with "0x" up to 127 bytes

mn-ha-spi *spi_num*

Specifies the Security Parameter Index (SPI) number. *spi_num* must be an integer from 256 through 4294967295.

reverse-tunnel

Default: enabled.
All the mobile IP user to use reverse IP tunnels. The **no** keyword disables this option.

security-level { ipsec | none }

Default: none
Configures the security level needed for the subscriber's traffic.
ipsec: secures both MIP control and data traffic with IPSec.
none: none of the traffic is secured

Important: This keyword corresponds to the 3GPP2-Security-Level RADIUS attribute. This attribute indicates the type of security that the home network mandates on the visited network.

Important: For this attribute, the integer value "3" enables IPSec for tunnels and registration messages, "4" Disables IPSec

send { accounting-correlation-info | dns-address | imsi | terminal-verification }

accounting-correlation-info: Configures whether the FA sends the correlation info to the NVSE in the RRQ. Default is disabled.
dns-address: Enables the HA to send the DNS address NVSE in the RRP. Default is disabled. This should only be enabled on the HA side.
imsi: Configures sending the IMSI NVSE in the RRQ. Default is sending IMSI in custom-1 format.
terminal-verification: Enables the FA to send the terminal verification NVSE in the RRQ. Default is disabled. This should only be enabled on the FA side.

Important: **send dns-address** is a proprietary feature developed for a specific purpose and requires the MN to be able to renegotiate IPCP for DNS addresses and reregister MIP if necessary. Since this feature needs the MN to support certain PPP/MIP behavior, and not all MNs support that particular behavior, **send dns-address** should be enabled only after careful consideration.

Usage

Use as subscriber service contracts change.

Example

```
mobile-ip home-agent 10.2.3.4

no mobile-ip reverse-tunnel
```

mobile-ip ha

Accommodates two Mobile IP (MIP) Home Agent (HA) options in subscriber mode.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mobile-ip ha { assignment-table` *`name`* **`| ignore-unknown-ha-addr-error }`**

`no`

Disables the mobile IP HA option specified.

`assignment-table` *`name`*

Specifies the name of an existing MIP HA Assignment table. *`name`* must be an alphanumeric string of 1 through 63 characters.

`ignore-unknown-ha-addr-error`

Default is disabled.
Enables or disables the HA to accept or reject the RRQ from a particular subscriber.

Usage

Use this command to assign a MIP HA Assignment table to the current subscriber.
Use this command to disable or enable the HA to accept or reject the RRQ from a particular subscriber when the HA address in the incoming MIP RRQ is not the same as the HA service address. The feature is off by default which causes the RRQ to be rejected with the error code UNKNOWN_HOME_AGENT.

Example

The following command assigns the MIP HA Assignment table named *`Atable1`* to the current subscriber:

```
mobile-ip ha assignment-table Atable1
```

The following command sets **`ignore-unknown-ha-addr-error`** to its default disabled state:

```
no mobile-ip ha ignore-unknown-ha-addr-error
```

mobile-ip reg-lifetime-override

Overrides the Mobile IP (MIP) registration lifetime from HA with value configured for subscriber.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

mobile-ip reg-lifetime-override [*dur* **| infinite]**

[default | no] mobile-ip reg-lifetime-override

mobile-ip reg-lifetime-override*dur*

Default: 100 seconds.
Overrides the MIP registration lifetime from HA for the specified period of time in seconds. *dur* must be an integer from 1 through 65534.

infinite

Sets the MIP registration lifetime override value to infinite for a particular subscriber.

default

Sets the value of mobile IP registration lifetime override option to 100 seconds.

no

Disables the MIP registration lifetime override option.

Usage

Use this command to configure MIP registration-lifetime per realm/domain. This value overrides the default lifetime configured under HA service.

Example

The following command overrides the MIP registration lifetime value from HA service and defaults the MIP registration lifetime to 100 seconds for the current subscriber:

```
default mobile-ip reg-lifetime-override
```

mobile-ip send accounting-correlation-info

Enables the sending call correlation information Normal Vendor/Organization Specific Extensions (NVSEs) to the HA in the MIP Registry Registrar Protocol (RRP).

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] mobile-ip send accounting-correlation-info
```

default

Disables the support for sending call correlation information NVSEs to the HA in MIP RRQ.
This is the default mode.

no

Removes the configured support for sending call correlation information.

Usage

Use this command to support PDSN-Correlation-ID VSE and send the call correlation information.

Example

The following command enables sending call correlation information NVSEs to the HA in MIP RRQ

```
mobile-ip send accounting-correlation-info
```

mobile-ipv6

Configures Mobile IPv6 related parameters for a subscriber.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] mobile-ipv6 { home-address ipv6_address | home-agent ipv6_address |
home-link-prefix ipv6_address | tunnel mtu value }
```

default

Disables the support for sending call correlation information NVSEs to the HA in MIP RRQ.
This is the default mode.

no

Removes the configured support for sending call correlation information.

home-address *ipv6_address*

Specifies the home address for the subscriber. *ipv6_address* must be entered using IPv6 colon-separated notation.

home-agent *ipv6_address*

Specifies the IPv6 address of the mobile IP user's home agent. *ipv6_address* must be entered using IPv6 colon-separated notation.

home-link-prefix *ipv6_address*

Specifies the IPv6 address of the mobile IP user's home link. *ipv6_address* must be entered using IPv6 colon-separated notation.

tunnel mtu *value*

Configures the tunnel MTU (in bytes) for the IPv6 tunnel between the HA and the mobile node. *value* must be an integer from 1024 through 2000. The default is 1500.

Usage

This command sets the mobile-ipv6 parameters for a subscriber. Use this command to set the home-address, home-agent, and home-link prefix

Example

Use the following command to set the tunnel MTU value to *1800*:

```
mobile-ipv6 tunnel mtu 1800
```

nai-construction-domain

After authentication, the domain name specified by this command replaces the Network Access Identifier (NAI) constructed for the subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

nai-construction-domain *domain_name*

no nai-construction-domain

nai-construction-domain *domain_name*

Defines the domain name to use to replace the NAI constructed domain name. *domain_name* must be an alphanumeric string of 1 through 79 characters.

no

Deletes the defined domain name.

Usage

Define or delete a domain name to use to replace the NAI constructed domain name after authentication.

Example

the following command sets the domain name to *private1*:

```
nai-construction-domain private1
```

To delete the previously configured domain name, use the following command:

```
no nai-construction-domain
```

nbns

Configures and enables use of NetBIOS Name Service for the subscriber.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
nbns { primary IPv4-address | secondary IPv4-address }

no nbns { primary [ IPv4-address ] | secondary [ IPv4-address ] }
```

nbns primary

Designates primary NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

nbns secondary

Designates secondary/failover NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

IPv4-address

Specifies the IP address used for this service using IPv4 dotted-decimal notation.

no

Removes/disables use of a previously configured NetBios Name Service.

Usage

This command specifies NBNS parameters. The NBNS option is present for both PDP type IP and PDP type PPP for GGSN.
The system can be configured to use of NetBIOS Name Service for the Access Point Name (APN).

Example

The following command configures the subscriber's NetBIOS Name Service to primary IP *192.168.1.15*:

```
nbns primary 192.168.1.15
```

nexthop-forwarding-address

Configures the next hop forwarding address for the subscriber.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

nexthop-forwarding-address *ip_address*

no nexthop-forwarding-address

nexthop-forwarding-address *ip_address*

Configures the IP address of the nexthop forwarding address. *ip_address* must be entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

no

Disables this function. This is the default setting.

Usage

Use this command to configure the next hop forwarding address for the subscriber.

Example

The following command configures the next hop forwarding address to *10.1.1.1* (IPv4):

```
nexthop-forwarding-address 10.1.1.1
```

npu qos

Configures an Network Processing Unit (NPU) QoS priority queue for packets from the subscriber.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
npu qos traffic priority { best-effort | bronze | derive-from-packet-dscp | gold | silver
}
```

best-effort

Assigns the best-effort queue priority. This is the lowest priority.

bronze

Assigns the bronze queue priority. This is the third-highest priority.

derive-from-packet-dscp

Default: Enabled
Specifies that the priority is to be determined from the DS field in the packet's TOS octet.

gold

Assigns the gold queue priority. This is the highest priority.

silver

Assigns the silver queue priority. This is the second-highest priority.

Usage

This command is used in conjunction with the Network Processing Unit (NPU) Quality of Service (QoS) functionality.
The system can be configured to determine the priority of a subscriber packet either based on the configuration of the subscriber, or from the differentiated service (DS) field in the packet's TOS octet (representing the differentiated service code point (DSCP) value).
Refer to the *System Administration Guide* for additional information on NPU QoS functionality.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command configures the subscriber's priority queue to be gold:

```
npu qos traffic priority gold
```

nw-reachability-server

Binds the name of a configured network reachability server to the current subscriber and enables network reachability detection.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

nw-reachability server *server_name*

no nw-reachability server

nw-reachability server *server_name*

Specifies the name of a network reachability server that has been defined in the current context. *server_name* is an alphanumeric string of 1 through 16 characters.

no nw-reachability server

Deletes the name of the network reachability server from the current subscribers configuration and disable network reachability failure detection for the current subscriber.

Usage

Use this command to define the network reachability server for the current subscriber and enable network reachability failure detection for the current subscriber. If a network reachability server is defined in an IP pool, that setting takes precedence over this command.

Important: Refer to the HA configuration mode command **policy nw-reachability-fail** to configure the action that should be taken when network reachability fails.

Important: Refer to the context configuration mode command **nw-reachability server** to configure network reachability servers.

Important: Refer to the **nw-reachability server server_name** keyword of the **ip pool** command in the *Context Configuration Mode Commands* chapter to bind the network reachability server to an IP pool.

Example

To bind a network reachability server named *InternetDevice* to the current subscriber, enter the following command:

```
nw-reachability server InternetDevice
```

outbound

Configures the subscriber host password for use when authenticating PPP sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

outbound [encrypted] password *pwd*

no outbound password

[outbound encrypted] password *pwd*

Specifies the password to use for point-to-point protocol session host authentication. The **encrypted** keyword indicates the password specified uses encryption.
The password specified as *pwd* must be an alphanumeric string of 1 through 63 characters without encryption, or 1 through 127 characters with encryption.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

no outbound password

Clears the outbound password configuration from the subscriber data.

Usage

Sets the outbound (egress) password for increased security.

Example

outbound password *secretPwd*

outbound encrypted password *scrambledPwd*

no outbound password

overload-disconnect

Sets the threshold parameter for overload disconnect.

Product

ASN-GW, HA,PDIF, PDSN,PHS GWPDG/TTG

Privilege

Security Administrator, Administrator

Syntax

overload-disconnect [threshold { inactivity-time *inactivity_time_threshold* **| connect-time** *connect_time_threshold* **}]**

[default | no] overload-disconnect [threshold { inactivity-time | threshhold connect-time }]

threshold inactivity-time *inactivity_time_threshold*

Sets the inactivity time threshold (in seconds) as an integer from 0 through 4294967295. The default value of zero disables this feature. If *inactivity-time* for the subscriber's session is greater than *inactivity_time_threshold*, the session becomes a candidate for disconnection.

threshold connect-time *connect_time_threshold*

Sets the connection time threshold (in seconds) as an integer from 0 through 4294967295. A value of zero disables this feature. If connect-time for the subscriber's session is greater than *connect_time_threshold*, the session becomes a candidate for disconnection.

default

Enables the default condition for this subscriber.

no

Disables the overload disconnect feature for this subscriber. This is the default condition for PDIF.

Usage

Set a subscriber's overload disconnect threshold in seconds, based on either inactivity or connection time. When this threshold is exceeded during a session, the subscriber's session becomes a candidate for disconnection. To set overload-disconnect policies for the entire chassis, see **congestion-control overload-disconnect** in the *Global Configuration Mode Commands* chapter.

Example

```
overload-disconnect threshold inactivity-time 120

default overload disconnect threshold connect-time

no overload-disconnect threshold connect-time

no overload disconnect
```

password

Configures the subscribers password for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ encrypted ] password pwd

no password
```

encrypted

Indicates the password provided is encrypted.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

pwd

Specifies the user's password for authentication. *pwd* must be an alphanumeric string of 1 through 63 characters without encryption, or from 1 through 127 characters with encryption. A "null" password is allowed and is entered as consecutive double quotes (" "). See Example(s) for correct syntax.

Important: Subscribers configured with a null password will be authenticated using PAP and CHAP (MD5) only. Subscribers configured without a password (**no password**) will only be able to access services if the service is configured to allow no authentication.

no

Used to clear the subscriber password configuration from the subscriber data.

Important: Subscribers with no password will only be able to access services if the service is configured to grant access with no authentication.

Usage

Password management is critical to system security and all precautions should be taken to ensure passwords are not shared or to easily deciphered.

Example

```
password secretPwd

password ""

no password
```

pdif mobile-ip

Configures PDIF subscriber call setup parameters.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[default | no] pdif mobile-ip { release-tia | required | simple-ip-fallback }

[default | no]

Disables the option specified.

release-tia

Specifies that after subscriber call setup is complete, the tunnel inner address (TIA) is released. If SImple IP is enabled, the TIA becomes the principal communications tunnel and the restriction that it is only to be used to set up a Mobile-IP call is lifted. This parameter is disabled by default.

required

Specifies that Mobile IP is required for this subscriber whenever a call is set up. This parameter is disabled by default.

simple-ip-fallback

Specifies that Simple IP should be used when Mobile IP could not be established. This parameter is disabled by default.

Usage

Use this command to configure specific behavior for the PDIF subscriber during call setup.

Example

The following command enables the system to fall back to Simple IP when Mobile IP fails for this subscriber during call setup:

```
pdif mobile-ip simple-ip-fallback
```

permission

Enables or disables the subscriber's ability to access wireless data services.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] permission { ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip }
```

no

Disables the usage of the specified service.

ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip

ha-mobile-ip: enables or disables the Home Agent (HA) support for Mobile IP (MIP) service.
pdsn-mobile-ip: enables or disables packet data and Foreign Agent (FA) support for MIP service.
pdsn-simple-ip: enables or disables packet data support for simple IP service.

Usage

Grants the subscriber access to services in the current context.

Example

```
permission pdsn-mobile-ip

no permission ha-mobile-ip
```

policy ipv6 tunnel

Sets maximum transmission unit (MTU) behavior for the IPv6 tunnel between the HA and Mobile Node.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

policy ipv6 tunnel mtu exceed { fragment | notify-sender }

mtu exceed { fragment | notify-sender }

fragment: Adjusts tunnel MTU and fragment packets
notify-sender: Sends an ICMPv6 Packet Too Big message to the original sender

Usage

Use this command to configure MTU behavior for an IPv6 tunnel between the HA and Mobile Node.

Example

```
policy ipv6 tunnel mtu exceed fragment
```

policy-group

Assigns or removes a flow-based traffic policy group to a subscriber.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] policy-group *policy_group_name* **direction { in | out }**

no

Removes assigned policy group from a subscriber configuration.

policy-group *policy_group_name*

Specifies the traffic policy group name for a subscriber session flow pre-configured within a destination context. *policy_group_name* is an alphanumeric string of 1 through 15 characters that is case sensitive.

direction { in | out }

Specifies the direction of flow in which the traffic policies need to be applied.

- **in**: specifies the incoming traffic
- **out**: specifies the outgoing traffic

Usage

Use this command to assign a traffic policy group to a subscriber for traffic policing.

Example

```
policy-group traffic_policy_group1 direction in
```

ppp

Configures the point-to-point protocol (PPP) options for the current subscriber.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression { mode { normal | stateless } | protocols { *protocols* [*protocols*] } | ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } } | ipv4 { disable | enable | passive } | ipv6 { disable | enable | passive } | keepalive *seconds* | min-compression-size *min_octets* | mtu *max_octets* | remote-renegotiation disconnect { always | nai-prefix-msid-mismatch } }

default ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation [vj compress-slot-id] | ipv4 | ipv6 | keepalive | min-compression-size | mtu | remote-renegotiation disconnect }

no ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression protocols | ipv4 | ipv6 | keepalive | mtu | remote-renegotiation disconnect }

---

default

Restores the default value for the option specified.

---

no

Resets the option specified to its default.

---

always-on-vse-packet

Default: Enabled
If this feature is enabled, the PDSN sends special 3GPP2 VSE PPP packets to the Mobile Node with a maximum inactivity timer value. This configuration is applicable only for PDSNsessions.

---

accept-ipv6-peer-ifield

Default: None
Configures an IPv6-to-IPv4 (6to4) tunnel and controls the behavior of IPv6CP negotiation for the Interface ID. If enabled, PDSN will accept a valid interface-id proposed by the peer.

---

data-compression { mode { normal | stateless } | protocols { *protocols* [*protocols*] }

Default: all protocols enabled.
Specifies the subscriber's mode of data compression or the compression protocol to use.
mode: sets the mode of compression where *modes* must be one of:

- **normal**: Packets are compressed using the packet history for automatic adjustment for best compression.

- **stateless**: Each packet is compressed individually.

protocols *protocols*: sets the compression protocol where *protocols* must be one of:

- **deflate**: DEFLATE algorithm
- **mppc**: Microsoft PPP algorithm
- **stac**: STAC algorithm

---

ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } }

Default: **force**

detect: The local side does not include the Van Jacobson (VJ) Compression option in its IPCP configuration request unless the peer sends an Internet Protocol Control Protocol (IPCP) NAK including a VJ compression option. If the peer requests the VJ compression option in its IPCP request the local side will ACK/NAK.

force: The IP header compression negotiation in IPCP happens normally. The local side requests the VJ compression option in its IPCP configure request. If the peer side requests VJ compression in its IPCP request, the local side will ACK/NAK the option.

vj compress-slot-id [both | none | receive | transmit]: Configures the direction in which VJ slotid compression should be negotiated.

- **both** - If the client proposes VJ slotid compression, accept it and propose slotid compression for the downlink and uplink.
- **none** - If the client proposes VJ slotid compression, NAK the offer, do not propose slotid compression for the downlink.
- **receive** - (Default) If the client proposes VJ slotid compression in the uplink direction accept the configuration.
- **transmit** - Propose VJ slotid compression for uplink.

---

ipv4 { disable | enable | passive }

Default: enable

Controls IPCP negotiation during PPP negotiation.

disable: The PDSN does not negotiate IPCP with the mobile.

enable: The PDSN negotiates IPCP with the mobile.

passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

---

ipv6 { disable | enable | passive }

Default: enable

Controls IPv6CP negotiation during PPP negotiation.

disable: The PDSN does not negotiate IPCP with the mobile.

enable: The PDSN negotiates IPCP with the mobile.

passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

---

keepalive *seconds*

Default: 30

Specifies the frequency of sending the Link Control Protocol keepalive messages. *seconds* must be either 0 or an integer from 5 through 14400. The special value 0 disables the keepalive messages entirely.

---

min-compression-size *min_octets*

Default: 128

Specifies the smallest packet (in octets) to which compression may be applied. *min_octets* must be an integer from 0 through 2000.

mtu *max_octets*

Default: 1500
Specifies the maximum transmission unit (MTU) [in octets] for packets. *max_octets* must be an integer from 100 through 2000.

remote-renegotiation disconnect { always | nai-prefix-msid-mismatch }

Default: Disabled
Terminates the already established PPP sessions if they are renegotiated by the remote side by sending LCP Conf-req/nak/ack. The following termination conditions are available:

- **always**: Automatically disconnects the session.
- **nai-prefix-msid-mismatch**: Disconnects the session only if the MSID of the session does not match NAI-Prefix (prefix before "@" for the NAI). The configuration of the renegotiated (new) NAI is used for the matching process.

Usage

Adjust packet sizes and compression to improve bandwidth utilization. Each network may have unique characteristics such that determining the best packet size and compression options may require system monitoring over an extended period of time.

Example

```
ppp data-compression protocols mode stateless

ppp mtu 500

no ppp data-compression protocols

no ppp keepalive
```

prepaid 3gpp2

Enables 3GPP2 compliant prepaid billing support for a subscriber to be configured by 3GPP2 attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored.

Product

HA, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
prepaid 3gpp2 { accounting [ no-final-access-request ] | duration-quota final-duration-
algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time }
| preference { duration | volume } }

default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }

no prepaid 3gpp2 accounting
```

`default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }`

Sets the 3GPP2 Pre-paid settings to the default values.
`duration-quota final-duration-algorithm`: Resets the end of billing duration quota algorithm to the default of current-time.
`preference`: Resets the preference to duration, If both duration and volume attributes are present.

`no prepaid 3gpp2 accounting`

Disables 3GPP2 prepaid accounting. All 3GPP2 Prepaid attributes received from a RADIUS server are ignored.

`accounting [ no-final-access-request ]`

Default: Disabled
Enables 3GPP2 prepaid accounting behavior.
Sets the low-watermark for remaining byte credits. *`percentage`* is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. *`percentage`* must be an integer from 1 through 99.
`no-final-access-request`: Stops sending final online access-request on termination of 3GPP2 prepaid sessions. By default, this option is disabled.

`duration-quota final-duration-algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time }`

Defines what behavior marks the end of the billing duration for duration-based quota usage accounting. The default behavior sets the duration quota algorithm to current-time.
Default: current-time
`current-time`: Selects the duration quota as the difference between the session termination timestamp and the session setup timestamp.
`last-airlink-activity-time`: Selects the duration quota as the difference between the last-user-activity timestamp (G17) and the session setup timestamp.

last-user-layer3-activity-time: Selects the duration quota as the difference between the timestamp of the last layer-3 packet sent to or received from the user and the session setup timestamp.

preference { duration | volume }

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration
duration: The duration attribute takes precedence.
volume: The volume attribute takes precedence

Usage

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

Example

The following command enables 3GPP2 prepaid support for the default user:

```
prepaid 3gpp2 accounting
```

prepaid custom

Enables custom prepaid billing support for a subscriber to be configured by attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored. The keywords set prepaid values that are used if the corresponding RADIUS attribute is not present. If the RADIUS attribute is present, it takes precedence over these values.

Product

HA, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
prepaid custom { accounting | byte-count compressed | low-watermark percent percentage |
renewal interval seconds } | preference { duration | volume }

default prepaid custom { byte-count | low-watermark }

no prepaid custom { accounting | byte-count compressed | low-watermark | renewal }
```

default prepaid custom { byte-count | low-watermark }

Resets custom prepaid settings to the default values.
byte-count: Resets to the default of basing the prepaid byte credits on the flow of uncompressed traffic.
low-watermark: Disables sending an access request to retrieve more credits when a low watermark is reached.

no prepaid custom { accounting | byte-count compressed | low-watermark | renewal}

byte-count compressed: The prepaid byte credits are based on the flow of uncompressed traffic. This is the default.
low-watermark: Disables the low watermark feature. An access-request is not sent to the RADIUS server until the credits granted for the subscriber session are depleted.
renewal: Disables time-based renewals for prepaid accounting.

accounting

Default: Disabled
Enables custom prepaid accounting behavior.

byte-count compressed

Default: uncompressed.
When compression is used, the prepaid byte credits are based on the flow of compressed traffic. The default is to base the prepaid byte credits on the flow of uncompressed traffic.

low-watermark percent *percentage*

Default: Disabled.
Sets the low-watermark for remaining byte credits. *percentage* is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. *percentage* must be an integer from 1 through 99.

renewal interval *seconds*

Default:
The time in seconds to wait before sending a new RADIUS access-request to the RADIUS server to retrieve more credits. *seconds* must be an integer from 60 through 65535.

preference { duration | volume }

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration
duration: The duration attribute takes precedence.
volume: The volume attribute takes precedence

Usage

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

Example

The following command enables custom prepaid support for the default user:

```
prepaid custom accounting
```

prepaid unclassify

This command provides customer specific functionality.

prepaid voice-push

This command provides customer specific functionality.

prepaid wimax

Enables WiMAX prepaid accounting for this subscriber. This feature is disabled by default.

Product

ASN-GW

Privilege

Administrator

Syntax

```
[ no ] prepaid wimax accounting
```

no

Disables WiMAX prepaid accounting for this subscriber.

Usage

Use this command to enable WiMAX prepaid accounting for this subscriber.

proxy-dns intercept list-name

Identifies a proxy DNS intercept rules list for the selected subscriber.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] proxy-dns intercept list-name *name*

no

Removes the intercept list from the subscribers profile.

proxy-dns intercept list-name *name*

Specifies a name of a proxy DNS intercept list used for the selected subscriber.
name is the name of the intercept list expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to identify a proxy DNS rules list for the selected subscriber. For a more detailed explanation of the HA Proxy DNS Intercept feature, see the **proxy-dns intercept-list** command in the *Context Configuration Mode Commands* chapter.

proxy-mip

Configures support for Proxy Mobile IP for the subscriber.

Product

PDSN, GGSN, ASN-GW, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] proxy-mip required
```

no

Disables support for Proxy Mobile IP.

required

Enables support for Proxy Mobile IP.

Usage

When enabled through the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP. For subscriber sessions using Proxy Mobile IP, R-P and PPP sessions are established as they would for a Simple IP session. However, the AGW/FA performs Mobile IP operations with an HA (identified by information stored in the subscriber's profile) on behalf of the MN while the MN performs only Simple IP processes.

Example

The following command enables proxy mobile IP for the current subscriber:

```
proxy-mip required
```

qos rate-limit

Configure the action on subscriber traffic flow that violates or exceeds the peak/committed data rate under traffic policing functionality. When configured, the PDG/TTG performs traffic policing for the subscriber session. If the GGSN changes the QoS via an Update PDP Context Request, the PDG/TTG uses the new QoS values for traffic policing.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
qos rate-limit { downlink | uplink } [ qci qci_val ] [ burst-size { bytes | auto-readjust
[ duration dur ] } ] [ exceed-action { drop | lower-ip-precedence | transmit } [ violate-
action { drop | lower-ip-precedence | shape [ transmit-when-buffer-full ] | transmit } ]
] | [ violate-action { drop | lower-ip-precedence | shape [ transmit-when-buffer-full ] |
transmit } [ exceed-action { drop | lower-ip-precedence | transmit } ] ] +no qos rate-
limit direction { downlink | uplink } [ qci qci_val ]
```

no

Disables the QoS data rate limit configuration for the subscriber.

---

downlink

Applies the specified limits and actions to the downlink (to the data coming from the GGSN over the Gn' interface).

---

uplink

Applies the specified limits and actions to the uplink (to the data coming from the UE over the IPSec tunnel).

Important: If this keyword is omitted, the same values are used for all classes.

---

qci *qci_val*

qci_val is the QoS Class identifier (QCI) for which the negotiate limit is being set expressed as an integer from 1 through 9. If no qci-val is configured, it will be taken as undefined-qci (same as undefined-qos class).

---

burst-size { *bytes* | auto-readjust [duration *dur*] }

Default: See the *Usage* section for this command
The burst size allowed (in bytes) for peak data rate and committed data rate.
bytes must be an integer from 1 through 6000000.

Important: The minimum value of this parameter should be configured to the greater of the following two values: 1) three times greater than the packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the "bucket" for the configured peak-data-rate. If the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

auto-readjust [duration *dur* **]** provides the option to calculate the Burst size dynamically while configuring rate-limit. When enabled. the system calculates the burst size using the GGSN QoS-negotiated rate that will be enforced.
Every time there is a change in the rates (due to an updated QoS), the burst sizes will be updated accordingly. This keyword also provides two different burst sizes. One burst size for peak rate and another for committed rate.
By default this keyword is disabled.
duration *dur* specifies the duration of burst in seconds. If the duration is not specified, the default is 1 second. *dur* must be an integer from 1 through 30.

---

exceed-action { drop | lower-ip-precedence | transmit }

Default: See the *Usage* section for this command
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop**: Drops the packets.
- **lower-ip-precedence**: Transmits the packets after lowering the ip-precedence.
- **transmit**: Transmits the packets.

---

violate-action { drop | lower-ip-precedence | transmit }

Default: See the *Usage* section for this command
Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **drop**: Drops the packets.
- **lower-ip-precedence**: Transmits the packets after lowering the IP precedence.
- **transmit**: Transmits the packet after lowering the IP precedence.

shape [transmit-when-buffer-full]: Enables traffic shaping and buffers user packets when subscriber traffic violates the allowed peak/committed data rate. The **[transmit-when-buffer-full]** keyword allows the packets to be transmitted when buffer memory is full.
transmit: Transmits the packet

Usage

This command configures APN quality of service (QoS) data rate shaping through traffic policing. This command specifies the actions to take on subscriber flows exceeding or violating allowed peak or committed data rates. The shaping function also provides an enhanced function to buffer the excessive user packets and send them to the subscriber when subscriber traffic drops below the committed or peak data rate limit.

Important: The buffering of user packets in traffic shaping does not apply for real-time traffic.

Important: If the exceed/violate action is set to “lower-ip-precedence”, this command may override the configuration of the **ip qos-dscp** command in the GGSN service Configuration mode for packets from the GGSN to the PDG/TTG. In addition, the GGSN service **ip qos-dscp** command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that this command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the PDG/TTG; it accepts all of the PDG/TTG-provided values for the PDP context.

Important: This command should be used in conjunction with the max-contexts command to limit the maximum possible bandwidth consumption by the APN.

For additional information on QoS traffic shaping and policing, see the *System Administration Guide.*

Default Values

The following table displays the default values for each of the traffic classes:

Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): 16000000 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): 8640000 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Streaming	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): 16000000 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): 8640000 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Interactive, Traffic Handling Priority: 1	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 2	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 3	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Background	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop

Usage

This command configures the APN quality of service (QoS) data rate shaping through traffic policing/shaping. This command specifies the actions to take on subscriber flows exceeding or violating allowed peak/committed data rates. The shaping function also provides an enhanced function to buffer the excessive user packets and send them to the subscriber when subscriber traffic drops below the committed or peak data rate limit.

Important: The buffering of user packets in traffic shaping does not apply for real-time traffic.

Important: If the exceed/violate action is set to "lower-ip-precedence", this command may override the configuration of the **ip qos-dscp** command in the GGSN service configuration mode for packets from the GGSN to the SGSN. In addition, the GGSN service **ip qos-dscp** command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context.

Important: This command should be used in conjunction with the **max-contexts** command to limit the maximum possible bandwidth consumption by the APN.

Default Values:

To calculate the burst size dynamically a new optional keyword **auto-readjust** [**duration** *dur*] is provided with **burst-size** keyword. By default the burst size is fixed if defined in bytes with this command. In other words irrespective of the rate being enforced, burst-size fixed as given in the **burst-size** *bytes* parameter.

For the need of variable burst size depending on the rate being enforced this new keyword **auto-readjust** [**duration** *dur*] is provided. Use of this keyword enables the calculation of burst size as per token bucket algorithm calculation as T=B/R, where T is the time interval, B is the burst size and R is the Rate being enforced.

It also provides different burst size for Peak and Committed data rate-limiting.

If **auto-readjust** keyword is not used a fixed burst size must be defined which will be applicable for peak data rate and committed data rate irrespective of rate being enforced.

If **auto-readjust** keyword is provided without specifying the duration a default duration of 1 second will be taken for burst size calculation.

Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak or committed data-rate bps in uplink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos rate-limit direction uplink violate-action shape transmit-when-
buffer-full
```

qos traffic-police

Enables and configures traffic policing through bandwidth limitations and action for the subscriber traffic if it exceeds or violates the peak or committed data rate. Uplink and downlink limits are configured separately.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

qos traffic-police direction { downlink | uplink } [burst-size *bytes* **] [committed-data-rate** *bps* **] [exceed-action { drop | lower-ip-precedence | transmit }] [peak-data-rate** *bps* **] [violate-action { drop | lower-ip-precedence | transmit }]**

no qos traffic-police direction { downlink | uplink }

downlink

Applies the specified limits and actions to the downlink (data to the subscriber).

uplink

Apply the specified limits and actions to the uplink (data from the subscriber).

burst-size *bytes*

Default: 3000
Specifies the allowed peak burst size allowed in bytes.
bytes must be an integer from 0 through 4294967295.

Important: This parameter should be configured to at least the greater of the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the "bucket" for the configured peak-data-rate.

committed-data-rate *bps*

Default: 144000
Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps).
bps must be an integer from 0 through 4294967295).

exceed-action { drop | lower-ip-precedence | transmit }

Default: lower-ip-precedence
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the ip-precedence
transmit: Transmits the packet

peak-data-rate *bps*

Default: 256000
Specifies the peak data-rate for the subscriber in bits per second (bps).
bps must be an integer from 0 through 4294967295).

violate-action { drop | lower-ip-precedence | transmit }

Default: drop
Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the IP precedence
transmit: Transmits the packet

no

Disables traffic policing in the specified direction for the current subscriber.

Usage

Use this command to limit the bandwidth a subscriber uses in the uplink and downlink directions.

Important: If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the **ip user-datagram-tos copy** command is configured to. In addition, the "lower-ip-precedence" option may also override the configuration of the **ip qos-dscp** command. Therefore, it is recommended that command not be used when specifying this option.

Details on the QoS traffic policing can be found in the *System Administration Guide*.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-police direction uplink peak-data-rate 128000 violate-action
lower-ip-precedence
```

The following command sets a downlink peak data rate of *256000* bps and drops packets when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-police direction downlink peak-data-rate 256000 violate-
action drop
```

qos traffic-shape

Enables and configures traffic shaping functionality when buffering the data packets during congestion or when the subscriber exceeds the configured peak or committed data rate limit. The system buffers the data packets during an instantaneous burst and deliver them to the subscriber when traffic flow drops below the peak or committed data rate. Uplink and downlink traffic shaping are configured separately.

Important: This feature is NOT supported for real-time traffic.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
qos traffic-shape direction { downlink | uplink } [ burst-size bytes ] [ committed-data-rate bps ] [ exceed-action { drop | lower-ip-precedence | transmit } ] [ peak-data-rate bps ] [ violate-action { drop | lower-ip-precedence | buffer [ transmit-when-buffer-full ] | transmit } ] +

no qos traffic-shape direction { downlink | uplink }
```

downlink

Applies the specified limits and actions to the downlink (data to the subscriber).

uplink

Applies the specified limits and actions to the uplink (data from the subscriber).

burst-size *bytes*

Default: 3000
Specifies the allowed peak burst size in bytes.
bytes must be an integer from 0 through 4294967295.

Important: It is recommended that this parameter be configured to at least the greater of the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

committed-data-rate *bps*

Default: 144000
Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps).
bps must be an integer from 0 through 4294967295).

exceed-action { drop | lower-ip-precedence | transmit }

Default: lower-ip-precedence

Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the ip-precedence
transmit: Transmits the packet

---

peak-data-rate *bps*

Default: 256000
Specifies the peak data-rate for the subscriber in bits per second (bps).
bps must be an integer from 0 through 4294967295).

---

violate-action { drop | lower-ip-precedence | buffer [transmit-when-buffer-full] | transmit }

Default: See the *Usage* section for this command
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the IP precedence
buffer [transmit-when-buffer-full]: Enables traffic shaping and buffers user packets when subscriber traffic violates the allowed peak/committed data rate. The **[transmit-when-buffer-full]** keyword allows the packet to be transmitted when buffer memory is full.
transmit: Transmits the packet

+

More than one of the above keywords can be entered within a single command.

---

no

Disables traffic policing for the specified direction for the current subscriber.

Usage

Use this command to provide the traffic shaping function to a subscriber in the uplink and downlink directions. This feature is providing a traffic flow control different to QoS traffic policing. When a subscriber violates or exceeds the peak data rate instead of dropping the packets, as in QoS traffic policing, this feature buffers subscriber data packets and sends the buffered data when the traffic flow is low or not in congestion state.

Important: If the exceed or violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed or violate the traffic limits regardless how the **ip user-datagram-tos copy** command is configured. In addition, the "lower-ip-precedence" option may also override the configuration of the **ip qos-dscp** command. Therefore, this command should not be used when specifying this option.

Details on the QoS traffic policing functionality is located in the System Administration Guide.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-shape direction uplink peak-data-rate 12800 violate-action
lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak-data-rate *256000* bps in downlink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos traffic-shape direction downlink peak-data-rate 256000 violate-action
buffer transmit-when-buffer-full
```

radius accounting

Sets the RADIUS accounting parameters for the subscriber or domain. This command takes precedence over the similar Context Configuration command and is disabled by default.

Product

All

Privilege

Administrator

Syntax

radius accounting { interim { interval-timeout *timeout* **| normal | suppress } | ip remote-address list-id** *list_id* **| mode { session-based | access-flow-based { none | auxillary-flows | all-flows | main-a10-only } } | start { normal | suppress } | stop { normal | suppress } }**

no radius accounting { ip remote-address list-id *list_id* **| interim [interval-timeout] }**

interim { interval-timeout *timeout* **| normal | suppress }**

interval-timeout *timeout*: Indicates the time (in seconds) between updates to session counters (log file on RADIUS or AAA event log) during the session. *timeout* must be an integer from 50 to 40000000.

Caution: Interim interval settings received from the RADIUS server take precedence over this setting on the system. While the low limit of this setting on the system is a minimum of 50 seconds, the low limit setting on the RADIUS server can be as little as 1 second. To avoid increasing network traffic unnecessarily and potentially reducing network and system performance, do not set this parameter to a value less than 50 on the RADIUS server.

normal: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

ip remote-address list-id *list_id*

Specifies the identification number of the IP address list to use for the subscriber for remote address-based accounting.
list_id: Specifies the RADIUS accounting remote IP address list identifier for remote-address accounting for the subscriber. *list_id* must be an integer from 1 through 65535.
This command is used as part of the Remote Address-based accounting feature and associates the subscriber with a list of remote addresses. Remote address accounting data is collected each time the subscriber communicates with any of the addresses specified in the list.
Remote address lists are configured using the **list** keyword in the **radius accounting ip remote-address** command in the Context Configuration mode.

mode { session-based | access-flow-based { none | auxillary-flows | all-flows | main-a10-only } }

Default: **session-based**
Specifies if the radius accounting mode is either session-based or access-flow-based.

session-based: configures session-based RADIUS accounting behavior for the subscriber - which means a single radius accounting message generated for the subscriber session not separate accounting messages for individual A10 connections or flows.
access-flow-based: configures access-flow-based RADIUS accounting behavior for the subscriber. This offers flexibility by generating separate accounting messages for flows and A10 sessions.

- **all-flows**: Generates separate RADIUS accounting messages per access flow. Separate accounting messages are not generated for data path connections. (For example, separate messages are not sent for the main A10 or auxiliary connections.).
- **auxillary-flows**: Generates RADIUS accounting records for the main data path connection and for access-flows for all auxiliary data connections. (For example, separate RADIUS accounting messages are generated for the main A10 session and for access-flows within auxiliary A10 connections. The main A10 session accounting does not include octets or other accounting information from the auxiliary flows.)
- **main-a10-only**: Configures access-flow-based single accounting messages (for example only single start/interim/stop) are generated for the main A-10 flows only.
- **none**: Generates separate RADIUS accounting messages for all data path connections (for example, PDSN main or auxiliary A10 connections) but not for individual access-flows. This is essentially A10 connection-based accounting.

---

start { normal | suppress }

normal: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

---

stop { normal | suppress }

normal: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

---

no

ip remote-address list-id *list_id*: Deletes the entry for the specified *list_id*.
interim [interval-timeout]: Disables the interim interval setting.

Usage

Use this command to allow a per-domain setting for the RADIUS accounting.

Example

Set the accounting interim interval to one minute (*60* seconds) for all sessions that use the current subscriber configuration:

```
radius accounting interim interval-timeout 60
```

Do not send RADIUS interim accounting messages:

```
radius accounting interim suppress
```

Sets the accounting message start normal for main A-10 flows only.

```
radius accounting mode main-a10-only start normal
```

radius group

Applies a RADIUS server group at the subscriber level for AAA functionality.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius group *group_name*

{ default | no } radius group

radius *group_name*

Specifies the name of the server group that is used for authentication and/or accounting for the specific subscriber. *group_name* must be an alphanumeric string of 1 through 63 characters. It must have been preconfigured within the same context of subscriber.

default

Sets or restores the default RADIUS server group specified at the context level or in the default subscriber profile.

no

Disables the applied RADIUS group for specific subscriber.

Usage

This feature provides the RADIUS configurables under radius group node. Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual RADIUS server group for subscriber in that context. Each server group consists of a list of AAA servers. IF no RADIUS group is applied for this subscriber or the default subscriber profile, the default server group available at context level is used for accounting and authentication of the subscriber.

Example

Following command applies a previously configured RADIUS server group named *star1* to a subscriber within the specific context:

```
radius group star1
```

Following command disables the applied RADIUS server group for the specific subscriber.

```
no radius group
```

radius returned-framed-ip-address

Sets the policy whether or not to reject a call when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-framed-ip-address 255.255.255.255-policy { accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied }

default radius returned-framed-ip-address 255.255.255.255-policy
```

accept-call-when-ms-ip-not-supplied

Accepts calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.

reject-call-when-ms-ip-not-supplied

Rejects calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.

default

Sets the policy to its default of rejecting calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.

Usage

Use this command to set the behavior for the current subscriber when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Example

The following command sets the subscriber profile to reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address:

```
radius returned-framed-ip-address 255.255.255.255-policy reject-call-when-ms-ip-not-supplied
```

rohc-profile-name

Identifies the robust header compression (RoHC) profile configuration that will be applied to bearer sessions belonging to this subscriber.

Product

HSGW,PDSN

Privilege

Administrator

Syntax

rohc-profile-name *name*

name

Specifies the name of the RoHC profile that the system will use to apply header compression and decompression parameters to bearer session data for this subscriber. *name* must be an existing RoHC profile expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify a RoHC configuration profile to be applied to bearer sessions belonging to this subscriber. RoHC profiles are configured through the Global Configuration Mode using the **rohc-profile** command.

Example

The following command specifies that the RoHC profile named *rohc-cfg1* is to be applied to all bearer sessions belonging to this subscriber:

```
rohc-profile-name rohc-cfg1
```

secondary ip pool

Specifies a secondary IP pool to be used as backup pool for Network Address Translation (NAT).

Important: This command requires the purchase and installation of a license. Please contact your Cisco sales representative for more information.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

secondary ip pool *pool_name*

no secondary ip pool

no

Removes the previous secondary IP pool configuration.

secondary ip pool *pool_name*

Specifies the secondary IP pool name.
pool_name must be an alphanumeric string of 1 through 31 characters.

Usage

Use this command to configure a secondary IP pool for NAT subscribers, which is not overwritten by the RADIUS supplied list. The secondary pool will be appended to the RADIUS supplied IP pool list or subscriber template provided IP pool list, as applicable, during call setup.

Example

The following command configures a secondary IP pool named *test123*:

```
secondary ip pool test123
```

simultaneous

Enables or disables the simultaneous use of both Mobile and Simple IP services.

Product

PDSN, FA, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] simultaneous simple-and-mobile-ip
```

no

Disables the simultaneous use.

Usage

Subscribers with mobile devices that concurrently support mobile and simple IP services require this option to be set.

Example

```
no simultaneous simple-and-mobile-ip

simultaneous simple-and-mobile-ip
```

timeout

Configures the subscriber session timeouts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout { absolute | idle } *seconds*

no timeout [absolute | idle]

timeout absolute

Default: 0
Specifies the absolute maximum time a session may exist (in seconds) in any state (active or dormant).

timeout idle

Default: 0
Specifies the maximum duration of the session (in seconds) before the system automatically terminates the session due to inactivity.

seconds

Specifies the maximum amount of time (in seconds) before the specified timeout action is activated. *seconds* must be an integer from 0 through 4294967295. The special value 0 disables the timeout specified.

no

Indicates the timeout specified is to be returned to its default behavior. If a timeout value is not specified, all timeouts are set to their default values.

Usage

Reduce the idle timeout to free session resources faster for use by new requests.

Example

```
timeout absolute 18000

no timeout
```

timeout long-duration

Configures the long duration timeout and optionally the inactivity duration of HA subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout long-duration *ldt_timeout* **[inactivity-time** *inact_timeout* **]**

[no | default]timeout long-duration

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

long-duration *ldt_timeout*

Default: 0
Designates the maximum duration of the session (in seconds) before the system automatically reports/terminates the session.
ldt_timeout must be a value in the range from 0 through 4294967295. The special value 0 disables the timer.

inactivity-time *inact_timeout*

Specifies the maximum amount of time (in seconds) before the specified session is marked as dormant.
inact_timeout must be a value in the range from 0 through 4294967295. The special value 0 disables the inactivity time specified.

Usage

Use this command to set the long duration timeout period and inactivity timer for subscriber sessions. Reduce the idle timeout to free session resources faster for use by new requests.
Refer to the **long-duration-action detection** and **long-duration-action disconnection** commands for more information.

Example

The following command sets the long duration timeout duration to *300* seconds and inactivity timer for subscriber session to *45* seconds:

```
timeout long-duration 300 inactivity-time 45
```

tpo policy

Specifies the Traffic Performance Optimization (TP)) policy for subscribers.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

tpo policy *tpo_policy_name*

{ default | no } tpo policy

default

Configures the default setting.
Default: Use the default TPO policy configured in the rulebase.

no

Deletes TPO policy from the subscriber configuration.

tpo policy *tpo_policy_name*

Specifies the name of the TPO policy as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the TPO policy for the subscriber template.

Example

The following command specifies to use the TPO policy named *tpo_policy_110*:

```
tpo policy tpo_policy_110
```

tunnel address-policy

Specifies the policy for address allocation and validation for all tunneled calls (IP-IP, IP-GRE) except L2TP calls. With this command enabled, GGSN IP address validation could be disabled for specified incoming calls.

For GGSN systems, this command can also be specified in the APN Configuration mode (**tunnel address-policy**) which would mean the system defers to the old **l3-to-l2-tunnel address policy** command for calls coming through L2TP tunnels.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default tunnel address-policy
```

alloc-only

Allocates IP addresses locally without validation.

alloc-validate

Default.
The VPN Manager allocates and validates all incoming IP addresses from a static pool of IP addresses.

no-alloc-validate

No IP address assignment or validation is done for calls coming in via L3 tunnels. Incoming static IP addresses are passed. This option allows for the greatest flexibility.

default

Resets the tunnel address-policy to **alloc-validate**.

Usage

This command supports scalable solutions for Corporate APN deployment as many corporations handle their own IP address assignments. In some cases this is done to relieve the customer or the mobile operators from the necessity of reconfiguring the range of IP addresses for the IP pools at the GGSN.

Example

The following command resets the IP address validation policy to validate against a static pool of address:

```
default tunnel address-policy
```

The following command disables IP address validation for calls coming through tunnels:

```
tunnel address-policy no-alloc-validate
```

tunnel ipip

Configures IP-in-IP tunnelling parameters for the current subscriber.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

tunnel ipip peer-address *peer_address* **local-address** *local_addr* **]**

no tunnel ipip

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the IP-in-IP tunnel.

local-address *local_addr*

Specifies the IP address of the interface in the destination context originating the IP-in-IP tunnel.

no

Disables IP-in-IP tunneling for the current subscriber.

Usage

Subscriber IP payloads are encapsulated with IP-in-IP headers and tunneled by the GGSN or PDSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using IP-in-IP and tunnel it from a local address of *192.168.1.100* to a gateway with an IP address of *192.168.1.225*:

```
tunnel ipip peer-address 192.168.1.225 local-address 192.168.1.100
preference 1
```

tunnel ipsec

Configures sessions for the current subscriber to use an IPSec tunnel based on the IP pool corresponding to the subscriber's assigned IP address.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
tunnel ipsec use-policy-matching-ip-pooler-address

no tunnel ipsec use-policy-matching-ip-pooler-address
```

no

Disables the use of the IPSec policy that matches the IP pool that the assigned IP address relates to.

Usage

Use this command to set the current subscribers sessions to use an IPSec policy that is assigned to the IP pool that the subscribers assigned IP address relates to.

Example

The following command enables the use of the policy that matches the IP pool address:

```
tunnel ipsec use-policy-matching-ip-pooler-address
```

tunnel l2tp

Configures L2TP tunnel parameters for the subscriber.

Product

All products supporting L2TP

Privilege

Security Administrator, Administrator

Syntax

tunnel l2tp [peer-address *ip address* **[[encrypted] [secret** *secret*]] [**preference** *number*] **[tunnel-context** *context* **] [local-address** *ip_address* **] [crypto-map** *map_name* **{ [encrypted] isakmp-secret** *secret* **}]]**

no tunnel l2tp [peer-address *ip_address* **]**

---

peer-address *ip_address*

A peer L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *ip_address* must be an IP address entered using IPv4 dotted-decimal or IPv6 colon-separated format.

[encrypted] secret *secret*

Specifies the shared key (secret) between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *secret* must be an alphanumeric string of 1 through 63 characters that is case sensitive.
encrypted: Specifies the encrypted shared key between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *secret* must be an alphanumeric string of 1 through 128 characters that is case sensitive.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

---

preference *number*

Default: 1
Specifies the order in which a group of tunnels configured for this subscriber will be tried. *number* must be an integer from 1 through 65535.

---

tunnel-context *context*

Specifies the name of the context containing ports through which this subscriber's data traffic is to be communicated between this LAC and the LNS. *context* must be an alphanumeric string of 1 through 79 characters.

---

local-address *ip_address*

Specifies a LAC service bind address which is given as a hint that is used to select a particular LAC service. *ip_address* must be an IP address entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

crypto-map *map_name* **{ [encrypted] isakmp-secret** *secret* **}**

Specifies the name of a crypto map that has been configured in the current context. *map_name* must be an alphanumeric string from 1 to 127 alphanumeric characters.
isakmp-secret *secret*: Specifies the pre-shared key for the Internet Key Exchange (IKE). *secret* must be an alphanumeric string of 1 through 127 characters.
encrypted isakmp-secret *secret*: Specifies the pre-shared key for IKE. Encryption must be used when sending the key. *secret* must be an alphanumeric string of 1 through 127 characters.

no

Disables tunneling for the current subscriber. When peer-address is included, the tunneling for that specific L2TP Network Server (LNS) is disabled but tunneling to other configured LNSs is still enabled.

Usage

Use this command to configure specific L2TP tunneling parameters for the current subscriber.

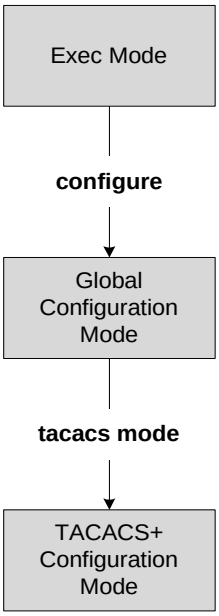
Example

To specify L2tp tunneling to the LNS peer at the IP address *198.162.10.100* with a shared secret of *bigco* and preference of *1*, enter the following command:

```
tunnel l2tp peer-address 198.162.10.100 secret bigco preference 1
```

Chapter 262
TACACS+ Configuration Mode Commands

This chapter describes all commands available in the TACACS+ Configuration Mode. TACACS+ (Terminal Access Controller Access-Control System Plus) is a secure, encrypted protocol. By remotely accessing TACACS+ servers that are provisioned with the administrative user account database, the ASR 000 supports TACACS+ accounting and authentication services for system administrative users.



Important: TACACS Configuration Mode is available in releases 11.0 and later.

accounting

Enables the recording of the start and the stop time each command issued during a TACACS+-authenticated CLI session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] accounting { start-stop | command }
```

no

Disables a configured TACACS+ accounting setting (either **accounting start-stop** or **accounting command**).

{start-stop | command}

Specifies the type of accounting records to be recorded.

- **start-stop**: Records the time at which the session starts (the time at which the user passes authentication) and the time at which the user exits. If a user exits before passing authentication, only a stop time is recorded.
- **command**: Enables accounting on a command-by-command basis. The TACACS+ server is contacted prior to the execution of the command and the command which is about to be executed is recorded. Only commands which are valid for the user privilege and context (mode) in which they are about to be executed will be recorded. Note that the ASR 5000 does not record whether the command itself succeeded or failed. For security reasons, some secure or restricted commands are not recorded. In such cases, the accounting record will record the command as three asterisks ("***").

Usage

Use this command to configure the accounting method for TACACS+-based CLI sessions.

authorization

Enables the authorization of TACACS+ CLI users on a command-by-command, command + command argument, or command prompt basis. If the user is not authorized to execute the command, the command will fail.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] authorization { command | prompt | arguments }
```

no

Disables a configured TACACS+ authorization **command**, **prompt**, or **arguments** setting.

{ command | prompt | arguments }

Specifies the type of authorization behavior to enforce:

- **command**: Enables per-command authorization. The TACACS+ server is contacted for each command and each command is authorized for the user. If the user is not authorized to execute the command, then the command fails. If the user is authorized for the command, the command is executed.
- **prompt**: Enables per-command authorization, as described for the **command** option above. However, since commands may be duplicated in different CLI modes, this version of the command authorization also passes the command prompt string to the server. The TACACS+ server is contacted for each prompt and command and must have a matching string for the prompt/command combination. Enabling **prompt** authorization supersedes **command** authorization, since the prompt and command must be authorized together.
- **arguments**: Enables per-command and command + argument authorization. The TACACS+ server authorizes each command and its arguments for the user. If the user is not authorized to execute the command and the corresponding arguments, the command fails. If the command does not contain any arguments, then the command only is passed to the authorization server.

Usage

Use this command to configure the authorization method for TACACS+-based CLI sessions.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

on-authen-fail

Defines system behavior when an administrative login fails due to a TACACS+ authentication failure. This command also can be used to configure system behavior separately for TACACS+ authentication failures for administrative users accessing the system via the ASR 5000 console port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
on-authen-fail { continue | stop } [ tty console ]
```

`{ continue | stop }`

Specifies the type of authentication behavior to enforce:

- **`continue`**: After a TACACS+ authentication failure, the system will continue with authentication using non-TACACS+ authentication services.
- **`stop`**: After a TACACS+ authentication failure, the system forces the failed TACACS+ user to exit.

`tty console`

Release 12 and later systems only: Used after the **`stop`** or **`continue`** parameters to specify system behavior for users being authenticated via the ASR 5000 console port:

- **`stop tty console`**: Forces the failed TACACS+ user to exit.
- **`continue tty console`**: The system will continue with authentication using non-TACACS+ authentication services.

Usage

Use this command to configure system behavior for users that fail TACACS+ authentication.

on-network-error

Configures ASR 5000 behavior when a TACACS+ login fails due to a network error. This command also can be used to configure system behavior separately for TACACS+ network error login failures for administrative users accessing the system via the ASR 5000 console port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
on-network-error { continue | stop } [ tty console ]
```

`continue`

The system will continue with authentication using non-TACACS+ authentication services.

`stop`

The system forces the failed TACACS+ user to exit.

`tty console`

Release 12 and later systems only: Can be used after the **`continue`** or **`stop`** options to specify system behavior for TACACS+ CLI users being authenticated via the console port on the chassis:

- **`stop tty console`**: Forces the failed user to exit when authentication fails.
- **`continue tty console`**: The system will continue with authentication using non-TACACS+ authentication services.

Usage

Use this command to configure system behavior for users who fail TACACS+ authentication due to a network error.

on-unknown-user

Configures ASR 5000 behavior when a TACACS+ server cannot authenticate a given user name. This command also can be used to configure system behavior separately for TACACS+ unknown user login failures for administrative users accessing the system via the ASR 5000 console port.

Important: Some TACACS+ server implementations will not send a Reply message indicating that the user name is invalid. Instead, these types of implementations will accept the username, whether valid or not, and then examine the username and password in combination before sending a Reply message indicating a failed TACACS+ login. In these cases, specifying **`on-unknown-user`** will not enforce the desired system behavior. To avoid this scenario, determine the method the configured TACACS+ servers will use to validate user names before deciding whether specifying the **`on-unknown-user`** command will provide the desired result.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
on-unkown-user { continue | stop } [ tty console ]
```

`{ continue | stop }`

Specifies the particular behavior to enforce:

- **`continue`**: The system continues with authentication using non-TACACS+ authentication services.
- **`stop`**: The system forces the failed TACACS+ user to exit.

[

`tty console`

Release 12 and later systems only: Can be used after the **`continue`** or **`stop`** options to specify the behavior of the system for TACACS+ CLI users being authenticated via the console port on the chassis.

- **`stop tty console`**: The system forces the failed user to exit when authentication fails.
- **`continue tty console`**: The system will continue with authentication using non-TACACS+ authentication services.

Usage

Use this command to configure ASR 5000 behavior for users who fail TACACS+ user name authentication.

server

Configures TACACS+ AAA service-related parameters for use in authenticating ASR 5000 administrative users via a TACACS+ server.

Important: Once a TACACS+ server is configured with the **server** command, TACACS+ AAA services for the ASR 5000 must be enabled using the **aaa tacacs+** command in Global Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] server priority *priority_number* **ip-address** *ip_address* **[service { authentication | authorization | accounting }] [port** *port_number* **] [{ encrypted password** *shared_secret* **| password** *text_password* **| key** *text_password* **}] [timeout** *seconds* **] [retries** *num_retries* **] [nas-source-address** *ip_address* **]**

no

Removes a specified **server priority** from the TACACS+ server list.

priority

Specifies the order in which TACACS+ servers are to be tried. A maximum of three TACACS+ AAA servers can be configured. *priority_number* can be an integer from 1 (highest priority) to 3 (lowest priority). If no server with priority 1 is specified, the next highest priority is used. If the specified priority matches that of a TACACS+ server already configured, any previously defined server configuration parameter(s) for that priority are returned to the default setting(s).

ip-address

Specifies the IP address of the TACACS+ server in IPv4 dotted-decimal notation. Only one IP address can be defined for a given **server priority**

[service { authentication | authorization | accounting }]

service: *Release 12 and later systems only*: Specifies one or more of the AAA services that the specified TACACS+ server will provide. Use of the **service** keyword requires that at lease one of the available services be specified. If the **service** keyword is not used, the ASR 5000 will use the TACACS+ server for all AAA service types. The default is to use authentication, authorization and accounting. Available service types are:

- **authentication**: The specified TACACS+ server should be used for authentication. If a TACACS+ authentication server is not available, TACACS+ will not be used for authorization or accounting.
- **authorization**: The specified TACACS+ server should be used for authorization. If TACACS+ authentication is not used, TACACS+ authorization will not be used. If no authorization server is specified and the user is authenticated, the user will remain logged in with minimum privileges (Inspector level).
- **accounting**: The specified TACACS+ server should be used for accounting. If TACACS+ authentication is not used, TACACS+ accounting will not be used. If no accounting server is specified and the user is authenticated, no accounting will be performed for the user.

port

Specifies the TCP port number to use for communication with the TACACS+ server. *port_number* can be an integer from 1 through 65535. If a port is not specified, the ASR 5000 will use port 49.

[{ encrypted password *shared_secret* **| password** *text_password* **| key** *text_password* **}]**

Specify the encrypted or plain-text password:

- **encrypted password** *shared_secret*: Specifies the encrypted value of the shared secret key. The server-side configuration must match the decrypted value for the protocol to work correctly. If **encrypted password** is specified, specifying **password** is invalid. No encryption is used if this value is null (""). The encrypted password can be an alphanumeric string of 1 through 100 characters. If neither an **encrypted password** or **password** is specified, the ASR 5000 will not use encryption
- **password** *plain_text_password*: **Release 12.0 and later systems**. Instead of using an encrypted password value, the user can specify a plain-text value for the password. If the **password** keyword is specified, specifying **encrypted password** is invalid. A null string (“”) represents no encryption. The password can be an alphanumeric string of 1 through 32 characters. If neither an **encrypted password** or **password** is specified, then the ASR 5000 will not use encryption.
- **key** *plain_text_password*: **Release 11.0 systems only**. Instead of using an encrypted password value, the user can specify a plain-text key value for the password. If the **key** keyword is specified, then specifying **encrypted password** is invalid. A null string represents no encryption. The password can be from 1 to 32 alphanumeric characters in length. If neither an **encrypted password** or **key** is specified, then the ASR 5000 will not use encryption.

[timeout *seconds* **]**

Specifies the number of seconds to wait for a connection timeout from the TACACS+ server. *seconds* can be an integer from 1 through 1000. If no timeout is specified, the ASR 5000 will use the default value of 10 seconds.

[

retries *number*

Release 12 and later systems only: Specifies the number of retry attempts at establishing a connection to the TACACS+ server if the initial attempt fails. **retries** *number* can be an integer from 0 through 100. The default is 3. Specifying 0 (zero) retries results in the ASR 5000 trying only once to establish a connection. No further retries will be attempted.

nas-source-address *ip_address*

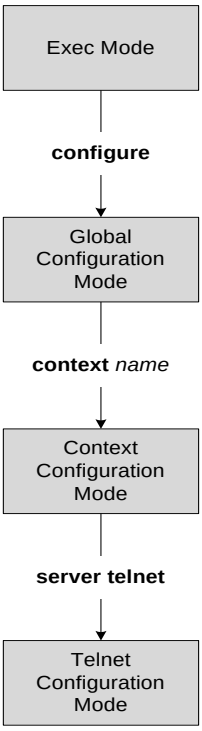
Release 12 and later systems only: Sets the IPv4 address to be specified in the Source Address of the IP header in the TACACS+ protocol packet sent from the NAS to the TACACS+ server. *ip_address* is entered using IPv4 dotted-decimal notation and must be valid for the interface.

Usage

Use this command to specify TACACS+ service parameters for a specified TACACS+ server.

Chapter 263
Telnet Configuration Mode Commands

The Telnet Configuration Mode is used to manage the telnet server options for the current context.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

max servers

Configures the maximum number of telnet servers that can be started within any 60-second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *count*

count

Default: 40
Specifies the maximum number of servers that can be spawned in any 6- second interval. *count* must be an integer from 1 through 100.

Usage

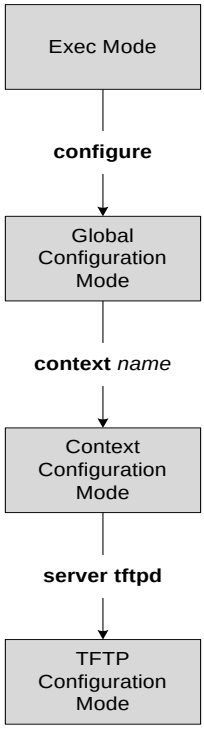
Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

Example

```
max servers 50
```

Chapter 264
TFTP Configuration Mode Commands

The TFTP configuration mode is used to manage the TFTP (Trivial File Transfer Protocol) servers for the current context.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

max servers

Configures the maximum number of TFTP servers that can be started within any 60-second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *count*

count

Default: 40
Specifies the maximum number of servers that can be spawned in any 60-second interval. *count* must be an integer from 1 through 100.

Usage

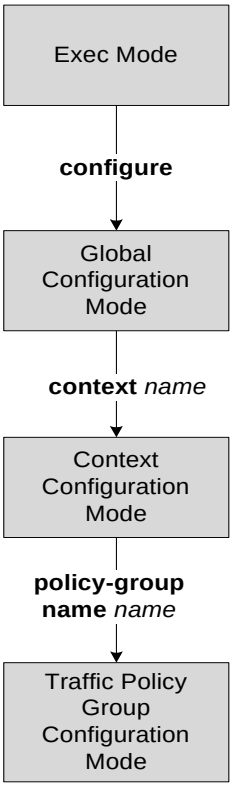
Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that TFTP services do not cause excessive system impact to other services.

Example

```
max servers 50
```

Chapter 265
Traffic Policy Group Configuration Mode Commands

Policy-Group is used to form a set of configured Policy-Maps for the Traffic Policy feature. Multiple policies can be applied for a subscriber session flow within a destination context.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

policy

Assigns traffic policies, pre-configured in Policy-Map Configuration mode, to a Policy Group for flow-based traffic policing of a subscriber session flow.

Product

PDSN, HA, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

[no] policy *policy_map_name* **precedence** *value* **direction [in | out]**

---

no

Disables/removes configured policy for traffic policing.

---

direction [in | out]

Specifies the direction in which the policies need to be applied.

---

policy *policy_map_name*

Specifies the policy name as an alphanumeric string of 1 through 15 characters.

---

precedence *value*

Specifies the precedence of traffic policies to resolve.
value is an integer from 1 through 16. If a session flow matches multiple policies, this keyword resolves them.

Usage

Use this command to form a policy-group with a set of pre-configured Policy-Maps.

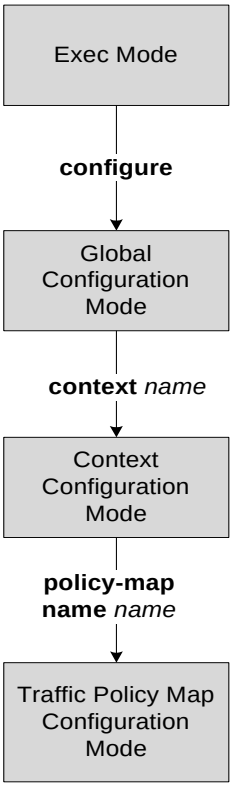
Example

The following commands assigns the traffic policy *policymap1* with precedence *2*.

```
policy policymap1 precedence 2
```

Chapter 266
Traffic Policy-Map Configuration Mode Commands

A Policy-Map imposes a flow-based traffic policy for Traffic Policy feature within a destination context. It designates the flow treatment based on the classification rules configured in Class-Map mode for a subscriber session flow.



3gpp2 data-over-signaling

Configures 3GPP2-related flow treatment policy for the flow-based traffic policing of subscriber sessions.

Product

PDSN, HA, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

3gpp2 data-over-signaling marking [class-map *class_name* **]**

no 3gpp2 data-over-signaling marking

no

Disables configured 3GPP2-related flow treatment policy.

class-map *class_name*

Associates class map to be used for selective data over signaling (DOS) marking. *class_name* is an alphanumeric string of 1 through 15 characters.

marking

Indicates 3GPP2-related traffic flow for data over signaling channel.

Usage

Use this command to mark traffic flows for 3GPP2-related policy.

Example

```
3gpp2 data-over-signaling marking
```

access-control

Configures the access control action for traffic flows matching the Class-Map rules.

Product

PDSN, HA, ASN GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
access-control { allow | discard }
```

allow

Allows the packets, if the policy matches with the criteria defined in the Class-Map assigned to the specific traffic policy.

discard

Discards the packets, if the policy matches with the criteria defined in the Class-Map assigned to the specific traffic policy.

Usage

Configures the action or treatment for traffic flows match criteria specified in the assigned Class-Map.

Example

The following command allows the packets or traffic flow on matching with criteria specified in assigned Class-Map for specific traffic policy.

```
access-control allow
```

accounting suppress

Suppresses accounting action for traffic flows matching the policy map.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] accounting suppress
```

no

Removes the suppression of accounting for traffic flow matching this policy map.

Usage

Use this command to suppress accounting action on traffic flow matching this policy map.
Policy maps configured for accounting suppression are used to implement the QChat Billing Suppression feature that selectively starts and terminates accounting sessions based on the categorization of traffic as being interesting or non-interesting. See the **accounting trigger** command.

Example

The following command configures suppression of accounting on traffic flows matching this policy map:

```
accounting suppress
```

accounting trigger

Configures an accounting trigger policy map to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting. This command supports the QCHAT Billing Suppression feature.

Product

PDSN, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

`[ no | default ] accounting trigger { inactivity-timeout | interesting-traffic | intra-service-handoff }`

`default`

Sets or restores the default value assigned for specified parameter.

`no`

Disables previously configured triggers.

`inactivity-timeout`

Generates an accounting Stop message if there has been no data activity on the session for the interim accounting timeout interval.
Default: disabled

`interesting-traffic`

Generates an accounting Start message upon arrival of interesting traffic.
Default: disabled

`intra-service-handoff`

Generates accounting Start and Stop messages during intra-service handoffs.
Default: enabled
If disabled, the messages are suppressed during the handoffs. The current accounting session continues and no Stop or Start messages are generated during the intra-service handoff.

Usage

Use this command to configure an accounting trigger policy map (ATPM) to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting. This command supports the QChat Billing Suppression feature.
Interesting traffic is identified as traffic that does not match any of the other Accounting Policy Maps (APMs) configured for accounting suppression. See the **`accounting suppress`** command.
An ATPM is similar to an APM, but without the class map rules. The ATPM is configured as of type accounting using the **`type accounting`** command.
Optionally, timeout can be triggered when there is no data traffic for the interim accounting timeout interval using the **`accounting trigger inactivity-timeout stop`** command. On timeout, the accounting

session is terminated and an Accounting Stop message is sent. A new accounting session is created if interesting traffic resumes.
In the ATPM, the trigger to start accounting for interesting traffic is configured using the **accounting trigger interesting-traffic** command. Accounting Start is triggered on arrival of interesting traffic, or change in airlink parameters conveyed through active-start airlink record. If an active-start record was included in the initial connection setup, Accounting Start is not triggered. But if the active-start comes separately and is the first one for the session, it is treated as airlink change and an Accounting Start is sent. The ATPM should have the lowest precedence among the APMs.
As the airlink events are generated on the ingress side, the ATPM must be included in a policy group that is applied to the ingress direction in the subscriber profile. The configuration is applicable only for standard trigger policy and session based accounting mode.

Example

The following command sets the trigger to generate accounting start message upon arrival of interesting traffic:

```
accounting trigger interesting-traffic
```

class-map

Assigns a traffic classification rule (Class-Map) to the policy map.

Product

PDSN, HA, ASN GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

[no] class-map *name*

no

Enables or disables **class-map**.

name

Specifies the name of the class map assigned for this policy map. The class map should have been preconfigured via the Class Map Configuration Mode.
name must be an alphanumeric a string of 1 through 15 characters.

Usage

Use this command to assign a class map to the policy map for traffic policing. The class map is configured in the Class Map Configuration Mode.

Example

The following command assigns the class map *classification1* to the current policy map:

```
class classification1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

flow-tp-trigger

This command specifies that the traffic volume will be calculated based on the traffic on the flow.

Product

PDSN, HA, ASN GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

flow-tp-trigger volume *traffic_volume_threshold*

no flow-tp-trigger volume

traffic_volume_threshold

Specifies the volume threshold to trigger traffic policing. *volume* must be an integer from 1 through 4294967295.

Usage

This command is available if you have purchased and installed the Intelligent Traffic Control License on your system. Use this command to calculate the traffic volume based on the traffic on the flow.

Example

```
flow-tp-trigger volume 500
```

ip header-compression

Enables the system to mark IP flows for Robust Header Compression (RoHC).

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip header-compression rohc flow-marking
```

no

Disables the setting.

rohc flow-marking

Marks the IP flow for SO67 and PPP RoHC.

Usage

Use this command to mark IP flows for SO67 and PPP RoHC.

Example

```
ip header-compression rohc flow-marking
```

qos encaps-header

Enables and configures Quality of Service (QoS) policy to use Differentiated Service Code Point (DSCP) marking in IP header fields for the flow-based traffic policing to subscriber session flow.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

qos encaps-header dscp-marking { *dscp_code* | copy-from-user-datagram [ignore-pcf-signaled-dscp] | user-datagram }

no qos encaps-header dscp-marking { *dscp_code* | copy-from-user-datagram [ignore-pcf-signaled-dscp] }

no

Enables/Disables the **qos encaps-header**.
The value must be expressed as a hexadecimal value from 0x00 through 0x3F.

dscp-marking *dscp_code*

Uses the DSCP code value marked in the IP header of packet/flow to determine the QoS for traffic policing. *dscp_code* must be expressed as a hexadecimal number from 0x00 through 0x3F.

copy-from-user-datagram

Uses the DSCP code value from the user datagram (UDP header) to determine the QoS for traffic policing.

ignore-pcf-signaled-dscp

Overrides the highest priority DSCP value signaled by the PCF.

user-datagram

Uses the DSCP value copied from the user datagram.

Usage

Use this command to apply the QoS policy based on the DSCP value encapsulated in the IP packet header to police subscriber session traffic flows.

Important: For more information on the QoS traffic policing, see the *System Administration Guide*.

Example

The following command sets QoS policy with DSCP code value to *0x0C* for Class 1, silver (AF12):

```
qos encaps-header dscp-marking 0x0c
```

qos traffic-police

Enables and configures Quality of Service (QoS) policy for flow-based traffic policing of subscriber session flows on a per-flow basis.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

qos traffic-police committed *bps* **peak** *bps* **burst-size** *byte* **exceed-action { drop | lower-ip-precedence | allow } violate-action { drop | lower-ip-precedence | allow }**

no qos traffic-police

---

no

Enables/Disables the **qos traffic-police**

Important: This parameter should be configured to be greater than the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the "bucket" for the configured peak-data-rate.

---

burst-size *bytes*

Default: 3000
Specifies the allowed peak burst size in bytes. *bytes* must be an integer from 0 through 4294967295.

Important: This parameter should be configured to be greater than the following two values: 1) three times greater than the packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the "bucket" for the configured peak-data-rate.

---

committed *bps*

Default: 144000
Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps).
bps must be an integer from 0 through 4294967295.

---

exceed-action { drop | lower-ip-precedence | allow }

Default: **lower-ip-precedence**
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the ip-precedence
allow: Transmits the packet

---

peak *bps*

Default: 256000

Specifies the peak data-rate for the subscriber in bits per second (bps).
bps must be an integer from 0 through 4294967295.

violate-action { drop | lower-ip-precedence | allow }

Default: drop
Specifies the action to take on the packets that exceed both the committed-data-rate and the peak-data-rate.
The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the IP precedence
allow: Transmits the packet

Usage

Use this command to apply the QoS policy to a subscriber session flow for flow-based traffic policing.

Important: For additional information on the QoS traffic policing, see the *System Administration Guide*.

Example

The following command sets the committed data rate to *102400* bps with a peak data rate of *128000* bps and a burst size of *2048* bytes. This lowers the IP precedence when the committed-data-rate is exceeded and drops the packets when the peak-data-rate are violated:

```
qos traffic-police commited 102400 peak 128000 burst-size 2048 exceed-
action lower-ip-precedence violate-action drop
```

qos user-datagram dscp-marking

Enables and configures Quality of Service (QoS) policy related to differentiated service code point (DSCP) marking in the user datagrams of subscriber session flows on a per-flow basis.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

qos user-datagram dscp-marking *dscp_code*

no qos user-datagram dscp-marking

dscp_code

Specifies the use of the DSCP code value marked in the IP header of packet/flow to determine the QoS for traffic policing. *dscp_code* must be expressed as a hexadecimal number from 0x00 through 0x3F.

Usage

Use this command to apply the QoS policy to subscriber session flow by DSCP marking in user datagram.

Example

The following command sets DSCP marking for user datagram as *0x01* for QoS to subscriber session flow:

```
qos user-datagram dscp-marking 0x01
```

sess-tp-trigger

Configures the trigger for traffic policing based on the traffic volume for a subscriber session.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

sess-tp-trigger volume *volume* **direction { both | downlink | uplink }**

no sess-tp-trigger

no

Enables or disables the **sess-tp-trigger**

volume

Specifies the traffic volume threshold (in bytes) that triggers traffic control. *volume* is an integer from 1 through 4294967295.

Usage

Use this command to trigger traffic control based on the traffic volume for a subscriber session. This command requires the purchase and installation of a license.

Example

```
sess-tp-trigger 500
```

type

Specifies the type of traffic policy within a specific Policy-Map.

Product

PDSN, HA, ASN GW, HSGW, P-GW, SCM

Privilege

Administrator

Syntax

type { accounting | dynamic { three-gpp2 rev-A profile-id { any | id *profile_id* **| range** *low_value* **to** *high_value* **} flow-id { any | id** *flow_id* **| range** *low_value* **to** *high_value* **} | pre-provisioned wimax asn-service-profile-id { any | id** *service_id* **} asn-pdfid { any | id** *pdf_id* **} | static | template }**

accounting

Specifies the type of traffic policing as accounting for this specific policy map. This configuration is used for enabling/disabling the accounting of different flows matching conditions within this Policy-Map.

dynamic

Identifies the type of policy map as dynamic.

three-gpp2 rev-A

Configures the dynamic policy map type for CDMA2000-3GPP2 RevA service.

profile-id { any | id *profile_id* **| range** *low_hex* **to** *high_hex* **}**

Specifies the profile id matching within this policy map.
any: allows any profile identifier matching this policy map.
id *profile_id*: allows specific profile identifier matching with in this policy map. *profile_id* must be a hexadecimal number from 0x0 to 0xFFFF.
range *low_value* **to** *high_value*: identifies a range in which a profile identifier must fall within to be considered a match. *low_value* and *high_value* must be either a hexadecimal number from 0x0 to 0xFFFF, or an integer from 0 through 65535 characters.

flow-id { any | id *flow_id* **| range** *low_hex* **to** *high_hex* **}**

Specifies the flow id matching in this policy map.
any allows any flow identifier matching with in this policy map.
id *flow_id* allows specific flow identifier matching with in this policy map. *flow_id* must be either a a hexadecimal number from 0x0 to 0xFFFF, or an integer from 0 to 65535.
range *low_value* **to** *high_value*: identifies a range in which a flow identifier must fall within to be considered a match. *low_value* and *high_value* must be either a hexadecimal number from 0x0 to 0xFFFF, or an integer 0 to 65535.

pre-provisioned

Identifies the type of policy map as pre-provisioned.

wimax

Configures WiMAX service policy map in an ASN-GW service.

asn-service-profile { any | id *service_id* **}**

Specifies the ASN Service profile identifier to match with in this policy map.
any: Allows any ASN Service Profile Identifier matching within this policy map.
id *service_id*: Allows specific Service Profile matching to a specified identifier. *service_id* must be an integer from 1 to 65535 that matches a service ID that was configured in the Subscriber Configuration Mode.

asn-pdfid { any | id *pdf_id* **}**

Specifies the ASN Packet Data Flow Identifier to match with in this policy map.
any: Allows any ASN Packet Data Flow Identifier matching within this policy map.
id *pdf_id*: Allows specific Packet Data Flow matching to a specified identifier. *pdf_id* must be an integer from 1 to 255 that matches a PDF ID that was configured in the Subscriber Configuration Mode.

static

Specifies the type of traffic policing as static for this specific Policy Map. In this type of policy, the traffic flow classification and flow treatment is pre-defined with classification rules through Class-Map configuration.
This is the detailed type of policy map.

template

Specifies the type of traffic policy to as a template to all subscribers associated with this policy map.

Usage

Specifies the type of traffic policy within the specific Policy-Map.

Example

The following commands configures the traffic policy for this Policy-Map as static:

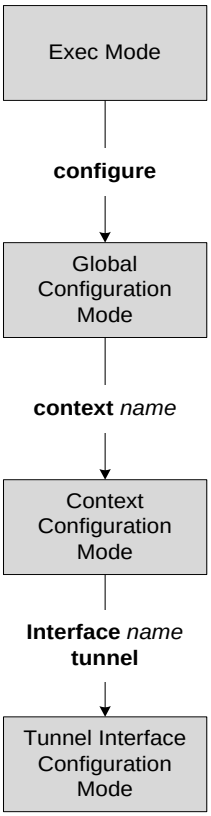
```
type static
```

The following commands configures the traffic policy for this Policy-Map as pre-provisioned for WiMAX service requiring a match of any service profile and PDF id of *3*:

```
type pre-provisioned wimax asn-service-profile any asn-pdfid id 3
```

Chapter 267
Tunnel Interface Configuration Mode Commands

The Tunnel Interface Configuration Mode is used to create and manage the IP interfaces for various types of tunnels including associated parameters, such as addresses and address resolution options.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

description

Enters descriptive text for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Clears the description for the interface.

text

Contains the descriptive text for this interface. *text* must be an alphanumeric string of 0 through 79 characters. If spaces are required, the string must be bracketed with double quotation marks (“). The interface description is case sensitive.

Usage

Set the description to provide useful information regarding the interface’s primary function, services, end users, etc.

Example

The following command describes this interface:

```
description sampleInterfaceDescriptiveText
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ip address

Configures the IPv4 address for this tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip address [*ip_address***/***ip_mask* **|** *ip_address ip_mask***]**

no ip address *ip_address*

no

Removes the configured IPv4 address bound to a tunnel interface.

*ip_address***/***ip_mask* **|** *ip_address ip_mask*

Specifies a destination IP address or group of addresses that will use this route.
*ip_address***/***ip_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. *ip_address***/***ip_mask* must be specified using IPv4 dotted-decimal and CIDR notation. *ip_mask*is an integer which is the number of bits in the subnet mask.
ip_address ip_mask: Specifies an IP address and the networking (subnet) mask pair which is used to identify the set of IP addresses to which the route applies. *ip_address* must be specified using the IPv4 dotted-decimal notation. *ip_mask* must be specified using the IPv4 dotted-decimal notation as network mask for subnets.
The mask as specified by *ip_mask* or resulting from *ip_address***/***ip_mask* is used to determine the network for packet routing.
Zeroes ("0") in the resulting mask indicate that the corresponding bit in the IP address is not significant in determining the network for packet routing.
Ones ("1") in the resulting mask indicate the corresponding bit in the IP address is significant in determining the network.

Usage

Use this command to bind the IPv4 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

Example

The following command will assign the *10.2.3.4* as IPv4 address to this tunnel interface:

```
ip address 10.2.3.4
```

ipv6 address

Configures the IPv6 address for the specific tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ipv6 address *ipv6_address/ipv6_mask*

no ipv6 address *ipv6_address*

no

Removes the configured IPv6 address bound to a tunnel interface.

*ipv6_address***/***ipv6_mask*

Specifies a destination IP address or group of addresses that will use this route.
*ipv6_address***/***ipv6_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. *ipv6_address***/***ipv6_mask* must be specified usingIPv6 colon-separated and CIDR notation. *ipv6_mask* is a numeric value which is the number of bits in the subnet mask.

Usage

Use this command to bind the IPv6 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

Example

The following command will assign the *1001::2:010:1234* as IPv6 address to this tunnel interface:

```
ipv6 address 1001::2:010:1234
```

tunnel-mode

Configures the tunnel mode type for this tunnel interface. It also enters the specific tunnel configuration mode, if required.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
tunnel-mode { gre | ipv6ip }

defualt tunnel-mode
```

default

Sets the default tunnel mode for this interface. By default, the tunnel mode is set to IPv6-to-IPv4 type.

gre

Default: Disabled
Sets the tunnel interface mode to Generic Routing Encapsulation (GRE) type and enters the GRE Tunnel Configuration mode, if required.

ipv6ip

Default: Enabled
Sets the tunnel interface mode to IPv6-to-IPv4 type and creates the IPv6-to-IPv4 Tunnel Configuration mode, if required.

Usage

Use this command to set the tunnel mode type of GRE or IPv6-to-IPv4 for the tunneling interface.

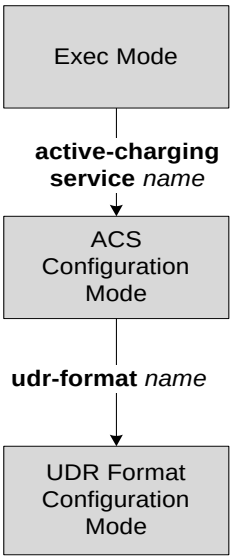
Example

The following command sets the tunnel mode to GRE for specific interface:

```
tunnel-mode gre
```

Chapter 268
UDR Format Configuration Mode Commands

The UDR Format Configuration Mode enables configuring User Detail Record (UDR) formats.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

attribute

This command allows you to specify the fields and their order in UDRs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
attribute attribute { [ format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-
HH:MM:SS | YYYYMMDDHHMMSS | seconds } [ localtime ] | [ { bytes | pkts } { downlink |
uplink } ] ] priority priority }

no attribute attribute [ priority priority ]
```

no

If added previously, removes the specified attribute from the UDR format.

attribute *attribute*

Specifies the attribute.
attribute must be one of the following:

Attribute	Description
diameter-session-id	This attribute reports Diameter session identifier. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
failure-handling-mode	This attribute reports failure handling mode in case the Online Charging System (OCS) goes abnormal.
radius-called-station-id	This attribute reports the Called Station ID of the mobile handling the flow.
radius-calling-station-id	This attribute reports the Calling Station ID of the mobile handling the flow.
radius-fa-nas-identifier	This attribute reports the RADIUS NAS identifier of Foreign Agent (FA).
radius-fa-nas-ip-address	This attribute reports the RADIUS IP address of Foreign Agent (FA).
radius-nas-identifier	This attribute reports the RADIUS NAS identifier.
radius-nas-ip-address	This attribute reports the RADIUS NAS IP address. Note that this attribute is interchangeable with **sn-st16-ip-addr** for the user.
radius-user-name	This attribute reports the user name associated with the flow.

Attribute	Description
sn-3gpp2-bsid	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-3gpp2-carrier-id	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-3gpp2-esn	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-3gpp2-meid	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-3gpp2-service-option	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-acct-beginning-session	This attribute reports the Session Beginning information. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-acct-session-continue	This attribute reports the Session Continue information. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-acct-session-id	This attribute reports the Accounting Session identifier.
sn-acct-session-time	This attribute reports the duration from acct-status-type:start to acct-status-type:stop. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-acct-status-type	This attribute reports the Accounting Status identifier. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-charging-type	This attribute reports the charging type: offline or online. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.

Attribute	Description
sn-closure-reason	This attribute reports the reason for termination of the flow/UDR: • 0 = CALL_TERMINATION — normal, such as subscriber session ended • 1 = PDSN_HO — handoff control processing specified • 2 = TIME_LIMIT • 3 = VOLUME_LIMIT • 4 = MGMT_INTERVENTION • 5 = ACCT_SESS_START • 6 = CCRU_RESPONSE • 7 = OFFLINE_CHARGING — for UDRs generated when offline charging trigger is received from DCCA
sn-content-id	This attribute reports the unique identifier for the content-id.
sn-content-label	This attribute reports the identifier for text label for content-id.
sn-content-vol	This attribute reports the identifier for content volume.
sn-correlation-id	This attribute reports the RADIUS correlation identifier.
sn-duration	This attribute reports the time difference between the first and last packet of a single data flow accounted in the UDR record. For example, the time difference between the first ICMP echo request and the last ICMP echo response before the record gets written for the content-id.
sn-end-time [format *format*]	This attribute reports the timestamp for last packet of flow in UTC.
sn-fa-correlation-id	This attribute reports the RADIUS Correlation Identifier of the Foreign Agent (FA).
sn-fa-ip-address	This attribute reports IP address of the FA.
sn-filler-blank	This attribute inserts a blank filler field, generates an empty UDR field.
sn-filler-zero	This attribute inserts a “0” in the UDR field.
sn-format-name	This attribute reports name of the UDR format used.
sn-group-id	This attribute reports the sequence group identifier for the records.
sn-ha-ip-address	This attribute reports IP address of the Home Agent (HA). ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-local-seq-no	This attribute reports unique local sequence number of UDR identifier per ACSMgr/SessMgr and linearly increasing in UDR file.

Attribute	Description
sn-ocs-ip-address	This attribute reports IP address of the Online Charging Server. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-rulebase	This attribute reports name of the ACS rulebase used.
sn-sequence-no	This attribute reports unique sequence number (per **sn-sequence-group** and **radius-nas-ip-address**) of UDR identifier and linearly increasing in UDR file.
sn-served-bsa-addr	This attribute reports address of Base Station Area being served.
sn-service-name	This attribute reports name of the ACS service.
sn-st16-ip-addr	This option has been deprecated. This attribute reports IP address of the chassis handling this flow. This attribute is interchangeable with **radius-nas-ip-address** for other systems.
sn-start-time [format *format* **]**	This attribute reports timestamp for first packet of flow in UTC.
sn-stream-number	This attribute reports unique UDR billing record identifier. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-subscriber-id	This attribute reports subscriber ID.
sn-subscriber-nat-flow-ip	This attribute reports NAT IP address(es) of NAT-enabled subscriber.
sn-timestamp	This attribute reports timestamp when the UDR is actually generated. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.

format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds }

Specifies the timestamp format.

localtime

Specifies the local time. By default, timestamps are displayed in Coordinated Universal Time (UTC).

{ bytes | pkts } { downlink | uplink }

Specifies bytes/packets sent/received from/by mobile.

priority *priority*

Specifies the position priority of the field within the UDR. Lower numbered priorities (across all attribute, event-label, and rule-variable) occur first.
priority must be an integer from 1 through 65535. Up to 50 position priorities (across all attribute, event-label, and rule-variable) can be configured.

Usage

Use this command to set the attributes and priority for UDR file format.
A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the **no attribute** command, you can either remove all occurrences of a particular field by specifying the field name or remove a single occurrence by additionally specifying the optional **priority** keyword.
Consider the following scenario. If the volume/time threshold interval is large enough (or disabled). At time t=0, 10 ICMP packets are sent, which takes 9 seconds. There is nothing for the next 100 seconds, and then again 10 ICMP packets are sent which takes 10 seconds, and then again nothing for next the 60 seconds and then the session is terminated.
In this scenario:

- sn-start-time should be t = 0.
- sn-end-time should be t = 0+9+100+10 (sn-end-time would be the last ICMP packet sent).
- sn-duration should be sn-end-time minus sn-start-time, i.e. 0+9+100+10 – 0 = 119 seconds (since the ICMP flow would exist between the two intervals of sending ICMP packets, the sn-start-time would be that of the first packet of the flow and sn-end-time of the last packet (20th packet). Hence, sn-duration would take into account all the seconds between the first and last packet of the flow).

Example

The following is an example of this command:

```
attribute radius-user-name priority 12
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

event-label

This command allows you to specify an optional event label/identifier to be used as an attribute in the UDRs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-label *event_label* **priority** *priority*

no event-label

no

If previously configured, removes the event label configuration.

event_label

Specifies the event label/identifier to be used as UDR attribute.
event_label must be an alphanumeric string of 1 through 63 characters.

priority *priority*

Specifies the Comma Separated Value (CSV) position of the attribute (label/identifier) in the UDR.
priority must be an integer from 1 through 65535.

Usage

Use this command to configure an optional event label/identifier as an attribute in the UDR and its position in the UDR.

Example

The following is an example of this command:

```
event-label radius_csv1 priority 23
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

rule-variable

This command allows you to specify fields and their order in UDRs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

rule-variable *rule_variable* **priority** *priority*

no rule-variable *rule_variable* **[priority** *priority* **]**

no

If previously configured, removes the specified rule variable configuration.

rule-variable *rule_variable*

Specifies the rule variable for the UDR format.
rule_variable must be one of the following options:

- **bearer 3gpp2**: Bearer-related configuration:
  - **always-on**
  - **bsid**
  - **carrier-id**
  - **esn**
  - **ip-qos**
  - **ip-technology**
  - **meid**
  - **release-indicator**
  - **serv-MDN**
  - **service-option**
  - **session-begin**
  - **session-continue**

Important: For more information on protocol-based rules see the *ACS Ruledef Configuration Mode Commands* chapter.

priority *priority*

Specifies the CSV position of the field (protocol rule) in the UDR.
priority must be an integer from 1 through 65535.

Usage

Use this command to specify what field appears in which order in the UDR.
A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the **no rule-variable** command, you can either remove all occurrences of a particular field by specifying the field name, or remove a single occurrence by additionally specifying the optional priority keyword.

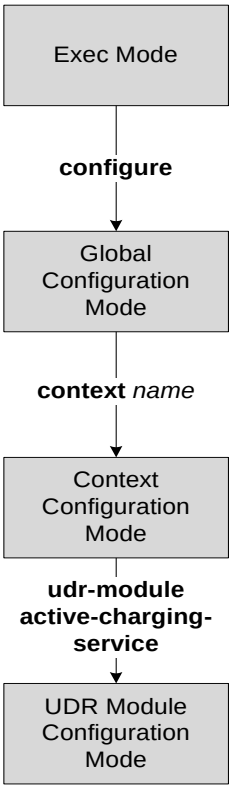
Example

The following is an example of this command:

```
rule-variable bearer 3gpp2 bsid priority 36
```

Chapter 269
UDR Module Configuration Mode Commands

The UDR Module Configuration Mode allows you to configure Usage Data Record (UDR) file transfer parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cdr

This command allows you to configure EDR/UDR file transfer parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cdr { purge { storage-limit storage_limit | time-limit time_limit } [ max-files
max_records_to_purge ] | push-interval push_interval | push-trigger space-usage-percent
trigger_percentage | remove-file-after-transfer | transfer-mode { pull [ module-only ] |
push primary { encrypted-url encrypted_url | url url } [ [ max-files max_records ] [
module-only ] [ secondary { encrypted-secondary-url encrypted_secondary_url | secondary-
url secondary_url } ] [ via local-context ] + ] | use-harddisk }

default cdr [ purge | push-interval | push-trigger space-usage-percent | remove-file-
after-transfer | transfer-mode [ module-only | push via ] | use-harddisk ] +

no cdr [ purge | remove-file-after-transfer | use-harddisk ] +
```

default

Configures the default setting for the specified keyword(s):

- **purge**: Disabled
- **push-interval**: 300 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Pull
- **push via**: line card is used for push
- **use-harddisk**: Disabled

Important: The **use-harddisk** keyword is only available on ASR 5000 chassis.

no

If previously configured, disables the specified configuration:

- **purge**: Disables purging of records.
- **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.
- **use-harddisk**: Disables data storage on the SMC hard disk.

Important: The **use-harddisk** keyword is available only on the ASR 5000 chassis.

purge { storage-limit *storage_limit* **| time-limit** *time_limit* **} [max-files** *max_records_to_purge* **]**

Specifies to purge/delete the CDR/UDR records based on "time" or "volume" limit.

- **storage-limit** *storage_limit*: Specifies to start deleting files when the specified megabytes of space is used for storage.

  storage_limit specifies the volume limit for the record files, in megabytes, and must be an integer from 10 through 143360.

- **time-limit** *time_limit*: Specifies to start deleting files older than the specified time limit.

  time_limit specifies the time limit for the record files, and must be an integer from 600 through 2592000.

- **max-files** *max_records_to_purge*: Specifies the maximum number of records to purge.

  max_records_to_purge must be an integer from 1000 through 10000.

push-interval *value*

Specifies the transfer interval (in seconds) to push UDR/EDR files to an external file server.
value must be an integer from 60 through 3600.
Default: 300

push-trigger space-usage-percent *trigger_percentage*

Specifies the UDR/EDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server.
trigger_percentage specifies the UDR/EDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.
Default: 80%

remove-file-after-transfer

Specifies that the system must delete UDR/EDR files after they are transferred to the external file server.
Default: Disabled

transfer-mode { pull [module-only] | push primary { encrypted-url *encrypted_url* **| url** *url* **} [[max-files** *max_records* **] [module-only] [secondary { encrypted-secondary-url** *encrypted_secondary_url* **| secondary-url** *secondary_url* **}] [via local-context] +]**

Specifies the UDR/EDR file transfer mode.

- **pull**: Specifies that the L-ESS is to pull the CDR files.
- **push**: Specifies that the system is to push CDR files to the configured L-ESS.
- **max-files** *max_records*: Specifies the maximum number of files sent per iteration based on configured file size.

  Default: 4000

- **module-only**: Specifies that the transfer-mode is only applicable to the UDR module; if not configured it is applicable to both EDR and UDR modules. This enables support for individual record transfer-mode configuration for each module.
- **primary encrypted-url** *encrypted_url*: Specifies the primary location in encrypted format to which the system pushes the CDR files.

encrypted_url must be the primary location name in an encrypted format, and must be an alphanumeric string of 1 through 1024 characters.

- **primary url** *url*: Specifies the primary location to which the system pushes the CDR files.

  url must be the primary location, and must be an alphanumeric string of 1 through 1024 characters in the format: *//user:password@host:[port]/directory*.

- **secondary encrypted-secondary-url** *encrypted_secondary_url*: Specifies the secondary location in encrypted format to which the system pushes the CDR files when the primary location is unreachable or fails.

  encrypted_secondary_url must be the location in an encrypted format, and must be an alphanumeric string of 1 through 1024 characters.

- **secondary secondary-url** *secondary_url*: Specifies the secondary location to which the system pushes the CDR files when the primary location is unreachable or fails.

  secondary_url must be the secondary location, and must be an alphanumeric string of 1 through 1024 characters in the format: *//user:password@host:[port]/directory*.

- **via local-context**: Selects the LC/SPIO for transfer of CDRs. The system pushes the UDR files via SPIO in the local context.

use-harddisk

Important: The **use-harddisk** keyword is available only on the ASR 5000 chassis.

Specifies that on an ASR 5000 chassis, the hard disk on the SMC will be used to store UDR/EDR files. When configured to use the hard disk for UDR/EDR storage, UDR/EDR files are transferred from packet processing cards to the hard disk on the SMC.
Default: Disabled

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure how charging data records (CDR) are moved and stored.
On the ASR 5000 chassis, run this command only from the local context. Running in any other context would fail and deliver an error message.
If PUSH transfer mode is configured, the L-ESS server URL to which the CDR files need to be transferred to must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur
- After switching from the primary server, 30 minutes elapses

When changing the transfer-mode from pull to push, disable the PULL from L-ESS and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains udr directory created within it.
When changing the transfer-mode from push to pull, after changing, enable PULL on the L-ESS. Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH

activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.

The **cdr use-harddisk** command is available only on the ASR 5000 chassis. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message *"Failure: Please Check if CDRMOD is running in this context or not."*

The **cdr use-harddisk** command can be configured either in the UDR or EDR module, but will be applicable to both record types. Configuring in one of the modules will prevent the configuration to be applied in the other module. Any change to this configuration must be done in the module in which it was configured, the change will be applied to both record types.

The VPNMgr can send a maximum of 4000 files to the remote server per iteration. However if the individual file size is big (say when compression is not enabled), then while transferring 4000 files SFTP operation takes a lot of time. To prevent this, the **cdr transfer-mode push** command can be configured with the keyword **max-files**, which allows operators to configure the maximum number of files sent per iteration based on configured file size.

Example

The following command configures the system to retain a copy of the data file after it has been transferred to the storage location:

```
no cdr remove-file-after-transfer
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

file

This command allows you to configure UDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

file [charging-service-name { include | omit }] [compression { gzip | none }] [current-prefix *string* **] [delete-timeout** *seconds* **] [directory** *directory_name* **] [exclude-checksum-record] [field-separator { hyphen | omit | underscore }] [file-sequence-number rulebase-seq-num] [headers] [name** *file_name* **] [reset-indicator] [rotation [num-records** *number* **| time** *seconds* **| volume** *bytes* **]] [sequence-number { length** *length* **| omit | padded | padded-six-length | unpadded }] [storage-limit** *limit* **] [time-stamp { expanded-format | rotated-format | unix-format }] [trailing-text** *string* **] [trap-on-file-delete] [udr-seq-num] [xor-final-record] +**

default file [charging-service-name] [compression] [current-prefix] [delete-timeout] [directory] [field-separator] [file-sequence-number] [headers] [name] [reset-indicator] [rotation { num-records | time | volume }] [sequence-number] [storage-limit] [time-stamp] [trailing-text] [udr-seq-num]

---

default

Configures the default setting for the specified keyword(s). Using the **default file** command will reset some but not all keyword parameters to their default values. To ensure that the default is reset for a specific parameter, include the corresponding keyword in the command.

---

charging-service-name { include | omit }

Specifies to include/exclude name of the charging service in the file name.

- **include**: Includes name of the charging service in the UDR file name.
- **omit**: Excludes name of the charging service in the UDR file name.

Default: **include**

---

compression { gzip | none }

Configures gzip compression of the UDR file.

- **gzip**: Enables GNU zip compression of the UDR file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

Default: **none**

---

current-prefix *string*

Specifies a string to add to the beginning of the UDR file that is currently being used to store UDR records. *string* must be an alphanumeric string of 1 through 31 characters.
Default: curr

delete-timeout *seconds*

Specifies a timeout period (in seconds) when completed UDR files are deleted. By default, files are never deleted.
seconds must be an integer from 3600 through 31536000.
Default: Disabled

directory *directory_name*

Specifies a subdirectory in the default directory in which to store UDR files.
directory_name must be an alphanumeric string of 1 through 191 characters.
Default: /records/udr

exclude-checksum-record

When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic Redundancy Check (CRC) of all preceding records from the UDR file.
Default: Disabled, inserts checksum record into the UDR file header.

field-separator { hyphen | omit | underscore }

Specifies the field separators to be used between two fields of a UDR file name.

- **hyphen**: Specifies to use '-' (hyphen) as the field separator.
- **omit**: Excludes the field separator.
- **underscore**: Specifies to use '_' (underscore) as the field separator.

Default: **underscore**

file-sequence-number rulebase-seq-num

Generates unique file sequence numbers for different rulebase-format-name combinations.

headers

Includes a file header summarizing the record layout.

name *file_name*

Default: udr
Specifies a string to use as the base file name for UDR files.
file_name must be an alphanumeric string of 1 through 31 characters. The file name format is as follows:
base_rulebase_format_sequencenum_timestamp

- *base*: Specifies type of record in file or contains the operator-specified string. Default: udr
- *rulebase*: Specifies the name of the ACS rulebase. UDRs from different rulebases go into different UDR files.
- *format*: Specifies the name of the UDR format if **single-udr-format** is specified, else the format field (and the trailing underscore) is omitted from the file name.
- *sequencenum*: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all UDR files on the system.
- *timestamp*: Contains a timestamp based on file creation time in UTC formatted as: MMDDYYYYHHMMSS.

UDR files that have not been closed have a string added to the beginning of their file names.

File name for a UDR file in CSV format that contains information for a rulebase named *rulebase1* and a UDR schema named *udr_schema1* appears as follows:
udr_rulebase1_udr_schema1_00005_01302006143409
If file name is not configured, the system creates files for EDRs/UDRs/FDRs (xDRs) using the following name template with limits to 256 characters:
basename_ChargSvcName_ timestamp_SeqNumResetIndicator_FileSeqNumber

- *basename*: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ACS.
- *ChargSvcName*: A system context-based configurable text string that uniquely identifies a specific context-based charging service.
- *timestamp*: Date and time at the instance of file creation. Date and time in the format: "MMDDYYYYHHmmSS", where HH is a 24-hour value from 00-23.
- *SeqNumResetIndicator*: A one-byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 through 255, which is incremented by a value of 1 for the following conditions:
  - Failure of an ACS software process on an individual packet processing card
  - Failure of the system such that a second system takes over (for example, a standby or backup chassis put in place according to Inter-chassis Session Recovery)
  - File Sequence Number (FileSeqNumber) rollover from 999999999 to 0
- *FileSeqNumber*: unique file sequence number for the file is a 9-digit integer from 000000000 through 999999999. It is unique on each chassis.

File name for a closed xDR file in CSV format that contains information for ACS *xyz_city1* and charging service name *preapaid2* with timestamp *12311969190000*, and file sequence number counter reset indicator to *002* for file sequence number *034939002* appears as follows:
xyz_city1_preapaid2_12311969190000_002_034939002
File name for a running xDR file in CSV format that contains information for the same parameters for file sequence number *034939003* prefixed with *curr_* and appears as follows:
curr_xyz_city1_preapaid2_12311969190000_002_034939002

---

reset-indicator

Specifies to include the reset indicator counter value, from 0 to 255, in the UDR file name and is incremented (by one) whenever any of the following conditions occur:

- An ACSMgr/SessMgr process fails.
- An Inter-chassis Session Recovery (ICSR) peer chassis has transitioned from standby to active.
- The sequence number in sequence-number keyword has rolled over to zero.

---

rotation { num-records *records* **| time** *seconds* **| volume** *bytes* **}**

Specifies when to close a UDR file and create a new one.

- **num-records** *records*: Specifies the number of records that should be added to the file. When the number of records in the file reaches this specified value, the file is complete.

  records must be an integer from 100 through 10240.

  Default: 1024

- **time** *seconds*: Specifies the period of time to wait before closing the UDR file and creating a new one.

  seconds must be an integer from 30 through 86400.

Default: 3600 seconds

- **volume** *bytes*: Specifies the maximum size of the UDR file before closing it and creating a new one.

  bytes must be an integer from 51200 through 62914560.

  Default: 102400 bytes

  Note that higher settings may provide the best compression ratio when the **compression** keyword is set to *gzip*.

---

sequence-number { length *length* **| omit | padded | padded-six-length | unpadded }**

Specifies including or excluding the sequence number in the file name.

- **length** *length*: Includes the sequence number with the specified length.

  length must be the length of the file sequence number with preceding zeroes in the file name, and must be an integer from 1 through 9.

  Important: The **length** configuration is applicable in both UDR and EDR modules. When applied in both modules without the **file udr-seq-num** configuration, the minimum among the two values will come into effect for both modules. With the **file udr-seq-num** config, each module will use its own value of length.

- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

Default: **padded**

---

storage-limit *limit*

Specifies deleting files when the specified amount of space, in bytes, is used up for UDR/EDR file storage on packet processing card RAM.
On an ASR 5000 chassis, *limit* must be an integer from 10485760 through 536870912.
Default: 33554432

Important: On the ASR 5000 chassis, the total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.

---

time-stamp { expanded-format | rotated-format | unix-format }

Specifies the timestamp of when the file was created be included in the file name.

- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of *x.y*, where *x* is the number of seconds since 1/1/1970 and *y* is the fractional portion of the current second that has elapsed.

---

trailing-text *string*

Specifies the inclusion of arbitrary text string in the file name.

string must be an alphanumeric string of 1 through 30 characters.

trap-on-file-delete

Instructs the system to send an SNMP notification (trap) when an UDR/EDR file is deleted due to lack of space.
Default: Disabled

udr-seq-num

Specifies that the file sequence numbers that are part of the UDR file names be independently generated. If disabled, a single set of sequence numbers are shared by both UDR and EDR files.
Default: Disabled

xor-final-record

Specifies inserting an XOR checksum (in place of the CRC checksum) into the UDR file header if the **exclude-checksum-record** keyword is left at its default setting.
Default: Disabled

+

More than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure UDR file characteristics.

Example

The following command sets the prefix of the current active UDR file to *current*:

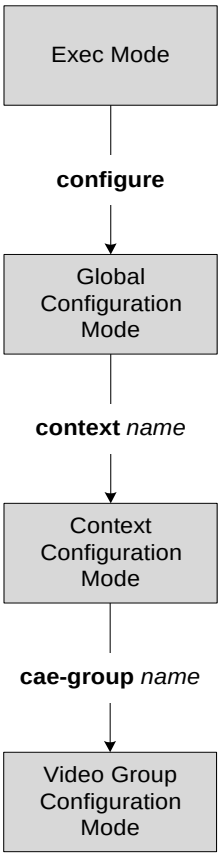
```
file current-prefix current
```

The following command sets the base file name to *UDRfile*:

```
file name UDRfile
```

Chapter 270
Video Group Configuration Mode

The Video Group Configuration Mode is used to add CAEs to a CAE group and configure the CAEs for load balancing and health-check monitoring. The CAE (Content Adaptation Engine) is an optional component of the Mobile Videoscape. For additional information, refer to the *Mobile Video Gateway Administration Guide*.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

keepalive-server

Specifies keep-alive messaging information for Content Adaptation Engine (CAE) health-check monitoring, which is part of CAE load balancing on the Mobile Video Gateway. Note that this command and its options configure settings that apply to all CAEs in the CAE group, not to an individual CAE.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[default] keepalive-server deadtime *seconds* **interval** *seconds* **num-retry** *num-retries* **port** *port_number* **timeout** *seconds* **[-noconfirm]**

default keepalive-server

Sets the CAE keep-alive settings to their default values.

keepalive-server deadtime *seconds* **interval** *seconds* **num-retry** *num-retries* **port** *port_number* **timeout** *seconds* **[-noconfirm]**

Specifies keep-alive messaging information for CAE health-check monitoring.

deadtime *seconds*

Specifies the periodic retry interval (in seconds) after a CAE is detected down. *seconds* is an integer from 1 through 1800. The default value is 120 seconds.

interval *seconds*

Specifies the interval (in seconds) for how often the Mobile Video Gateway sends a keep-alive message to the CAEs. *seconds* is an integer from 0 through 120. The default value is 10 seconds. A value of 0 turns off keep-alive detection and marks the state of all CAEs to Up.

num-retry *num_retries*

Specifies the number of keepalive retries after a CAE does not respond. *num_retries* is an integer from 1 through 20. The default value is 3 retries.

port *port_number*

Specifies the TCP port number for health-check monitoring, which is an integer from 1 through 65535. The default value is 5100.

timeout *seconds*

Specifies the keep-alive timeout (in seconds) which is an integer from 1 through 30. The default value is 3 seconds.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to specify keep-alive messaging information for CAE health-check monitoring, which is part of CAE load balancing on the Mobile Video Gateway.

Example

The following command specifies keep-alive messaging information for the CAEs in the CAE group:

```
keepalive-server deadtime 120 interval 10 num-retry 3 port 5100 timeout 3
```

local-address

Specifies the local IPv4 address on the Mobile Video Gateway for the keepalive TCP connection used for Content Adaptation Engine (CAE) load balancing.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[no] local-address *IPv4_address* **[-noconfirm]**

no local-address *IPv4_address*

Deletes the local IPv4 address if previously specified.

local-address *IPv4_address*

Specifies the local IPv4 address on the Mobile Video Gateway for the keep-live TCP connection used for CAE load balancing. *IPv4_address* must be in dotted decimal notation.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to specify the local IPv4 address on the Mobile Video Gateway, in dotted-decimal notation.

Example

The following command specifies the local IPv4 address on the Mobile Video Gateway:

```
local-address 10.2.3.4
```

server

Adds a CAE (Content Adaptation Engine) and its IPv4 address and port number to the associated CAE group. The Mobile Video Gateway uses this information for CAE load balancing. The Mobile Video Gateway has a system limit of 64 CAEs.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[no] server *cae_name* **address** *IPv4_address* **port** *port_number* **[-noconfirm]**

no server *cae_name*

Deletes the CAE from the CAE group if previously configured.

server *cae_name* **address** *IPv4_address* **port** *port_number*

Adds a CAE and its IPv4 address and port number to the associated CAE group. *cae_name* is an alphanumeric string of 1 through 15 characters. *IPv4_address* must be in dotted-decimal notation. *port_number* is an integer from 1 through 5535. The default value is 80.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to add a CAE and its IPv4 address and port number to the associated CAE group.

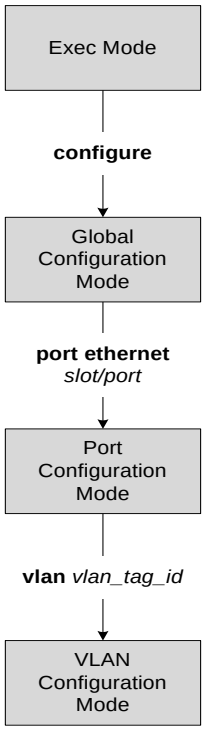
Example

The following command adds a CAE named *cae_1* and its IPv4 address and port number to the associated CAE group:

```
server cae_1 address 10.2.3.4 port 80
```

Chapter 271
VLAN Configuration Mode Commands

The VLAN Configuration Mode is used to create and manage Virtual LANs and their bindings between contexts.



bind interface

Configures a virtual interface to context association for the current VLAN.

Product

HA, HSGW, PDSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bind interface *interface_name context_name*

no

Indicates the binding between the virtual interface specified and the context specified is to be unbound for the current VLAN.

interface_name context_name

Specifies the name and context of the virtual interface to be bound to the context. *interface_name* must be an alphanumeric string of 1 through 79 characters.
context_name must refer to a previously configured context expressed as an alphanumeric string of 1 through 79 characters.

Usage

Bind a virtual interface and context to allow the VLAN to provide service.

Example

bind interface *sampleVirtual sampleContext*

no bind interface *sampleVirtual sampleContext*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ingress-mode

Toggles between enabling and disabling the port ingress (incoming) mode.

Product

HA, HSGW, PDSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ingress-mode
```

no

Disables the port ingress mode.

Usage

Use this command to enable or disable the ingress mode for the port.

Example

```
ingress-mode
```

priority

Configures 802.1p VLAN priority bit for ASN-GW only.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

priority *value*

no priority

no

Disables the setting of the 802.1p priority bit.

value

Sets the value of the 802.1p priority bit as an integer from 0 through 7, with 7 being the highest priority.

Usage

Set a value for the VLAN priority bit as used in the ANS-GW.
Refer to the *ASN-GW Administration Guide* for additional information on support for 802.1p.

Example

To set a VLAN priority bit value, use the following command:

```
priority 3
```

To disable the use of a VLAN priority bit, use the following command:

```
no priority
```

shutdown

Disables or enables traffic over the current VLAN.

Product

HA, HSGW, PDSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the VLAN. When omitted the VLAN is shutdown.

Usage

Shut down a VLAN.
To bring a VLAN into service, execute this command using the **no** keyword.

Example

To disable a VLAN from sending or receiving network traffic use the following command:

```
shutdown
```

To enable a VLAN use the following command:

```
no shutdown
```

vlan-map

Sets a single next-hop IP address so that multiple VLANs can use a single next-hop gateway. **vlan-map** is associated with a specific interface.

Product

HA, HSGW, PDSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

vlan-map next-hop *ip_address*

next-hop *ip_address*

Defines an IP address for the next-hop gateway.
ip_address: can be entered using IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use **vlan-map** to combine multiple VLAN links to go through a single IP address. This feature is used in conjunction with nexthop forwarding and overlapping IP pools.
After configuring the vlan-map, go to the Port Ethernet Configuration mode to attach the vlan-map to a specific VLAN.

Example

The following command sets an IPv4 for a next-hop gateway.

```
vlan-map next-hop 123.123.123.1
```
