Introduction

This document describes how to set up an Adaptive Security Appliance (ASA) 7.2.2 to perform SSL VPN on a stick. This setup applies to a specific case in which the ASA does not allow split tunneling and users connect directly to the ASA before they are permitted to go to the Internet.

Note: In ASA version 7.2.2, the *intra-interface* keyword of the **same-security-traffic permit** configuration mode command allows all traffic to enter and exit the same interface (not just IPsec traffic).

Prerequisites

Requirements

Ensure that you meet these requirements before you attempt this configuration:

- The hub ASA Security Appliance needs to run version 7.2.2
- Cisco SSL VPN Client (SVC) 1.x

Note: Download the SSL VPN Client package (sslclient-win*.pkg) from Cisco Software Download (registered customers only) . Copy the SVC to the flash memory on the ASA. The SVC is to be downloaded to the remote user computers in order to establish the SSL VPN connection with the ASA. Refer to Installing the SVC Software section of the *Cisco Security Appliance Command Line Configuration Guide, Version 7.2* for more information.

Components Used

The information in this document is based on these software and hardware versions:

- Cisco 5500 Series Adaptive Security Appliance (ASA) that runs software version 7.2(2)

- Cisco SSL VPN Client version for Windows 1.1.4.179
- PC that runs Windows 2000 Professional or Windows XP
- Cisco Adaptive Security Device Manager (ASDM) version 5.2(2)

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to the Cisco Technical Tips Conventions for more information on document conventions.

Background Information

The SSL VPN Client (SVC) is a VPN tunneling technology that gives remote users the benefits of an IPsec VPN client without the need for network administrators to install and configure IPsec VPN clients on remote computers. The SVC uses the SSL encryption that is already present on the remote computer as well as the WebVPN login and authentication of the security appliance.

To establish an SVC session, the remote user enters the IP address of a WebVPN interface of the security appliance in the browser, and the browser connects to that interface and displays the WebVPN login screen. If the user satisfies the login and authentication, and the security appliance identifies the user as requiring the SVC, the security appliance downloads the SVC to the remote computer. If the security appliance identifies the user as having the option to use the SVC, the security appliance downloads the SVC to the remote computer while presenting a link on the user screen to skip the SVC installation.

After downloading, the SVC installs and configures itself, and then the SVC either remains or uninstalls itself (depending on the configuration) from the remote computer when the connection terminates.

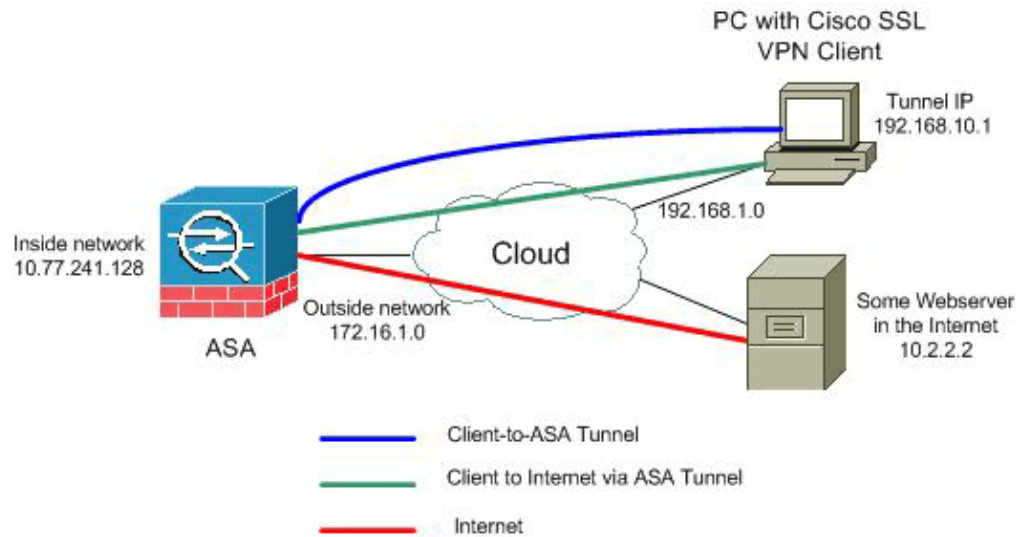

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the Command Lookup Tool (registered customers only) to obtain more information on the commands used in this section.

Network Diagram

This document uses this network setup:

Note: The IP addressing schemes used in this configuration are not legally routable on the Internet. They are RFC 1918 addresses which have been used in a lab environment.

ASA 7.2(2) Configurations Using ASDM 5.2(2)

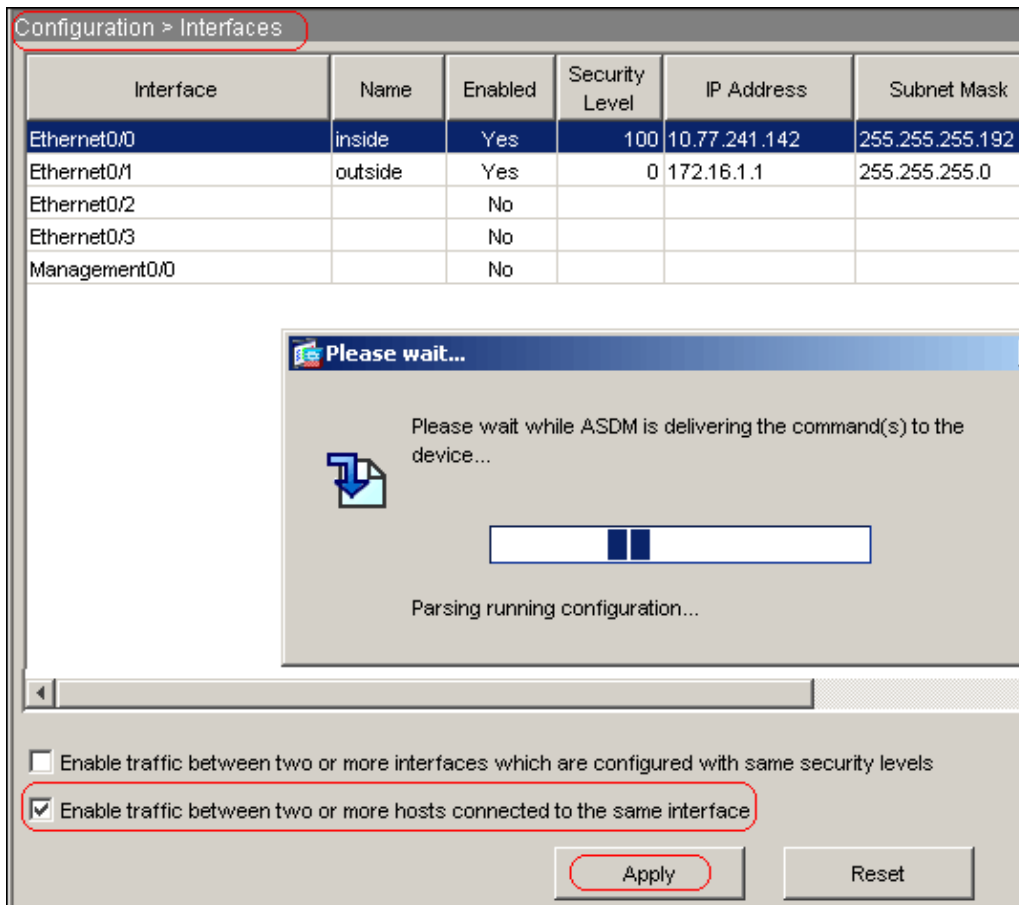

This document assumes the basic configurations, such as interface configuration, are already made and working properly.

Note: Refer to Allowing HTTPS Access for ASDM in order to allow the ASA to be configured by the ASDM.

Note: WebVPN and ASDM cannot be enabled on the same ASA interface unless you change the port numbers. Refer to ASDM and WebVPN Enabled on the Same Interface of ASA for more information.

Complete these steps in order to configure the SSL VPN on a stick in ASA:

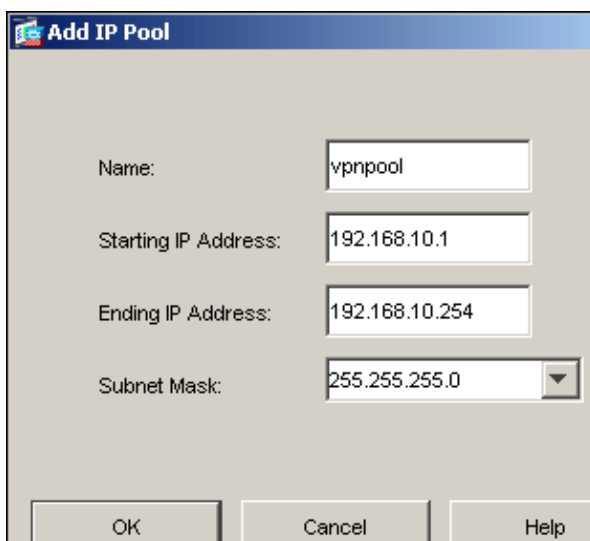

1. Choose **Configuration > Interfaces**, and check the **Enable traffic between two or more hosts connected to the same interface** check box in order to allow SSL VPN traffic to enter and exit the same interface.
2. Click **Apply**.

Note: Here is the equivalent CLI configuration command:

```
Cisco ASA 7.2(2)
ciscoasa(config)#same-security-traffic permit intra-interface
```

3. Choose **Configuration > VPN > IP Address Management > IP Pools > Add** in order to create an IP address pool named *vpnpool*.

4. Click **Apply**.

Note: Here is the equivalent CLI configuration command:

Cisco ASA 7.2(2)

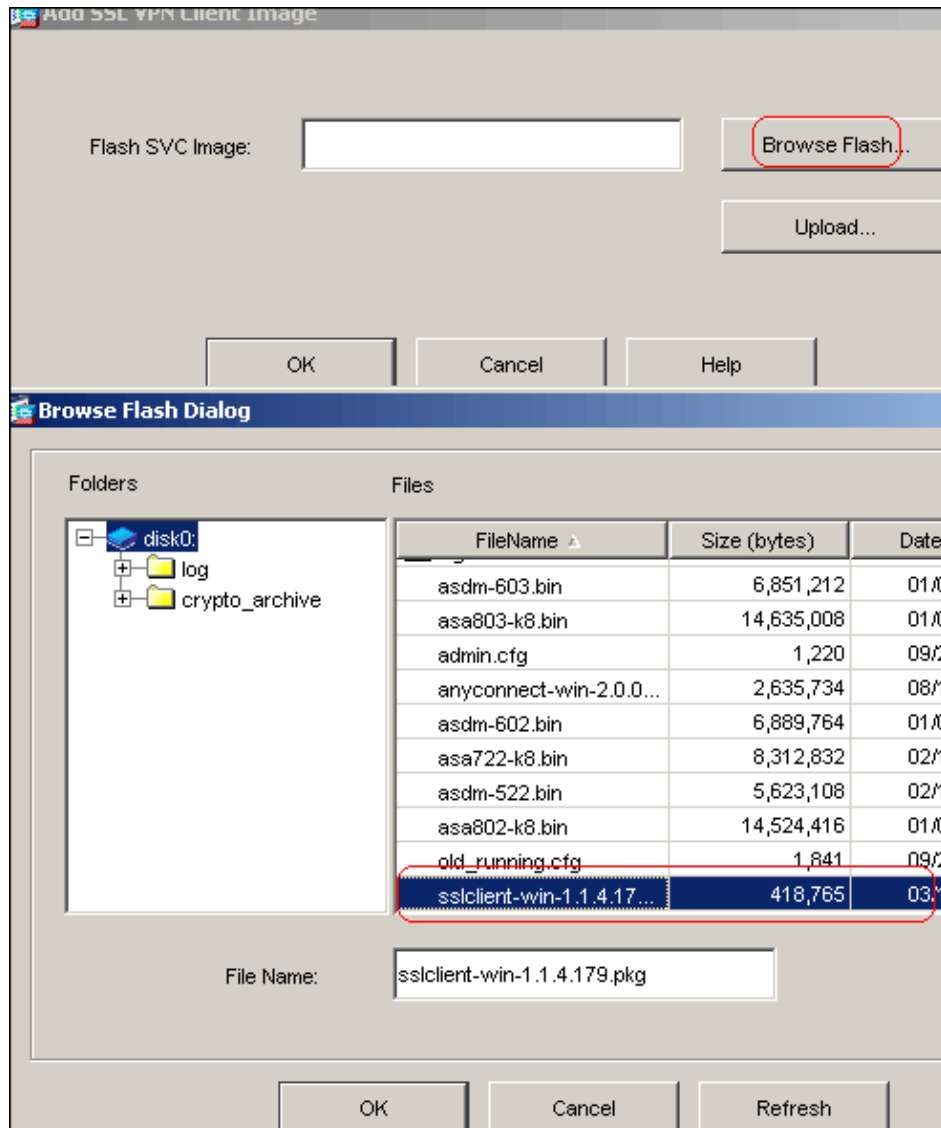

```
ciscoasa(config)#ip local pool vpnpool 192.168.10.1-192.168.10.254
```

5. Enable WebVPN:

- Choose **Configuration > VPN > WebVPN > WebVPN Access**, and select the outside interface.
- Click **Enable**.
- Check the **Enable Tunnel Group Drop-down List on WebVPN Login Page** check box in order to allow users to choose their respective groups from the Login page.

- Click **Apply**.
- Choose **Configuration > VPN > WebVPN > SSL VPN Client > Add** in order to add the SSL VPN Client image from the flash memory of ASA.

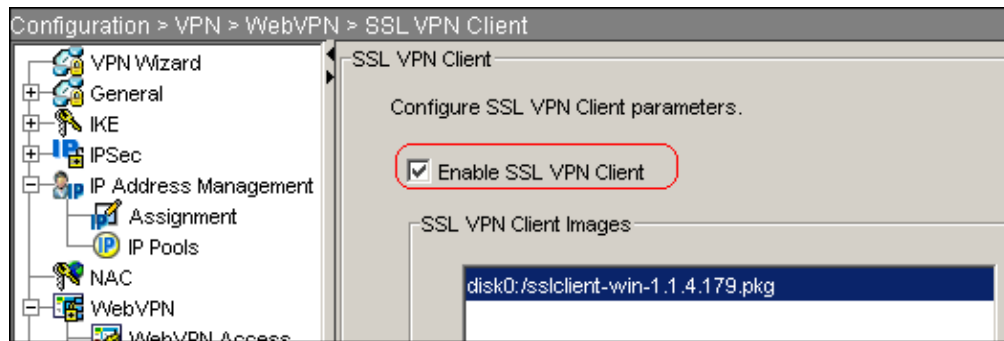

f. Click **OK**.

g. Click **OK**.

h. Click **SSL VPN Client** check box.

Note: Here are the equivalent CLI configuration commands:

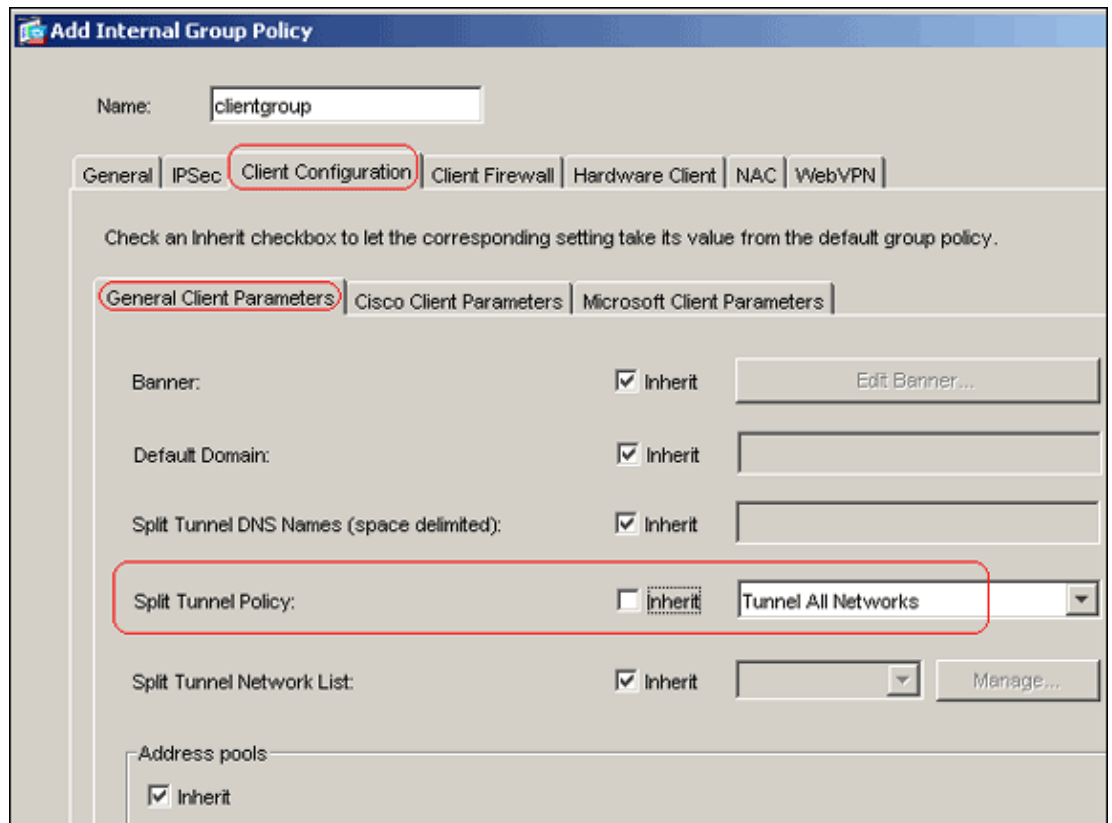

Cisco ASA 7.2(2)
<pre> ciscoasa(config)#webvpn ciscoasa(config-webvpn)#enable outside ciscoasa(config-webvpn)#svc image disk0:/sslclient-win-1.1.4.179.pkg 1 ciscoasa(config-webvpn)#tunnel-group-list enable ciscoasa(config-webvpn)#svc enable </pre>

6. Configure the group policy:

- a. Choose **Configuration > VPN > General > Group Policy > Add (Internal Group Policy)** in order to create an internal group policy named *clientgroup*.
- b. Click the **General** tab, and select the **WebVPN** check box in order to enable the WebVPN as tunneling protocol.

- c. Click the **Client Configuration** tab, and then click the **General Client Parameters** tab.
- d. Choose **Tunnel All Networks** from the Split Tunnel Policy drop-down list in order to make all the packets travel from the remote PC through a secure tunnel.

e. Click the **WebVPN > SSLVPN Client** tab, and choose these options:

- a. For the Use SSL VPN Client option, uncheck the **Inherit** check box, and click the **Optional** radio button.

This option allows the remote client to choose whether or not to download the SVC. The Always choice ensures that the SVC is downloaded to the remote workstation during each SSL VPN connection.

- b. For the Keep Installer on Client System option, uncheck the **Inherit** check box, and click the **Yes** radio button

This option allows the SVC software to remain on the client machine. Therefore, the ASA is not required to download the SVC software to the client each time a connection is made. This option is a good choice for remote users who often access the corporate network.

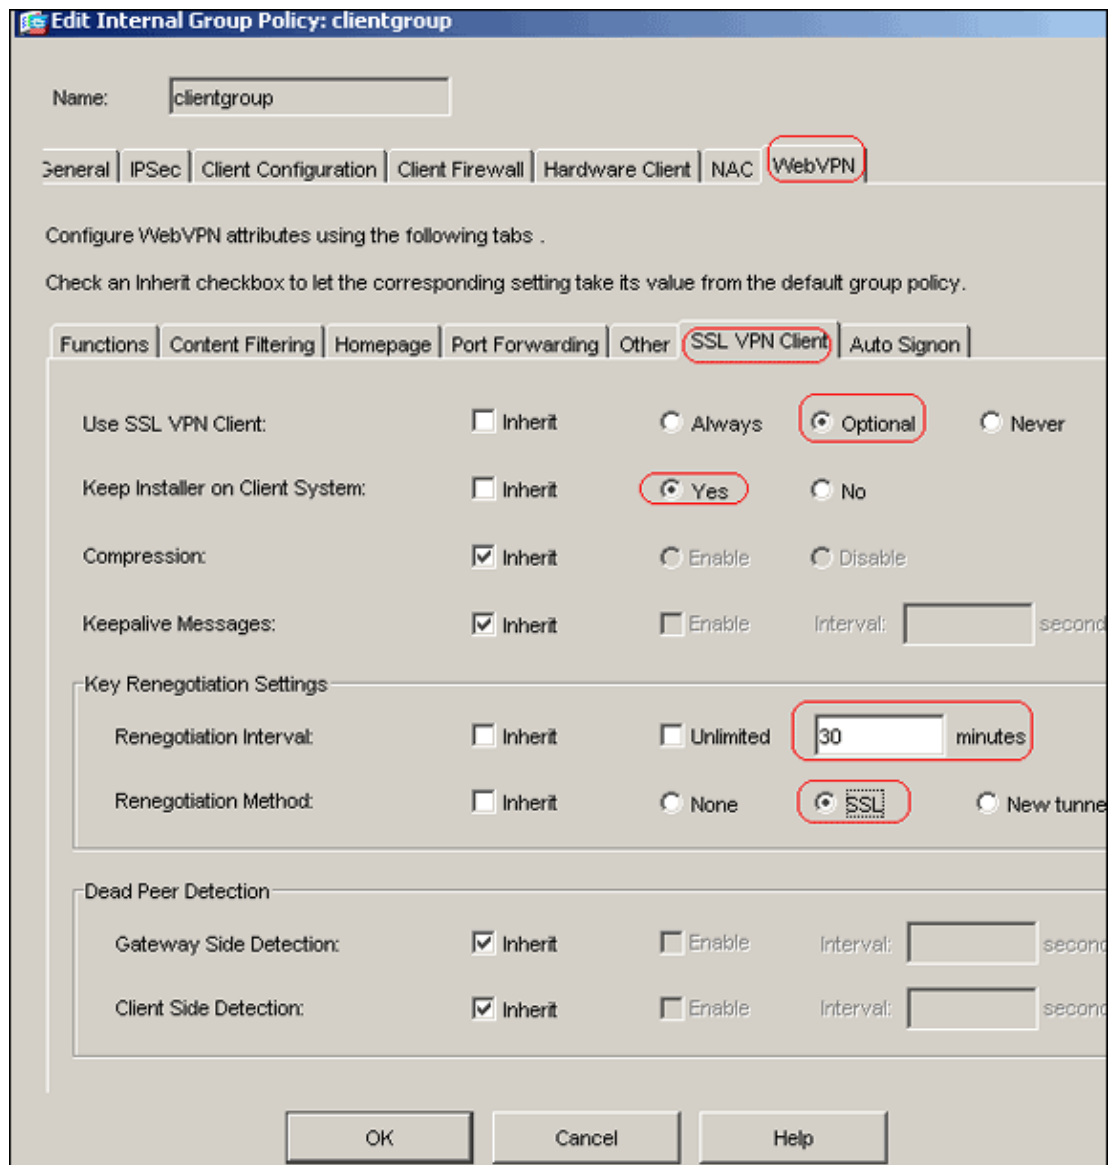

- c. For the Renegotiation Interval option, uncheck the **Inherit** box, uncheck the **Unlimited** check box, and enter the number of minutes until rekey.

Note: Security is enhanced by setting limits on the length of time a key is valid.

- d. For the Renegotiation Method option, uncheck the **Inherit** check box, and click the **SSL** radio button.

Note: Renegotiation can use the present SSL tunnel or a new tunnel created specifically for renegotiation.

Your SSL VPN Client attributes should be configured as shown in this image:

f. Click **OK**, and then click **Apply**.

Note: Here are the equivalent CLI configuration commands:

```

Cisco ASA 7.2(2)

ciscoasa(config)#group-policy clientgroup internal
ciscoasa(config)#group-policyclientgroup attributes
ciscoasa(config-group-policy)#vpn-tunnel-protocol webvpn
ciscoasa(config-group-policy)#split-tunnel-policy tunnelall
ciscoasa(config-group-policy)#webvpn
ciscoasa(config-group-webvpn)#svc required
ciscoasa(config-group-webvpn)#svc keep-installer installed

```

```
ciscoasa(config-group-webvpn)#svc rekey time 30
ciscoasa(config-group-webvpn)#svc rekey method ssl
```

7. Choose **Configuration > VPN > General > Users > Add** in order to create a new user account *ssluser1*.
8. Click **OK**, and then click **Apply**.

The screenshot shows the 'Add User Account' dialog box with the following fields and values:

- Identity** (selected tab)
- Username:** ssluser1
- Password:** *****
- Confirm Password:** *****
- User authenticated using MSCHAP
- Privilege level is used with command authorization.
- Privilege Level:** 2

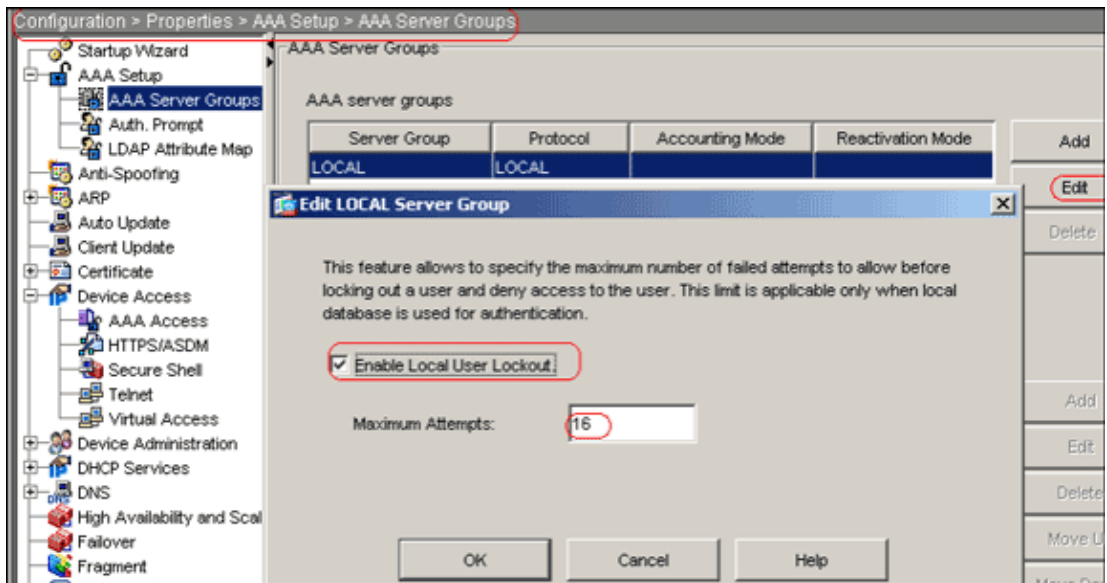

Buttons: OK, Cancel, Help

Note: Here is the equivalent CLI command:

Cisco ASA 7.2(2)

```
ciscoasa(config)#username ssluser1 password asdmASA@
```

9. Choose **Configuration > Properties > AAA Setup > AAA Servers Groups > Edit**.
10. Select the the default server group *LOCAL*, and click **Edit**.
11. In the Edit LOCAL Server Group dialog box, click the **Enable Local User Lockout** check box, and enter 16 in the Maximum Attempts text box.
12. Click **OK**.

Note: Here is the equivalent CLI command:

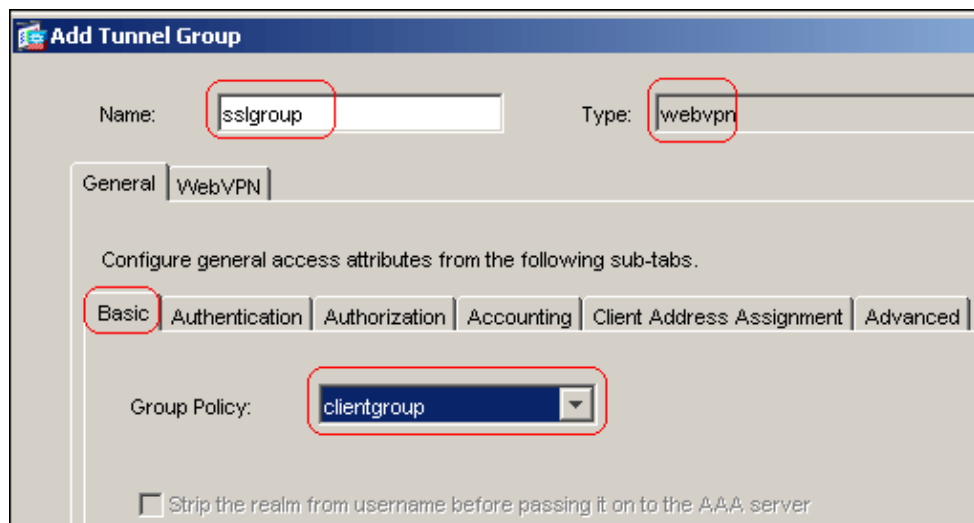

```

Cisco ASA 7.2(2)
ciscoasa(config)#aaa local authentication attempts max-fail 16

```

13. Configure the tunnel group:

- a. Choose **Configuration > VPN > General > Tunnel Group > Add(WebVPN access)** in order to create a new tunnel group named *sslgroup*.
- b. Click the **General** tab, and then click the **Basic** tab.
- c. Choose **clientgroup** from the Group Policy drop-down list.

- d. Click the **Client Address Assignment** tab, and then click **Add** in order to assign the available address pool *vpnpool*.

Add Tunnel Group

Name: Type:

General | WebVPN

Configure general access attributes from the following sub-tabs.

Basic | Authentication | Authorization | Accounting | **Client Address Assignment** | Advanced

To specify whether to use DHCP or address pools for address assignment, go to Configuration > VPN > IP Address Management > Assignment.

DHCP Servers

IP Address:

Address Pools

To configure interface-specific address pools, go to the Advanced tab.

Available Pools

Assigned pools

vpnpool

- e. Click the **WebVPN** tab, and then click the **Group Aliases and URLs** tab.
- f. Type the alias name in the parameter box, and click **Add** in order to add it to the list of group names on the Login page.

General | **WebVPN**

Configure WebVPN access attributes from the following sub-tabs.

Basic | NetBIOS Servers | **Group Aliases and URLs** | Web Page

Group Aliases

Alias:

Enable

Alias	Status
sslgroup_users	enable

- g. Click **OK**, and then click **Apply**.

Note: Here are the equivalent CLI configuration commands:

Cisco ASA 7.2(2)
<pre> ciscoasa(config)#tunnel-group sslgroup type webvpn ciscoasa(config)#tunnel-group sslgroup general-attributes ciscoasa(config-tunnel-general)#address-pool vpnpool ciscoasa(config-tunnel-general)#default-group-policy clientgroup ciscoasa(config-tunnel-general)#exit </pre>

```
ciscoasa(config)#tunnel-group sslgroup webvpn-attributes
ciscoasa(config-tunnel-webvpn)#group-alias sslgroup_users enable
```

14. Configure NAT:

- a. Choose **Configuration > NAT > Add > Add Dynamic NAT Rule** to allow the traffic that comes from the inside network to be translated with the use of the outside IP address 172.16.1.5.

The screenshot shows the 'Add Dynamic NAT Rule' configuration window. It is divided into two main sections: 'Real Address' and 'Dynamic Translation'. In the 'Real Address' section, the 'Interface' is set to 'inside', 'IP Address' is '0.0.0.0', and 'Netmask' is '0.0.0.0'. In the 'Dynamic Translation' section, the 'Interface' is set to 'outside'. Below this, there are buttons for '+ Add', 'Edit', and 'Delete'. A table is displayed with the following data:

Select	Pool ID	Addresses Pool
<input checked="" type="checkbox"/>	1	172.16.1.5

At the bottom of the window, there is a 'NAT Options...' button and three buttons: 'OK', 'Cancel', and 'Help'.

- b. Click **OK**.
- c. Choose **Configuration > NAT > Add > Add Dynamic NAT Rule** to allow the traffic that comes from the outside network 192.168.10.0 to be translated with the use of the outside IP address 172.16.1.5.

d. Click **OK**.

e. Click **Apply**.

Note: Here are the equivalent CLI configuration commands:

Cisco ASA 7.2(2)
<pre>ciscoasa(config)#global (outside) 1 172.16.1.5 ciscoasa(config)#nat (inside) 1 0.0.0.0 0.0.0.0 ciscoasa(config)#nat (outside) 1 192.168.10.0 255.255.255.0</pre>

Establish the SSL VPN Connection with SVC

Complete these steps in order to establish a SSL VPN connection with ASA.

1. Type in the Address field of your web browser the URL or IP address for the WebVPN interface of the ASA.

For example:

```
https://<IP address of the ASA WebVPN interface>
```

2. Enter your user name and password, and then choose your respective group from the Group drop-down list.

Note: ActiveX software must be installed in your computer before you download the SSL VPN Client.

This dialog box appears as the connection is established:

This message appears once the connection is established:

3. Once the connection is established, double-click the yellow key icon that appears in the task bar of your computer.

The Cisco Systems SSL VPN Client dialog box displays information about the SSL connection.

Use this section in order to confirm that your configuration works properly.

The Output Interpreter Tool (registered customers only) (OIT) supports certain **show** commands. Use the OIT to view an analysis of **show** command output.

- **show webvpn svc** Displays the SVC images stored in the ASA flash memory.

```
ciscoasa#show webvpn svc
1. disk0:/sslclient-win-1.1.4.179.pkg 1
   CISCO STC win2k+ 1.0.0
   1,1,4,179
   Fri 01/18/2008 15:19:49.43
```

```
1 SSL VPN Client(s) installed
```

- **show vpn-sessiondb svc** Displays the information about the current SSL connections.

```
ciscoasa#show vpn-sessiondb svc

Session Type: SVC

Username       : ssluser1
Index          : 1
Assigned IP    : 192.168.10.1          Public IP      : 192.168.1.1

ssluser1	192.168.1.1	clientgroup sslgroup	WebVPN 3DES	08:48:52 UTC Thu Mar 20 2014 0h:08m:14s

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

- **vpn-sessiondb logoff name <username>** Allows you to log off the SSL VPN session for the specified user name.

```
ciscoasa#vpn-sessiondb logoff name ssluser1
Called vpn_remove_uauth: success!
webvpn_svc_np_tear_down: no ACL
NFO: Number of sessions with name "ssluser1" logged off : 1
```

Similarly, you can use the command **vpn-sessiondb logoff svc** in order to terminate all the SVC sessions.

Note: If the PC goes to standby or hibernate mode, then the SSL VPN connection can be terminated.

```
webvpn_rx_data_cstp
webvpn_rx_data_cstp: got message
SVC message: t/s=5/16: Client PC is going into suspend mode (Sleep, Hibernate, etc)
Called vpn_remove_uauth: success!
webvpn_svc_np_tear_down: no ACL
```

```
ciscoasa#show vpn-sessiondb svc
INFO: There are presently no active sessions
```

- **Debug webvpn svc <1-255>** Provides the real-time WebVPN events in order to establish the session.

```
Ciscoasa#debug webvpn svc 7
