## Introduction

This document provides step-by-step instructions on how to allow VPN Clients access to the Internet while they are tunneled into a Cisco Adaptive Security Appliance (ASA) 5500 Series Security Appliance. This configuration allows VPN Clients secure access to corporate resources via IPsec while giving unsecured access to the Internet.

**Warning:** Split tunneling can pose a security risk when configured. Because VPN Clients have

unsecured access to the Internet, they can be compromised by an attacker. That attacker might then be able to access the corporate LAN via the IPsec tunnel. A compromise between full tunneling and split tunneling can be to allow VPN Clients local LAN access only. Refer to PIX/ASA 7.x: Allow Local LAN Access for VPN Clients Configuration Example for more information.

## Prerequisites

### Requirements

This document assumes that a working remote access VPN configuration already exists on the ASA. Refer to PIX/ASA 7.x as a Remote VPN Server using ASDM Configuration Example if one is not already configured.

### Components Used

The information in this document is based on these software and hardware versions:

- Cisco ASA 5500 Series Security Appliance Software version 7.x and later
- Cisco Systems VPN Client version 4.0.5

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Network Diagram

The VPN Client is located on a typical SOHO network and connects across the Internet to the main office.

## Related Products

This configuration can also be used with Cisco PIX 500 Series Security Appliance Software version 7.x.

## Conventions

Refer to the Cisco Technical Tips Conventions for more information on document conventions.

## Background Information

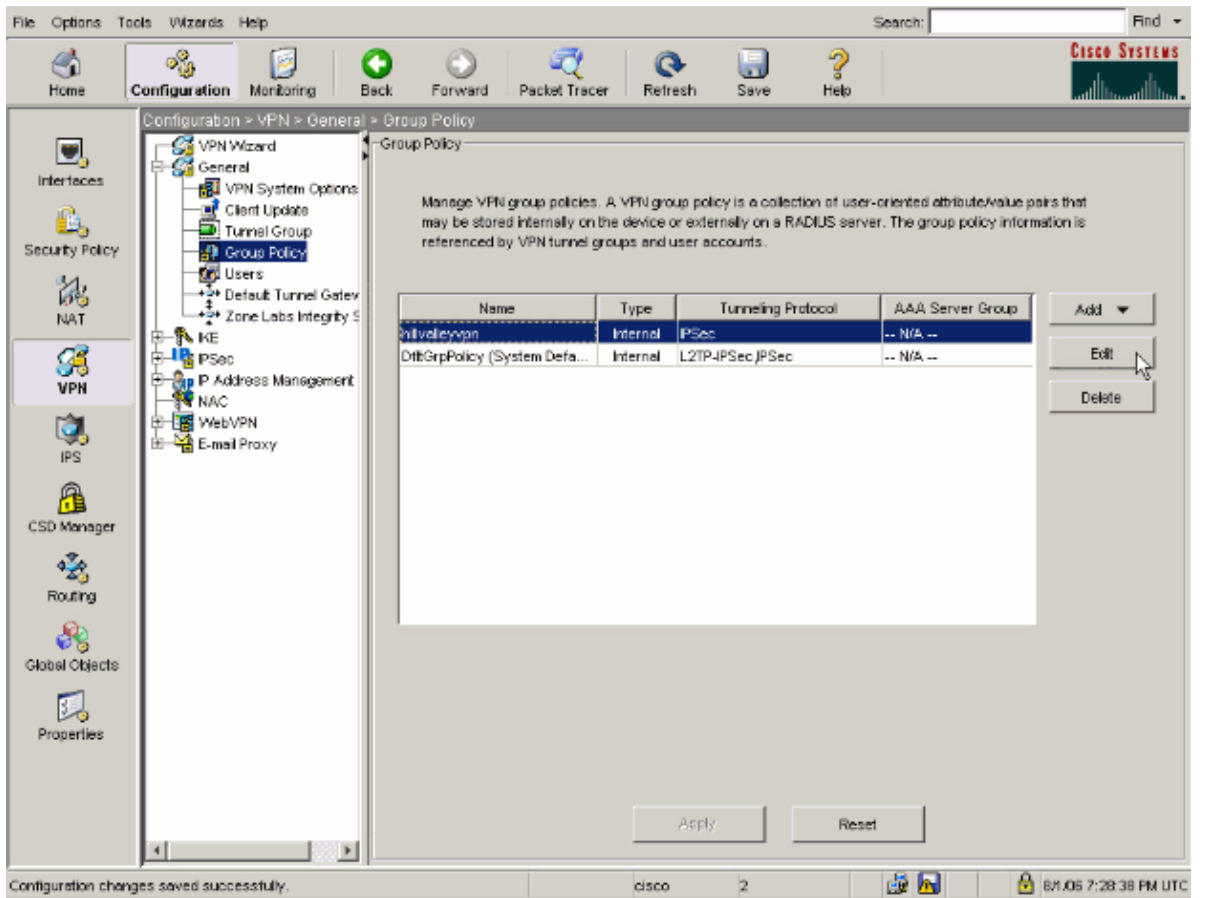

In a basic VPN Client to ASA scenario, all traffic from the VPN Client is encrypted and sent to the ASA no matter what its destination is. Based on your configuration and the number of users supported, such a set up can become bandwidth intensive. Split tunneling can work to alleviate this problem since it allows users to send only that traffic which is destined for the corporate network across the tunnel. All other traffic such as instant messaging, email, or casual browsing is sent out to the Internet via the local LAN of the VPN Client.

## Configure Split Tunneling on the ASA

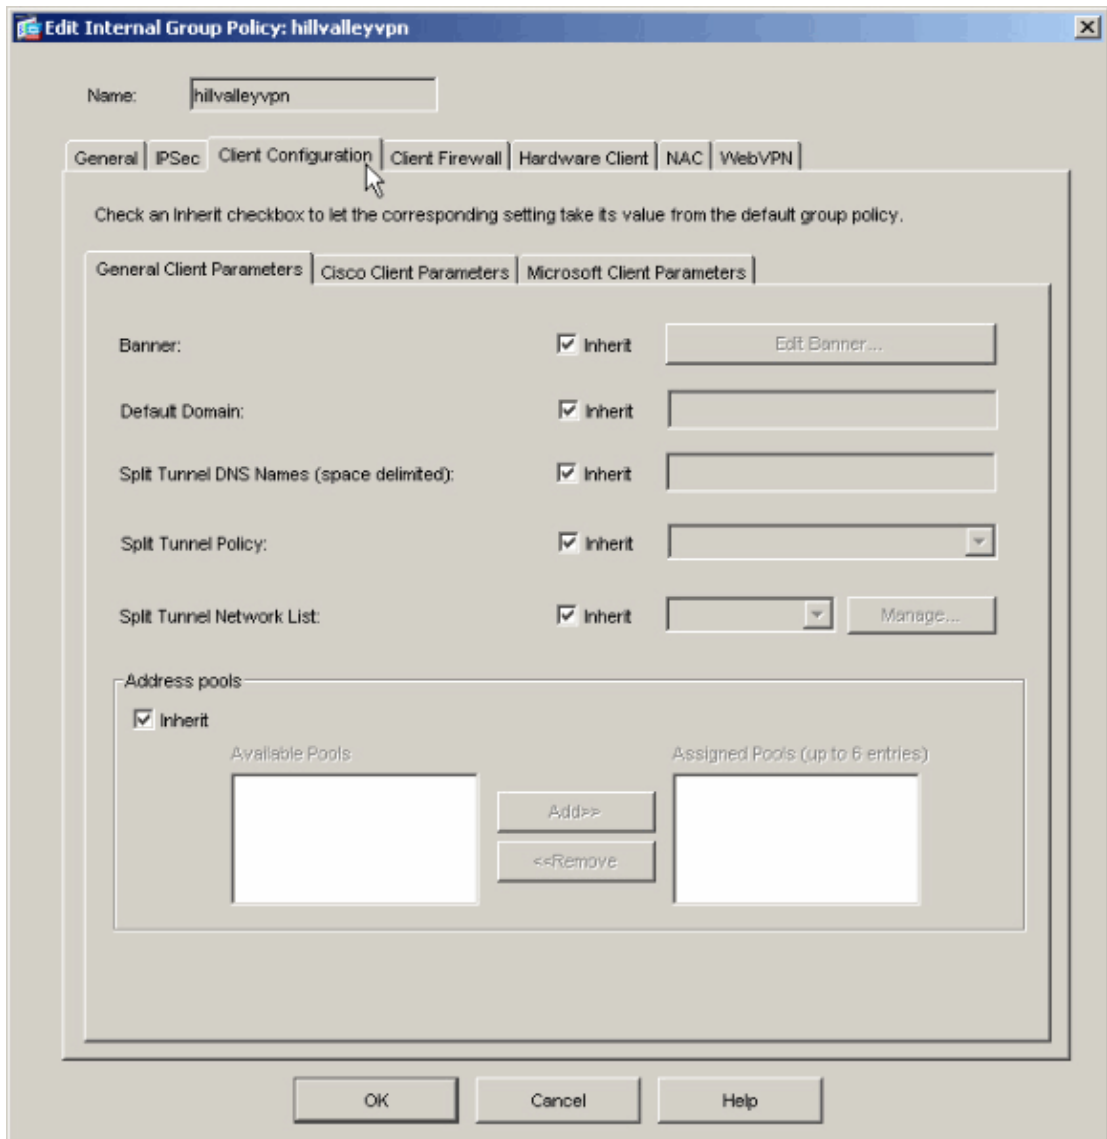

### Configure the ASA 7.x with Adaptive Security Device Manager (ASDM) 5.x

Complete these steps in order to configure your tunnel group to allow split tunneling for the users in the group.

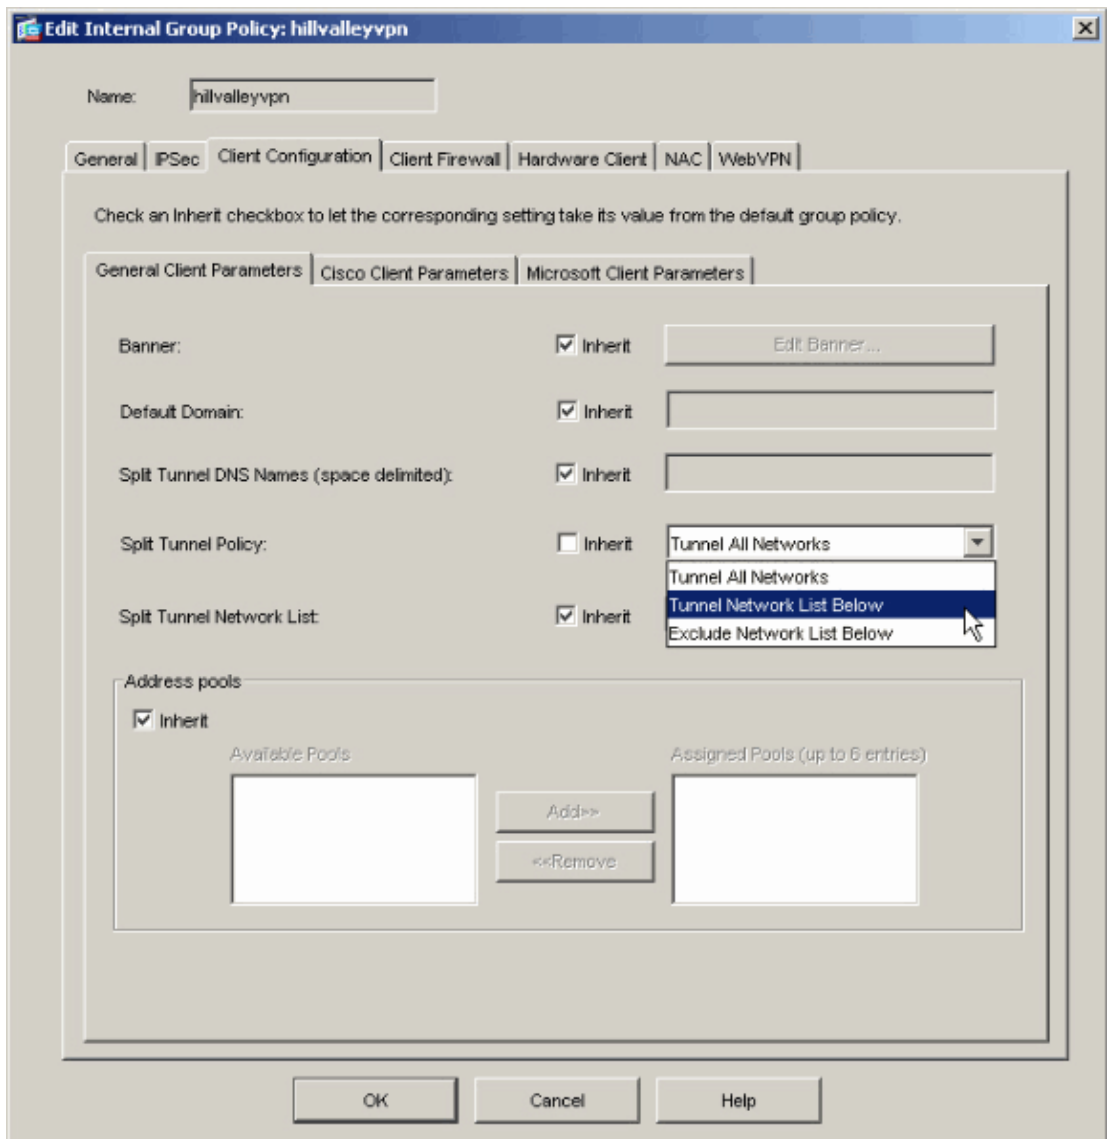

1. Choose **Configuration > VPN > General > Group Policy** and select the Group Policy that you wish to enable local LAN access in. Then click **Edit**.

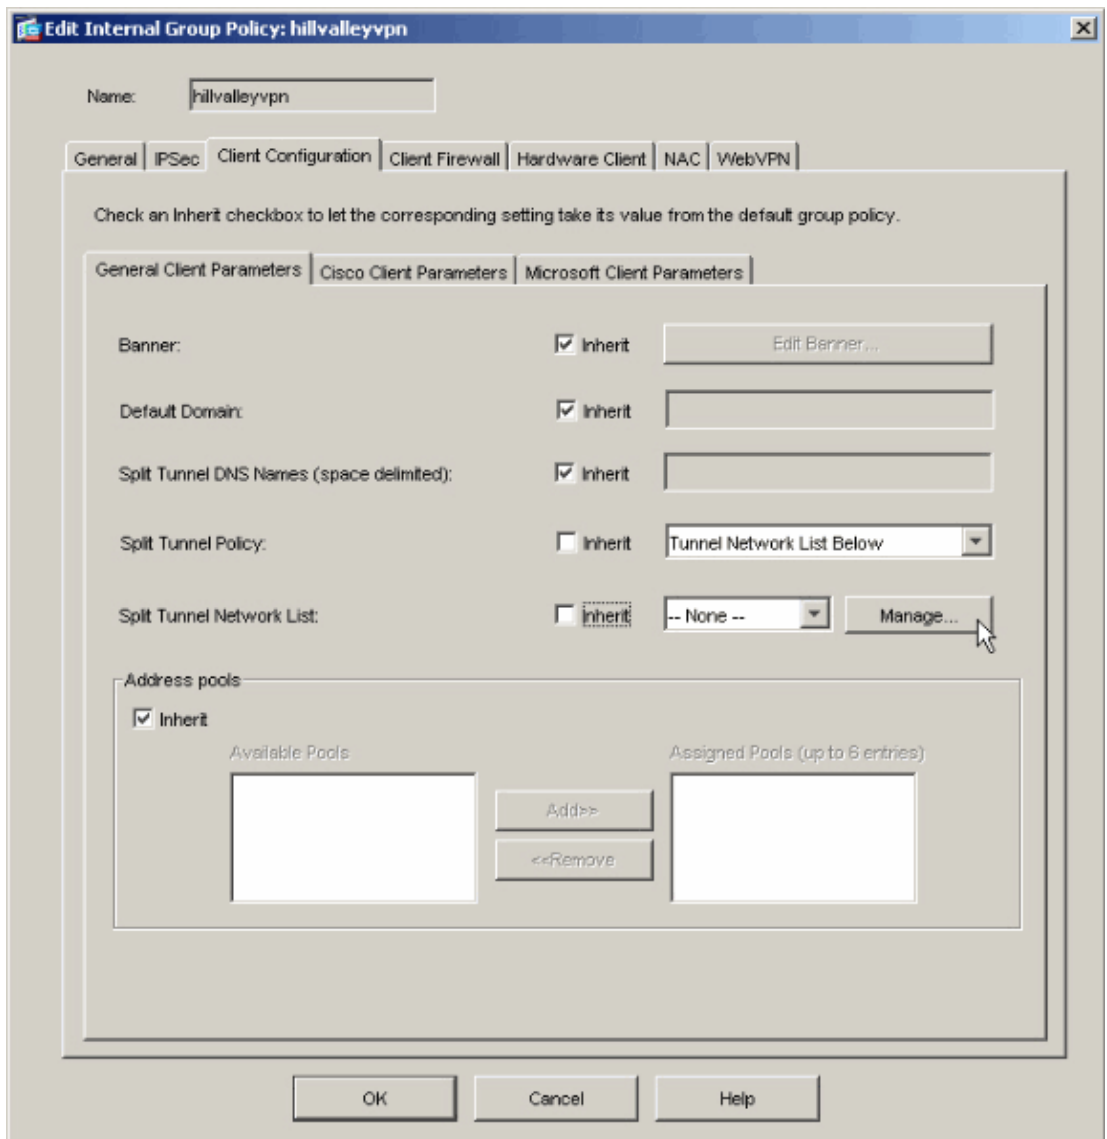

2. Go to the Client Configuration tab.

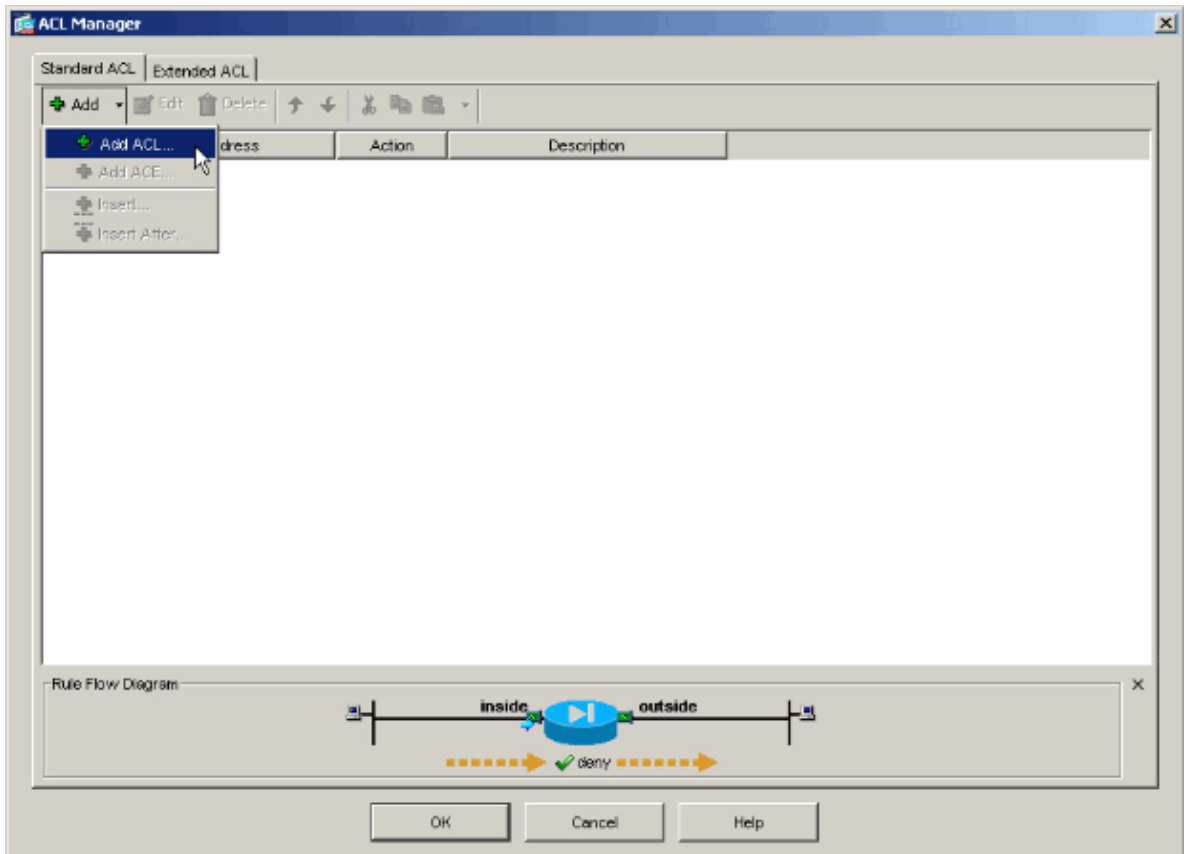

3. Uncheck the **Inherit** box for Split Tunnel Policy and chose **Tunnel Network List Below**.

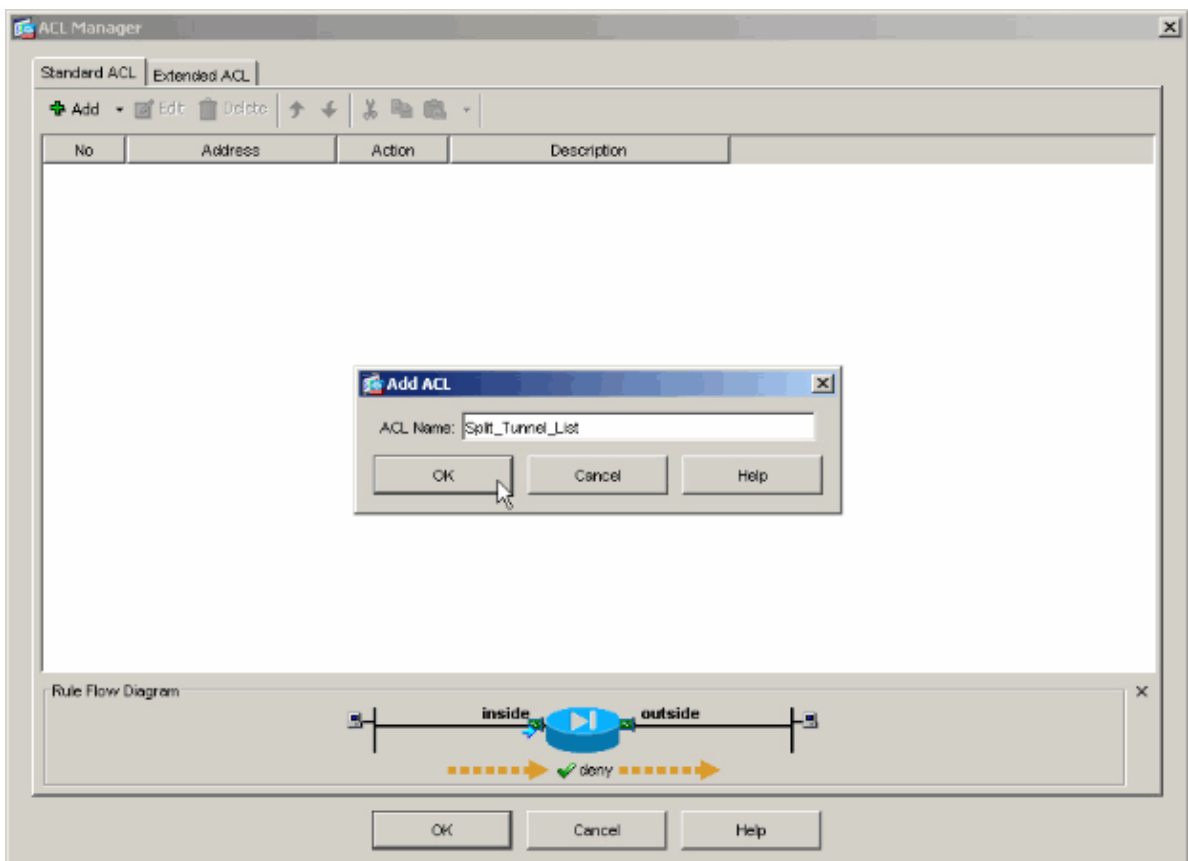

4. Uncheck the **Inherit** box for Split Tunnel Network List and then click **Manage** in order to launch the ACL Manager.

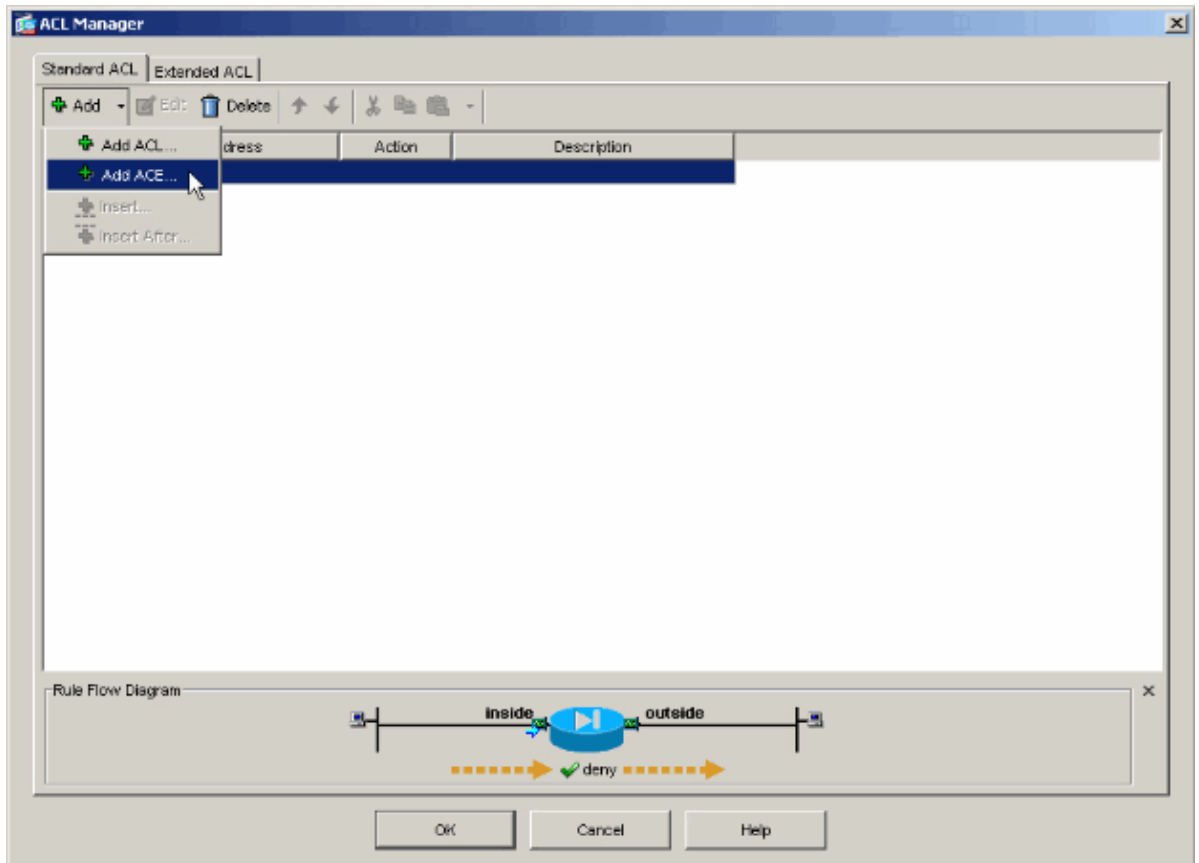

5. Within the ACL Manager, choose **Add > Add ACL...** in order to create a new access list.

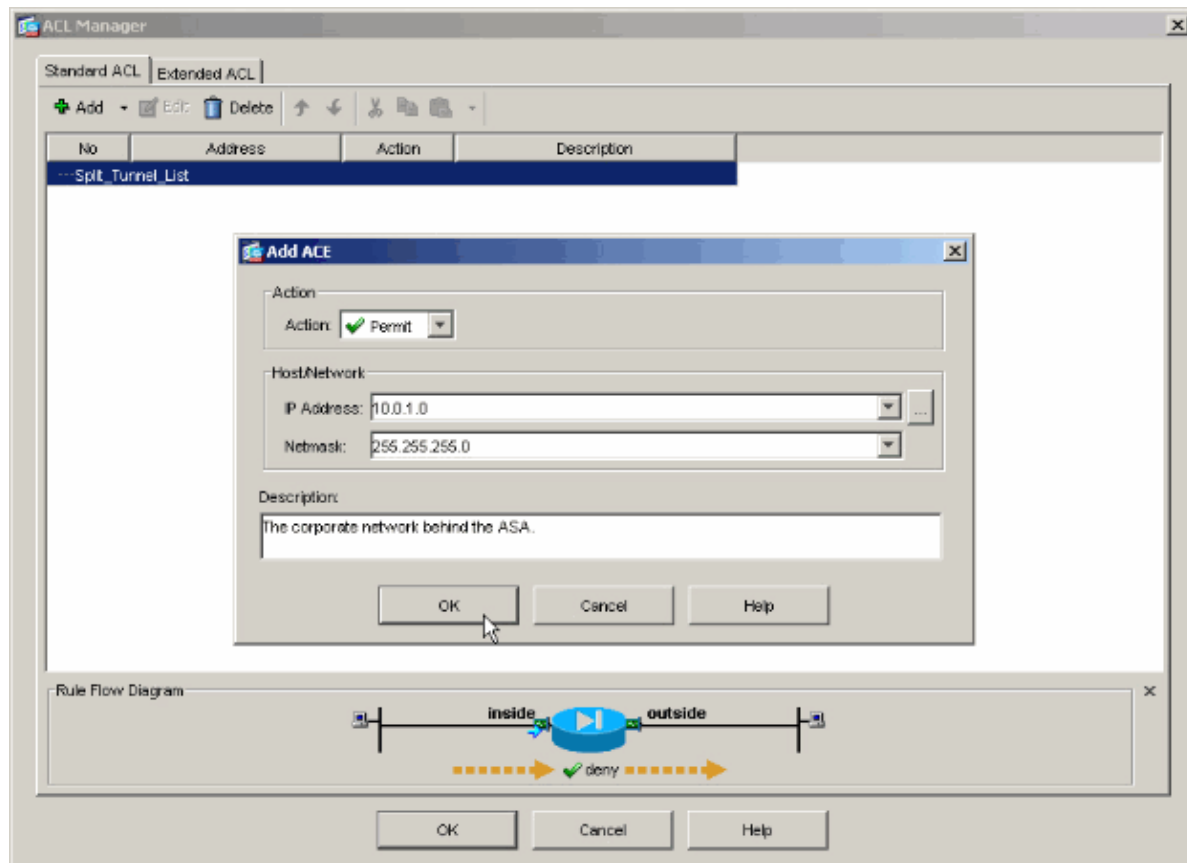

6. Provide a name for the ACL and click **OK**.

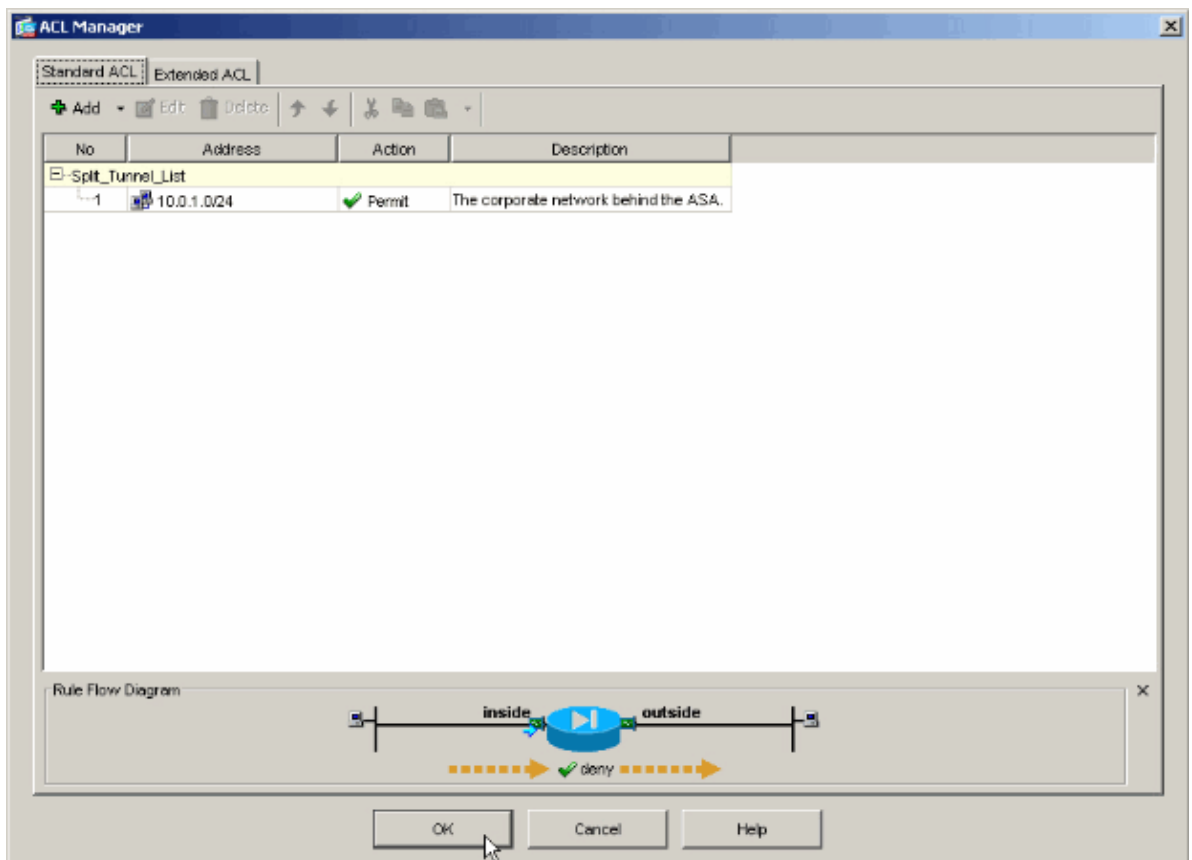

7. Once the ACL is created, choose **Add > Add ACE...** in order to add an Access Control Entry (ACE).

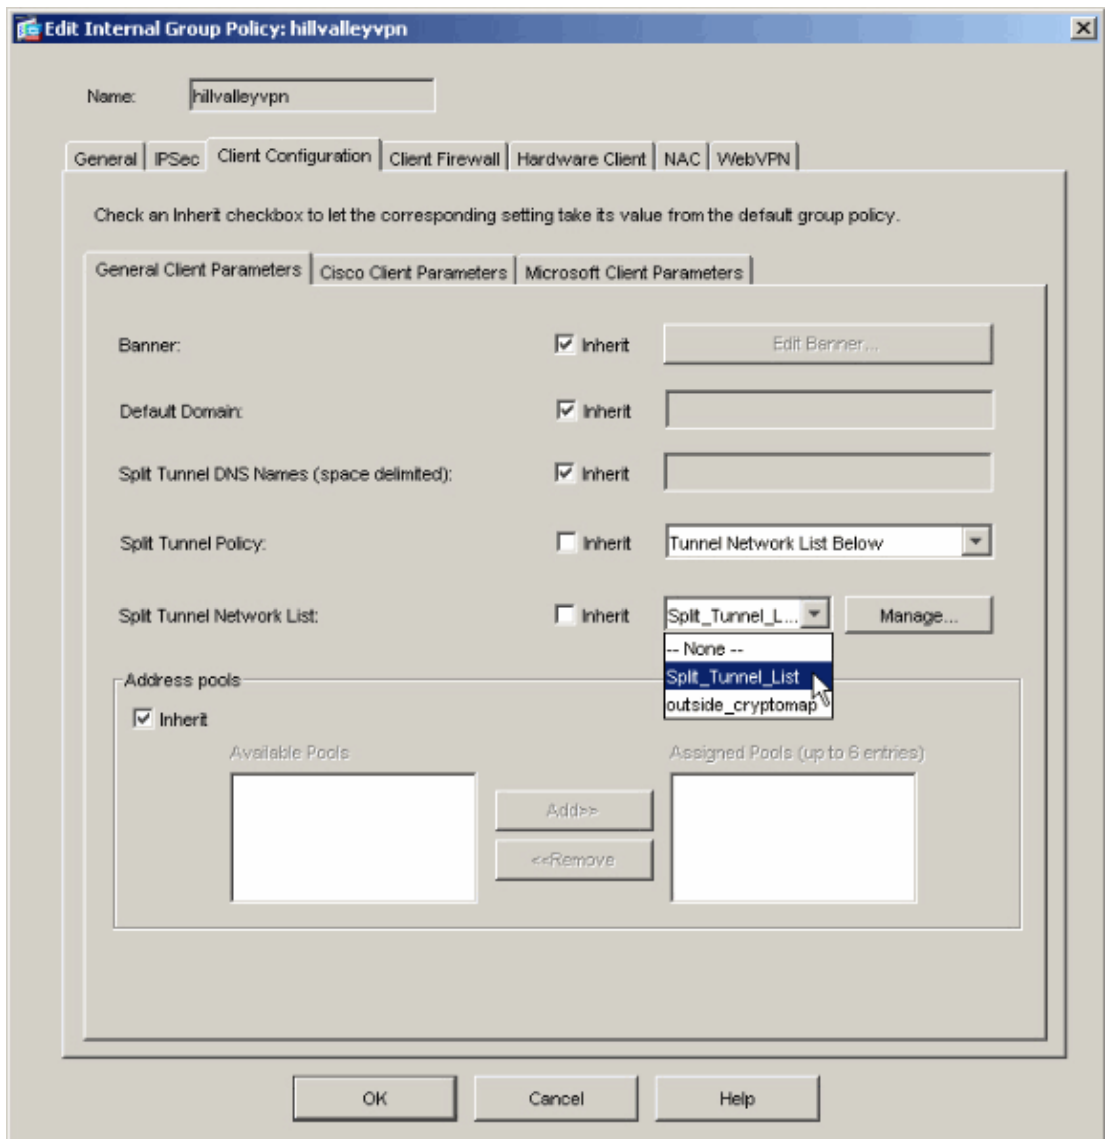

8. Define the ACE that corresponds to the LAN behind the ASA. In this case, the network is 10.0.1.0/24.
- Choose **Permit**.
  - Choose an IP Address of **10.0.1.0**
  - Choose a Netmask of **255.255.255.0**.
  - (Optional)* Provide a description.
  - Click **OK**.

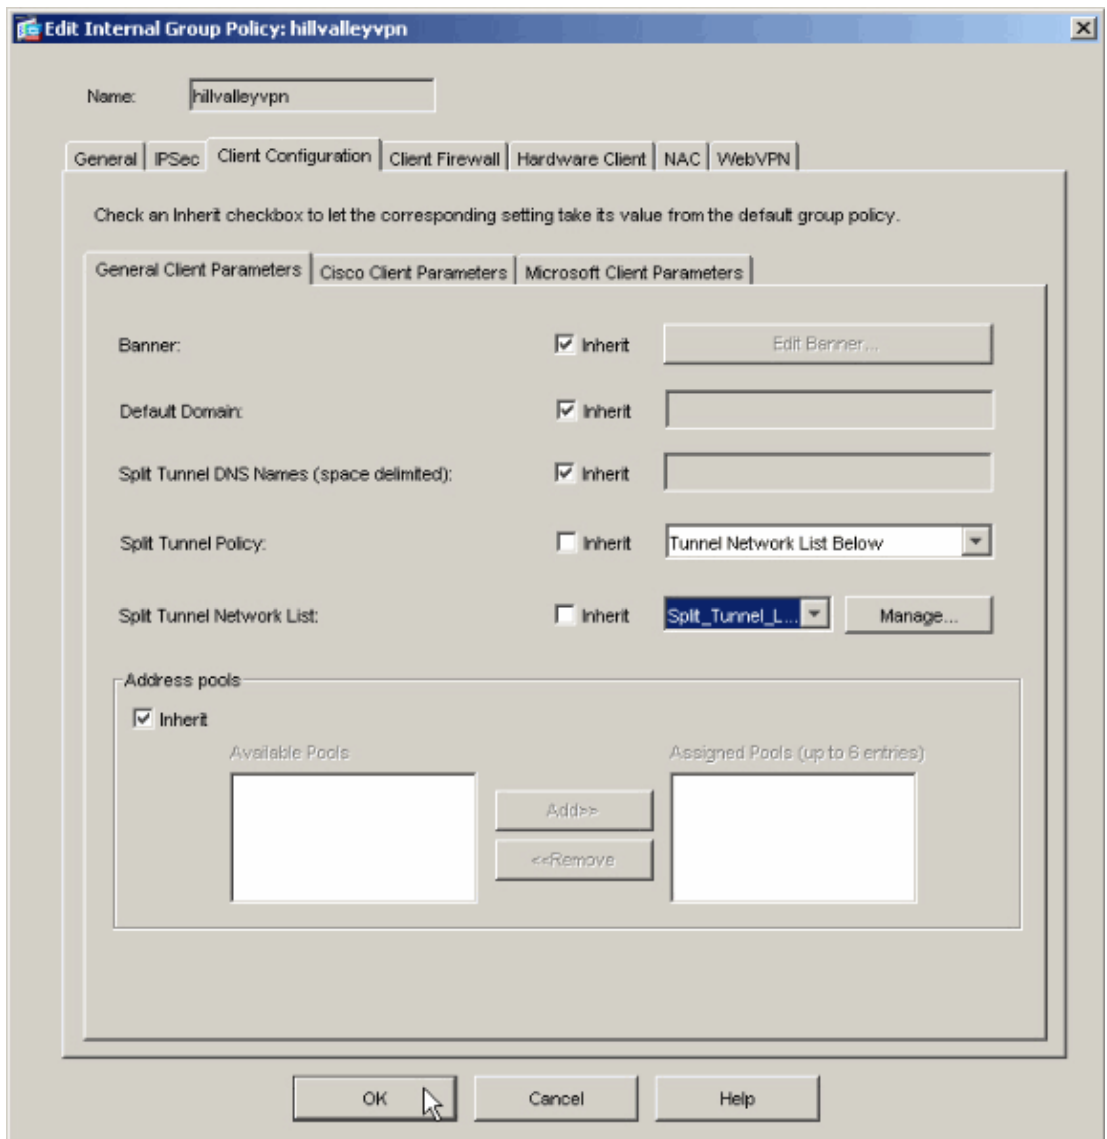

9. Click **OK** in order to exit the ACL Manager.

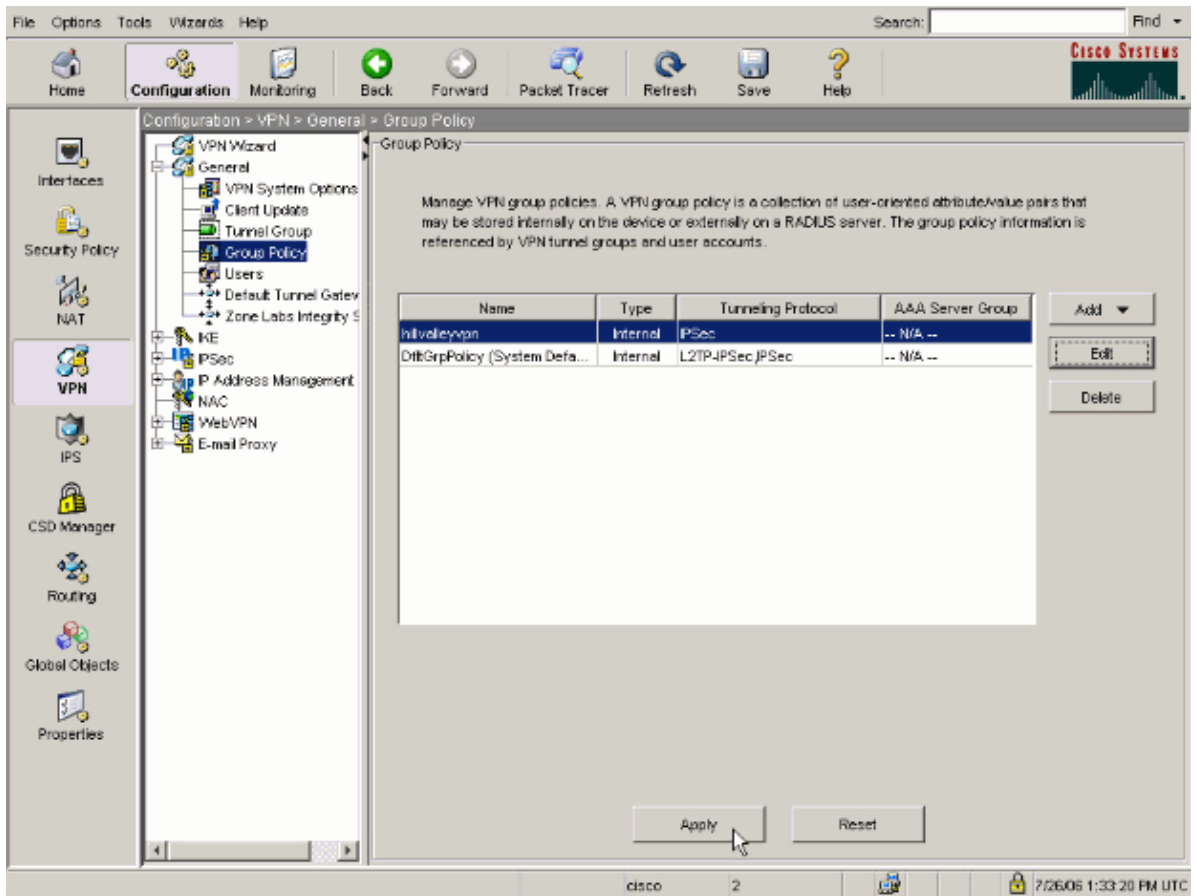

10. Be sure that the ACL you just created is selected for Split Tunnel Network List.

11. Click **OK** in order to return to the Group Policy configuration.

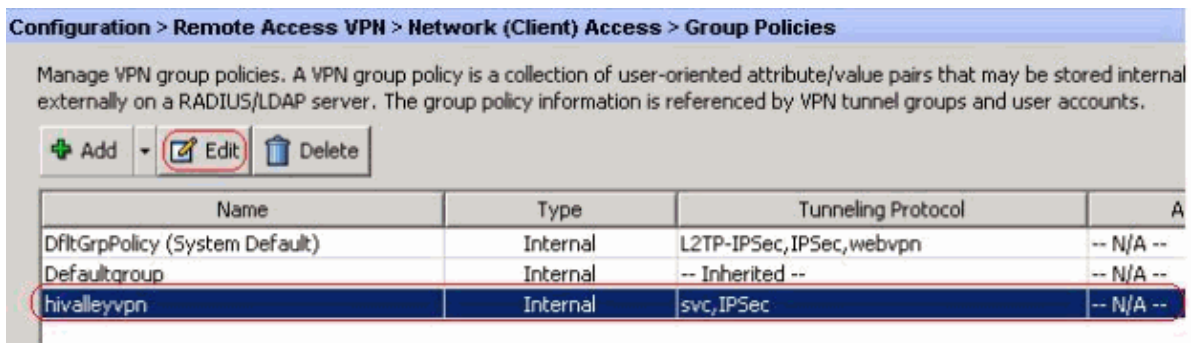

12. Click **Apply** and then **Send** (if required) in order to send the commands to the ASA.

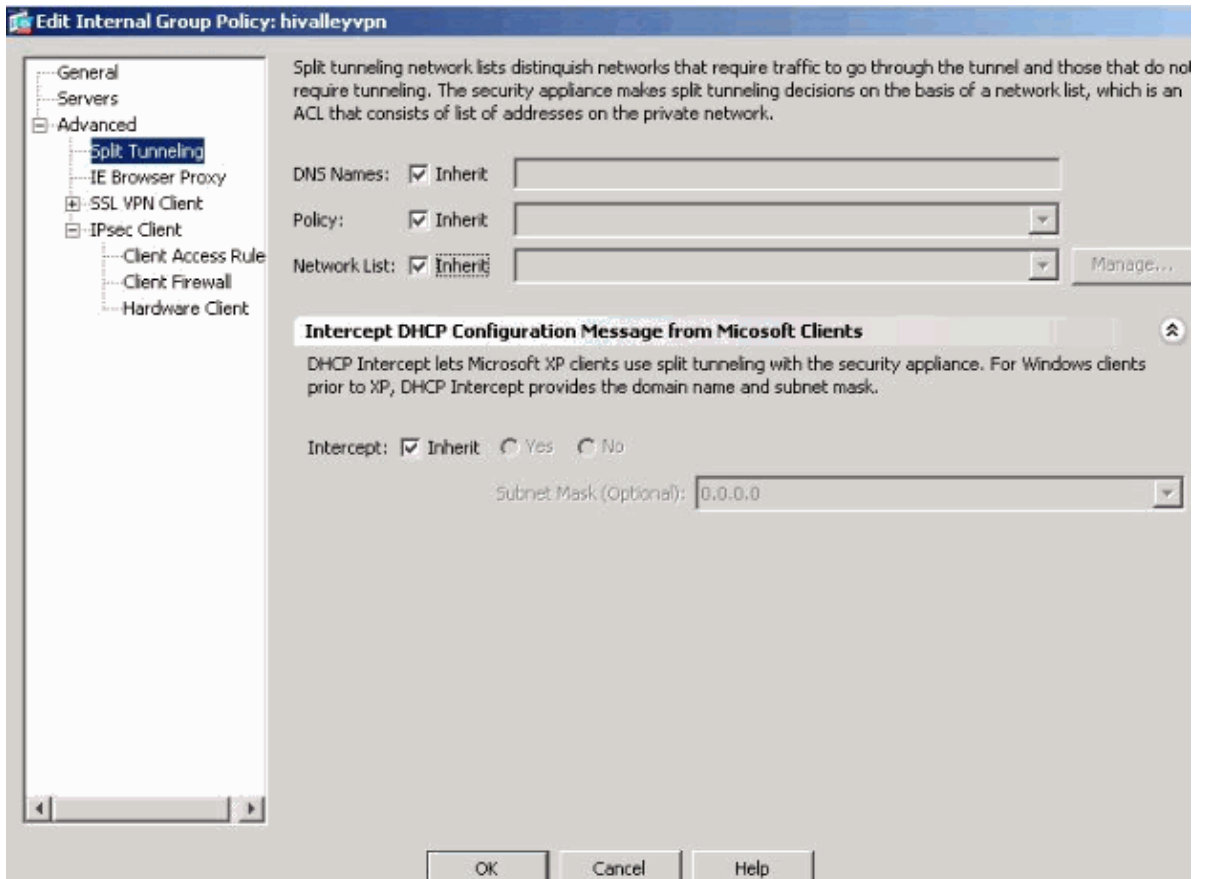

## Configure the ASA 8.x with Adaptive Security Device Manager (ASDM) 6.x

Complete these steps in order to configure your tunnel group to allow split tunneling for the users in the group.

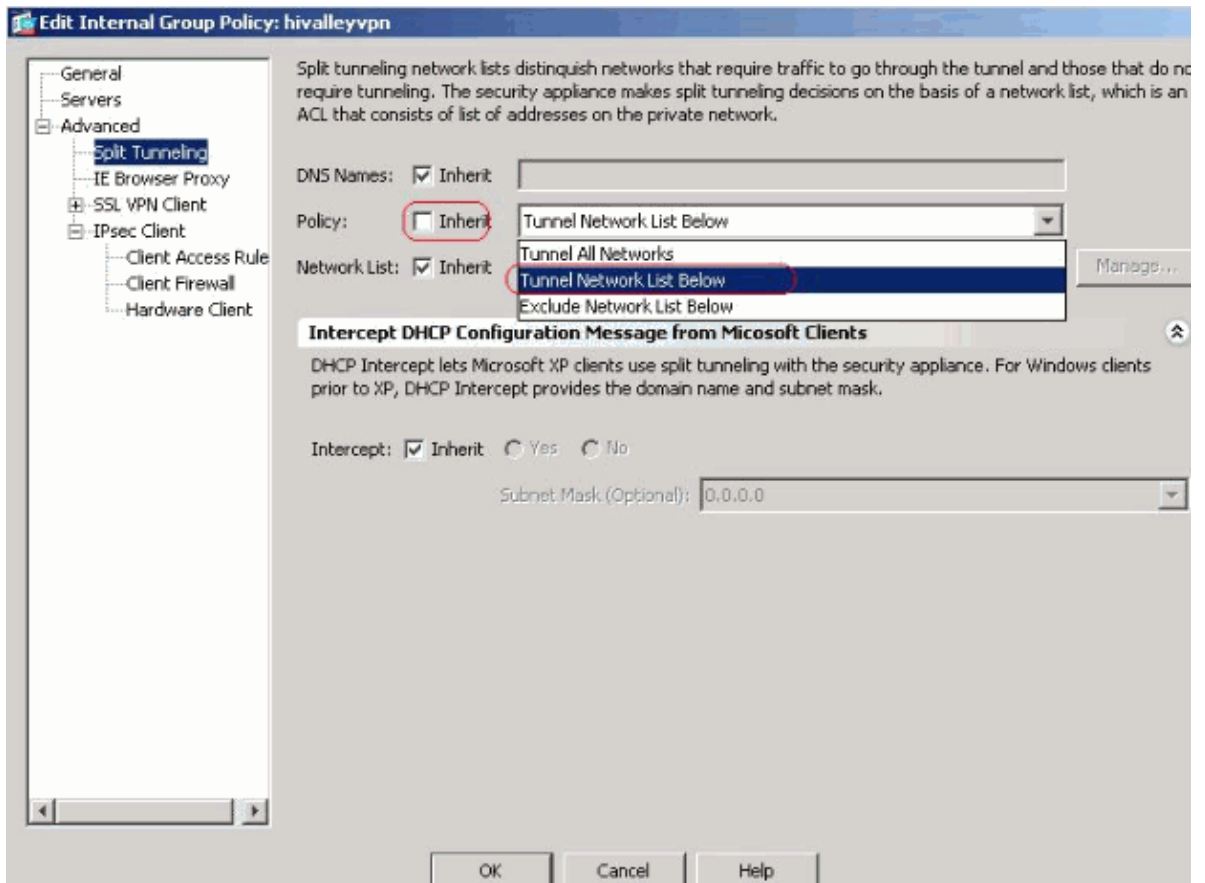

1. Choose **Configuration > Remote Access VPN > Network (Client) Access > Group Policies**, and choose the Group Policy in which you want to enable local LAN access. Then click **Edit**.

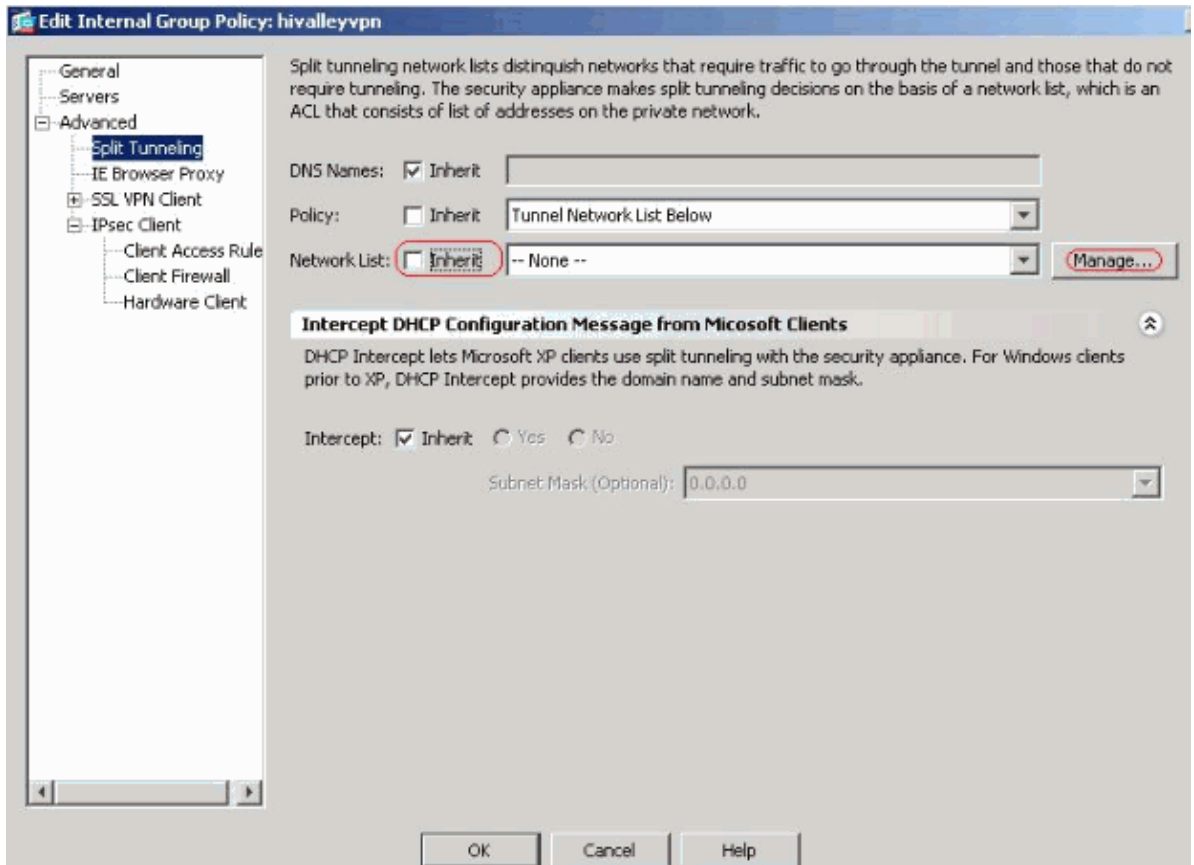

2. Click **Split Tunneling**.

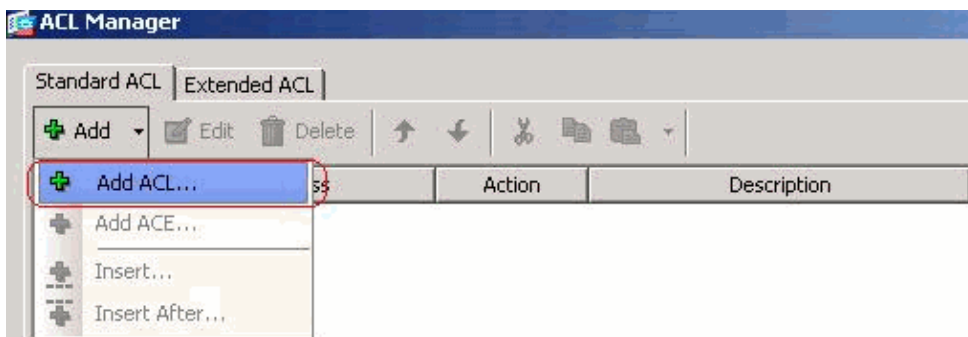

3. Uncheck the **Inherit** box for Split Tunnel Policy, and chose **Tunnel Network List Below**.

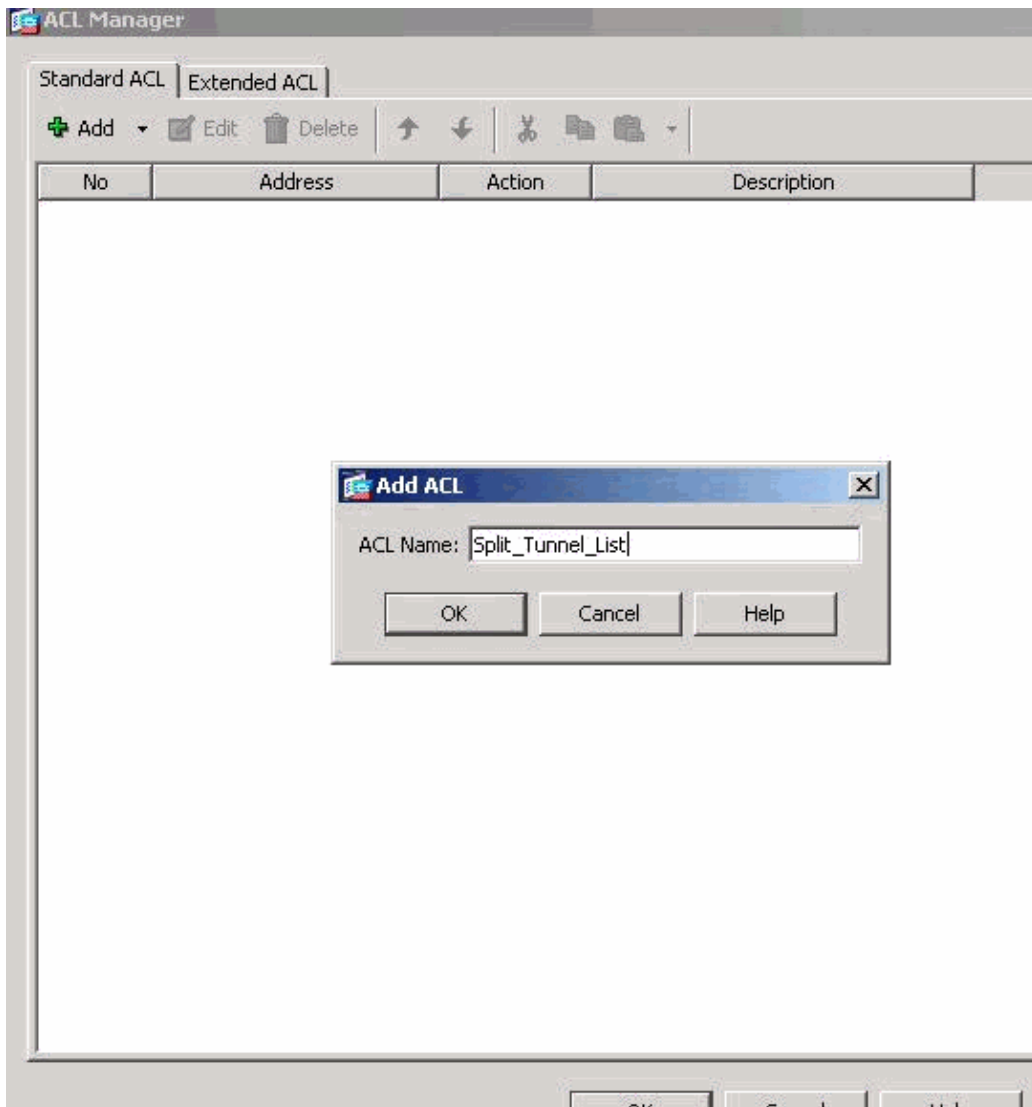

4. Uncheck the **Inherit** box for Split Tunnel Network List, and then click **Manage** in order to launch the ACL Manager.

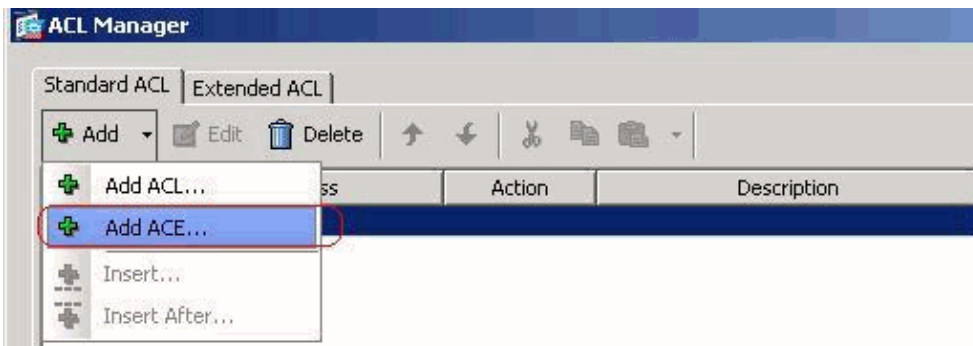

5. Within the ACL Manager, choose **Add > Add ACL...** in order to create a new access list.

6. Provide a name for the ACL, and click **OK**.

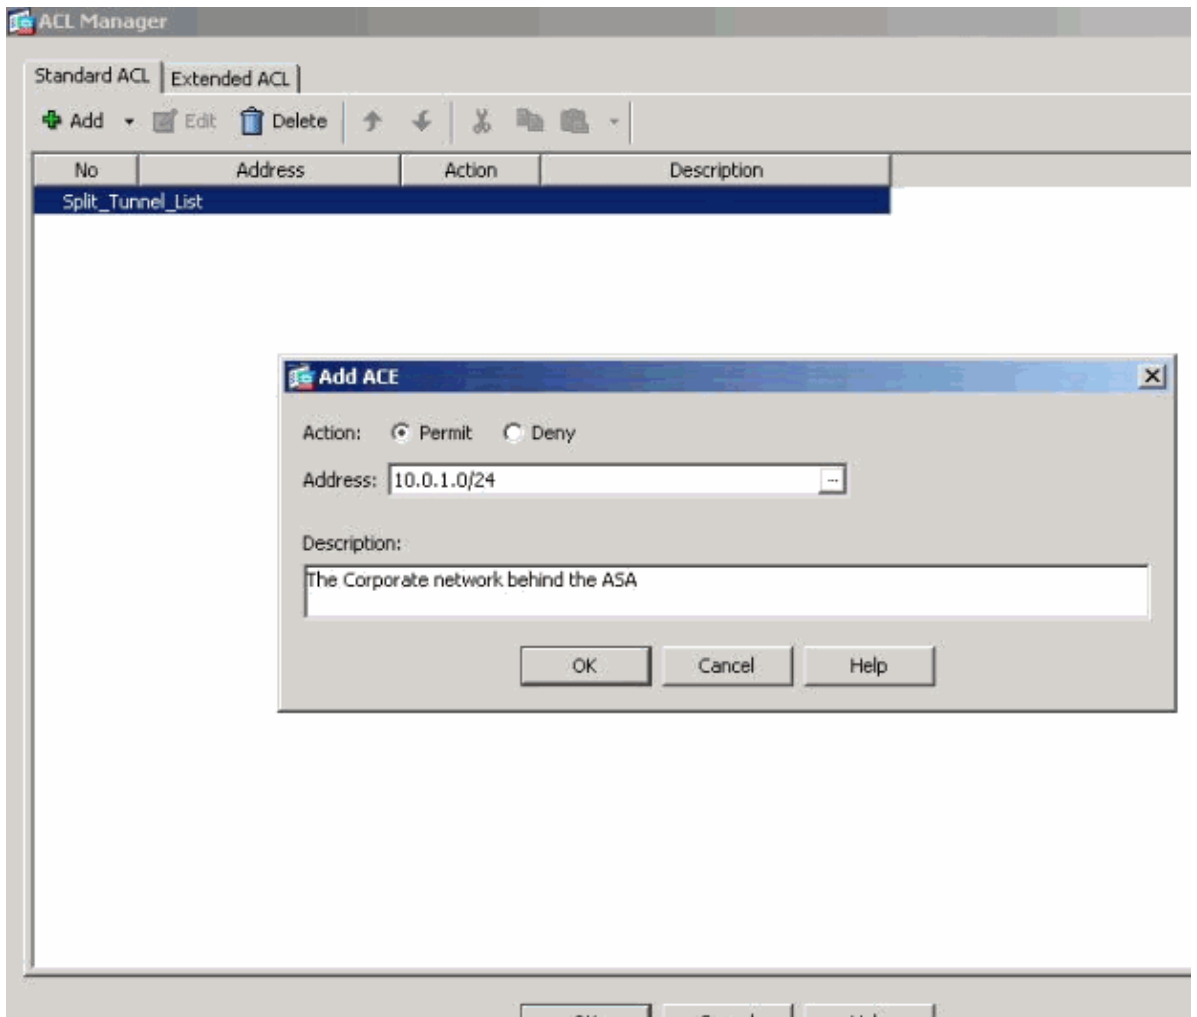

7. Once the ACL is created, choose **Add > Add ACE...** in order to add an Access Control Entry (ACE).

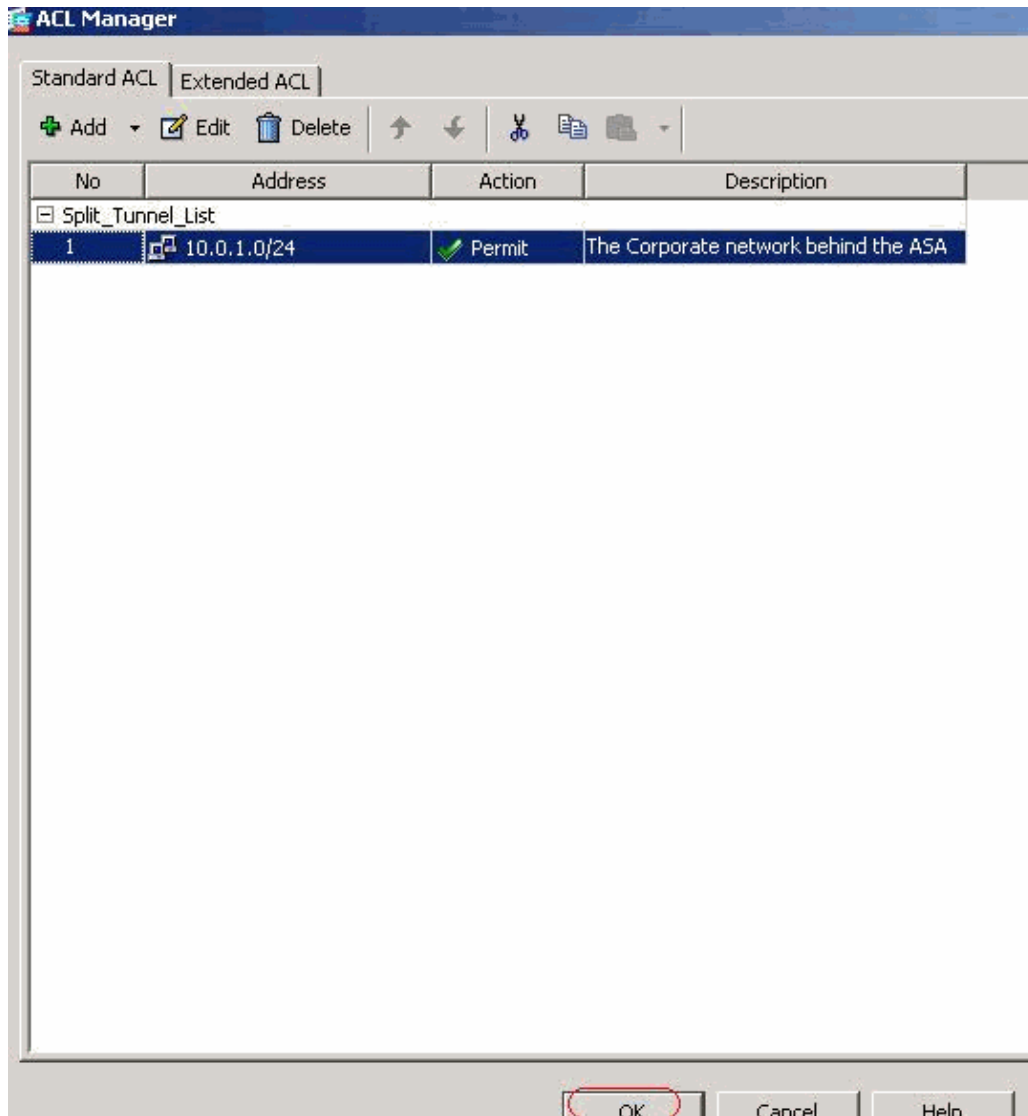

8. Define the ACE that corresponds to the LAN behind the ASA. In this case, the network is 10.0.1.0/24.

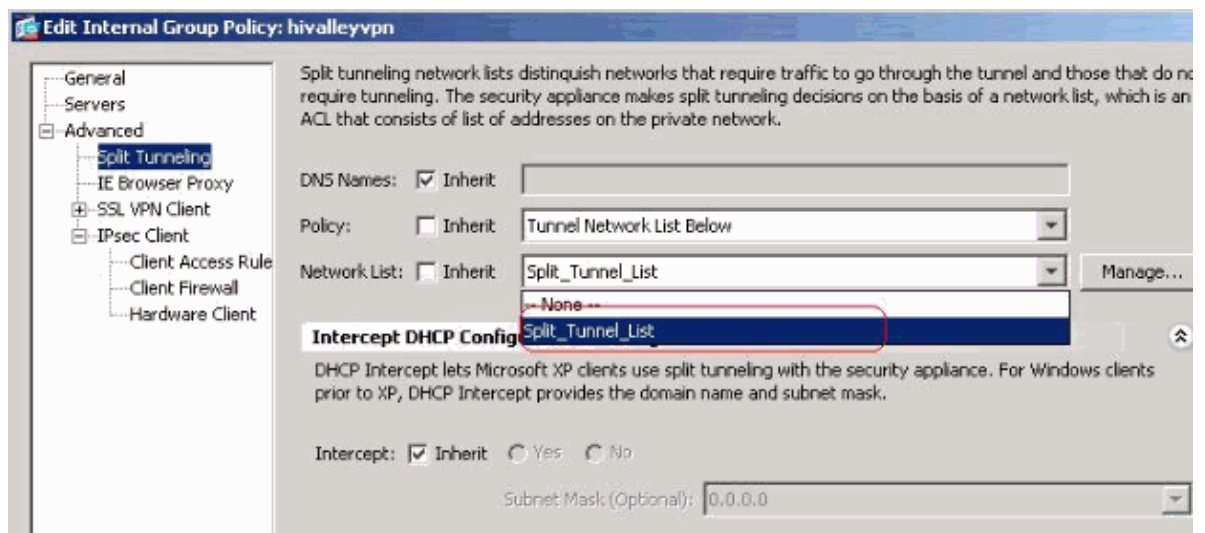

- a. Click the **Permit** radio button.
- b. Choose the network address with mask **10.0.1.0/24**.
- c. (Optional) Provide a description.
- d. Click **OK**.

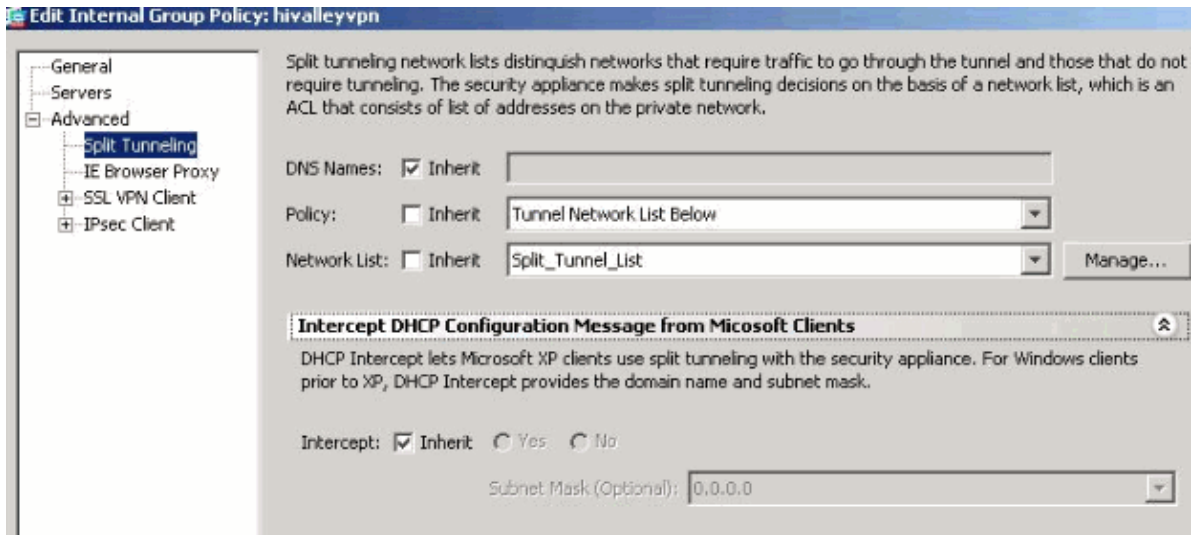

9. Click **OK** in order to exit the ACL Manager.

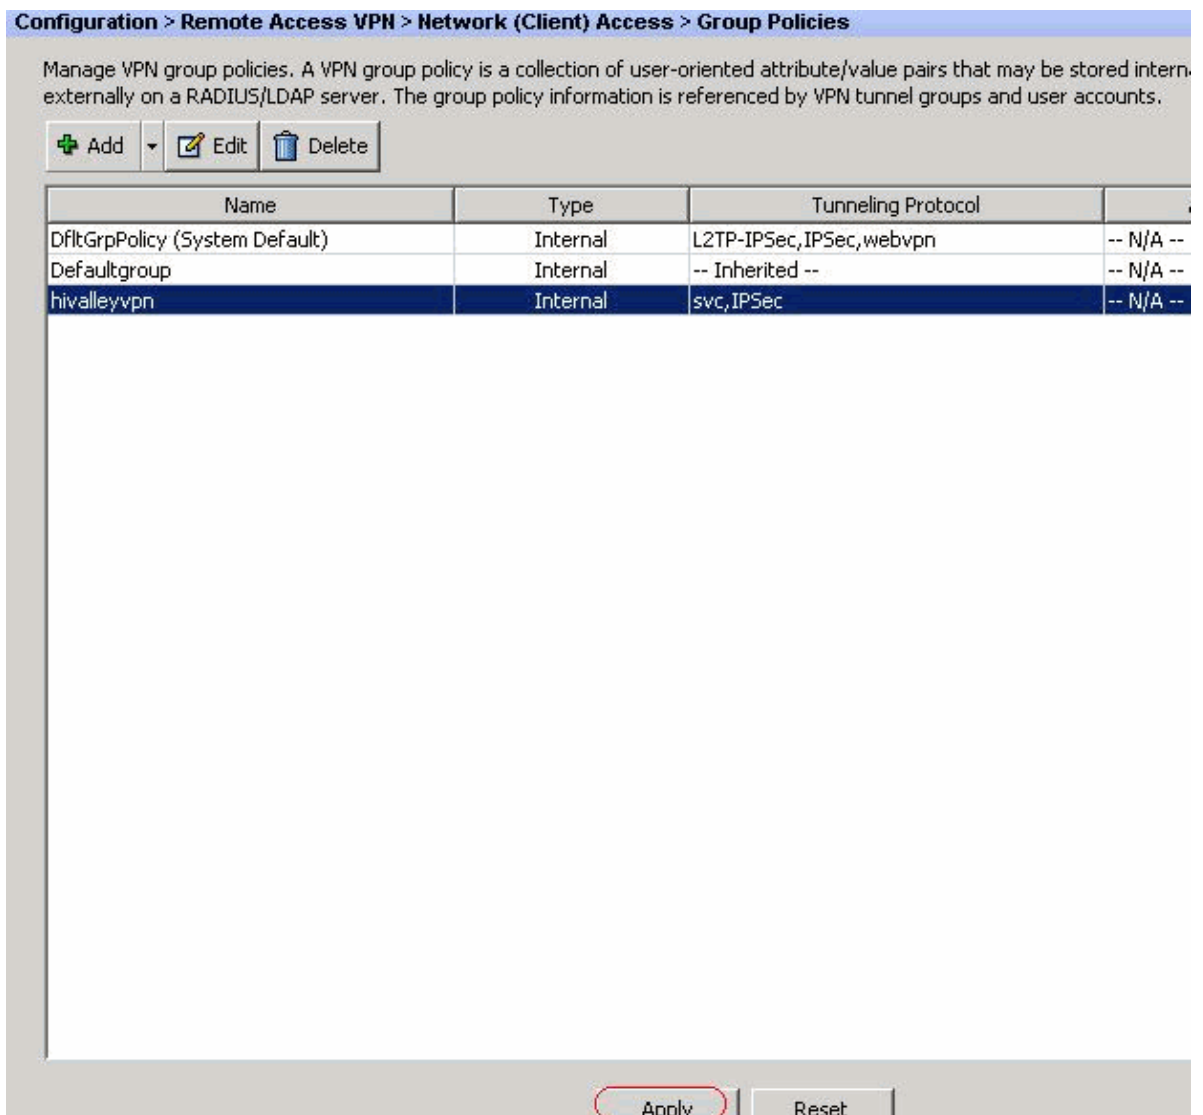

10. Be sure that the ACL you just created is selected for Split Tunnel Network List.

11. Click **OK** in order to return to the Group Policy configuration.

12. Click **Apply** and then **Send** (if required) in order to send the commands to the ASA.

## Configure the ASA via CLI

Rather than use the ASDM, you can complete these steps in the ASA CLI in order to allow split tunneling on the ASA:

**Note:** The CLI Split Tunneling configuration is the same for both ASA 7.x and 8.x.

1. Enter configuration mode.

```
ciscoasa>enable
Password: *****
ciscoasa#configure terminal
ciscoasa(config)#
```

2. Create the access list that defines the network behind the ASA.

```
ciscoasa(config)#access-list Split_Tunnel_List remark The corporate network behind t
ciscoasa(config)#access-list Split_Tunnel_List standard permit 10.0.1.0 255.255.255.
```

3. Enter Group Policy configuration mode for the policy that you wish to modify.

```
ciscoasa(config)#group-policy hillvalleyvpn attributes
ciscoasa(config-group-policy)#
```

4. Specify the split tunnel policy. In this case the policy is **tunnelspecified**.

```
ciscoasa(config-group-policy)#split-tunnel-policy tunnelspecified
```

5. Specify the split tunnel access list. In this case, the list is **Split\_Tunnel\_List**.

```
ciscoasa(config-group-policy)#split-tunnel-network-list value Split_Tunnel_List
```

6. Issue this command:

```
ciscoasa(config)#tunnel-group hillvalleyvpn general-attributes
```

7. Associate the group policy with the tunnel group

```
ciscoasa(config-tunnel-ipsec)# default-group-policy hillvalleyvpn
```

8. Exit the two configuration modes.

```
ciscoasa(config-group-policy)#exit
ciscoasa(config)#exit
ciscoasa#
```

9. Save the configuration to non-volatile RAM (NVRAM) and press **Enter** when prompted to specify the source filename.

```
ciscoasa#copy running-config startup-config

Source filename [running-config]?
Cryptochecksum: 93bb3217 0f60bfa4 c36bbb29 75cf714a

3847 bytes copied in 3.470 secs (1282 bytes/sec)
ciscoasa#
```

## Verify

Follow the steps in these sections in order to verify your configuration.

- Connect with the VPN Client
- View the VPN Client Log
- Test Local LAN Access with Ping

## Connect with the VPN Client

Connect your VPN Client to the VPN Concentrator in order to verify your configuration.

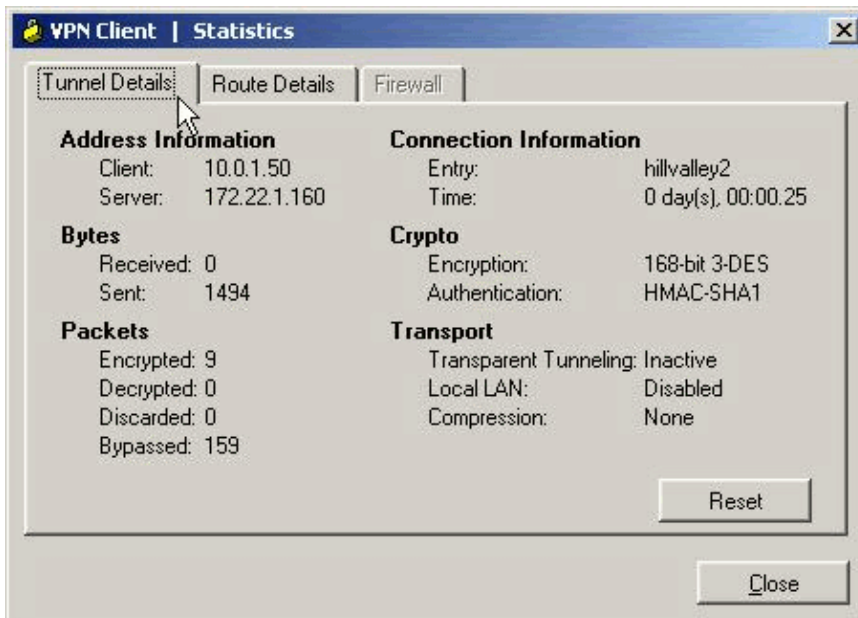

1. Choose your connection entry from the list and click **Connect**.

2. Enter your credentials.

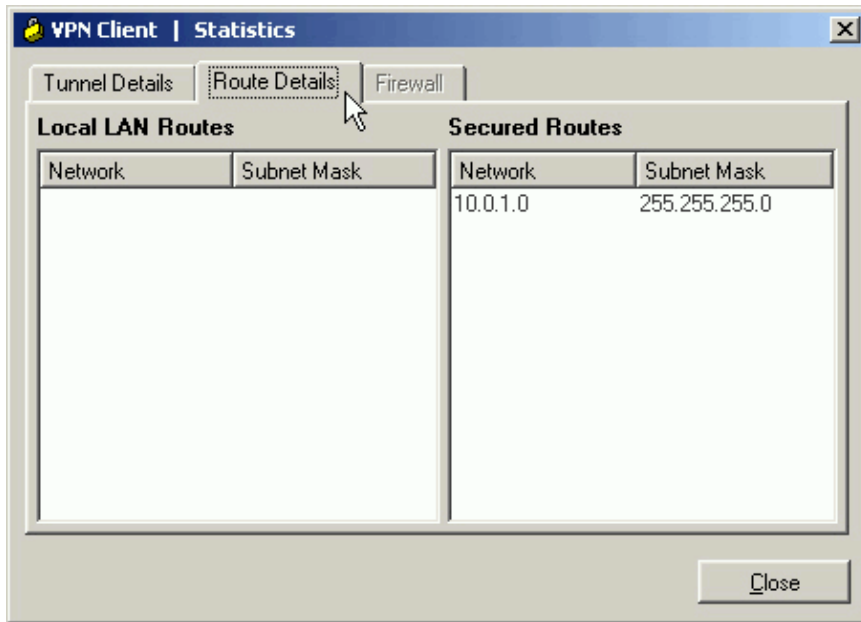

3. Choose **Status > Statistics...** in order to display the Tunnel Details window where you can inspect the particulars of the tunnel and see traffic flowing.

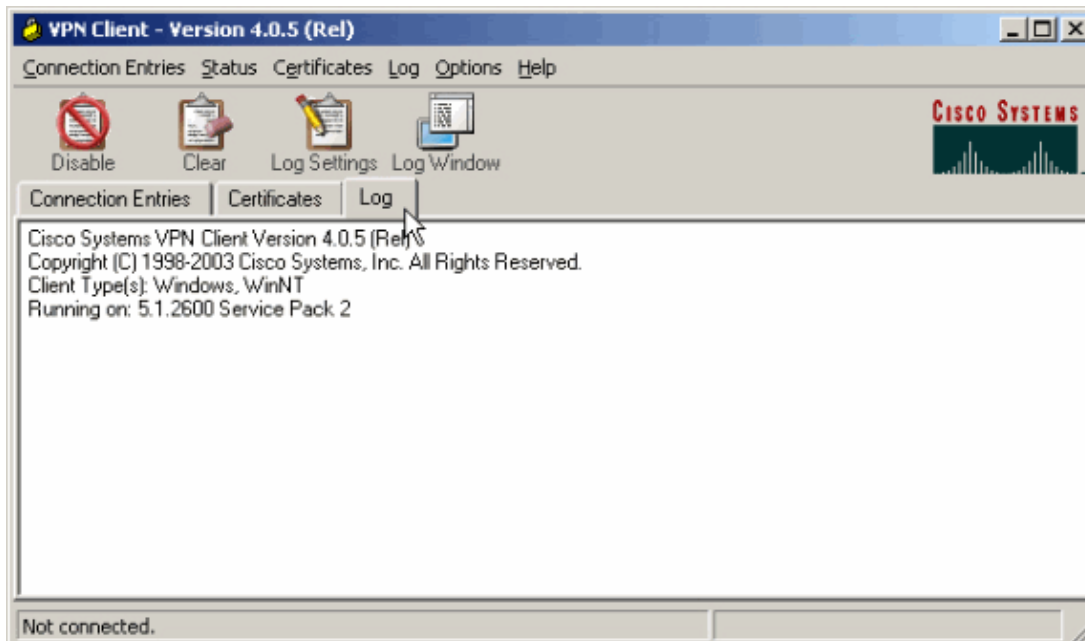

4. Go to the Route Details tab in order to see the routes that the VPN Client is securing to the ASA.

In this example, the VPN Client is securing access to 10.0.1.0/24 while all other traffic is not encrypted and not sent across the tunnel.

## View the VPN Client Log

When you examine the VPN Client log, you can determine whether or not the parameter that specifies split tunneling is set. In order to view the log, go to the Log tab in the VPN Client. Then click on **Log Settings** in order to adjust what is logged. In this example, IKE is set to **3 – High** while all other log elements are set to **1 – Low**.

```

## Test Local LAN Access with Ping

An additional way to test that the VPN Client is configured for split tunneling while tunneled to the ASA is to use the **ping** command at the Windows command line. The local LAN of the VPN Client is 192.168.0.0/24 and another host is present on the network with an IP address of 192.168.0.3.

```

C:\>ping 192.168.0.3
Pinging 192.168.0.3 with 32 bytes of data:

Reply from 192.168.0.3: bytes=32 time<1ms TTL=255

```

```
Reply from 192.168.0.3: bytes=32 time<1ms TTL=255
Reply from 192.168.0.3: bytes=32 time<1ms TTL=255
Reply from 192.168.0.3: bytes=32 time<1ms TTL=255
```

```
Ping statistics for 192.168.0.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

## Troubleshoot

There is currently no specific troubleshooting information available for this configuration.
