Introduction

This document demonstrates how to form an IPsec tunnel with pre-shared keys to join two private networks: the 192.168.1.x private network inside the Cisco router and the 10.32.50.x private network inside the Checkpoint Firewall.

Prerequisites

Requirements

This sample configuration assumes that traffic from inside the router and inside the Checkpoint to the Internet (represented here by the 172.18.124.x networks) flows before you start the configuration.

Components Used

The information in this document is based on these software and hardware versions:

- Cisco 3600 router
- Cisco IOS® Software (C3640-JO3S56I-M), Release 12.1(5)T, RELEASE SOFTWARE (fc1)
- Checkpoint Firewall 4.1

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the Command Lookup Tool (registered customers only) to find more information on the commands used in this document.

Network Diagram

This document uses this network setup:

Configurations

This document uses these configurations.

- Router Configuration
- Checkpoint Firewall Configuration

Checkpoint Firewall Configuration

Complete these steps to configure the Checkpoint Firewall.

1. Since the IKE and IPsec default lifetimes differ between vendors, select **Properties > Encryption** to set the Checkpoint lifetimes to agree with the Cisco defaults.

The Cisco default IKE lifetime is 86400 seconds (= 1440 minutes), and it can be modified by these commands:

- ◆ **crypto isakmp policy #**
- ◆ **lifetime #**

The configurable Cisco IKE lifetime is from 60–86400 seconds. The Cisco default IPsec lifetime is 3600 seconds, and it can be modified by the **crypto ipsec security-association lifetime seconds #** command.

The configurable Cisco IPsec lifetime is from 120–86400 seconds.

2. Select **Manage > Network objects > New (or Edit) > Network** to configure the object for the internal network (called "cpinside") behind the Checkpoint.

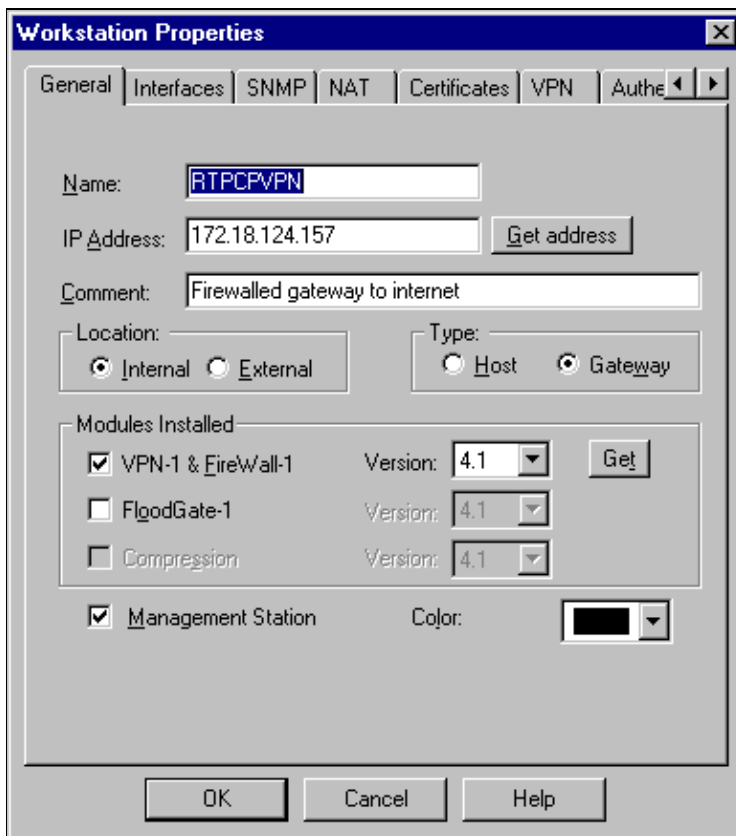

This should agree with the destination (second) network in the Cisco **access-list 115 permit ip 192.168.1.0 0.0.0.255 10.32.50.0 0.0.0.255** command.

Select **Internal** under Location.

3. Select **Manage > Network objects > Edit** to edit the object for the RTPCPVPN Checkpoint (gateway) endpoint that the Cisco router points to in the **set peer 172.18.124.157** command.

Select **Internal** under Location. For Type, select **Gateway**. Under Modules Installed, select the **VPN-1 & FireWall-1** check box, and also select the **Management Station** check box:

4. Select **Manage > Network objects > New > Network** to configure the object for the external network (called "inside_cisco") behind the Cisco router.

This should agree with the source (first) network in the Cisco **access-list 115 permit ip 192.168.1.0 0.0.0.255 10.32.50.0 0.0.0.255** command.

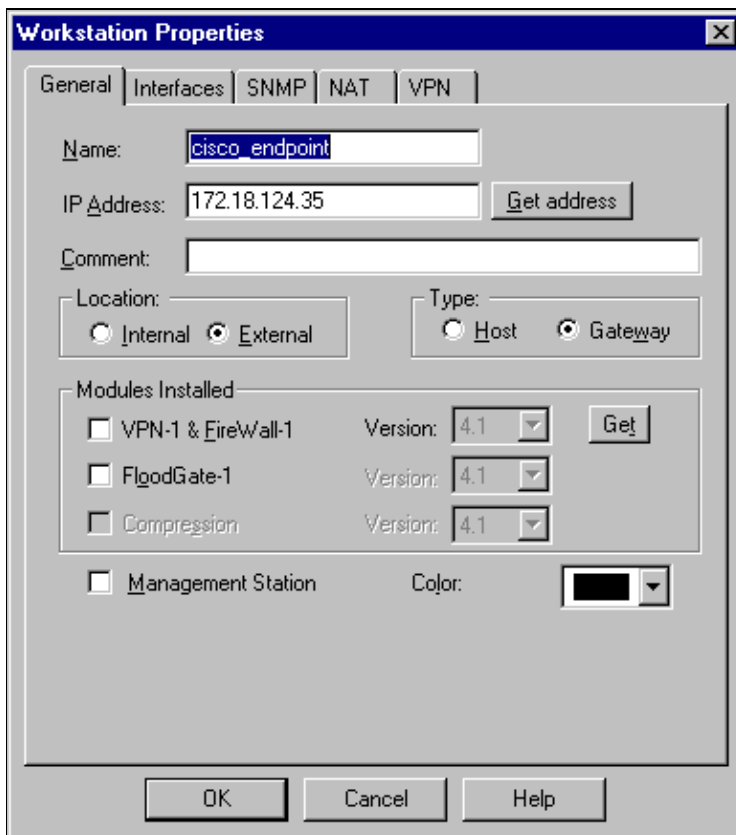

Select **External** under Location.

5. Select **Manage > Network objects > New > Workstation** to add an object for the external Cisco router gateway (called "cisco_endpoint"). This is the Cisco interface to which the **crypto map name** command is applied.

Select **External** under Location. For Type, select **Gateway**.

Note: Do not select the VPN-1/FireWall-1 check box.

6. Select **Manage > Network objects > Edit** to edit the Checkpoint gateway endpoint (called "RTPCPVPN") VPN tab. Under Domain, select **Other** and then select the inside of the Checkpoint network (called "cpinside") from the drop-down list. Under Encryption schemes defined, select **IKE**, and then click **Edit**.

7. Change the IKE properties for DES encryption to agree with these commands:

◆ **crypto isakmp policy #**

◆ **encryption des**

Note: DES encryption is the default so it is not visible in the Cisco configuration.

8. Change the IKE properties to SHA1 hashing to agree with these commands:

◆ **crypto isakmp policy #**

◆ **hash sha**

Note: The SHA hashing algorithm is the default so it is not visible in the Cisco configuration.

Change these settings:

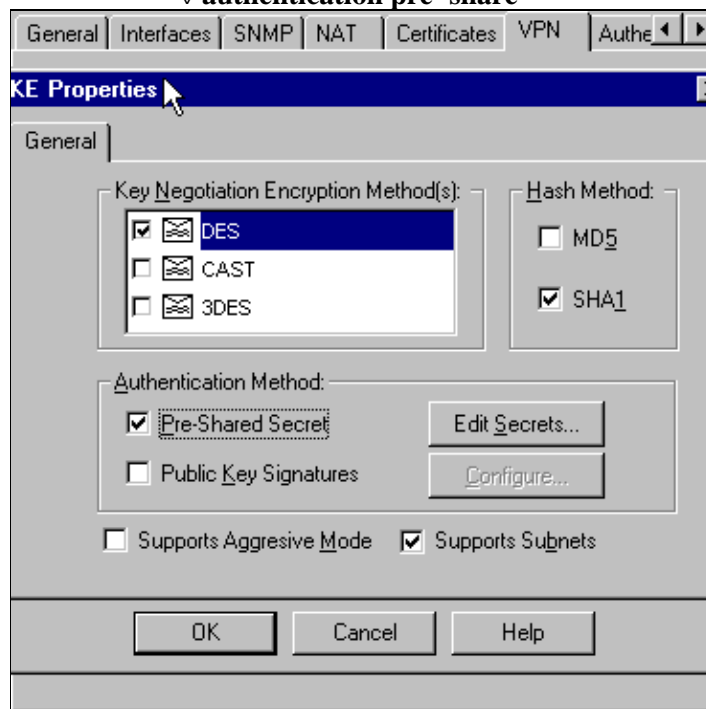

◆ De-select **Aggressive Mode**.

◆ Check **Supports Subnets**.

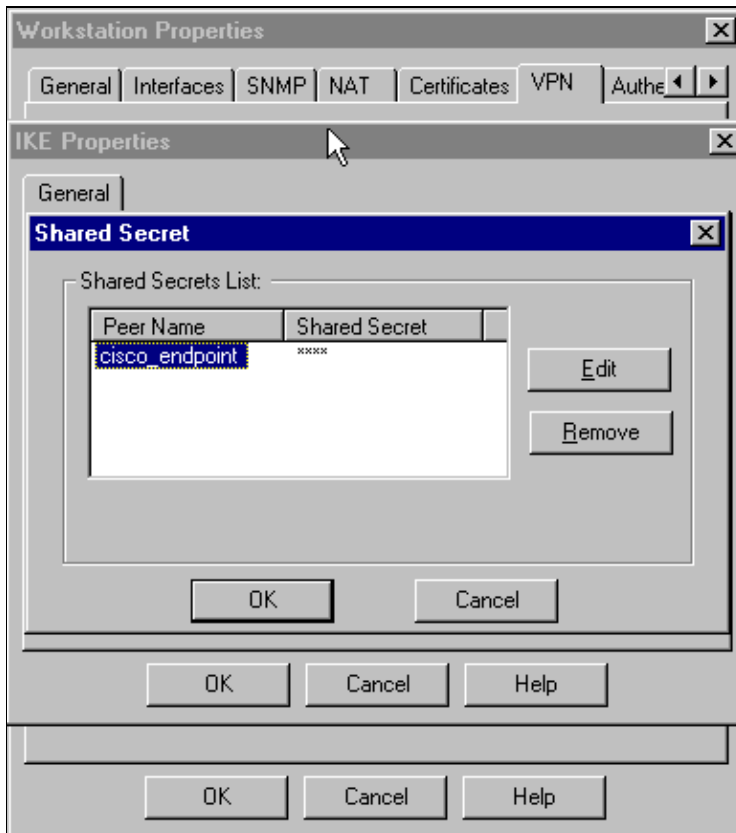

◆ Check **Pre-Shared Secret** under Authentication Method. This agrees with these commands:

◇ **crypto isakmp policy #**

◇ **authentication pre-share**

9. Click **Edit Secrets** to set the pre-shared key to agree with the Cisco **crypto isakmp key key address address** command:

10. Select **Manage > Network objects > Edit** to edit the "cisco_endpoint" VPN tab. Under Domain, select **Other**, and then select the inside of the Cisco network (called "inside_cisco"). Under Encryption schemes defined, select **IKE**, and then click **Edit**.

11. Change the IKE properties DES encryption to agree with these commands:

◆ **crypto isakmp policy #**

◆ **encryption des**

Note: DES encryption is the default so it is not visible in the Cisco configuration.

12. Change the IKE properties to SHA1 hashing to agree with these commands:

◆ **crypto isakmp policy #**

◆ **hash sha**

Note: The SHA hashing algorithm is the default so it is not visible in the Cisco configuration.

Change these settings:

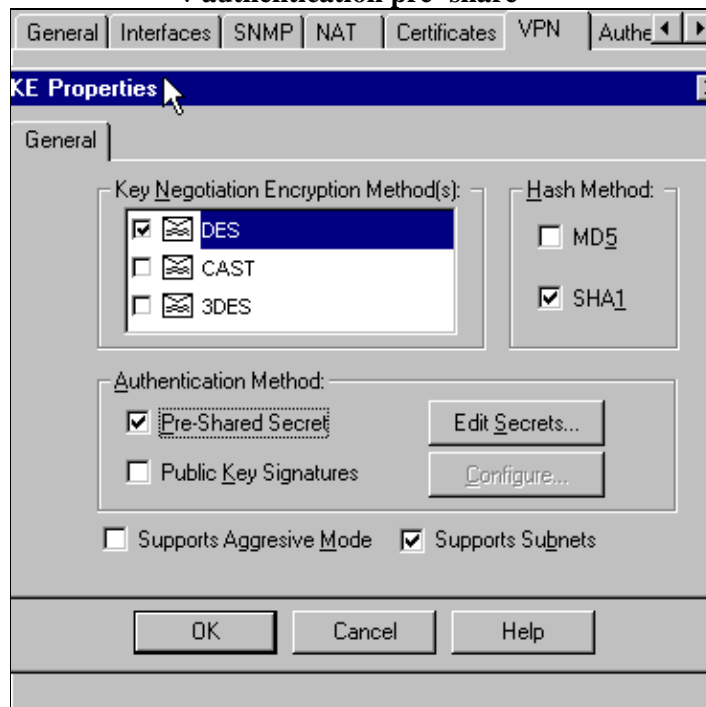

◆ De-select **Aggressive Mode**.

◆ Check **Supports Subnets**.

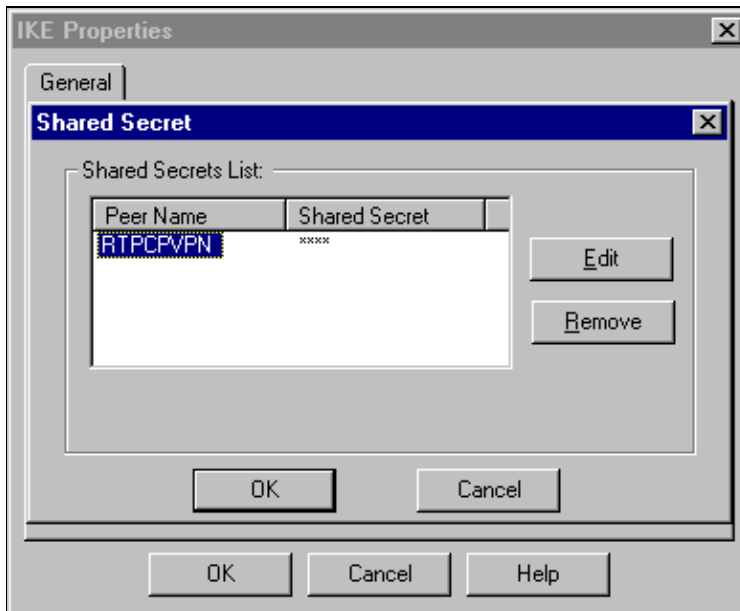

◆ Check **Pre-Shared Secret** under Authentication Method. This agrees with these commands:

◇ **crypto isakmp policy #**

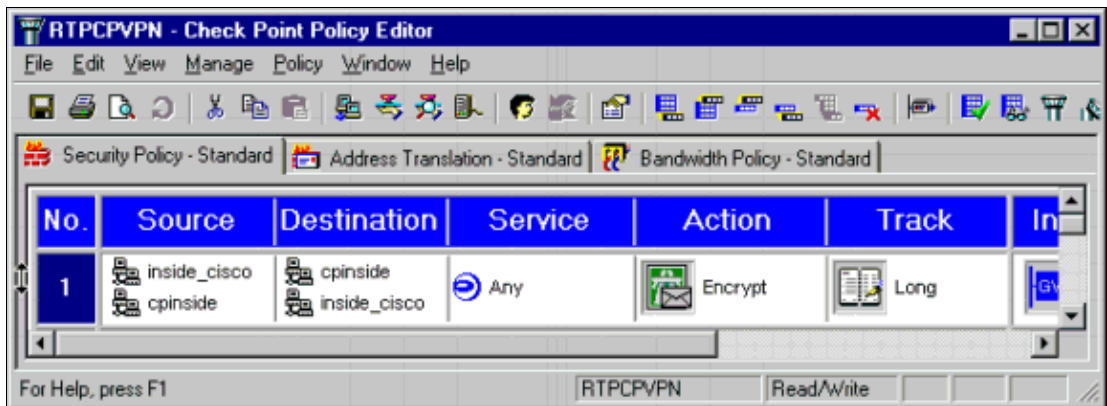

◇ **authentication pre-share**

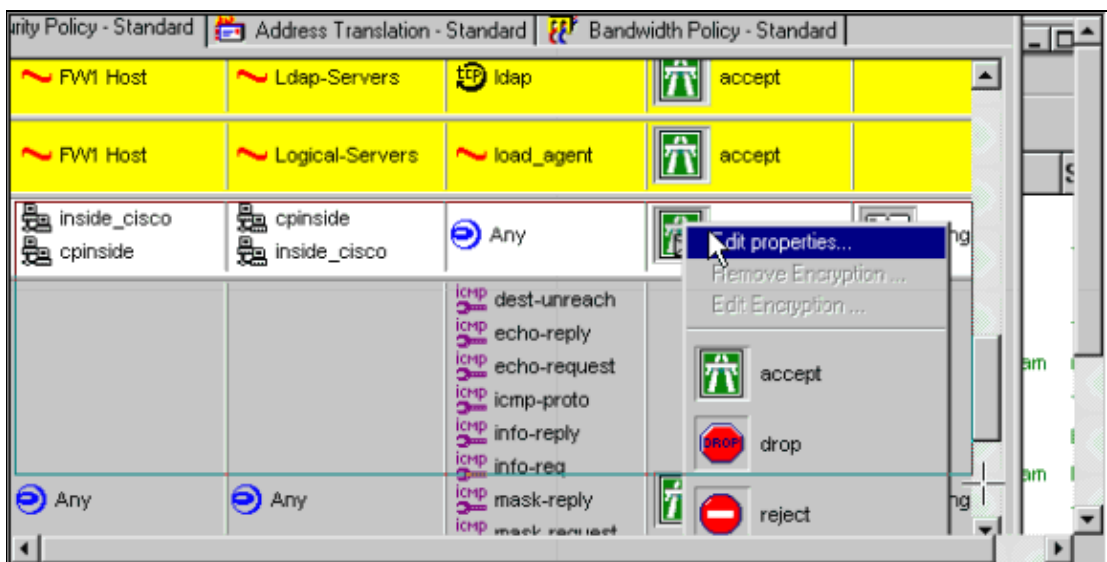

13. Click **Edit Secrets** to set the pre-shared key to agree with the **crypto isakmp key key address address** Cisco command.

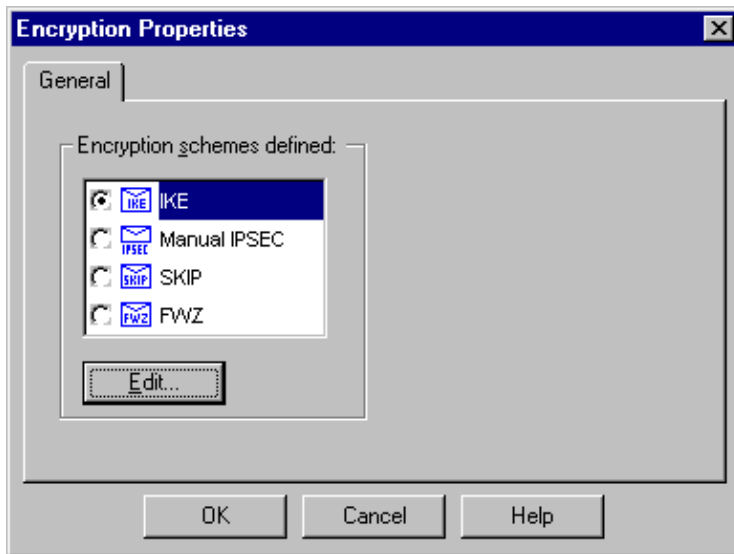

14. In the Policy Editor window, insert a rule with both Source and Destination as "inside_cisco" and "cpinside" (bidirectional). Set **Service=Any**, **Action=Encrypt**, and **Track=Long**.

15. Click the green **Encrypt** icon and select **Edit properties** to configure encryption policies under the Action heading.

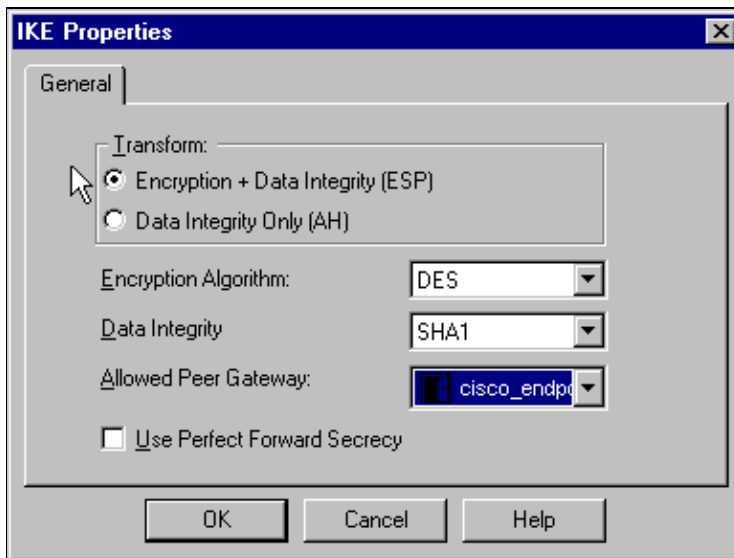

16. Select **IKE**, and then click **Edit**.

- On the IKE Properties window, change these properties to agree with the Cisco IPsec transforms in the `crypto ipsec transform-set rtpset esp-des esp-sha-hmac` command:

Under Transform, select **Encryption + Data Integrity (ESP)**. The Encryption Algorithm should be **DES**, Data Integrity should be **SHA1**, and the Allowed Peer Gateway should be the external router gateway (called "cisco_endpoint"). Click **OK**.

- After you configure the Checkpoint, select **Policy > Install** on the Checkpoint menu to have the changes take effect.

Verify

This section provides information you can use to confirm your configuration is working properly.

The Output Interpreter Tool (registered customers only) (OIT) supports certain **show** commands. Use the OIT to view an analysis of **show** command output.

- **show crypto isakmp sa** View all current IKE security associations (SAs) at a peer.
- **show crypto ipsec sa** View the settings used by current SAs.

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

Troubleshooting Commands

Note: Refer to Important Information on Debug Commands before you use **debug** commands.

- **debug crypto engine** Displays debug messages about crypto engines, which perform encryption and decryption.
- **debug crypto isakmp** Displays messages about IKE events.
- **debug crypto ipsec** Displays IPsec events.
- **clear crypto isakmp** Clears all active IKE connections.
- **clear crypto sa** Clears all IPsec SAs.

Network Summarization

When multiple adjacent inside networks are configured in the encryption domain on the Checkpoint, the device might automatically summarize them with regard to interesting traffic. If the router is not configured to match, the tunnel is likely to fail. For example, if the inside networks of 10.0.0.0 /24 and 10.0.1.0 /24 are configured to be included in the tunnel, they might be summarized to 10.0.0.0 /23.

Checkpoint

Because the Tracking was set for Long in the Policy Editor window, denied traffic should appear in red in the Log Viewer. More verbose debug can be obtained with:

```
C:\WINNT\FW1\4.1\fwstop
C:\WINNT\FW1\4.1\fw d -d
```

and in another window:

```
C:\WINNT\FW1\4.1\fwstart
```

Note: This was a Microsoft Windows NT installation.

Issue these commands to clear SAs on the Checkpoint:

```
fw tab -t IKE_SA_table -x
fw tab -t ISAKMP_ESP_table -x
fw tab -t inbound_SPI -x
fw tab -t ISAKMP_AH_table -x
```

Answer **yes** at the Are you sure? prompt.

Sample debug Output

```
Configuration register is 0x2102

cisco_endpoint#debug crypto isakmp
Crypto ISAKMP debugging is on
cisco_endpoint#debug crypto isakmp
Crypto IPSEC debugging is on
cisco_endpoint#debug crypto engine
Crypto Engine debugging is on
```

```
