## Command Reference

The following commands are introduced or modified in the feature or features documented in this module:

### New Commands

- **address**
- **ca trust-point**
- **client authentication list**
- **client configuration address**
- **crypto isakmp profile**
- **crypto keyring**
- **crypto map isakmp-profile**
- **initiate-mode**
- **isakmp authorization list**
- **keepalive (isakmp profile)**

- **keyring**
- **key-string**
- **match identity**
- **no crypto xauth**
- **pre-shared-key**
- **quit**
- **rsa-pubkey**
- **self-identity**
- **serial-number**
- **set isakmp-profile**
- **show crypto isakmp key**
- **show crypto isakmp profile**
- **vrf**

**Modified Commands**

- **clear crypto sa**
- **crypto isakmp peer**
- **crypto map isakmp-profile**
- **show crypto dynamic-map**
- **show crypto ipsec sa**
- **show crypto isakmp sa**
- **show crypto map (IPSec)**

For information about these commands, see the *Cisco IOS Security Command Reference* at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Glossary

**CA**—certification authority. CA is an entity that issues digital certificates (especially X.509 certificates) and vouches for the binding between the data items in a certificate.

**CLI**—command-line-interface. CLI is an interface that allows the user to interact with the operating system by entering commands and optional arguments. The UNIX operating system and DOS provide CLIs.

**client**—Corresponding IPSec IOS peer of the UUT in the Multi Protocol Label Switching (MPLS) network.

**dead peer**—IKE peer that is no longer reachable.

**DN**—Distinguished Name. A DN is the global, authoritative name of an entry in the Open System Interconnection (OSI Directory [X.500]).

**FQDN**—fully qualified domain name. A FQDN is the full name of a system rather than just its host name. For example, aldebaran is a host name, and aldebaran.interop.com is an FQDN.

**FR**—Frame Relay. FR is an industry-standard, switch-data-link-layer protocol that handles multiple virtual circuits using high-level data link (HDLC) encapsulation between connected devices. Frame Relay is more efficient than X.25, the protocol for which it generally is considered a replacement.

**FVRF**—Front Door Virtual Routing and Forwarding (VRF) repository. FVRF is the VRF used to route the encrypted packets to the peer.

**IDB**—Interface descriptor block. An IDB subblock is an area of memory that is private to an application. This area stores private information and states variables that an application wants to associate with an IDB or an interface. The application uses the IDB to register a pointer to its subblock, not to the contents of the subblock itself.

**IKE**—Internet Key Exchange. IKE establishes a shared security policy and authenticates keys for services (such as IPSec) that require keys. Before any IPSec traffic can be passed, each router, firewall, and host must verify the identity of its peer. This can be done by manually entering preshared keys into both hosts or by a CA service.

**IKE keepalive**—Bidirectional mechanism for determining the liveliness of an IKE peer.

**IPSec**—Security protocol for IP.

**IVRF**—Inside Virtual Routing and Forwarding. IVRF is the VRF of the plaintext packets.

**MPLS**—Multiprotocol Label Switching. MPLS is a switching method that forwards IP traffic using a label. This label instructs the routers and the switches in the network where to forward the packets based on preestablished IP routing information.

**RSA**—Rivest, Shamir, and Adelman are the inventors of the RSA technique. The RSA technique is a public-key cryptographic system that can be used for encryption and authentication.

**SA**—Security Association. SA is an instance of security policy and keying material applied to a data flow.

**VPN**—Virtual Private Network. A VPN enables IP traffic to travel securely over a public TCP or IP network by encrypting all traffic from one network to another. A VPN uses "tunneling" to encrypt all information at the IP level.

**VRF**—Virtual Route Forwarding. VRF is A VPN routing and forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a PE router.

**XAUTH**—Extended authentication. XAUTH is an optional exchange between IKE Phase 1 and IKE Phase 2, in which the router demands additional authentication information in an attempt to authenticate the actual user (as opposed to authenticating the peer).

**Note**

# IPsec Usability Enhancements

---

**First Published: July 11, 2008**

**Last Updated: July 11, 2008**

The IPsec Usability Enhancements feature introduces functionality that eases the configuration and monitoring of your IPsec virtual private network (VPN). Benefits of this feature include intelligent defaults for IPsec and Internet Key Exchange (IKE) and the ability to easily verify and troubleshoot IPsec VPNs.

## **Finding Feature Information in This Module**

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for IPsec Usability Enhancements](#)” section on page 24.

## **Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Prerequisites for IPsec Usability Enhancements

- You must be familiar with IPsec, IKE, and encryption.
- You must have configured IPsec and enabled IKE on your router.
- You must be running Cisco IOS k9 crypto image on your router.

## Information About IPsec Usability Enhancements

To utilize the IPsec Usability Enhancements feature, you should understand the following concepts:

- [IPsec Overview, page 2](#)
- [IPsec Operation, page 2](#)

## IPsec Overview

IPsec is a framework of open standards developed by the Internet Engineering Task Force (IETF), which provides security for transmission of sensitive information over public networks. IPsec acts at the network layer, protecting and authenticating IP packets between participating IPsec devices (peers), such as Cisco routers.

IPsec provides secure tunnels between two peers. You may define which packets are considered sensitive and should be sent through these secure tunnels. You may also define the parameters that should be used to protect these sensitive packets by specifying characteristics of the tunnels. When an IPsec peer detects a sensitive packet, it sets up the appropriate secure tunnel and sends the packet through the tunnel to the remote peer.

## IPsec Operation

An IPsec operation involves five basic steps: identifying interesting traffic, IKE phase-1, IKE phase-2, establishing the tunnel or IPsec session, and finally tearing down the tunnel.

### Step 1: Identifying Interesting Traffic

The VPN devices recognize the traffic, or sensitive packets, to detect. IPsec is either applied to the sensitive packet, the packet is bypassed, or the packet is dropped. Based on the traffic type, if IPsec is applied then IKE phase-1 is initiated.

### Step 2: IKE Phase-1

There are three exchanges between the VPN devices to negotiate an IKE security policy and establish a secure channel.

During the first exchange, the VPN devices negotiate matching IKE transform sets to protect the IKE exchange resulting in establishing an Internet Security Association and Key Management Protocol (ISAKMP) policy to utilize. The ISAKMP policy consists of an encryption algorithm, a hash algorithm, an authentication algorithm, a Diffie-Hellman (DH) group, and a lifetime parameter.

There are eight default ISAKMP policies supported. For more information on default ISAKMP policies, see the section “[Verifying IKE Phase-1, ISAKMP, Default Policies](#).”

The second exchange consists of a Diffie-Hellman exchange, which establishes a shared secret.

The third exchange authenticates peer identity. After the peers are authenticated, IKE phase-2 begins.

### Step 3: IKE Phase-2

The VPN devices negotiate the IPsec security policy used to protect the IPsec data. IPsec transform sets are negotiated.

A transform set is a combination of algorithms and protocols that enact a security policy for network traffic. For more information on default transform sets, see the section “[Verifying Default IPsec Transform-Sets](#).” A VPN tunnel is ready to be established.

### Step 4: Establishing the Tunnel—IPsec Session

The VPN devices apply security services to IPsec traffic and then transmit the IPsec data. Security associations (SAs) are exchanged between peers. The negotiated security services are applied to the tunnel traffic while the IPsec session is active.

### Step 5: Terminating the Tunnel

The tunnel is torn down when an IPsec SA lifetime time-out occurs or if the packet counter is exceeded. The IPsec SA is removed.

## How to Utilize IPsec Usability Enhancements

This section contains the following optional procedures:

- [Verifying IKE Phase-1, ISAKMP, Default Policies](#), page 3
- [Verifying Default IPsec Transform-Sets](#), page 7
- [Verifying and Troubleshooting IPsec VPNs](#), page 9

## Verifying IKE Phase-1, ISAKMP, Default Policies

When IKE negotiation begins, the peers try to find a common policy, starting with the highest priority policy as specified on the remote peer. The peers negotiate the policy sets until there is a match. If peers have more than one policy set in common, the lowest priority number is used.

There are three groups of IKE phase-1, ISAKMP, policies as defined by policy priority ranges and behavior:

- Default ISAKMP policies, which are automatically enabled.
- User configured ISAKMP policies, which you may configure with the **crypto isakmp policy** command.
- Easy VPN (EzVPN) ISAKMP policies, which are made available during EzVPN configuration.

This section describes the three groups of ISAKMP policies, how they behave in relationship to one another, how to determine which policies are in use with the appropriate **show** command, and how to disable the default ISAKMP policies.

### Default IKE Phase-1 Policies

There are eight default IKE phase-1, ISAKMP, policies supported (see [Table 1](#)) that are enabled automatically. If you have neither manually configured IKE policies with the **crypto isakmp policy** command nor disabled the default IKE policies with the **no crypto isakmp default policy** command,

the default IKE policies will be used during peer IKE negotiations. You can verify that the default IKE policies are in use by issuing either the **show crypto isakmp policy** command or the **show crypto isakmp default policy** command.

The default IKE policies define the following policy set parameters:

- The priority, 65507–65514, where 65507 is the highest priority and 65514 is the lowest priority.
- The authentication method, Rivest, Shamir, and Adelman (RSA) or preshared keys (PSK).
- The encryption method, Advanced Encryption Standard (AES) or Triple Data Encryption Standard (3DES).
- The hash function, Secure Hash Algorithm (SHA-1) or Message-Digest algorithm 5 (MD5).
- The DH group specification DH2 or DH5
  - DH2 specifies the 768-bit DH group.
  - DH5 specifies the 1536-bit DH group.

**Table 1**     *Default IKE Phase-1, ISAKMP, Policies*

| Priority | Authentication | Encryption | Hash | Diffie-Hellman |
|----------|----------------|------------|------|----------------|
| 65507    | RSA            | AES        | SHA  | DH5            |
| 65508    | PSK            | AES        | SHA  | DH5            |
| 65509    | RSA            | AES        | MD5  | DH5            |
| 65510    | PSK            | AES        | MD5  | DH5            |
| 65511    | RSA            | 3DES       | SHA  | DH2            |
| 65512    | PSK            | 3DES       | SHA  | DH2            |
| 65513    | RSA            | 3DES       | MD5  | DH2            |
| 65514    | PSK            | 3DES       | MD5  | DH2            |

## User Configured IKE Policies

You may configure IKE policies with the **crypto isakmp policy** command. User configured IKE policies are uniquely identified and configured with a priority number ranging from 1–10000, where 1 is the highest priority and 10000 the lowest priority.

Once you have configured one or more IKE policies with a priority of 1–10000:

- The user configured policies will be used during peer IKE negotiations.
- The default IKE policies will no longer be used during peer IKE negotiations.
- The user configured policies may be displayed by issuing the **show crypto isakmp policy** command.

## EzVPN ISAKMP Policies

If you have configured EzVPN (see [Related Documents](#)), the default EzVPN ISAKMP policies in use are uniquely identified with a priority number ranging from 65515–65535, where 65515 is the highest priority and 65535 is the lowest priority.

Once a user has configured EzVPN:

- The default EzVPN ISAKMP policies and the default IKE policies will be used during peer IKE negotiations.
- The EzVPN ISAKMP policies and the default IKE policies will be displayed by issuing the **show crypto isakmp policy** command.
- Default ISAKMP policies will be displayed by issuing the **show crypto isakmp default policy** command unless they have been disabled by issuing the **no crypto isakmp default policy** command.

## SUMMARY STEPS

1. **enable**
2. **show crypto isakmp default policy**
3. **configure terminal**
4. **no crypto isakmp default policy**

## DETAILED STEPS

|        | Command or Action                                                                                                | Purpose                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                           | Enables privileged EXEC mode.<br><br>• Enter your password if prompted.                            |
| Step 2 | <b>show crypto isakmp default policy</b><br><br><b>Example:</b><br>Router# show crypto isakmp default policy     | (Optional) Displays default ISAKMP policies if no policy with a priority of 1–10000 is configured. |
| Step 3 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                   | Enters global configuration mode.                                                                  |
| Step 4 | <b>no crypto isakmp default policy</b><br><br><b>Example:</b><br>Router(config)# no crypto isakmp default policy | (Optional) Turns off default ISAKMP policies with priorities 65507–65514.                          |

## Examples

The following is sample output of the **show crypto isakmp default policy** command. The default policies are displayed because the default policies have not been disabled.

```
Router# show crypto isakmp default policy
```

```
Default IKE policy
Default protection suite of priority 65507
 encryption algorithm: AES - Advanced Encryption Standard (128 bit key).
 hash algorithm: Secure Hash Standard
 authentication method: Rivest-Shamir-Adleman Signature
 Diffie-Hellman group: #5 (1536 bit)
 lifetime: 86400 seconds, no volume limit
```

```

Default protection suite of priority 65508
 encryption algorithm: AES - Advanced Encryption Standard (128 bit key).
 hash algorithm: Secure Hash Standard
 authentication method: Pre-Shared Key
 Diffie-Hellman group: #5 (1536 bit)
 lifetime: 86400 seconds, no volume limit
Default protection suite of priority 65509
 encryption algorithm: AES - Advanced Encryption Standard (128 bit key).
 hash algorithm: Message Digest 5
 authentication method: Rivest-Shamir-Adleman Signature
 Diffie-Hellman group: #5 (1536 bit)
 lifetime: 86400 seconds, no volume limit
Default protection suite of priority 65510
 encryption algorithm: AES - Advanced Encryption Standard (128 bit key).
 hash algorithm: Message Digest 5
 authentication method: Pre-Shared Key
 Diffie-Hellman group: #5 (1536 bit)
 lifetime: 86400 seconds, no volume limit
Default protection suite of priority 65511
 encryption algorithm: Three key triple DES
 hash algorithm: Secure Hash Standard
 authentication method: Rivest-Shamir-Adleman Signature
 Diffie-Hellman group: #2 (1024 bit)
 lifetime: 86400 seconds, no volume limit
Default protection suite of priority 65512
 encryption algorithm: Three key triple DES
 hash algorithm: Secure Hash Standard
 authentication method: Pre-Shared Key
 Diffie-Hellman group: #2 (1024 bit)
 lifetime: 86400 seconds, no volume limit
Default protection suite of priority 65513
 encryption algorithm: Three key triple DES
 hash algorithm: Message Digest 5
 authentication method: Rivest-Shamir-Adleman Signature
 Diffie-Hellman group: #2 (1024 bit)
 lifetime: 86400 seconds, no volume limit
Default protection suite of priority 65514
 encryption algorithm: Three key triple DES
 hash algorithm: Message Digest 5
 authentication method: Pre-Shared Key
 Diffie-Hellman group: #2 (1024 bit)
 lifetime: 86400 seconds, no volume limit

```

The following example disables the default IKE policies then shows the resulting output of the **show crypto isakmp default policy** command, which is blank:

```

Router# configure terminal
Router(config)# no crypto isakmp default policy
Router(config)# exit
Router# show crypto isakmp default policy
Router#
!There is no output since the default IKE policies have been disabled.

```

The following is an example system log message that is generated whenever the default ISAKMP policies are in use:

```
%CRYPTO-6-IKMP_POLICY_DEFAULT: Using ISAKMP Default policies
```

## Verifying Default IPsec Transform-Sets

A transform set represents a certain combination of security protocols and algorithms. During the IPsec SA negotiation, the peers agree to use a particular transform set for protecting a particular data flow.

During IPsec SA negotiations with IKE, the peers search for a transform set that is the same at both peers. When such a transform set is found, it is selected and is applied to the protected traffic as part of the IPsec SAs of both peers.

### Default Transform Sets

A default transform set will be used by any crypto map or IPsec profile where no other transform set has been configured and if the following is true:

- The default transform sets have not been disabled with the **no crypto ipsec default transform-set** command.
- The crypto engine in use supports the encryption algorithm.

The two default transform sets each define an Encapsulation Security Protocol (ESP) encryption transform type and an ESP authentication transform type as shown in [Table 2](#).

**Table 2**    *Default Transform Sets and Parameters*

| Default Transform Name    | ESP Encryption Transform and Description                                   | ESP Authentication Transform and Description                                                                   |
|---------------------------|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| #!default_transform_set_0 | esp-3des<br>(ESP with the 168-bit 3DES or Triple DES encryption algorithm) | esp-sha-hmac                                                                                                   |
| #!default_transform_set_1 | esp-aes<br>(ESP with the 128-bit AES encryption algorithm)                 | esp-sha-hmac<br>(ESP with the SHA-1, hash message authentication code [HMAC] variant authentication algorithm) |

### SUMMARY STEPS

1. **enable**
2. **show crypto ipsec default transform-set**
3. **configure terminal**
4. **no crypto ipsec default transform-set**

## DETAILED STEPS

|        | Command or Action                                                                                                            | Purpose                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>show crypto ipsec default transform-set</b><br><br><b>Example:</b><br>Router# show crypto ipsec default transform-set     | (Optional) Displays the default IPsec transform sets currently in use by IKE.                                    |
| Step 3 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                               | Enters global configuration mode.                                                                                |
| Step 4 | <b>no crypto ipsec default transform-set</b><br><br><b>Example:</b><br>Router(config)# no crypto ipsec default transform-set | (Optional) Disables the default IPsec transform sets.                                                            |

## Examples

The following example displays output from the **show crypto ipsec default transform-set** command when the default transform sets are enabled, the default setting:

```
Router# show crypto ipsec default transform-set

Transform set #1!default_transform_set_1: { esp-aes esp-sha-hmac }
 will negotiate = { Transport, },

Transform set #0!default_transform_set_0: { esp-3des esp-sha-hmac }
 will negotiate = { Transport, },
```

The following example displays output from the **show crypto ipsec default transform-set** command when the default transform sets have been disabled with the **no crypto ipsec default transform-set** command.

```
Router(config)# no crypto ipsec default transform-set
Router(config)# exit
Router#
Router# show crypto ipsec default transform-set
! There is no output.
Router#
```

The following is an example system log message that is generated whenever IPsec SAs have negotiated with a default transform set:

```
%CRYPTO-5-IPSEC_DEFAULT_TRANSFORM: Using Default IPsec transform-set
```

## Verifying and Troubleshooting IPsec VPNs

Perform one of the following optional tasks in this section, depending on whether you want to verify IKE phase-1 or IKE phase-2 tunnels or troubleshoot your IPsec VPN:

- [Verifying IKE Phase-1, ISAKMP, page 9](#)
- [Verifying IKE Phase-2, page 13](#)
- [Troubleshooting IPsec VPNs, page 16](#)

### Verifying IKE Phase-1, ISAKMP

To display statistics for ISAKMP tunnels, use the following optional commands.

#### SUMMARY STEPS

1. **show crypto mib isakmp flowmib failure** [*vrf vrf-name*]
2. **show crypto mib isakmp flowmib global** [*vrf vrf-name*]
3. **show crypto mib isakmp flowmib history** [*vrf vrf-name*]
4. **show crypto mib isakmp flowmib peer** [*index peer-mib-index*] [*vrf vrf-name*]
5. **show crypto mib isakmp flowmib tunnel** [*index tunnel-mib-index*] [*vrf vrf-name*]

#### DETAILED STEPS

##### Step 1 **show crypto mib isakmp flowmib failure** [*vrf vrf-name*]

For ISAKMP tunnel failures, this command displays event information. The following is sample output for this command:

```
Router# show crypto mib isakmp flowmib failure
```

```
vrf Global
Index: 1
Reason: peer lost
Failure time since reset: 00:07:27
Local type: ID_IPV4_ADDR
Local value: 192.0.2.1
Remote type: ID_IPV4_ADDR
Remote Value: 192.0.2.2
Local Address: 192.0.2.1
Remote Address: 192.0.2.2
Index: 2
Reason: peer lost
Failure time since reset: 00:07:27
Local type: ID_IPV4_ADDR
Local value: 192.0.3.1
Remote type: ID_IPV4_ADDR
Remote Value: 192.0.3.2
Local Address: 192.0.3.1
Remote Address: 192.0.3.2
Index: 3
Reason: peer lost
Failure time since reset: 00:07:32
Local type: ID_IPV4_ADDR
Remote type: ID_IPV4_ADDR
```

```

Remote Value: 192.0.2.2
Local Address: 192.0.2.1
Remote Address: 192.0.2.2

```

### Step 2 **show crypto mib isakmp flowmib global [vrf vrf-name]**

Global ISAKMP tunnel statistics are displayed by issuing this command. The following is sample output for this command:

```
Router# show crypto mib isakmp flowmib global
```

```

vrf Global
Active Tunnels: 3
Previous Tunnels: 0
In octets: 2856
Out octets: 3396
In packets: 16
Out packets: 19
In packets drop: 0
Out packets drop: 0
In notifys: 4
Out notifys: 7
In P2 exchg: 3
Out P2 exchg: 6
In P2 exchg invalids: 0
Out P2 exchg invalids: 0
In P2 exchg rejects: 0
Out P2 exchg rejects: 0
In IPSEC delete: 0
Out IPSEC delete: 0
SAs locally initiated: 3
SAs locally initiated failed: 0
SAs remotely initiated failed: 0
System capacity failures: 0
Authentication failures: 0
Decrypt failures: 0
Hash failures: 0
Invalid SPI: 0

```

### Step 3 **show crypto mib isakmp flowmib history [vrf vrf-name]**

For information about ISAKMP tunnels that are no longer active, this command displays event information including the reason that the tunnel was terminated. The following is sample output for this command:

```
Router# show crypto mib isakmp flowmib history
```

```

vrf Global
Reason: peer lost
Index: 2
Local type: ID_IPV4_ADDR
Local address: 192.0.2.1
Remote type: ID_IPV4_ADDR
Remote address: 192.0.2.2
Negotiation mode: Main Mode
Diffie Hellman Grp: 2
Encryption algo: des
Hash algo: sha
Auth method: psk
Lifetime: 86400
Active time: 00:06:30
Policy priority: 1
Keepalive enabled: Yes

```

```

In octets: 3024
In packets: 22
In drops: 0
In notifys: 18
In P2 exchanges: 1
In P2 exchg invalids: 0
In P2 exchg rejected: 0
In P2 SA delete reqs: 0
Out octets: 4188
Out packets: 33
Out drops: 0
Out notifys: 28
Out P2 exchgs: 2
Out P2 exchg invalids: 0
Out P2 exchg rejects: 0
Out P2 Sa delete requests: 0
Reason: peer lost
Index: 3
Local type: ID_IPV4_ADDR
Local address: 192.0.3.1
Remote type: ID_IPV4_ADDR
Remote address: 192.0.3.2
Negotiation mode: Main Mode
Diffie Hellman Grp: 2
Encryption algo: des
Hash algo: sha
Auth method: psk
Lifetime: 86400
Active time: 00:06:25
Policy priority: 1
Keepalive enabled: Yes
In octets: 3140
In packets: 23
In drops: 0
In notifys: 19
In P2 exchanges: 1
In P2 exchg invalids: 0
In P2 exchg rejected: 0
In P2 SA delete reqs: 0
Out octets: 4304
Out packets: 34
Out drops: 0
Out notifys: 29
Out P2 exchgs: 2
Out P2 exchg invalids: 0
Out P2 exchg rejects: 0
Out P2 Sa delete requests: 0

```

**Step 4** **show crypto mib isakmp flowmib peer** [*index peer-mib-index*] [*vrf vrf-name*]

For active ISAKMP peer associations, this command displays information including indexes, type of connection, and IP addresses. The following is sample output for this command:

```
Router# show crypto mib isakmp flowmib peer
```

```

vrf Global
Index: 1
Local type: ID_IPV4_ADDR
Local address: 192.0.2.1
Remote type: ID_IPV4_ADDR
Remote address: 192.0.2.2

```

```

Index: 2
Local type: ID_IPV4_ADDR

```

Index: 3
Local type: ID_IPV4_ADDR
Local address: 192.0.4.1
Remote type: ID_IPV4_ADDR
Remote address: 192.0.4.1

```

**Step 5** **show crypto mib isakmp flowmib tunnel** [*index tunnel-mib-index*] [*vrf vrf-name*]

For active ISAKMP tunnels, this command displays tunnel statistics. The following is sample output for this command:

```
Router# show crypto mib isakmp flowmib tunnel
```

```

vrf Global
Index: 1
Local type: ID_IPV4_ADDR
Local address: 192.0.2.1
Remote type: ID_IPV4_ADDR
Remote address: 192.0.2.2

Out notifys: 12
Out P2 exchgs: 2
Out P2 exchg invalids: 0
Out P2 exchg rejects: 0
Out P2 Sa delete requests: 0

```

---

## Verifying IKE Phase-2

To display statistics for IPsec phase-2 tunnels, use the following optional commands.

### SUMMARY STEPS

1. **show crypto mib ipsec flowmib endpoint** [*vrf vrf-name*]
2. **show crypto mib ipsec flowmib failure** [*vrf vrf-name*]
3. **show crypto mib ipsec flowmib global** [*vrf vrf-name*]
4. **show crypto mib ipsec flowmib history** [*vrf vrf-name*]
5. **show crypto mib ipsec flowmib spi** [*vrf vrf-name*]
6. **show crypto mib ipsec flowmib tunnel** [*index tunnel-mib-index*] [*vrf vrf-name*]

### DETAILED STEPS

#### Step 1 **show crypto mib ipsec flowmib endpoint** [*vrf vrf-name*]

Information for each active endpoint, local or remote device, associated with an IPsec phase-2 tunnel is displayed by issuing this command. The following is sample output for this command:

```
Router# show crypto mib ipsec flowmib endpoint

vrf Global
 Index: 1
 Local type: Single IP address
 Local address: 192.1.2.1
 Protocol: 0
 Local port: 0
 Remote type: Single IP address
 Remote address: 192.1.2.2
 Remote port: 0

 Index: 2
 Local type: Subnet
 Local address: 192.1.3.0 255.255.255.0
 Protocol: 0
 Local port: 0
 Remote type: Subnet
 Remote address: 192.1.3.0 255.255.255.0
 Remote port: 0
```

#### Step 2 **show crypto mib ipsec flowmib failure** [*vrf vrf-name*]

For ISAKMP tunnel failures, this command displays event information. The following is sample output for this command:

```
Router# show crypto mib ipsec flowmib failure

vrf Global
 Index: 1
 Reason: Operation request
 Failure time since reset: 00:25:18
 Src address: 192.1.2.1
 Destination address: 192.1.2.2
 SPI: 0
```

**Step 3** **show crypto mib ipsec flowmib global [vrf vrf-name]**

Global IKE phase-2 tunnel statistics are displayed by issuing this command. The following is sample output for this command:

```
Router# show crypto mib ipsec flowmib global
```

```
vrf Global
Active Tunnels: 2
Previous Tunnels: 0
In octets: 800
Out octets: 1408
In packets: 8
Out packets: 8
Uncompressed encrypted bytes: 1408
In packets drops: 0
Out packets drops: 2
In replay drops: 0
In authentications: 8
Out authentications: 8
In decrypts: 8
Out encrypts: 8
Compressed bytes: 0
Uncompressed bytes: 0
In uncompressed bytes: 0
Out uncompressed bytes: 0
In decrypt failures: 0
Out encrypt failures: 0
No SA failures: 0
! Number of SA Failures.
Protocol use failures: 0
System capacity failures: 0
In authentication failures: 0
Out authentication failures: 0
```

**Step 4** **show crypto mib ipsec flowmib history [vrf vrf-name]**

For information about IKE phase-2 tunnels that are no longer active, this command displays event information including the reason that the tunnel was terminated. The following is sample output for this command:

```
Router# show crypto mib ipsec flowmib history
```

```
vrf Global
Reason: Operation request
Index: 1
Local address: 192.1.2.1
Remote address: 192.1.2.2
IPSEC keying: IKE
Encapsulation mode: 1
Lifetime (KB): 4608000
Lifetime (Sec): 3600
Active time: 00:24:32
Lifetime threshold (KB): 423559168
Lifetime threshold (Sec): 3590000

Expired SA instances: 4
Current SA instances: 4
In SA DH group: 1
In sa encrypt algorithm: des
In SA auth algorithm: rsig
In SA ESP auth algo: ESP_HMAC_SHA
In SA uncompress algorithm: None
Out SA DH group: 1
```

```

Out SA encryption algorithm: des
Out SA auth algorithm: ESP_HMAC_SHA
Out SA ESP auth algorithm: ESP_HMAC_SHA
Out SA uncompress algorithm: None
In octets: 400
Decompressed octets: 400
In packets: 4
In drops: 0
In replay drops: 0
In authentications: 4
In authentication failures: 0
In decrypts: 4
In decrypt failures: 0
Out octets: 704
Out uncompressed octets: 704
Out packets: 4
Out drops: 1
Out authentications: 4
Out authentication failures: 0
Out encryptions: 4
Out encryption failures: 0
Compressed octets: 0
Decompressed octets: 0
Out uncompressed octets: 704

```

**Step 5** `show crypto mib ipsec flowmib spi [vrf vrf-name]`

The security protection index (SPI) table contains an entry for each active and expiring security IKE phase-2 association. The following is sample output for this command, which displays the SPI table:

Router# **show crypto mib ipsec flowmib spi**

```

vrf Global
Tunnel Index: 1
SPI Index: 1
SPI Value: 0xCC57D053
SPI Direction: In
SPI Protocol: AH
SPI Status: Active

SPI Index: 2
SPI Value: 0x68612DF
SPI Direction: Out
SPI Protocol: AH
SPI Status: Active

SPI Index: 3
SPI Value: 0x56947526
SPI Direction: In
SPI Protocol: ESP
SPI Status: Active

SPI Index: 4
SPI Value: 0x8D7C2204
SPI Direction: Out
SPI Protocol: ESP
SPI Status: Active

```

**Step 6** `show crypto mib ipsec flowmib tunnel [index tunnel-mib-index] [vrf vrf-name]`

For active IKE phase-2 tunnels, this command displays tunnel statistics. The following is sample output for this command:

```

Router# show crypto mib ipsec flowmib tunnel

vrf Global
 Index: 1
 Local address: 192.0.2.1
 Remote address: 192.0.2.2
 IPSEC keying: IKE

## Troubleshooting IPsec VPNs

The **show tech-support ipsec** command simplifies the collection of the IPsec related information if you are troubleshooting a problem.

### SUMMARY STEPS

1. **show tech-support ipsec [peer *ipv4address* | vrf *vrf-name*]**

## DETAILED STEPS

### Step 1 **show tech-support ipsec**

There are three variations of the **show tech-support ipsec** command:

- **show tech-support ipsec**
- **show tech-support ipsec peer *ipv4address***
- **show tech-support ipsec vrf *vrf-name***

For a sample display of the output from the **show tech-support ipsec** command for the individual **show** commands listed below for each variation see the “[Related Documents](#)” section.

#### **Output of the show tech-support ipsec Command**

If you enter the **show tech-support ipsec** command without any keywords, the command output displays the following **show** commands, in order of output:

- **show version**
- **show running-config**
- **show crypto isakmp sa count**
- **show crypto ipsec sa count**
- **show crypto session summary**
- **show crypto session detail**
- **show crypto isakmp sa detail**
- **show crypto ipsec sa detail**
- **show crypto isakmp peers**
- **show crypto ruleset detail**
- **show processes memory | include Crypto IKMP**
- **show processes cpu | include Crypto IKMP**
- **show crypto eli**
- **show crypto engine accelerator statistic**

#### **Output of the show tech-support ipsec peer Command**

If you enter the **show tech-support ipsec** command with the **peer** keyword and the *ipv4address* argument, the output displays the following **show** commands, in order of output for the specified peer:

- **show version**
- **show running-config**
- **show crypto session remote *ipv4address* detail**
- **show crypto isakmp sa peer *ipv4address* detail**
- **show crypto ipsec sa peer *ipv4address* detail**
- **show crypto isakmp peers *ipv4address***
- **show crypto ruleset detail**
- **show processes memory | include Crypto IKMP**

- **show processes cpu | include Crypto IKMP**
- **show crypto eli**
- **show crypto engine accelerator statistic**

#### Output of the show tech-support ipsec vrf Command

If you enter the **show tech-support ipsec** command with the **vrf** keyword and the *vrf-name* argument, the output displays the following **show** commands, in order of output for the specified Virtual Routing and Forwarding (VRF):

- **show version**
  - **show running-config**
  - **show crypto isakmp sa count vrf *vrf-name***
  - **show crypto ipsec sa count vrf *vrf-name***
  - **show crypto session ivrf *ivrf-name* detail**
  - **show crypto session fvrf *fvrf-name* detail**
  - **show crypto isakmp sa vrf *vrf-name* detail**
  - **show crypto ipsec sa vrf *vrf-name* detail**
  - **show crypto ruleset detail**
  - **show processes memory | include Crypto IKMP**
  - **show processes cpu | include Crypto IKMP**
  - **show crypto eli**
  - **show crypto engine accelerator statistic**
- 

## Configuration Examples for IPsec Usability Enhancements

This section provides the following configuration examples:

- [IKE Default Policies: Example, page 18](#)
- [Default Transform Sets: Example, page 20](#)

### IKE Default Policies: Example

In the following example, crypto maps are configured on RouterA and RouterB and default IKE policies are in use. Traffic is routed from Pagent A to Pagent B. Checking the system log on Peer A and Peer B confirms that the default IKE policies are in use on both peers (see [Figure 1](#)).

**Figure 1** Example Site to Site Topology

```

! Configuring RouterA.
RouterA(config)# crypto isakmp key identity address 209.165.200.226
RouterA(config)# crypto map testmap 10 ipsec-isakmp
% NOTE: This new crypto map will remain disabled until a peer
 and a valid access list have been configured.
RouterA(config-crypto-map)# set peer 209.165.200.226
RouterA(config-crypto-map)# match address 101
RouterA(config-crypto-map)# exit
RouterA(config)# ip route 209.165.200.225 255.255.255.224 209.165.200.226
RouterA(config)# access-list 101 permit ip host 209.165.200.227 host 209.165.200.225
RouterA(config)# end
RouterA(config)# interface Ethernet1/2
RouterA(config-if)# crypto map testmap
RouterA(config-if)# end
RouterA(config)# crypto ipsec transform test_transf esp-aes esp-sha-hmac
RouterA(cfg-crypto-trans)# mode tunnel
RouterA(cfg-crypto-trans)# end
RouterA(config)# crypto map testmap 10
RouterA(config-crypto-map)# set transform-set test_transf
RouterA(config-crypto-map)# end

! Configuring RouterB.

## Default Transform Sets: Example

In the following example, static crypto maps are configured on RouterA and dynamic crypto maps are configured on RouterB. Traffic is routed from Pagent A to Pagent B. The IPsec SAs negotiate with default transform sets and the traffic is encrypted. Executing the **show crypto map** command on both peers verifies that the default transform sets are in use (see [Figure 1](#)).

```
! Configuring RouterA.
RouterA(config)# crypto isakmp key identify address 209.165.200.225
RouterA(config)# crypto map testmap 10 ipsec-isakmp
% NOTE: This new crypto map will remain disabled until a peer
 and a valid access list have been configured.
RouterA(config-crypto-map)# set peer 209.165.200.225
RouterA(config-crypto-map)# match address 101
RouterA(config-crypto-map)# exit
RouterA(config)# ip route 209.165.200.226 255.255.255.255 209.165.200.225
RouterA(config)# access-list 101 permit ip host 209.165.200.227 host 209.165.200.226
RouterA(config)# end
RouterA(config)# interface Ethernet1/2
RouterA(config-if)# crypto map testmap
RouterA(config-if)# end
RouterA(config)# crypto isakmp policy 10
RouterA(config-isakmp)# encryption aes
RouterA(config-isakmp)# authentication pre-share
RouterA(config-isakmp)# hash sha
RouterA(config-isakmp)# group 5
RouterA(config-isakmp)# end

! Configuring RouterB.
RouterB(config)# crypto isakmp key identity address 209.165.200.229
RouterB(config)# crypto dynamic-map dyn_testmap 10
RouterB(config-crypto-map)# crypto map testmap 10 ipsec-isakmp dynamic dyn_testmap
RouterB(config)# ip route 209.165.200.227 255.255.255.255 209.165.200.229
RouterB(config)# end
RouterB(config)# interface GigabitEthernet0/1
RouterB(config-if)# crypto map testmap
RouterB(config-if)# end
RouterB(config)# crypto isakmp policy 10
RouterB(config-isakmp)# encryption aes
RouterB(config-isakmp)# authentication pre-share
RouterB(config-isakmp)# hash sha
RouterB(config-isakmp)# group 5
RouterB(config-isakmp)# end

! The SA is using the default transform set and traffic is encrypted on RouterA.
RouterA# show crypto isakmp sa detail | include 209.165.200.229.*209.165.200.225.*ACTIVE

## Feature Information for IPsec Usability Enhancements

Table 3 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

Table 3 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 3** Feature Information for IPsec Usability Enhancements

| Feature Name                 | Releases  | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# Glossary

**peer**—In the context of this module, a router or other device that participates in IPsec.

**SA**—security association. Description of how two or more entities use security services in the context of a particular security protocol (AH or ESP) to communicate securely on behalf of a particular data flow. The transform and the shared secret keys are used for protecting the traffic.

**transform**—List of operations performed on a dataflow to provide data authentication, data confidentiality, and data compression. For example, one transform is the ESP protocol with the HMAC-MD5 authentication algorithm; another transform is the AH protocol with the 56-bit DES encryption algorithm and the ESP protocol with the HMAC-SHA authentication algorithm.

**tunnel**—In the context of this module, a secure communication path between two peers, such as two routers. It does not refer to using IPsec in tunnel mode.

## **Public Key Infrastructure (PKI)**

# Implementing and Managing PKI Features Roadmap

---

This roadmap lists the features documented in the *Cisco IOS Security Configuration Guide* and maps them to the modules in which they appear.

## Roadmap History

This roadmap was first published on May 2, 2005, and last updated on May 2, 2005.

## Feature and Release Support

[Table 56](#) lists public key infrastructure (PKI) feature support for the following Cisco IOS software release trains:

- [Cisco IOS Releases 12.2T, 12.3, and 12.3T](#)

Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table. *Not all features may be supported in your Cisco IOS software release.*

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

[Table 56](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 56**      **Supported PKI Features**

| Release                                          | Feature Name                                               | Feature Description                                                                                                                                                                                                                                                                                                                                         | Where Documented                                                                                                                |
|--------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Cisco IOS Releases 12.2T, 12.3, and 12.3T</b> |                                                            |                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                 |
| 12.3(14)T                                        | Administrative Secure Device Provisioning Introducer       | This feature allows you to act as an administrative introducer to introduce a device into a PKI network and then provide a username as the device name for the record locator in the AAA database.                                                                                                                                                          | “Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI”                                                           |
| 12.3(14)T                                        | Persistent Self-Signed Certificates                        | This feature allows users the HTTPS server to generate and save a self-signed certificate in the router’s startup configuration. Thus, future SSL handshakes between the client and the HTTPS server can use the same self-signed certificate without user intervention.                                                                                    | “Configuring Certificate Enrollment for a PKI”                                                                                  |
| 12.3(14)T                                        | Secure Device Provisioning Certificate-Based Authorization | This feature allows certificates issued by other authority (CA) servers to be used for SDP introductions.                                                                                                                                                                                                                                                   | “Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI”                                                           |
| 12.3(14)T                                        | Subordinate Certificate Server                             | This enhancement allows you to configure a subordinate certificate server to grant all or certain SCEP or manual certificate requests.                                                                                                                                                                                                                      | “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment”                                                    |
| 12.3(14)T                                        | USB Storage                                                | This feature explains how to store RSA keys on a device external to the router via a USB eToken. The SmartCard technology (which is owned by Aladdin Knowledge Systems) in a USB key form factor (also referred to as a USB eToken) provides secure configuration distribution and allows users to store PKI credentials, such as RSA keys, for deployment. | “Storing PKI Credentials External to the Router”                                                                                |
| 12.3(11)T                                        | The Certificate Server Auto Archive enhancement            | This enhancement enables the CA certificate and CA key to be backed up automatically just once after they are generated by the certificate server. As a result, it is not necessary to generate an exportable CA key if CA backup is desirable.                                                                                                             | “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment”                                                    |
| 12.3(11)T                                        | PKI AAA Authorization Using the Entire Subject Name        | This feature provides users with the ability to query the AAA server using the entire subject name from the certificate as a unique AAA username.                                                                                                                                                                                                           | “Configuring Revocation and Authorization of Certificates in a PKI”                                                             |
| 12.3(11)T                                        | PKI Status                                                 | This enhancement added the <b>status</b> keyword to the <b>show crypto pki trustpoints</b> command, which allows you to view the current status of the trustpoint. Prior to this enhancement, you had to issue the <b>show crypto pki certificates</b> and the <b>show crypto pki timers</b> commands for the current status.                               | “Configuring Certificate Enrollment for a PKI” and “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment” |
| 12.3(11)T                                        | Reenroll Using Existing Certificates                       | This feature allows users to reenroll a router with a Cisco IOS CA via existing certificates from a third-party vendor CA.                                                                                                                                                                                                                                  | “Configuring Certificate Enrollment for a PKI”                                                                                  |
| 12.3(8)T                                         | Easy Secure Device Deployment                              | This feature introduces support for SDP (formerly called EzSDD), which offers a web-based enrollment interface that enables network administrators to deploy new devices in large networks.                                                                                                                                                                 | “Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI”                                                           |

**Table 56**      **Supported PKI Features (continued)**

| Release  | Feature Name                                                               | Feature Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Where Documented                                                                     |
|----------|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| 12.3(8)T | Easy Secure Device Deployment AAA Integration                              | This feature integrates an external AAA database, allowing the introducer to be authenticated against a AAA database instead of having to use the enable password of the local Cisco certificate server.                                                                                                                                                                                                                                                                                                                                                                                                | “Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI”                |
| 12.3(7)T | The Certificate Server Registration Authority (RA) Mode enhancement        | A certificate server can be configured to run in RA mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment”         |
| 12.3(7)T | The “crypto pki” commands should be a synonym for “crypto ca” commands     | This enhancement changes all commands that begin as “crypto ca” to “crypto pki.” Although the router will still accept crypto ca, all output will be read back as crypto pki.                                                                                                                                                                                                                                                                                                                                                                                                                           | All modules that contain crypto ca commands.                                         |
| 12.3(7)T | Key Rollover for Certificate Renewal                                       | This feature allows the certificate renewal request to be made before the certificate expires and retains the old key and certificate until the new certificate is available.                                                                                                                                                                                                                                                                                                                                                                                                                           | “Configuring Certificate Enrollment for a PKI”                                       |
| 12.3(7)T | PKI: Query Multiple Servers During Certificate Revocation Check            | This feature introduces the ability for Cisco IOS software to make multiple attempts to retrieve the CRL, allowing operations to continue when a particular server is not available. In addition, the ability to override the CDPs in a certificate with a manually configured CDP has been introduced. Manually overriding the CDPs in a certificate can be advantageous when a particular server is unavailable for an extended period of time. The certificate’s CDPs can be replaced with a URL or directory specification without reissuing all of the certificates that contain the original CDP. | “Configuring Revocation and Authorization of Certificates in a PKI”                  |
| 12.3(7)T | Protected Private Key Storage                                              | This feature allows a user to encrypt and lock the RSA private keys that are used on a Cisco IOS router, thereby, preventing unauthorized use of the private keys.                                                                                                                                                                                                                                                                                                                                                                                                                                      | “Deploying RSA Keys Within a PKI”                                                    |
| 12.3(4)T | Import of RSA Key Pair and Certificates in PEM Format                      | This feature allows customers to use PEM-formatted files to import or export RSA key pairs. PEM-formatted files allow customers to directly use existing RSA key pairs on their Cisco IOS routers instead of generating new keys. Also, customers can issue certificate requests and receive issued certificates in PEM-formatted files.                                                                                                                                                                                                                                                                | “Deploying RSA Keys Within a PKI” and “Configuring Certificate Enrollment for a PKI” |
| 12.3(4)T | Using Certificate ACLs to Ignore Revocation Check and Expired Certificates | This feature allows a certificate that meets specified criteria to be accepted regardless of the validity period of the certificate, or if the certificate meets the specified criteria, revocation checking does not have to be performed. Certificate ACLs are used to specify the criteria that the certificate must meet to be accepted or to avoid revocation checking. In addition, if AAA communication is protected by a certificate, this feature provides for the AAA checking of the certificate to be ignored.                                                                              | “Configuring Revocation and Authorization of Certificates in a PKI”                  |

**Table 56**      **Supported PKI Features (continued)**

| Release   | Feature Name                                        | Feature Description                                                                                                                                                                                                                                                                                                                                                                                                                 | Where Documented                                                             |
|-----------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| 12.3(4)T  | Cisco IOS Certificate Server                        | This feature introduces support for the Cisco IOS CS, which offers users a CA that is directly integrated with Cisco IOS software to more easily deploy basic PKI networks.                                                                                                                                                                                                                                                         | “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment” |
| 12.3(4)T  | Direct HTTP Enrollment with CA Servers              | This feature allows users to configure an enrollment profile if their CA server does not support SCEP and they do not want to use an RA as a proxy. The enrollment profile allows users to send HTTP requests directly to the CA server instead of the RA proxy.                                                                                                                                                                    | “Configuring Certificate Enrollment for a PKI”                               |
| 12.3(2)T  | Online Certificate Status Protocol (OCSP)           | This feature allows users to enable OCSP instead of CRLs to check certificate status. Unlike CRLs, which provide only periodic certificate status, OCSP can provide timely information regarding the status of a certificate.                                                                                                                                                                                                       | “Configuring Revocation and Authorization of Certificates in a PKI”          |
| 12.3(1)   | PKI Integration with AAA Server                     | This feature provides additional scalability for authorization by generating a AAA username from the certificate presented by the peer. A AAA server is queried to determine whether the certificate is authorized for use by the internal component. The authorization is indicated by a component-specified label that must be present in the AV pair for the user.                                                               | “Configuring Revocation and Authorization of Certificates in a PKI”          |
| 12.2(15)T | Certificate Security Attribute-Based Access Control | Under the IPsec protocol, CA interoperability permits Cisco IOS devices and a CA to communicate so that the Cisco IOS device can obtain and use digital certificates from the CA. Certificates contain several fields that are used to determine whether a device or user is authorized to perform a specified action. This feature adds fields to the certificate that allow specifying an ACL, to create a certificate-based ACL. | “Configuring Revocation and Authorization of Certificates in a PKI”          |
| 12.2(15)T | Exporting and Importing RSA Keys                    | This feature allows you to transfer security credentials between devices by exporting and importing RSA keys. The key pair that is shared between two devices will allow one device to immediately and transparently take over the functionality of the other router.                                                                                                                                                               | “Deploying RSA Keys Within a PKI”                                            |
| 12.2(15)T | Multiple-Tier CA Hierarchy                          | This enhancement enables users to set up a PKI in a hierarchical framework to support multiple CAs. Within a hierarchical PKI, all enrolled peers can validate the certificate of one another as long as the peers share a trusted root CA certificate or a common subordinate CA.                                                                                                                                                  | “Configuring Certificate Enrollment for a PKI”                               |
| 12.2(13)T | Manual Certificate Enrollment (TFTP Cut-and-Paste)  | This feature allows users to generate a certificate request and accept CA certificates as well as the router’s certificates via a TFTP server or manual cut-and-paste operations.                                                                                                                                                                                                                                                   | “Configuring Certificate Enrollment for a PKI”                               |
| 12.2(8)T  | Certificate Autoenrollment                          | This feature introduces certificate autoenrollment, which allows the router to automatically request a certificate from the CA that is using the parameters in the configuration.                                                                                                                                                                                                                                                   | “Configuring Certificate Enrollment for a PKI”                               |

**Table 56**      **Supported PKI Features (continued)**

| Release  | Feature Name                        | Feature Description                                                                                                                                                                                                        | Where Documented                               |
|----------|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| 12.2(8)T | Certificate Enrollment Enhancements | This feature introduces five new <b>crypto ca trustpoint</b> subcommands that provide new options for certificate requests and allow users to specify fields in the configuration instead of having to go through prompts. | “Configuring Certificate Enrollment for a PKI” |
| 12.2(8)T | Multiple RSA Key Pair Support       | This feature allows a user to configure a router to have multiple RSA key pairs. Thus, the Cisco IOS software can maintain a different key pair for each identity certificate.                                             | “Deploying RSA Keys Within a PKI”              |
| 12.2(8)T | Trustpoint CLI                      | This feature introduces the <b>crypto ca trustpoint</b> command, which adds support for trustpoint CAs.                                                                                                                    | “Configuring Certificate Enrollment for a PKI” |

# Cisco IOS PKI Overview: Understanding and Planning a PKI

---

Cisco IOS public key infrastructure (PKI) provides certificate management to support security protocols such as IP Security (IPSec), secure shell (SSH), and secure socket layer (SSL).

This module identifies and describes concepts that are needed to understand, plan for, and implement a PKI.

## Module History

This module was first published on May 2, 2005, and last updated on July 17, 2008.

## Contents

- [Information About Cisco IOS PKI, page 1](#)
- [Planning for a PKI, page 5](#)
- [Where to Go Next, page 6](#)
- [Additional References, page 6](#)
- [Glossary, page 8](#)

## Information About Cisco IOS PKI

Before implementing a basic PKI, you should understand the following concepts:

- [What Is Cisco IOS PKI?, page 2](#)
- [RSA Keys Overview, page 3](#)
- [What Are CAs?, page 3](#)
- [Certificate Enrollment: How It Works, page 4](#)
- [Certificate Revocation: Why It Occurs, page 5](#)

## What Is Cisco IOS PKI?

A PKI is composed of the following entities:

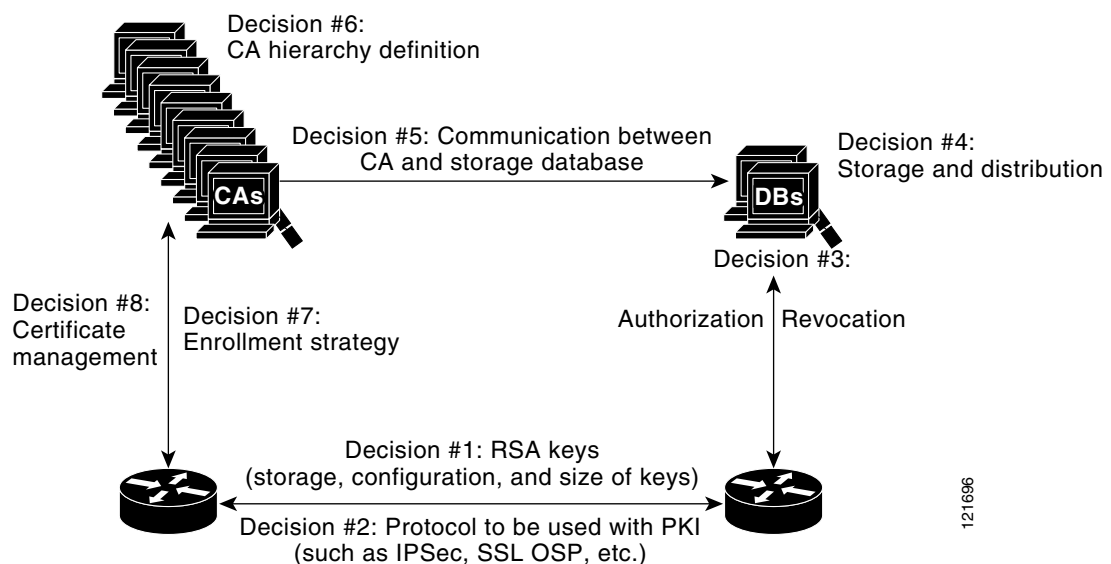

- Peers communicating on a secure network
- At least one certification authority (CA) that grants and maintains certificates
- Digital certificates, which contain information such as the certificate validity period, peer identity information, encryption keys that are used for secure communications, and the signature of the issuing CA
- An optional registration authority (RA) to offload the CA by processing enrollment requests
- A distribution mechanism (such as Lightweight Directory Access Protocol [LDAP] or HTTP) for certificate revocation lists (CRLs)

PKI provides customers with a scalable, secure mechanism for distributing, managing, and revoking encryption and identity information in a secured data network. Every entity (a person or a device) participating in the secured communication is enrolled in the PKI in a process where the entity generates an Rivest, Shamir, and Adelman (RSA) key pair (one private key and one public key) and has their identity validated by a trusted entity (also known as a CA or trustpoint).

After each entity enrolls in a PKI, every peer (also known as an end host) in a PKI is granted a digital certificate that has been issued by a CA. When peers must negotiate a secured communication session, they exchange digital certificates. Based on the information in the certificate, a peer can validate the identity of another peer and establish an encrypted session with the public keys contained in the certificate.

Although you can plan for and set up your PKI in a number of different ways, [Figure 97](#) shows the major components that make up a PKI and suggests an order in which each decision within a PKI can be made. [Figure 97](#) is a suggested approach; you can choose to set up your PKI from a different perspective.

**Figure 97**      **Deciding How to Set Up Your PKI**

121696

## RSA Keys Overview

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key will be included in the certificate so that peers can use it to encrypt data that is sent to the router. The private key is kept on the router and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.

RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

## What Are CAs?

A CA, also known as a trustpoint, manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use a CA provided by a third-party CA vendor, or you can use an “internal” CA, which is the Cisco IOS Certificate Server.

## Hierarchical PKI: Multiple CAs

PKI can be set up in a hierarchical framework to support multiple CAs. At the top of the hierarchy is a root CA, which holds a self-signed certificate. The trust within the entire hierarchy is derived from the RSA key pair of the root CA. The subordinate CAs within the hierarchy can be enrolled with either the root CA or with another subordinate CA. These enrollment options are how multiple tiers of CAs are configured. Within a hierarchical PKI, all enrolled peers, can validate the certificate of one another if the peers share a trusted root CA certificate or a common subordinate CA.

Figure 98 shows the enrollment relationships among CAs within a three-tiered hierarchy.

**Figure 98** *Three-Tiered CA Hierarchy Sample Topology*

Each CA corresponds to a trustpoint. For example, CA11 and CA12 are subordinate CAs, holding CA certificates that have been issued by CA1; CA111, CA112, and CA113 are also subordinate CAs, but their CA certificates have been issued by CA11.

## When to Use Multiple CAs

Multiple CAs provide users with added flexibility and reliability. For example, subordinate CAs can be placed in branch offices while the root CA is at the office headquarters. Also, different granting policies can be implemented per CA, so you can set up one CA to automatically grant certificate requests while another CA within the hierarchy requires each certificate request to be manually granted.

Scenarios in which at least a two-tier CA is recommended are as follows:

- Large and very active networks in which a large number of certificates are revoked and reissued. A multiple tier CA helps to control the size of the CRLs.
- When online enrollment protocols are used, the root CA can be kept offline with the exception of issuing subordinate CA certificates. This scenario provides added security for the root CA.

## Certificate Enrollment: How It Works

Certificate enrollment is the process of obtaining a certificate from a CA. Each end host that wants to participate in the PKI must obtain a certificate. Certificate enrollment occurs between the end host requesting the certificate and the CA. [Figure 99](#) and the following steps describe the certificate enrollment process.

**Figure 99** *Certificate Enrollment Process*

1. The end host generates an RSA key pair.
2. The end host generates a certificate request and forwards it to the CA (or the RA, if applicable).
3. The CA receives the certificate enrollment request, and, depending on your network configuration, one of the following options occurs:
  - c. Manual intervention is required to approve the request.
  - d. The end host is configured to automatically request a certificate from the CA. Thus, operator intervention is no longer required at the time the enrollment request is sent to the CA server.

**Note**

If you configure the end host to automatically request certificates from the CA, you should have an additional authorization mechanism.

4. After the request is approved, the CA signs the request with its private key and returns the completed certificate to the end host.
5. The end host writes the certificate to a storage area such as NVRAM.

## Certificate Enrollment Via Secure Device Provisioning

Secure Device Provisioning (SDP) is a web-based certificate enrollment interface that can be used to easily deploy PKI between two end devices, such as a Cisco IOS client and a Cisco IOS certificate server.

SDP (also referred to as Trusted Transitive Introduction [TTI]) is a communication protocol that provides a bidirectional introduction between two end entities, such as a new network device and a Virtual Private Network (VPN). SDP involves the following three entities:

- **Introducer**—A mutually trusted device that introduces the petitioner to the registrar. The introducer can be a device user, such as a system administrator.
- **Petitioner**—A new device that is joined to the secure domain.
- **Registrar**—A certificate server or other server that authorizes the petitioner.

SDP is implemented over a web browser in three phases—welcome, introduction, and completion. Each phase is shown to the user via a web page. For more information on each phase and how SDP works, see the “Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI” module.

## Certificate Revocation: Why It Occurs

After each participant has successfully enrolled in the PKI, the peers are ready to begin negotiations for a secure connection with each other. Thus, the peers present their certificates for validation followed by a revocation check. After the peer verifies that the other peer’s certificate was issued by an authenticated CA, the CRL or Online Certificate Status Protocol (OCSP) server is checked to ensure that the certificate has not been revoked by the issuing CA. The certificate usually contains a certificate distribution point (CDP) in the form of a URL. Cisco IOS software uses the CDP to locate and retrieve the CRL. If the CDP server does not respond, the Cisco IOS software reports an error, which may result in the peer’s certificate being rejected.

## Planning for a PKI

Planning for a PKI requires evaluating the requirements and expected use for each of the PKI components shown in [Figure 97](#). It is recommended that you (or the network administrator) thoroughly plan the PKI before beginning any PKI configuration.

Although there are a number of approaches to consider when planning the PKI, this document begins with peer-to-peer communication and proceeds as shown in [Figure 97](#). However you or the network administrator choose to plan the PKI, understand that certain decisions influence other decisions within the PKI. For example, the enrollment and deployment strategy could influence the planned CA hierarchy. Thus, it is important to understand how each component functions within the PKI and how certain component options are dependent upon decisions made earlier in the planning process.

## Where to Go Next

As suggested in [Figure 97](#), you begin to configure a PKI by setting up and deploying RSA keys. For more information, see the module “Deploying RSA Keys Within a PKI.”

## Glossary

**CDP**—certificate distribution point. Field within a digital certificate containing information that describes how to retrieve the CRL for the certificate. The most common CDPs are HTTP and LDAP URLs. A CDP may also contain other types of URLs or an LDAP directory specification. Each CDP contains one URL or directory specification.

**certificates**—Electronic documents that bind a user's or device's name to its public key. Certificates are commonly used to validate a digital signature.

**CRL**—certificate revocation list. Electronic document that contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when the certificate was issued and when it expires. A new CRL is issued when the current CRL expires.

**CA**—certification authority. Service responsible for managing certificate requests and issuing certificates to participating IPsec network devices. This service provides centralized key management for the participating devices and is explicitly trusted by the receiver to validate identities and to create digital certificates.

**peer certificate**—Certificate presented by a peer, which contains the peer's public key and is signed by the trustpoint CA.

**PKI**—public key infrastructure. System that manages encryption keys and identity information for components of a network that participate in secured communications.

**RA**—registration authority. Server that acts as a proxy for the CA so that CA functions can continue when the CA is offline. Although the RA is often part of the CA server, the RA could also be an additional application, requiring an additional device to run it.

**RSA keys**—Public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. An RSA key pair (a public and a private key) is required before you can obtain a certificate for your router.

# Deploying RSA Keys Within a PKI

---

**First Published: May 2, 2005**

**Last Updated: November 17, 2006**

This module explains how to set up and deploy Rivest, Shamir, and Adelman (RSA) keys within a public key infrastructure (PKI). An RSA key pair (a public and a private key) is required before you can obtain a certificate for your router; that is, the end host must generate a pair of RSA keys and exchange the public key with the certification authority (CA) to obtain a certificate and enroll in a PKI.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for RSA Keys Within a PKI”](#) section on page 20.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Prerequisites for Configuring RSA Keys for a PKI

- Before setting up and deploying RSA keys for a PKI, you should be familiar with the module “Cisco IOS PKI Overview: Understanding and Planning a PKI.”
- As of Cisco IOS Release 12.3(7)T, all commands that begin as “crypto ca” have been changed to begin as “crypto pki.” Although the router will still accept crypto ca commands, all output will be read back as crypto pki.

## Information About RSA Keys Configuration

To deploy RSA keys within a PKI, you should understand the following concepts:

- [RSA Keys Overview, page 2](#)
- [Reasons to Store Multiple RSA Keys on a Router, page 3](#)
- [Benefits of Exportable RSA Keys, page 3](#)
- [Passphrase Protection While Importing and Exporting RSA Keys, page 4](#)

## RSA Keys Overview

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key will be included in the certificate so that peers can use it to encrypt data that is sent to the router. The private key is kept on the router and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.

RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

If you want a modulus value between 512 and 1024, enter an integer value that is a multiple of 64. If you want a value higher than 1024, enter 1536 or 2048. If you enter a value greater than 512, key generation may take a minute or longer.

**Note**

---

As of Cisco IOS Release 12.4(11)T, peer *public* RSA key modulus values up to 4096 bits are automatically supported.

The largest private RSA key modulus is 2048 bits. Therefore, the largest RSA private key a router may generate or import is 2048 bits.

The recommended modulus value for a CA is 2048 bits; the recommended modulus value for a client is 1024 bits.

---

## Usage RSA Keys Versus General-Purpose RSA Keys

There are two mutually exclusive types of RSA key pairs—usage keys and general-purpose keys. When you generate RSA key pairs (via the **crypto key generate rsa** command), you will be prompted to select either usage keys or general-purpose keys.

### Usage RSA Keys

Usage keys consist of two RSA key pairs—one RSA key pair is generated and used for encryption and one RSA key pair is generated and used for signatures. With usage keys, each key is not unnecessarily exposed. (Without usage keys, one key is used for both authentication methods, increasing the exposure of that key.)

### General-Purpose RSA Keys

General-purpose keys consist of only one RSA key pair that used for both encryption and signatures. General-purpose key pairs are used more frequently than usage key pairs.

## Reasons to Store Multiple RSA Keys on a Router

Configuring multiple RSA key pairs allows the Cisco IOS software to maintain a different key pair for each CA with which it is dealing or the software can maintain multiple key pairs and certificates with the same CA. Thus, the Cisco IOS software can match policy requirements for each CA without compromising the requirements specified by the other CAs, such as key length, key lifetime, and general-purpose versus usage keys.

Named key pairs (which are specified via the **label** *key-label* option) allow you to have multiple RSA key pairs, enabling the Cisco IOS software to maintain a different key pair for each identity certificate.

## Benefits of Exportable RSA Keys

### Caution

Exportable RSA keys should be carefully evaluated before use because using exportable RSA keys introduces the risk that these keys might be exposed.

Any existing RSA keys are *not* exportable. New keys are generated as nonexportable by default. It is not possible to convert an existing nonexportable key to an exportable key.

As of Cisco IOS Release 12.2(15)T, users can share the private RSA key pair of a router with standby routers, therefore transferring the security credentials between networking devices. The key pair that is shared between two routers will allow one router to immediately and transparently take over the functionality of the other router. If the main router were to fail, the standby router could be dropped into the network to replace the failed router without the need to regenerate keys, reenroll with the CA, or manually redistribute keys.

Exporting and importing an RSA key pair also enables users to place the same RSA key pair on multiple routers so that all management stations using Secure Shell (SSH) can be configured with a single public RSA key.

### Exportable RSA Keys in PEM-Formatted Files

Using privacy-enhanced mail (PEM)-formatted files to import or export RSA keys can be helpful for customers who are running Cisco IOS software Release 12.3(4)T or later and who are using secure socket layer (SSL) or secure shell (SSH) applications to manually generate RSA key pairs and import the keys back into their PKI applications. PEM-formatted files allow customers to directly use existing RSA key pairs on their Cisco IOS routers instead of generating new keys.

## Passphrase Protection While Importing and Exporting RSA Keys

You have to include a passphrase to encrypt the PKCS12 file or the PEM file that will be exported, and when the PKCS12 or PEM file is imported, the same passphrase has to be entered to decrypt it. Encrypting the PKCS12 or PEM file when it is being exported, deleted, or imported protects the file from unauthorized access and use while it is being transported or stored on an external device.

The passphrase can be any phrase that is at least eight characters in length; it can include spaces and punctuation, excluding the question mark (?), which has special meaning to the Cisco IOS parser.

### How to Convert an Exportable RSA Key Pair to a Nonexportable RSA Key Pair

Passphrase protection protects the external PKCS12 or PEM file from unauthorized access and use. To prevent an RSA key pair from being exported, it must be labeled “nonexportable.” To convert an exportable RSA key pair into a nonexportable key pair, the key pair must be exported and then reimported without specifying the “exportable” keyword.

## How to Set Up and Deploy RSA Keys Within a PKI

This section contains the following procedures:

- [Generating an RSA Key Pair, page 4](#)
- [Generating and Storing Multiple RSA Key Pairs, page 5](#)
- [Exporting and Importing RSA Keys, page 6](#)
- [Encrypting and Locking Private Keys on a Router, page 10](#)
- [Removing RSA Key Pair Settings, page 13](#)

## Generating an RSA Key Pair

Perform this task to manually generate an RSA key pair.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto key generate rsa {general-keys | usage-keys} [label *key-label*] [modulus *modulus-size*] [exportable]**
4. **exit**
5. **show crypto key mypubkey rsa**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                              | Enters global configuration mode.                                                                                                                                                                                      |
| Step 3 | <b>crypto key generate rsa {general-keys   usage-keys} [label key-label] [modulus modulus-size] [exportable]</b><br><br><b>Example:</b><br>Router(config)# crypto key generate rsa general-keys modulus 360 | Generates RSA key pairs. <ul style="list-style-type: none"> <li>If a <i>key-label</i> argument is not specified, the default value, which is the fully qualified domain name (FQDN) of the router, is used.</li> </ul> |
| Step 4 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                  | Exits global configuration mode.                                                                                                                                                                                       |
| Step 5 | <b>show crypto key mypubkey rsa</b><br><br><b>Example:</b><br>Router# show crypto key mypubkey rsa                                                                                                          | (Optional) Displays the RSA public keys of your router.<br><br>This step allows you to verify that the RSA key pair has been successfully generated.                                                                   |

## What to Do Next

After you have successfully generated an RSA key pair, you can proceed to any of the additional tasks in this module to generate additional RSA key pairs, perform export and import of RSA key pairs, or configure additional security parameters for the RSA key pair (such as encrypting or locking the private key).

## Generating and Storing Multiple RSA Key Pairs

Perform this task to configure the router to generate and store multiple RSA key pairs and associate the key pairs with a trustpoint.

A trustpoint (also known as a CA) manages certificate requests and issues certificates to participating network devices. These services provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

## Prerequisites

You must have already generated an RSA key pair as shown in the task “[Generating an RSA Key Pair](#).”

## SUMMARY STEPS

1. **crypto pki trustpoint *name***
2. **rsa-keypair *key-label* [*key-size* [*encryption-key-size*]]**
3. **exit**
4. **exit**
5. **show crypto key mypubkey rsa**

## DETAILED STEPS

|        | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>crypto pki trustpoint <i>name</i></b><br><br><b>Example:</b><br>Router(config)# crypto pki trustpoint fancy-ca                                          | Creates a trustpoint and enters ca-trustpoint configuration mode.                                                                                                                                                                                                                                  |
| Step 2 | <b>rsa-keypair <i>key-label</i> [<i>key-size</i> [<i>encryption-key-size</i>]]</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# rsa-keypair fancy-keys | Specifies the key pair that is to be used with the trustpoint. <ul style="list-style-type: none"> <li>Specify the <i>key-size</i> argument for generating the key and specify the <i>encryption-key-size</i> argument to request separate encryption, signature keys, and certificates.</li> </ul> |
| Step 3 | <b>exit</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# exit                                                                                          | Exits ca-trustpoint configuration mode.                                                                                                                                                                                                                                                            |
| Step 4 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                 | Exits global configuration mode.                                                                                                                                                                                                                                                                   |
| Step 5 | <b>show crypto key mypubkey rsa</b><br><br><b>Example:</b><br>Router# show crypto key mypubkey rsa                                                         | (Optional) Displays the RSA public keys of your router.<br><br>This step allows you to verify that the RSA key pair has been successfully generated.                                                                                                                                               |

## Exporting and Importing RSA Keys

This section contains the following tasks that can be used for exporting and importing RSA keys. Whether you are using PKCS12 files or PEM files, exportable RSA keys allow you to use existing RSA keys on Cisco IOS routers instead of having to generate new RSA keys if the main router were to fail.

- [Exporting and Importing RSA Keys in PKCS12 Files, page 7](#)
- [Exporting and Importing RSA Keys in PEM-Formatted Files, page 8](#)

## Exporting and Importing RSA Keys in PKCS12 Files

Exporting and importing RSA key pairs enables users to transfer security credentials between devices. The key pair that is shared between two devices allows one device to immediately and transparently take over the functionality of the other router.

### Prerequisites for Exporting and Importing RSA Key in PKCS12 Files

You must generate an RSA key pair and mark it “exportable” as specified in the task “[Generating an RSA Key Pair](#).”

### Restrictions for Exporting and Importing RSA Keys in PKCS12 Files

- You cannot export RSA keys that existed on the router before your system was upgraded to Cisco IOS Release 12.2(15)T or later. You have to generate new RSA keys and label them as “exportable” after you upgrade the Cisco IOS software.
- When you import a PKCS12 file that was generated by a third-party application, the PKCS12 file must include a CA certificate.
- If you want reexport an RSA key pair after you have already exported the key pair and imported them to a target router, you must specify the **exportable** keyword when you are importing the RSA key pair.
- The largest RSA key a router may import is 2048-bits.

### SUMMARY STEPS

1. **crypto pki trustpoint** *name*
2. **rsa***keypair* *key-label* [*key-size* [*encryption-key-size*]]
3. **exit**
4. **crypto pki export** *trustpointname* **pkcs12** *destination-url* *passphrase*
5. **crypto pki import** *trustpointname* **pkcs12** *source-url* *passphrase*
6. **exit**
7. **show crypto key mypubkey** *rsa*

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <pre>crypto pki trustpoint <i>name</i></pre> <p><b>Example:</b><br/>Router(config)# crypto pki trustpoint my-ca</p>                                                                                                     | Creates the trustpoint name that is to be associated with the RSA key pair and enters ca-trustpoint configuration mode.                                                                                                                                 |
| Step 2 | <pre>rsakeypair <i>key-label</i> [<i>key-size</i><br/>[<i>encryption-key-size</i>]]</pre> <p><b>Example:</b><br/>Router(ca-trustpoint)# rsakeypair my-keys</p>                                                          | Specifies the key pair that is to be used with the trustpoint.                                                                                                                                                                                          |
| Step 3 | <pre>exit</pre> <p><b>Example:</b><br/>Router(ca-trustpoint)# exit</p>                                                                                                                                                  | Exits ca-trustpoint configuration mode.                                                                                                                                                                                                                 |
| Step 4 | <pre>crypto pki export <i>trustpointname</i> pkcs12<br/><i>destination-url</i> <i>passphrase</i></pre> <p><b>Example:</b><br/>Router(config)# crypto pki export my-ca pkcs12<br/>tftp://tftpserver/my-keys PASSWORD</p> | <p>Exports the RSA keys via the trustpoint name.</p> <p><b>Note</b> You can export the trustpoint using any of the following file system types: flash, FTP, null, NVRAM, remote file copying (RCP), SCP, system, TFTP, Webflash, Xmodem, or Ymodem.</p> |
| Step 5 | <pre>crypto pki import <i>trustpointname</i> pkcs12<br/><i>source-url</i> <i>passphrase</i></pre> <p><b>Example:</b><br/>Router(config)# crypto pki import my-ca pkcs12<br/>tftp://tftpserver/my-keys PASSWORD</p>      | Imports the RSA keys to the target router.                                                                                                                                                                                                              |
| Step 6 | <pre>exit</pre> <p><b>Example:</b><br/>Router(config)# exit</p>                                                                                                                                                         | Exits global configuration mode.                                                                                                                                                                                                                        |
| Step 7 | <pre>show crypto key mypubkey rsa</pre> <p><b>Example:</b><br/>Router# show crypto key mypubkey rsa</p>                                                                                                                 | (Optional) Displays the RSA public keys of your router.                                                                                                                                                                                                 |

## Exporting and Importing RSA Keys in PEM-Formatted Files

Perform this task to export or import RSA key pairs in PEM files.

## Prerequisites for Exporting and Importing RSA Keys in PEM-Formatted Files

You must generate an RSA key pair and mark it “exportable” as specified in the task “[Generating an RSA Key Pair](#).”

## Restrictions for Exporting and Importing RSA Keys in PEM Formatted Files

- You cannot export and import RSA keys that were generated without an exportable flag before your system was upgraded to Cisco IOS Release 12.3(4)T or a later release. You have to generate new RSA keys after you upgrade the Cisco IOS software.
- The largest RSA key a router may import is 2048 bits.

## SUMMARY STEPS

1. **crypto key generate rsa** {usage-keys | general-keys} label *key-label* [exportable]
2. **crypto key export rsa** *key-label* **pem** {terminal | url *url*} {3des | des} *passphrase*
3. **crypto key import rsa** *key-label* **pem** [usage-keys] {terminal | url *url*} [exportable] *passphrase*

4. **exit**
5. **show crypto key mypubkey rsa**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                    |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>crypto key generate rsa</b> {usage-keys   general-keys} <b>label</b> key-label [ <b>exportable</b> ]<br><br><b>Example:</b><br>Router(config)# crypto key generate rsa general-keys label mykey exportable             | Generates RSA key pairs.<br><br>To use PEM files, the RSA key pair must be labeled exportable.                                                                                                                                             |
| Step 2 | <b>crypto key export rsa</b> key-label <b>pem</b> {terminal   url url} {3des   des} <i>passphrase</i><br><br><b>Example:</b><br>Router(config)# crypto key export rsa mycs pem url nvram: 3des PASSWORD                   | Exports the generated RSA key pair.<br><br><b>Tip</b> Be sure to keep the PEM file safe. For example, you may want to store it on another backup router.                                                                                   |
| Step 3 | <b>crypto key import rsa</b> key-label <b>pem</b> [usage-keys] {terminal   url url} [ <b>exportable</b> ] <i>passphrase</i><br><br><b>Example:</b><br>Router(config)# crypto key import rsa mycs2 pem url nvram: PASSWORD | Imports the generated RSA key pair.<br><br><b>Note</b> If you do not want the key to be exportable from your CA, import it back to the CA after it has been exported as a nonexportable key pair. Thus, the key cannot be taken off again. |
| Step 4 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                                | Exits global configuration mode.                                                                                                                                                                                                           |
| Step 5 | <b>show crypto key mypubkey rsa</b><br><br><b>Example:</b><br>Router# show crypto key mypubkey rsa                                                                                                                        | (Optional) Displays the RSA public keys of your router.                                                                                                                                                                                    |

## Encrypting and Locking Private Keys on a Router

Digital signatures are used to authenticate one device to another device. To use digital signatures, private information (the private key) must be stored on the device that is providing the signature. The stored private information may aid an attacker who steals the hardware device that contains the private key; for example, a thief might be able to use the stolen router to initiate a secure connection to another site by using the RSA private keys stored in the router.

### Note

RSA keys are lost during password recovery operations. If you lose your password, the RSA keys will be deleted when you perform the password recovery operation. (This function prevents an attacker from performing password recovery and then using the keys.)

To protect the private RSA key from an attacker, a user can encrypt the private key that is stored in NVRAM via a passphrase. Users can also “lock” the private key, which blocks new connection attempts from a running router and protects the key in the router if the router is stolen by an attempted attacker.

Perform this task to encrypt and lock the private key that is saved to NVRAM.

## Prerequisites

Before encrypting or locking a private key, you should perform the following tasks:

- Generate an RSA key pair as shown in the task “[Generating an RSA Key Pair](#).”
- Optionally, you can authenticate and enroll each router with the CA server.

### Note

The RSA keys must be unlocked while enrolling the CA. The keys can be locked while authenticating the router with the CA because the private key of the router is not used during authentication.

## Restrictions for Encrypting and Locking Private Keys

### Backward Compatibility Restriction

Any image prior to Cisco IOS Release 12.3(7)T does not support encrypted keys. To prevent your router from losing all encrypted keys, ensure that only unencrypted keys are written to NVRAM before booting an image prior to Cisco IOS Release 12.3(7)T.

If you must download an image prior to Cisco IOS Release 12.3(7)T, decrypt the key and immediately save the configuration so the downloaded image does not overwrite the configuration.

### Interaction with Applications

An encrypted key is not effective after the router boots up until you manually unlock the key (via the **crypto key unlock rsa** command). Depending on which key pairs are encrypted, this functionality may adversely affect applications such as IP security (IPsec), SSH, and SSL; that is, management of the router over a secure channel may not be possible until the necessary key pair is unlocked.

## SUMMARY STEPS

1. **crypto key encrypt [write] rsa [name *key-name*] passphrase *passphrase***
2. **exit**
3. **show crypto key mypubkey rsa**
4. **crypto key lock rsa [name *key-name*] passphrase *passphrase***
5. **show crypto key mypubkey rsa**
6. **crypto key unlock rsa [name *key-name*] passphrase *passphrase***
7. **configure terminal**
8. **crypto key decrypt [write] rsa [name *key-name*] passphrase *passphrase***

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>crypto key encrypt</b> [ <b>write</b> ] <b>rsa</b> [ <b>name</b> <i>key-name</i> ]<br><b>passphrase</b> <i>passphrase</i><br><br><b>Example:</b><br>Router(config)# crypto key encrypt write rsa<br>name pki.company.com passphrase password | Encrypts the RSA keys.<br><br>After this command is issued, the router can continue to use the key; the key remains unlocked.<br><br><b>Note</b> If the <b>write</b> keyword is not issued, the configuration must be manually written to NVRAM; otherwise, the encrypted key will be lost next time the router is reloaded.                                                                                            |
| Step 2 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                                                      | Exits global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>show crypto key mypubkey rsa</b><br><br><b>Example:</b><br>Router# show crypto key mypubkey rsa                                                                                                                                              | (Optional) Shows that the private key is encrypted (protected) and unlocked.<br><br><b>Note</b> You can also use this command to verify that applications such as Internet Key Exchange (IKE) and SSH are properly working after the key has been encrypted.                                                                                                                                                            |
| Step 4 | <b>crypto key lock rsa</b> [ <b>name</b> <i>key-name</i> ] <b>passphrase</b> <i>passphrase</i><br><br><b>Example:</b><br>Router# crypto key lock rsa name<br>pki.company.com passphrase password                                                | (Optional) Locks the encrypted private key on a running router.<br><br><b>Note</b> After the key is locked, it cannot be used to authenticate the router to a peer device. This behavior disables any IPsec or SSL connections that use the locked key.<br><br>Any existing IPsec tunnels created on the basis of the locked key will be closed.<br><br>If all RSA keys are locked, SSH will automatically be disabled. |
| Step 5 | <b>show crypto key mypubkey rsa</b><br><br><b>Example:</b><br>Router# show crypto key mypubkey rsa                                                                                                                                              | (Optional) Shows that the private key is protected and locked.<br><br>The output will also show failed connection attempts via applications such as IKE, SSH, and SSL.                                                                                                                                                                                                                                                  |
| Step 6 | <b>crypto key unlock rsa</b> [ <b>name</b> <i>key-name</i> ]<br><b>passphrase</b> <i>passphrase</i><br><br><b>Example:</b><br>Router# crypto key unlock rsa name<br>pki.company.com passphrase password                                         | (Optional) Unlocks the private key.<br><br><b>Note</b> After this command is issued, you can continue to establish IKE tunnels.                                                                                                                                                                                                                                                                                         |

|        | Command or Action                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                              |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# <code>configure terminal</code>                                                                                                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                    |
| Step 8 | <code>crypto key decrypt [write] rsa [name key-name]</code><br><code>passphrase passphrase</code><br><br><b>Example:</b><br>Router(config)# <code>crypto key decrypt write rsa</code><br>name <code>pki.company.com</code> <code>passphrase password</code> | (Optional) Deletes the encrypted key and leaves only the unencrypted key.<br><br><b>Note</b> The <b>write</b> keyword immediately saves the unencrypted key to NVRAM. If the <b>write</b> keyword is not issued, the configuration must be manually written to NVRAM; otherwise, the key will remain encrypted the next time the router is reloaded. |

## Removing RSA Key Pair Settings

You might want to remove an RSA key pair for one of the following reasons:

- During manual PKI operations and maintenance, old RSA keys can be removed and replaced with new keys.
- An existing CA is replaced and the new CA requires newly generated keys; for example, the required key size might have changed in an organization so you would have to delete the old 1024-bit keys and generate new 2048-bit keys.

Perform this task to remove all RSA keys or the specified RSA key pair that has been generated by your router.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto key zeroize rsa [key-pair-label]`
4. `exit`
5. `show crypto key mypubkey rsa`

**DETAILED STEPS**

|        | Command or Action                                                                                                                      | Purpose                                                                                                                                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                 | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                         | Enters global configuration mode.                                                                                                                                                                                          |
| Step 3 | <b>crypto key zeroize rsa</b> [ <i>key-pair-label</i> ]<br><br><b>Example:</b><br>Router(config)# crypto key zeroize rsa<br>fancy-keys | Deletes RSA key pairs from your router.<br><ul style="list-style-type: none"><li>• If the <i>key-pair-label</i> argument is not specified, all RSA keys that have been generated by your router will be deleted.</li></ul> |
| Step 4 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                             | Exits global configuration mode.                                                                                                                                                                                           |
| Step 5 | <b>show crypto key mypubkey rsa</b><br><br><b>Example:</b><br>Router# show crypto key mypubkey rsa                                     | (Optional) Displays the RSA public keys of your router.<br>This step allows you to verify that the RSA key pair has been successfully generated.                                                                           |

## Configuration Examples for RSA Key Pair Deployment

This section contains the following configuration examples:

- [Generating and Specifying RSA Keys: Example, page 14](#)
- [Exporting and Importing RSA Keys: Examples, page 14](#)
- [Encrypting and Locking Private Keys on a Router: Examples, page 18](#)

### Generating and Specifying RSA Keys: Example

The following example is a sample trustpoint configuration that shows how to generate and specify the RSA key pair “exampleCAkeys”:

```
crypto key generate rsa general-purpose exampleCAkeys
crypto ca trustpoint exampleCAkeys
 enroll url http://exampleCAkeys/certsrv/mscep/mscep.dll
 rsakeypair exampleCAkeys 1024 1024
```

### Exporting and Importing RSA Keys: Examples

This section contains the following configuration examples:

- [Exporting and Importing RSA Keys in PKCS12 Files: Example, page 15](#)
- [Generating, Exporting, Importing, and Verifying RSA Keys in PEM Files: Example, page 15](#)
- [Exporting Router RSA Key Pairs and Certificates from PEM Files: Example, page 16](#)
- [Importing Router RSA Key Pairs and Certificate from PEM Files: Example, page 18](#)

## Exporting and Importing RSA Keys in PKCS12 Files: Example

In the following example, an RSA key pair “mynewkp” is generated on Router A, and a trustpoint name “mynewtp” is created and associated with the RSA key pair. The trustpoint is exported to a TFTP server, so that it can be imported on Router B. By importing the trustpoint “mynewtp” to Router B, the user has imported the RSA key pair “mynewkp” to Router B.

### Router A

```
crypto key generate rsa general label mykeys exportable
! The name for the keys will be:mynewkp
Choose the size of the key modulus in the range of 360 to 2048 for your
General Purpose Keys. Choosing a key modulus greater than 512 may take
a few minutes.
How many bits in the modulus [512]:
% Generating 512 bit RSA keys ...[OK]
!
crypto pki trustpoint mynewtp
 rsakeypair mykeys
exit

crypto pki export mytp pkcs12 flash:myexport companyname
Destination filename [myexport]?
Writing pkcs12 file to tftp://mytftpserver/myexport
CRYPTO_PKI:Exported PKCS12 file successfully.
Verifying checksum... OK (0x3307)
!
Feb 18 17:30:09 GMT:%CRYPTO-6-PKCS12EXPORT_SUCCESS:PKCS #12 Successfully Exported.
```

### Router B

```
crypto pki import mynewtp pkcs12 flash:myexport companyname
Source filename [myexport]?
CRYPTO_PKI:Imported PKCS12 file successfully.

!
Feb 18 18:07:50 GMT:%CRYPTO-6-PKCS12IMPORT_SUCCESS:PKCS #12 Successfully Imported.
```

## Generating, Exporting, Importing, and Verifying RSA Keys in PEM Files: Example

The following example shows how to generate, export, bring the key back (import), and verify the status of the RSA key pair “mycs”:

```
! Generate the key pair
!
Router(config)# crypto key generate rsa general-purpose label mycs exportable
The name for the keys will be: mycs

Choose the size of the key modulus in the range of 360 to 2048 for your
General Purpose Keys. Choosing a key modulus greater than 512 may take a few minutes.

How many bits in the modulus [512]: 1024
% Generating 1024 bit RSA keys ...[OK]
!
```

```

! Archive the key pair to a remote location, and use a good password.
!
Router(config)# crypto key export rsa mycs pem url nvram:3des PASSWORD

% Key name:mycs
Usage:General Purpose Key
Exporting public key...
Destination filename [mycs.pub]?
Writing file to nvram:mycs.pub
Exporting private key...
Destination filename [mycs.prv]?
Writing file to nvram:mycs.prv
!
! Import the key as a different name.
!
Router(config)# crypto key import rsa mycs2 pem url nvram:mycs PASSWORD

% Importing public key or certificate PEM file...
Source filename [mycs.pub]?
Reading file from nvram:mycs.pub
% Importing private key PEM file...
Source filename [mycs.prv]?
Reading file from nvram:mycs.prv% Key pair import succeeded.
!
! After the key has been imported, it is no longer exportable.
!
! Verify the status of the key.
!
Router# show crypto key mypubkey rsa

% Key pair was generated at:18:04:56 GMT Jun 6 2003
Key name:mycs
Usage:General Purpose Key
Key is exportable.

## Exporting Router RSA Key Pairs and Certificates from PEM Files: Example

The following example shows how to generate and export the RSA key pair “aaa” and certificates of the router in PEM files that are associated with the trustpoint “mycs.” This example also shows PEM-formatted files, which include PEM boundaries before and after the base64-encoded data, that are used by other SSL and SSH applications.

```

Router(config)# crypto key generate rsa general-keys label aaa exportable

The name for the keys will be:aaa

```

Choose the size of the key modulus in the range of 360 to 2048 for your General Purpose Keys. Choosing a key modulus greater than 512 may take a few minutes.

```

!
How many bits in the modulus [512]:
% Generating 512 bit RSA keys ...[OK]
!

## Importing Router RSA Key Pairs and Certificate from PEM Files: Example

The following example shows how to import the RSA key pairs and certificate to the trustpoint “ggg” from PEM files via TFTP:

```
Router(config)# crypto pki import ggg pem url tftp://10.1.1.2/username/msca password
% Importing CA certificate...
Address or name of remote host [10.1.1.2]?
Destination filename [username/msca.ca]?
Reading file from tftp://10.1.1.2/username/msca.ca
Loading username/msca.ca from 10.1.1.2 (via Ethernet0):!
[OK - 1082 bytes]

% Importing private key PEM file...
Address or name of remote host [10.1.1.2]?
Destination filename [username/msca.prv]?
Reading file from tftp://10.1.1.2/username/msca.prv
Loading username/msca.prv from 10.1.1.2 (via Ethernet0):!
[OK - 573 bytes]

% Importing certificate PEM file...
Address or name of remote host [10.1.1.2]?
Destination filename [username/msca.crt]?
Reading file from tftp://10.1.1.2/username/msca.crt
Loading username/msca.crt from 10.1.1.2 (via Ethernet0):!
[OK - 1289 bytes]
% PEM files import succeeded.
Router(config)#
```

## Encrypting and Locking Private Keys on a Router: Examples

This section contains the following configuration examples:

- [Configuring and Verifying an Encrypted Key: Example, page 18](#)
- [Configuring and Verifying a Locked Key: Example, page 19](#)

### Configuring and Verifying an Encrypted Key: Example

The following example shows how to encrypt the RSA key “pki-123.company.com.” Thereafter, the **show crypto key mypubkey rsa** command is issued to verify that the RSA key is encrypted (protected) and unlocked.

```
Router(config)# crypto key encrypt rsa name pki-123.company.com passphrase password
Router(config)# exit
Router# show crypto key mypubkey rsa

% Key pair was generated at:00:15:32 GMT Jun 25 2003
Key name:pki-123.company.com
Usage:General Purpose Key
*** The key is protected and UNLOCKED. ***
Key is not exportable.

```

## Where to Go Next

After you have generated an RSA key pair, you should set up the trustpoint. If you have already set up the trustpoint, you should authenticate and enroll the routers in a PKI. For information on enrollment, see the module “Configuring Certificate Enrollment for a PKI.”

## Additional References

The following sections provide references related to configuring RSA keys for a PKI.

## Feature Information for RSA Keys Within a PKI

Table 57 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the *“Implementing and Managing PKI Features Roadmap”*.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

Table 57 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 57**      **Feature Information for RSA Keys Within a PKI**

# Configuring Authorization and Revocation of Certificates in a PKI

---

**First Published: May 2, 2005**

Last Updated: June 19, 2006

This module describes how to configure authorization and revocation of certificates in a public key infrastructure (PKI).

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Certificate Authorization and Revocation](#)” section on page 40.*

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

# Prerequisites for Authorization and Revocation of Certificates

## Plan Your PKI Strategy

### Tip

It is strongly recommended that you plan your entire PKI strategy before you begin to deploy actual certificates.

Authorization and revocation can occur only after you or a network administrator have completed the following tasks:

- Configured the CA.
- Enrolled peer devices with the CA.
- Identified and configured the protocol (such as IP Security [IPsec] or secure socket layer [SSL]) that is to be used for peer-to-peer communication.

You should decide which authorization and revocation strategy you are going to configure before enrolling peer devices because the peer device certificates might have to contain authorization and revocation-specific information.

### “crypto ca” to “crypto pki” CLI Change

As of Cisco IOS Release 12.3(7)T, all commands that begin as “crypto ca” have been changed to begin as “crypto pki.” Although the router will still accept crypto ca commands, all output will be read back as crypto pki.

## Information About Authorization and Revocation of Certificates

Before configuring certificate authorization and revocation, you should understand the following concepts:

- [PKI Authorization, page 2](#)
- [PKI and AAA Server Integration for Certificate Status, page 3](#)
- [CRLs or OCSP Server: Choosing a Certificate Revocation Mechanism, page 4](#)
- [When to Use Certificate-Based ACLs for Authorization or Revocation, page 7](#)
- [PKI Certificate Chain Validation, page 8](#)

## PKI Authorization

PKI authentication does not provide authorization. Current solutions for authorization are specific to the router that is being configured, although a centrally managed solution is often required.

There is not a standard mechanism by which certificates are defined as authorized for some tasks and not for others. This authorization information can be captured in the certificate itself if the application is aware of the certificate-based authorization information. But this solution does not provide a simple mechanism for real-time updates to the authorization information and forces each application to be aware of the specific authorization information embedded in the certificate.

When the certificate-based ACL mechanism is configured as part of the trustpoint authentication, the application is no longer responsible for determining this authorization information, and it is no longer possible to specify for which application the certificate is authorized. In some cases, the certificate-based ACL on the router gets so large that it cannot be managed. Additionally, it is beneficial to retrieve certificate-based ACL indications from an external server. (For more information on using certificate-based ACLs for authentication, see the section [“When to Use Certificate-Based ACLs for Authorization or Revocation.”](#))

Current solutions to the real-time authorization problem involve specifying a new protocol and building a new server (with associated tasks, such as management and data distribution).

## PKI and AAA Server Integration for Certificate Status

Integrating your PKI with an authentication, authorization, and accounting (AAA) server provides an alternative online certificate status solution that leverages the existing AAA infrastructure. Certificates can be listed in the AAA database with appropriate levels of authorization. For components that do not explicitly support PKI-AAA, a default label of “all” from the AAA server provides authorization. Likewise, a label of “none” from the AAA database indicates that the specified certificate is not valid. (The absence of any application label is equivalent, but “none” is included for completeness and clarity). If the application component does support PKI-AAA, the component may be specified directly; for example, the application component could be “ipsec,” “ssl,” or “osp.” (ipsec=IP Security, ssl=Secure Sockets Layer, and osp=Open Settlement Protocol.)

### Note

- Currently, no application component supports specification of the application label.
- There may be a time delay when accessing the AAA server. If the AAA server is not available, the authorization fails.

## RADIUS or TACACS+: Choosing a AAA Server Protocol

The AAA server can be configured to work with either the RADIUS or TACACS+ protocol. When you are configuring the AAA server for the PKI integration, you must set the RADIUS or TACACS attributes that are required for authorization.

If the RADIUS protocol is used, the password that is configured for the username in the AAA server should be set to “cisco,” which is acceptable because the certificate validation provides authentication and the AAA database is only being used for authorization. When the TACACS protocol is used, the password that is configured for the username in the AAA server is irrelevant because TACACS supports authorization without requiring authentication (the password is used for authentication).

In addition, if you are using TACACS, you must add a PKI service to the AAA server. The custom attribute “cert-application=all” is added under the PKI service for the particular user or usergroup to authorize the specific username.

## Attribute-Value Pairs for PKI and AAA Server Integration

[Table 1](#) lists the attribute-value (AV) pairs that are to be used when setting up PKI integration with a AAA server. (Note the values shown in the table are possible values.) The AV pairs must match the client configuration. If they do not match, the peer certificate is not authorized.

**Note**

Users can sometimes have AV pairs that are different from those of every other user. As a result, a unique username is required for each user. The **all** parameter (within the **authorization username** command) specifies that the entire subject name of the certificate will be used as the authorization username.

**Table 1** *AV Pairs That Must Match*

| AV Pair                                             | Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cisco-avpair=pki:cert-application=all               | Valid values are “all” and “none.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| cisco-avpair=pki:cert-trustpoint=msca               | <p>The value is a Cisco IOS command-line interface (CLI) configuration trustpoint label.</p> <p><b>Note</b> The cert-trustpoint AV pair is normally optional. If it is specified, the Cisco IOS router query must be coming from a certificate trustpoint that has a matching label, and the certificate that is authenticated must have the specified certificate serial number.</p>                                                                                                                                                                                                                               |
| cisco-avpair=pki:cert-serial=16318DB7000100001671   | <p>The value is a certificate serial number.</p> <p><b>Note</b> The cert-serial AV pair is normally optional. If it is specified, the Cisco IOS router query must be coming from a certificate trustpoint that has a matching label, and the certificate that is authenticated must have the specified certificate serial number.</p>                                                                                                                                                                                                                                                                               |
| cisco-avpair=pki:cert-lifetime-end=1:00 jan 1, 2003 | <p>The cert-lifetime-end AV pair is available to artificially extend a certificate lifetime beyond the time period that is indicated in the certificate itself. If the cert-lifetime-end AV pair is used, the cert-trustpoint and cert-serial AV pairs must also be specified. The value must match the following form: hours:minutes month day, year.</p> <p><b>Note</b> Only the first three characters of a month are used: Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec. If more than three characters are entered for the month, the remaining characters are ignored (for example Janxxxx).</p> |

## CRLs or OCSP Server: Choosing a Certificate Revocation Mechanism

After a certificate is validated as a properly signed certificate, a certificate revocation method is performed to ensure that the certificate has not been revoked by the issuing CA. Cisco IOS software supports two revocation mechanisms—certificate revocation lists (CRLs) and Online Certificate Status Protocol (OCSP). (Cisco IOS software also supports AAA integration for certificate checking; however, additional authorization functionality is included. For more information on PKI and AAA certificate authorization and status check, see the section “[PKI and AAA Server Integration for Certificate Status](#).”)

The following sections explain how each revocation mechanism works:

- [What Is a CRL?, page 5](#)
- [What Is OCSP?, page 6](#)

## What Is a CRL?

A certificate revocation list (CRL) contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when each certificate was issued and when it expires.

CAs publish new CRLs periodically or when a certificate for which the CA is responsible has been revoked. By default, a new CRL will be downloaded after the currently cached CRL expires. An administrator may also configure the duration for which CRLs are cached in router memory or disable CRL caching completely. The CRL caching configuration will apply to all CRLs associated with a trustpoint.

When the CRL expires, the router deletes it from its cache. A new CRL is downloaded when a certificate is presented for verification; however, if a newer version of the CRL that lists the certificate under examination is on the server but the router is still using the CRL in its cache, the router will not know that the certificate has been revoked. The certificate will pass the revocation check even though it should have been denied.

When a CA issues a certificate, the CA can include in the certificate the CRL distribution point (CDP) for that certificate. Cisco IOS client devices use CDPs to locate and load the correct CRL. The Cisco IOS client supports multiple CDPs, but the Cisco IOS CA currently supports only one CDP; however, third-party vendor CAs may support multiple CDPs or different CDPs per certificate. If a CDP is not specified in the certificate, the client device will use the default Simple Certificate Enrollment Protocol (SCEP) method to retrieve the CRL. (The CDP location can be specified via the **cdp-url** command.)

When implementing CRLs, you should consider the following design considerations:

- CRL lifetimes and the security association (SA) and Internet Key Exchange (IKE) lifetimes  
The CRL lifetime determines the length of time between CA-issued updates to the CRL. (The default CRL lifetime value, which is 168 hours [1 week], can be changed via the **lifetime crl** command.)
- The method and location of the CDP
  - The method determines how the CRL is retrieved; some possible choices include HTTP, Lightweight Directory Access Protocol (LDAP), SCEP, or TFTP.  
HTTP, TFTP, and LDAP are the most commonly used methods. Although Cisco IOS software defaults to SCEP, an HTTP CDP is recommended for large installations using CRLs because HTTP can be made highly scalable.
  - The location determines from where the CRL is retrieved; for example, you can specify the server and file path from which to retrieve the CRL.

## Querying All CDPs During Revocation Check

When a CDP server does not respond to a request, the Cisco IOS software reports an error, which may result in the peer's certificate being rejected. To prevent a possible certificate rejection and if there are multiple CDPs in a certificate, the Cisco IOS software will attempt to use the CDPs in the order in which they appear in the certificate. The router will attempt to retrieve a CRL using each CDP URL or directory specification. If an error occurs using a CDP, an attempt will be made using the next CDP.

**Note**

Prior to Cisco IOS Release 12.3(7)T, the Cisco IOS software makes only one attempt to retrieve the CRL, even when the certificate contains more than one CDP.

**Tip**

Although the Cisco IOS software will make every attempt to obtain the CRL from one of the indicated CDPs, it is recommended that you use an HTTP CDP server with high-speed redundant HTTP servers to avoid application timeouts because of slow CDP responses.

## What Is OCSP?

OCSP is an online mechanism that is used to determine certificate validity and provides the following flexibility as a revocation mechanism:

- OCSP can provide real-time certificate status checking.
- OCSP allows the network administrator to specify a central OCSP server, which can service all devices within a network.
- OCSP also allows the network administrator the flexibility to specify multiple OCSP servers, either per client certificate or per group of client certificates.
- OCSP server validation is usually based on the root CA certificate or a valid subordinate CA certificate, but may also be configured so that external CA certificates or self-signed certificates may be used. Using external CA certificates or self-signed certificates allows the OCSP servers certificate to be issued and validated from an alternative PKI hierarchy.

A network administrator can configure an OCSP server to collect and update CRLs from different CA servers. The devices within the network can rely on the OCSP server to check the certificate status without retrieving and caching each CRL for every peer. When peers have to check the revocation status of a certificate, they send a query to the OCSP server that includes the serial number of the certificate in question and an optional unique identifier for the OCSP request, or a nonce. The OCSP server holds a copy of the CRL to determine if the CA has listed the certificate as being revoked; the server then responds to the peer including the nonce. If the nonce in the response from the OCSP server does not match the original nonce sent by the peer, the response is considered invalid and certificate verification fails. The dialog between the OCSP server and the peer consumes less bandwidth than most CRL downloads.

If the OCSP server is using a CRL, CRL time limitations will be applicable; that is, a CRL that is still valid might be used by the OCSP server although a new CRL has been issued by the CRL containing additional certificate revocation information. Because fewer devices are downloading the CRL information on a regular basis, you can decrease the CRL lifetime value or configure the OCSP server not to cache the CRL. For more information, check your OCSP server documentation.

## When to Use an OCSP Server

OCSP may be more appropriate than CRLs if your PKI has any of the following characteristics:

- Real-time certificate revocation status is necessary. CRLs are updated only periodically and the latest CRL may not always be cached by the client device. For example, if a client does not yet have the latest CRL cached and a newly revoked certificate is being checked, that revoked certificate will successfully pass the revocation check.

- There are a large number of revoked certificates or multiple CRLs. Caching a large CRL consumes large portions of Cisco IOS memory and may reduce resources available to other processes.
- CRLs expire frequently, causing the CDP to handle a larger load of CRLs.

**Note**

As of Cisco IOS Release 12.4(9)T or later, an administrator may configure CRL caching, either by disabling CRL caching completely or setting a maximum lifetime for a cached CRL per trustpoint.

## When to Use Certificate-Based ACLs for Authorization or Revocation

Certificates contain several fields that are used to determine whether a device or user is authorized to perform a specified action.

Because certificate-based ACLs are configured on the device, they do not scale well for large numbers of ACLs; however, certificate-based ACLs do provide very granular control of specific device behavior. Certificate-based ACLs are also leveraged by additional features to help determine when PKI components such as revocation, authorization, or a trustpoint should be used. They provide a general mechanism allowing users to select a specific certificate or a group of certificates that are being validated for either authorization or additional processing.

Certificate-based ACLs specify one or more fields within the certificate and an acceptable value for each specified field. You can specify which fields within a certificate should be checked and which values those fields may or may not have.

There are six logical tests for comparing the field with the value—equal, not equal, contains, does not contain, less than, and greater than or equal. If more than one field is specified within a single certificate-based ACL, the tests of all of the fields within the ACL must succeed to match the ACL. The same field may be specified multiple times within the same ACL. More than one ACL may be specified, and ACL will be processed in turn until a match is found or all of the ACLs have been processed.

## Ignore Revocation Checks Using a Certificate-Based ACL

Certificate-based ACLs can be configured to instruct your router to ignore the revocation check and expired certificates of a valid peer. Thus, a certificate that meets the specified criteria can be accepted regardless of the validity period of the certificate, or if the certificate meets the specified criteria, revocation checking does not have to be performed. You can also use a certificate-based ACL to ignore the revocation check when the communication with a AAA server is protected with a certificate.

### Ignoring Revocation Lists

To allow a trustpoint to enforce CRLs except for specific certificates, enter the **match certificate** command with the **skip revocation-check** keyword. This type of enforcement is most useful in a hub-and-spoke configuration in which you also want to allow direct spoke-to-spoke connections. In pure hub-and-spoke configurations, all spokes connect only to the hub, so CRL checking is necessary only on the hub. For one spoke to communicate directly with another spoke, the **match certificate** command with the **skip revocation-check** keyword can be used for neighboring peer certificates instead of requiring a CRL on each spoke.

### Ignoring Expired Certificates

To configure your router to ignore expired certificates, enter the **match certificate** command with the **allow expired-certificate** keyword. This command has the following purposes:

- If the certificate of a peer has expired, this command may be used to “allow” the expired certificate until the peer can obtain a new certificate.
- If your router clock has not yet been set to the correct time, the certificate of a peer will appear to be not yet valid until the clock is set. This command may be used to allow the certificate of the peer even though your router clock is not set.

**Note**

- If Network Time Protocol (NTP) is available only via the IPsec connection (usually via the hub in a hub-and-spoke configuration), the router clock can never be set. The tunnel to the hub cannot be “brought up” because the certificate of the hub is not yet valid.
- “Expired” is a generic term for a certificate that is expired or that is not yet valid. The certificate has a start and end time. An expired certificate, for purposes of the ACL, is one for which the current time of the router is outside the start and end times specified in the certificate.

**Skipping the AAA Check of the Certificate**

If the communication with an AAA server is protected with a certificate, and you want to skip the AAA check of the certificate, use the **match certificate** command with the **skip authorization-check** keyword. For example, if a virtual private network (VPN) tunnel is configured so that all AAA traffic goes over that tunnel, and the tunnel is protected with a certificate, you can use the **match certificate** command with the **skip authorization-check** keyword to skip the certificate check so that the tunnel can be established.

The **match certificate** command and the **skip authorization-check** keyword should be configured after PKI integration with an AAA server is configured.

**Note**

If the AAA server is available only via an IPsec connection, the AAA server cannot be contacted until after the IPsec connection is established. The IPsec connection cannot be “brought up” because the certificate of the AAA server is not yet valid.

## PKI Certificate Chain Validation

A certificate chain establishes a sequence of trusted certificates—from a peer certificate to the root CA certificate. Within a PKI hierarchy, all enrolled peers can validate the certificate of one another if the peers share a trusted root CA certificate or a common subordinate CA. Each CA corresponds to a trustpoint.

When a certificate chain is received from a peer, the default processing of a certificate chain path continues until the first trusted certificate, or trustpoint, is reached. In Cisco IOS Release 12.4(6)T and later releases, an administrator may configure the level to which a certificate chain is processed on all certificates including subordinate CA certificates.

Configuring the level to which a certificate chain is processed allows for the reauthentication of trusted certificates, the extension of a trusted certificate chain, and the completion of a certificate chain that contains a gap.

**Reauthentication of Trusted Certificates**

The default behavior is for the router to remove any trusted certificates from the certificate chain sent by the peer before the chain is validated. An administrator may configure certificate chain path processing so that the router does not remove CA certificates that are already trusted before chain validation, so that all certificates in the chain are re-authenticated for the current session.

### Extending the Trusted Certificate Chain

The default behavior is for the router to use its trusted certificates to extend the certificate chain if there are any missing certificates in the certificate chain sent by the peer. The router will validate only certificates in the chain sent by the peer. An administrator may configure certificate chain path processing so that the certificates in the peer's certificate chain and the router's trusted certificates are validated to a specified point.

### Completing Gaps in a Certificate Chain

An administrator may configure certificate chain processing so that if there is a gap in the configured Cisco IOS trustpoint hierarchy, certificates sent by the peer can be used to complete the set of certificates to be validated.

**Note**

If the trustpoint is configured to require parent validation and the peer does not provide the full certificate chain, the gap cannot be completed and the certificate chain is rejected and invalid.

**Note**

It is a configuration error if the trustpoint is configured to require parent validation and there is no parent trustpoint configured. The resulting certificate chain gap cannot be completed and the subordinate CA certificate cannot be validated. The certificate chain is invalid.

## How to Configure Authorization and Revocation of Certificates for Your PKI

This section contains the following procedures:

- [Configuring PKI Integration with a AAA Server, page 9](#)
- [Configuring a Revocation Mechanism for PKI Certificate Status Checking, page 13](#)
- [Configuring Certificate Authorization and Revocation Settings, page 16](#)
- [Configuring Certificate Chain Validation, page 25](#)

## Configuring PKI Integration with a AAA Server

Perform this task to generate a AAA username from the certificate presented by the peer and specify which fields within a certificate should be used to build the AAA database username.

### Restrictions When Using the Entire Subject Name for PKI Authorization

The following restrictions should be considered when using the **all** keyword as the subject name for the **authorization username** command:

- Some AAA servers limit the length of the username (for example, to 64 characters). As a result, the entire certificate subject name cannot be longer than the limitation of the server.
- Some AAA servers limit the available character set that may be used for the username (for example, a space [ ] and an equal sign [=] may not be acceptable). You cannot use the **all** keyword for a AAA server having such a character-set limitation.

- The **subject-name** command in the trustpoint configuration may not always be the final AAA subject name. If the fully qualified domain name (FQDN), serial number, or IP address of the router are included in a certificate request, the subject name field of the issued certificate will also have these components. To turn off the components, use the **fqdn**, **serial-number**, and **ip-address** commands with the **none** keyword.
- CA servers sometimes change the requested subject name field when they issue a certificate. For example, CA servers of some vendors switch the relative distinguished names (RDNs) in the requested subject names to the following order: CN, OU, O, L, ST, and C. However, another CA server might append the configured LDAP directory root (for example, O=cisco.com) to the end of the requested subject name.
- Depending on the tools you choose for displaying a certificate, the printed order of the RDNs in the subject name could be different. Cisco IOS software always displays the least significant RDN first, but other software, such as Open Source Secure Socket Layer (OpenSSL), does the opposite. Therefore, if you are configuring a AAA server with a full distinguished name (DN) (subject name) as the corresponding username, ensure that the Cisco IOS software style (that is, with the least significant RDN first) is used.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authorization network** *listname* [*method*]
5. **crypto pki trustpoint** *name*
6. **enrollment url** *url*
7. **revocation-check** *method*
8. **exit**
9. **authorization username** {*subjectname* *subjectname*}
10. **authorization list** *listname*
11. **tacacs-server host** *hostname* [**key** *string*]  
or  
**radius-server host** *hostname* [**key** *string*]

## DETAILED STEPS

|        | Command or Action                             | Purpose                                                                                                            |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
|        | <b>Example:</b><br>Router> enable             |                                                                                                                    |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                                                  |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                                                    |

|        | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>aaa new-model</b><br><br><b>Example:</b><br>Router(config)# aaa new-model                                                                    | Enables the AAA access control model.                                                                                                                                                                     |
| Step 4 | <b>aaa authorization network listname [method]</b><br><br><b>Example:</b><br>Router (config)# aaa authorization network<br>maxaaa group tacacs+ | Sets the parameters that restrict user access to a network. <ul style="list-style-type: none"> <li><i>method</i>—Can be <b>group radius</b>, <b>group tacacs+</b>, or <b>group group-name</b>.</li> </ul> |
| Step 5 | <b>crypto pki trustpoint name</b><br><br><b>Example:</b><br>Route (config)# crypto pki trustpoint msca                                          | Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.                                                                                                                     |
| Step 6 | <b>enrollment url url</b><br><br><b>Example:</b><br>Router (ca-trustpoint)# enrollment url<br>http://caserver.mycompany.com                     | Specifies the enrollment parameters of your CA. <ul style="list-style-type: none"> <li>The <i>url</i> argument is the URL of the CA to which your router should send certificate requests.</li> </ul>     |
| Step 7 | <b>revocation-check method</b><br><br><b>Example:</b><br>Router (ca-trustpoint)# revocation-check crl                                           | (Optional) Checks the revocation status of a certificate.                                                                                                                                                 |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router (ca-trustpoint)# exit                                                                              | Exits ca-trustpoint configuration mode and returns to global configuration mode.                                                                                                                          |

|         | Command or Action                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <p><b>authorization username</b> {<b>subjectname</b> <i>subjectname</i>}</p> <p><b>Example:</b><br/>Router (config)# authorization username <i>subjectname</i> <i>serialnumber</i></p>                                                                                                                                                                            | <p>Sets parameters for the different certificate fields that are used to build the AAA username.</p> <p>The <i>subjectname</i> argument can be any of the following:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Entire distinguished name (subject name) of the certificate.</li> <li>• <b>commonname</b>—Certification common name.</li> <li>• <b>country</b>—Certificate country.</li> <li>• <b>email</b>—Certificate e-mail.</li> <li>• <b>ipaddress</b>—Certificate IP address.</li> <li>• <b>locality</b>—Certificate locality.</li> <li>• <b>organization</b>—Certificate organization.</li> <li>• <b>organizationalunit</b>—Certificate organizational unit.</li> <li>• <b>postalcode</b>—Certificate postal code.</li> <li>• <b>serialnumber</b>—Certificate serial number.</li> <li>• <b>state</b>—Certificate state field.</li> <li>• <b>streetaddress</b>—Certificate street address.</li> <li>• <b>title</b>—Certificate title.</li> <li>• <b>unstructuredname</b>—Certificate unstructured name.</li> </ul> |
| Step 10 | <p><b>authorization list</b> <i>listname</i></p> <p><b>Example:</b><br/>Route (config)# authorization list maxaaa</p>                                                                                                                                                                                                                                             | Specifies the AAA authorization list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 11 | <p><b>tacacs-server host</b> <i>hostname</i> [<b>key</b> <i>string</i>]</p> <p><b>Example:</b><br/>Router(config)# tacacs-server host 192.0.2.2<br/>key a_secret_key</p> <p>or</p> <p><b>radius-server host</b> <i>hostname</i> [<b>key</b> <i>string</i>]</p> <p><b>Example:</b><br/>Router(config)# radius-server host 192.0.2.1<br/>key another_secret_key</p> | <p>Specifies a TACACS+ host.</p> <p>or</p> <p>Specifies a RADIUS host.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Troubleshooting Tips

To display debug messages for the trace of interaction (message type) between the CA and the router, use the **debug crypto pki transactions** command. (See the sample output, which shows a successful PKI integration with AAA server exchange and a failed PKI integration with AAA server exchange.)

### Successful Exchange

Router# **debug crypto pki transactions**

```
Apr 22 23:15:03.695: CRYPTO_PKI: Found a issuer match
Apr 22 23:15:03.955: CRYPTO_PKI: cert revocation status unknown.
Apr 22 23:15:03.955: CRYPTO_PKI: Certificate validated without revocation check
```

Each line that shows “CRYPTO\_PKI\_AAA” indicates the state of the AAA authorization checks. Each of the AAA AV pairs is indicated, and then the results of the authorization check are shown.

```
Apr 22 23:15:04.019: CRYPTO_PKI_AAA: checking AAA authorization (ipsecca_script_aaalist,
PKIAAA-L, <all>)
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute ("cert-application" = "all")
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute ("cert-trustpoint" = "CA1")
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute ("cert-serial" = "15DE")
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: authorization passed
Apr 22 23:12:30.327: CRYPTO_PKI: Found a issuer match
```

### Failed Exchange

Router# **debug crypto pki transactions**

```
Apr 22 23:11:13.703: CRYPTO_PKI_AAA: checking AAA authorization =
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: reply attribute ("cert-application" = "all")
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: reply attribute ("cert-trustpoint" = "CA1")
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: reply attribute ("cert-serial" = "233D")
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: parsed cert-lifetime-end as: 21:30:00
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: timezone specific extended
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: cert-lifetime-end is expired
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: cert-lifetime-end check failed.
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: authorization failed
```

In the above failed exchange, the certificate has expired.

## Configuring a Revocation Mechanism for PKI Certificate Status Checking

Perform this task to set up a CRL as the certificate revocation mechanism—CRLs or OCSP—that is used to check the status of certificates in a PKI.

### The revocation-check Command

Use the **revocation-check** command to specify at least one method (OCSP, CRL, or skip the revocation check) that is to be used to ensure that the certificate of a peer has not been revoked. For multiple methods, the order in which the methods are applied is determined by the order specified via this command.

If your router does not have the applicable CRL and is unable to obtain one or if the OCSP server returns an error, your router will reject the peer’s certificate—unless you include the **none** keyword in your configuration. If the **none** keyword is configured, a revocation check will not be performed and the certificate will always be accepted.

### Nonces and Peer Communications with OCSP Servers

When using OCSP, nonces, unique identifiers for OCSP requests, are sent by default during peer communications with your OCSP server. The use of nonces offers a more secure and reliable communication channel between the peer and OCSP server.

If your OCSP server does not support nonces, you may disable the sending of nonces. For more information, check your OCSP server documentation.

## Prerequisites

- Before issuing any client certificates, the appropriate settings on the server (such as setting the CDP) should be configured.
- When configuring an OCSP server to return the revocation status for a CA server, the OCSP server must be configured with an OCSP response signing certificate that is issued by that CA server. Ensure that the signing certificate is in the correct format, or the router will not accept the OCSP response. See your OCSP manual for additional information.

## Restrictions

- OCSP transports messages over HTTP, so there may be a time delay when you access the OCSP server.
- If the OCSP server depends on normal CRL processing to check revocation status, the same time delay that affects CRLs will also apply to OCSP.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint *name***
4. **ocsp url *url***
5. **revocation-check *method1* [*method2* [*method3*]]**
6. **ocsp disable-nonce**
7. **exit**
8. **exit**
9. **show crypto pki certificates**
10. **show crypto pki trustpoints [*status* | *label* [*status*]]**

## DETAILED STEPS

|--------|------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 3 | <b>crypto pki trustpoint name</b><br><br><b>Example:</b><br>Router(config)# crypto pki trustpoint hazel                            | Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.                                                                                                                                                                                                                                                                                                                                                                               |
| Step 4 | <b>ocsp url url</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# ocsp url<br>http://ocsp-server                                | (Optional) Specifies the URL of an OCSP server so that the trustpoint can check the certificate status. This URL will override the URL of the OCSP server (if one exists) in the Authority Info Access (AIA) extension of the certificate.                                                                                                                                                                                                                          |
| Step 5 | <b>revocation-check method1 [method2 [method3]]</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# revocation-check ocsp<br>none | Checks the revocation status of a certificate. <ul style="list-style-type: none"> <li><b>crl</b>—Certificate checking is performed by a CRL. This is the default option.</li> <li><b>none</b>—Certificate checking is ignored.</li> <li><b>ocsp</b>—Certificate checking is performed by an OCSP server.</li> </ul> If a second and third method are specified, each method will be used only if the previous method returns an error, such as a server being down. |
| Step 6 | <b>ocsp disable-nonce</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# ocsp disable-nonce                                      | (Optional) Specifies that a nonce, or an OCSP request unique identifier, will not be sent during peer communications with the OCSP server.                                                                                                                                                                                                                                                                                                                          |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# exit                                                                  | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|         | Command or Action                                                                                                          | Purpose                                                         |
|---------|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| Step 9  | <b>show crypto pki certificates</b><br><br><b>Example:</b><br>Router# show crypto pki certificates                         | (Optional) Displays information about your certificates.        |
| Step 10 | <b>show crypto pki trustpoints [status   label [status]]</b><br><br><b>Example:</b><br>Router# show crypto pki trustpoints | Displays information about the trustpoint configured in router. |

## Configuring Certificate Authorization and Revocation Settings

Perform this task to specify a certificate-based ACL, to ignore revocation checks or expired certificates, to manually override the default CDP location, to manually override the OCSP server setting, to configure CRL caching, or to set session acceptance or rejection based on a certificate serial number, as appropriate.

### Configuring Certificate-Based ACLs to Ignore Revocation Checks

To configure your router to use certificate-based ACLs to ignore revocation checks and expired certificates, perform the following steps:

- Identify an existing trustpoint or create a new trustpoint to be used when verifying the certificate of the peer. Authenticate the trustpoint if it has not already been authenticated. The router may enroll with this trustpoint if you want. Do not set optional CRLs for the trustpoint if you plan to use the **match certificate** command and **skip revocation-check** keyword.
- Determine the unique characteristics of the certificates that should not have their CRL checked and of the expired certificates that should be allowed.
- Define a certificate map to match the characteristics identified in the prior step.
- You can add the **match certificate** command and **skip revocation-check** keyword and the **match certificate command** and **allow expired-certificate** keyword to the trustpoint that was created or identified in the first step.

### Manually Overriding CDPs in a Certificate

Users can override the CDPs in a certificate with a manually configured CDP. Manually overriding the CDPs in a certificate can be advantageous when a particular server is unavailable for an extended period of time. The certificate's CDPs can be replaced with a URL or directory specification without reissuing all of the certificates that contain the original CDP.

### Manually Overriding the OCSP Server Setting in a Certificate

Administrators can override the OCSP server setting specified in the Authority Information Access (AIA) field of the client certificate or set by the issuing the **ocsp url** command. One or more OCSP servers may be manually specified, either per client certificate or per group of client certificates by the

**match certificate override ocs**p command. The **match certificate override ocs**p command overrides the client certificate AIA field or the **ocsp url** command setting if a client certificate is successfully matched to a certificate map during the revocation check.

**Note**

Only one OCSF server can be specified per client certificate.

## Configuring CRL Cache Control

By default, a new CRL will be downloaded after the currently cached CRL expires. Administrators can either configure the maximum amount of time in minutes a CRL remains in the cache by issuing the **crl cache delete-after** command or disable CRL caching by issuing the **crl cache none** command. Only the **crl-cache delete-after** command or the **crl-cache none** command may be specified. If both commands are entered for a trustpoint, the last command executed will take effect and a message will be displayed.

Neither the **crl-cache none** command nor the **crl-cache delete-after** command affects the currently cached CRL. If you configure the **crl-cache none** command, all CRLs downloaded after this command is issued will not be cached. If you configure the **crl-cache delete-after** command, the configured lifetime will only affect CRLs downloaded after this command is issued.

This functionality is useful is when a CA issues CRLs with no expiration date or with expiration dates days or weeks ahead.

## Configuring Certificate Serial Number Session Control

A certificate serial number can be specified to allow a certificate validation request to be accepted or rejected by the trustpoint for a session. A session may be rejected, depending on certificate serial number session control, even if a certificate is still valid. Certificate serial number session control may be configured by using either a certificate map with the **serial-number** field or an AAA attribute, with the **cert-serial-not** command.

Using certificate maps for session control allows an administrator to specify a single certificate serial number. Using the AAA attribute allows an administrator to specify one or more certificate serial numbers for session control.

## Prerequisites

- The trustpoint should be defined and authenticated before attaching certificate maps to the trustpoint.
- The certificate map must be configured before the CDP override feature can be enabled or the **serial-number** command is issued.
- The PKI and AAA server integration must be successfully completed to use AAA attributes as described in [“PKI and AAA Server Integration for Certificate Status.”](#)

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki certificate map** *label sequence-number*
4. *field-name match-criteria match-value*

5. **exit**
6. **crypto pki trustpoint** *name*
7. **crl-cache none**
8. **crl-cache delete-after** *time*
9. **match certificate** *certificate-map-label* [**allow expired-certificate** | **skip revocation-check** | **skip authorization-check**]
10. **match certificate** *certificate-map-label* **override cdp** {**url** | **directory**} *string*
11. **match certificate** *certificate-map-label* **override ocsp** [**trustpoint** *trustpoint-label*] *sequence-number* **url** *ocsp-url*
12. **exit**
13. **aaa new-model**
14. **aaa attribute list** *list-name*
15. **attribute type** {*name*} {*label*}
16. **exit**
17. **exit**
18. **show crypto pki certificates**

## DETAILED STEPS

|        | Command or Action                                                                                                                                      | Purpose                                                                                                                 |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                         | Enters global configuration mode.                                                                                       |
| Step 3 | <b>crypto pki certificate map</b> <i>label</i> <i>sequence-number</i><br><br><b>Example:</b><br>Router(config)# crypto pki certificate map<br>Group 10 | Defines values in a certificate that should be matched or not matched and enters ca-certificate-map configuration mode. |

|        | Command or Action                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Step 13 | <p><b>aaa new-model</b></p> <p><b>Example:</b><br/> Router(config)# aaa new-model</p>                                                                                                                                                                                                                                                      | (Optional) Enables the AAA access control model.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 14 | <p><b>aaa attribute list</b> <i>list-name</i></p> <p><b>Example:</b><br/> Router(config)# aaa attribute list crl</p>                                                                                                                                                                                                                       | (Optional) Defines an AAA attribute list locally on a router and enters config-attr-list configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|         | Command or Action                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------|-----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 15 | <b>attribute type</b> {name}{value}<br><br><b>Example:</b><br>Router(config-attr-list)# attribute type cert-serial-not 6C4A | (Optional) Defines an AAA attribute type that is to be added to an AAA attribute list locally on a router.<br><br>To configure certificate serial number session control, an administrator may specify a specific certificate in the <i>value</i> field to be accepted or rejected based on its serial number where <i>name</i> is set to <b>cert-serial-not</b> . If the serial number of the certificate matches the serial number specified by the attribute type setting, the certificate will be rejected.<br><br>For a full list of available AAA attribute types, execute the <b>show aaa attributes</b> command. |
| Step 16 | <b>exit</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# exit<br><br><b>Example:</b><br>Router(config-attr-list)# exit  | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 17 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 18 | <b>show crypto pki certificates</b><br><br><b>Example:</b><br>Router# show crypto pki certificates                          | (Optional) Displays the components of the certificates installed on the router if the CA certificate has been authenticated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Examples

The following is a sample OCSP response when signing a certificate. The OCSP-related extensions are in bold.

```
Certificate:
 Data:
 Version: v3
 Serial Number:0x14
 Signature Algorithm:MD5withRSA - 1.2.840.113549.1.1.4
 Issuer:CN=CA server,OU=PKI,O=Cisco Systems
 Validity:
 Not Before:Thursday, August 8, 2002 4:38:05 PM PST
 Not After:Tuesday, August 7, 2003 4:38:05 PM PST
 Subject:CN=OCSP server,OU=PKI,O=Cisco Systems
 Subject Public Key Info:
 Algorithm:RSA - 1.2.840.113549.1.1.1
 Public Key:
 Exponent:65537
 Public Key Modulus:(1024 bits) :
 <snip>

 Extensions:
 Identifier:Subject Key Identifier - 2.5.29.14
 Critical:no
```

```

Key Identifier:
 <snip>
Identifier:Authority Key Identifier - 2.5.29.35
Critical:no
Key Identifier:
 <snip>

Identifier:OCSP NoCheck:- 1.3.6.1.5.5.7.48.1.5
Critical:no
Identifier:Extended Key Usage:- 2.5.29.37
Critical:no
Extended Key Usage:
 OCSPSigning
Identifier:CRL Distribution Points - 2.5.29.31
Critical:no
Number of Points:1
Point 0
 Distribution Point:
[URIName:ldap://CA-server/CN=CA server,OU=PKI,O=Cisco Systems]
Signature:
 Algorithm:MD5withRSA - 1.2.840.113549.1.1.4
Signature:
 <snip>

```

The following example shows an excerpt of the running configuration output when adding a **match certificate override ocs** command to the beginning of an existing sequence:

```

match certificate map3 override ocs 5 url http://192.0.2.3/
show running-configuration
.
.
.
 match certificate map3 override ocs 5 url http://192.0.2.3/
 match certificate map1 override ocs 10 url http://192.0.2.1/
 match certificate map2 override ocs 15 url http://192.0.2.2/

```

The following example shows an excerpt of the running configuration output when an existing **match certificate override ocs** command is replaced and a trustpoint is specified to use an alternative PKI hierarchy:

```

match certificate map4 override ocs trustpoint tp4 10 url http://192.0.2.4/newvalue
show running-configuration
.
.
.
 match certificate map3 override ocs trustpoint tp3 5 url http://192.0.2.3/
 match certificate map1 override ocs trustpoint tp1 10 url http://192.0.2.1/
 match certificate map4 override ocs trustpoint tp4 10 url
 http://192.0.2.4/newvalue
 match certificate map2 override ocs trustpoint tp2 15 url http://192.0.2.2/

```

## Troubleshooting Tips

If you ignored revocation check or expired certificates, you should carefully check your configuration. Verify that the certificate map properly matches either the certificate or certificates that should be allowed or the AAA checks that should be skipped. In a controlled environment, try modifying the certificate map and determine what is not working as expected.

## Configuring Certificate Chain Validation

Perform this task to configure the processing level for the certificate chain path of your peer certificates.

### Prerequisites

- The device must be enrolled in your PKI hierarchy.
- The appropriate key pair must be associated with the certificate.

### Restrictions

- A trustpoint associated with the root CA cannot be configured to be validated to the next level.

The **chain-validation** command is configured with the **continue** keyword for the trustpoint associated with the root CA, an error message will be displayed and the chain validation will revert to the default **chain-validation** command setting.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **chain-validation** [{**stop** | **continue**} [*parent-trustpoint*]]
5. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 3 | <b>crypto pki trustpoint name</b><br><br><b>Example:</b><br>Router(config)# crypto pki trustpoint ca-sub1                                                                         | Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 4 | <b>chain-validation</b> [{ <b>stop</b>   <b>continue</b> }<br>[ <i>parent-trustpoint</i> ]]<br><br><b>Example:</b><br>Router(ca-trustpoint)# chain-validation<br>continue ca-sub1 | Configures the level to which a certificate chain is processed on all certificates including subordinate CA certificates. <ul style="list-style-type: none"><li>Use the <b>stop</b> keyword to specify that the certificate is already trusted. This is the default setting.</li><li>Use the <b>continue</b> keyword to specify that the subordinate CA certificate associated with the trustpoint must be validated.</li><li>The <i>parent-trustpoint</i> argument specifies the name of the parent trustpoint the certificate must be validated against.</li></ul> |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# exit                                                                                                                 | Returns to global configuration mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Configuration Examples for Setting Up Authorization and Revocation of Certificates

This section contains the following configuration examples:

- [Configuring and Verifying PKI AAA Authorization: Examples, page 27](#)
- [Configuring a Revocation Mechanism: Examples, page 31](#)
- [Configuring a Hub Router at a Central Site for Certificate Revocation Checks: Example, page 32](#)
- [Configuring Certificate Authorization and Revocation Settings: Examples, page 36](#)
- [Configuring Certificate Chain Validation: Examples, page 38](#)

## Configuring and Verifying PKI AAA Authorization: Examples

This section provides configuration examples of PKI AAA authorizations:

- [Router Configuration: Example, page 27](#)
- [Debug of a Successful PKI AAA Authorization: Example, page 29](#)
- [Debugs of a Failed PKI AAA Authorization: Example, page 30](#)

### Router Configuration: Example

The following **show running-config** command output shows the working configuration of a router that is set up to authorize VPN connections using the PKI Integration with AAA Server feature:

```
Router# show running-config

## Debug of a Successful PKI AAA Authorization: Example

The following **show debugging** command output shows a successful authorization using the PKI Integration with AAA Server feature:

Router# **show debugging**

General OS:

```

TACACS access control debugging is on
AAA Authentication debugging is on
AAA Authorization debugging is on

```

Cryptographic Subsystem:

Crypto PKI Trans debugging is on

Router#

```

## Debugs of a Failed PKI AAA Authorization: Example

The following **show debugging** command output shows that the router is not authorized to connect using VPN. The messages are typical of those that you might see in such a situation.

In this example, the peer username was configured as not authorized, by moving the username to a Cisco Secure ACS group called VPN\_Router\_Disabled in Cisco Secure ACS. The router, router7200.company.com, has been configured to check with a Cisco Secure ACS AAA server prior to establishing a VPN connection to any peer.

Router# **show debugging**

General OS:

TACACS access control debugging is on  
AAA Authentication debugging is on  
AAA Authorization debugging is on

## Configuring a Revocation Mechanism: Examples

This section contains the following configuration examples that can be used when specifying a revocation mechanism for your PKI:

- [Configuring an OCSP Server: Example, page 31](#)
- [Specifying a CRL and Then an OCSP Server: Example, page 31](#)
- [Specifying an OCSP Server: Example, page 31](#)
- [Disabling Nonces in Communications with the OCSP Server: Example, page 32](#)

### Configuring an OCSP Server: Example

The following example shows how to configure the router to use the OCSP server that is specified in the AIA extension of the certificate:

```

Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# revocation-check ocsp

```

### Specifying a CRL and Then an OCSP Server: Example

The following example shows how to configure the router to download the CRL from the CDP. If the CRL is unavailable, the OCSP server that is specified in the AIA extension of the certificate will be used. If both options fail, certificate verification will also fail.

```

Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# revocation-check crl ocsp

```

### Specifying an OCSP Server: Example

The following example shows how to configure your router to use the OCSP server at the HTTP URL “http://myocspserver:81.” If the server is down, the revocation check will be ignored.

```
Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# ocsf url http://myocspserver:81
Router(ca-trustpoint)# revocation-check ocsf none
```

## Disabling Nonces in Communications with the OCSP Server: Example

The following example shows communications when a nonce, or a unique identifier for the OCSP request, is disabled for communications with the OCSP server:

```
Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# ocsf url http://myocspserver:81
Router(ca-trustpoint)# revocation-check ocsf none
Router(ca-trustpoint)# ocsf disable-nonce
```

## Configuring a Hub Router at a Central Site for Certificate Revocation Checks: Example

The following example shows a hub router at a central site that is providing connectivity for several branch offices to the central site.

The branch offices are also able to communicate directly with each other using additional IPSec tunnels between the branch offices.

The CA publishes CRLs on an HTTP server at the central site. The central site checks CRLs for each peer when setting up an IPSec tunnel with that peer.

The example does not show the IPSec configuration—only the PKI-related configuration is shown.

### Home Office Hub Configuration

```
crypto pki trustpoint VPN-GW
enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
serial-number none
fqdn none
ip-address none
subject-name o=Home Office Inc,cn=Central VPN Gateway
revocation-check crl
```

### Central Site Hub Router

```
Router# show crypto ca certificate
```

```
Certificate
 Status: Available
 Certificate Serial Number: 2F62BE1400000000CA0
 Certificate Usage: General Purpose
 Issuer:
 cn=Central Certificate Authority
 o=Home Office Inc
 Subject:
 Name: Central VPN Gateway
 cn=Central VPN Gateway
 o=Home Office Inc
 CRL Distribution Points:
 http://ca.home-office.com/CertEnroll/home-office.crl
 Validity Date:
 start date: 00:43:26 GMT Sep 26 2003
 end date: 00:53:26 GMT Sep 26 2004
 renew date: 00:00:00 GMT Jan 1 1970
 Associated Trustpoints: VPN-GW
```

```

CA Certificate
 Status: Available
 Certificate Serial Number: 1244325DE0369880465F977A18F61CA8
 Certificate Usage: Signature
 Issuer:
 cn=Central Certificate Authority
 o=Home Office Inc
 Subject:
 cn=Central Certificate Authority
 o=Home Office Inc
 CRL Distribution Points:
 http://ca.home-office.com/CertEnroll/home-office.crl
 Validity Date:
 start date: 22:19:29 GMT Oct 31 2002
 end date: 22:27:27 GMT Oct 31 2017
 Associated Trustpoints: VPN-GW

```

### Trustpoint on the Branch Office Router

```

crypto pki trustpoint home-office
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none

ip-address none
subject-name o=Home Office Inc,cn=Branch 1
revocation-check crl

```

A certificate map is entered on the branch office router.

#### Router# configure terminal

Enter configuration commands, one per line. End with CNTL/Z.

```

branch1(config)# crypto pki certificate map central-site 10
branch1(ca-certificate-map)#

```

The output from the **show certificate** command on the central site hub router shows that the certificate was issued by the following:

cn=Central Certificate Authority

o=Home Office Inc

These two lines are combined into one line using a comma (,) to separate them, and the original lines are added as the first criteria for a match.

```

Router (ca-certificate-map)# issuer-name co cn=Central Certificate Authority, ou=Home
Office Inc

```

!The above line wrapped but should be shown on one line with the line above it.

The same combination is done for the subject name from the certificate on the central site router (note that the line that begins with “Name:” is not part of the subject name and must be ignored when creating the certificate map criteria). This is the subject name to be used in the certificate map.

cn=Central VPN Gateway

o=Home Office Inc

```

Router (ca-certificate-map)# subject-name eq cn=central vpn gateway, o=home office inc

```

Now the certificate map is added to the trustpoint that was configured earlier.

```

Router (ca-certificate-map)# crypto pki trustpoint home-office
Router (ca-trustpoint)# match certificate central-site skip revocation-check
Router (ca-trustpoint)# exit
Router (config)# exit

```

The configuration is checked (most of configuration is not shown).

```
Router# write term
!Many lines left out
.
.
.
crypto pki trustpoint home-office
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none
 ip-address none
 subject-name o=Home Office Inc,cn=Branch 1
 revocation-check crl
 match certificate central-site skip revocation-check
!
!
crypto pki certificate map central-site 10
 issuer-name co cn = Central Certificate Authority, ou = Home Office Inc
 subject-name eq cn = central vpn gateway, o = home office inc
!many lines left out
```

Note that the issuer-name and subject-name lines have been reformatted to make them consistent for later matching with the certificate of the peer.

If the branch office is checking the AAA, the trustpoint will have lines similar to the following:

```
crypto pki trustpoint home-office
 auth list allow_list
 auth user subj commonname
```

After the certificate map has been defined as was done above, the following command is added to the trustpoint to skip AAA checking for the central site hub.

```
match certificate central-site skip authorization-check
```

In both cases, the branch site router has to establish an IPSec tunnel to the central site to check CRLs or to contact the AAA server. However, without the **match certificate** command and **central-site skip authorization-check (argument and keyword)**, the branch office cannot establish the tunnel until it has checked the CRL or the AAA server. (The tunnel will not be established unless the **match certificate** command and **central-site skip authorization-check** argument and keyword are used.)

The **match certificate** command and **allow expired-certificate** keyword would be used at the central site if the router at a branch site had an expired certificate and it had to establish a tunnel to the central site to renew its certificate.

#### Trustpoint on the Central Site Router

```
crypto pki trustpoint VPN-GW
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none
 ip-address none
 subject-name o=Home Office Inc,cn=Central VPN Gateway
 revocation-check crl
```

#### Trustpoint on the Branch 1 Site Router

```
Router# show crypto ca certificate
```

```
Certificate
 Status: Available
 Certificate Serial Number: 2F62BE1400000000CA0
```

```

Certificate Usage: General Purpose
Issuer:
 cn=Central Certificate Authority
 o=Home Office Inc
Subject:
 Name: Branch 1 Site
 cn=Branch 1 Site
 o=Home Office Inc
CRL Distribution Points:
 http://ca.home-office.com/CertEnroll/home-office.crl
Validity Date:
 start date: 00:43:26 GMT Sep 26 2003
 end date: 00:53:26 GMT Oct 3 2003
 renew date: 00:00:00 GMT Jan 1 1970
Associated Trustpoints: home-office
CA Certificate
Status: Available
Certificate Serial Number: 1244325DE0369880465F977A18F61CA8
Certificate Usage: Signature
Issuer:
 cn=Central Certificate Authority
 o=Home Office Inc
Subject:
 cn=Central Certificate Authority
 o=Home Office Inc
CRL Distribution Points:
 http://ca.home-office.com/CertEnroll/home-office.crl
Validity Date:
 start date: 22:19:29 GMT Oct 31 2002
 end date: 22:27:27 GMT Oct 31 2017
Associated Trustpoints: home-office

```

A certificate map is entered on the central site router.

```

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router (config)# crypto pki certificate map branch1 10
Router (ca-certificate-map)# issuer-name co cn=Central Certificate Authority, ou=Home Office Inc
!The above line wrapped but should be part of the line above it.
Router (ca-certificate-map)# subject-name eq cn=Branch 1 Site,o=home office inc

```

The certificate map is added to the trustpoint.

```

Router (ca-certificate-map)# crypto pki trustpoint VPN-GW
Router (ca-trustpoint)# match certificate branch1 allow expired-certificate
Router (ca-trustpoint)# exit
Router (config) #exit

```

The configuration should be checked (most of the configuration is not shown).

```

Router# write term

!many lines left out

crypto pki trustpoint VPN-GW
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none
 ip-address none
 subject-name o=Home Office Inc,cn=Central VPN Gateway
 revocation-check crl
 match certificate branch1 allow expired-certificate
!
!

```

```
crypto pki certificate map central-site 10
 issuer-name co cn = Central Certificate Authority, ou = Home Office Inc
 subject-name eq cn = central vpn gateway, o = home office inc
! many lines left out
```

The **match certificate** command and **branch1 allow expired-certificate** (argument and keyword) and the certificate map should be removed as soon as the branch router has a new certificate.

## Configuring Certificate Authorization and Revocation Settings: Examples

This section contains the following configuration examples that can be used when specifying a CRL cache control setting or certificate serial number session control:

- [Configuring CRL Cache Control, page 36](#)
- [Configuring Certificate Serial Number Session Control, page 37](#)

### Configuring CRL Cache Control

The following example shows how to disable CRL caching for all CRLs associated with the CA1 trustpoint:

```
crypto pki trustpoint CA1
 enrollment url http://CA1:80
 ip-address FastEthernet0/0
 crl query ldap://ldap_CA1
 revocation-check crl
 crl-cache none
```

The current CRL is still cached immediately after executing the example configuration shown above:

```
Router# show crypto pki crls
CRL Issuer Name:
 cn=name Cert Manager,ou=pki,o=company.com,c=US
 LastUpdate: 18:57:42 GMT Nov 26 2005
 NextUpdate: 22:57:42 GMT Nov 26 2005
 Retrieved from CRL Distribution Point:
 ldap://ldap.company.com/CN=name Cert Manager,O=company.com
```

When the current CRL expires, a new CRL is then downloaded to the router at the next update. The **crl-cache none** command takes effect and all CRLs for the trustpoint are no longer cached; caching is disabled. You can verify that no CRL is cached by executing the **show crypto pki crls** command. No output will be shown because there are no CRLs cached.

The following example shows how to configure the maximum lifetime of 2 minutes for all CRLs associated with the CA1 trustpoint:

```
crypto pki trustpoint CA1
 enrollment url http://CA1:80
 ip-address FastEthernet0/0
 crl query ldap://ldap_CA1
 revocation-check crl
 crl-cache delete-after 2
```

The current CRL is still cached immediately after executing the example configuration above for setting the maximum lifetime of a CRL:

```
Router# show crypto pki crls
CRL Issuer Name:
 cn=name Cert Manager,ou=pki,o=company.com,c=US
```

```
LastUpdate: 18:57:42 GMT Nov 26 2005
NextUpdate: 22:57:42 GMT Nov 26 2005
Retrieved from CRL Distribution Point:
 ldap://ldap.company.com/CN=name Cert Manager,O=company.com
```

When the current CRL expires, a new CRL is downloaded to the router at the next update and the **crl-cache delete-after** command takes effect. This newly cached CRL and all subsequent CRLs will be deleted after a maximum lifetime of 2 minutes.

You can verify that the CRL will be cached for 2 minutes by executing the **show crypto pki crls** command. Note that the NextUpdate time is 2 minutes after the LastUpdate time.

```
Router# show crypto pki crls

CRL Issuer Name:
 cn=name Cert Manager,ou=pki,o=company.com,c=US
 LastUpdate: 22:57:42 GMT Nov 26 2005

 NextUpdate: 22:59:42 GMT Nov 26 2005
 Retrieved from CRL Distribution Point:
 ldap://ldap.company.com/CN=name Cert Manager,O=company.com
```

## Configuring Certificate Serial Number Session Control

The following example shows the configuration of certificate serial number session control using a certificate map for the CA1 trustpoint:

```
crypto pki trustpoint CA1
 enrollment url http://CA1
 chain-validation stop
 crl query ldap://ldap_server
 revocation-check crl
 match certificate crl
!
crypto pki certificate map crl 10
 serial-number co 279d
```

### Note

If the *match-criteria* value is set to **eq** (equal) instead of **co** (contains), the serial number must match the certificate map serial number *exactly*, including any spaces.

The following example shows the configuration of certificate serial number session control using AAA attributes. In this case, all valid certificates will be accepted if the certificate does not have the serial number “4ACA.”

```
crypto pki trustpoint CA1
 enrollment url http://CA1
 ip-address FastEthernet0/0
 crl query ldap://ldap_CA1
 revocation-check crl
 aaa new-model
!
aaa attribute list crl
attribute-type aaa-cert-serial-not 4ACA
```

The server log shows that the certificate with the serial number “4ACA” was rejected. The certificate rejection is shown in bold.

```
.
.
.
```

```

## Configuring Certificate Chain Validation: Examples

This section contains the following configuration examples that can be used to specify the level of certificate chain processing for your device certificates:

- [Configuring Certificate Chain Validation from Peer to Root CA, page 38](#)
- [Configuring Certificate Chain Validation from Peer to Subordinate CA, page 39](#)
- [Configuring Certificate Chain Validation Through a Gap, page 39](#)

### Configuring Certificate Chain Validation from Peer to Root CA

In the following configuration example, all of the certificates will be validated—the peer, SubCA11, SubCA1, and RootCA certificates.

```

crypto pki trustpoint RootCA
 enrollment terminal
 chain-validation stop
 revocation-check none
 rsakeypair RootCA

crypto pki trustpoint SubCA1
 enrollment terminal
 chain-validation continue RootCA
 revocation-check none

```

```
rsa-keypair SubCA1

crypto pki trustpoint SubCA11
 enrollment terminal
 chain-validation continue SubCA1
 revocation-check none
 rsa-keypair SubCA11
```

## Configuring Certificate Chain Validation from Peer to Subordinate CA

In the following configuration example, the following certificates will be validated—the peer and SubCA1 certificates.

```
crypto pki trustpoint RootCA
 enrollment terminal
 chain-validation stop
 revocation-check none
 rsa-keypair RootCA

crypto pki trustpoint SubCA1
 enrollment terminal
 chain-validation continue RootCA
 revocation-check none
 rsa-keypair SubCA1

crypto pki trustpoint SubCA11
 enrollment terminal
 chain-validation continue SubCA1
 revocation-check none
 rsa-keypair SubCA11
```

## Configuring Certificate Chain Validation Through a Gap

In the following configuration example, SubCA1 is not in the configured Cisco IOS hierarchy but is expected to have been supplied in the certificate chain presented by the peer.

If the peer supplies the SubCA1 certificate in the presented certificate chain, the following certificates will be validated—the peer, SubCA11, and SubCA1 certificates.

If the peer does not supply the SubCA1 certificate in the presented certificate chain, the chain validation will fail.

```
crypto pki trustpoint RootCA
 enrollment terminal
 chain-validation stop
 revocation-check none
 rsa-keypair RootCA

crypto pki trustpoint SubCA11
 enrollment terminal
 chain-validation continue RootCA
 revocation-check none
 rsa-keypair SubCA11
```

## Additional References

The following sections provide references related to PKI certificate authorization and revocation.

## Feature Information for Certificate Authorization and Revocation

Table 2 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For details on when support for a specific command was introduced, see the command reference documentation. For information on a feature in this technology that is not documented here, see the Implementing and Managing PKI Features Roadmap.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

### Note

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2**      **Feature Information for PKI Certificate Authorization and Revocation**

| Feature Name                                                  | Software Releases | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache Control Enhancements for Certification Revocation Lists | 12.4(9)T          | <p>This feature provides users the ability to disable CRL caching or to specify the maximum lifetime for which a CRL will be cached in router memory. It also provides functionality to configure certificate serial number session control.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">What Is a CRL?</a></li> <li>• <a href="#">Configuring Certificate Authorization and Revocation Settings</a></li> <li>• <a href="#">Configuring Certificate Authorization and Revocation Settings: Examples</a></li> </ul> <p>The following commands were introduced or modified by this feature: <b>crl-cache delete-after</b>, <b>crl-cache none</b>, <b>crypto pki certificate map</b></p> |
| Certificate-Complete Chain Validation                         | 12.4(6)T          | <p>This feature provides users the ability to configure the level to which a certificate chain is processed on all certificates including subordinate CA certificates.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">PKI Certificate Chain Validation</a></li> <li>• <a href="#">Configuring Certificate Chain Validation</a></li> <li>• <a href="#">Configuring Certificate Chain Validation: Examples</a></li> </ul> <p>The following command was introduced by this feature: <b>chain-validation</b></p>                                                                                                                                                                             |
| OCSP - Server Certification from Alternate Hierarchy          | 12.4(6)T          | <p>This feature provides users with the flexibility to specify multiple OCSP servers, either per client certificate or per group of client certificates, and provides the capability for OCSP server validation based on external CA certificates or self-signed certificates.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">What Is OCSP?</a></li> <li>• <a href="#">Configuring Certificate Authorization and Revocation Settings</a></li> </ul> <p>The following command was introduced by this feature: <b>match certificate override ocsp</b></p>                                                                                                                                  |

**Table 2** *Feature Information for PKI Certificate Authorization and Revocation (continued)*

| Feature Name                                        | Software Releases      | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Optional OCSP Nonce                                 | 12.2(33)SR<br>12.4(4)T | <p>This feature provides users with the ability to configure the sending of a nonce, or unique identifier for an OCSP request, during OCSP communications.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">What Is OCSP?</a></li> <li>• <a href="#">Configuring a Revocation Mechanism for PKI Certificate Status Checking</a></li> <li>• <a href="#">Disabling Nonces in Communications with the OCSP Server: Example</a></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                 |
| Certificate Security Attribute-Based Access Control | 12.2(15)T              | <p>Under the IPsec protocol, CA interoperability permits Cisco IOS devices and a CA to communicate so that the Cisco IOS device can obtain and use digital certificates from the CA. Certificates contain several fields that are used to determine whether a device or user is authorized to perform a specified action. This feature adds fields to the certificate that allow specifying an ACL, creating a certificate-based ACL.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">When to Use Certificate-Based ACLs for Authorization or Revocation</a></li> <li>• <a href="#">Configuring Certificate Authorization and Revocation Settings</a></li> </ul> <p>The following commands were introduced or modified by this feature: <b>crypto pki certificate map</b>, <b>crypto pki trustpoint</b>, <b>match certificate</b></p> |
| Online Certificate Status Protocol (OCSP)           | 12.3(2)T               | <p>This feature allows users to enable OCSP instead of CRLs to check certificate status. Unlike CRLs, which provide only periodic certificate status, OCSP can provide timely information regarding the status of a certificate.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">CRLs or OCSP Server: Choosing a Certificate Revocation Mechanism</a></li> <li>• <a href="#">Configuring a Revocation Mechanism for PKI Certificate Status Checking</a></li> </ul> <p>The following commands were introduced by this feature: <b>ocsp url</b>, <b>revocation-check</b></p>                                                                                                                                                                                                                                                            |

**Table 2**      **Feature Information for PKI Certificate Authorization and Revocation (continued)**

| Feature Name                                                    | Software Releases | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PKI AAA Authorization Using the Entire Subject Name             | 12.3(11)T         | <p>This feature provides users with the ability to query the AAA server using the entire subject name from the certificate as a unique AAA username.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Attribute-Value Pairs for PKI and AAA Server Integration</a></li> <li>• <a href="#">Configuring PKI Integration with a AAA Server</a></li> </ul> <p>The following command was modified by this feature:<br/><b>authorization username</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PKI Integration with AAA Server                                 | 12.3(1)           | <p>This feature provides additional scalability for authorization by generating a AAA username from the certificate presented by the peer. A AAA server is queried to determine whether the certificate is authorized for use by the internal component. The authorization is indicated by a component-specified label that must be present in the AV pair for the user.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">PKI and AAA Server Integration for Certificate Status</a></li> <li>• <a href="#">Configuring PKI Integration with a AAA Server</a></li> </ul> <p>The following commands were introduced by this feature:<br/><b>authorization list, authorization username</b></p>                                                                                                                                                                                                     |
| PKI: Query Multiple Servers During Certificate Revocation Check | 12.3(7)T          | <p>This feature introduces the ability for Cisco IOS software to make multiple attempts to retrieve the CRL, allowing operations to continue when a particular server is not available. In addition, the ability to override the CDPs in a certificate with a manually configured CDP has been introduced. Manually overriding the CDPs in a certificate can be advantageous when a particular server is unavailable for an extended period of time. The certificate's CDPs can be replaced with a URL or directory specification without reissuing all of the certificates that contain the original CDP.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Querying All CDPs During Revocation Check</a></li> <li>• <a href="#">Manually Overriding CDPs in a Certificate</a></li> </ul> <p>The following command was introduced by this feature:<br/><b>match certificate override cdp</b></p> |

**Table 2** *Feature Information for PKI Certificate Authorization and Revocation (continued)*

| Feature Name                                                               | Software Releases        | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PKI: Query Multiple Servers During Certificate Revocation Check            | 12.3(7)T                 | <p>This feature introduces the ability for Cisco IOS software to make multiple attempts to retrieve the CRL, allowing operations to continue when a particular server is not available. In addition, the ability to override the CDPs in a certificate with a manually configured CDP has been introduced. Manually overriding the CDPs in a certificate can be advantageous when a particular server is unavailable for an extended period of time. The certificate's CDPs can be replaced with a URL or directory specification without reissuing all of the certificates that contain the original CDP.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li><a href="#">Querying All CDPs During Revocation Check</a></li> <li><a href="#">Manually Overriding CDPs in a Certificate</a></li> </ul> <p>The following command was introduced by this feature:<br/><b>match certificate override cdp</b></p> |
| Using Certificate ACLs to Ignore Revocation Check and Expired Certificates | 12.3(4)T                 | <p>This feature allows a certificate that meets specified criteria to be accepted regardless of the validity period of the certificate, or if the certificate meets the specified criteria, revocation checking does not have to be performed. Certificate ACLs are used to specify the criteria that the certificate must meet to be accepted or to avoid revocation checking. In addition, if AAA communication is protected by a certificate, this feature provides for the AAA checking of the certificate to be ignored.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li><a href="#">Ignore Revocation Checks Using a Certificate-Based ACL</a></li> <li><a href="#">Configuring Certificate-Based ACLs to Ignore Revocation Checks</a></li> </ul> <p>The following command was modified by this feature:<br/><b>match certificate</b></p>                                                           |
| Certificate - Security Attribute-Based Access Control                      | Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OCSP (Online Certificate Status Protocol)                                  | Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Optional OCSP Nonce                                                        | Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 2** *Feature Information for PKI Certificate Authorization and Revocation (continued)*

| Feature Name                                               | Software Releases        | Feature Configuration Information                             |
|------------------------------------------------------------|--------------------------|---------------------------------------------------------------|
| PKI AAA Authorization Using the Entire Subject Name        | Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers. |

# Configuring Certificate Enrollment for a PKI

---

**First Published: May 2, 2005**

**Last Updated: August 21, 2007**

Certificate enrollment, which is the process of obtaining a certificate from a certification authority (CA), occurs between the end host that requests the certificate and the CA. Each peer that participates in the public key infrastructure (PKI) must enroll with a CA. This module describes the different methods available for certificate enrollment and how to set up each method for a participating PKI peer.

## **Finding Feature Information in This Module**

*Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for PKI Certificate Enrollment](#)” section on page 34.*

## **Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Prerequisites for PKI Certificate Enrollment

Before configuring peers for certificate enrollment, you should have the following items:

- A generated Rivest, Shamir, and Adelman (RSA) key pair to enroll and a PKI in which to enroll.
- Your CA should be authenticated.
- Familiarity with the module “Cisco IOS PKI Overview: Understanding and Planning a PKI.”

**Note**

As of Cisco IOS Release 12.3(7)T, all commands that begin with “**crypto ca**” have been changed to begin with “**crypto pki**.” Although the router will still accept **crypto ca** commands, all output will be read back as **crypto pki**.

## Information About Certificate Enrollment for a PKI

Before configuring peers to request a certificate and enroll in the PKI, you should understand the following concepts:

- [What Are CAs?, page 2](#)
- [Authentication of the CA, page 3](#)
- [Supported Certificate Enrollment Methods, page 3](#)
- [Registration Authorities \(RA\), page 4](#)
- [Automatic Certificate Enrollment, page 4](#)
- [Certificate Enrollment Profiles, page 5](#)

## What Are CAs?

A CA manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use the Cisco IOS certificate server or a CA provided by a third-party CA vendor.

## Hierarchical PKI: Multiple CAs

A PKI can be set up in a hierarchical framework to support multiple CAs. At the top of the hierarchy is a root CA, which holds a self-signed certificate. The trust within the entire hierarchy is derived from the RSA key pair of the root CA. The subordinate CAs within the hierarchy can be enrolled with either the root CA or with another subordinate CA. Multiple tiers of CAs are configured by either the root CA or with another subordinate CA. Within a hierarchical PKI, all enrolled peers, can validate the certificate of one another if the peers share a trusted root CA certificate or a common subordinate CA.

### When to Use Multiple CAs

Multiple CAs provide users with added flexibility and reliability. For example, subordinate CAs can be placed in branch offices while the root CA is at the office headquarters. Also, different granting policies can be implemented per CA, so you can set up one CA to automatically grant certificate requests while another CA within the hierarchy requires each certificate request to be manually granted.

Scenarios in which at least a two-tier CA is recommended are as follows:

- Large and very active networks in which a large number of certificates are revoked and reissued. A multiple tier CA helps to control the size of the certificate revocation lists (CRLs).
- When online enrollment protocols are used, the root CA can be kept offline except to issue subordinate CA certificates. This scenario provides added security for the root CA.

## Authentication of the CA

The certificate of the CA must be authenticated before the device will be issued its own certificate and before certificate enrollment can occur. Authentication of the CA typically occurs only when you initially configure PKI support at your router. To authenticate the CA, issue the **crypto pki authenticate** command, which authenticates the CA to your router by obtaining the self-signed certificate of the CA that contains the public key of the CA.

### Authentication via the fingerprint Command

After Cisco IOS Release 12.3(12), you can issue the **fingerprint** command to preenter a fingerprint that can be matched against the fingerprint of a CA certificate during authentication.

If a fingerprint is not preentered for a trustpoint, and if the authentication request is interactive, you must verify the fingerprint that is displayed during authentication of the CA certificate. If the authentication request is noninteractive, the certificate will be rejected without a preentered fingerprint.

#### Note

If the authentication request is made using the command-line interface (CLI), the request is an interactive request. If the authentication request is made using HTTP or another management tool, the request is a noninteractive request.

## Supported Certificate Enrollment Methods

Cisco IOS software supports the following methods to obtain a certificate from a CA:

- Simple Certificate Enrollment Protocol (SCEP)—A Cisco developed enrollment protocol that uses HTTP to communicate with the CA or registration authority (RA). SCEP is the most commonly used method for sending and receiving requests and certificates.

#### Note

To take advantage of automated certificate and key rollover functionality, you must be running a CA that supports rollover and SCEP must be used as your client enrollment method.

If you are running a Cisco IOS CA, you must be running Cisco IOS Release 12.4(2)T or a later release for rollover support.

- PKCS12—The router imports certificates in PKCS12 format from an external server.
- IOS File System (IFS)—The router uses any file system that is supported by Cisco IOS software (such as TFTP, FTP, flash, and NVRAM) to send a certificate request and to receive the issued certificate. Users may enable IFS certificate enrollment when their CA does not support SCEP.

**Note** Prior to Cisco IOS Release 12.3(4)T, only the TFTP file system is supported within IFS.

- Manual cut-and-paste—The router displays the certificate request on the console terminal, allowing the user to enter the issued certificate on the console terminal. A user may manually cut-and-paste certificate requests and certificates when there is no network connection between the router and CA.
- Enrollment profiles—The router sends HTTP-based enrollment requests directly to the CA server instead of to the RA-mode CS. Enrollment profiles can be used if a CA server does not support SCEP.
- Self-signed certificate enrollment for a trustpoint—The secure HTTP (HTTPS) server generates a self-signed certificate that is to be used during the secure socket layer (SSL) handshake, establishing a secure connection between the HTTPS server and the client. The self-signed certificate is then saved in the router's startup configuration (NVRAM). The saved, self-signed certificate can then be used for future SSL handshakes, eliminating the user intervention that was necessary to accept the certificate every time the router reloaded.

**Note**

To take advantage of autoenrollment and auto reenrollment, do not use either TFTP or manual cut-and-paste enrollment as your enrollment method. Both TFTP and manual cut-and-paste enrollment methods are manual enrollment processes, requiring user input.

## Registration Authorities (RA)

A Cisco IOS certificate server can be configured to run in RA mode. An RA offloads authentication and authorization responsibilities from a CA. When the RA receives a SCEP or manual enrollment request, the administrator can either reject or grant it on the basis of local policy. If the request is granted, it will be forwarded to the issuing CA, and the CA can be configured to automatically generate the certificate and return it to the RA. The client can later retrieve the granted certificate from the RA.

## Automatic Certificate Enrollment

Certificate autoenrollment allows the CA client to automatically request a certificate from its CA sever. This automatic router request eliminates the need for operator intervention when the enrollment request is sent to the CA server. Automatic enrollment is performed on startup for any trustpoint CA that is configured and that does not have a valid client certificate. When the certificate expires, a new certificate is automatically requested.

**Note**

When automatic enrollment is configured, clients automatically request client certificates. The CA server performs its own authorization checks; if these checks include a policy to automatically issue certificates, all clients will automatically receive certificates, which is not very secure. Thus, automatic certificate enrollment should be combined with additional authentication and authorization mechanisms (such as Secure Device Provisioning (SDP), leveraging existing certificates, and one-time passwords).

### Automated Client Certificate and Key Rollover

By default, the automatic certificate enrollment function requests a new client certificate and keys from the CS before the client's current certificate expires. Certificate and key rollover allows the certificate renewal rollover request to be made before the certificate expires by retaining the current key and certificate until the new, or rollover, certificate is available. After a specified amount of time, the rollover certificate and keys will become the active certificate and keys. The expired certificate and keys are immediately deleted upon rollover and removed from the certificate chain and CRL.

The setup for automatic rollover is twofold: CA clients must be automatically enrolled and the client's CAs must be automatically enrolled and have the **auto-rollover** command enabled. For more information on configuring your CA servers for automatic certificate rollover see the section "Automatic CA Certificate and Key Rollover" in the chapter "[Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment](#)."

An optional renewal percentage parameter can be used with the **auto-enroll** command to allow a new certificate to be requested when a specified percentage of the lifetime of the certificate has passed. For example, if the renewal percentage is configured as 90 and the certificate has a lifetime of one year, a new certificate is requested 36.5 days before the old certificate expires. In order for automatic rollover to occur, the renewal percentage must be less than 100.

#### Tip

If CA autoenrollment is not enabled, you may manually initiate rollover on an existing client with the **crypto pki enroll** command if the expiration time of the current client certificate is equal to or greater than the expiration time of the corresponding CA certificate.

The client will initiate the rollover process, which only occurs if the server is configured for automated rollover and has an available rollover server certificate.

#### Note

A key pair is also sent if configured by the **auto-enroll re-generate** command and keyword. It is recommended that a new key pair be issued for security reasons.

## Certificate Enrollment Profiles

Enrollment profiles allow users to specify certificate authentication, enrollment, and reenrollment parameters when prompted. The values for these parameters are referenced by two templates that make up the profile. One template contains parameters for the HTTP request that is sent to the CA server to obtain the certificate of the CA (also known as certificate authentication); the other template contains parameters for the HTTP request that is sent to the CA for certificate enrollment.

Configuring two templates enables users to specify different URLs or methods for certificate authentication and enrollment; for example, authentication (getting the certificate of the CA) can be performed via TFTP (using the **authentication url** command) while enrollment can be performed manually (using the **enrollment terminal** command).

Prior to Cisco IOS Release 12.3(11)T, certificate requests could be sent only in a PKCS10 format; however, an additional parameter has now been added to the profile, allowing users to specify the PKCS7 format for certificate renewal requests.

#### Note

A single enrollment profile can have up to three separate sections for each task—certificate authentication, enrollment, and reenrollment.

# How to Configure Certificate Enrollment for a PKI

This section contains the following enrollment option procedures. If you configure enrollment or autoenrollment (the first task), you cannot configure manual certificate enrollment. Also, if you configure TFTP or manual cut-and-paste certificate enrollment, you cannot configure autoenrollment, auto reenrollment, an enrollment profile, nor can you utilize the automated CA certificate rollover capability.

- [Configuring Certificate Enrollment or Autoenrollment, page 6](#)
- [Configuring Manual Certificate Enrollment, page 11](#)
- [Configuring a Persistent Self-Signed Certificate for Enrollment via SSL, page 17](#)
- [Configuring a Certificate Enrollment Profile for Enrollment or Reenrollment, page 21](#)

## Configuring Certificate Enrollment or Autoenrollment

Perform this task to configure certificate enrollment for clients participating in your PKI.

### Prerequisites for Autoenrollment

Before configuring automatic certificate enrollment requests, you should ensure that all necessary enrollment information is configured.

#### Prerequisites for Enabling Automated Client Certificate and Key Rollover

CA client support for certificate rollover is automatically enabled when using autoenrollment. For automatic CA certificate rollover to run successfully, the following prerequisites are applicable:

- Your network devices must support shadow PKI.
- Your clients must be running Cisco IOS Release 12.4(2)T or a later release.
- The client's CS must support automatic rollover. See the section "Automatic CA Certificate and Key Rollover" in the chapter "[Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment](#)" for more information on CA server automatic rollover configuration.

#### Prerequisites for Specifying Autoenrollment Initial Key Generation Location

To specify the location of the autoenrollment initial key generation, you must be running Cisco IOS Release 12.4(11)T or a later release.

### Restrictions for Autoenrollment

#### RSA Key Pair Restriction for Autoenrollment

Trustpoints configured to generate a new key pair using the **regenerate** command or the **regenerate** keyword of the **auto-enroll** command must not share key pairs with other trustpoints. To give each trustpoint its own key pair, use the **rsakeypair** command in ca-trustpoint configuration mode. Sharing key pairs among regenerating trustpoints is not supported and will cause loss of service on some of the trustpoints because of key and certificate mismatches.

#### Restrictions for Automated Client Certificate and Key Rollover

In order for clients to run automatic CA certificate rollover successfully, the following restrictions are applicable:

- SCEP must be used to support rollover. Any device that enrolls with the PKI using an alternative to SCEP as the certificate management protocol or mechanism (such as enrollment profiles, manual enrollment, or TFTP enrollment) will not be able to take advantage of the rollover functionality provided by SCEP.
- If the configuration cannot be saved to the startup configuration after a shadow certificate is generated, rollover will not occur.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment** [**mode**] [**retry period** *minutes*] [**retry count** *number*] **url** *url* [**pem**]
5. **subject-name** [*x.500-name*]
6. **ip address** {*ip address* | *interface* | **none**}
7. **serial-number** [**none**]
8. **auto-enroll** [*percent*] [**regenerate**]
9. **usage** *method1* [*method2* [*method3*]]
10. **password** *string*
11. **rsa****keypair** *key-label* [*key-size* [*encryption-key-size*]]
12. **fingerprint** *ca-fingerprint*
13. **on** *devicename*:
14. **exit**
15. **crypto pki authenticate** *name*
16. **exit**
17. **copy system:running-config nvram:startup-config**
18. **show crypto pki certificates**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 3 | <b>crypto pki trustpoint name</b><br><br><b>Example:</b><br>Router(config)# crypto pki trustpoint mytp                                                                       | Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 4 | <b>enrollment [mode] [retry period minutes] [retry count number] url url [pem]</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment url<br>http://cat.example.com | Specifies the URL of the CA on which your router should send certificate requests. <ul style="list-style-type: none"> <li><b>mode</b>—Specifies RA mode if your CA system provides an RA.</li> <li><b>retry period minutes</b>—Specifies the wait period between certificate request retries. The default is 1 minute between retries.</li> <li><b>retry count number</b>— Specifies the number of times a router will resend a certificate request when it does not receive a response from the previous request. (Specify from 1 to 100 retries.)</li> <li><b>url url</b>—URL of the file system where your router should send certificate requests. For enrollment method options, see the <b>enrollment</b> command in the <a href="#">Cisco IOS Security Command Reference</a>.</li> <li><b>pem</b>—Adds privacy-enhanced mail (PEM) boundaries to the certificate request.</li> </ul> <p><b>Note</b> An enrollment method other than TFTP or manual cut-and-paste must be configured to support autoenrollment.</p> |
| Step 5 | <b>subject-name [x.500-name]</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# subject-name cat                                                                           | (Optional) Specifies the requested subject name that will be used in the certificate request. <ul style="list-style-type: none"> <li><b>x.500-name</b>—If it is not specified, the fully qualified domain name (FQDN), which is the default subject name, will be used.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 6 | <b>ip address {ip address   interface   none}</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# ip address 192.168.1.66                                                   | (Optional) Includes the IP address of the specified interface in the certificate request. <p>Issue the <b>none</b> keyword if no IP address should be included.</p> <p><b>Note</b> If this command is enabled, you will not be prompted for an IP address during enrollment for this trustpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|         | Command or Action                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------|------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <b>serial-number</b> [none]<br><br><b>Example:</b><br>Router(ca-trustpoint)# serial-number                                   | (Optional) Specifies the router serial number in the certificate request, unless the <b>none</b> keyword is issued.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 8  | <b>auto-enroll</b> [percent] [regenerate]<br><br><b>Example:</b><br>Router(ca-trustpoint)# auto-enroll regenerate            | <p>(Optional) Enables autoenrollment, allowing the client to automatically request a rollover certificate from the CA. If autoenrollment is not enabled, the client must be manually reenrolled in your PKI upon certificate expiration.</p> <ul style="list-style-type: none"> <li>By default, only the Domain Name System (DNS) name of the router is included in the certificate.</li> <li>Use the <i>percent</i> argument to specify that a new certificate will be requested after the percentage of the lifetime of the current certificate is reached.</li> <li>Use the <b>regenerate</b> keyword to generate a new key for the certificate even if a named key already exists.</li> </ul> <p><b>Note</b> If the key pair being rolled over is exportable, the new key pair will also be exportable. The following comment will appear in the trustpoint configuration to indicate whether the key pair is exportable: “! RSA key pair associated with trustpoint is exportable.”</p> <p><b>Note</b> It is recommended that a new key pair be generated for security reasons.</p> |
| Step 9  | <b>usage</b> method1 [method2 [method3]]<br><br><b>Example:</b><br>Router(ca-trustpoint)# usage ssl-client                   | <p>(Optional) Specifies the intended use for the certificate. Available options are <b>ike</b>, <b>ssl-client</b>, and <b>ssl-server</b>; the default is <b>ike</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 10 | <b>password</b> string<br><br><b>Example:</b><br>Router(ca-trustpoint)# password meow                                        | <p>(Optional) Specifies the revocation password for the certificate. If this command is enabled, you will not be prompted for a password during enrollment for this trustpoint.</p> <p><b>Note</b> When SCEP is used, this password can be used to authorize the certificate request—often via a one-time password or similar mechanism.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 11 | <b>rsakeypair</b> key-label [key-size [encryption-key-size]]<br><br><b>Example:</b><br>Router(ca-trustpoint)# rsakeypair cat | <p>(Optional) Specifies which key pair to associate with the certificate.</p> <ul style="list-style-type: none"> <li>A key pair with <i>key-label</i> will be generated during enrollment if it does not already exist or if the <b>auto-enroll regenerate</b> command was issued.</li> <li>Specify the <i>key-size</i> argument for generating the key, and specify the <i>encryption-key-size</i> argument to request separate encryption, signature keys, and certificates.</li> </ul> <p><b>Note</b> If this command is not enabled, the FQDN key pair is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 12</b> | <pre>fingerprint ca-fingerprint</pre> <p><b>Example:</b><br/> Router(ca-trustpoint)# fingerprint 12EF53FA 355CD23E 12EF53FA 355CD23E</p>       | <p>(Optional) Specifies a fingerprint that can be matched against the fingerprint of a CA certificate during authentication.</p> <p><b>Note</b> If the fingerprint is not provided and authentication of the CA certificate is interactive, the fingerprint will be displayed for verification.</p>                                                                                                                                                 |
| <b>Step 13</b> | <pre>on devicename:</pre> <p><b>Example:</b><br/> Router(ca-trustpoint)# on usbtokens0:</p>                                                    | <p>(Optional) Specifies that RSA keys will be created on the specified device upon autoenrollment initial key generation.</p> <p>Devices that may be specified include NVRAM, local disks, and USB tokens. USB tokens may be used as cryptographic devices in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication to be performed on the token.</p> |
| <b>Step 14</b> | <pre>exit</pre> <p><b>Example:</b><br/> Router(ca-trustpoint)# exit</p>                                                                        | Exits ca-trustpoint configuration mode and returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 15</b> | <pre>crypto pki authenticate name</pre> <p><b>Example:</b><br/> Router(config)# crypto pki authenticate mytp</p>                               | <p>Retrieves the CA certificate and authenticates it.</p> <ul style="list-style-type: none"> <li>Check the certificate fingerprint if prompted.</li> </ul> <p><b>Note</b> This command is optional if the CA certificate is already loaded into the configuration.</p>                                                                                                                                                                              |
| <b>Step 16</b> | <pre>exit</pre> <p><b>Example:</b><br/> Router(config)# exit</p>                                                                               | Exits global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 17</b> | <pre>copy system:running-config nvram:startup-config</pre> <p><b>Example:</b><br/> Router# copy system:running-config nvram:startup-config</p> | <p>(Optional) Copies the running configuration to the NVRAM startup configuration.</p> <p><b>Note</b> Autoenrollment will not update NVRAM if the running configuration has been modified but not written to NVRAM.</p>                                                                                                                                                                                                                             |
| <b>Step 18</b> | <pre>show crypto pki certificates</pre> <p><b>Example:</b><br/> Router# show crypto pki certificates</p>                                       | (Optional) Displays information about your certificates, including any rollover certificates.                                                                                                                                                                                                                                                                                                                                                       |

## Examples

The following example shows the configuration for the “mytp-A” certificate server and its associated trustpoint, where RSA keys generated by the initial autoenrollment for the trustpoint will be stored on a USB token, “usbtokens0”:

```
crypto pki server mytp-A
 database level complete
 issuer-name CN=company, L=city, C=country
 grant auto
! Specifies that certificate requests will be granted automatically.
```

```
!
```

```
crypto pki trustpoint mytp-A
 revocation-check none
 rsakeypair myTP-A
 storage usbtoken0:
! Specifies that keys will be stored on usbtoken0:.
 on usbtoken0:
! Specifies that keys generated on initial auto enroll will be generated on and stored on ! usbtoken0:
```

## Configuring Manual Certificate Enrollment

Manual certificate enrollment can be set up via TFTP or the manual cut-and-paste method. Both options can be used if your CA does not support SCEP or if a network connection between the router and CA is not possible. Perform one of the following tasks to set up manual certificate enrollment:

- [Configuring Cut-and-Paste Certificate Enrollment, page 11](#)
- [Configuring TFTP Certificate Enrollment, page 14](#)

## PEM-Formatted Files for Certificate Enrollment Request

Using PEM-formatted files for certificate requests can be helpful for customers who are using terminal or profile-based enrollment to request certificates from their CA server. Customers using PEM-formatted files can directly use existing certificates on their Cisco IOS routers.

## Restrictions for Manual Certificate Enrollment

### Switching Enrollment URLs When Using SCEP

We do not recommend switching URLs if SCEP is used; that is, if the enrollment URL is “http://myca,” do not change the enrollment URL after getting the CA certificate and before enrolling the certificate. A user can switch between TFTP and manual cut-and-paste

### Key Regeneration Restriction

Do not regenerate the keys manually using the **crypto key generate** command; key regeneration will occur when the **crypto pki enroll** command is issued if the **regenerate** keyword is specified.

## Configuring Cut-and-Paste Certificate Enrollment

Perform this task to configure manual certificate enrollment via the cut-and-paste method for peers participating in your PKI.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment terminal** [*pem*]
5. **fingerprint** *ca-fingerprint*
6. **exit**

7. **crypto pki authenticate** *name*
8. **crypto pki enroll** *name*
9. **crypto pki import** *name* **certificate**
10. **exit**
11. **show crypto pki certificates**

## DETAILED STEPS

|        | Command or Action                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 3 | <b>crypto pki trustpoint name</b><br><br><b>Example:</b><br>Router(config)# crypto pki trustpoint mytp                             | Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.                                                                                                                                                                                                                                                                                                                                                               |
| Step 4 | <b>enrollment terminal [pem]</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment terminal                              | Specifies manual cut-and-paste certificate enrollment method. The certificate request will be displayed on the console terminal so that you may manually copied (or cut). <ul style="list-style-type: none"> <li><b>pem</b>—Configures the trustpoint to generate PEM-formatted certificate requests to the console terminal.</li> </ul>                                                                                                            |
| Step 5 | <b>fingerprint ca-fingerprint</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# fingerprint 12EF53FA 355CD23E 12EF53FA 355CD23E | (Optional) Specifies a fingerprint that can be matched against the fingerprint of a CA certificate during authentication. <p><b>Note</b> If the fingerprint is not provided, it will be displayed for verification.</p>                                                                                                                                                                                                                             |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                         | Exits ca-trustpoint configuration mode and returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                    |
| Step 7 | <b>crypto pki authenticate name</b><br><br><b>Example:</b><br>Router(config)# crypto pki authenticate mytp                         | Retrieves the CA certificate and authenticates it.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 8 | <b>crypto pki enroll name</b><br><br><b>Example:</b><br>Router(config)# crypto pki enroll mytp                                     | Generates certificate request and displays the request for copying and pasting into the certificate server. <p>You are prompted for enrollment information, such as whether to include the router FQDN and IP address in the certificate request. You are also given the choice about displaying the certificate request to the console terminal.</p> <p>The base-64 encoded certificate with or without PEM headers as requested is displayed.</p> |

|         | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <b>crypto pki import</b> <i>name</i> <b>certificate</b><br><br><b>Example:</b><br>Router(config)# <b>crypto pki import</b> mytp<br>certificate | Imports a certificate manually at the console terminal (pasting).<br><br>The base-64 encoded certificate is accepted from the console terminal and inserted into the internal certificate database.<br><br><b>Note</b> You must enter this command twice if usage keys, a signature key and an encryption key, are used. The first time the command is entered, one of the certificates is pasted into the router. The second time the command is entered, the other certificate is pasted into the router. It does not matter which certificate is pasted first.<br><br><b>Note</b> Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If this applies to the certificate authority you are using, import the general purpose certificate. The router will not use one of the two key pairs generated. |
| Step 10 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# <b>exit</b>                                                                              | Exits global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 11 | <b>show crypto pki certificates</b><br><br><b>Example:</b><br>Router# <b>show crypto pki certificates</b>                                      | (Optional) Displays information about your certificates, the certificates of the CA, and RA certificates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Configuring TFTP Certificate Enrollment

Perform this task to configure manual certificate enrollment using a TFTP server.

### Prerequisites for TFTP Certificate Enrollment

- You must know the correct URL to use if you are configuring certificate enrollment via TFTP.
- The router must be able to write a file to the TFTP server for the **crypto pki enroll** command.
- If using a file specification with the **enrollment** command, the file must contain the CA certificate either in binary format or be base-64 encoded.
- You must know if your CA ignores key usage information in a certificate request and issues only a general purpose usage certificate.

#### Caution

Some TFTP servers require that the file must exist on the server before it can be written.

Most TFTP servers require that the file be “write-able” by the world. This requirement may pose a risk

because any router or other device may write or overwrite the certificate request; thus, the replacement certificate request will not be used by the CA administrator, who must first check the enrollment request fingerprint before granting the certificate request.

---

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint *name***
4. **enrollment [mode] [retry period *minutes*] [retry count *number*] url *url* [pem]**
5. **fingerprint *ca-fingerprint***
6. **exit**
7. **crypto pki authenticate *name***
8. **crypto pki enroll *name***
9. **crypto pki import *name* certificate**
10. **exit**
11. **show crypto pki certificates**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>crypto pki trustpoint name</b><br><br><b>Example:</b><br>Router(config)# crypto pki trustpoint mytp                                                                                  | Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 4 | <b>enrollment [mode] [retry period minutes] [retry count number] url url [pem]</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment url tftp://certserver/file_specification | Specifies TFTP as the enrollment method to send the enrollment request and to retrieve the CA certificate and router certificate and any optional parameters.<br><br><b>Note</b> For TFTP enrollment, the url must be configured as a TFTP url, tftp://example_tftp_url.<br><br>An optional file specification filename may be included in the TFTP url. If the file specification is not included, the FQDN will be used. If the file specification is included, the router will append the extension “.ca” to the specified file name. |
| Step 5 | <b>fingerprint ca-fingerprint</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# fingerprint 12EF53FA 355CD23E 12EF53FA 355CD23E                                                      | (Optional) Specifies the fingerprint of the CA certificate received via an out-of-band method from the CA administrator.<br><br><b>Note</b> If the fingerprint is not provided, it will be displayed for verification.                                                                                                                                                                                                                                                                                                                   |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                              | Exits ca-trustpoint configuration mode and returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 7 | <b>crypto pki authenticate name</b><br><br><b>Example:</b><br>Router(config)# crypto pki authenticate mytp                                                                              | Retrieves the CA certificate and authenticates it from the specified TFTP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                | Command or Action                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <b>crypto pki enroll</b> <i>name</i><br><br><b>Example:</b><br>Router(config)# crypto pki enroll mytp                                | Generates certificate request and writes the request out to the TFTP server.<br><br>You are prompted for enrollment information, such as whether to include the router FQDN and IP address in the certificate request. You are queried about whether or not to display the certificate request to the console terminal.<br><br>The filename to be written is appended with the extension “.req”. For usage keys, a signature key and an encryption key, two requests are generated and sent. The usage key request filenames are appended with the extensions “-sign.req” and “-encr.req” respectively.                                                                                                                                                                                                                                                   |
| <b>Step 9</b>  | <b>crypto pki import</b> <i>name</i> <b>certificate</b><br><br><b>Example:</b><br>Router(config)# crypto pki import mytp certificate | Imports a certificate via TFTP at the console terminal, which retrieves the granted certificate.<br><br>The router will attempt to retrieve the granted certificate via TFTP using the same filename used to send the request, except the extension is changed from “.req” to “.crt”. For usage key certificates, the extensions “-sign.crt” and “-encr.crt” are used.<br><br>The router will parse the received files, verify the certificates, and insert the certificates into the internal certificate database on the router.<br><br><b>Note</b> Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If your CA ignores the usage key information in the certificate request, only import the general purpose certificate. The router will not use one of the two keypairs generated. |
| <b>Step 10</b> | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                           | Exits global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 11</b> | <b>show crypto pki certificates</b><br><br><b>Example:</b><br>Router# show crypto pki certificates                                   | (Optional) Displays information about your certificates, the certificates of the CA, and RA certificates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Configuring a Persistent Self-Signed Certificate for Enrollment via SSL

This section contains the following tasks:

- [Configuring a Trustpoint and Specifying Self-Signed Certificate Parameters, page 18](#)
- [Enabling the HTTPS Server, page 20](#)

### Note

These tasks are optional because if you enable the HTTPS server, it generates a self-signed certificate automatically using default values.

## Persistent Self-Signed Certificates Overview

The SSL protocol can be used to establish a secure connection between an HTTPS server and a client (web browser). During the SSL handshake, the client expects the SSL server's certificate to be verifiable using a certificate the client already possesses.

If Cisco IOS software does not have a certificate that the HTTPS server can use, the server generates a self-signed certificate by calling a PKI application programming interface (API). When the client receives this self-signed certificate and is unable to verify it, intervention is needed. The client asks you if the certificate should be accepted and saved for future use. If you accept the certificate, the SSL handshake continues.

Future SSL handshakes between the same client and the server use the same certificate. However, if the router is reloaded, the self-signed certificate is lost. The HTTPS server must then create a new self-signed certificate. This new self-signed certificate does not match the previous certificate so you are once again asked to accept it.

Requesting acceptance of the router's certificate each time that the router reloads may present an opportunity for an attacker to substitute an unauthorized certificate when you are being asked to accept the certificate. Persistent self-signed certificates overcome all these limitations by saving a certificate in the router's startup configuration.

## Restrictions

You can configure only one trustpoint for a persistent self-signed certificate.

## Configuring a Trustpoint and Specifying Self-Signed Certificate Parameters

Perform the following task to configure a trustpoint and specify self-signed certificate parameters.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment selfsigned**
5. **subject-name** [*x.500-name*]
6. **rsa** *key-label* [*key-size* [*encryption-key-size*]]
7. **crypto pki enroll** *name*
8. **end**
9. **show crypto pki certificates** [*trustpoint-name* [*verbose*]]
10. **show crypto pki trustpoints** [*status* | *label* [*status*]]

## DETAILED STEPS

|        | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 3 | <b>crypto pki trustpoint name</b><br><br><b>Example:</b><br>Router(config)# crypto pki trustpoint local                                        | Declares the CA that your router should use and enters ca-trustpoint configuration mode.<br><br><b>Note</b> Effective with Cisco IOS Release 12.3(8)T, the <b>crypto pki trustpoint</b> command replaced the <b>crypto ca trustpoint</b> command.                                                                                                                                                                                                                                                                                                      |
| Step 4 | <b>enrollment selfsigned</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# enrollment selfsigned                                            | Specifies self-signed enrollment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 5 | <b>subject-name [x.500-name]</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# subject-name                                                 | (Optional) Specifies the requested subject name to be used in the certificate request. <ul style="list-style-type: none"> <li>If the <i>x-500-name</i> argument is not specified, the FQDN, which is the default subject name, is used.</li> </ul>                                                                                                                                                                                                                                                                                                     |
| Step 6 | <b>rsakeypair key-label [key-size [encryption-key-size]]</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# rsakeypair examplekeys 1024 1024 | (Optional) Specifies which key pair to associate with the certificate. <ul style="list-style-type: none"> <li>The <i>key-label</i> argument will be generated during enrollment if it does not already exist or if the <b>auto-enroll regenerate</b> command was issued.</li> <li>Specify the <i>key-size</i> argument for generating the key, and specify the <i>encryption-key-size</i> argument to request separate encryption, signature keys, and certificates.</li> </ul> <b>Note</b> If this command is not enabled, the FQDN key pair is used. |
| Step 7 | <b>crypto pki enroll name</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# crypto pki enroll local                                         | Tells the router to generate the persistent self-signed certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 8 | <b>end</b><br><br><b>Example:</b><br>Router(ca-trustpoint)# end<br><br><b>Example:</b><br>Router(config)# end                                  | (Optional) Exits ca-trustpoint configuration mode and global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|         | Command or Action                                                                                                                                                     | Purpose                                                                                                                            |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <b>show crypto pki certificates</b> [ <i>trustpoint-name</i> ]<br>[ <i>verbose</i> ]]<br><br><b>Example:</b><br>Router# show crypto pki certificates local<br>verbose | Displays information about your certificate, the certification authority certificate, and any registration authority certificates. |
| Step 10 | <b>show crypto pki trustpoints</b> [ <i>status</i>   <i>label</i> ]<br>[ <i>status</i> ]]<br><br><b>Example:</b><br>Router# show crypto pki trustpoints status        | Displays the trustpoints that are configured in the router.                                                                        |

## Enabling the HTTPS Server

Perform the following task to enable the HTTPS server.

### Prerequisites

To specify parameters, you must create a trustpoint and configure it. To use default values, delete any existing self-signed trustpoints. Deleting all self-signed trustpoints causes the HTTPS server to generate a persistent self-signed certificate using default values as soon as the server is enabled.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http secure-server**
4. **end**
5. **copy system:running-config nvram: startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                        | Purpose                                                                                                           |
|--------|------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                           | Enters global configuration mode.                                                                                 |
| Step 3 | <b>ip http secure-server</b><br><br><b>Example:</b><br>Router(config)# ip http secure-server                                             | Enables the secure HTTP web server.<br><br><b>Note</b> A key pair (modulus 1024) and a certificate are generated. |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                 | Exits global configuration mode.                                                                                  |
| Step 5 | <b>copy system:running-config nvram:startup-config</b><br><br><b>Example:</b><br>Router# copy system:running-config nvram:startup-config | Saves the self-signed certificate and the HTTPS server in enabled mode.                                           |

## Configuring a Certificate Enrollment Profile for Enrollment or Reenrollment

Perform this task to configure an enrollment profile for certificate enrollment or reenrollment of a router with a Cisco IOS CA that is already enrolled with a third-party vendor CA.

Enable a router that is enrolled with a third-party vendor CA to use its existing certificate to enroll with the Cisco IOS certificate server so the enrollment request is automatically granted. To enable this functionality, you must issue the **enrollment credential** command. Also, you cannot configure manual certificate enrollment.

### Prerequisites

Before configuring a certificate enrollment profile for the client router that is already enrolled with a third party vendor CA so that the router can reenroll with a Cisco IOS certificate server, you should have already performed the following tasks at the client router:

- Defined a trustpoint that points to the third-party vendor CA.
- Authenticated and enrolled the client router with the third-party vendor CA.

### Restrictions

- To use certificate profiles, your network must have an HTTP interface to the CA.

- If an enrollment profile is specified, an enrollment URL may not be specified in the trustpoint configuration. Although both commands are supported, only one command can be used at a time in a trustpoint.
- Because there is no standard for the HTTP commands used by various CAs, the user is required to enter the command that is appropriate to the CA that is being used.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment profile** *label*
5. **exit**
6. **crypto pki profile enrollment** *label*
7. **authentication url** *url*  
or  
**authentication terminal**
8. **authentication command**
9. **enrollment url** *url*  
or  
**enrollment terminal**
10. **enrollment credential** *label*
11. **enrollment command**
12. **parameter** *number* {**value** *value* | **prompt** *string*}
13. **exit**
14. **show crypto pki certificates**

| Step 9  | <b>enrollment url url</b><br><br><b>Example:</b><br>Router(ca-profile-enroll)# enrollment url http://entrust:81/cda-cgi/clientcgi.exe<br>or<br><br><b>enrollment terminal</b><br><br><b>Example:</b><br>Router(ca-profile-enroll)# enrollment terminal | Specifies the URL of the CA server to which to send certificate enrollment requests via HTTP or TFTP.<br><br><br><br><br>Specifies manual cut-and-paste certificate enrollment.                          |
| Step 10 | <b>enrollment credential label</b><br><br><b>Example:</b><br>Router(ca-profile-enroll)# enrollment credential Entrust                                                                                                                                  | (Optional) Specifies the third-party vendor CA trustpoint that is to be enrolled with the Cisco IOS CA.<br><br><b>Note</b> This command cannot be issued if manual certificate enrollment is being used. |
| Step 11 | <b>enrollment command</b><br><br><b>Example:</b><br>Router(ca-profile-enroll)# enrollment command                                                                                                                                                      | (Optional) Specifies the HTTP command that is sent to the CA for enrollment.                                                                                                                             |
| Step 12 | <b>parameter number {value value   prompt string}</b><br><br><b>Example:</b><br>Router(ca-profile-enroll)# parameter 1 value aaaa-bbbb-cccc                                                                                                            | (Optional) Specifies parameters for an enrollment profile.<br><br>This command can be used multiple times to specify multiple values.                                                                    |
| Step 13 | <b>exit</b><br><br><b>Example:</b><br>Router(ca-profile-enroll)# exit<br>Router(config)# exit                                                                                                                                                          | Enter this command two times—one time to exit ca-profile-enroll configuration mode and the second time to exit global configuration mode.                                                                |
| Step 14 | <b>show crypto pki certificates</b><br><br><b>Example:</b><br>Router# show crypto pki certificates                                                                                                                                                     | (Optional) Displays information about your certificates, the certificates of the CA, and RA certificates.                                                                                                |

## What to Do Next

If you configured the router to reenroll with a Cisco IOS CA, you should configure the Cisco IOS certificate server to accept enrollment requests only from clients already enrolled with the specified third-party vendor CA trustpoint to take advantage of this functionality. For more information, see the module “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment.”

# Configuration Examples for PKI Certificate Enrollment Requests

This section contains the following configuration examples:

- [Configuring Autoenrollment: Example, page 25](#)
- [Configuring Certificate Autoenrollment with Key Regeneration: Example, page 26](#)
- [Configuring Cut-and-Paste Certificate Enrollment: Example, page 27](#)
- [Configuring Manual Certificate Enrollment with Key Regeneration: Example, page 30](#)
- [Creating and Verifying a Persistent Self-Signed Certificate: Example, page 30](#)
- [Configuring Direct HTTP Enrollment: Example, page 32](#)

## Configuring Autoenrollment: Example

The following example shows how to configure the router to automatically enroll with a CA on startup, enabling automatic rollover, and how to specify all necessary enrollment information in the configuration:

```
crypto pki trustpoint frog
 enrollment url http://frog.phoobin.com/
 subject-name OU=Spiral Dept., O=tiedye.com
 ip-address ethernet-0
 serial-number none
 usage ike
 auto-enroll regenerate
 password revokeme
 rsa-key frog 2048
!
crypto pki certificate chain frog
certificate pki 0B

quit
```

### Note

In this example, keys are neither regenerated nor rolled over.

## Configuring Certificate Autoenrollment with Key Regeneration: Example

The following example shows how to configure the router to automatically enroll with the CA named “trustme1” on startup and enable automatic rollover. The **regenerate** keyword is issued, so a new key will be generated for the certificate and reissued when the automatic rollover process is initiated. The renewal percentage is configured as 90 so if the certificate has a lifetime of one year, a new certificate is requested 36.5 days before the old certificate expires. The changes made to the running configuration are saved to the NVRAM startup configuration because autoenrollment will not update NVRAM if the running configuration has been modified but not written to NVRAM.

```
crypto pki trustpoint trustme1
 enrollment url http://trustme1.company.com/
 subject-name OU=Spiral Dept., O=tiedye.com
 ip-address ethernet0
 serial-number none
 auto-enroll 90 regenerate
 password revokeme
 rsakeypair trustme1 2048
 exit
crypto pki authenticate trustme1
copy system:running-config nvram:startup-config
```

## Configuring Cut-and-Paste Certificate Enrollment: Example

The following example shows how to configure certificate enrollment using the manual cut-and-paste enrollment method:

```
Router(config)# crypto pki trustpoint TP
Router(ca-trustpoint)# enrollment terminal
Router(ca-trustpoint)# crypto pki authenticate TP
```

Enter the base 64 encoded CA certificate.  
End with a blank line or the word "quit" on a line by itself

```

## Configuring Manual Certificate Enrollment with Key Regeneration: Example

The following example shows how to regenerate new keys with a manual certificate enrollment from the CA named “trustme2”:

```
crypto pki trustpoint trustme2
 enrollment url http://trustme2.company.com/
 subject-name OU=Spiral Dept., O=tiedye.com
 ip-address ethernet0
 serial-number none
 regenerate
 password revokeme
 rsakeypair trustme2 2048s
 exit
crypto pki authenticate trustme2
crypto pki enroll trustme2
```

## Creating and Verifying a Persistent Self-Signed Certificate: Example

The following example shows how to declare and enroll a trustpoint named “local” and generate a self-signed certificate with an IP address:

```
crypto pki trustpoint local
 enrollment selfsigned
 end
configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

crypto pki enroll local
Nov 29 20:51:13.067: %SSH-5-ENABLED: SSH 1.99 has been enabled
Nov 29 20:51:13.267: %CRYPTO-6-AUTOGEN: Generated new 512 bit key pair
% Include the router serial number in the subject name? [yes/no]: yes
% Include an IP address in the subject name? [no]: yes
Enter Interface name or IP Address[]: ethernet 0
Generate Self Signed Router Certificate? [yes/no]: yes
Router Self Signed Certificate successfully created
```

### Note

A router can have only one self-signed certificate. If you attempt to enroll a trustpoint configured for a self-signed certificate and one already exists, you receive a notification and are asked if you want to replace it. If so, a new self-signed certificate is generated to replace the existing one.

### Enabling the HTTPS Server: Example

The following example shows how to enable the HTTPS server and generate a default trustpoint because one was not previously configured:

```
configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

ip http secure-server
% Generating 1024 bit RSA keys ...[OK]
*Dec 21 19:14:15.421:%PKI-4-NOAUTOSAVE:Configuration was modified. Issue "write memory"
to save new certificate
Router(config)#
```

### Note

You need to save the configuration to NVRAM if you want to keep the self-signed certificate and have the HTTPS server enabled following router reloads.

The following message also appears:

```
*Dec 21 19:14:10.441:%SSH-5-ENABLED:SSH 1.99 has been enabled
```

#### Note

Creation of the key pair used with the self-signed certificate causes the Secure Shell (SSH) server to start. This behavior cannot be suppressed. You may want to modify your access control lists (ACLs) to permit or deny SSH access to the router.

### Verifying the Self-Signed Certificate Configuration: Example

The following example displays information about the self-signed certificate that you just created:

```
Router# show crypto pki certificates
```

```
Router Self-Signed Certificate
 Status: Available
 Certificate Serial Number: 01
 Certificate Usage: General Purpose
 Issuer:
 cn=IOS-Self-Signed-Certificate-3326000105
 Subject:
 Name: IOS-Self-Signed-Certificate-3326000105
 cn=IOS-Self-Signed-Certificate-3326000105
 Validity Date:
 start date: 19:14:14 GMT Dec 21 2004
 end date: 00:00:00 GMT Jan 1 2020
 Associated Trustpoints: TP-self-signed-3326000105
```

#### Note

The number 3326000105 above is the router's serial number and varies depending on the router's actual serial number.

The following example displays information about the key pair corresponding to the self-signed certificate:

```
Router# show crypto key mypubkey rsa
```

```
% Key pair was generated at: 19:14:10 GMT Dec 21 2004
Key name: TP-self-signed-3326000105
Usage: General Purpose Key
Key is not exportable.
Key Data:
30819F30 0D06092A 864886F7 0D010101 05000381 8D003081 89028181 00B88F70

2B941BCA 550999A7 2EFE12A5 6B7B669A 2D88AB77 39B38E0E AA23CB8C B7020301 0001
% Key pair was generated at: 19:14:13 GMT Dec 21 2004
Key name: TP-self-signed-3326000105.server
Usage: Encryption Key
Key is not exportable.
Key Data:
307C300D 06092A86 4886F70D 01010105 00036B00 30680261 00C5680E 89777B42
463E5783 FE96EA9E F446DC7B 70499AF3 EA266651 56EE29F4 5B003D93 2FC9F81D
8A46E12F 3FBAC2F3 046ED9DD C5F27C20 1BBA6B9B 08F16E45 C34D6337 F863D605
34E30F0E B4921BC5 DAC9EBBA 50C54AA0 BF551BDD 88453F50 61020301 0001
```

#### Note

The second key pair with the name TP-self-signed-3326000105.server is the SSH key pair and is generated when any key pair is created on the router and SSH starts up.

The following example displays information about the trustpoint named “local”:

```
Router# show crypto pki trustpoints
```

```
Trustpoint local:
 Subject Name:
 serialNumber=C63EBBE9+ipaddress=10.3.0.18+hostname=test.company.com
 Serial Number: 01
 Persistent self-signed certificate trust point
```

## Configuring Direct HTTP Enrollment: Example

The following example show how to configure an enrollment profile for direct HTTP enrollment with a CA server:

```
crypto pki trustpoint Entrust
 enrollment profile E
 serial

crypto pki profile enrollment E
 authentication url http://entrust:81
 authentication command GET /certs/cacert.der
 enrollment url http://entrust:81/cda-cgi/clientcgi.exe
 enrollment command POST reference_number=$P2&authcode=$P1
 &retrievedAs=rawDER&action=getServerCert&pkcs10Request=$REQ
 parameter 1 value aaaa-bbbb-cccc
 parameter 2 value 5001
```

## Additional References

The following sections provide references related to certificate enrollment for a PKI.

## Feature Information for PKI Certificate Enrollment

[Table 1](#) lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the “[Implementing and Managing PKI Features Roadmap](#).”

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

---

[Table 1](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

---

**Table 1**      **Feature Information for PKI Certificate Enrollment**

| Feature Name                                 | Releases  | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS USB Token PKI Enhancements—Phase 2 | 12.4(11)T | <p>This feature enhances USB token functionality by using the USB token as a cryptographic device. USB tokens may be used for RSA operations such as key generation, signing, and authentication.</p> <p>The following sections in this document provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Configuring Certificate Enrollment or Autoenrollment</a></li> </ul> <p><b>Note</b> This document covers the use of utilizing USB tokens for RSA operations during initial autoenrollment for a trustpoint. For other documents on this topic, see the “<a href="#">Related Documents</a>” section.</p>                                                                                                                                                  |
| Certificate Authority (CA) Key Rollover      | 12.4(2)T  | <p>This feature introduces the ability for root CAs to roll over expiring CA certificates and keys and to have these changes propagate through the PKI network without manual intervention.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Automatic Certificate Enrollment</a></li> <li>• <a href="#">Configuring Certificate Enrollment or Autoenrollment</a></li> </ul> <p>The following commands were introduced or modified by this feature: <b>auto-rollover</b>, <b>crypto pki certificate chain</b>, <b>crypto pki export pem</b>, <b>crypto pki server</b>, <b>crypto pki server info request</b>, <b>show crypto pki certificates</b>, <b>show crypto pki server</b>, and <b>show crypto pki trustpoint</b></p> |
| Certificate Autoenrollment                   | 12.2(8)T  | <p>This feature introduces certificate autoenrollment, which allows the router to automatically request a certificate from the CA that is using the parameters in the configuration.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Automatic Certificate Enrollment</a></li> <li>• <a href="#">Configuring Certificate Enrollment or Autoenrollment</a></li> </ul> <p>The following commands were introduced by this feature: <b>auto-enroll</b>, <b>rsa keypair</b>, <b>show crypto ca timers</b></p>                                                                                                                                                                                                                   |

**Table 1** *Feature Information for PKI Certificate Enrollment (continued)*

| Feature Name                                          | Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Certificate Enrollment Enhancements                   | 12.2(8)T | <p>This feature introduces five new <b>crypto ca trustpoint</b> subcommands that provide new options for certificate requests and allow users to specify fields in the configuration instead of having to go through prompts.</p> <p>The following section provides information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Configuring Certificate Enrollment or Autoenrollment</a></li> </ul> <p>The following commands were introduced by this feature:<br/> <b>ip-address (ca-trustpoint), password (ca-trustpoint), serial-number, subject-name, usage</b></p>                                                                                                                                                                                                                           |
| Direct HTTP Enrollment with CA Servers                | 12.3(4)T | <p>This feature allows users to configure an enrollment profile if their CA server does not support SCEP and they do not want to use an RA-mode CS. The enrollment profile allows users to send HTTP requests directly to the CA server instead of to an RA-mode CS.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Certificate Enrollment Profiles</a></li> <li>• <a href="#">Configuring a Certificate Enrollment Profile for Enrollment or Reenrollment</a></li> </ul> <p>The following commands were introduced by this feature:<br/> <b>authentication command, authentication terminal, authentication url, crypto ca profile enrollment, enrollment command, enrollment profile, enrollment terminal, enrollment url, parameter</b></p> |
| Import of RSA Key Pair and Certificates in PEM Format | 12.3(4)T | <p>This feature allows customers to issue certificate requests and receive issued certificates in PEM-formatted files.</p> <p>The following section provides information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Configuring Manual Certificate Enrollment</a></li> </ul> <p>The following commands were modified by this feature:<br/> <b>enrollment, enrollment terminal</b></p>                                                                                                                                                                                                                                                                                                                                                                                                        |

# Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

---

**First Published: May 2, 2005**

**Last Updated: July 11, 2008**

This module describes how to use Secure Device Provisioning (SDP) in a public key infrastructure (PKI). SDP is a web-based certificate enrollment interface that can be used to easily deploy PKI between two end devices, such as a Cisco IOS client and a Cisco IOS certificate server. The end devices may or may not be directly connected to the network at the time of deployment or provisioning. SDP provides a solution for users deploying a large number of peer devices (including certificates and configurations).

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for SDP in a PKI” section on page 46](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

# Prerequisites for Setting Up SDP

## Setting Up SDP for Enrollment in a PKI

Before you set up SDP, your environment should meet the following requirements:

- The petitioner device and the server must have IP connectivity between each other.
- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.
- A Cisco IOS Release 12.3(8)T PKI-enabled image or a later image.

## Setting Up SDP for Enrollment in a PKI Using USB Tokens

To leverage USB tokens to provision devices with SDP, your environment should meet the following requirements:

- Both the petitioner device and the server must have IP connectivity between each other.
- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.
- The introducer must have access to a petitioner device.
- The introducer must have access to the USB token and PIN, if configured.
- A Cisco IOS Release 12.4(15)T PKI-enabled image or a later image.

### Note

Cisco IOS Release 12.4(15)T or a later release provides the flexibility to move credentials stored on the USB token. However, the device used to configure the USB token may run any Cisco IOS Release 12.3(14)T PKI-enabled image or a later image.

## Using SDP to Configure a Device for an Internet Connection Through a Service Provider

To leverage SDP to configure a device that is not connected to the Internet, your environment should meet the following requirements:

- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.
- A Cisco router that supports a DHCP client and a PPPoE client and has a configured LAN or WAN interface.
- A Cisco IOS Release 12.4(20)T PKI-enabled image or a later image. If a previous Cisco IOS release is used on one of the devices, the SDP functionality will default to the earlier Cisco IOS version.

# Information About Setting Up SDP for Enrollment in a PKI

Before using SDP for certificate enrollment, you should understand the following concepts:

- [SDP Overview, page 3](#)
- [How SDP Works, page 4](#)
- [SDP Leveraging USB Tokens, page 10](#)

- [How SDP Uses an External AAA Database, page 13](#)
- [How Custom Templates Work with SDP, page 15](#)

## SDP Overview

SDP (also referred to as Trusted Transitive Introduction [TTI]) is a communication protocol that provides a bidirectional introduction between two end entities, such as a new network device and a Virtual Private Network (VPN). SDP involves the following three entities (see [Figure 1](#)):

- **Introducer**—A mutually trusted device that introduces the petitioner to the registrar. The introducer can be a device user, such as a system administrator.
  - An introducer can be configured as an administrative introducer, which allows an administrator performing the introduction to supply the name for the device being introduced. The supplied device name is used as if it were the name of an introducer in the normal SDP mechanisms, preserving the existing functionality of the SDP configuration. For more information on function of the administrative introducer, see the section “[Authentication and Authorization Lists for an Administrative Introducer.](#)”
- **Petitioner**—A client, or new device, to be introduced to the secure network.
- **Registrar**—A server that authorizes the petitioner. The registrar can be a certificate server.

**Figure 1** *Post-Introduction Secure Communication*

As of Cisco IOS Release 12.4(20)T or a later release, the introducer can start the SDP process without establishing prior Internet connectivity on the petitioner. The use of the prep-connect phase and the connect phase provides the ability to configure a petitioner for Internet connectivity through a service provider. For more information on the prep-connect phase and the connect phase, see the section “[How SDP Works.](#)”

The registrar communicates directly with an external authentication, authorization, and accounting (AAA) server to verify petitioner credentials, permit or deny enrollment, and retrieve specific petitioner configuration information. The petitioner and registrar serve web pages to the introducer, the end user. The petitioner receives the bootstrap configuration from a remote management system via the introducer’s web browser.

SDP is implemented over a web browser with six possible phases—prep-connect (optional), connect, start (optional), welcome, introduction, and completion. Each phase is shown to the user via a web page. For more information on each phase, see the section “[How SDP Works.](#)”

## How SDP Works

The following sections describe how SDP deploys PKI between two devices:

- [SDP Prep-Connect Phase](#)
- [SDP Connect Phase](#)
- [SDP Start Phase](#)
- [SDP Welcome Phase](#)
- [SDP Introduction Phase](#)
- [SDP Completion Phase](#)

The SDP process starts with one of three entry pages being loaded into the web browser by the introducer: the SDP prep-connect phase received from the administrator; the start phase loaded from the registrar; or the welcome phase loaded from the petitioner.

The sample figures show how to introduce the local device (the petitioner) to the secure domain of the registrar. The “introducer” is referred to as the end user.

### SDP Prep-Connect Phase

The prep-connect page is optional. Without the prep-connect page, the petitioner must have IP connectivity established.

The administrator must configure the prep-connect template and send the prep-connect page to the introducer. For more information on configuring the prep-connect template, see the section “[Default Prep-Connect Template](#).”

The administrator must also obtain and communicate the username and password for the secure network to the introducer by a telephone call, an e-mail, a secure e-mail, a CD, or a USB token. The registrar may be configured to authenticate the introducer using an existing AAA infrastructure (for example, an existing username and password database that is part of the existing corporate domain). The SDP prep-connect phase supports a one time password mechanism as is used by common AAA infrastructures. For more information on SDP and AAA, see the section “[How SDP Uses an External AAA Database](#).”

After receiving the prep-connect page, the introducer must load the page onto the computer where the HTTP browser will run. The introducer then loads the prep-connect page into the HTTP browser as a local file and then the prep-connect page is displayed (see [Figure 2](#)).

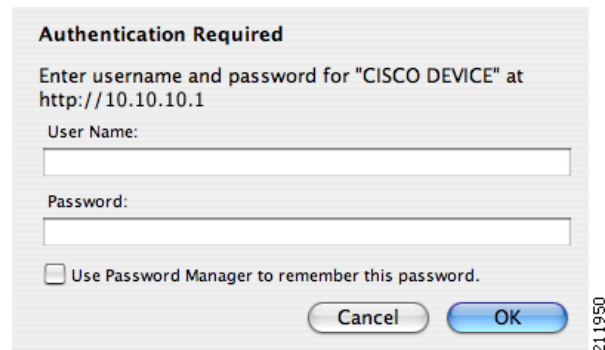

**Figure 2**      **Sample SDP Prep-Connect Page**

After the introducer clicks the Log onto Cisco Device button, the login dialog box is displayed (see [Figure 3](#)). The introducer enters the factory default username (cisco) and password (cisco) of the Cisco device.

**Figure 3** *Sample Petitioner Login Dialog Box*

The introducer authenticates with the petitioner and then Internet connectivity is tested by attempting to access a known URL. Access to [www.cisco.com](http://www.cisco.com) (198.133.219.25) is tested by default. The administrator can modify the URL to be used for testing connectivity by modifying the default prep-connect template. For more information about modifying the default test URL and other fields that the administrator may configure for the prep-connect page, see the section [“Default Prep-Connect Template.”](#)

**Note**

To mitigate the possibility that the prep-connect page could be modified to contain an IP address of an untrusted registrar or that a prep-connect page might be e-mailed from an untrusted source, use a secure method, such as secure e-mail, to send the prep-connect page.

If Internet connectivity is established either the start page or welcome page is displayed, depending on the prep-connect template setting as defined by the administrator. If Internet connectivity is not established, the connect page is displayed.

## SDP Connect Phase

The connect page is displayed only if the prep-connect page is used and there is no IP connectivity for the petitioner at the completion of the prep-connect phase. The connect page has three IP address assignment methods to allow flexibility for your Cisco IOS platform: Dynamic Host Configuration Protocol (DHCP), Point to Point Protocol over Ethernet (PPPoE), or static IP address assignment.

**Note**

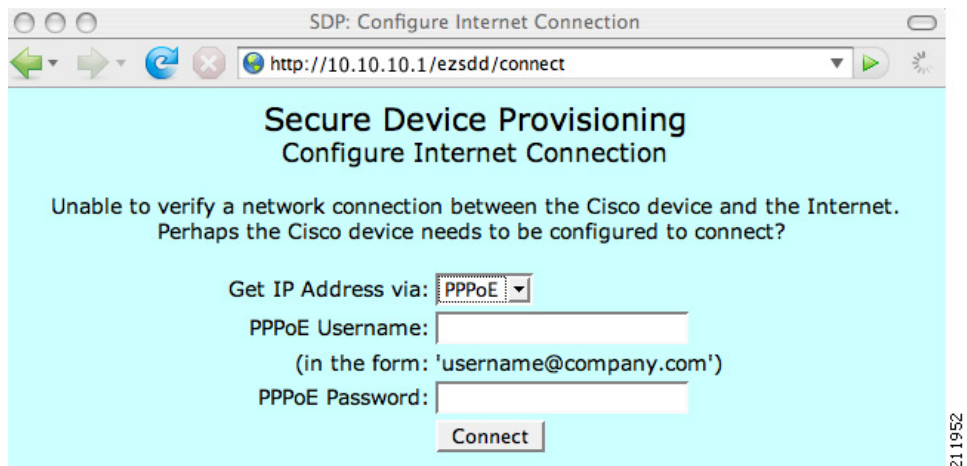

SDP functionality is not used with the Cisco IOS configuration to establish Internet connectivity. SDP functionality includes a signature on the Cisco IOS configuration, guaranteeing that the values have not changed in transit.

### DHCP IP Address Assignment Method

If the introducer chooses DHCP, the default method, for the IP address assignment method option (see [Figure 4](#)), clicking the Connect button causes the petitioner to be configured for Internet connectivity.

**Figure 4** *Sample Connect Page for DHCP IP Address Assignment Method***PPPoE IP Address Assignment Method**

If the introducer chooses PPPoE, input fields for PPPoE username and password are displayed (see [Figure 5](#)). The introducer must enter the username and password as supplied by the Internet service provider (ISP) and then click the Connect button, which causes petitioner to be configured for Internet connectivity.

**Figure 5** *Sample Connect Page for PPPoE IP Address Assignment Method***Static IP Address Assignment Method**

If the introducer chooses static, input fields for the IP address, netmask, and the default gateway are displayed (see [Figure 6](#)). The introducer must enter the configuration values as supplied by the ISP and then click the Connect button, which causes petitioner to be configured for Internet connectivity.

**Figure 6** *Connect Page for Static IP Address Assignment Method*

#### Connect Page IP Address Configuration

After IP address configuration, Internet connectivity is tested again by attempting to access a known URL configured by the administrator in the prep-connect template ([www.cisco.com](http://www.cisco.com) by default). If Internet connectivity is now established either the start page or welcome page is displayed, depending on the prep-connect template setting as defined by the administrator. If Internet connectivity is not established, the introducer should verify the settings entered or contact their administrator.

## SDP Start Phase

The start page is optional. Without the start page, during the SDP exchange, the user clicks the Next button on the welcome page and is sent to the registrar's introduction page. Because the user has not previously connected to the registrar, the user is required to log in to the registrar using available credentials (per the registrar configuration). Some browsers fail to reconnect to the registrar after the user credentials are requested (after the user has entered the login data). As of Cisco IOS Release 12.4(4)T, users may configure their browsers to begin the SDP exchange by contacting the registrar's introduction URL via a start page. Thereafter, the registrar can direct the user to the welcome page, which is on the petitioner device. The SDP transaction will then continue through the welcome, introduction, and completion phases as described in this document.

To begin the SDP transaction from the registrar, the user must configure the browser via the **template http start** command; otherwise, the SDP transaction must begin from the welcome page on the petitioner. For more information on how to configure a custom template, see the section "[How Custom Templates Work with SDP](#)."

Before the welcome page is displayed, the user must direct his or her browser to the start page via the URL <http://registrar/ezsdd/intro>. A login dialog box is then displayed, and the end user can log into the registrar via a username and password supplied by the administrator to access the secure network (see [Figure 7](#)).

**Figure 7** Registrar Remote Login Dialog Box

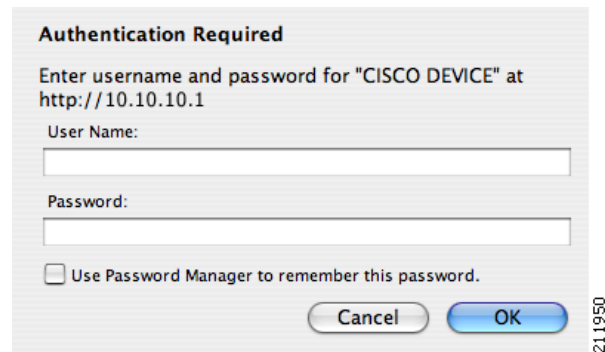

After entering a valid username and password, the start page is displayed (see [Figure 8](#)).

**Figure 8** Sample SDP Start Page

After entering the URL of the petitioner's welcome page (for example, <http://10.10.10.1/ezsdd/welcome>) and clicking the Next button on the start web page, the end user enters the SDP welcome phase and logs into his or her petitioner as shown in [Figure 9](#).

## SDP Welcome Phase

The welcome phase begins when the user clicks the Next button on the start page. Before the welcome page is displayed, the user must log into the petitioner via the URL “<http://10.10.10.1/ezsdd/welcome>.” The local login dialog box is then displayed (see [Figure 9](#)). The end user can then log into the local device via the factory default username (cisco) and password (cisco).

**Figure 9**      **Petitioner Local Login Dialog Box**

After the password is successfully entered, the welcome web page is displayed (see [Figure 10](#)), which is served by the petitioner.

**Figure 10**      **Sample SDP Welcome Page**

After entering the URL of the registrar (for example, <http://192.0.2.155/ezsdd/intro>) and clicking the Next button on the welcome web page, the SDP introduction phase begins and the introduction page, which is served by the registrar, is displayed.

## SDP Introduction Phase

Before the introduction page is displayed, the end user must log into the registrar if the user has not already done so from the start page (see [“SDP Start Phase”](#)), which utilizes the external AAA database.

With an external AAA database, the introducer can use an account on the database to perform the introduction without requiring knowledge of the enable password of the registrar. Without an external AAA database, the introducer may use the enable password of the registrar for authentication.

### Note

Using the enable password of the registrar exposes the password to end users; therefore, it is recommended that the enable password be used for administrative testing only.

The administrative introducer is identified by the HTTP authentication for the introduction page (or the start page), with the AAA database query returning administrative privilege for the user. If the introducer has administrator privilege, the device name is that which was entered in the administrative introduction page. If the introducer does not have administrative privileges, the device name is the introducer name. The existing device certificate is the current certificate on the petitioner, which may be the

manufacturing identification certificate (MIC). This certificate may or may not exist. For more information on the function of the external AAA database, see the section “[How SDP Uses an External AAA Database](#).”

After the end user successfully enters his or her password, the introduction web page is displayed (see [Figure 11](#)).

**Figure 11** *Sample SDP Introduction Page*

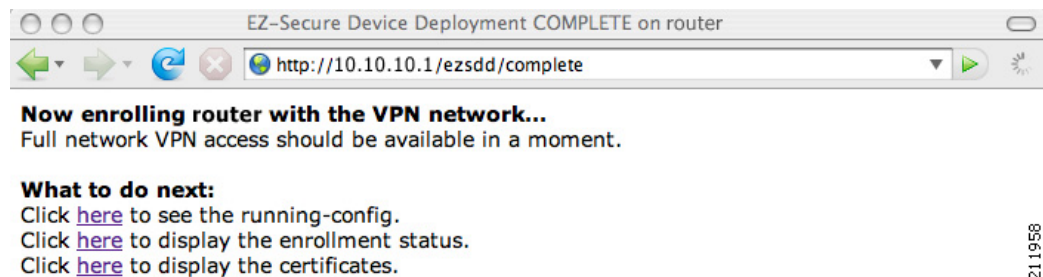

At this point, the registrar passes device information to the external management system to obtain a bootstrap configuration file. For more information on options available to identify a customized bootstrap configuration file, see the section “[Custom HTML Template Expansion Rules](#).”

After the end user clicks the Next button on the introduction page, the end user enters the completion phase and automatically returns to his or her local device.

## SDP Completion Phase

Now that the end user has enrolled the petitioner with the registrar, the petitioner will serve the completion page (see [Figure 12](#)).

**Figure 12** *Sample SDP Completion Page*

The SDP exchange is now complete. The petitioner has received configuration information from the registrar and should receive a certificate from the registrar shortly.

## SDP Leveraging USB Tokens

SDP provides for highly scalable deployments and streamlines the deployment of an individual device or multiple devices. USB tokens provide for secure storage and configuration distribution.

As of Cisco IOS Release 12.4(15)T or a later release, USB tokens may be utilized to transfer PKI credentials using SDP to a remote device, and SDP may be used to configure the USB token. The USB token may then be used to provision a device at the same location, or the USB token may be transported to another location where it may be used to provision a remote device. For more information about configuring and using USB tokens, see the “[Related Documents](#)” section.

An example SDP deployment using a USB token to transfer PKI credentials is shown in [Figure 13](#). The required devices include the USB token and the SDP entities required to provision a device. These SDP entities are the introducer, the registrar, a petitioner at the local location, Petitioner A, and a petitioner at the remote location, Petitioner B. Optionally, a management server may be used.

**Note**

An optional configuration would be to configure one device as both the registrar and a petitioner, which may be beneficial when the USB token is transported to a remote location. The remote location would not require a separate petitioner device.

**Figure 13** Example SDP Environment Using USB Tokens to Transfer Credentials

230524

## Use of SDP to Configure the USB Token

Prior to initiating an SDP introduction a USB token is inserted into the petitioner device. In the example configuration shown in [Figure 13](#), the USB token would be inserted into Petitioner A. The petitioner may be configured to ignore any existing information on the USB token. As in regular SDP operations, for a scalable configuration of USB tokens, an initial template configuration has to be prepared and placed onto each SDP device with appropriate target configuration information.

Files used to provision a device are moved in the following sequence, shown by the numbered arrows in [Figure 13](#).

1. One petitioner, Petitioner A, is at the local location. petitioner A engages directly with the SDP exchange to perform the initial configuration of the USB token. Files used to configure the USB token, binary files and template files, are retrieved from the registrar and moved to Petitioner A. The URL for the binary file location is expanded on the registrar. Binary files are not processed through the template expansion functions. The template expansion occurs on the registrar for both the source URL and destination URL. By default, binary files and template files will be retrieved from and stored to NVRAM on the registrar and petitioner respectively. The binary file location on the registrar and the destination binary file location on Petitioner A may be specified with the **binary file** command. The template file location on the registrar and the destination template file location on Petitioner A may be specified with the **template file** command.
2. The RSA keys and certificate chain information are moved from Petitioner A to the USB token.
3. The USB token is transported to the remote location where it is inserted into Petitioner B.
4. The configuration files on the USB token are used to provision the local device. Files from the USB token may be moved to a storage location on Petitioner B with the **crypto key move rsa** command.

## SDP Phases with a USB Token

The same SDP phase concepts introduced in the “[SDP Overview](#)” section are used, with the following distinctions in the SDP welcome phase, the SDP introduction phase, and the SDP completion phase.

### SDP Welcome Phase with a USB Token

The SDP welcome phase begins as usual, when an introduction is initiated by connecting to the welcome user interface. If there is an existing certificate on the USB token, it will be used for signing the SDP exchange. Instead of a local RSA key pair, a new RSA key pair on the token is used.

#### Note

The RSA key pair generation may take a substantial length of time, anywhere from 5 to 10 minutes if the key is generated on the token. The length of time is dependent on hardware key generation routines available on the USB token. An informative web page will be presented to the introducer, indicating that RSA key pair generation is occurring.

The new key pair generated by Petitioner A is added to the USB token without removing any existing RSA key pairs. SDP AV pairs indicate both that a token is being used and if there is any token secondary configuration information. If an optional management server is in use, the AV pair information is used to determine if any special configuration commands are needed.

### SDP Introduction Phase with a USB Token

The SDP Introduction phase begins with AV pairs being transferred to the registrar. When the registrar detects USB token related AV pairs, the registrar, if previously configured, may prepare configuration information destined for the USB token. Currently configuration commands are sent as a specific configuration files that are subsequently merged with the running configuration.

The administrator can leverage normal SDP configuration commands to configure the USB token. USB token information that should be configured includes the certificate, the bootstrap configuration, and the PIN number configuration.

### **SDP Completion Phase with a USB Token**

At the beginning of the completion phase, the introduction proceeds with AV pairs being transferred to the petitioner (in [Figure 13](#), this would be Petitioner A). The various files are stored in the specified file system locations and then the existing configuration file processing proceeds. This ordering allows the configuration to take advantage of the new files that have been transferred.

## **Use of the Configured USB Token**

After the USB token is configured by Petitioner A, it is transported from its current location to the remote location, where the second petitioner, Petitioner B is located. The USB token is inserted into the target device, Petitioner B, which then inherits the USB token configuration and cryptographic material from the USB token. The end user at the remote location must have the PIN number on the USB token. The PIN number is either the default factory PIN or the PIN number the administrator configured during the introduction phase.

## **How SDP Uses an External AAA Database**

The external AAA database is accessed twice during the SDP exchange. The first time the AAA database is accessed the introducer is authenticated; that is, when the registrar receives an introduction request via the secure HTTP (HTTPS) server, the registrar does an AAA lookup based on the introducer's username and password to authorize the request. The second time the AAA database is accessed authorization information is obtained and applied to the configuration and certificates that are issued to the petitioner device; that is, the registrar checks the integrity of the request by verifying the request signature using the petitioner-signing certificate. The certificate subject name may be specified in the AAA database, and up to nine configuration template variables may be specified and expanded into the template configuration.

### **Use of a Self-Signed Certificate Versus a Certificate Issued by Another CA Server**

By default, the SDP exchange results in only one certificate being issued to the petitioner device. Although just one certificate is issued, the introducer is not restricted from introducing multiple devices and thus obtaining multiple certificates. By specifying the subject name in the certificate that is issued, you can be assured that all certificates that are issued in this way are associated with the introducer. You can use PKI AAA integration to further restrict the use of these certificates. Additionally, the AAA database can be configured to accept only one authentication and authorization request per user.

Because the petitioner certificate is self-signed, it is just used to convey the public key of the petitioner. No verification or authorization check is performed on the certificate; thus, authorization is per-user based and no per-device information is used.

There are some scenarios when per-device authorization is preferred. Therefore, if the petitioner is able to use certificates issued by other certification authority (CA) servers for SDP transactions, the existing PKI can be used and authorization can be achieved over the certificate attributes.

Configuring the petitioner and the registrar for certificate-based authorization provides authorization of the specific device being deployed. Previously, introducer-to-petitioner device communication was secured only using physical security between the introducer and the petitioner device. SDP certificate-based authorization gives the registrar an opportunity to validate the current device identity before accepting the introduction.

## Authentication and Authorization Lists for SDP

When you are configuring your SDP registrar, if you specify an authentication list and an authorization list, the registrar uses the specified lists for all introducer requests. The authentication list is used when authenticating the introducer (the AAA server checks for a valid account by looking at the username and password). The authorization list is used to receive the appropriate authorized fields for the certificate subject name and a list of template variables to be expanded into the Cisco IOS command-line interface (CLI) snippet that is sent back to the petitioner. The authentication and authorization lists will usually point to the same AAA server list, but it is possible to use a different database for authentication and authorization. (Storing files on different databases is not recommended.)

When a petitioner makes an introduction request, multiple queries are sent to the AAA list database on the RADIUS or TACACS+ server. The queries search for entries of the following form:

```
user Password <userpassword>
 cisco-avpair="ttdi:subjectname=<<DN subjectname>>"
 cisco-avpair="ttdi:iosconfig#<<value>>"
 cisco-avpair="ttdi:iosconfig#<<value>>"
 cisco-avpair="ttdi:iosconfig#=<<value>>"
```

### Note

The existence of a valid AAA username record is enough to pass the authentication check. The “cisco-avpair=tdi” information is necessary only for the authorization check.

If a subject name was received in the authorization response, the SDP registrar stores it in the enrollment database, and that “subjectname” overrides the subject name that is supplied in the subsequent certificate request (PKCS10) from the petitioner device.

The numbered “tdi:iosconfig” values are expanded into the SDP Cisco IOS snippet that is sent to the petitioner. The configurations replace any numbered (\$1 through \$9) template variable. Because the default Cisco IOS snippet template does not include the variables \$1 through \$9, these variables are ignored unless you configure an external Cisco IOS snippet template. To specify an external configuration, use the **template config** command. For more information on external configurations, see the section [“Custom Configuration and File Template Variable Expansion Rules at the Petitioner.”](#)

### Note

The template configuration location may include a variable “\$n,” which is expanded to the name with which the user is logged in.

## Authentication and Authorization Lists for an Administrative Introducer

The SDP mechanisms assume a permanent relationship between the introducer and the device. As a result, the introducer username is used to define the device name.

In some SDP deployment scenarios, the introducer is an administrator doing the introduction for many devices. However, using the introducer (the administrator) name to define the device name results in multiple devices being incorrectly deployed with the same device name. Instead, an administrative introducer allows the administrator to specify the correct device name during the introduction.

More generally stated, the introducer username is used as the database record locator to determine all other information about the device including the Cisco IOS configuration template, various template variables (pulled from an AAA database and expanded into the template), and the appropriate subject name for PKI certificates issued to the device. For simplicity, this database record locator is called the user/device name.

The administrative introducer provides a device name. In that way, an administrator can provide the appropriate record locator when doing an introduction. For example, if an administrator is trying to introduce a device for username “user1,” the administrator introduces the device into the PKI network and provides user1 as the record locator after logging into the registrar using the administrator’s own credentials. The record locator, user1, becomes the device name. All other template and PKI certificate subject name information specific to the introduction is then provided by the user1 username records instead of by the administrator’s record.

The registrar device uses the supplied username information with a user introducer name. The username allows the existing mechanisms for determining a user’s authorization, template, and PKI certificate information to be supported without modification.

## How Custom Templates Work with SDP

You may use custom templates to streamline the SDP process.

- Custom templates allow you to complete the web pages with the required start information, so the introducer is no longer required to contact the registrar and can immediately begin the SDP transaction.
- Custom templates allow customized deployment information to be displayed on the web pages, thereby tailoring the user experience.

An easy way to define a custom template is to modify the default template. Without custom templates, the introducer must contact the registrar for information to begin the SDP transaction. For a list of the default templates, see the section “[Default Templates for SDP Transaction Web Pages](#).”

### Note

It is recommended that only advanced SDP users configure custom templates because problems can result from modifying templates incorrectly before the templates are displayed in the introducer’s browser.

## Custom Template Variable Expansion

There are expansion variables in the templates that are replaced by the Cisco IOS SDP registrar or petitioner. These variables are expanded as follows:

- \$\$—“\$”
- \$a—attribute-value (AV) pairs
- \$c—Trusted certificate
- \$d—Dump AV pairs in browser
- \$h—Hostname
- \$k—Keylabel or “tti”
- \$l—Trustpoint label = “tti”
- \$n—HTTP client’s username
- \$s—Default TTI key size
- \$t—Trustpoint configuration
- \$u—Completion URL
- \$1 to \$9—Variables retrieved from AAA server during user authentication

## Custom Template Variable Expansion Rules

Configuration and templates are used during an SDP exchange. Prior to use and after distribution, these templates are expanded using the following rules based in the SDP communication stage.

### Custom HTML Template Expansion Rules

HTML templates are expanded immediately before being served to the HTTP client. The HTTP templates are expanded as follows:

- \$u—Completion url, which is be populated with the SDP completion URL (for example: `http://10.10.10.1/ezsdd/completion`). This variable is used internally by SDP as the internal “wizard” state. It is expected that the SDP introduction page include something similar to the following text: “<FORM action=“\$u”method=“post”>” for normal wizard processing.
- \$n—introducer name or the device name entered by the administrative introducer.
- \$\$—\$
- \$h—Hostname
- \$a—All AV pairs with or without a specified template character will be written out in the following HTML form format. (Because these AV pairs are not “INPUT type=hidden,” they are directly displayed on the web page for debugging templates or the SDP process.)

```
<INPUT type=hidden NAME=“attribute string here”
```

```
value=“variable string here”>

```

all HTML templates should have this!

```
$d = dump all av pairs in: attribute = value

```

### URL Template Expansion Rules

There are URLs for the configuration template source, the file template source, and the file destination. These variables are expanded when the registrar prepares the URL, just before retrieving the configuration or file. For the file destination, these variables are expanded just before the petitioner copies the file to the file destination.

- \$\$—\$
- \$h—Hostname

### Custom Configuration and File Template Variable Expansion Rules

Custom configuration and file template variables are expanded both when the registrar prepares the configuration or file template and when the petitioner receives the configuration or file template.

#### Custom Configuration and File Template Variable Expansion Rules at the Registrar

When the registrar expands the configuration or file template, the following variables are used by the Cisco IOS CA. These variables are expanded before being sent through the SDP wizard.

- \$\$—\$
- \$h—Hostname
- \$t—A simple default trustpoint configuration that includes \$l, \$k, and \$s to be expanded at the client
- \$1 to \$9—Variables retrieved from AAA server during user authentication (not applicable to the file template)

### Custom Configuration and File Template Variable Expansion Rules at the Petitioner

When the petitioner expands the configuration or file template, the following variables are expanded:

- \$\$—\$
- \$h—Hostname
- \$k—Keylabel
- \$l—Trustpoint label
- \$s—Key size
- \$c—Expanded to certificate chain
- \$n—Expanded to username (not applicable to the file template)

### Custom Configuration HTTP Template Variable Expansion Rules

Custom configuration HTTP templates provide flexibility for backend Common Gateway Interface (CGI) scripts and integration with external management systems. Template URLs run through the HTTP template expansions before registrar retrieves the bootstrap configuration from the external management system. The device name (\$n) is expanded into the URL and passed to the external management system so that a specific bootstrap configuration file can be located based on the device information.

#### Note

You should only modify the HTML text that is displayed. The existing expansion variables, Javascript, and forms in the default templates should not be removed when customizing the templates. They are required for SDP to function properly.

The HTTP template expansion and **template config** command allow you to specify either of the following file types to obtain a customized bootstrap configuration file:

- A configuration file based on the device name (for example, template config  
http://myserver/\$n-config-file.conf)
- A CGI script based on the device name (for example, template config  
http://myserver/cgi-bin/mysdpcgi post)

As of Cisco IOS Release 12.4(6)T, the CGI support has been expanded so that the bootstrap configuration can be identified by not only the device name, but also the type, current Cisco IOS version information, and current configuration. This functionality expands the **template config** command with the **post** keyword, which tells the registrar to send this additional device information to the external management system via a CGI script with the HTTP or HTTPS protocol only.

The registrar passes the device information via AV pairs (\$a) to the external management system. Using the AV pair information, the management system identifies the appropriate bootstrap configuration files and sends it back to the registrar. The additional AV pairs that are sent with the expanded CGI support for identification of customized bootstrap configuration file are shown in [Table 1](#).

**Table 1** AV Pairs Sent During HTTP Post to External Management System

| AV Pair             | Description                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------|
| TTIFixSubjectName   | AAA_AT_TTI_SUBJECTNAME (sent only if the realm authentication user is not the root user on the registrar) |
| TTIIosRunningConfig | Output of <b>show running-config brief</b>                                                                |
| TTIKeyHash          | Digest calculated over the device public key                                                              |

**Table 1** *AV Pairs Sent During HTTP Post to External Management System (continued)*

| AV Pair        | Description                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TTIPrivilege   | AAA_AT_TTI_PRIVILEGE—"admin" is sent if the user is an administrator, "user" is sent if the user is not an administrator (sent only if the realm authentication user is an administrator and the information is available from the AAA server) |
| TTISignature   | Digest calculated over all AV pairs except UserDeviceName and TTISignCert                                                                                                                                                                      |
| TTISignCert    | Device current certificate (sent only if the device currently has a certificate)                                                                                                                                                               |
| TTITemplateVar | AAA_AT_TTI_IOSCONFIG(1-9) (sent only if the realm authentication user is not the root user on the registrar)                                                                                                                                   |
| TTIUserName    | Device name                                                                                                                                                                                                                                    |
| TTIVersion     | TTI version of the registrar                                                                                                                                                                                                                   |
| UserDeviceName | Device name as entered by the administrative introducer (sent only if the realm authentication user is an administrator)                                                                                                                       |

**Note**

The registrar must be running Cisco IOS Release 12.4(6)T, the **template config** command must be issued with the **post** keyword, and the *url* argument must include either HTTP or HTTPS. No other protocol is supported for the expanded CGI template functionality (for example, FTP).

## Default Templates for SDP Transaction Web Pages

The following default templates exist for each SDP transaction web page:

- [Default Prep-Connect Template](#)
- [Default Start Page Template](#)
- [Default Welcome Page Template](#)
- [Default Introduction Page Template](#)
- [Default Admin-Introduction Page Template](#)
- [Default Completion Page Template](#)

### Default Prep-Connect Template

The prep-connect template may be modified by the administrator to contain values that are appropriate for their environment. The format of the prep-connect page may also be modified by the settings contained in the template.

Except for the registrar IP address, which the administrator must customize, the prep-connect template may be used as shown below.

```
<html><head><title>
SDP: Test Internet Connection</title></head>
<noscript>
If you see this message, your browser is not running JavaScript,

which is required by Cisco Secure Device Provisioning.

If you cannot enable JavaScript, please contact your system administrator.

</noscript>
<body style="background-color: rgb(204, 255, 255);">
```

```

<div style="text-align: center;"><big><big>
Secure Device Provisioning</big>

Test Internet Connection</big>

<form action="http://10.10.10.1/ezsdd/connect" method="post">
<input type="submit" value="Log onto Cisco Device">

Default username/password is cisco/cisco.
<input type="hidden" name="TTIAfterConnectURL"
value="http://10.10.10.1/ezsdd/welcome">
<!-- Note, that for the below, 198.133.219.25 = www.cisco.com. -->
<input type="hidden" name="TTIConnectTestURL" value="http://198.133.219.25">
<input type="hidden" name="TTIInsideAddr" value="10.10.10.1">
<input type="hidden" name="TTIlanport" value="Vlan1">
<input type="hidden" name="TTIwanport" value="FastEthernet4">
</form></div></body></html>

```

### Hidden HTML Form Fields

The hidden HTML form fields communicate initial configuration information to the browser as set by the administrator and are not signed.

#### Note

The term “hidden” refers to the fact that these HTML form fields are not displayed on the prep-connect page to reduce potential confusion to the introducer.

The administrator can set hidden HTML form fields in the prep-connect template as shown in [Table 2](#).

**Table 2 Administrator Defined AV Pairs Sent During Prep-Connect Phase**

AV Pair	Description
TTIAfterConnectURL	The administrator may set the TTIAfterConnectURL field to either the welcome page URL or the start page URL. The welcome page URL is specified with the factory default petitioner IP address. The connect after URL may be any valid URL if SDP is not going to be used after establishing Internet connectivity.
TTIConnectTestURL	The administrator may set the TTIConnectTestURL field to a valid URL that should be accessible when Internet connectivity is established. The default prep-connect template value is www.cisco.com (198.133.219.25).
TTIInsideAddr	The administrator may set the TTIInsideAddr field to the factory default IP address of the petitioner. For the Cisco 871 ISR, the IP address is 10.10.10.1.
TTIlanportx	The administrator may set the TTIlanportx field to the LAN interface name of the petitioner platform. This field is used to apply the Cisco IOS connect configuration. For the Cisco 871, the field value is “Vlan1.”
TTIwanport	The administrator may set the TTIwanport field to the WAN interface name of the petitioner. This field is used to apply the Cisco IOS connect configuration. For the Cisco 871, the field value is “FastEthernet4.”

#### Note

The connect template cannot be customized.

## Default Start Page Template

```
<html><head><title>EZ-Secure Device Deployment Start page on $h</title></head>
<NOSCRIPT>
If you see this message, your browser is not running JavaScript.

Cisco Secure Device Deployment requires JavaScript.
 Please contact
your system administrator.

</NOSCRIPT>
<SCRIPT LANGUAGE="JavaScript">
function submit_to_url(form){
form.action=form.TTIWelcomeURL.value;return true;}</SCRIPT>
Welcome to Cisco Secure Device Deployment Server $h <FORM
action="" method="post" onSubmit="return submit_to_url(this)"> Your
device:

end
```

## How to Set Up SDP for a PKI

This section contains the following procedures that should be followed when setting up SDP for your PKI. You can configure the registrar according to only one of the registrar configuration tasks.

- [Enabling the SDP Petitioner, page 21](#)
- [Enabling the SDP Registrar and Adding AAA Lists to the Server, page 23](#)
- [Enabling the SDP Registrar for Certificate-Based Authorization, page 27](#)
- [Configuring an Administrative Introducer, page 29](#)
- [Configuring Custom Templates, page 32](#)

### Enabling the SDP Petitioner

Perform this task to enable or disable the petitioner and associate a trustpoint with the SDP exchange.

You can also use this task to configure the petitioner to use a certificate and the Rivest, Shamir, and Adelman (RSA) keys associated with a specific trustpoint.

#### Note

The petitioner is enabled by default on a Cisco device that contains a crypto image; thus, you have only to issue the **crypto provisioning petitioner** command if you have previously disabled the petitioner or if you want to use an existing trustpoint instead of the automatically generated trustpoint.

Note

By default, the SDP petitioner device uses an existing certificate. If multiple certificates and one specific certificate exist, use this task to make a choice. However, this task is not necessary to enable the default behavior.

## Prerequisites

- The HTTP server must be enabled via the **ip http server** command. (The HTTP server is typically enabled by default on many default Cisco IOS configurations.)
- If you are configuring the petitioner to use a certificate and RSA keys, your SDP petitioner device must have an existing manufacturer’s or a third-party certificate.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto provisioning petitioner**
4. **trustpoint** *trustpoint-label*  
or  
**trustpoint signing** *trustpoint-label*
5. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto provisioning petitioner</b>  <b>Example:</b> Router(config)# crypto provisioning petitioner	Allows SDP petitioner device behavior to be modified and enters tti-petitioner configuration mode. <div> <div>Note</div> <div>Effective with Cisco IOS Release 12.3(14)T, the <b>crypto provisioning petitioner</b> command replaced the <b>crypto wui tti petitioner</b> command.</div> </div>

	Command or Action	Purpose
Step 4	<b>trustpoint</b> <i>trustpoint-label</i>	(Optional) Specifies the trustpoint that is to be associated with the SDP exchange between the petitioner and the registrar.
	<b>Example:</b> Router(tti-petitioner)# <b>trustpoint</b> mytrust  or  <b>trustpoint signing</b> <i>trustpoint-label</i>  <b>Example:</b> Router(tti-petitioner)# <b>trustpoint</b> signing mytrust	<b>Note</b> If this command is not issued, the <i>trustpoint-label</i> argument is automatically labeled “tti.”  (Optional) Specifies the trustpoint and associated certificate that are used when signing all introduction data during the SDP exchange.
Step 5	<b>end</b>	(Optional) Exits tti-petitioner configuration mode.
	<b>Example:</b> Router(tti-petitioner)# <b>end</b>	

## Troubleshooting Tips

After the SDP exchange is complete, a new trustpoint-label named “tti” will exist. The trustpoint will be automatically enrolled with the certificate server (the registrar). To verify that the trustpoint is really there, use the **show running-config** command.

## What to Do Next

If you set up the petitioner to use a certificate and the RSA keys associated with the specified trustpoint, you should configure the registrar as shown in the task [“Enabling the SDP Registrar for Certificate-Based Authorization.”](#)

## Enabling the SDP Registrar and Adding AAA Lists to the Server

Perform this task to enable the registrar and associate a certificate server with the SDP exchange.

You can also use this task if you want to add an authentication list and an authorization list to the RADIUS or TACACS+ server.

## Prerequisites

Before configuring an registrar, ensure the following tasks are complete:

- Enable the HTTP server or the HTTPS server.

### Note

It is recommended that you issue the **ip http secure-server** command to enable the HTTPS web server. If you enable a secure server, you should issue the **ip http secure-trustpoint** command. You must disable the standard HTTP server via the **no ip http server** command (if the standard server is enabled). The specified trustpoint is a registrar local trustpoint appropriate for HTTPS communication between the registrar and the user’s browser.

- Configure the Cisco IOS certificate server (via the **crypto pki server** command).

If you are configuring AAA lists, you should complete the prerequisites required for the registrar in addition to completing the following tasks:

- Add user information to the AAA server database. To configure a RADIUS or TACACS+ AAA server, see the “Configuring RADIUS” and “Configuring TACACS+” chapters of the *Cisco IOS Security Configuration Guide*.
- Configure new AAA lists. To configure AAA lists, see the following chapters in the *Cisco IOS Security Configuration Guide*: “Configuring RADIUS,” “Configuring TACACS+,” “Configuring Authentication,” and “Configuring Authorization.”

## Restrictions

### Cisco IOS CA Device Requirement

During the SDP process, a Cisco IOS CA certificate is automatically issued to the peer device. If an SDP registrar is configured on a third-party vendor’s CA device, the SDP process will not work.

## The template config Command

There are nine Cisco IOS configuration variables. If you require more configuration flexibility, the **template config** command can be used to reference a configuration template that is specific to the introducer. For more information on configuration flexibility, see the “[Custom Configuration and File Template Variable Expansion Rules](#)” section.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto provisioning registrar**
4. **pki-server** *label*
5. **authentication list** *list-name*
6. **authorization list** *list-name*
7. **template username** *name* [**password** *password*]
8. **template config** *url* [**post**]
9. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto provisioning registrar</b>  <b>Example:</b> Router(config)# crypto provisioning registrar	Configures a device to become a registrar for the SDP exchange and enters tti-registrar configuration mode. <p><b>Note</b> Effective with Cisco IOS Release 12.3(14)T, the <b>crypto provisioning registrar</b> command replaced the <b>crypto wui tti registrar</b> command.</p>
Step 4	<b>pki-server label</b>  <b>Example:</b> Router(tti-registrar)# pki-server mycs	Specifies the certificate server that is to be associated with the SDP exchange between the petitioner and the registrar.
Step 5	<b>authentication list list-name</b>  <b>Example:</b> Router (tti-registrar)# authentication list authen-tac	(Optional) Authenticates the introducer in an SDP exchange.
Step 6	<b>authorization list list-name</b>  <b>Example:</b> Router (tti-registrar)# authorization list author-rad	(Optional) Receives the appropriate authorized fields for the certificate subject name and list of template variables to be expanded into the Cisco IOS CLI snippet that is sent back to the petitioner.
Step 7	<b>template username name [password password]</b>  <b>Example:</b> Router(tti-registrar)# template username ftpuser password ftppwd	(Optional) Establishes a username and password in which to access the configuration template on the file system.

	Command or Action	Purpose
Step 8	<b>template config url [post]</b>  <b>Example:</b> Router(tti-registrar)# template config http://myserver/cgi-bin/mycgi post	(Optional) Specifies a remote URL for the Cisco IOS CLI configuration template.  The <i>url</i> can reference a configuration file allows you to specify the device name (\$n) to identify a bootstrap configuration. CGI support allows you to reference a CGI script via HTTP or HTTPS and identify the bootstrap configuration by not only the device name, but also by the type, current Cisco IOS version information, and current configuration.  The <b>post</b> keyword must be used for CGI support.  <b>Note</b> The registrar must be running Cisco IOS Release 12.4(6)T or later to utilize expanded CGI support. If the registrar is running an earlier version of Cisco IOS, the additional device identification information will be ignored.
Step 9	<b>end</b>  <b>Example:</b> Router(tti-registrar)# end	(Optional) Exits tti-registrar configuration mode.

## Examples

To help troubleshoot the SDP transaction, you can issue the **debug crypto provisioning** command, which displays output from the petitioner and registrar devices.

The following is output for the **debug crypto provisioning** command. The output from the petitioner and registrar devices are shown below.

```
Petitioner device
! The user starts the Welcome phase.
Nov 7 03:15:48.171: CRYPTO_PROVISIONING: received welcome get request.
! The router generates a Rivest, Shamir, and Adelman (RSA) keypair for future enrollment.
Nov 7 03:15:48.279: CRYPTO_PROVISIONING: keyhash 'A506BE3B83C6F4B4A6EFCEB3D584AACA'
! The TTI transaction is completed.
Nov 7 03:16:10.607: CRYPTO_PROVISIONING: received completion post request.
```

```
Registrar device
!. During the introduction phase, the browser prompts for login information.
06:39:18: CRYPTO_PROVISIONING: received introduction post request.
06:39:18: CRYPTO_PROVISIONING: checking AAA authentication (ipsecca_script_aalist,
ttiuser)
! This happens if the user types in the wrong username or password.
06:39:19: CRYPTO_PROVISIONING: authentication declined by AAA, or AAA server not found -
0x3
06:39:19: CRYPTO_PROVISIONING: aaa query fails!
! The user re-enters login information.

## Enabling the SDP Registrar for Certificate-Based Authorization

Perform this task to enable the SDP registrar to perform the following functions:

- Verify the petitioner-signing certificate using a specified trustpoint or any configured trustpoint.
- Initiate authorization lookups using the introducer username and the certificate name field.

### Prerequisites

You must also configure the SDP petitioner to use a certificate and RSA keys associated with a specific trustpoint. To complete this task, use the trustpoint signing command as shown in the task [“Enabling the SDP Petitioner.”](#)

### Restrictions

Because RADIUS does not differentiate between authentication and authorization, you need to use the default password, cisco, for certificate authorization.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto provisioning registrar**
4. **template file** *sourceURL destinationURL*
5. **binary file** *sourceURL destinationURL*
6. **authentication trustpoint** {*trustpoint-label* | **use-any**}
7. **authorization** {**login** | **certificate** | **login certificate**}
8. **authorization username** {**subjectname** *subjectname*}
9. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto provisioning registrar</b>  <b>Example:</b> Router(config)# crypto provisioning registrar	Configures a device to become an SDP registrar and enters tti-registrar configuration mode.
Step 4	<b>template file</b> <i>sourceURL destinationURL</i>  <b>Example:</b> Router(tti-registrar)# template file http://myserver/registrar_file_r1 http://myserver/petitioner_file_p1	(Optional) Specifies the source template file location on the registrar and the destination template file location on the petitioner.  <b>Note</b> This command is useful when using a USB token to provision a device.  The template expansion occurs on the registrar for both the source URL and file content. The destination URL is expanded on the petitioner.
Step 5	<b>binary file</b> <i>sourceURL destinationURL</i>  <b>Example:</b> Router(tti-registrar)# binary file http://myserver/registrar_file_a1 http://myserver/petitioner_file_b1	(Optional) Specifies the binary file location on the registrar and the destination binary file location on the petitioner.  <b>Note</b> This command is useful when using a USB token to provision a device.  Both the source and destination URL are expanded on the registrar. Also, the destination URL and file content are expanded on the petitioner. Binary files are not processed through the template expansion functions.
Step 6	<b>authentication trustpoint</b> { <i>trustpoint-label</i>   <b>use-any</b> }  <b>Example:</b> Router(tti-registrar)# authentication trustpoint mytrust	(Optional) Specifies the trustpoint used to authenticate the SDP petitioner device's existing certificate. <ul style="list-style-type: none"> <li><i>trustpoint-label</i>—Specifies a specific trustpoint.</li> <li><b>use-any</b>—Specifies any configured trustpoint.</li> </ul> <b>Note</b> If you do not use this command to specify a trustpoint, the existing petitioner certificate is not validated. (This functionality provides compatibility with self-signed petitioner certificates.)

	Command or Action	Purpose
Step 7	<b>authorization {login   certificate   login certificate}</b>  <b>Example:</b> Router(tti-registrar)# authorization login certificate	(Optional) Enables AAA authorization for an introducer or a certificate. <ul style="list-style-type: none"> <li>Use the <b>login</b> keyword for authorization based on the introducer's username.</li> <li>Use the <b>certificate</b> keyword for authorization based on the petitioner's certificate.</li> <li>Use the <b>login certificate</b> keyword for authorization based on the introducer's username and the petitioner's certificate.</li> </ul>
Step 8	<b>authorization username subjectname subjectname</b>  <b>Example:</b> Router(tti-registrar)# authorization username subjectname all	Sets parameters for the different certificate fields that are used to build the AAA username. <ul style="list-style-type: none"> <li>The <b>all</b> keyword specifies that the entire subject name if the certificate is used as the authorization username.</li> </ul>
Step 9	<b>end</b>  <b>Example:</b> Router(tti-registrar)# end	(Optional) Exits tti-registrar configuration mode.

## Configuring an Administrative Introducer

Perform the following task to configure an administrative introducer using administrator authentication and authorization lists.

### Prerequisites

The administrative introducer must have enable privileges on the client device and administrator privileges on the server.

### Restrictions

When using RADIUS, a user/device that needs to be introduced by the administrative introducer must always use cisco as its own password. TACACS+ does not have this limitation; a user/device can have any password and be introduced by the administrative introducer.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto provisioning registrar**
4. **administrator authentication list** *list-name*
5. **administrator authorization list** *list-name*
6. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto provisioning registrar</b>  <b>Example:</b> Router(config)# crypto provisioning registrar	Configures a device to become an SDP registrar and enters tti-registrar configuration mode.
Step 4	<b>administrator authentication list list-name</b>  <b>Example:</b> Router(tti-registrar)# administrator authentication list authen-tac	Configures the AAA list used to authenticate an administrator during an introduction.
Step 5	<b>administrator authorization list list-name</b>  <b>Example:</b> Router(tti-registrar)# administrator authorization list author-tac	Configures the AAA list used to obtain authorization information for an administrator during an introduction. Information that can be obtained includes the certificate subject name and/or the list of template variables to be expanded into the Cisco IOS CLI snippet that is sent back to the petitioner.
Step 6	<b>end</b>  <b>Example:</b> Router(tti-registrar)# end	(Optional) Exits tti-registrar configuration mode.

## Examples

The following example from the **show running-config** command allows you to verify that an administrative introducer using administrator authentication and authorization lists have been created:

```
Router# show running-config

## Configuring Custom Templates

Perform this task to create and configure custom templates.

### SUMMARY STEPS

- enable
- configure terminal
- crypto provisioning registrar
- template http start *URL*
- template http welcome *URL*
- template http introduction *URL*
- template http admin-introduction *URL*
- template http completion *URL*
- template http error *URL*
- end

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto provisioning registrar</b>  <b>Example:</b> Router(config)# crypto provisioning registrar	Configures a device to become an SDP registrar and enters tti-registrar configuration mode.
Step 4	<b>template http start <i>URL</i></b>  <b>Example:</b> Router(tti-registrar)# template http start tftp://registrar.company.com/start.html	Directs the TTI registrar to use the custom start page template.  <b>Note</b> This command is required to use the start page functionality. If this command is not issued, the welcome page will be the initial communication between the introducer and the petitioner.

	Command or Action	Purpose
Step 5	<b>template http welcome URL</b>  <b>Example:</b> Router(tti-registrar)# template http welcome tftp://registrar.company.com/welcome.html	(Optional) Uses a custom welcome template rather than the default template.
Step 6	<b>template http introduction URL</b>  <b>Example:</b> Router(tti-registrar)# template http introduction tftp://registrar.company.com/intro.html	(Optional) Uses a custom introduction template rather than the default template.
Step 7	<b>template http admin-introduction URL</b>  <b>Example:</b> Router(tti-registrar)# template http admin-introduction tftp://registrar.company.com/admin-intro.html	(Optional) Uses a custom admin-introduction template rather than the default template.
Step 8	<b>template http completion URL</b>  <b>Example:</b> Router(tti-registrar)# template http completion tftp://registrar.company.com/completion.html	(Optional) Uses a custom completion template rather than the default template.
Step 9	<b>template http error URL</b>  <b>Example:</b> Router(tti-registrar)# template http error tftp://registrar.company.com/error.html	(Optional) Uses a custom error template rather than the default template.
Step 10	<b>end</b>  <b>Example:</b> Router(tti-registrar)# end	(Optional) Exits tti-registrar configuration mode.

## Examples

The following example shows the use of custom start, introduction, and completion templates:

```
template http start tftp://registrar.company.com/start.html
template http introduction tftp://registrar.company.com/intro.html
template http completion tftp://registrar.company.com/completion.html
```

## Configuration Examples for Setting Up a PKI via SDP

This section contains the following configuration examples:

- [Verifying the SDP Registrar: Example, page 34](#)
- [Verifying the SDP Petitioner: Example, page 37](#)
- [Adding AAA Lists to a RADIUS or TACACS+ Server: Examples, page 39](#)

- [Using a Configuration Template File: Example, page 41](#)
- [CGI Script: Example, page 41](#)
- [Configuring the Petitioner and Registrar for Certificate-Based Authentication: Example, page 43](#)
- [Configuring an Administrative Introducer Using Authentication and Authorization Lists: Example, page 44](#)

## Verifying the SDP Registrar: Example

The following sample output from the **show running-config** command verifies that the certificate server “cs1” was configured and associated with the SDP exchange between the registrar and petitioner:

```
Router# show running-config

## Verifying the SDP Petitioner: Example

After the SDP exchange is complete, the petitioner will automatically enroll with the registrar and obtain a certificate. The following sample output via the **show running-config** command shows the automatically generated configuration, which verifies that the trustpoint is really there:

```
Router# show running-config

Building configuration...

## Adding AAA Lists to a RADIUS or TACACS+ Server: Examples

This section contains the following configuration examples:

- [TACACS+ AAA Server Database: Example, page 40](#)
- [RADIUS AAA Server Database: Example, page 40](#)
- [AAA List on a TACACS+ and a RADIUS AAA Server: Example, page 40](#)

## TACACS+ AAA Server Database: Example

In the following example, user information has been added to a TACACS+ AAA database. The username is “user1.” The password is “cisco.” Two Cisco IOS configuration template variables are configured for “user1”: iosconfig1 and iosconfig2. The variables will replace \$1 and \$2 in the configuration template file. The subject name “CN=user1, O=company, C=US” is also configured. This subject name will replace the subject name field in the subsequent enrollment request (PKCS10) that is received from the petitioner device.

```
user = user1
 password = clear "pswd"

 service=tti
 ! The certificate server inserts the following subject name to the certificate.
 set subjectname="CN=user1, O=company, C=US"

 ! Up to nine template variables may be added.
 set iosconfig1="ntp server 10.3.0.1"
 set iosconfig2="hostname user1-vpn"
```

## RADIUS AAA Server Database: Example

User information has been added to the RADIUS AAA server database in the following example. The username is “user1.” The password is “cisco.” Two Cisco IOS configuration template variables are configured for “user1”: iosconfig1 and iosconfig2. The variables will replace \$1 and \$2 in the configuration template file. The subject name “CN=user1, O=company, C=US” is also configured. This subject name will replace the subject name field in the subsequent enrollment request (PKCS10) that is received from the petitioner device.

```
user = user1
 password = clear "pswd"
 radius=company
 reply_attributes=9,1="tti:subjectname=CN=user1, O=company, C=US"
 ! Up to nine template variables may be added.
 9,1="tti:iosconfig1=ntp server 10.3.0.5"
 9,1="tti:iosconfig2=hostname user1-vpn"
```

## AAA List on a TACACS+ and a RADIUS AAA Server: Example

The following is a configuration example showing that AAA authentication has been configured on a TACACS+ server and that AAA authorization has been configured on a RADIUS server.

### Note

---

Authentication and authorization usually point to the same server.

---

```
Router(config)# tacacs-server host 10.0.0.48 key cisco
Router(config)# aaa authentication login authen-tac group tacacs+
```

```
Router(config)# radius-server host 10.0.1.49 key cisco
Router(config)# aaa authorization network author-rad group radius
```

## Using a Configuration Template File: Example

You can use a different configuration template file on the basis of the introducer name. For example, if you have multiple template files for different users, each with the username in the filename, configure the following under the registrar:

```
Router(config)# crypto provisioning registrar
Router (tti-registrar)# pki-server cs1
Router (tti-registrar)# template config tftp://server/config-$n.txt
```

In this example, the default configuration file shown in the section “[Default Template for the Configuration File](#)” will be used because the **template config** command does not reference a CGI script.

## CGI Script: Example

The following example would execute a CGI script named “mysdpcgi”:

```
Router(config)# crypto provisioning registrar
Router (tti-registrar)# pki-server cs1
Router (tti-registrar)# template config tftp://server/cgi-bin/mysdpcgi post
```

The following is an example CGI script, named “mysdpcgi”, that would be executed with the example **template config** command above:

```
#!/usr/bin/perl -w

for debugging use the -debug form
use CGI (-debug);
use CGI;

base64 decoding is being used.
use MIME::Base64;

The following has been commented out, but left for your information.
#
Reading everything that has been received from stdin and writing it to the debug log to
see what has been sent from the registrar.
#
Remember to reset the STDIN pointer so that the normal CGI processing can get the input.
#
print STDERR "mysdpcgi.cgi dump of stdin:\n";
if($ENV{'REQUEST_METHOD'} eq "GET"){
$input_data = $ENV{'QUERY_STRING'};
}
else {
$data_length = $ENV{'CONTENT_LENGTH'};
$bytes_read = read(STDIN, $input_data, $data_length);
}
print STDERR $input_data, "\n";
exit;

$query = new CGI;
my %av_table;

A basic configuration file is being sent back, therefore it is being indicated as plain
text in the command below.
```

```

print $query->header ("text/plain");
print "\n";

For testing, parameters can be passed in so that the test applications can
see what has been received.
#
print STDERR "The following are the raw AV pairs mysdp.cgi received:\n";
for each $key ($query->param) {
print STDERR "! $key is: \n";
$value = $query->param($key);
print STDERR "! ", $value;
print STDERR "! \n";
}

The post process AV pairs are identical to those in Cisco IOS and may be used to produce
AV pair specific configurations as needed.

%av_table = &postprocessavpairs($query->param);

Decoded values may be written out.
WARNING: Some error_logs cannot handle the amount of data and will freeze.
print STDERR "The following are the decoded AV pairs mysdp.cgi received:\n";
now write the values out
while (($a, $v) = each(%av_table)) {
print STDERR "$a = $v\n";
}

Identifying the AV pairs and specifying them in the config.

while (($a, $v) = each(%av_table)) {
 if ($a eq "TTIIosRunningConfig") {
 $search = "hostname ";
 $begin = index($v, $search) + length($search);
 $end = index($v, "\n", $begin);
 $hostname = substr($v, $begin, $end - $begin);
 }
 if ($a eq "TTIIosVersion") {
 $search = "Version ";
 $begin = index($v, $search) + length($search);
 $end = index($v, "(", $begin);
 $version = substr($v, $begin, $end - $begin);
 }
}

print <<END_CONFIG;
!
! Config auto-generated by sdp.cgi
! This is for SDP testing only and is not a real config
!
!
\st
!
\sc
!
cry pki trust Version-$version-$hostname

! NOTE: The last line of the config must be 'end' with a blank line after the end
statement.

END_CONFIG
;

Emulate IOS tti_postprocessavpairs functionality
sub postprocessavpairs {

```

```

@attributes = @_;

Combine any AV pairs that were split apart
$n = 0; #element index counter
while ($attributes[$n]) {
see if we are at the start of a set
if ($attributes[$n] =~ m/_0/) {
 # determine base attribute name
 $a = (split /_0/, $attributes[$n])[0];
 # set initial (partial) value
 $v = $query->param($attributes[$n]);

 # loop and pull the rest of the matching
 # attributes's values into v (would be
 # faster if we stop at first non-match)
 $c = $n+1;
 while ($attributes[$c]) {
 if ($attributes[$c] =~ m/$a/) {
 $v = $v.$query->param($attributes[$c]);
 }
 $c++;
 }

 # store in the av hash table
 $av_table{$a} = $v;
} else {
 # store in hash table if not part of a set
 if ($attributes[$n] !~ m/_\d/) {
 $av_table{$attributes[$n]} = $query->param($attributes[$n]);
 }
}
$n++;
}

de-base64 decode all AV pairs except userdevicename
while (($a, $v) = each(%av_table)) {
 if ($a ne "userdevicename") {
 $av_table{$a} = decode_base64($av_table{$a});
 }
}

return %av_table;
}

```

**Note**

A CGI script cannot be executed without using the **post** keyword with the **template config** command in Cisco IOS Release 12.4(6)T or a later release.

## Configuring the Petitioner and Registrar for Certificate-Based Authentication: Example

The following examples shows how to configure a petitioner to use the certificate issued by the trustpoint named mytrust:

```

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Router(config)# crypto provisioning petitioner
Router(tti-petitioner)# trustpoint signing mytrust
Router(tti-petitioner)# end

```

The following example shows how to configure a registrar to verify the petitioner-signing certificate and to perform authorization lookups:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# crypto provisioning registrar
Router(tti-registrar)# authentication trustpoint mytrust
Router(tti-registrar)# authorization login certificate
Router(tti-registrar)# authorization username subjectname all
Router(tti-registrar)# end
```

## Configuring an Administrative Introducer Using Authentication and Authorization Lists: Example

The following example shows how to configure an administrative introducer with the authentication list “authen-tac” and the authorization list “author-tac”:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Router(config)# crypto provisioning registrar
Router(tti-registrar)# administrator authentication list authen-tac
Router(tti-registrar)# administrator authorization list author-tac
Router(tti-registrar)# end
```

## Feature Information for SDP in a PKI

Table 3 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the “Implementing and Managing PKI Features Roadmap.”

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

Table 3 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 3** Feature Information for SDP in a PKI

Feature Name	Releases	Feature Information
Secure Device Provisioning (SDP) Connect Template	12.4(20)T	<p>This feature provides the ability to configure a device for Internet connectivity through a service provider.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Prerequisites for Setting Up SDP</a></li> <li>• <a href="#">SDP Overview</a></li> <li>• <a href="#">How SDP Works</a></li> <li>• <a href="#">Default Templates for SDP Transaction Web Pages</a></li> </ul>
USB Token and Secure Device Provisioning (SDP) Integration	12.4(15)T	<p>This feature provides the ability to provision remote devices using a USB token as a mechanism to transfer credentials from one network device to a remote device via SDP.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Prerequisites for Setting Up SDP</a></li> <li>• <a href="#">SDP Leveraging USB Tokens</a></li> <li>• <a href="#">Enabling the SDP Registrar for Certificate-Based Authorization</a></li> </ul> <p>The following commands were introduced by this feature: <b>binary file, crypto key move rsa, template file.</b></p> <p><b>Note</b> For other documentation on this topic, see the “<a href="#">Related Documents</a>” section.</p>

**Table 3** *Feature Information for SDP in a PKI (continued)*

Feature Name	Releases	Feature Information
SDP Expanded Template CGI Support	12.4(6)T	<p>This feature allows users to configure the SDP registrar to send a bootstrap configuration to the SDP petitioner based on not only the device name, but also its current Cisco IOS version and current configuration.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">SDP Introduction Phase</a></li> <li>• <a href="#">Custom Configuration and File Template Variable Expansion Rules</a></li> <li>• <a href="#">Default Template for the Configuration File</a></li> <li>• <a href="#">Enabling the SDP Registrar and Adding AAA Lists to the Server</a></li> <li>• <a href="#">CGI Script: Example</a></li> </ul> <p>The following command was modified by this feature: <b>template config</b></p>
Secure Device Provisioning (SDP) Start Page	12.4(4)T	<p>This feature allows users to configure their browsers to begin the TTI transaction by contacting the registrar's introduction URL via a start page. Thus, users no longer have to begin the TTI transaction from the welcome page on the petitioner.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">How Custom Templates Work with SDP</a></li> <li>• <a href="#">Configuring Custom Templates</a></li> </ul> <p>The following commands were introduced by this feature: <b>template http admin-introduction, template http completion, template http error, template http introduction, template http start, template http welcome</b></p>
Administrative Secure Device Provisioning Introducer	12.3(14)T	<p>This feature allows you to act as an administrative introducer to introduce a device into a PKI network and then provide a username as the device name for the record locator in the AAA database.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Authentication and Authorization Lists for an Administrative Introducer</a></li> <li>• <a href="#">Configuring an Administrative Introducer</a></li> </ul> <p>The following commands were introduced by this feature: <b>administrator authentication list, administrator authorization list</b></p>

**Table 3** *Feature Information for SDP in a PKI (continued)*

Feature Name	Releases	Feature Information
Easy Secure Device Deployment	12.3(8)T	<p>This feature introduces support for SDP, which offers a web-based enrollment interface that enables network administrators to deploy new devices in large networks.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Information About Setting Up SDP for Enrollment in a PKI</a></li> <li>• <a href="#">Enabling the SDP Registrar and Adding AAA Lists to the Server</a></li> </ul> <p>The following commands were introduced or modified by this feature: <b>crypto wui tti petitioner</b>, <b>crypto wui tti registrar</b>, <b>pki-server</b>, <b>template config</b>, <b>template username</b>, <b>trustpoint (tti-petitioner)</b></p>
Easy Secure Device Deployment AAA Integration	12.3(8)T	<p>This feature integrates an external AAA database, allowing the SDP introducer to be authenticated against a AAA database instead of having to use the enable password of the local Cisco certificate server.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">How SDP Uses an External AAA Database</a></li> <li>• <a href="#">Enabling the SDP Registrar and Adding AAA Lists to the Server</a></li> </ul> <p>The following commands were introduced or modified by this feature: <b>authentication list (tti-registrar)</b>, <b>authorization list (tti-registrar)</b>, <b>debug crypto wui template config</b>, <b>template username</b></p>
Secure Device Provisioning (SDP) Certificate-Based Authorization	12.3(14)T	<p>This feature allows certificates issued by other authority (CA) servers to be used for SDP introductions.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Use of a Self-Signed Certificate Versus a Certificate Issued by Another CA Server</a></li> <li>• <a href="#">Enabling the SDP Registrar for Certificate-Based Authorization</a></li> </ul> <p>The following commands were introduced by this feature: <b>administrator authentication list</b>, <b>administrator authorization list</b></p>

# Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment

---

**First Published: May 2, 2005**

**Last Updated: November 17, 2006**

This module describes how to set up and manage a Cisco IOS certificate server for public key infrastructure (PKI) deployment. A certificate server embeds a simple certificate server, with limited certification authority (CA) functionality, into the Cisco IOS software. Thus, the following benefits are provided to the user:

- Easier PKI deployment by defining default behavior. The user interface is simpler because default behaviors are predefined. That is, you can leverage the scaling advantages of PKI without all of the certificate extensions that a CA provides, thereby allowing you to easily enable a basic PKI-secured network.
- Direct integration with Cisco IOS software.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for the Cisco IOS Certificate Server](#)” section on page 50.*

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Additional References, page 48](#)
- [Feature Information for the Cisco IOS Certificate Server, page 50](#)

## Prerequisites for Configuring a Cisco IOS Certificate Server

### Planning Your PKI Before Configuring the Certificate Server

Before configuring a Cisco IOS certificate server, it is important that you have planned for and chosen appropriate values for the settings you intend to use within your PKI (such as certificate lifetimes and certificate revocation list (CRL) lifetimes). After the settings have been configured in the certificate server and certificates have been granted, settings cannot be changed without having to reconfigure the certificate server and reenrolling the peers. For information on certificate server default settings and recommended settings, see the section “[Certificate Server Default Values and Recommended Values](#).”

### Enabling an HTTP Server

The certificate server supports Simple Certificate Enrollment Protocol (SCEP) over HTTP. The HTTP server must be enabled on the router for the certificate server to use SCEP. (To enable the HTTP server, use the **ip http server** command.) The certificate server will automatically enable or disable SCEP services after the HTTP server is enabled or disabled. If the HTTP server is not enabled, only manual PKCS10 enrollment is supported.

#### Note

To take advantage of automatic CA certificate and key pair rollover functionality for all types of certificate servers, Cisco IOS Release 12.4(4)T or a later release must be used and SCEP must be used as the enrollment method.

### Configuring Reliable Time Services

Time services must be running on the router because the certificate server must have reliable time knowledge. If a hardware clock is unavailable, the certificate server will depend on manually configured clock settings, such as Network Time Protocol (NTP). If there is not a hardware clock or the clock is invalid, the following message will be displayed at bootup:

```
% Time has not been set. Cannot start the Certificate server.
```

After the clock has been set, the certificate server will automatically switch to running status.

For information on manually configuring clock settings, see the section “Setting Time and Calendar Services” in the chapter “Performing Basic System Management” of the *Cisco IOS Network Management Configuration Guide*.

### “crypto ca” to “crypto pki” CLI Change

As of Cisco IOS Release 12.3(7)T, all commands that begin as “crypto ca” have been changed to begin as “crypto pki.” Although the router will still accept crypto ca commands, all output will be read back as crypto pki.

# Restrictions for Configuring a Cisco IOS Certificate Server

The certificate server does not provide a mechanism for modifying the certificate request that is received from the client; that is, the certificate that is issued from the certificate server matches the requested certificate without modifications. If a specific certificate policy, such as name constraints, must be issued, the policy must be reflected in the certificate request.

## Information About Cisco IOS Certificate Servers

Before setting up and deploying a certificate server in your PKI, you should understand the following concepts:

- [RSA Key Pair and Certificate of the Certificate Server, page 3](#)
- [Certificate Server Database, page 4](#)
- [Trustpoint of the Certificate Server, page 6](#)
- [Certificate Revocation Lists \(CRLs\), page 6](#)
- [Certificate Server Error Conditions, page 7](#)
- [Certificate Enrollment Using a Certificate Server, page 8](#)
- [Types of CA Servers: Subordinate and Registration Authorities \(RAs\), page 8](#)
- [Automatic CA Certificate and Key Rollover, page 9](#)

## RSA Key Pair and Certificate of the Certificate Server

The certificate server automatically generates a 1024-bit Rivest, Shamir, and Adelman (RSA) key pair. You must manually generate an RSA key pair if you prefer a different key pair modulus. For information on completing this task, see the section “[Generating a Certificate Server RSA Key Pair.](#)”

**Note**

---

The recommended modulus for a certificate server key pair is 2048 bits.

---

The certificate server will use a regular Cisco IOS RSA key pair as its CA key. This key pair must have the same name as the certificate server. If you do not generate the key pair before the certificate server is created on the router, a general-purpose key pair will be automatically generated during the configuration of the certificate server.

As of Cisco IOS Release 12.3(11)T and later releases, the CA certificate and CA key can be backed up automatically one time after they are generated by the certificate server. As a result, it is not necessary to generate an exportable CA key for backup purposes.

**What to Do with Automatically Generated Key Pairs in Cisco IOS Software Prior to Release 12.3(11)T**

If the key pair is automatically generated, it will not be marked as exportable. Thus, you must manually generate the key pair as exportable if you want to back up the CA key. For information on how to complete this task, see the section “[Generating a Certificate Server RSA Key Pair.](#)”

## How the CA Certificate and CA Key Are Automatically Archived

At initial certificate server setup, you can enable the CA certificate and the CA key to be automatically archived so that they may be restored later if either the original copy or the original configuration is lost.

When the certificate server is turned on the first time, the CA certificate and CA key will be generated. If automatic archive is also enabled, the CA certificate and the CA key will be exported (archived) to the server database. The archive can be in PKCS12 or privacy-enhanced mail (PEM) format.

**Note**

- This CA key backup file is extremely important and should be moved immediately to another secured place.
- This archiving action occurs only one time. Only the CA key that is (1) manually generated and marked exportable or (2) automatically generated by the certificate server will be archived (this key will be marked nonexportable).
- Autoarchiving will not occur if you generate the CA key manually and mark it “nonexportable.”
- In addition to the CA certificate and CA key archive file, you should also regularly back up the serial number file (.ser) and the CRL file (.crl). The serial file and the CRL file are both critical for CA operation if you need to restore your certificate server.
- It is not possible to manually back up a server that uses nonexportable RSA keys or manually generated, nonexportable RSA keys. Although automatically generated RSA keys are marked as nonexportable, they are automatically archived once.

## Certificate Server Database

The Cisco IOS certificate server stores files for its own use and may publish files for other processes to use. Critical files generated by the certificate server that are needed for its ongoing operation are stored to only one location per file type for its exclusive use. The certificate server reads from and writes to these files. The critical certificate server files are the serial number file (.ser) and the CRL storage location file (.crl). Files that the certificate server writes to, but does not read from again, may be published and available for use by other processes. An example of a file that may be published is the issued certificates file (.crt).

Performance of your certificate server may be affected by the following factors, which should be considered when you choose storage options and publication options for your certificate server files.

- The storage or publish locations you choose may affect your certificate server performance. Reading from a network location takes more time than reading directly from a router’s local storage device.
- The number of files you choose to store or publish to a specific location may affect your certificate server performance. The local Cisco IOS file system may not always be suitable for a large number of files.
- The file types you choose to store or publish may affect your certificate server performance. Certain files, such as the .crl files, can become very large.

**Note**

It is recommended that you store .ser and .crl files to your local Cisco IOS file system and publish your .crt files to a remote file system.

## Certificate Server Database File Storage

The certificate server allows the flexibility to store different critical file types to different storage locations depending on the database level set (see the **database level** command for more information). When choosing storage locations, consider the file security needed and server performance. For instance, serial number files and archive files (.p12 or .pem) might have greater security restrictions than the issued certificates file storage location (.crt) or the name file storage location (.cnm).

Table 1 shows the critical certificate server file types by file extension that may be stored to a specific location.

**Table 1**      **Certificate Server Storage Critical File Types**

File Extension	File Type
.ser	The main certificate server database file.
.crl	The CRL storage location.
.crt	The issued certificates storage location.
.cnm	The certificate name and expiration file storage location.
.p12	The certificate server certificate archive file location in PKCS12 format.
.pem	The certificate server certificate archive file location in PEM format.

Cisco IOS certificate server files may be stored to three levels of specificity:

- Default location, NVRAM
- Specified primary storage location for all critical files
- Specified storage location for specific critical file(s).

A more specific storage location setting overrides a more general storage location setting. For instance, if you have not specified any certificate server file storage locations, all certificate server files will be stored to NVRAM. If you specify a storage location for the name file, only the name file will be stored there; all other files will still be stored to NVRAM. If you then specify a primary location, all files except the name file will now be stored to this location, instead of NVRAM.

**Note**

You may specify either .p12 or .pem; you cannot specify both types of archive files.

## Certificate Server Database File Publication

A publish file is a copy of the original file and is available for other processes to use or for your use. If the certificate server fails to publish a file, it does cause the server to shut down. You may specify one publish location for the issued certificates file and name file and multiple publish locations for the CRL file. See Table 2 for files types available for publication. You may publish files regardless of the database level that is set.

Table 2 Certificate Server Publish File Types

File Extension	File Type
.crl	The CRL publish location.
.crt	The issued certificates publish location.
.cnm	The certificate name and expiration file publish location.

## Trustpoint of the Certificate Server

The certificate server will also have an automatically generated trustpoint of the same name; the trustpoint will store the certificate of the certificate server. After the router detects that a trustpoint is being used to store the certificate of the certificate server, the trustpoint will be locked so that it cannot be modified.

Before configuring the certificate server you can perform the following:

- Manually create and set up this trustpoint (using the **crypto pki trustpoint** command), which allows you to specify an alternative RSA key pair (using the **rsa keypair** command).
- Specify that the initial autoenrollment key pair will be generated on a specific device, such as a configured and available USB token, using the **on** command.

### Note

The automatically generated trustpoint and the certificate server certificate are not available for the certificate server device identity. Thus, any command-line interface (CLI) (such as the **ip http secure-trustpoint** command) that is used to specify the CA trustpoint to obtain certificates and authenticate the connecting client's certificate must point to an additional trustpoint configured on the certificate server device.

If the server is a root certificate server, it will use the RSA key pairs and several other attributes to generate a self-signed certificate. The associated CA certificate will have the following key usage extensions—Digital Signature, Certificate Sign, and CRL Sign.

After the CA certificate is generated, attributes can be changed only if the certificate server is destroyed.

### Note

A certificate server trustpoint must not be automatically enrolled using the **auto-enroll** command. Initial enrollment of the certificate server must be initiated manually and ongoing automatic rollover functionality may be configured with the **auto-rollover** command. For more information on automatic rollover functionality, see the section [“Automatic CA Certificate and Key Rollover.”](#)

## Certificate Revocation Lists (CRLs)

By default, CRLs are issued once every 168 hours (1 calendar week). To specify a value other than the default value for issuing the CRL, execute the **lifetime crl** command. After the CRL is issued, it is written to the specified database location as *ca-label.crl*, where *ca-label* is the name of the certificate server.

CRLs can be distributed via SCEP, which is the default method, or a CRL distribution point (CDP), if configured and available. If you set up a CDP, use the **cdp-url** command to specify the CDP location. If the **cdp-url** command is not specified, the CDP certificate extension will not be included in the

certificates that are issued by the certificate server. If the CDP location is not specified, Cisco IOS PKI clients will automatically request a CRL from the certificate server with a SCEP GetCRL message. The CA then returns the CRL in a SCEP CertRep message to the client. Because all SCEP messages are enveloped and signed PKCS#7 data, the SCEP retrieval of the CRL from the certificate server is costly and not highly scalable. In very large networks, an HTTP CDP provides better scalability and is recommended if you have many peer devices that will be checking CRLs. You may specify the CDP location by a simple HTTP URL string for example,

```
cdp-url http://my-cdp.company.com/filename.crl
```

The certificate server supports only one CDP; thus, all certificates that are issued include the same CDP.

If you have PKI clients that are not running Cisco IOS software and that do not support a SCEP GetCRL request and wish to use a CDP you may set up an external server to distribute CRLs and configure the CDP to point to that server. Or, you can specify a non-SCEP request for the retrieval of the CRL from the certificate server by specifying the **cdp-url** command with the URL in the following format where *cs-addr* is the location of the certificate server:

```
cdp-url http://cs-addr/cgi-bin/pkiclient.exe?operation=GetCRL
```

**Note**

If your Cisco IOS CA is also configured as your HTTP CDP server, specify your CDP with the **cdp-url** `http://cs-addr/cgi-bin/pkiclient.exe?operation=GetCRL` command syntax.

It is the responsibility of the network administrator to ensure that the CRL is available from the location that is specified via the **cdp-url** command.

The CDP location may be changed after the certificate server is running via the **cdp-url** command. New certificates will contain the updated CDP location, but existing certificates will not be reissued with the newly specified CDP location. When a new CRL is issued, the certificate server uses its current cached CRL to generate a new CRL. (When the certificate server is rebooted, it reloads the current CRL from the database.) A new CRL cannot be issued unless the current CRL has expired. After the current CRL expires, a new CRL is issued only after a certificate is revoked from the CLI.

## Certificate Server Error Conditions

At startup, the certificate server checks the current configuration before issuing any certificates. It reports the last known error conditions via the **show crypto pki server** command output. Example errors can include any of the following conditions:

- Storage inaccessible
- Waiting for HTTP server
- Waiting for time setting

If the certificate server experiences a critical failure at any time, such as failing to publish a CRL, the certificate server will automatically enter a disabled state. This state allows the network administrator to fix the condition; thereafter, the certificate server will return to the previous normal state.

## Certificate Enrollment Using a Certificate Server

A certificate enrollment request functions as follows:

- The certificate server receives the enrollment request from an end user, and the following actions occur:
  - A request entry is created in the enrollment request database with the initial state. (See [Table 3](#) for a complete list of certificate enrollment request states.)
  - The certificate server refers to the CLI configuration (or the default behavior any time a parameter is not specified) to determine the authorization of the request. Thereafter, the state of the enrollment request is updated in the enrollment request database.
- At each SCEP query for a response, the certificate server examines the current request and performs one of the following actions:
  - Responds to the end user with a “pending” or “denied” state.
  - Generates and signs the appropriate certificate and stores the certificate in the enrollment request database.

If the connection of the client has closed, the certificate server will wait for the client to request another certificate.

All enrollment requests transition through the certificate enrollment states that are defined in [Table 3](#). To see current enrollment requests, use the **crypto pki server request pkcs10** command.

**Table 3** *Certificate Enrollment Request State Descriptions*

Certificate Enrollment State	Description
authorized	The certificate server has authorized the request.
denied	The certificate server has denied the request for policy reasons.
granted	The CA core has generated the appropriate certificate for the certificate request.
initial	The request has been created by the SCEP server.
malformed	The certificate server has determined that the request is invalid for cryptographic reasons.
pending	The enrollment request must be manually accepted by the network administrator.

### SCEP Enrollment

All SCEP requests are treated as new certificate enrollment requests, even if the request specifies a duplicate subject name or public key pair as a previous certificate request.

## Types of CA Servers: Subordinate and Registration Authorities (RAs)

CA servers have the flexibility to be configured as a subordinate certificate server or an RA-mode certificate server.

### Why Configure a Subordinate CA?

A subordinate certificate server provides all the same features as a root certificate server. The root RSA key pairs are extremely important in a PKI hierarchy, and it is often advantageous to keep them offline or archived. To support this requirement, PKI hierarchies allow for subordinate CAs that have been signed by the root authority. In this way, the root authority can be kept offline (except to issue occasional CRL updates), and the subordinate CA can be used during normal operation.

### Why Configure an RA-Mode Certificate Server?

A Cisco IOS certificate server can be configured to run in RA mode. An RA offloads authentication and authorization responsibilities from a CA. When the RA receives a SCEP or manual enrollment request, the administrator can either reject or grant it on the basis of local policy. If the request is granted, it will be forwarded to the issuing CA, and the CA will automatically generate the certificate and return it to the RA. The client can later retrieve the granted certificate from the RA.

An RA is the authority charged with recording or verifying some or all of the data required for the CA to issue certificates. In many cases the CA will undertake all of the RA functions itself, but where a CA operates over a wide geographical area or when there is security concern over exposing the CA to direct network access, it may be administratively advisable to delegate some of the tasks to an RA and leave the CA to concentrate on its primary tasks of signing certificates and CRLs.

## Automatic CA Certificate and Key Rollover

CAs—root CAs, subordinate CAs, and RA-mode CAs—like their clients, have certificates and key pairs with expiration dates that need to be reissued when the current certificate and key pair are about to expire. When a root CA's certificate and key pair are expiring it must generate a self-signed rollover certificate and key pair. If a subordinate CA or an RA-mode CA's certificate and key pair are expiring, it will request a rollover certificate and key pair from its superior CA, obtaining the superior CA's new self-signed rollover certificates at the same time. The CA must distribute the new CA rollover certificate and keys too all its peers. This process, called rollover, allows for continuous operation of the network while the CAs and their clients are switching from an expiring CA certificate and key pair to a new CA certificate and key pair.

Rollover relies on the PKI infrastructure requirements of trust relationships and synchronized clocks. The PKI trust relationships allow (1) the new CA certificate to be authenticated, and (2) the rollover to be accomplished automatically without the loss of security. Synchronized clocks allow the rollover to be coordinated throughout your network.

## Automatic CA Certificate Rollover: How It Works

The CA server must have rollover configured. All levels of CAs must be automatically enrolled and have **auto-rollover** enabled. CA clients support rollover automatically when automatically enrolled. For more information about clients and automatic rollover, see the section “[Automatic Certificate Enrollment](#)” in the chapter “Configuring Certificate Enrollment for a PKI”.

After CAs have rollover enabled and their clients are automatically enrolled, there are three stages to the automatic CA certificate rollover process.

### Stage One: Active CA Certificate and Key Pair Only

In stage one, there is an active CA certificate and key pair only.

**Stage Two: Rollover CA Certificate and Key Pair Generation and Distribution**

In stage two, the rollover CA certificate and key pair are generated and distributed. The superior CA generates a rollover certificate and key pair. After the CA successfully saves its active configuration, the CA is ready to respond to client requests for the rollover certificate and key pair. When the superior CA receives a request for the new CA certificate and key pair from a client, the CA responds by sending the the new rollover CA certificate and key pair to the requesting client. The clients store the rollover CA certificate and key pair.

**Note**

When a CA generates its rollover certificate and key pair, it must be able to save its active configuration. If the current configuration has been altered, saving of the rollover certificate and key pair will not happen automatically. In this case, the administrator must save the configuration manually or rollover information will be lost.

**Stage Three: Rollover CA Certificate and Key Pair Become the Active CA Certificate and Key Pair**

In stage three, the rollover CA certificate and key pair become the active CA certificate and key pair. All devices that have stored a valid rollover CA certificate rename the rollover certificate to the active certificate and the once-active certificate and key pair are deleted.

## How to Set Up and Deploy a Cisco IOS Certificate Server

This section contains the following procedures:

- [Generating a Certificate Server RSA Key Pair, page 10](#)
- [Configuring Certificate Servers, page 13](#)
- [Configuring Certificate Server Functionality, page 24](#)
- [Working with Automatic CA Certificate Rollover, page 28](#)
- [Maintaining, Verifying, and Troubleshooting the Certificate Server, Certificates, and the CA, page 30](#)

### Generating a Certificate Server RSA Key Pair

Perform this task to manually generate an RSA key pair for the certificate server. Manually generating a certificate server RSA key pair allows you to specify the type of key pair you want to generate, to create an exportable key pair for backup purposes, to specify the key pair storage location, or to specify the key generation location.

If you are running Cisco IOS Release 12.3(8)T or earlier releases, you may want to create an exportable certificate server key pair for backup, or archive purposes. If this task is not performed, the certificate server will automatically generate a key pair, which will not be marked as exportable. Automatic CA certificate archiving was introduced in Cisco IOS Release 12.3(11)T.

As of Cisco IOS Release 12.4(11)T and later releases, if your router has a USB token configured and available, the USB token can be used as cryptographic device in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication of credentials to be performed on a USB token. The private key never leaves the USB token and is not exportable. The public key is exportable. For titles of specific documents about configuring a USB token and making it available to use as a cryptographic device, see the [“The following sections provide references related to Cisco IOS certificate server.Related Documents”](#) section.

**Note**

It is recommended that the private key be kept in a secure location and that you regularly archive the certificate server database.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **crypto key generate rsa** [**general-keys** | **usage-keys** | **signature** | **encryption**] [**label** *key-label*] [**exportable**] [**modulus** *modulus-size*] [**storage** *devicename:*] [**on** *devicename:*]
4. **crypto key export rsa** *key-label* **pem** {**terminal** | **url** *url*} {**3des** | **des**} *passphrase*
5. **crypto key import rsa** *key-label* **pem** [**usage-keys** | **signature** | **encryption**] {**terminal** | **url** *url*} [**exportable**] [**on** *devicename:*] *passphrase*
6. **exit**
7. **show crypto key mypubkey rsa**

**DETAILED STEPS**

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto key generate rsa</b> [ <b>general-keys</b>   <b>usage-keys</b>   <b>signature</b>   <b>encryption</b> ] [ <b>label</b> <i>key-label</i> ] [ <b>exportable</b> ] [ <b>modulus</b> <i>modulus-size</i> ] [ <b>storage</b> <i>devicename:</i> ] [ <b>on</b> <i>devicename:</i> ]  <b>Example:</b> Router (config)# crypto key generate rsa label mycs exportable modulus 2048	<p>Generates the RSA key pair for the certificate server.</p> <p>When specifying a label name, you must use the same name for the label that you plan to use for the certificate server (via the <b>crypto pki server cs-label</b> command). By default, the fully qualified domain name (FQDN) of the router is used for the key label.</p> <p>If you manually generate the exportable RSA key pair but wait until after the CA certificate has been generated before issuing the <b>no shutdown</b> command, you can use the <b>crypto ca export pkcs12</b> command to export a PKCS12 file that contains the certificate server certificate and the private key.</p> <p>By default, the modulus size of a CA key is 1024 bits. The recommended modulus for a CA key is 2048 bits. The range for a CA key is from 350 to 2048 bits.</p>

	Command or Action	Purpose
Step 4	<b>crypto key export rsa</b> <i>key-label</i> <b>pem</b> [ <b>terminal</b>   <b>url</b> <i>url</i> ] { <b>3des</b>   <b>des</b> } <i>passphrase</i>  <b>Example:</b> Router (config)# <b>crypto key export rsa</b> mycs pem url nvram: 3des PASSWORD	(Optional) Exports the generated RSA key pair.  Allows you to export the generated keys.
Step 5	<b>crypto key import rsa</b> <i>key-label</i> <b>pem</b> [ <b>usage-keys</b>   <b>signature</b>   <b>encryption</b> ] { <b>terminal</b>   <b>url</b> <i>url</i> } [ <b>exportable</b> ] [ <b>on</b> <i>devicename:</i> ] <i>passphrase</i>  <b>Example:</b> Router (config)# <b>crypto key import rsa</b> mycs2 pem url nvram:mycs PASSWORD	(Optional) Imports RSA key pair.  To create the imported keys on a USB token, use the <b>on</b> keyword and specify the appropriate device location.  If you exported the RSA keys using the <b>exportable</b> keyword and you want to change the RSA key pair to nonexportable, import the key back to the certificate server without the <b>exportable</b> keyword. The key cannot be exported again.
Step 6	<b>exit</b>  <b>Example:</b> Router (config)# <b>exit</b>	Exits global configuration.
Step 7	<b>show crypto key mypubkey rsa</b>  <b>Example:</b> Router# <b>show crypto key mypubkey rsa</b>	Displays the RSA public keys of your router.

## Examples

The following example generates a general usage 1024-bit RSA key pair on a USB token with the label “ms2” with crypto engine debugging messages shown:

```
Router(config)# crypto key generate rsa on usbtoken0 label ms2 modulus 1024
The name for the keys will be: ms2
% The key modulus size is 1024 bits
% Generating 1024 bit RSA keys, keys will be on-token, non-exportable...
Jan 7 02:41:40.895: crypto_engine: Generate public/private keypair [OK]
Jan 7 02:44:09.623: crypto_engine: Create signature
Jan 7 02:44:10.467: crypto_engine: Verify signature
Jan 7 02:44:10.467: CryptoEngine0: CRYPTO_ISA_RSA_CREATE_PUBKEY(hw) (ipsec)
Jan 7 02:44:10.467: CryptoEngine0: CRYPTO_ISA_RSA_PUB_DECRYPT(hw) (ipsec)
```

Now, the on-token keys labeled “ms2” may be used for enrollment.

The following example shows the successful import of an encryption key to a configured and available USB tokens:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# crypto key import rsa encryption on usbtoken0 url nvram:e password
% Importing public Encryption key or certificate PEM file...
filename [e-encr.pub]?
Reading file from nvram:e-encr.pub
% Importing private Encryption key PEM file...
Source filename [e-encr.prv]?
Reading file from nvram:e-encr.prv
% Key pair import succeeded.
```

## Configuring Certificate Servers

The following tasks explain how to configure a certificate server, a subordinate certificate server, or an RA-mode certificate server, and how to enable automatic rollover.

- [Configuring a Certificate Server, page 13](#)
- [Configuring a Subordinate Certificate Server, page 15](#)
- [Configuring a Certificate Server to Run in RA Mode, page 21](#)
- [Configuring the Root Certificate Server to Delegate Enrollment Tasks to the RA Mode Certificate Server, page 23](#)

### Prerequisites for Automatic CA Certificate Rollover

When configuring a certificate server, for automatic CA certificate rollover to run successfully, the following prerequisites are applicable for your CA servers:

- You must be running Cisco IOS Release 12.4(2)T or a later release on your CA servers.
- Your CA server must be enabled and fully configured with a reliable time of day, an available key pair, a self-signed, valid CA certificate associated with the key pair, a CRL, an accessible storage device, and an active HTTP/SCEP server.
- CA clients must have successfully completed automatic enrollment and have autoenrollment enabled with the same certificate server.

**Note**

If you are running Cisco IOS 12.4(2)T or earlier releases, only your root CA will support automatic CA certificate rollover functionality. Cisco IOS 12.4(4)T or later releases support all CAs—root CAs, subordinate CAs, and RA-mode CAs.

### Restrictions for Automatic CA Certificate Rollover

When configuring a certificate server, in order for automatic CA certificate rollover to run successfully, the following restrictions are applicable:

- SCEP must be used to support rollover. Any device that enrolls with the PKI using an alternative to SCEP as the certificate management protocol or mechanism (such as enrollment profiles, manual enrollment, or TFTP enrollment) will not be able to take advantage of the rollover functionality provided by SCEP.
- If you have automatic archive configured on your network and the archive fails, rollover will not occur because the certificate server will not enter the rollover state, and the rollover certificate and key pair will not be automatically saved.

### Configuring a Certificate Server

Perform this task to configure a Cisco IOS certificate server and enable automatic rollover.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **ip http server**
4. **crypto pki server** *cs-label*
5. **no shutdown**
6. **auto-rollover** [*time-period*]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>ip http server</b>  <b>Example:</b> Router(config)# ip http server	Enables the HTTP server on your system.
Step 4	<b>crypto pki server</b> <i>cs-label</i>  <b>Example:</b> Router(config)# crypto pki server server-pki	Defines a label for the certificate server and enters certificate server configuration mode. <p><b>Note</b> If you manually generated an RSA key pair, the <i>cs-label</i> argument must match the name of the key pair.</p>
Step 5	<b>no shutdown</b>  <b>Example:</b> Router(cs-server)# no shutdown	(Optional) Enables the certificate server. <p><b>Note</b> Only use this command at this point if you want to use the preconfigured default functionality. That is, do not issue this command just yet if you plan to change any of the default settings as shown in the task <a href="#">“Configuring Certificate Server Functionality.”</a></p>
Step 6	<b>auto-rollover</b> [ <i>time-period</i> ]  <b>Example:</b> Router(cs-server)# auto-rollover 90	(Optional) Enables the automated CA certificate rollover functionality. <ul style="list-style-type: none"> <li><i>time-period</i>—default is 30 days.</li> </ul>

## Examples

The following example shows how to configure the certificate server “ca”:

```
Router(config)# crypto pki server ca
Router(cs-server)# no shutdown
```

```
% Once you start the server, you can no longer change some of
% the configuration.
Are you sure you want to do this? [yes/no]: yes
% Generating 1024 bit RSA keys ...[OK]
```

```
% Certificate Server enabled.
Router(cs-server)# end
!
Router# show crypto pki server

Certificate Server ca:
 Status: enabled, configured
 CA cert fingerprint: 5A856122 4051347F 55E8C246 866D0AC3
 Granting mode is: manual
 Last certificate issued serial number: 0x1
 CA certificate expiration timer: 19:44:57 GMT Oct 14 2006
 CRL NextUpdate timer: 19:45:25 GMT Oct 22 2003
 Current storage dir: nvram:
 Database Level: Complete - all issued certs written as <serialnum>.cer
```

The following example shows how to enable automated CA certificate rollover on the server mycs with the **auto-rollover** command. The **show crypto pki server** command shows that the automatic rollover has been configured on the server mycs with an overlap period of 25 days.

```
Router(config)# crypto pki server mycs
Router(cs-server)# auto-rollover 25
Router(cs-server)# no shut

%Some server settings cannot be changed after CA certificate generation.
% Generating 1024 bit RSA keys, keys will be non-exportable...[OK]
% Exporting Certificate Server signing certificate and keys...

% Certificate Server enabled.
Router(cs-server)#

Router# show crypto pki server

Certificate Server mycs:
 Status:enabled
 Server's configuration is locked (enter "shut" to unlock it)
 Issuer name:CN=mycs
 CA cert fingerprint:70AFECA9 211CDDCC 6AA9D7FF 3ADB03AE
 Granting mode is:manual
 Last certificate issued serial number:0x1
 CA certificate expiration timer:00:49:26 PDT Jun 20 2008
 CRL NextUpdate timer:00:49:29 PDT Jun 28 2005
 Current storage dir:nvram:
 Database Level:Minimum - no cert data written to storage
 Auto-Rollover configured, overlap period 25 days
 Autorollover timer:00:49:26 PDT May 26 2008
```

## Configuring a Subordinate Certificate Server

Perform this task to configure a subordinate certificate server to grant all or certain SCEP or manual certificate requests and to enable automatic rollover.

### Restrictions

- You must be running Cisco IOS Release 12.3(14)T or a later release. (Versions prior to Cisco IOS software Release 12.3(14)T support only one certificate server and no hierarchy; that is, subordinate certificate servers are not supported.)
- The root certificate server should be a Cisco IOS certificate server.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment url** *url*
5. **exit**
6. **crypto pki server** *cs-label*
7. **issuer name** *DN-string*
8. **mode sub-cs**
9. **auto-rollover** [*time-period*]
10. **grant auto rollover** {*ca-cert* | *ra-cert*}
11. **no shutdown**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto pki trustpoint</b> <i>name</i>  <b>Example:</b> Router (config)# crypto pki trustpoint sub	Declares the trustpoint that your subordinate certificate server should use and enters ca-trustpoint configuration mode.
Step 4	<b>enrollment url</b> <i>url</i>  <b>Example:</b> Router (ca-trustpoint)# enrollment url http://192.0.2.6	Specifies the enrollment URL of the issuing CA certificate server (root certificate server).
Step 5	<b>exit</b>  <b>Example:</b> Router (ca-trustpoint)# exit	Exits ca-trustpoint configuration mode.
Step 6	<b>crypto pki server</b> <i>cs-label</i>  <b>Example:</b> Router(config)# crypto pki server sub	Enables a Cisco IOS certificate server and enters cs-server configuration mode.  <b>Note</b> The subordinate server must have the same name as the trustpoint that was created in Step 3 above.

	Command or Action	Purpose
Step 7	<b>issuer name</b> <i>DN-string</i>  <b>Example:</b> Router(cs-server)# issuer-name CN=sub CA, O=Cisco, C=us	(Optional) Specifies the DN as the CA issuer name for the certificate server.
Step 8	<b>mode sub-cs</b>  <b>Example:</b> Router(cs-server)# mode sub-cs	Places the PKI server into sub-certificate server mode.
Step 9	<b>auto-rollover</b> [ <i>time-period</i> ]  <b>Example:</b> Router(cs-server)# auto-rollover 90	(Optional) Enables the automated CA certificate rollover functionality. <ul style="list-style-type: none"> <li><i>time-period</i>—default is 30 days.</li> </ul>
Step 10	<b>grant auto rollover</b> { <b>ca-cert</b>   <b>ra-cert</b> }  <b>Example:</b> Router(cs-server)# grant auto rollover ca-cert	(Optional) Automatically grants reenrollment requests for subordinate CAs and RA-mode CAs without operator intervention. <ul style="list-style-type: none"> <li><b>ca-cert</b>—Specifies that the subordinate CA rollover certificate will be automatically granted.</li> <li><b>ra-cert</b>—Specifies that the RA-mode CA rollover certificate will be automatically granted.</li> </ul> <b>Note</b> If this is the first time that a subordinate certificate server is enabled and enrolled, the certificate request must be manually granted.
Step 11	<b>no shutdown</b>  <b>Example:</b> Router(cs-server)# no shutdown	Enables or reenables the certificate server.  If this is the first time that a subordinate certificate server is enabled, the certificate server will generate the key and obtain its signing certificate from the root certificate server.

## Examples

If the certificate server fails to enable or if the certificate server has trouble handling the request that has been configured, you can use the **debug crypto pki server** command to troubleshoot your configuration as shown in the following examples (Clock Not Set and Trustpoint Not Configured):

```
Router# debug crypto pki server
```

### Clock Not Set

```
Router (config)# crypto pki server sub
Router (cs-server)# mode sub-cs
Router (cs-server)# no shutdown
%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key % or type Return to exit
Password:
*Jan 6 20:57:37.667: CRYPTO_CS: enter FSM: input state initial, input signal no shut

Re-enter password:
% Generating 1024 bit RSA keys ...
```

```
*Jan 6 20:57:45.303: CRYPTO_CS: starting enabling checks
*Jan 6 20:57:45.303: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]
% Time has not been set. Cannot start the Certificate server
```

### Trustpoint Not Configured

```
Router (config)# crypto pki server sub
Router (cs-server)# mode sub-cs
Router (cs-server)# no shutdown

%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key or type Return to exit
Password:
Jan 6 21:00:15.961: CRYPTO_CS: enter FSM: input state initial, input signal no shut.
Jan 6 21:03:34.309: CRYPTO_CS: enter FSM: input state initial, input signal time set.
Jan 6 21:03:34.313: CRYPTO_CS: exit FSM: new state initial.
Jan 6 21:03:34.313: CRYPTO_CS: cs config has been unlocked
Re-enter password:
% Generating 1024 bit RSA keys ...
Jan 6 21:03:44.413: CRYPTO_CS: starting enabling checks
Jan 6 21:03:44.413: CRYPTO_CS: associated trust point 'sub' does not exist; generated
automatically
Jan 6 21:03:44.417: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]

Jan 6 21:04:03.993: CRYPTO_CS: nvram filesystem
Jan 6 21:04:04.077: CRYPTO_CS: serial number 0x1 written.
You must specify an enrollment URL for this CA before you can authenticate it.
% Failed to authenticate the Certificate Authority
```

If the certificate server fails to obtain its signing certificate from the root certificate server, you can use the **debug crypto pki transactions** command to troubleshoot your configuration as shown in the following example:

```
Router# debug crypto pki transactions

Jan 6 21:07:00.311: CRYPTO_CS: enter FSM: input state initial, input signal time set
Jan 6 21:07:00.311: CRYPTO_CS: exit FSM: new state initial
Jan 6 21:07:00.311: CRYPTO_CS: cs config has been unlocked no sh
%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key % or type Return to exit
Password:
Jan 6 21:07:03.535: CRYPTO_CS: enter FSM: input state initial, input signal no shut
Re-enter password:
% Generating 1024 bit RSA keys ...
Jan 6 21:07:10.619: CRYPTO_CS: starting enabling checks
Jan 6 21:07:10.619: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]

Jan 6 21:07:20.535: %SSH-5-ENABLED: SSH 1.99 has been enabled
Jan 6 21:07:25.883: CRYPTO_CS: nvram filesystem
Jan 6 21:07:25.991: CRYPTO_CS: serial number 0x1 written.
Jan 6 21:07:27.863: CRYPTO_CS: created a new serial file.
Jan 6 21:07:27.863: CRYPTO_CS: authenticating the CA 'sub'
Jan 6 21:07:27.867: CRYPTO_PKI: Sending CA Certificate Request:

```

If the certificate server fails to enable or if the certificate server has trouble handling the request that has been configured, you can use the **debug crypto pki server** command to troubleshoot the progress of an enrollment. This command can also be used to debug the root CA (turn it on at the root CA).

## Configuring a Certificate Server to Run in RA Mode

### Restrictions for Configuring a Certificate Server for RA Mode

When the Cisco IOS certificate server is acting as an RA, the issuing CA should be a Cisco IOS certificate server.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment url** *url*
5. **subject-name** *x.500-name*
6. **exit**
7. **crypto pki server** *cs-label*
8. **mode ra**
9. **auto-rollover** [*time-period*]
10. **grant auto rollover** {*ca-cert* | *ra-cert*}
11. **no shutdown**
12. **no shutdown**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	<b>crypto pki trustpoint</b> <i>name</i>  <b>Example:</b> Router (config)# crypto pki trustpoint ra-server	Declares the trustpoint that your RA mode certificate server should use and enters ca-trustpoint configuration mode.
Step 4	<b>enrollment url</b> <i>url</i>  <b>Example:</b> Router (ca-trustpoint)# enrollment url http://ca-server.company.com	Specifies the enrollment URL of the issuing CA certificate server (root certificate server).
Step 5	<b>subject-name</b> <i>x.500-name</i>  <b>Example:</b> Router (ca-trustpoint)# subject-name cn=ioscs RA	(Optional) Specifies the subject name the RA will use.  <b>Note</b> Include “cn=ioscs RA” or “ou=ioscs RA” in the subject name so that the issuing CA certificate server can recognize the RA (see Step 7 below).
Step 6	<b>exit</b>  <b>Example:</b> Router (ca-trustpoint)# exit	Exits ca-trustpoint configuration mode.
Step 7	<b>crypto pki server</b> <i>cs-label</i>  <b>Example:</b> Router(config)# crypto pki server ra-server	Enables a Cisco IOS certificate server and enters cs-server configuration mode.  <b>Note</b> The certificate server must have the same name as the trustpoint that was created in Step 3 above.
Step 8	<b>mode ra</b>  <b>Example:</b> Router(cs-server)# mode ra	Places the PKI server into RA certificate server mode.
Step 9	<b>auto-rollover</b> [ <i>time-period</i> ]  <b>Example:</b> Router(cs-server)# auto-rollover 90	(Optional) Enables the automatic CA certificate rollover functionality. <ul style="list-style-type: none"> <li><i>time-period</i>—default is 30 days.</li> </ul>
Step 10	<b>grant auto rollover</b> { <b>ca-cert</b>   <b>ra-cert</b> }  <b>Example:</b> Router(cs-server)# grant auto rollover ra-cert	(Optional) Automatically grants reenrollment requests for subordinate CAs and RA-mode CAs without operator intervention. <ul style="list-style-type: none"> <li><b>ca-cert</b>—Specifies that the subordinate CA rollover certificate will be automatically granted.</li> <li><b>ra-cert</b>—Specifies that the RA-mode CA rollover certificate will be automatically granted.</li> </ul> If this is the first time that a subordinate certificate server is enabled and enrolled, the certificate request must be manually granted.

	Command or Action	Purpose
Step 11	<b>no shutdown</b>  <b>Example:</b> Router(cs-server)# no shutdown	Enables the certificate server.  <b>Note</b> After this command is issued, the RA will automatically enroll with the root certificate server.  After the RA certificate has been successfully received, you must issue the <b>no shutdown</b> command again, which reenables the certificate server.
Step 12	<b>no shutdown</b>  <b>Example:</b> Router(cs-server)# no shutdown	Reenables the certificate server.

## Configuring the Root Certificate Server to Delegate Enrollment Tasks to the RA Mode Certificate Server

Perform the following steps on the router that is running the issuing certificate server; that is, configure the root certificate server that is delegating enrollment tasks to the RA mode certificate server.

### Note

Granting enrollment requests for an RA is essentially the same process as granting enrollment requests for client devices—except that enrollment requests for an RA are displayed in the section “RA certificate requests” of the command output for the **crypto pki server info-requests** command.

## SUMMARY STEPS

1. **enable**
2. **crypto pki server** *cs-label* **info requests**
3. **crypto pki server** *cs-label* **grant req-id**
4. **configure terminal**
5. **crypto pki server** *cs-label*
6. **grant ra-auto**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>crypto pki server</b> <i>cs-label</i> <b>info requests</b>  <b>Example:</b> Router# crypto pki server root-server info requests	Displays the outstanding RA certificate request.  <b>Note</b> This command is issued on the router that is running the issuing certificate server.

	Command or Action	Purpose
Step 3	<b>crypto pki server</b> <i>cs-label</i> <b>grant</b> <i>req-id</i>  <b>Example:</b> Router# <b>crypto pki server</b> root-server <b>grant</b> 9	Grants the pending RA certificate request.  <b>Note</b> Because the issuing certificate server will delegate the enrollment request verification task to the RA, you must pay extra attention to the RA certificate request before granting it.
Step 4	<b>configure terminal</b>  <b>Example:</b> Router# <b>configure terminal</b>	Enters global configuration mode.
Step 5	<b>crypto pki server</b> <i>cs-label</i>  <b>Example:</b> Router (config)# <b>crypto pki server</b> root-server	Enables a Cisco IOS certificate server and enters cs-server configuration mode.
Step 6	<b>grant ra-auto</b>  <b>Example:</b> Router(cs-server)# <b>grant ra-auto</b>	(Optional) Specifies that all enrollment requests from an RA are to be granted automatically.  <b>Note</b> For the <b>grant ra-auto</b> command to work, you have to include “cn=ioscs RA” or “ou=ioscs RA” in the subject name of the RA certificate. (See Step 2 above.)

## What to Do Next

After you have configured a certificate server, you can use the preconfigured default values or specify values via the CLI for the functionality of the certificate server. If you choose to specify values other than the defaults, see the following section, “[Configuring Certificate Server Functionality](#).”

## Configuring Certificate Server Functionality

After you have enabled a certificate server and are in certificate server configuration mode, use any of the steps in this task to configure basic certificate server functionality values other than the default values.

### Certificate Server Default Values and Recommended Values

The default values for a certificate server are intended to address a relatively small network (of about ten devices). For example, the database settings are minimal (via the **database level minimal** command) and the certificate server handles all CRL requests via SCEP. For larger networks, it is recommended that you use either the database setting “names” or “complete” (as described in the **database level** command) for possible audit and revocation purposes. Depending on the CRL checking policy, you should also use an external CDP in a larger network.

## Certificate Server File Storage and Publication Locations

You have the flexibility to store file types to different storage and publication locations.

### SUMMARY STEPS

1. **database url** *root-url*
2. **database url** {*cnm* | *crl* | *crt* | **p12** | **pem** | **ser**} *root-url*
3. **database url** {*cnm* | *crl* | *crt*} **publish** *root-url*
4. **database level** {*minimal* | *names* | **complete**}
5. **database username** *username* [**password** [*encr-type*] *password*]
6. **database archive** {**pkcs12** | **pem**} [**password** [*encr-type*] *password*]
7. **issuer-name** *DN-string*
8. **lifetime** {*ca-certificate* | *certificate*} *time*
9. **lifetime crl** *time*
10. **lifetime enrollment-request** *time*
11. **cdp-url** *url*
12. **no shutdown**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>database url</b> <i>root-url</i>  <b>Example:</b> Router (cs-server)# database url tftp://cert-svr-db.company.com	Specifies the primary location where database entries for the certificate server will be written out.  If this command is not specified, all database entries will be written to NVRAM.
Step 2	<b>database url</b> { <i>cnm</i>   <i>crl</i>   <i>crt</i>   <b>p12</b>   <b>pem</b>   <b>ser</b> } <i>root-url</i>  <b>Example:</b> Router (cs-server)# database url ser nvram:	Specifies certificate server critical file storage location by file type.  <b>Note</b> If this command is not specified, all critical files will be stored to the primary location if specified. If the primary location is not specified, all critical files will be stored to NVRAM.
Step 3	<b>database url</b> { <i>cnm</i>   <i>crl</i>   <i>crt</i> } <b>publish</b> <i>root-url</i>  <b>Example:</b> Router (cs-server)# database url crl publish tftp://csdb_specific_crl_files.company.com	Specifies certificate server publish location by file type.  <b>Note</b> If this command is not specified, all publish files will be stored to the primary location if specified. If the primary location is not specified, all publish files will be stored to NVRAM.

	Command or Action	Purpose
Step 4	<p><b>database level</b> {<b>minimal</b>   <b>names</b>   <b>complete</b>}</p> <p><b>Example:</b> Router (cs-server)# database level complete</p>	<p>Controls what type of data is stored in the certificate enrollment database.</p> <ul style="list-style-type: none"> <li><b>minimal</b>—Enough information is stored only to continue issuing new certificates without conflict; the default value.</li> <li><b>names</b>—In addition to the information given in the minimal level, the serial number and subject name of each certificate.</li> <li><b>complete</b>—In addition to the information given in the minimal and names levels, each issued certificate is written to the database.</li> </ul> <p><b>Note</b> The <b>complete</b> keyword produces a large amount of information; if it is issued, you should also specify an external TFTP server in which to store the data via the <b>database url</b> command.</p>
Step 5	<p><b>database username</b> <i>username</i> [<b>password</b> [<i>encr-type</i>] <i>password</i>]</p> <p><b>Example:</b> Router (cs-server)# database username user password PASSWORD</p>	<p>(Optional) Sets a username and password when a user is required to access a primary certificate enrollment database storage location.</p>
Step 6	<p><b>database archive</b> {<b>pkcs12</b>   <b>pem</b>} [<b>password</b> [<i>encr-type</i>] <i>password</i>]</p> <p><b>Example:</b> Router (cs-server)# database archive pem</p>	<p>(Optional) Sets the CA key and CA certificate archive format and password to encrypt the file.</p> <p>The default value is <b>pkcs12</b>, so if this subcommand is not configured, autoarchiving will still be done, and the PKCS12 format will be used.</p> <ul style="list-style-type: none"> <li>The password is optional. If it is not configured, you will be prompted for the password when the server is turned on for the first time.</li> </ul> <p><b>Note</b> It is recommended that you remove the password from the configuration after the archive is finished.</p>
Step 7	<p><b>issuer-name</b> <i>DN-string</i></p> <p><b>Example:</b> Router (cs-server)# issuer-name my-server</p>	<p>(Optional) Sets the CA issuer name to the specified distinguished name (<i>DN-string</i>). The default value is as follows: <b>issuer-name cn={cs-label}</b>.</p>
Step 8	<p><b>lifetime</b> {<b>ca-certificate</b>   <b>certificate</b>} <i>time</i></p> <p><b>Example:</b> Router (cs-server)# lifetime certificate 888</p>	<p>(Optional) Specifies the lifetime, in days, of a CA certificate or a certificate.</p> <p>Valid values range from 1 day to 1825 days. The default CA certificate lifetime is 3 years; the default certificate lifetime is 1 year. The maximum certificate lifetime is 1 month less than the lifetime of the CA certificate.</p>
Step 9	<p><b>lifetime crl</b> <i>time</i></p> <p><b>Example:</b> Router (cs-server)# lifetime crl 333</p>	<p>(Optional) Defines the lifetime, in hours, of the CRL that is used by the certificate server.</p> <p>Maximum lifetime value is 336 hours (2 weeks). The default value is 168 hours (1 week).</p>

	Command or Action	Purpose
Step 10	<b>lifetime enrollment-request</b> <i>time</i>  <b>Example:</b> Router (cs-server)# lifetime enrollment-request 888	(Optional) Specifies how long an enrollment request should stay in the enrollment database before being removed.  Maximum lifetime is 1000 hours.
Step 11	<b>cdp-url</b> <i>url</i>  <b>Example:</b> Router (cs-server)# cdp-url http://my-cdp.company.com	(Optional) Defines the CDP location to be used in the certificates that are issued by the certificate server. <ul style="list-style-type: none"> <li>The URL must be an HTTP URL.</li> </ul> If you have PKI clients that are not running Cisco IOS software and that do not support a SCEP GetCRL request, use the following URL format: http://server.company.com/certEnroll/filename.crl Or, if your Cisco IOS certificate server is also configured as your CDP, use the following URL format http://cs-addr/cgi-bin/pkiclient.exe?operation=GetCRL where <i>cs-addr</i> is the location of the certificate server.  <b>Note</b> Although this command is optional, it is strongly recommended for any deployment scenario.
Step 12	<b>no shutdown</b>  <b>Example:</b> Router (cs-server)# no shutdown	Enables the certificate server.  You should issue this command only after you have completely configured your certificate server.

## Examples

The following example shows how to configure a CDP location where the PKI clients do not support SCEP GetCRL requests:

```
Router(config)# crypto pki server aaa
Router(cs-server)# database level minimum
Router(cs-server)# database url tftp://10.1.1.1/username1/
Router(cs-server)# issuer-name CN=aaa
Router(cs-server)# cdp-url http://server.company.com/certEnroll/aaa.crl
```

After a certificate server has been enabled on a router, the **show crypto pki server** command displays the following output:

```
Router# show crypto pki server

Certificate Server status:enabled, configured
Granting mode is:manual
Last certificate issued serial number:0x1
CA certificate expiration timer:19:31:15 PST Nov 17 2006
CRL NextUpdate timer:19:31:15 PST Nov 25 2003
Current storage dir:nvram:
Database Level:Minimum - no cert data written to storage
```

## Working with Automatic CA Certificate Rollover

This section describes different methods of initiating automatic CA certificate rollover on the server and obtaining rollover certificates. Use the following tasks as appropriate:

- [Starting Automated CA Certificate Rollover Immediately, page 28](#)
- [Requesting a Certificate Server Client's Rollover Certificate, page 28](#)
- [Exporting a CA Rollover Certificate, page 29](#)

### Starting Automated CA Certificate Rollover Immediately

Use this task to initiate the automated CA certificate rollover process immediately on your root CA server.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki server *cs-label* [rollover [cancel]]**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto pki server <i>cs-label</i> [rollover [cancel]]</b>  <b>Example:</b> Router(config)# crypto pki server mycs rollover	Immediately starts the CA certificate rollover process by generating a shadow CA certificate.  To delete the CA certificate rollover certificate and keys, use the <b>cancel</b> keyword.

### Requesting a Certificate Server Client's Rollover Certificate

Use this task to request a certificate server client's rollover certificate.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki server *cs-label* [rollover request pkcs10 terminal]**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto pki server cs-label [rollover request pkcs10 terminal]</b>  <b>Example:</b> Router(config)# crypto pki server mycs rollover request pkcs10 terminal	Requests a client rollover certificate from the server.

## Examples

The following example shows a rollover certificate request being inputted into the server:

```
Router# crypto pki server mycs rollover request pkcs10 terminal

% Enter Base64 encoded or PEM formatted PKCS10 enrollment request.

% End with a blank line or "quit" on a line by itself.

-----BEGIN CERTIFICATE REQUEST-----

MIIBUTCBuwIBADASMRawDgYDVQQDEwdOZXdsb290MIGfMA0GCSqGSIb3DQEBAQUA
A4GNADCBiQKBgQDMHeev1ERSs320zbLQQk+3lhV/R2HpYQ/im6uT1jkJf5iy0UPR

eW3tyCo=

-----END CERTIFICATE REQUEST-----
```

## Exporting a CA Rollover Certificate

Use this task to export a CA rollover certificate.

## SUMMARY STEPS

- enable
- configure terminal
- crypto pki export trustpoint pem {terminal | url url} [rollover]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto pki export trustpoint pem {terminal   url url} [rollover]</b>  <b>Example:</b> Router(config)# crypto pki export mycs pem terminal rollover	Exports a CA shadow certificate.

## Maintaining, Verifying, and Troubleshooting the Certificate Server, Certificates, and the CA

Use the tasks in this section to help maintain, verify, and troubleshoot the certificate server, certificates and the CA as appropriate:

- [Managing the Enrollment Request Database, page 30](#)
- [Removing Enrollment Requests from the Enrollment Request Database: Examples, page 38](#)
- [Deleting a Certificate Server, page 33](#)
- [Verifying and Troubleshooting Certificate Server and CA Status, page 34](#)
- [Verifying CA Certificate Information, page 34](#)

### Managing the Enrollment Request Database

SCEP supports two client authentication mechanisms—manual and preshared key. Manual enrollment requires the administrator at the CA server to specifically authorize the enrollment requests; enrollment using preshared keys allows the administrator to preauthorize enrollment requests by generating a one-time password (OTP).

Use any of the optional steps within this task to help manage the enrollment request database by performing functions such as specifying enrollment processing parameters that are to be used by SCEP and by controlling the run-time behavior or the certificate server.

## SUMMARY STEPS

1. **enable**
2. **crypto pki server cs-label grant {all | req-id}**
3. **crypto pki server cs-label reject {all | req-id}**
4. **crypto pki server cs-label password generate [minutes]**

5. **crypto pki server** *cs-label* **revoke** *certificate-serial-number*
6. **crypto pki server** *cs-label* **request pkcs10** {*url* | **terminal**} [**base64** | **pem**]
7. **crypto pki server** *cs-label* **info** **crl**
8. **crypto pki server** *cs-label* **info** **requests**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>crypto pki server</b> <i>cs-label</i> <b>grant</b> { <b>all</b>   <i>req-id</i> }  <b>Example:</b> Router# crypto pki server mycs grant all	Grants all or specific SCEP requests.
Step 3	<b>crypto pki server</b> <i>cs-label</i> <b>reject</b> { <b>all</b>   <i>req-id</i> }  Router# crypto pki server mycs reject all	Rejects all or specific SCEP requests.
Step 4	<b>crypto pki server</b> <i>cs-label</i> <b>password generate</b> [ <i>minutes</i> ]  <b>Example:</b> Router# crypto pki server mycs password generate 75	Generates a OTP for SCEP requests. <ul style="list-style-type: none"> <li><i>minutes</i>—Length of time, in minutes, that the password is valid. Valid values range from 1 to 1440 minutes. The default is 60 minutes.</li> </ul> <b>Note</b> Only one OTP is valid at a time; if a second OTP is generated, the previous OTP is no longer valid.
Step 5	<b>crypto pki server</b> <i>cs-label</i> <b>revoke</b> <i>certificate-serial-number</i>  <b>Example:</b> Router# crypto pki server mycs revoke 3	Revokes a certificate on the basis of its serial number. <ul style="list-style-type: none"> <li><i>certificate-serial-number</i>—One of the following options: <ul style="list-style-type: none"> <li>A string with a leading 0x, which is treated as a hexadecimal value</li> <li>A string with a leading 0 and no x, which is treated as octal</li> <li>All other strings, which are treated as decimal</li> </ul> </li> </ul>

	Command or Action	Purpose
Step 6	<pre>crypto pki server cs-label request pkcs10 {url   terminal} [base64   pem]</pre> <p><b>Example:</b> Router# crypto pki server mycs request pkcs10 terminal pem</p>	<p>Manually adds either a base64-encoded or PEM-formatted PKCS10 certificate enrollment request to the request database.</p> <p>After the certificate is granted, it will be displayed on the console terminal using base64 encoding.</p> <ul style="list-style-type: none"> <li>• <b>pem</b>—Specifies the certificate will be returned <i>with</i> PEM headers automatically added to the certificate after the certificate is granted, regardless of whether PEM headers were used in the request.</li> <li>• <b>base64</b>—Specifies the certificate will be returned <i>without</i> privacy-enhanced mail (PEM) headers, regardless of whether PEM headers were used in the request.</li> </ul>
Step 7	<pre>crypto pki server cs-label info crl</pre> <p><b>Example:</b> Router# crypto pki server mycs info crl</p>	Displays information regarding the status of the current CRL.
Step 8	<pre>crypto pki server cs-label info requests</pre> <p><b>Example:</b> Router# crypto pki server mycs info requests</p>	Displays all outstanding certificate enrollment requests.

## Removing Requests from the Enrollment Request Database

After the certificate server receives an enrollment request, the server can leave the request in a pending state, reject it, or grant it. The request stays in the enrollment request database for 1 week until the client polls the certificate server for the result of the request. If the client exits and never polls the certificate server, you can remove either individual requests or all requests from the database.

Use this task to remove requests from the database and allow the server to be returned to a clean slate with respect to the keys and transaction IDs. Also, you can use this task to help troubleshoot a SCEP client that may not be behaving properly.

### SUMMARY STEPS

1. **enable**
2. **crypto pki server cs-label remove {all | req-id}**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>crypto pki server <i>cs-label</i> remove {all   <i>req-id</i>}</b>  <b>Example:</b> Router# <b>crypto pki server mycs remove 15</b>	Removes enrollment requests from the enrollment request database.

## Deleting a Certificate Server

Users can delete a certificate server from the PKI configuration if they no longer want it on the configuration. Typically, a subordinate certificate server or an RA is being deleted. However, users may delete a root certificate server if they are moving it to another device via the archived RSA keys.

Perform this task to delete a certificate server from your PKI configuration.

### Note

When a certificate server is deleted, the associated trustpoint and key are also deleted.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no crypto pki server *cs-label***

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>no crypto pki server <i>cs-label</i></b>  <b>Example:</b> Router (config)# no crypto pki server mycs	Deletes a certificate server and associated trustpoint and key.

## Verifying and Troubleshooting Certificate Server and CA Status

Use any of the following optional steps to verify the status of the certificate server or the CA.

### SUMMARY STEPS

1. **enable**
2. **debug crypto pki server**
3. **dir filesystem:**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>debug crypto pki server</b>  <b>Example:</b> Router# debug crypto pki server	Enables debugging for a crypto PKI certificate server. <ul style="list-style-type: none"><li>• This command can be used for monitoring the progress of an enrollment and for troubleshooting if the certificate server fails to respond or if the certificate server has trouble handling the request that has been configured.</li></ul>
Step 3	<b>dir filesystem:</b>  <b>Example:</b> Router# dir slot0:	Displays a list of files on a file system. <ul style="list-style-type: none"><li>• This command can be used to verify the certificate server autoarchived file if the <b>database url</b> command was entered to point to a local file system. You should be able to at least see “<i>cs-label.ser</i>” and “<i>cs-label.crl</i>” files in the database.</li></ul>

## Verifying CA Certificate Information

To obtain information relating to the CA certificates including the certificate server rollover process, rollover certificates, and timers, you may use any of the following commands.

#### Note

These commands are not exclusive to shadow certificate information. If no shadow certificate exists, the following commands will simply display the active certificate information.

### SUMMARY STEPS

1. **crypto pki certificate chain** *name*
2. **crypto pki server** *cs-label* **info requests**
3. **show crypto pki certificates**
4. **show crypto pki server**
5. **show crypto pki trustpoints**

## DETAILED STEPS

- Step 1** The **crypto pki certificate chain** command can be used to view the certificate chain details and to distinguish the current active certificate from the rollover certificate in the certificate chain. The following example shows a certificate chain with an active CA certificate and a shadow, or rollover, certificate:

```
Router(config)# crypto pki certificate chain mica

certificate 06
certificate ca 01
! This is the peer's shadow PKI certificate.
certificate rollover 0B
! This is the CA shadow PKI certificate
certificate rollover ca 0A
```

- Step 2** The **crypto pki server info requests** command displays all outstanding certificate enrollment requests. The following example shows the output for shadow PKI certificate information requests:

```
Router# crypto pki server myca info requests

Enrollment Request Database:
RA certificate requests:

 ReqID State Fingerprint SubjectName

RA rollover certificate requests:

 ReqID State Fingerprint SubjectName

Router certificates requests:

 ReqID State Fingerprint SubjectName

1 pending A426AF07FE3A4BB69062E0E47198E5BF hostname=client

Router rollover certificates requests:

 ReqID State Fingerprint SubjectName

2 pending B69062E0E47198E5BFA426AF07FE3A4B hostname=client
```

- Step 3** The **show crypto pki certificates** command displays information about your certificate, the certification authority certificate, shadow certificates, and any registration authority certificates. The following example displays the certificate of the router and the certificate of the CA. There is no shadow certificate available. A single, general-purpose RSA key pair was previously generated, and a certificate was requested but not received for that key pair. Note that the certificate status of the router shows “Pending.” After the router receives its certificate from the CA, the Status field changes to “Available” in the **show** output.

```
Router# show crypto pki certificates

Certificate
 Subject Name
 Name: myrouter.example.com
 IP Address: 192.0.2.1
 Serial Number: 04806682
 Status: Pending
 Key Usage: General Purpose
```

```

Fingerprint: 428125BD A3419600 3F6C7831 6CD8FA95 00000000
CA Certificate
Status: Available
Certificate Serial Number: 3051DF7123BEE31B8341DFE4B3A338E5F
Key Usage: Not Set

```

- Step 4** The **show crypto pki server** command displays the current state and configuration of the certificate server. The following example shows that the certificate server “routercs” has rollover configured. The CA auto-rollover time has occurred and the rollover, or shadow, PKI certificate is available. The status shows the rollover certificate fingerprint and rollover CA certificate expiration timer information.

```

Router# show crypto pki server

Certificate Server routercs:
 Status: enabled, configured
 Issuer name: CN=walnutcs
 CA cert fingerprint: 800F5944 74337E5B C2DF6C52 9A7B1BDB
 Granting mode is: auto
 Last certificate issued serial number: 0x7
 CA certificate expiration timer: 22:10:29 GMT Jan 29 2007
 CRL NextUpdate timer: 21:50:56 GMT Mar 5 2004
 Current storage dir: nvram:
 Database Level: Minimum - no cert data written to storage
Rollover status: available for rollover
 Rollover CA cert fingerprint: 6AAF5944 74227A5B 23DF3E52 9A7F1FEF
 Rollover CA certificate expiration timer: 22:10:29 GMT Jan 29 2017

```

- Step 5** The **show crypto pki trustpoints** command displays the trustpoints that are configured in the router. The following output shows that a shadow CA certificate is available and shows the SCEP capabilities reported during the last enrollment operation:

```

Router# show crypto pki trustpoints

Trustpoint vpn:
 Subject Name:
 cn=Cisco SSL CA
 o=Cisco Systems
 Serial Number: 0FFEBBDC1B6F6D9D0EA7875875E4C695
 Certificate configured.
 Rollover certificate configured.
 Enrollment Protocol:
 SCEPv1, PKI Rollover

```

## Configuration Examples for Using a Certificate Server

This section contains the following configuration examples:

- [Configuring Specific Storage and Publication Locations: Examples, page 37](#)
- [Removing Enrollment Requests from the Enrollment Request Database: Examples, page 38](#)
- [Autoarchiving the Certificate Server Root Keys: Examples, page 39](#)
- [Restoring a Certificate Server from Certificate Server Backup Files: Examples, page 41](#)
- [Subordinate Certificate Server: Example, page 43](#)
- [RA Mode Certificate Server: Example, page 45](#)
- [Enabling CA Certificate Rollover to Start Immediately: Example, page 47](#)

## Configuring Specific Storage and Publication Locations: Examples

The following example shows the configuration of a minimal local file system, so that the certificate server can respond quickly to certificate requests. The .ser and .crl files are stored on the local Cisco IOS file system for fast access, and a copy of all of the .crt files are published to a remote location for long-term logging.

```
crypto pki server myserver
 !Pick your database level.
 database level minimum
 !Specify a location for the .crt files that is different than the default local
 !Cisco IOS file system.
 database url crt publish http://url username user1 password secret
```

### Note

Free space on the local file system should be monitored, in case the .crl file becomes too large.

The following example shows the configuration of a primary storage location for critical files, a specific storage location for the critical file serial number file, the main certificate server database file, and a password protected file publication location for the CRL file:

```
Router(config)# crypto pki server mycs
Router(cs-server)# database url ftp://cs-db.company.com
!
% Server database url was changed. You need to move the
% existing database to the new location.
!
Router(cs-server)# database url ser nvram:
Router(cs-server)# database url crt publish ftp://crl.company.com username myname password
mypassword
Router(cs-server)# end
```

The following output displays the specified primary storage location and critical file storage locations specified:

```
Router# show
```

```
Sep 3 20:19:34.216: %SYS-5-CONFIG_I: Configured from console by user on console
```

```
Router# show crypto pki server
```

```
Certificate Server mycs:
 Status: disabled
 Server's configuration is unlocked (enter "no shut" to lock it)
 Issuer name: CN=mycs
 CA cert fingerprint: -Not found-
 Granting mode is: manual
 Last certificate issued serial number: 0x0
 CA certificate expiration timer: 00:00:00 GMT Jan 1 1970
 CRL not present.
 Current primary storage dir: ftp://cs-db.company.com
 Current storage dir for .ser files: nvram:
 Database Level: Minimum - no cert data written to storage
The following output displays all storage and publication locations. The serial number file (.ser) is stored in NVRAM. The CRL file will be published to ftp://crl.company.com with a username and password. All other critical files will be stored to the primary location, ftp://cs-db.company.com.
```

```
Router# show running-config
```

```
section crypto pki server
crypto pki server mycs shutdown database url ftp://cs-db.company.com
```

```

database url crl publish ftp://crl.company.com username myname password 7
12141C0713181F13253920
database url ser nvram:
Router#

```

## Removing Enrollment Requests from the Enrollment Request Database: Examples

The following examples show both the enrollment requests that are currently in the enrollment request database and the result after one of the enrollment requests has been removed from the database.

### Enrollment Request Currently in the Enrollment Request Database

The following example shows that the **crypto pki server info requests** command has been used to display the enrollment requests that are currently in the Enrollment Request Database:

```
Router# crypto pki server myserver info requests
```

Enrollment Request Database:

```

RA certificate requests:
ReqID State Fingerprint SubjectName

```

```

Router certificates requests:
ReqID State Fingerprint SubjectName

2 pending 1B07F3021DAAB0F19F35DA25D01D8567 hostname=host1.company.com
1 denied 5322459D2DC70B3F8EF3D03A795CF636 hostname=host2.company.com

```

### crypto pki server remove Command Used to Remove One Enrollment Request

The following example shows that the **crypto pki server remove** command has been used to remove Enrollment Request 1:

```
Router# crypto pki server myserver remove 1
```

### Enrollment Request Database After the Removal of One Enrollment Request

The following example shows the result of the removal of Enrollment Request 1 from the Enrollment Request Database:

```
Router# crypto pki server mycs info requests
```

Enrollment Request Database:

```

RA certificate requests:
ReqID State Fingerprint SubjectName

```

```

Router certificates requests:
ReqID State Fingerprint SubjectName

2 pending 1B07F3021DAAB0F19F35DA25D01D8567 hostname=host1.company.com

```

## Autoarchiving the Certificate Server Root Keys: Examples

The following output configurations and examples show what you might see if the **database archive** command has not been configured (that is, configured using the default value); if the **database archive** command has been configured to set the CA certificate and CA key archive format as PEM, without configuring a password; and if the **database archive** command has been configured to set the CA certificate and CA key archive format as PKCS12, with a password configured. The last example is sample content of a PEM-formatted archive file.

### database archive Command Not Configured

#### Note

The default is PKCS12, and the prompt for the password appears after the **no shutdown** command has been issued.

```
Router (config)# crypto pki server myserver
Router (cs-server)# no shutdown

% Generating 1024 bit RSA keys ...[OK]
% Ready to generate the CA certificate.
%Some server settings cannot be changed after CA certificate generation.

Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
! Note the next two lines, which are asking for a password.
% Please enter a passphrase to protect the private key.
Password:
% Certificate Server enabled.
Router (cs-server)# end

Router# dir nvram:

Directory of nvram:/

 125 -rw- 1693 <no date> startup-config
 126 ---- 5 <no date> private-config
 1 -rw- 32 <no date> myserver.ser
 2 -rw- 214 <no date> myserver.crl
! Note the next line, which indicates PKCS12 format.
 3 -rw- 1499 <no date> myserver.p12
```

### database archive Command and pem Keyword Configured

#### Note

The prompt for the password appears after the **no shutdown** command has been issued.

```
Router (config)# crypto pki server myserver
Router (cs-server)# database archive pem
Router (cs-server)# no shutdown

% Generating 1024 bit RSA keys ...[OK]
% Ready to generate the CA certificate.
%Some server settings cannot be changed after CA certificate generation.

Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
!Note the next two lines, which are asking for a password.
% Please enter a passphrase to protect the private key.
Password:
```

```
% Certificate Server enabled.
Router (cs-server)# end

Router# dir nvram

Directory of nvram:/

 125 -rw- 1693 <no date> startup-config
 126 ---- 5 <no date> private-config
 1 -rw- 32 <no date> myserver.ser
 2 -rw- 214 <no date> myserver.crl
! Note the next line showing that the format is PEM.
 3 -rw- 1705 <no date> myserver.pem
```

### database archive Command and pkcs12 Keyword (and Password) Configured

#### Note

When the password is entered, it will be encrypted. However, it is recommended that you remove the password from the configuration after the archive has finished.

```
Router (config)# crypto pki server myserver
Router (cs-server)# database archive pkcs12 password cisco123
Router (cs-server)# no shutdown

% Generating 1024 bit RSA keys ...[OK]
% Ready to generate the CA certificate.
% Some server settings cannot be changed after CA certificate generation.

Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
! Note that you are not being prompted for a password.
% Certificate Server enabled.
Router (cs-server)# end
Router# dir nvram:
Directory of nvram:/

 125 -rw- 1693 <no date> startup-config
 126 ---- 5 <no date> private-config
 1 -rw- 32 <no date> myserver.ser
 2 -rw- 214 <no date> myserver.crl
! Note that the next line indicates that the format is PKCS12.
 3 -rw- 1499 <no date> myserver.p12
```

### PEM-Formatted Archive

The following sample output shows that autoarchiving has been configured in PEM file format. The archive consists of the CA certificate and the CA private key. To restore the certificate server using the backup, you would have to import the PEM-formatted CA certificate and CA key individually.

#### Note

In addition to the CA certificate and CA key archive files, you should also back up the serial file (.ser) and the CRL file (.crl) regularly. The serial file and the CRL file are both critical for CA operation if you need to restore your certificate server.

```
Router# more nvram:mycs.pem

## Restoring a Certificate Server from Certificate Server Backup Files: Examples

The following example shows that restoration is from a PKCS12 archive and that the database URL is NVRAM (the default).

```

Router# copy tftp://192.0.2.71/backup.ser nvram:mycs.ser
Destination filename [mycs.ser]?

32 bytes copied in 1.320 secs (24 bytes/sec)
Router# copy tftp://192.0.2.71/backup.crl nvram:mycs.crl
Destination filename [mycs.crl]?

214 bytes copied in 1.324 secs (162 bytes/sec)
Router# configure terminal
Router (config)# crypto pki import mycs pkcs12 tftp://192.0.2.71/backup.p12 cisco123
Source filename [backup.p12]?
CRYPTO_PKI: Imported PKCS12 file successfully.
Router (config)# crypto pki server mycs
! fill in any certificate server configuration here
Router (cs-server)# no shutdown
% Certificate Server enabled.
Router (cs-server)# end
Router# show crypto pki server

Certificate Server mycs:
 Status: enabled
 Server's current state: enabled
 Issuer name: CN=mycs
 CA cert fingerprint: 34885330 B13EAD45 196DA461 B43E813F
 Granting mode is: manual
 Last certificate issued serial number: 0x1

```

```

CA certificate expiration timer: 01:49:13 GMT Aug 28 2007
CRL NextUpdate timer: 01:49:16 GMT Sep 4 2004
Current storage dir: nvram:
Database Level: Minimum - no cert data written to storage

```

The following example shows that restoration is from a PEM archive and that the database URL is flash:

```

Router# copy tftp://192.0.2.71/backup.ser flash:mycs.ser
Destination filename [mycs.ser]?
32 bytes copied in 1.320 secs (24 bytes/sec)
Router# copy tftp://192.0.2.71/backup.crl flash:mycs.crl
Destination filename [mycs.crl]?
214 bytes copied in 1.324 secs (162 bytes/sec)
Router# configure terminal
! Because CA cert has Digital Signature usage, you need to import using the "usage-keys"
keyword
Router (config)# crypto ca import mycs pem usage-keys terminal cisco123
% Enter PEM-formatted CA certificate.
% End with a blank line or "quit" on a line by itself.
! Paste the CA cert from .pem archive.

Jan 6 22:35:02.359: CRYPTO_CS: enter FSM: input state enabled, input signal time set
Jan 6 22:35:02.359: CRYPTO_CS: exit FSM: new state enabled
Jan 6 22:35:02.359: CRYPTO_CS: cs config has been locked

```

## Root Certificate Server Differentiation: Example

When issuing certificates, the root certificate server (or parent subordinate certificate server) will differentiate the certificate request from “Sub CA,” “RA,” and peer requests, as shown in the following sample output:

```

Router# crypto pki server server1 info req

Enrollment Request Database:
RA certificate requests:
ReqID State Fingerprint SubjectName

Subordinate CS certificate requests:
ReqID State Fingerprint SubjectName

1 pending CB9977AD8A73B146D3221749999B0F66 hostname=host-subcs.company.com

```

```

RA certificate requests:
ReqID State Fingerprint SubjectName

Router certificate requests:
ReqID State Fingerprint SubjectName

```

## Show Output for a Subordinate Certificate Server: Example

The following **show crypto pki server** command output indicates that a subordinate certificate server has been configured:

```

Router# show crypto pki server

Certificate Server sub:
 Status: enabled
 Server's configuration is locked (enter "shut" to unlock it)
 Issuer name: CN=sub
 CA cert fingerprint: 11B586EE 3B354F33 14A25DDD 7BD39187
 Server configured in subordinate server mode
 Upper CA cert fingerprint: 328ACC02 52B25DB8 22F8F104 B6055B5B
 Granting mode is: manual
 Last certificate issued serial number: 0x1

 CRL NextUpdate timer: 22:33:29 GMT Jan 13 2005
 Current storage dir: nvram:
 Database Level: Minimum - no cert data written to storage

```

## RA Mode Certificate Server: Example

The following output is typical of what you might see after having configured an RA mode certificate server:

```

Router-ra (config)# crypto pki trustpoint myra
Router-ra (ca-trustpoint)# enrollment url http://192.0.2.17
! Include "cn=ioscs RA" or "ou=ioscs RA" in the subject-name.
Router-ra (ca-trustpoint)# subject-name cn=myra, ou=ioscs RA, o=company, c=us
Router-ra (ca-trustpoint)# exit
Router-ra (config)# crypto pki server myra
Router-ra (cs-server)# mode ra
Router-ra (cs-server)# no shutdown
% Generating 1024 bit RSA keys ...[OK]

Certificate has the following attributes:
Fingerprint MD5: 32661452 0DDA3CE5 8723B469 09AB9E85
Fingerprint SHA1: 9785BBCE 6C67D27C C950E8D0 718C7A14 C0FE9C38
% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.
% Ready to request the CA certificate.
%Some server settings cannot be changed after the CA certificate has been requested.

Are you sure you want to do this? [yes/no]: yes
%
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this
 password to the CA administrator in order to revoke your certificate.
 For security reasons your password will not be saved in the configuration.
 Please make a note of it.

```

```

Password:
Re-enter password:

% The subject name in the certificate will include: cn=myra, ou=ioscs RA, o=company, c=us
% The subject name in the certificate will include: Router-ra.company.com
% Include the router serial number in the subject name? [yes/no]: no
% Include an IP address in the subject name? [no]: no
Request certificate from CA? [yes/no]: yes
% Certificate request sent to Certificate Authority
% The certificate request fingerprint will be displayed.
% The 'show crypto pki certificate' command will also show the fingerprint.

% Enrollment in progress...
Router-ra (cs-server)#
Sep 15 22:32:40.197: CRYPTO_PKI: Certificate Request Fingerprint MD5: 82B41A76 AF4EC87D
AAF093CD 07747D3A
Sep 15 22:32:40.201: CRYPTO_PKI: Certificate Request Fingerprint SHA1: 897CDF40 C6563EAA
0FED05F7 0115FD3A 4FFC5231
Sep 15 22:34:00.366: %PKI-6-CERTRET: Certificate received from Certificate Authority
Router-ra (cs-server)#
Router-ra(cs-server)# end

```

```
Router-ra# show crypto pki server
```

```

Certificate Server myra:
 Status: enabled
 Issuer name: CN=myra
 CA cert fingerprint: 32661452 0DDA3CE5 8723B469 09AB9E85
 ! Note that the certificate server is running in RA mode
 Server configured in RA mode
 RA cert fingerprint: C65F5724 0E63B3CC BE7AE016 BE0D34FE
 Granting mode is: manual
 Current storage dir: nvram:
 Database Level: Minimum - no cert data written to storage

```

The following output shows the enrollment request database of the issuing certificate server after the RA has been enabled:

#### Note

The RA certificate request is recognized by the issuing certificate server because "ou=ioscs RA" is listed in the subject name.

```

Router-ca# crypto pki server mycs info request
Enrollment Request Database:

Subordinate CA certificate requests:
ReqID State Fingerprint SubjectName

! The request is identified as RA certificate request.
RA certificate requests:
ReqID State Fingerprint SubjectName

12 pending 88F547A407FA0C90F97CDE8900A30CB0
hostname=Router-ra.company.com,cn=myra,ou=ioscs RA,o=company,c=us

```

```
Router certificates requests:
ReqID State Fingerprint SubjectName

```

```
! Issue the RA certificate.
Router-ca# crypto pki server mycs grant 12
```

The following output shows that the issuing certificate server is configured to issue a certificate automatically if the request comes from an RA:

```
Router-ca(config)# crypto pki server mycs
Router-ca (cs-server)# grant ra-auto
% This will cause all certificate requests already authorized by known RAs to be
automatically granted.

Are you sure you want to do this? [yes/no]: yes
Router-ca (cs-server)# end
Router-ca# show crypto pki server

Certificate Server mycs:
 Status: enabled
 Server's current state: enabled
 Issuer name: CN=mycs
 CA cert fingerprint: 32661452 0DDA3CE5 8723B469 09AB9E85
 ! Note that the certificate server will issue certificate for requests from the RA.
 Granting mode is: auto for RA-authorized requests, manual otherwise
 Last certificate issued serial number: 0x2
 CA certificate expiration timer: 22:29:37 GMT Sep 15 2007
 CRL NextUpdate timer: 22:29:39 GMT Sep 22 2004
 Current storage dir: nvram:
 Database Level: Minimum - no cert data written to storage
```

The following example shows the configuration of “myra”, an RA server, configured to support automatic rollover from “myca”, the CA. After the RA server is configured, automatic granting of certificate reenrollment requests is enabled:

```
crypto pki trustpoint myra
 enrollment url http://myca
 subject-name ou=iosca RA
 rsakeypair myra
crypto pki server myra
 mode ra
 auto-rollover

crypto pki server mycs
 grant auto rollover ra-cert
 auto-rollover 25
```

## Enabling CA Certificate Rollover to Start Immediately: Example

The following example shows how to enable automated CA certificate rollover on the server mycs with the **crypto pki server** command. The **show crypto pki server** command then shows the current state of the mycs server and that the rollover certificate is currently available for rollover.

```
Router(config)# crypto pki server mycs rollover

Jun 20 23:51:21.211:%PKI-4-NOSHADOWAUTOSAVE:Configuration was
modified. Issue "write memory" to save new IOS CA certificate

! The config has not been automatically saved because the config has been changed.
```

```
Router# show crypto pki server
```

```
Certificate Server mycs:
 Status:enabled
 Server's configuration is locked (enter "shut" to unlock it)
 Issuer name:CN=mycs
 CA cert fingerprint:E7A5FABA 5D7AA26C F2A9F7B3 03CE229A
 Granting mode is:manual
 Last certificate issued serial number:0x2
 CA certificate expiration timer:00:49:26 PDT Jun 20 2008
 CRL NextUpdate timer:00:49:29 PDT Jun 28 2005
 Current storage dir:nvram:
 Database Level:Minimum - no cert data written to storage
 Rollover status:available for rollover
 ! Rollover certificate is available for rollover.
 Rollover CA certificate fingerprint:9BD7A443 00A6DD74 E4D9ED5F B7931BE0
 Rollover CA certificate expiration time:00:49:26 PDT Jun 20 2011
 Auto-Rollover configured, overlap period 25 days
```

## Where to Go Next

After the certificate server is successfully running, you can either begin enrolling clients via manual mechanisms (as explained in the module “Configuring Certificate Enrollment for a PKI”) or begin configuring SDP, which is a web-based enrollment interface, (as explained in the module “Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI.”)

# Feature Information for the Cisco IOS Certificate Server

Table 4 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the “[Implementing and Managing PKI Features Roadmap](#).”

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

Table 4 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 4** Feature Information for the Cisco IOS Certificate Server

Feature Name	Releases	Feature Information
Cisco IOS USB Token PKI Enhancements—Phase 2	12.4(11)T	<p>This feature enhances USB token functionality by using the USB token as a cryptographic device. USB tokens may be used for RSA operations such as key generation, signing, and authentication.</p> <p>The following sections in this document provide information about this feature:</p> <ul style="list-style-type: none"> <li><a href="#">RSA Key Pair and Certificate of the Certificate Server</a></li> <li><a href="#">Trustpoint of the Certificate Server</a></li> <li><a href="#">Generating a Certificate Server RSA Key Pair</a></li> </ul> <p><b>Note</b> This document covers the use of using USB tokens for RSA operations during certificate server configuration. For other documents on this topic, see the “<a href="#">The following sections provide references related to Cisco IOS certificate server.Related Documents</a>” section.</p>
IOS Certificate Server (CS) Split Database	12.4(4)T	<p>This feature allows the user to set storage locations and publish locations for specific certificate server file types.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li><a href="#">Certificate Server Database</a></li> <li><a href="#">Configuring Certificate Server Functionality</a></li> <li><a href="#">Configuring Specific Storage and Publication Locations: Examples</a></li> </ul> <p>The following command was modified by this feature: <b>database url</b></p>

# Storing PKI Credentials

---

**First Published: May 2, 2005**

**Last Updated: August 21, 2007**

This module explains how to store public key infrastructure (PKI) credentials, such as Rivest, Shamir, and Adelman (RSA) keys and certificates in a specific location.

An example of a certificate storage location includes NVRAM, which is the default location, and other local storage locations, such as flash, as supported by your platform.

An example of an RSA key and certificate storage location includes a USB token. Selected Cisco platforms support smart card technology in a USB key form factor (such as an Aladdin USB eToken key). USB tokens provide secure configuration distribution, provide RSA operations such as on-token key generation, signing, and authentication, and allow users to store Virtual Private Network (VPN) credentials for deployment.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Storing PKI Credentials](#)” section on [page 25](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Additional References, page 23](#)
- [Feature Information for Storing PKI Credentials, page 25](#)

## Prerequisites for Storing PKI Credentials

### Prerequisites for Specifying a Local Certificate Storage Location

Before you can specify the local certificate storage location, your system should meet the following requirements:

- A Cisco IOS Release 12.4(2)T PKI-enabled image or a later image
- A platform that supports storing PKI credentials as separate files
- A configuration that contains at least one certificate
- An accessible local file system

### Prerequisites for Specifying USB Token Storage for PKI Credentials

Before you can use a USB token, your system should meet the following requirements:

- A Cisco 871 router, Cisco 1800 series, Cisco 2800 series, a Cisco 3800 series router, or a Cisco 7200VXR NPE-G2 platform
- At least a Cisco IOS Release 12.3(14)T image running on any of the supported platforms
- A Cisco supported USB token
- A k9 image

## Restrictions for Storing PKI Credentials

### Restrictions for Specifying a Local Certificate Storage Location

When storing certificates to a local storage location, the following restrictions are applicable:

- Only local file systems may be used. An error message will be displayed if a remote file system is selected, and the command will not take effect.
- A subdirectory may be specified if supported by the local file system. NVRAM does not support subdirectories.

### Restrictions for Specifying USB Token Storage

When using a USB token to store PKI data, the following restrictions are applicable:

- USB token support requires a 3DES (k9) Cisco IOS software image, which provides secure file storage.
- You cannot boot an image from a USB token. (However, you can boot a configuration from a USB token.)
- USB hubs are currently not supported. Thus, the number of supported devices is limited to the number of available USB ports.

# Information About Storing PKI Credentials

To determine where to store PKI credentials, you should understand the following concepts:

- [Storing Certificates to a Local Storage Location, page 3](#)
- [PKI Credentials and USB Tokens, page 3](#)

## Storing Certificates to a Local Storage Location

Certificates are stored to NVRAM by default, however some routers do not have the required amount of NVRAM to successfully store certificates. Introduced in Cisco IOS Release 12.4(2)T is the ability to specify where certificates are stored on a local file system.

All Cisco platforms support NVRAM and flash local storage. Depending on your platform, you may have other supported local storage options including bootflash, slot, disk, USB flash, or USB token.

During run time, you can specify what active local storage device you would like to use to store certificates.

## PKI Credentials and USB Tokens

To use a secure USB token on your router, you should understand the following concepts:

- [How a USB Token Works, page 3](#)
- [Benefits of USB Tokens, page 4](#)

### How a USB Token Works

A smart card is a small plastic card, containing a microprocessor and memory that allows you to store and process data. A USB token is a smart card with a USB interface. The token can securely store any type of file within its available storage space (32 KB). Configuration files that are stored on the USB token can be encrypted and accessed only via a user PIN. The router will not load the configuration file unless the proper PIN has been configured for secure deployment of router configuration files.

After you plug the USB token into the router, you must log into the USB token; thereafter, you can change default settings, such as the user PIN (default: 1234567890) and the allowed number of failed login attempts (default: 15 attempts) before future logins are refused. For more information on accessing and configuring the USB token, see the section “[Logging Into and Setting Up the USB Token.](#)”

After you have successfully logged into the USB token, you can copy files from the router on to the USB token via the **copy** command. USB token RSA keys and associated IPsec tunnels remain available until the router is reloaded. To specify the length of time before the keys are removed and the IPsec tunnels are torn down, issue the **crypto pki token removal timeout** command.

[Table 1](#) highlights the capabilities of the USB token.

**Table 1**      **Functionality Highlights for USB Tokens**

Function	USB Token
Accessibility	Used to securely store and transfer digital certificates, preshared keys, and router configurations from the USB token to the router.
Storage Size	32 KB

**Table 1**      **Functionality Highlights for USB Tokens (continued)**

Function	USB Token
<b>File Types</b>	<ul style="list-style-type: none"> <li>Typically used to store digital certificates, preshared keys, and router configurations for IPsec VPNs.</li> <li>USB tokens cannot store Cisco IOS images.</li> </ul>
<b>Security</b>	<ul style="list-style-type: none"> <li>Files can be encrypted and accessed only with a user PIN.</li> <li>Files can also be stored in a nonsecure format.</li> </ul>
<b>Boot Configurations</b>	<ul style="list-style-type: none"> <li>The router can use the configuration stored in the USB token during boot time.</li> <li>The router can use the secondary configuration stored in the USB token during boot time. (A secondary configuration allows users to load their IPsec configuration.)</li> </ul>

## Benefits of USB Tokens

USB token support on a Cisco router provides the following application benefits:

### Removable Credentials: Provide or Store VPN Credentials on an External Device for Deployment

A USB token can use smart card technology to store a digital certificate and configuration for IPsec VPN deployment. This ability enhances the capability of the router to generate RSA public keys to authenticate at least one IPsec tunnel. (Because a router can initiate multiple IPsec tunnels, the USB token can contain several certificates, as appropriate.)

Storing VPN credentials on an external device reduces the threat of compromising secure data.

### PIN Configuration for Secure File Deployment

A USB token can store a configuration file that can be used for enabling encryption on the router via a user-configured PIN. (That is, no digital certificates, preshared keys, or VPNs are used.)

### Touchless or Low Touch Configuration

The USB token can provide remote software configuration and provisioning with little or no human interaction. Configuration is set up as an automated process. That is, the USB token can store a bootstrap configuration that the router can use to boot from after the USB token has been inserted into the router. The bootstrap configuration connects the router to a TFTP server, which contains a configuration that completely configures the router.

### RSA Operations

As of Cisco IOS Release 12.4(11)T and later releases, a USB token may be used as a cryptographic device in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication to be performed on the token.

General-purpose, special-usage, encryption, or signature RSA key pairs with a modulus of 2048 bits or less may be generated from credentials located on your token storage device. Private keys are not distributed and remain on the token by default, however you may configure the private key storage location.

Keys that reside on a USB token are saved to persistent token storage when they are generated. Key deletion will remove the keys stored on the token from persistent storage immediately. (Keys that do not reside on a token are saved to or deleted from nontoken storage locations when the **write memory** or a similar command is issued.)

Remote Device Configuration and Provisioning in a Secure Device Provisioning (SDP) Environment

As of Cisco IOS Release 12.4(15)T and later releases, SDP may be used to configure a USB token. The configured USB token may be transported to provision a device at a remote location. That is, a USB token may be used to transfer cryptographic information from one network device to another remote network device providing a solution for a staged USB token deployment.

For information about using USB tokens with SDP, see document titles in the “[Related Documents](#)” section.

## How to Configure PKI Storage

This section contains the following configuration tasks:

- [Specifying a Local Storage Location for Certificates, page 5](#)
- [Setting Up and Using USB Tokens on Cisco Routers, page 6](#)
- [Troubleshooting USB Tokens, page 16](#)

### Specifying a Local Storage Location for Certificates

The following procedure allows you to specify the local storage location for certificates.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. `crypto pki certificate storage location-name`
4. `exit`
5. **copy** *source-url destination-url*
6. `show crypto pki certificates storage`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto pki certificate storage</b> <i>location-name</i>  <b>Example:</b> Router(config)# crypto pki certificate storage flash:/certs	Specifies the local storage location for certificates.
Step 4	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode.
Step 5	<b>copy</b> <i>source-url destination-url</i>  <b>Example:</b> Router# copy system:running-config nvram:startup-config	(Optional) Saves the running configuration to the startup configuration.  <b>Note</b> Settings will only take effect when the running configuration is saved to the startup configuration.
Step 6	<b>show crypto pki certificates storage</b>  <b>Example:</b> Router# show crypto pki certificates storage	(Optional) Displays the current setting for the PKI certificate storage location.

## Examples

The following is sample output for the **show crypto pki certificates storage** command where the certificates are stored in the certs subdirectory of disk0:

```
Router# show crypto pki certificates storage
```

```
Certificates will be stored in disk0:/certs/
```

## Setting Up and Using USB Tokens on Cisco Routers

This section contains the following procedures that allow you to configure a router to support USB tokens:

- [Storing the Configuration on a USB Token, page 7](#)
- [Logging Into and Setting Up the USB Token, page 7](#)
- [Configuring the USB Token, page 10](#)
- [Setting Administrative Functions on the USB Token, page 13](#)

## Storing the Configuration on a USB Token

Perform this task to store the configuration file in a USB token.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **boot config usbtoken[0-9]:filename**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>boot config usbtoken[0-9]:filename</b>  <b>Example:</b> Router(config)# boot config usbtoken0:file	Specifies that the startup configuration file is stored in a secure USB token.

## Logging Into and Setting Up the USB Token

Perform this task to log into and to perform the initial set up of a USB token.

### Use of RSA Keys with a USB Token

- RSA keys are loaded after the USB token is successfully logged into the router.
- By default, newly generated RSA keys are stored on the most recently inserted USB token. Regenerated keys should be stored in the same location where the original RSA key was generated.

### Automatic Login

Automatic login allows the router to completely come back up without any user or operator intervention. The PIN is stored in the private NVRAM, so it is not visible in the startup or running configuration.

#### Note

A hand-generated startup configuration can contain the automatic login command for deployment purposes, but the **copy system:running-config nvram: startup-config** command must be issued to put the hand-generated configuration in the private configuration.

### Manual Login

Unlike automatic login, manual login requires that the user know the actual USB token PIN.

Manual login can be used when storing a PIN on the router is not desirable. Manual login may also be suitable for some initial deployment or hardware replacement scenarios for which the router is obtained from the local supplier or drop-shipped to the remote site. Manual login can be executed with or without privileges, and it will make files and RSA keys on the USB token available to the Cisco IOS software. If a secondary configuration file is configured, it will be executed only with the privileges of the user who is performing the login. Thus, if you want to use manual login and set up the secondary configuration on the USB token to perform anything useful, you need to enable privileges.

Manual login can also be used in recovery scenarios for which the router configuration has been lost. If the scenario contains a remote site that normally connects to the core network with a VPN, the loss of the configuration and RSA keys requires out-of-band services that the USB token can provide. The USB token can contain a boot configuration, a secondary configuration, or both, and RSA keys to authenticate the connection.

## SUMMARY STEPS

1. **enable**
2. **crypto pki token** *token-name* [**admin**] **login** [*pin*]  
or  
**configure terminal**
3. **crypto pki token** *token-name* **user-pin** [*pin*]
4. **exit**
5. **show usbtoken**[0-9]:*filename*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>crypto pki token token-name [admin] login [pin]</b>  <b>Example:</b> Router# crypto pki token usbtokens0 admin login 5678  or <b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Manually logs into the USB token.  You must specify the <b>admin</b> keyword if later you want to change the user PIN.  or  Puts the router in global configuration mode, which allows you to configure automatic USB token login.
Step 3	<b>crypto pki token token-name user-pin [pin]</b>  <b>Example:</b> Router(config)# crypto pki token usbtokens0 user-pin 1234	(Optional) Configures the router to log into the token automatically, using the specified PIN at router startup or when the USB token is inserted into a USB slot.  The PIN is encrypted and stored in NVRAM.  <b>Note</b> You will be asked to enter your passphrase.
Step 4	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode.
Step 5	<b>show usbtokens[0-9]:filename</b>  <b>Example:</b> Router# show usbtokens0:usbfile	(Optional) Verifies whether the USB token has been logged onto the router.

## What to Do Next

After you have logged into the USB token, it is available for use.

- To further configure the USB token, see the “[Configuring the USB Token](#)” section.
- To perform USB token administrative tasks, such as changing the user PIN, copying files from the router to the USB token set key storage location, and changing USB tokens, see the “[Setting Administrative Functions on the USB Token](#)” section.
- To utilize the USB token as a cryptographic device to perform RSA operations, see the document titles in the “[Related Documents](#)” section.
- To specify that the USB token be used for RSA operations during initial autoenrollment, see the document titles in the “[Related Documents](#)” section.

## Configuring the USB Token

After you have set up automatic login, you may perform this task to further configure the USB token.

### PINs and Passphrases

For additional PIN security with automatic login, you may encrypt your PIN stored in NVRAM and set up a passphrase for your USB token. Establishing a passphrase allows you to keep your PIN secure; another user needs only to know the passphrase, not the PIN.

When the USB token is inserted into the router, the passphrase is needed to decrypt the PIN. Once the PIN is decrypted, the router can then use the PIN to login the USB token.

**Note**

The user has only the access they would normally have and needs only privilege level 1 to log in.

### Unlocking and Locking the USB Token

The USB token itself can be locked (encrypted) or unlocked (decrypted).

Unlocking the USB token allows it to be used. Once unlocked, Cisco IOS treats the token as if it were automatically logged in. Any keys on the USB token are loaded, and if a secondary configuration file is on the token, it is executed with full user privileges (privilege level 15) independent of the privilege level of the logged-in user.

Locking the token, unlike logging out of the token, deletes any RSA keys loaded from the token and runs the secondary unconfiguration file, if configured.

### Secondary Configuration and Unconfiguration Files

Configuration files that exist on a USB token are called secondary configuration files. If you create and configure a secondary configuration file, it is executed after the token is logged in. The existence of a secondary configuration file is determined by the presence of a secondary configuration file option in the Cisco IOS configuration stored in NVRAM. When the token is removed or logged out and the removal timer expires, a separate secondary unconfiguration file is processed to remove all secondary configuration elements from the running configuration. Secondary configuration and secondary unconfiguration files are executed at privilege level 15 and are not dependent on the level of the user logged in.

### SUMMARY STEPS

1. **enable**
2. **crypto pki token *token-name* unlock [*pin*]**
3. **configure terminal**
4. **crypto pki token *token-name* encrypted-user-pin [write]**
5. **crypto pki token *token-name* secondary unconfig *file***
6. **exit**
7. **crypto pki token *token-name* lock [*pin*]**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>crypto pki token token-name unlock [pin]</b>  <b>Example:</b> Router# crypto pki token mytoken unlock mypin	(Optional) Allows the token to be used if the USB token has been locked.  Once unlocked, Cisco IOS treats the token as if it has been automatically logged in. Any keys on the token are loaded and if a secondary configuration file exists, it is executed.
Step 3	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 4	<b>crypto pki token token-name encrypted-user-pin [write]</b>  <b>Example:</b> Router(config)# crypto pki token mytoken encrypted-user-pin write	(Optional) Encrypts the stored PIN in NVRAM.
Step 5	<b>crypto pki token token-name secondary unconfig file</b>  <b>Example:</b> Router(config)# crypto pki token mytoken secondary unconfig configs/myunconfigfile.cfg	(Optional) Specifies the secondary configuration file and its location.
Step 6	<b>exit</b>  <b>Example:</b> Router(config)# exit	Enters privileged EXEC mode.
Step 7	<b>crypto pki token token-name lock [pin]</b>  <b>Example:</b> Router# crypto pki token mytoken lock mypin	(Optional) Deletes any RSA keys loaded from the token and runs the secondary unconfiguration file, if it exists.

## Examples

The following example shows both the configuration and encryption of a user PIN and then the router reloading and the user PIN being unlocked:

```
! Configuring the user PIN
```

```
Enter configuration commands, one per line. End with CNTL/Z.
```

```
Router(config)# crypto pki token usbtoken0: user-pin
```

```
Enter password:
```

```
! Encrypt the user PIN
```

```

Router (config)# crypto pki token usbtoken0: encrypted-user-pin
 Enter passphrase:
Router(config)# exit
Router#
Sep 20 21:51:38.076: %SYS-5-CONFIG_I: Configured from console by console
!

Router# show running config
.
.
.
crypto pki token usbtoken0 user-pin *encrypted*
.
.
.

! Reloading the router.
!
Router> enable
Password:
!
! Decrypting the user pin.
!
Router# crypto pki token usbtoken0: unlock
Token eToken is usbtoken0
!
Enter passphrase:
Token login to usbtoken0(eToken) successful
Router#
Sep 20 22:31:13.128: %CRYPTO-6-TOKENLOGIN: Cryptographic Token eToken
Login Successful

```

The following example shows how a secondary unconfiguration file might be used to remove secondary configuration elements from the running configuration. For example, a secondary configuration file might be used to set up a PKI trustpoint. A corresponding unconfiguration file, named `mysecondaryunconfigfile.cfg`, might contain this command line:

```
no crypto pki trustpoint token-tp
```

If the token were removed and the following commands executed, the trustpoint and associated certificates would be removed from the router's running configuration:

```

Router# configure terminal
Router(config)# no crypto pki token mytoken secondary unconfig mysecondaryunconfigfile.cfg

```

## What to Do Next

After you have logged into and configured the USB token, it is available for use.

- To perform USB token administrative tasks, such as changing the user PIN, copying files from the router to the USB token set key storage location, and changing USB tokens, see the “[Setting Administrative Functions on the USB Token](#)” section.
- To utilize the USB token as a cryptographic device to perform RSA operations, see the document titles in the “[Related Documents](#)” section.

- To specify that the USB token be used for RSA operations during initial autoenrollment, see the document titles in the “[Related Documents](#)” section.

## Setting Administrative Functions on the USB Token

Perform this task to change default settings, such as the user PIN, the maximum number of failed attempts on the USB token, or the credential storage location.

### SUMMARY STEPS

1. **enable**
2. **crypto pki token** *token-name* [**admin**] **change-pin** [*pin*]
3. **crypto pki token** *token-name* **device:** **label** *token-label*
4. **configure terminal**
5. **crypto key storage** *device:*
6. **crypto key generate rsa** [**general-keys** | **usage-keys** | **signature** | **encryption**] [**label** *key-label*] [**exportable**] [**modulus** *modulus-size*] [**storage** *devicename:*] [**on** *devicename:*]
7. **crypto key move rsa** *keylabel* [**non-exportable**] [**on** | **storage**] *location*
8. **crypto pki token** {*token-name* | **default**} **removal timeout** [*seconds*]
9. **crypto pki token** {*token-name* | **default**} **max-retries** [*number*]
10. **exit**
11. **copy usbflash**[0-9]:*filename* *destination-url*
12. **show usbtok**[0-9]:*filename*
13. **crypto pki token** *token-name* **logout**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>crypto pki token token-name [admin] change-pin [pin]</b>  <b>Example:</b> Router# crypto pki token usbtoken0 admin change-pin	(Optional) Changes the user PIN number on the USB token. <ul style="list-style-type: none"> <li>If the PIN is not changed, the default PIN—1234567890—will be used.</li> </ul> <b>Note</b> After the PIN has been changed, you must reset the login failure count to zero (via the <b>crypto pki token max-retries</b> command). The maximum number of allowable login failures is set (by default) to 15.
Step 3	<b>crypto pki token token-name device: label token-label</b>  <b>Example:</b> Router# crypto pki token my token usb0: label newlabel	(Optional) Sets or changes the name of the USB token. <ul style="list-style-type: none"> <li>The value of the <i>token-label</i> argument may be up to 31 alphanumeric characters in length including dashes and underscores.</li> </ul> <b>Tip</b> This command is useful when configuring multiple USB tokens for automatic login, secondary configuration files, or other token specific settings.
Step 4	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 5	<b>crypto key storage device:</b>  <b>Example:</b> Router(config)# crypto key storage usbtoken0:	(Optional) Sets the default RSA key storage location for newly created keys. <b>Note</b> Regardless of configuration settings, existing keys are stored on the device from where they were originally loaded.
Step 6	<b>crypto key generate rsa [general-keys   usage-keys   signature   encryption] [label key-label] [exportable] [modulus modulus-size] [storage devicename:] [on devicename:]</b>  <b>Example:</b> Router(config)# crypto key generate rsa label tokenkey1 storage usbtoken0:	(Optional) Generates the RSA key pair. <ul style="list-style-type: none"> <li>The <b>storage</b> keyword specifies the key storage location.</li> <li>The <b>on</b> keyword specifies that the keys will be generated on the designated device.</li> </ul>

	Command or Action	Purpose
Step 7	<p><b>crypto key move rsa</b> <i>keylabel</i> [<b>non-exportable</b>] [<b>on</b>   <b>storage</b>] <i>location</i></p> <p><b>Example:</b> Router(config)# crypto key move rsa keypairname non-exportable on token</p>	<p>(Optional) Moves existing Cisco IOS credentials from the current storage location to the specified storage location.</p> <p>By default, the RSA key pair remains stored on the current device.</p> <p>Generating the key on the router and moving it to the token takes less than a minute. Generating a key on the token, using the <b>on</b> keyword could take five to ten minutes, and is dependent on hardware key generation routines available on the USB token.</p> <p>When an existing RSA key pair is generated in Cisco IOS, stored on a USB token, and used for an enrollment, it may be necessary to move those existing RSA key pairs to an alternate location for permanent storage.</p> <p>This command is useful when using SDP with USB tokens to deploy credentials.</p>
Step 8	<p><b>crypto pki token</b> {<i>token-name</i>   <b>default</b>} <b>removal timeout</b> [<i>seconds</i>]</p> <p><b>Example:</b> Router(config)# crypto pki token usbtokens removal timeout 60</p>	<p>(Optional) Sets the time interval, in seconds, that the router will wait before removing the RSA keys that are stored in the USB token after the USB token has been removed from the router.</p> <p><b>Note</b> If this command is not issued, all RSA keys and IPsec tunnels associated with the USB token are torn down immediately after the USB token is removed from the router.</p>
Step 9	<p><b>crypto pki token</b> {<i>token-name</i>   <b>default</b>} <b>max-retries</b> [<i>number</i>]</p> <p><b>Example:</b> Router(config)# crypto pki token usbtokens max-retries 20</p>	<p>(Optional) Sets the maximum number of consecutive failed login attempts allowed before access to the USB token is denied.</p> <ul style="list-style-type: none"> <li>By default, the value is set at 15.</li> </ul>
Step 10	<p><b>exit</b></p> <p><b>Example:</b> Router(config)# exit</p>	Exits global configuration mode.
Step 11	<p><b>copy</b> usbflash[0-9]:<i>filename</i> <i>destination-url</i></p> <p><b>Example:</b> Router# copy usbflash0:file1 nvram:</p>	<p>Copies files from USB token to the router.</p> <ul style="list-style-type: none"> <li><i>destination-url</i>—See the <b>copy</b> command page documentation for a list of supported options.</li> </ul>
Step 12	<p><b>show usbtoken</b>[0-9]:<i>filename</i></p> <p><b>Example:</b> Router# show usbtoken:usbfile</p>	(Optional) Displays information about the USB token. You can use this command to verify whether the USB token has been logged onto the router.
Step 13	<p><b>crypto pki token</b> <i>token-name</i> <b>logout</b></p> <p><b>Example:</b> Router# crypto pki token usbtokens logout</p>	<p>Logs the router out of the USB token.</p> <p><b>Note</b> If you want to save any data to the USB token, you must log back into the token.</p>

## Troubleshooting USB Tokens

This section contains descriptions of the following Cisco IOS commands that can be used to help troubleshoot possible problems that may arise while using a USB token:

- [The show file systems Command, page 16](#)
- [The show usb device Command, page 17](#)
- [The show usb controllers Command, page 17](#)
- [The dir Command, page 19](#)

### The show file systems Command

Use the **show file systems** command to determine whether the router recognizes that there is a USB module plugged into a USB port. The USB module should appear on the list of file systems. If the module does not appear on the list, it can indicate any of the following problems:

- A connection problem with the USB module.
- The Cisco IOS image running on the router does not support a USB module.
- A hardware problem with the USB module itself.

### SUMMARY STEPS

1. **show file systems**

### DETAILED STEPS

- Step 1** Sample output from the **show file systems** command showing a USB token appears below. The USB module listing appears in the last line of the examples.

```
Router# show file systems
```

```
File Systems:
```

	Size(b)	Free(b)	Type	Flags	Prefixes
	-	-	opaque	rw	archive:
	-	-	opaque	rw	system:
	-	-	opaque	rw	null:
	-	-	network	rw	tftp:
*	129880064	69414912	disk	rw	flash:#

	-	-	opaque	wo	syslog:
	-	-	opaque	rw	xmodem:
	-	-	opaque	rw	ymodem:
	-	-	network	rw	rcp:
	-	-	network	rw	pram:
	-	-	network	rw	ftp:
	-	-	network	rw	http:
	-	-	network	rw	scp:
	-	-	network	rw	https:
	-	-	opaque	ro	cns:
	63158272	33037312	usbflash	rw	usbflash0:
	32768	858	usbtoken	rw	usbtoken1:

## The show usb device Command

Use the **show usb device** command to determine if a USB token is supported by Cisco.

### SUMMARY STEPS

1. **show usb device**

### DETAILED STEPS

- Step 1** The following sample output for the **show usb device** command indicates whether or not the module is supported is bold in the sample output below:

```
Router# show usb device

Host Controller:1
Address:0x11
Device Configured:YES
Device Supported:YES
Description:eToken Pro 4254
Manufacturer:AKS
Version:1.0
Serial Number:
Device Handle:0x1010000
USB Version Compliance:1.0
Class Code:0xFF
Subclass Code:0x0
Protocol:0x0
Vendor ID:0x529
Product ID:0x514
Max. Packet Size of Endpoint Zero:8
Number of Configurations:1
Speed:Low
Selected Configuration:1
Selected Interface:0

Configuration:
 Number:1
 Number of Interfaces:1
 Description:
 Attributes:None
 Max Power:60 mA

 Interface:
 Number:0
 Description:
 Class Code:255
 Subclass:0
 Protocol:0
 Number of Endpoints:0
```

## The show usb controllers Command

Use the **show usb controllers** command to determine if there is a hardware problem with a USB flash module. If the **show usb controllers** command displays an error, the error indicates a hardware problem in the USB module.

You can also use the **show usb controllers** command to verify that copy operations onto a USB flash module are occurring successfully. Issuing the **show usb controllers** command after performing a file copy should display successful data transfers.

## SUMMARY STEPS

### 1. show usb controllers

## DETAILED STEPS

- Step 1** The following sample output for the **show usb controllers** command displays a working USB flash module:

```
Router# show usb controllers

## The dir Command

Use the **dir** command with the **filesystem** keyword option **usbtoken[0-9]:** to display all files, directories, and their permission strings on the USB token.

### SUMMARY STEPS

1. **dir [filesystem: ]**

## DETAILED STEPS

**Step 1** The following sample output displays directory information for the USB token:

```
Router# dir usbtoken1:
```

```
Directory of usbtoken1:/
```

```

 2 d--- 64 Dec 22 2032 05:23:40 +00:00 1000
 5 d--- 4096 Dec 22 2032 05:23:40 +00:00 1001
 8 d--- 0 Dec 22 2032 05:23:40 +00:00 1002

## Configuration Examples for PKI Storage

This section contains the following configuration examples:

- [Storing Certificates to a Specific Local Storage Location: Example, page 21](#)
- [Logging Into a USB Token and Saving RSA Keys to the USB Token: Example, page 22](#)

### Storing Certificates to a Specific Local Storage Location: Example

The following configuration example shows how to store certificates to the certs subdirectory. The certs subdirectory does not exist and is automatically created.

Router# **dir nvram:**

```

114 -rw- 4687 <no date> startup-config
115 ---- 5545 <no date> private-config
116 -rw- 4687 <no date> underlying-config
 1 ---- 34 <no date> persistent-data
 3 -rw- 707 <no date> ioscaroot#7401CA.cer
 9 -rw- 863 <no date> msca-root#826E.cer
10 -rw- 759 <no date> msca-root#1BA8CA.cer
11 -rw- 863 <no date> msca-root#75B8.cer
24 -rw- 1149 <no date> storagename#6500CA.cer
26 -rw- 863 <no date> msca-root#83EE.cer

```

129016 bytes total (92108 bytes free)

Router# **configure terminal**

Enter configuration commands, one per line. End with CNTL/Z.

Router(config)# **crypto pki certificate storage disk0:/certs**

Requested directory does not exist -- created

Certificates will be stored in disk0:/certs/

Router(config)# **end**

Router# **write**

# Feature Information for Storing PKI Credentials

Table 2 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the “[Implementing and Managing PKI Features Roadmap](#).”

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

## **Other Security Features**

# Neighbor Router Authentication: Overview and Guidelines

---

You can prevent your router from receiving fraudulent route updates by configuring neighbor router authentication.

This chapter describes neighbor router authentication as part of a total security plan. It describes what neighbor router authentication is, how it works, and why you should use it to increase your overall network security.

This chapter refers to neighbor router authentication as “neighbor authentication.” Neighbor router authentication is also sometimes called “route authentication.”

## In This Chapter

This chapter describes the following topics:

- [About Neighbor Authentication](#)
- [How Neighbor Authentication Works](#)
- [Key Management \(Key Chains\)](#)
- [Finding Neighbor Authentication Configuration Information](#)

## About Neighbor Authentication

This section contains the following sections:

- [Benefits of Neighbor Authentication](#)
- [Protocols That Use Neighbor Authentication](#)
- [When to Configure Neighbor Authentication](#)

---

**Americas Headquarters:**  
**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Benefits of Neighbor Authentication

When configured, neighbor authentication occurs whenever routing updates are exchanged between neighbor routers. This authentication ensures that a router receives reliable routing information from a trusted source.

Without neighbor authentication, unauthorized or deliberately malicious routing updates could compromise the security of your network traffic. A security compromise could occur if an unfriendly party diverts or analyzes your network traffic. For example, an unauthorized router could send a fictitious routing update to convince your router to send traffic to an incorrect destination. This diverted traffic could be analyzed to learn confidential information of your organization, or merely used to disrupt your organization's ability to effectively communicate using the network.

Neighbor authentication prevents any such fraudulent route updates from being received by your router.

## Protocols That Use Neighbor Authentication

Neighbor authentication can be configured for the following routing protocols:

- Border Gateway Protocol (BGP)
- DRP Server Agent
- Intermediate System-to-Intermediate System (IS-IS)
- IP Enhanced Interior Gateway Routing Protocol (EIGRP)
- Open Shortest Path First (OSPF)
- Routing Information Protocol (RIP) version 2

## When to Configure Neighbor Authentication

You should configure any router for neighbor authentication if that router meets all of these conditions:

- The router uses any of the routing protocols previously mentioned.
- It is conceivable that the router might receive a false route update.
- If the router were to receive a false route update, your network might be compromised.
- If you configure a router for neighbor authentication, you also need to configure the neighbor router for neighbor authentication.

## How Neighbor Authentication Works

When neighbor authentication has been configured on a router, the router authenticates the source of each routing update packet that it receives. This is accomplished by the exchange of an authenticating key (sometimes referred to as a password) that is known to both the sending and the receiving router.

There are two types of neighbor authentication used: plain text authentication and Message Digest Algorithm Version 5 (MD5) authentication. Both forms work in the same way, with the exception that MD5 sends a "message digest" instead of the authenticating key itself. The message digest is created using the key and a message, but the key itself is not sent, preventing it from being read while it is being transmitted. Plain text authentication sends the authenticating key itself over the wire.

**Note**

Note that plain text authentication is not recommended for use as part of your security strategy. Its primary use is to avoid accidental changes to the routing infrastructure. Using MD5 authentication, however, is a recommended security practice.

**Caution**

As with all keys, passwords, and other security secrets, it is imperative that you closely guard authenticating keys used in neighbor authentication. The security benefits of this feature are reliant upon your keeping all authenticating keys confidential. Also, when performing router management tasks via Simple Network Management Protocol (SNMP), do not ignore the risk associated with sending keys using non-encrypted SNMP.

This section includes the following sections:

- [Plain Text Authentication](#)
- [MD5 Authentication](#)

## Plain Text Authentication

Each participating neighbor router must share an authenticating key. This key is specified at each router during configuration. Multiple keys can be specified with some protocols; each key must then be identified by a key number.

In general, when a routing update is sent, the following authentication sequence occurs:

- 
- Step 1** A router sends a routing update with a key and the corresponding key number to the neighbor router. In protocols that can have only one key, the key number is always zero.
  - Step 2** The receiving (neighbor) router checks the received key against the same key stored in its own memory.
  - Step 3** If the two keys match, the receiving router accepts the routing update packet. If the two keys do not match, the routing update packet is rejected.

These protocols use plain text authentication:

- DRP Server Agent
  - IS-IS
  - OSPF
  - RIP version 2
- 

## MD5 Authentication

MD5 authentication works similarly to plain text authentication, except that the key is never sent over the wire. Instead, the router uses the MD5 algorithm to produce a “message digest” of the key (also called a “hash”). The message digest is then sent instead of the key itself. This ensures that nobody can eavesdrop on the line and learn keys during transmission.

These protocols use MD5 authentication:

- OSPF

- RIP version 2
- BGP
- IP Enhanced IGRP

## Key Management (Key Chains)

You can configure key chains for these IP routing protocols:

- RIP version 2
- IP Enhanced IGRP
- DRP Server Agent

These routing protocols offer the additional function of managing keys by using key chains. When you configure a key chain, you specify a series of keys with lifetimes, and the Cisco IOS software rotates through each of these keys. This decreases the likelihood that keys will be compromised.

Each key definition within the key chain must specify a time interval for which that key will be activated (its “lifetime”). Then, during a given key’s lifetime, routing update packets are sent with this activated key. Keys cannot be used during time periods for which they are not activated. Therefore, it is recommended that for a given key chain, key activation times overlap to avoid any period of time for which no key is activated. If a time period occurs during which no key is activated, neighbor authentication cannot occur, and therefore routing updates will fail.

Multiple key chains can be specified.

Note that the router needs to know the time to be able to rotate through keys in synchronization with the other participating routers, so that all routers are using the same key at the same moment. Refer to the Network Time Protocol (NTP) and calendar commands in the “Performing Basic System Management” chapter of the *Cisco IOS Configuration Fundamentals Configuration Guide* for information about configuring time at your router.

## Finding Neighbor Authentication Configuration Information

To find complete configuration information for neighbor authentication, refer to the appropriate section and chapter in the *Cisco IOS IP Configuration Guide* as listed in [Table 66](#).

**Table 66** Location of Neighbor Authentication Information for Each Supported Protocol

Protocol	Chapter	Section
BGP	“Configuring BGP”	“Configuring Neighbor Options”
DRP Server Agent	“Configuring IP Services”	“Configuring a DRP Server Agent”
IP Enhanced IGRP	“Configuring IP Enhanced IGRP”	“Configuring Enhanced IGRP Route Authentication”
IS-IS	“Configuring Integrated IS-IS”	“Assigning a Password for an Interface” and “Configuring IS-IS Authentication Passwords”

**Table 66**      **Location of Neighbor Authentication Information for Each Supported Protocol**

Protocol	Chapter	Section
OSPF	“Configuring OSPF”	“Configuring OSPF Interface Parameters” and “Configuring OSPF Area Parameters” and “Creating Virtual Links”
RIP version 2	“Configuring RIP”	“Enabling RIP Authentication”

To find complete configuration information for key chains, refer to the “Managing Authentication Keys” section in the chapter “Configuring IP Routing Protocol-Independent Features” of the *Cisco IOS IP Configuration Guide*.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

## Configuring IP Security Options

---

Cisco provides IP Security Option (IPSO) support as described in RFC 1108. Cisco's implementation is only minimally compliant with RFC 1108 because the Cisco IOS software only accepts and generates a 4-byte IPSO.

IPSO is generally used to comply with the U.S. government's Department of Defense security policy.

For a complete description of IPSO commands, refer to the chapter "IP Security Options Commands" of the *Cisco IOS Security Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the chapter "Using Cisco IOS Software."

## In This Chapter

This chapter describes how to configure IPSO for both the basic and extended security options described in RFC 1108. This chapter also describes how to configure auditing for IPSO. This chapter includes the following sections:

- [IPSO Configuration Task List](#)
- [IPSO Configuration Examples](#)

## IPSO Configuration Task List

This section describes the following configuration tasks:

- [Configuring Basic IP Security Options](#)
- [Configuring Extended IP Security Options](#)
- [Configuring the DNSIX Audit Trail Facility](#)

---

**Americas Headquarters:**  
**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

© 2007 Cisco Systems, Inc. All rights reserved.

## Configuring Basic IP Security Options

Cisco's basic IPSO support provides the following features:

- Defines security level on a per-interface basis
- Defines single-level or multilevel interfaces
- Provides a label for incoming packets
- Strips labels on a per-interface basis
- Reorders options to put any basic security options first

To configure basic IPSO, complete the tasks in the following sections:

- [Enabling IPSO and Setting the Security Classifications](#)
- [Specifying How IP Security Options Are Processed](#)

### Enabling IPSO and Setting the Security Classifications

To enable IPSO and set security classifications on an interface, use either of the following commands in interface configuration mode:

Command	Purpose
Router(config-if)# <b>ip security dedicated</b> <i>level</i> <i>authority [authority...]</i>	Sets an interface to the requested IPSO classification and authorities.
Router(config-if)# <b>ip security multilevel</b> <i>level1</i> <i>[authority1...] to level2 authority2</i> <i>[authority2...]</i>	Sets an interface to the requested IPSO range of classifications and authorities.

Use the **no ip security** command to reset an interface to its default state.

### Specifying How IP Security Options Are Processed

To specify how IP security options are processed, use any of the following optional commands in interface configuration mode:

Command	Purpose
Router(config-if)# <b>ip security ignore-authorities</b>	Enables an interface to ignore the authorities field of all incoming packets.
Router(config-if)# <b>ip security implicit-labelling</b> <i>[level authority [authority...]]</i>	Classifies packets that have no IPSO with an implicit security label.
Router(config-if)# <b>ip security extended-allowed</b>	Accepts packets on an interface that has an extended security option present.
Router(config-if)# <b>ip security ad</b>	Ensures that all packets leaving the router on an interface contain a basic security option.
Router(config-if)# <b>ip security strip</b>	Removes any basic security option that might be present on a packet leaving the router through an interface.

Command	Purpose
Router(config-if) # <b>ip security first</b>	Prioritizes security options on a packet.
Router(config-if) # <b>ip security reserved-allowed</b>	Treats as valid any packets that have Reserved1 through Reserved4 security levels.

### Default Values for Command Keywords

To fully comply with IPSO, the default values for the minor keywords have become complex. Default value usages include the following:

- The default for all of the minor keywords is *off*, with the exception of **implicit-labelling** and **add**.
- The default value of **implicit-labelling** is *on* if the interface is “unclassified Genser;” otherwise, it is *off*.
- The default value for **add** is *on* if the interface is not “unclassified Genser;” otherwise, it is *off*.

Table 67 provides a list of all default values.

**Table 67**      **Default Security Keyword Values**

Interface Type	Level	Authority	Implicit Labeling	Add IPSO
None	None	None	On	Off
Dedicated	Unclassified	Genser	On	Off
Dedicated	Any	Any	Off	On
Multilevel	Any	Any	Off	On

The default value for any interface is “dedicated, unclassified Genser.” Note that this implies implicit labeling. This might seem unusual, but it makes the system entirely transparent to packets without options. This is the setting generated when you specify the **no ip security** interface configuration command.

## Configuring Extended IP Security Options

Cisco’s extended IPSO support is compliant with the Department of Defense Intelligence Information System Network Security for Information Exchange (DNSIX) specification documents. Extended IPSO functionality can unconditionally accept or reject Internet traffic that contains extended security options by comparing those options to configured allowable values. This support allows DNSIX networks to use additional security information to achieve a higher level of security than that achievable with basic IPSO.

Cisco also supports a subset of the security features defined in the DNSIX version 2.1 specification. Specifically, Cisco supports DNSIX definitions of the following:

- How extended IPSO is processed
- Audit trail facility

There are two kinds of extended IPSO fields defined by the DNSIX 2.1 specification and supported by Cisco’s implementation of extended IPSO—Network-level Extended Security Option (NLESO) and Auxiliary Extended Security Option (AESO) fields.

NLESO processing requires that security options be checked against configured allowable information, source, and compartment bit values, and requires that the router be capable of inserting extended security options in the IP header.

AESO is similar to NLESO, except that its contents are not checked and are assumed to be valid if its source is listed in the AESO table.

To configure extended IPSO, complete the tasks in the following sections:

- [Configuring Global Default Settings](#)
- [Attaching ESOs to an Interface](#)
- [Attaching AESOs to an Interface](#)

## Configuring Global Default Settings

To configure global default setting for extended IPSO, including AESOs, use the following command in global configuration mode:

Command	Purpose
Router(config)# <b>ip security eso-info</b> <i>source compartment-size default-bit</i>	Configures system-wide default settings.

## Attaching ESOs to an Interface

To specify the minimum and maximum sensitivity levels for an interface, use the following commands in interface configuration mode:

	Command	Purpose
<b>Step 1</b>	Router(config-if)# <b>ip security eso-min</b> <i>source compartment-bits</i>	Sets the minimum sensitivity level for an interface.
<b>Step 2</b>	Router(config-if)# <b>ip security eso-max</b> <i>source compartment-bits</i>	Sets the maximum sensitivity level for an interface.

## Attaching AESOs to an Interface

To specify the extended IPSO sources that are to be treated as AESO sources, use the following command in interface configuration mode:

Command	Purpose
Router(config-if)# <b>ip security aeso</b> <i>source compartment-bits</i>	Specifies AESO sources.

DNSIX version 2.1 causes slow-switching code.

See the “[IPSO Configuration Examples](#)” section at the end of this chapter.

## Configuring the DNSIX Audit Trail Facility

The audit trail facility is a UDP-based protocol that generates an audit trail of IPSO security violations. This facility allows the system to report security failures on incoming and outgoing packets. The Audit Trail Facility sends DNSIX audit trail messages when a datagram is rejected because of IPSO security violations. This feature allows you to configure organization-specific security information.

The DNSIX audit trail facility consists of two protocols:

- DNSIX Message Deliver Protocol (DMDP) provides a basic message-delivery mechanism for all DNSIX elements.
- Network Audit Trail Protocol provides a buffered logging facility for applications to use to generate auditing information. This information is then passed on to DMDP.

To configure the DNSIX auditing facility, complete the tasks in the following sections:

- [Enabling the DNSIX Audit Trail Facility](#)
- [Specifying Hosts to Receive Audit Trail Messages](#)
- [Specifying Transmission Parameters](#)

## Enabling the DNSIX Audit Trail Facility

To enable the DNSIX audit trail facility, use the following command in global configuration mode:

Command	Purpose
Router(config)# <b>dnsix-nat source</b> <i>ip-address</i>	Starts the audit writing module.

## Specifying Hosts to Receive Audit Trail Messages

To define and change primary and secondary addresses of the host to receive audit messages, use the following commands in global configuration mode:

	Command	Purpose
<b>Step 1</b>	Router(config)# <b>dnsix-nat primary</b> <i>ip-address</i>	Specifies the primary address for the audit trail.
<b>Step 2</b>	Router(config)# <b>dnsix-nat secondary</b> <i>ip-address</i>	Specifies the secondary address for the audit trail.
<b>Step 3</b>	Router(config)# <b>dnsix-nat authorized-redirection</b> <i>ip-address</i>	Specifies the address of a collection center that is authorized to change primary and secondary addresses. Specified hosts are authorized to change the destination of audit messages.

## Specifying Transmission Parameters

To specify transmission parameters, use the following commands in global configuration mode:

	Command	Purpose
<b>Step 1</b>	Router(config)# <b>dnsix-nat transmit-count</b> <i>count</i>	Specifies the number of records in a packet before it is sent to a collection center.
<b>Step 2</b>	Router(config)# <b>dnsix-dmdp retries</b> <i>count</i>	Specifies the number of transmit retries for DMDP.

# IPSO Configuration Examples

The following sections provide IPSO configuration examples:

- [Example 1](#)
- [Example 2](#)
- [Example 3](#)

## Example 1

In this example, three Ethernet interfaces are presented. These interfaces are running at security levels of Confidential Genser, Secret Genser, and Confidential to Secret Genser, as shown in [Figure 106](#).

**Figure 106** IPSO Security Levels

The following commands set up interfaces for the configuration in [Figure 106](#):

```

interface ethernet 0
 ip security dedicated confidential genser
interface ethernet 1
 ip security dedicated secret genser
interface ethernet 2
 ip security multilevel confidential genser to secret genser

```

It is possible for the setup to be much more complex.

## Example 2

In the following example, there are devices on Ethernet 0 that cannot generate a security option, and so must accept packets without a security option. These hosts do not understand security options; therefore, never place one on such interfaces. Furthermore, there are hosts on the other two networks that are using the extended security option to communicate information, so you must allow these to pass through the system. Finally, there also is a host (a Blacker Front End; see the “Configuring X.25 and LABP” chapter of the *Cisco IOS Wide-Area Networking Configuration Guide* for more information about Blacker emergency mode) on Ethernet 2 that requires the security option to be the first option present, and this condition also must be specified. The new configuration follows.

```

interface ethernet 0
 ip security dedicated confidential genser

```

```
ip security implicit-labelling
ip security strip
interface ethernet 1
ip security dedicated secret genser
ip security extended-allowed
!
interface ethernet 2
ip security multilevel confidential genser to secret genser
ip security extended-allowed
ip security first
```

## Example 3

This example shows how to configure a Cisco router with HP-UX CMW DNSIX hosts. The following commands should be configured on each LAN interface of the router for two DNSIX hosts to communicate:

```
ip security multilevel unclassified nsa to top secret nsa
ip security extended allowed
```

DNSIX hosts do not need to know the router's IP addresses, and DNSIX hosts do not need to set up M6RHDB entries for the routers.

---

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

## **Unicast Reverse Path Forwarding**

# Configuring Unicast Reverse Path Forwarding

---

## Feature History

Release	Modification
Cisco IOS	For information about feature support in Cisco IOS software, use Cisco Feature Navigator.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

This chapter describes the Unicast Reverse Path Forwarding (Unicast RPF) feature. The Unicast RPF feature helps to mitigate problems that are caused by malformed or forged IP source addresses that are passing through a router.

For a complete description of the Unicast RPF commands in this chapter, refer to the chapter “Unicast Reverse Path Forwarding Commands” of the *Cisco IOS Security Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

## In This Chapter

This chapter has the following sections:

- [About Unicast Reverse Path Forwarding](#)
- [Unicast RPF Configuration Task List](#)
- [Troubleshooting Tips](#)
- [Monitoring and Maintaining Unicast RPF](#)
- [Unicast RPF Configuration Examples](#)

# About Unicast Reverse Path Forwarding

The Unicast RPF feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

This section covers the following information:

- [How Unicast RPF Works](#)
- [Implementing Unicast RPF](#)
- [Restrictions](#)
- [Related Features and Technologies](#)
- [Prerequisites to Configuring Unicast RPF](#)

## How Unicast RPF Works

When Unicast RPF is enabled on an interface, the router examines all packets received as input on that interface to make sure that the source address and source interface appear in the routing table and match the interface on which the packet was received. This “look backwards” ability is available only when Cisco express forwarding (CEF) is enabled on the router, because the lookup relies on the presence of the Forwarding Information Base (FIB). CEF generates the FIB as part of its operation.

**Note**

Unicast RPF is an input function and is applied only on the input interface of a router at the upstream end of a connection.

Unicast RPF checks to see if any packet received at a router interface arrives on the best return path (return route) to the source of the packet. Unicast RPF does this by doing a reverse lookup in the CEF table. If the packet was received from one of the best reverse path routes, the packet is forwarded as normal. If there is no reverse path route on the same interface from which the packet was received, it might mean that the source address was modified. If Unicast RPF does not find a reverse path for the packet, the packet is dropped or forwarded, depending on whether an access control list (ACL) is specified in the **ip verify unicast reverse-path** interface configuration command.

**Note**

With Unicast RPF, all equal-cost “best” return paths are considered valid. This means that Unicast RPF works in cases where multiple return paths exist, provided that each path is equal to the others in terms of the routing cost (number of hops, weights, and so on) and as long as the route is in the FIB. Unicast RPF also functions where EIGRP variants are being used and unequal candidate paths back to the source IP address exist.

When a packet is received at the interface where Unicast RPF and ACLs have been configured, the following actions occur:

**Step 1** Input ACLs configured on the inbound interface are checked.

- Step 2** Unicast RPF checks to see if the packet has arrived on the best return path to the source, which it does by doing a reverse lookup in the FIB table.
- Step 3** CEF table (FIB) lookup is carried out for packet forwarding.
- Step 4** Output ACLs are checked on the outbound interface.
- Step 5** The packet is forwarded.
- 

This section provides information about Unicast RPF enhancements:

- [Access Control Lists and Logging](#)
- [Per-Interface Statistics](#)

## Access Control Lists and Logging

If an ACL is specified in the command, then when (and only when) a packet fails the Unicast RPF check, the ACL is checked to see if the packet should be dropped (using a deny statement in the ACL) or forwarded (using a permit statement in the ACL). Whether a packet is dropped or forwarded, the packet is counted in the global IP traffic statistics for Unicast RPF drops and in the interface statistics for Unicast RPF.

If no ACL is specified in the Unicast RPF command, the router drops the forged or malformed packet immediately and no ACL logging occurs. The router and interface Unicast RPF counters are updated.

Unicast RPF events can be logged by specifying the logging option for the ACL entries used by the Unicast RPF command. Using the log information, administrators can see what source addresses are being used in the attack, the time the packets arrived at the interface, and so on.

### Caution

Logging requires CPU and memory resources. Logging Unicast RPF events for attacks having a high rate of forged packets can degrade the performance of the router.

---

## Per-Interface Statistics

Each time a packet is dropped or forwarded at an interface, that information is counted two ways: globally on the router and at each interface where you have applied Unicast RPF. Global statistics on dropped packets provide information about potential attacks on the network; however, these global statistics do not help to specify which interface is the source of the attack.

Per-interface statistics allow network administrators to track two types of information about malformed packets: Unicast RPF drops and Unicast RPF suppressed drops. Statistics on the number of packets that Unicast RPF drops help to identify the interface that is the entry point of the attack. The Unicast RPF drop count tracks the number of drops at the interface. The Unicast RPF suppressed drop count tracks the number of packets that failed the Unicast RPF check but were forwarded because of the permit permission set up in the ACL. Using the drop count and suppressed drop count statistics, a network administrator can take steps to isolate the attack at a specific interface.

### Note

Judicious use of ACL logging can further identify the address or addresses that are being dropped by Unicast RPF.

---

Figure 38 illustrates how Unicast RPF and CEF work together to validate IP source addresses by verifying packet return paths. In this example, a customer has sent a packet having a source address of 192.168.1.1 from interface FDDI 2/0/0. Unicast RPF checks the FIB to see if 192.168.1.1 has a path to FDDI 2/0/0. If there is a matching path, the packet is forwarded. If there is no matching path, the packet is dropped.

**Figure 38**      **Unicast RPF Validating IP Source Addresses**

Figure 39 illustrates how Unicast RPF drops packets that fail validation. In this example, a customer has sent a packet having a source address of 209.165.200.225, which is received at interface FDDI 2/0/0. Unicast RPF checks the FIB to see if 209.165.200.225 has a return path to FDDI 2/0/0. If there is a matching path, the packet is forwarded. In this case, there is no reverse entry in the routing table that routes the customer packet back to source address 209.165.200.225 on interface FDDI 2/0/0, and so the packet is dropped.

**Figure 39**      **Unicast RPF Dropping Packets That Fail Verification**

## Implementing Unicast RPF

Unicast RPF has several key implementation principles:

- The packet must be received at an interface that has the best return path (route) to the packet source (a process called *symmetric routing*). There must be a route in the FIB matching the route to the receiving interface. Adding a route in the FIB can be done via static route, network statement, or dynamic routing. (ACLs permit Unicast RPF to be used when packets are known to be arriving by specific, less optimal asymmetric input paths.)
- IP source addresses at the receiving interface must match the routing entry for the interface.
- Unicast RPF is an input function and is applied only on the input interface of a router at the upstream end of a connection.

Given these implementation principles, Unicast RPF becomes a tool that network administrators can use not only for their customers but also for their downstream network or ISP, even if the downstream network or ISP has other connections to the Internet.

### Caution

Using optional BGP attributes such as weight and local preference, the best path back to the source address can be modified. Modification would affect the operation of Unicast RPF.

This section provides information about the implementation of Unicast RPF:

- [Security Policy and Unicast RPF](#)
- [Where to Use Unicast RPF](#)
- [Routing Table Requirements](#)
- [Where Not to Use Unicast RPF](#)
- [Unicast RPF with BOOTP and DHCP](#)

## Security Policy and Unicast RPF

Consider the following points in determining your policy for deploying Unicast RPF:

- Unicast RPF must be applied at the interface downstream from the larger portion of the network, preferably at the edges of your network.
- The further downstream you apply Unicast RPF, the finer the granularity you have in mitigating address spoofing and in identifying the sources of spoofed addresses. For example, applying Unicast RPF on an aggregation router helps mitigate attacks from many downstream networks or clients and is simple to administer, but it does not help identify the source of the attack. Applying Unicast RPF at the network access server helps limit the scope of the attack and trace the source of the attack; however, deploying Unicast RPF across many sites does add to the administration cost of operating the network.
- The more entities that deploy Unicast RPF across Internet, intranet, and extranet resources, the better the chances of mitigating large-scale network disruptions throughout the Internet community, and the better the chances of tracing the source of an attack.
- Unicast RPF will not inspect IP packets encapsulated in tunnels, such as GRE, LT2P, or PPTP. Unicast RPF must be configured at a home gateway so that Unicast RPF processes network traffic only after the tunneling and encryption layers have been stripped off the packets.

## Where to Use Unicast RPF

Unicast RPF can be used in any “single-homed” environment where there is essentially only one access point out of the network; that is, one upstream connection. Networks having one access point offer the best example of symmetric routing, which means that the interface where a packet enters the network is also the best return path to the source of the IP packet. Unicast RPF is best used at the network perimeter for Internet, intranet, or extranet environments, or in ISP environments for customer network terminations.

The following sections provide a look at implementing Unicast RPF in two network environments:

- [Enterprise Networks with a Single Connection to an ISP](#)
- [Network Access Server Application \(Applying Unicast RPF in PSTN/ISDN PoP Aggregation Routers\)](#)

### Enterprise Networks with a Single Connection to an ISP

In enterprise networks, one objective of using Unicast RPF for filtering traffic at the input interface (a process called *ingress filtering*) is for protection from malformed packets arriving from the Internet. Traditionally, local networks that have one connection to the Internet would use ACLs at the receiving interface to prevent spoofed packets from the Internet from entering their local network.

ACLs work well for many single-homed customers; however, there are trade-offs when ACLs are used as ingress filters, including two commonly referenced limitations:

- Packet per second (PPS) performance at very high packet rates
- Maintenance of the ACL (whenever there are new addresses added to the network)

Unicast RPF is one tool that addresses both of these limitations. With Unicast RPF, ingress filtering is done at CEF PPS rates. This processing speed makes a difference when the link is more than 1 Mbps. Additionally, since Unicast RPF uses the FIB, no ACL maintenance is necessary, and thus the administration overhead of traditional ACLs is reduced. The following figure and example demonstrate how Unicast RPF is configured for ingress filtering.

[Figure 40](#) illustrates an enterprise network that has a single link to an upstream ISP. In this example, Unicast RPF is applied at interface S0 on the enterprise router for protection from malformed packets arriving from the Internet. Unicast RPF is also applied at interface S5/0 on the ISP router for protection from malformed packets arriving from the enterprise network.

**Figure 40**      *Enterprise Network Using Unicast RPF for Ingress Filtering*

Using the topography in [Figure 40](#), a typical configuration (assuming that CEF is turned on) on the ISP router would be as follows:

```
ip cef
interface loopback 0
 description Loopback interface on Gateway Router 2
 ip address 192.168.3.1 255.255.255.255
 no ip redirects
 no ip directed-broadcast
 no ip proxy-arp
interface Serial 5/0
 description 128K HDLC link to ExampleCorp WT50314E R5-0
 bandwidth 128
 ip unnumbered loopback 0
 ip verify unicast reverse-path
 no ip redirects
 no ip directed-broadcast
 no ip proxy-arp
ip route 192.168.10.0 255.255.252.0 Serial 5/0
```

The gateway router configuration of the enterprise network (assuming that CEF is turned on) would look similar to the following:

```
ip cef
interface Ethernet 0
 description ExampleCorp LAN
 ip address 192.168.10.1 255.255.252.0
 no ip redirects
 no ip directed-broadcast
 no ip proxy-arp
interface Serial 0
```

```
description 128K HDLC link to ExampleCorp Internet Inc WT50314E C0
bandwidth 128
ip unnumbered ethernet 0
ip verify unicast reverse-path
no ip redirects
no ip directed-broadcast
no ip proxy-arp
ip route 0.0.0.0 0.0.0.0 Serial 0
```

Notice that Unicast RPF works with a single default route. There are no additional routes or routing protocols. Network 192.168.10.0/22 is a connected network. Hence, packets coming from the Internet with a source address in the range 192.168.10.0/22 will be dropped by Unicast RPF.

### Network Access Server Application (Applying Unicast RPF in PSTN/ISDN PoP Aggregation Routers)

Aggregation routers are ideal places to use Unicast RPF with single-homed clients. Unicast RPF works equally well on leased-line or PSTN/ISDN/xDSL customer connections into the Internet. In fact, dialup connections are reputed to be the greatest source of DoS attacks using forged IP addresses. As long as the network access server supports CEF, Unicast RPF will work. In this topology, the customer aggregation routers need not have the full Internet routing table. Aggregation routers need the routing prefixes information (IP address block); hence, information configured or redistributed in the Interior Gateway Protocol (IGP) or Internal Border Gateway Protocol (IBGP) (depending on the way that you add customer routes into your network) would be enough for Unicast RPF to do its job.

Figure 41 illustrates the application of Unicast RPF to the aggregation and access routers for an Internet service provider (ISP) point of presence (POP), with the ISP routers providing dialup customer connections. In this example, Unicast RPF is applied upstream from the customer dialup connection router on the receiving (input) interfaces of the ISP aggregation routers.

**Figure 41**      *Unicast RPF Applied to PSTN/ISDN Customer Connections*

## Routing Table Requirements

To work correctly, Unicast RPF needs proper information in the CEF tables. This requirement does not mean that the router must have the entire Internet routing table. The amount of routing information needed in the CEF tables depends on where Unicast RPF is configured and what functions the router performs in the network. For example, in an ISP environment, a router that is a leased-line aggregation router for customers needs only the information based on the static routes redistributed into the IGP or IBGP (depending on which technique is used in the network). Unicast RPF would be configured on the customer interfaces—hence the requirement for minimal routing information. In another scenario, a single-homed ISP could place Unicast RPF on the gateway link to the Internet. The full Internet routing table would be required. Requiring the full routing table would help protect the ISP from external DoS attacks that use addresses that are not in the Internet routing table.

## Where Not to Use Unicast RPF

Unicast RPF should not be used on interfaces that are internal to the network. Internal interfaces are likely to have routing asymmetry (see [Figure 42](#)), meaning multiple routes to the source of a packet. Unicast RPF should be applied only where there is natural or configured symmetry. As long as administrators carefully plan which interfaces they activate Unicast RPF on, routing asymmetry is not a serious problem.

For example, routers at the edge of the network of an ISP are more likely to have symmetrical reverse paths than routers that are in the core of the ISP network. Routers that are in the core of the ISP network have no guarantee that the best forwarding path out of the router will be the path selected for packets returning to the router. Hence, it is not recommended that you apply Unicast RPF where there is a chance of asymmetric routing, unless you use ACLs to allow the router to accept incoming packets. ACLs permit Unicast RPF to be used when packets are known to be arriving by specific, less optimal asymmetric input paths. However, it is simplest to place Unicast RPF only at the edge of a network or, for an ISP, at the customer edge of the network.

[Figure 42](#) illustrates how Unicast RPF can block legitimate traffic in an asymmetrical routing environment.

**Figure 42**      *Unicast RPF Blocking Traffic in an Asymmetrical Routing Environment*

## Unicast RPF with BOOTP and DHCP

Unicast RPF will allow packets with 0.0.0.0 source and 255.255.255.255 destination to pass so that Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) functions work properly. This enhancement was added in Cisco IOS Release 12.0 and later, but it is not in Cisco IOS Release 11.1CC.

## Restrictions

There are some basic restrictions to applying Unicast RPF to multihomed clients:

- Clients should not be multihomed to the same router because multihoming defeats the purpose of building a redundant service for the client.
- Customers must ensure that the packets flowing up the link (out to the Internet) match the route advertised out the link. Otherwise, Unicast RPF filters those packets as malformed packets.
- Unicast RPF is available only for platform images that support CEF. Unicast RPF is supported in Cisco IOS Releases 11.1(17)CC and 12.0 and later. It is not available in Cisco IOS Release 11.2 or 11.3.

## Related Features and Technologies

For more information about Unicast RPF-related features and technologies, review the following:

- Unicast RPF requires Cisco express forwarding (CEF) to function properly on the router. For more information about CEF, refer to the *Cisco IOS Switching Services Configuration Guide*.
- Unicast RPF can be more effective at mitigating spoofing attacks when combined with a policy of *ingress* and *egress* filtering using Cisco IOS access control lists (ACLs).
  - Ingress filtering applies filters to traffic received at a network interface from either internal or external networks. With ingress filtering, packets that arrive from other networks or the Internet and that have a source address that matches a local network, private, or broadcast address are dropped. In ISP environments, for example, ingress filtering can apply to traffic received at the router from either the client (customer) or the Internet.
  - Egress filtering applies filters to traffic exiting a network interface (the sending interface). By filtering packets on routers that connect your network to the Internet or to other networks, you can permit only packets with valid source IP addresses to leave your network.

For more information on network filtering, refer to RFC 2267 and to the *Cisco IOS IP Configuration Guide*.

- Cisco IOS software provides additional features that can help mitigate DoS attacks:
  - Committed Access Rate (CAR). CAR allows you to enforce a bandwidth policy against network traffic that matches an access list. For example, CAR allows you to rate-limit what should be low-volume traffic, such as ICMP traffic. To find out more about CAR, refer to the *Cisco IOS Quality of Service Solutions Configuration Guide*.
  - Context-based Access Control (CBAC). CBAC selectively blocks any network traffic not originated by a protected network. CBAC uses timeout and threshold values to manage session state information, helping to determine when to drop sessions that do not become fully established. Setting timeout values for network sessions helps mitigate DoS attacks by freeing up system resources, dropping sessions after a specified amount of time. For more information on CBAC, refer to the *Cisco IOS Security Configuration Guide*.

- TCP Intercept. The TCP Intercept feature implements software to protect TCP servers from TCP SYN-flooding attacks, which are a type of DoS attack. A SYN-flooding attack occurs when a hacker floods a server with a barrage of requests for connection. Like CBAC, the TCP Intercept feature also uses timeout and threshold values to manage session state information, helping to determine when to drop sessions that do not become fully established. For more information on TCP Intercept, refer to the *Cisco IOS Security Configuration Guide*.

## Prerequisites to Configuring Unicast RPF

Prior to configuring Unicast RPF, configure ACLs:

- Configure standard or extended ACLs to mitigate transmission of invalid IP addresses (perform egress filtering). Permit only valid source addresses to leave your network and get onto the Internet. Prevent all other source addresses from leaving your network for the Internet.
- Configure standard or extended ACLs entries to drop (deny) packets that have invalid source IP addresses (perform ingress filtering). Invalid source IP addresses include the following types:
  - Reserved addresses
  - Loopback addresses
  - Private addresses (RFC 1918, *Address Allocation for Private Internets*)
  - Broadcast addresses (including multicast addresses)
  - Source addresses that fall outside the range of valid addresses associated with the protected network
- Configure standard or extended ACL entries to forward (permit) packets that fail the Unicast RPF checks to allow specific traffic from known asymmetric routed sources.
- Configure ACLs to track Unicast RPF events by adding the logging option into the ACL command. During network attacks, judicious logging of dropped or forwarded packets (suppressed drops) can provide additional information about network attacks.

## Unicast RPF Configuration Task List

The following sections describe the configuration tasks for Unicast RPF. Each task in the list is identified as either optional or required.

- [Configuring Unicast RPF](#) (Required)
- [Verifying Unicast RPF](#) (Optional)

See the section “[Unicast RPF Configuration Examples](#)” at the end of this chapter.

## Configuring Unicast RPF

To use Unicast RPF, you must configure the router for CEF switching or CEF distributed switching. There is no need to configure the input interface for CEF switching because Unicast RPF has been implemented as a search through the FIB using the source IP address. As long as CEF is running on the router, individual interfaces can be configured with other switching modes. Unicast RPF is an input-side function that is enabled on an interface or subinterface that supports any type of encapsulation and operates on IP packets received by the router. It is very important that CEF be turned on globally in the router—Unicast RPF will not work without CEF.

To configure Unicast RPF, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>ip cef</b>	Enables CEF or distributed CEF on the router. Distributed CEF is required for routers that use a Route Switch Processor (RSP) and Versatile Interface Processor (VIP), which includes Unicast RPF.
	or Router(config)# <b>ip cef distributed</b>	You might want to disable CEF or distributed CEF (dCEF) on a particular interface if that interface is configured with a feature that CEF or dCEF does not support. In this case, you would enable CEF globally, but disable CEF on a specific interface using the <b>no ip route-cache cef</b> interface command, which enables all but that specific interface to use express forwarding. If you have disabled CEF or dCEF operation on an interface and want to reenabling it, you can do so by using the <b>ip route-cache cef</b> command in interface configuration mode.
Step 2	Router(config-if)# <b>interface type</b>	Selects the input interface on which you want to apply Unicast RPF. This is the receiving interface, which allows Unicast RPF to verify the best return path before forwarding the packet on to the next destination.  The interface type is specific to your router and the types of interface cards installed on the router. To display a list of available interface types, enter the <b>interface ?</b> command.
Step 3	Router(config-if)# <b>ip verify unicast reverse-path list</b>	Enables Unicast RPF on the interface. Use the <i>list</i> option to identify an access list. If the access list denies network access, spoofed packets are dropped at the interface. If the access list permits network access, spoofed packets are forwarded to the destination address. Forwarded packets are counted in the interface statistics. If the access list includes the logging option, information about the spoofed packets is logged to the log server.  Repeat this step for each access list that you want specify.
Step 4	Router(config-if)# <b>exit</b>	Exits interface configuration mode. Repeat Steps 2 and 3 for each interface on which you want to apply Unicast RPF.

## Verifying Unicast RPF

To verify that Unicast RPF is operational, use the **show cef interface** command. The following example shows that Unicast RPF is enabled at interface serial2/0/0.

```
Router-3# show cef interface serial 2/0/0
```

```
Serial2/0/0 is up (if_number 8)
Internet address is 192.168.10.2/30
ICMP redirects are never sent
Per packet loadbalancing is disabled
!The next line displays Unicast RPF packet dropping information.
IP unicast RPF check is enabled
Inbound access list is not set
Outbound access list is not set
Interface is marked as point to point interface
Packets switched to this interface on linecard are dropped to next slow path
Hardware idb is Serial2/0/0
Fast switching type 4, interface type 6
!The next line displays Unicast RPF packet dropping information.
IP Distributed CEF switching enabled
IP LES Feature Fast switching turbo vector
IP Feature CEF switching turbo vector
Input fast flags 0x40, Output fast flags 0x0, ifindex 7(7)
Slot 2 Slot unit 0 VC -1
Transmit limit accumulator 0x48001A02 (0x48001A02)
IP MTU 1500
```

## Troubleshooting Tips

If you experience problems while using Unicast RPF, check the following items.

### HSRP Failure

Failure to disable Unicast RPF before disabling CEF can cause Hot Standby Router Protocol (HSRP) failure. If you want to disable CEF on the router, you must first disable Unicast RPF. To disable Unicast RPF, see the section “[Monitoring and Maintaining Unicast RPF](#).”

### Dropped Boot Requests

In Cisco IOS Release 11.1(17)CC, Unicast RPF can drop BOOTP request packets that have a source address of 0.0.0.0 due to source address verification at the interface. To enable boot requests to work on the interface, you must use ACLs instead of Unicast RPF.

# Monitoring and Maintaining Unicast RPF

This section describes commands used to monitor and maintain Unicast RPF.

Command	Purpose
Router# <b>show ip traffic</b>	Displays global router statistics about Unicast RPF drops and suppressed drops.
Router# <b>show ip interface type</b>	Displays per-interface statistics about Unicast RPF drops and suppressed drops.
Router# <b>show access-lists</b>	Displays the number of matches to a specific ACL.
Router(config-if)# <b>no ip verify unicast reverse-path list</b>	Disables Unicast RPF at the interface. Use the <i>list</i> option to disable Unicast RPF for a specific ACL at the interface.

## Caution

To disable CEF, you must first disable Unicast RPF. Failure to disable Unicast RPF before disabling CEF can cause HSRP failure. If you want to disable CEF on the router, you must first disable Unicast RPF.

Unicast RPF counts the number of packets dropped or suppressed because of malformed or forged source addresses. Unicast RPF counts dropped or forwarded packets that include the following global and per-interface information:

- Global Unicast RPF drops
- Per-interface Unicast RPF drops
- Per-interface Unicast RPF suppressed drops

The **show ip traffic** command shows the total number (global count) of dropped or suppressed packets for all interfaces on the router. The Unicast RPF drop count is included in the IP statistics section.

```
Router# show ip traffic
```

```
IP statistics:
```

```
Rcvd: 1471590 total, 887368 local destination
 0 format errors, 0 checksum errors, 301274 bad hop count
 0 unknown protocol, 0 not a gateway
 0 security failures, 0 bad options, 0 with options
Opts: 0 end, 0 nop, 0 basic security, 0 loose source route
 0 timestamp, 0 extended security, 0 record route
 0 stream ID, 0 strict source route, 0 alert, 0 other
Frgs: 0 reassembled, 0 timeouts, 0 couldn't reassemble
 0 fragmented, 0 couldn't fragment
Bcast: 205233 received, 0 sent
Mcast: 463292 received, 462118 sent
Sent: 990158 generated, 282938 forwarded
! The second line below ("0 unicast RPF") displays Unicast RPF packet dropping
information.
Drop: 3 encapsulation failed, 0 unresolved, 0 no adjacency
 0 no route, 0 unicast RPF, 0 forced drop
```

A nonzero value for the count of dropped or suppressed packets can mean one of two things:

- Unicast RPF is dropping or suppressing packets that have a bad source address (normal operation).

- Unicast RPF is dropping or suppressing legitimate packets because the route is misconfigured to use Unicast RPF in environments where asymmetric routing exists; that is, where multiple paths can exist as the best return path for a source address.

The **show ip interface** command shows the total of dropped or suppressed packets at a specific interface. If Unicast RPF is configured to use a specific ACL, that ACL information is displayed along with the drop statistics.

```
Router> show ip interface ethernet0/1/1
```

```
Unicast RPF ACL 197
1 unicast RPF drop
1 unicast RPF suppressed drop
```

The **show access-lists** command displays the number of matches found for a specific entry in a specific access list.

```
Router> show access-lists
```

```
Extended IP access list 197
deny ip 192.168.201.0 0.0.0.63 any log-input (1 match)
permit ip 192.168.201.64 0.0.0.63 any log-input (1 match)
deny ip 192.168.201.128 0.0.0.63 any log-input
permit ip 192.168.201.192 0.0.0.63 any log-input
```

## Unicast RPF Configuration Examples

This section provides the following configuration examples:

- [Unicast RPF on a Leased-Line Aggregation Router Example](#)
- [Unicast RPF on the Cisco AS5800 Using Dialup Ports Example](#)
- [Unicast RPF with Inbound and Outbound Filters Example](#)
- [Unicast RPF with ACLs and Logging Example](#)

### Unicast RPF on a Leased-Line Aggregation Router Example

The following commands enable Unicast RPF on a serial interface:

```
ip cef
! or "ip cef distributed" for RSP+VIP based routers
!
interface serial 5/0/0
ip verify unicast reverse-path
```

### Unicast RPF on the Cisco AS5800 Using Dialup Ports Example

The following example enables Unicast RPF on a Cisco AS5800. The **interface Group-Async** command makes it easy to apply Unicast RPF on all the dialup ports.

```
ip cef
!
interface Group-Async1
ip verify unicast reverse-path
```

## Unicast RPF with Inbound and Outbound Filters Example

The following example uses a very simple single-homed ISP to demonstrate the concepts of ingress and egress filters used in conjunction with Unicast RPF. The example illustrates an ISP-allocated classless interdomain routing (CIDR) block 209.165.202.128/28 that has both inbound and outbound filters on the upstream interface. Be aware that ISPs are usually not single-homed. Hence, provisions for asymmetrical flows (when outbound traffic goes out one link and returns via a different link) need to be designed into the filters on the border routers of the ISP.

```
ip cef distributed
!
interface Serial 5/0/0
 description Connection to Upstream ISP
 ip address 209.165.200.225 255.255.255.252
 no ip redirects
 no ip directed-broadcast
 no ip proxy-arp
 ip verify unicast reverse-path
 ip access-group 111 in
 ip access-group 110 out
!
access-list 110 permit ip 209.165.202.128 0.0.0.31 any
access-list 110 deny ip any any log
access-list 111 deny ip host 0.0.0.0 any log
access-list 111 deny ip 127.0.0.0 0.255.255.255 any log
access-list 111 deny ip 10.0.0.0 0.255.255.255 any log
access-list 111 deny ip 172.16.0.0 0.15.255.255 any log
access-list 111 deny ip 192.168.0.0 0.0.255.255 any log
access-list 111 deny ip 209.165.202.128 0.0.0.31 any log
access-list 111 permit ip any any
```

## Unicast RPF with ACLs and Logging Example

The following example demonstrates the use of ACLs and logging with Unicast RPF. In this example, extended ACL 197 provides entries that deny or permit network traffic for specific address ranges. Unicast RPF is configured on interface Ethernet0 to check packets arriving at that interface.

For example, packets with a source address of 192.168.201.10 arriving at interface Ethernet0 are dropped because of the deny statement in ACL 197. In this case, the ACL information is logged (the logging option is turned on for the ACL entry) and dropped packets are counted per interface and globally. Packets with a source address of 192.168.201.100 arriving at interface Ethernet0 are forwarded because of the permit statement in ACL 197. ACL information about dropped or suppressed packets is logged (logging option turned on for the ACL entry) to the log server.

```
ip cef distributed
!
int eth0/1/1
 ip address 192.168.200.1 255.255.255.0
 ip verify unicast reverse-path 197
!
int eth0/1/2
 ip address 192.168.201.1 255.255.255.0
!
access-list 197 deny ip 192.168.201.0 0.0.0.63 any log-input
access-list 197 permit ip 192.168.201.64 0.0.0.63 any log-input
access-list 197 deny ip 192.168.201.128 0.0.0.63 any log-input
access-list 197 permit ip 192.168.201.192 0.0.0.63 any log-input
access-list 197 deny ip host 0.0.0.0 any log
```

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

# Unicast Reverse Path Forwarding Loose Mode

The Unicast Reverse Path Forwarding Loose Mode feature creates a new option for Unicast Reverse Path Forwarding (Unicast RPF), providing a scalable anti-spoofing mechanism suitable for use in multihome network scenarios. This mechanism is especially relevant for Internet Service Providers (ISPs), specifically on routers that have multiple links to multiple ISPs. In addition, Unicast RPF (strict or loose mode), when used in conjunction with a Border Gateway Protocol (BGP) “trigger,” provides an excellent quick reaction mechanism that allows network traffic to be dropped on the basis of either the source or destination IP address, giving network administrators an efficient tool for mitigating denial of service (DoS) and distributed denial of service (DDoS) attacks.

## History for the Unicast Reverse Path Forwarding Loose Mode Feature

Release	Modification
12.0(15)S	This feature was introduced.
12.1(8a)E	This feature was integrated into Cisco IOS Release 12.1(8a)E.
12.2(13)T	This feature was integrated into Cisco IOS Release 12.2(13)T.

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Prerequisites for Unicast Reverse Path Forwarding Loose Mode

- To use Unicast RPF, you must enable Cisco Express Forwarding (CEF) switching or distributed CEF (dCEF) switching in the router. There is no need to configure the input interface for CEF switching. As long as CEF is running on the router, individual interfaces can be configured for other switching modes.

## Information About Unicast Reverse Path Forwarding Loose Mode

Before configuring Unicast Reverse Path Forwarding Loose Check, you should understand the following concepts:

- [Unicast Reverse Path Forwarding: Background, page 2](#)
- [Loose Mode, page 3](#)

## Unicast Reverse Path Forwarding: Background

A number of common types of DoS attacks take advantage of forged or rapidly changing source IP addresses, allowing attackers to thwart efforts by ISPs to locate or filter these attacks. Unicast RPF was originally created to help mitigate such attacks by providing an automated, scalable mechanism to implement the Internet Engineering Task Force (IETF) Best Common Practices 38/Request for Comments 2827 (BCP 38/RFC 2827) anti-spoofing filtering on the customer-to-ISP network edge. By taking advantage of the information stored in the Forwarding Information Base (FIB) that is created by the CEF switching process, Unicast RPF can determine whether IP packets are spoofed or malformed by matching the IP source address and ingress interface against the FIB entry that reaches “back” to this source (a so-called “reverse lookup”). Packets that are received from one of the best reverse path routes back out of the same interface are forwarded as normal. If there is no reverse path route on the same interface from which the packet was received, it might mean that the source address was modified, and the packet is dropped (by default).

This original implementation of Unicast RPF, known as “strict mode,” required a match between the ingress interface and the reverse path FIB entry. With Unicast RPF, all equal-cost “best” return paths are considered valid, meaning that it works for cases in which multiple return paths exist, provided that each path is equal in routing cost to the others (number of hops, weights, and so on), and as long as the route is in the FIB. Unicast RPF also functions when Enhanced Interior Gateway Routing Protocol (EIGRP) variants are being used and unequal candidate paths back to the source IP address exist. The strict mode works well for customer-to-ISP network edge configurations that have symmetrical flows (including some multihomed configurations in which symmetrical flows can be enforced).

However, some customer-to-ISP network edges and nearly all ISP-to-ISP network edges use multihomed configurations in which routing asymmetry is typical. When traffic flows are asymmetrical, that is, those in which traffic from Network A to Network B would normally take a different path from traffic flowing from Network B to Network A, the Unicast RPF check will always fail the strict mode test. Because this type of asymmetric routing is common among ISPs and in the Internet core, the original implementation of Unicast RPF was not available for use by ISPs on their core routers and ISP-to-ISP links.

Over time and with an increase in DDoS attacks on the Internet, the functionality of Unicast RPF was reviewed as a tool that ISPs can use on the ISP-to-ISP network edge (an ISP router “peered” with another ISP router) to enable dynamic BGP, triggered black-hole filtering. To provide this functionality, however, the mechanisms used with Unicast RPF had to be modified to permit its deployment on the ISP-to-ISP network edge so that asymmetrical routing is not an issue.

## Loose Mode

To provide ISPs with a DDoS resistance tool on the ISP-to-ISP edge of a network, Unicast RPF was modified from its original strict mode implementation to check the source addresses of each ingress packet without regard for the specific interface on which it was received. This modification is known as “loose mode.” Loose mode allows Unicast RPF to automatically detect and drop packets such as the following:

- IETF RFC 1918 source addresses
- Other Documenting Special Use Addresses (DUSA) that should not appear in the source
- Unallocated addresses that have not been allocated by the Regional Internet Registries (RIRs)
- Source addresses that are routed to a null interface on the router

Loose mode removes the match requirement on the specific ingress interface, allowing Unicast RPF to loose-check packets. This packet checking allows the “peering” router of an ISP having multiple links to multiple ISPs to check the source IP address of ingress packets to determine whether they exist in the FIB. If they exist, the packets are forwarded. If they do not exist in the FIB, the packets fail and are dropped. This checking increases resistance against DoS and DDoS attacks that use spoofed source addresses and unallocated IP addresses.

## How to Configure Unicast Reverse Path Forwarding Loose Mode

This section contains the following procedure:

- [Configuring Unicast Reverse Path Forwarding Loose Mode, page 3](#)

### Configuring Unicast Reverse Path Forwarding Loose Mode

To configure Unicast RPF loose mode, perform the following steps.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip cef**
4. **interface** *type slot/port-adapter/port*
5. **ip verify unicast source reachable-via any**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>ip cef</b>  <b>Example:</b> Router (config)# ip cef	Enables CEF on the route processor card.
Step 4	<b>interface</b> <i>type slot/port-adapter/port</i>  <b>Example:</b> Router (config)# interface serial5/0/0	Configures an interface type and enters interface configuration mode.
Step 5	<b>ip verify unicast source reachable-via any</b> Router (config-if)# ip verify unicast source reachable-via any	Enables Unicast RPF using loose mode.

## Troubleshooting Tips

### CEF Not Enabled

If CEF is not enabled on your device and an attempt is made to deploy Unicast RPF, the following error message is generated:

```
Router(config-if)# ip verify unicast source reachable-via any
% CEF not enabled. Enable first.
```

### Dropped Packets

If it is believed that Unicast RPF is dropping packets that are deemed valid, it may be necessary to configure an access list within Unicast RPF to pass these specific packets.

- Check to see if Unicast RPF is dropping packets using the following **show** commands.

```
Router# show ip traffic | include unicast RPF
```

The above command output displays the global counter for packets dropped by Unicast RPF. If the packet drop counter is increasing, Unicast RPF is dropping packets.

```
Router# show ip interface {type/slot/port} | include verif
```

The above command output displays drop counters on a per-interface basis. If the packet drop counter is increasing, Unicast RPF is dropping packets on the referenced interface.

- Configure a “classification” access list (one that is used to identify traffic types) and add it to the Unicast RPF configuration on the interface or interfaces that are in question.

In this case, the most prudent classification access list would be one that includes a series of “deny” statements covering the traffic types in question (instead of the more traditional “permit” statements that would be used, for example, in a typical classification access list that would be applied directly to an interface). The **logging** keyword may be useful for this access list as well.

- Apply the above access list to Unicast RPF on the interface in question using the following command:

```
Router (config-if)# ip verify unicast source reachable-via any 199
```

- Periodically check the counters on the above access list using the following **show** command:

```
Router# show ip access-list 199
```

If the access list hit counters are increasing for the packet type in question, Unicast RPF is dropping the packets in question. To permit them, configure an access list using a “permit” statement for the packet type in question and apply it to Unicast RPF.

## Configuration Examples for Unicast Reverse Path Forwarding Loose Mode

This section includes the following configuration example:

- [Configuring Unicast RPF Using Loose Mode: Example, page 5](#)

### Configuring Unicast RPF Using Loose Mode: Example

The following example (see [Figure 1](#)) uses a simple dual-homed ISP to demonstrate the concept of Unicast RPF loose mode. The example illustrates an ISP (A) peering router that is connected to two different upstream ISPs (B and C) and shows that traffic flows into and out of ISP A may be asymmetric given this dual-homed configuration. Hence, provisions for asymmetrical flows (when outbound traffic goes out one link and returns via a different link) must be accounted for by the Unicast RPF deployment. In this case, it is appropriate to use the loose-mode configuration of Unicast RPF because this configuration alleviates the interface dependency of strict mode.

**Figure 1**      **Unicast RPF Loose Mode**

```

interface Serial4/0/0
description - link to ISP B
ip address 192.168.200.225 255.255.255.252
no ip redirects
no ip directed-broadcasts
no ip proxy-arp
ip verify unicast source reachable-via any
!
interface Serial5/0/0
description - link to ISP C
ip address 172.16.100.9 255.255.255.252
no ip redirects
no ip directed-broadcasts
no ip proxy-arp
ip verify unicast source reachable-via any
!

```

## **Secure Shell**

# Configuring Secure Shell

---

## Feature History

Release	Modification
Cisco IOS	For information about feature support in Cisco IOS software, use Cisco Feature Navigator.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

This chapter describes the Secure Shell (SSH) feature. The SSH feature consists of an application and a protocol.

For a complete description of the SSH commands in this chapter, refer to the chapter “Secure Shell Commands” of the *Cisco IOS Security Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

## In This Chapter

This chapter has the following sections:

- [About Secure Shell](#)
- [SSH Configuration Task List](#)
- [Troubleshooting Tips](#)
- [Monitoring and Maintaining SSH](#)
- [SSH Configuration Examples](#)

# About Secure Shell

Secure Shell (SSH) is an application and a protocol that provide a secure replacement to the Berkeley r-tools. The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley **rexec** and **rsh** tools. There are currently two versions of SSH available: SSH Version 1 and SSH Version 2. This document describes SSH Version 1. For information about SSH Version 2, see the document *Secure Shell Version 2 Support*.

**Note**

---

Hereafter, unless otherwise noted, the term “SSH” will denote “SSH Version 1” only.

---

This rest of this section covers the following information:

- [How SSH Works](#)
- [Restrictions](#)
- [Related Features and Technologies](#)
- [Prerequisites to Configuring SSH](#)

## How SSH Works

This section provides the following information about how SSH works:

- [SSH Server](#)
- [SSH Integrated Client](#)

### SSH Server

The SSH Server feature enables a SSH client to make a secure, encrypted connection to a Cisco router. This connection provides functionality that is similar to that of an inbound Telnet connection. Before SSH, security was limited to Telnet security. SSH allows a strong encryption to be used with the Cisco IOS software authentication. The SSH server in Cisco IOS software will work with publicly and commercially available SSH clients.

### SSH Integrated Client

The SSH Integrated Client feature is an application running over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco router to make a secure, encrypted connection to another Cisco router or to any other device running the SSH server. This connection provides functionality that is similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for a secure communication over an insecure network.

The SSH client in the Cisco IOS software works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), Triple DES (3DES), and password authentication. User authentication is performed like that in the Telnet session to the router. The user authentication mechanisms supported for SSH are RADIUS, TACACS+ and the use of locally stored user names and passwords.

**Note**

---

The SSH client functionality is available only when the SSH server is enabled.

---

## Restrictions

There following are some basic SSH restrictions:

- RSA authentication available in SSH clients is not supported in the SSH server for Cisco IOS software.
- SSH server and SSH client are supported on DES (56-bit) and 3DES (168-bit) data encryption software images only. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
- Execution shell is the only application supported.
- The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.

## Related Features and Technologies

For more information about SSH-related features and technologies, review the following:

- Authentication, Authorization, and Accounting (AAA) feature. AAA is a suite of network security services that provide the primary framework through which access control can be set up on your Cisco router or access server. For more information on AAA, refer to the Authentication, Authorization, and Accounting chapters earlier in this book and the *Cisco IOS Security Command Reference*.
- IP Security (IPSec) feature. IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses Internet Key Exchange (IKE) to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host. For more information on IPSec, refer to the chapter “Configuring IPSec Network Security” and the *Cisco IOS Security Command Reference*.

## Prerequisites to Configuring SSH

Prior to configuring SSH, perform the following tasks:

- Download the required image on your router. (The SSH server requires you to have an IPSec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(1)T downloaded on your router; the SSH client requires you to have an IPSec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(3)T downloaded on your router.) For more information on downloading a software image, refer to the *Cisco IOS Configuration Fundamentals Configuration Guide*.
- Configure a host name and host domain for your router.

To configure a host name and host domain, enter the following commands beginning in global configuration mode:

Command	Purpose
Router(config)# <b>hostname</b> <i>hostname</i>	Configures a host name for your router.
Router(config)# <b>ip domain-name</b> <i>domainname</i>	Configures a host domain for your router.

- Generate an RSA key pair for your router, which automatically enables SSH.  
To generate an RSA key pair, enter the following global configuration command:

Command	Purpose
Router(config)# <b>crypto key generate rsa</b>	<p>Enables the SSH server for local and remote authentication on the router.</p> <p>The recommended minimum modulus size is 1024 bits.</p> <hr/> <p> <b>Note</b> To delete the RSA key-pair, use the <b>crypto key zeroize rsa</b> global configuration command. Once you delete the RSA key-pair, you automatically disable the SSH server.</p>

- Configure user authentication for local or remote access. You can configure authentication with or without AAA. For more information, refer to the “Authentication, Authorization, and Accounting (AAA)” chapters earlier in the book.

## SSH Configuration Task List

The following sections describe the configuration tasks for SSH. Each task in the list is identified as either optional or required.

- [Configuring SSH Server](#) (Required)
- [Verifying SSH](#) (Optional)

See the section “[SSH Configuration Examples](#)” at the end of this chapter.

## Configuring SSH Server

### Note

The SSH client feature runs in user EXEC mode and has no specific configuration on the router.

### Note

The SSH commands are optional and are disabled when the SSH server is disabled.

To enable and configure a Cisco Router for SSH, you can configure SSH parameters. If you do not configure SSH parameters, the the default values will be used.

To configure SSH server, use the following command in global configuration mode:

Command	Purpose
Router(config)# <b>ip ssh</b> {[timeout <i>seconds</i> ]   [authentication-retries <i>integer</i> ]}	<p>(Required) Configures SSH control variables on your router.</p> <ul style="list-style-type: none"> <li>You can specify the timeout in seconds, not to exceed 120 seconds. The default is 120. This setting applies to the SSH negotiation phase. Once the EXEC session starts, the standard timeouts configured for the vty apply.</li> </ul> <p>By default, there are 5 vtys defined (0–4), therefore 5 terminal sessions are possible. After the SSH executes a shell, the vty timeout starts. The vty timeout defaults to 10 minutes.</p> <ul style="list-style-type: none"> <li>You can also specify the number of authentication retries, not to exceed 5 authentication retries. The default is 3.</li> </ul>

## Verifying SSH

To verify that the SSH server is enabled and view the version and configuration data for your SSH connection, use the **show ip ssh** command. The following example shows that SSH is enabled:

```
Router# show ip ssh
```

```
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
```

The following example shows that SSH is disabled:

```
Router# show ip ssh
```

```
%SSH has not been enabled
```

To verify the status of your SSH server connections, use the **show ssh** command. The following example shows the SSH server connections on the router when SSH is enabled:

```
Router# show ssh
Connection Version EncryptionStateUsername
0 1.5 3DESSession Startedguest
```

The following example shows that SSH is disabled:

```
Router# show ssh
```

```
%No SSH server connections running.
```

## Troubleshooting Tips

- If your SSH configuration commands are rejected as illegal commands, you have not successfully generated a RSA key pair for your router. Make sure you have specified a host name and domain. Then use the **crypto key generate rsa** command to generate a RSA key pair and enable the SSH server.
- When configuring the RSA key pair, you might encounter the following error messages:

- No hostname specified  
You must configure a host name for the router using the **hostname** global configuration command. For more information, see [“Prerequisites to Configuring SSH.”](#)
- No domain specified  
You must configure a host domain for the router using the **ip domain-name** global configuration command. For more information, see [“Prerequisites to Configuring SSH.”](#)
- The number of allowable SSH connections is limited to the maximum number of vtys configured for the router. Each SSH connection will use a vty resource.
- SSH uses either local security or the security protocol that is configured through AAA on your router for user authentication. When configuring AAA, you must ensure that the console is not running under AAA by applying a keyword in the global configuration mode to disable AAA on the console.

## Monitoring and Maintaining SSH

To monitor and maintain your SSH connections, use the following commands in user EXEC mode:

Command	Purpose
Router# <b>show ip ssh</b>	Displays the version and configuration data for SSH.
Router# <b>show ssh</b>	Displays the status of SSH server connections.

## SSH Configuration Examples

This section provides the following configuration examples, which are output from the **show running configuration** EXEC command on a Cisco 7200, Cisco 7500, and Cisco 12000.

- [SSH on a Cisco 7200 Series Router Example](#)
- [SSH on a Cisco 7500 Series Router Example](#)
- [SSH on a Cisco 1200 Gigabit Switch Router Example](#)

**Note**

The **crypto key generate rsa** command is not displayed in the **show running configuration** output.

### SSH on a Cisco 7200 Series Router Example

In the following example, SSH is configured on a Cisco 7200 with a timeout that is not to exceed 60 seconds, and no more than 2 authentication retries. Also, before configuring the SSH server feature on the router, TACACS+ is specified as the method of authentication.

```
hostname Router72K
aaa new-model
aaa authentication login default tacacs+
aaa authentication login aaa7200kw none
enable password enable7200pw

username mcisco password 0 maryspw
username jcisco password 0 johnspw
```

```

ip subnet-zero
no ip domain-lookup
ip domain-name cisco.com
! Enter the ssh commands.
ip ssh time-out 60
ip ssh authentication-retries 2

controller E1 2/0

controller E1 2/1

interface Ethernet1/0
ip address 192.168.110.2 255.255.255.0 secondary

## SSH on a Cisco 7500 Series Router Example

In the following example, SSH is configured on a Cisco 7500 with a timeout that is not to exceed 60 seconds and no more than 5 authentication retries. Before the SSH Server feature is configured on the router, RADIUS is specified as the method of authentication.

```
hostname Router75K
aaa new-model
aaa authentication login default radius
aaa authentication login aaa7500kw none
enable password enable7500pw

username mcisco password 0 maryspw
username jcisco password 0 johnspw
ip subnet-zero
no ip cef
no ip domain-lookup
ip domain-name cisco.com
! Enter ssh commands.

## Reverse SSH Enhancements

---

The Reverse SSH Enhancements feature provides an alternative method of configuring reverse Secure Shell (SSH). Using this feature, you can configure reverse SSH without having to list separate lines for every terminal or auxiliary line on which SSH has to be enabled. This feature also eliminates the rotary-group limitation. This feature is supported for SSH Version 1 and SSH Version 2.

### Feature History for Reverse SSH Enhancements

Release	Modification
12.3(11)T	This feature was introduced.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

### Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Prerequisites for Reverse SSH Enhancements

- SSH must be enabled.
- The SSH client and server must be running the same version of SSH.

## Restrictions for Reverse SSH Enhancements

- The **-I** keyword and *userid* :{number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.

## Information About Reverse SSH Enhancements

To configure Reverse SSH Enhancements, you should understand the following concepts:

- [Reverse Telnet, page 2](#)
- [Reverse SSH, page 2](#)

## Reverse Telnet

Cisco IOS software has for quite some time included a feature called Reverse Telnet, whereby you can telnet to a certain port range and connect to terminal or auxiliary lines. Reverse telnetting has often been used to connect a Cisco IOS router that has many terminal lines to the consoles of other Cisco IOS routers or to other devices. Telnetting makes it easy to reach the router console from anywhere simply by telnetting to the terminal server on a specific line. This telnetting approach can be used to configure a router even if all network connectivity to that router is disconnected. Reverse telnetting also allows modems that are attached to Cisco IOS routers to be used for dial-out (usually with a rotary device).

## Reverse SSH

Reverse telnetting can be accomplished using SSH. Unlike reverse telnetting, SSH provides for secure connections. The Reverse SSH Enhancements feature provides you with a simplified method of configuring SSH. Using this feature, you no longer have to configure a separate line for every terminal or auxiliary line on which you want to enable SSH. The previous method of configuring reverse SSH limited the number of ports that can be accessed to 100. The Reverse SSH Enhancements feature removes the port number limitation. For information on the alternative method of configuring reverse SSH, see the section “[How to Configure Reverse SSH Enhancements.](#)”

## How to Configure Reverse SSH Enhancements

This section contains the following procedures:

- [Configuring Reverse SSH for Console Access, page 3](#)
- [Configuring Reverse SSH for Modem Access, page 4](#)

- [Troubleshooting Reverse SSH on the Client, page 6](#)
- [Troubleshooting Reverse SSH on the Server, page 6](#)

## Configuring Reverse SSH for Console Access

To configure reverse SSH console access on the SSH server, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line** *line-number* [*ending-line-number*]
4. **no exec**
5. **login authentication** *listname*
6. **transport input ssh**
7. **exit**
8. **exit**
9. **ssh -l** *userid*:*{number}* *{ip-address}*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>line</b> <i>line-number</i> [ <i>ending-line-number</i> ]  <b>Example:</b> Router# line 1 3	Identifies a line for configuration and enters line configuration mode.
Step 4	<b>no exec</b>  <b>Example:</b> Router (config-line)# no exec	Disables EXEC processing on a line.
Step 5	<b>login authentication</b> <i>listname</i>  <b>Example:</b> Router (config-line)# login authentication default	Defines a login authentication mechanism for the lines. <b>Note</b> The authentication method must use a username and password.

	Command or Action	Purpose
Step 6	<b>transport input ssh</b>  <b>Example:</b> Router (config-line)# transport input ssh	Defines which protocols to use to connect to a specific line of the router. <ul style="list-style-type: none"><li>The <b>ssh</b> keyword must be used for the Reverse SSH Enhancements feature.</li></ul>
Step 7	<b>exit</b>  <b>Example:</b> Router (config-line)# exit	Exits line configuration mode.
Step 8	<b>exit</b>  <b>Example:</b> Router (config)# exit	Exits global configuration mode.
Step 9	<b>ssh -l userid:{number} {ip-address}</b>  <b>Example:</b> Router# ssh -l lab:1 router.example.com	Specifies the user ID to use when logging in on the remote networking device that is running the SSH server. <ul style="list-style-type: none"><li><i>userid</i>—User ID.</li><li><b>:—Signifies that a port number and terminal IP address will follow the <i>userid</i> argument.</b></li><li><i>number</i>—Terminal or auxiliary line number.</li><li><i>ip-address</i>—Terminal server IP address.</li></ul> <b>Note</b> The <i>userid</i> argument and <b>:rotary{number}{ip-address}</b> delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.

## Configuring Reverse SSH for Modem Access

To configure Reverse SSH for modem access, perform the steps shown in the “SUMMARY STEPS” section below.

In this configuration, reverse SSH is being configured on a modem used for dial-out lines. To get any of the dial-out modems, you can use any SSH client and start a SSH session as shown (in Step 10) to get to the next available modem from the rotary device.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line line-number [ending-line-number]**
4. **no exec**
5. **login authentication listname**
6. **rotary group**
7. **transport input ssh**

8. **exit**
9. **exit**
10. **ssh -l userid:rotary{number} {ip-address}**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>line line-number [ending-line-number]</b>  <b>Example:</b> Router# line 1 200	Identifies a line for configuration and enters line configuration mode.
Step 4	<b>no exec</b>  <b>Example:</b> Router (config-line)# no exec	Disables EXEC processing on a line.
Step 5	<b>login authentication listname</b>  <b>Example:</b> Router (config-line)# login authentication default	Defines a login authentication mechanism for the lines. <p><b>Note</b> The authentication method must use a username and password.</p>
Step 6	<b>rotary group</b>  <b>Example:</b> Router (config-line)# rotary 1	Defines a group of lines consisting of one or more virtual terminal lines or one auxiliary port line.
Step 7	<b>transport input ssh</b>  <b>Example:</b> Router (config-line)# transport input ssh	Defines which protocols to use to connect to a specific line of the router. <ul style="list-style-type: none"> <li>The <b>ssh</b> keyword must be used for the Reverse SSH Enhancements feature.</li> </ul>
Step 8	<b>exit</b>  <b>Example:</b> Router (config-line)# exit	Exits line configuration mode.
Step 9	<b>exit</b>  <b>Example:</b> Router (config)# exit	Exits global configuration mode.

	Command or Action	Purpose
Step 10	<b>ssh -l <i>userid</i>:rotary{<i>number</i>} {<i>ip-address</i>}</b>  <b>Example:</b> Router# ssh -l lab:rotary1 router.example.com	Specifies the user ID to use when logging in on the remote networking device that is running the SSH server. <ul style="list-style-type: none"> <li><i>userid</i>—User ID.</li> <li><b>:</b>—Signifies that a port number and terminal IP address will follow the <i>userid</i> argument.</li> <li><i>number</i>—Terminal or auxiliary line number.</li> <li><i>ip-address</i>—Terminal server IP address.</li> </ul> <b>Note</b> The <i>userid</i> argument and <b>:rotary{<i>number</i>}{<i>ip-address</i>}</b> delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.

## Troubleshooting Reverse SSH on the Client

To troubleshoot the reverse SSH configuration on the client (remote device), perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **debug ip ssh client**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>debug ip ssh client</b>  <b>Example:</b> Router# debug ip ssh client	Displays debugging messages for the SSH client.

## Troubleshooting Reverse SSH on the Server

To troubleshoot the reverse SSH configuration on the terminal server, perform the following steps. The steps may be configured in any order or independent of one another.

## SUMMARY STEPS

1. `enable`
2. `debug ip ssh`
3. `show ssh`
4. `show line`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>enable</code>  <b>Example:</b> Router> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<code>debug ip ssh</code>  <b>Example:</b> Router# <code>debug ip ssh</code>	Displays debugging messages for the SSH server.
Step 3	<code>show ssh</code>  <b>Example:</b> Router# <code>show ssh</code>	Displays the status of the SSH server connections.
Step 4	<code>show line</code>  <b>Example:</b> Router# <code>show line</code>	Displays parameters of a terminal line.

# Configuration Examples for Reverse SSH Enhancements

This section includes the following configuration examples:

- [Reverse SSH Console Access: Example, page 7](#)
- [Reverse SSH Modem Access: Example, page 8](#)

## Reverse SSH Console Access: Example

The following configuration example shows that reverse SSH has been configured for console access for terminal lines 1 through 3:

### Terminal Server Configuration

```
line 1 3
 no exec
 login authentication default
 transport input ssh
```

**Client Configuration**

The following commands configured on the SSH client will form the reverse SSH session with lines 1, 2, and 3, respectively:

```
ssh -l lab:1 router.example.com
ssh -l lab:2 router.example.com
ssh -l lab:3 router.example.com
```

## Reverse SSH Modem Access: Example

The following configuration example shows that dial-out lines 1 through 200 have been grouped under rotary group 1 for modem access:

```
line 1 200
 no exec
 login authentication default
 rotary 1
 transport input ssh
 exit
```

The following command shows that reverse SSH will connect to the first free line in the rotary group:

```
ssh -l lab:rotary1 router.example.com
```

# Secure Copy

---

The Secure Copy (SCP) feature provides a secure and authenticated method for copying router configuration or router image files. SCP relies on Secure Shell (SSH), an application and a protocol that provide a secure replacement for the Berkeley r-tools.

## Feature History for Secure Copy

Release	Modification
12.2(2)T	This feature was introduced.
12.0(21)S	This feature was integrated into Cisco IOS 12.0(21)S.
12.2(25)S	This feature was integrated into Cisco IOS 12.2(25)S.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Prerequisites for Secure Copy

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the router.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

## Information About Secure Copy

To configure Secure Copy feature, you should understand the following concepts.

- [How SCP Works, page 2](#)

## How SCP Works

The behavior of SCP is similar to that of remote copy (r<sub>cp</sub>), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. In addition, SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.

SCP allows a user who has appropriate authorization to copy any file that exists in the Cisco IOS File System (IFS) to and from a router by using the **copy** command. An authorized administrator may also perform this action from a workstation.

## How to Configure SCP

This section contains the following procedures:

- [Configuring SCP, page 2](#)
- [Verifying SCP, page 3](#)
- [Troubleshooting SCP, page 4](#)

## Configuring SCP

To enable and configure a Cisco router for SCP server-side functionality, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login** {default | list-name} method1 [method2...]
5. **aaa authorization** {network | exec | commands level | reverse-access | configuration} {default | list-name} [method1 [method2...]]
6. **username** name [privilege level] {password encryption-type encrypted-password}

## 7. ip scp server enable

### DETAILED STEPS

	Command	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>aaa new-model</b>  <b>Example:</b> Router (config)# aaa new-model	Sets AAA authentication at login.
Step 4	<b>aaa authentication login {default   list-name} method1 [method2...]</b>  <b>Example:</b> Router (config)# aaa authentication login default group tacacs+	Enables the AAA access control system.
Step 5	<b>aaa authorization {network   exec   commands level   reverse-access   configuration} {default   list-name} [method1 [method2...]]</b>  <b>Example:</b> Router (config)# aaa authorization exec default group tacacs+	Sets parameters that restrict user access to a network.  <b>Note</b> The <b>exec</b> keyword runs authorization to determine if the user is allowed to run an EXEC shell; therefore, you must use it when you configure SCP.
Step 6	<b>username name [privilege level] {password encryption-type encrypted-password}</b>  <b>Example:</b> Router (config)# username superuser privilege 2 password 0 superpassword	Establishes a username-based authentication system.  <b>Note</b> You may skip this step if a network-based authentication mechanism—such as TACACS+ or RADIUS—has been configured.
Step 7	<b>ip scp server enable</b>  <b>Example:</b> Router (config)# ip scp server enable	Enables SCP server-side functionality.

## Verifying SCP

To verify SCP server-side functionality, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `show running-config`

**DETAILED STEPS**

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>show running-config</b>  <b>Example:</b> Router# show running-config	Verifies the SCP server-side functionality.

**Troubleshooting SCP**

To troubleshoot SCP authentication problems, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `debug ip scp`

**DETAILED STEPS**

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>debug ip scp</b>  <b>Example:</b> Router# debug ip scp	Troubleshoots SCP authentication problems.

**Configuration Examples for Secure Copy**

This section provides the following configuration examples:

- [SCP Server-Side Configuration Using Local Authentication: Example, page 5](#)
- [SCP Server-Side Configuration Using Network-Based Authentication: Example, page 5](#)

## SCP Server-Side Configuration Using Local Authentication: Example

The following example shows how to configure the server-side functionality of SCP. This example uses a locally defined username and password.

```
! AAA authentication and authorization must be configured properly for SCP to work.
aaa new-model
aaa authentication login default local
aaa authorization exec default local
username tiger privilege 15 password 0 lab
! SSH must be configured and functioning properly.
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable
```

## SCP Server-Side Configuration Using Network-Based Authentication: Example

The following example shows how to configure the server-side functionality of SCP using a network-based authentication mechanism:

```
! AAA authentication and authorization must be configured properly for SCP to work.
aaa new-model
aaa authentication login default group tacacs+
aaa authorization exec default group tacacs+
! SSH must be configured and functioning properly.
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable
```

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Security Command Reference* at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*.

- **debug ip scp**
- **ip scp server enable**

# Glossary

**AAA**—authentication, authorization, and accounting. Framework of security services that provide the method for identifying users (authentication), for remote access control (authorization), and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

**rcp**—remote copy. Relying on Remote Shell (Berkeley r-tools suite) for security, rcp copies files, such as router images and startup configurations, to and from routers.

**SCP**—secure copy. Relying on SSH for security, SCP support allows the secure and authenticated copying of anything that exists in the Cisco IOS File Systems. SCP is derived from rcp.

**SSH**—Secure Shell. Application and a protocol that provide a secure replacement for the Berkeley r-tools. The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. SSH Version 1 is implemented in the Cisco IOS software.

# Secure Shell Version 2 Support

---

**First Published: November 3, 2003**

**Last Updated: July 11, 2008**

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2 (SSH Version 1 support was implemented in an earlier Cisco IOS software release). SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. Currently, the only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH also allows for the secure transfer of files.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for Secure Shell Version 2 Support” section on page 20](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Prerequisites for Secure Shell Version 2 Support

Prior to configuring SSH, perform the following task:

- Download the required image on your router. The SSH server requires you to have a k9 (Triple Data Encryption Standard [3DES]) software image from Cisco IOS Release 12.3(4)T, 12.2(25)S, or 12.3(7)JA downloaded on your router.

**Note**

The SSH Version 2 server is supported in Cisco IOS Release 12.3(4)T, 12.3(2)XE, 12.2(25)S, and 12.3(7)JA; the SSH Version 2 client is supported beginning with Cisco IOS Release 12.3(7)T and is supported in Cisco IOS Release 12.3(7)JA. (The SSH client runs both the SSH Version 1 and Version 2 protocol and is supported in both k8 and k9 images in Cisco IOS Release 12.3(4)T.)

For more information on downloading a software image, refer to [Cisco IOS Configuration Fundamentals and Network Management Configuration Guide](#).

## Restrictions for Secure Shell Version 2 Support

- Rivest, Shamir, and Adelman (RSA) user authentication is not supported in the SSH server or SSH client for Cisco IOS software.
- SSH servers and SSH clients are supported in 3DES software images.
- Execution Shell, remote command execution, and Secure Copy Protocol (SCP) are the only applications supported.
- Compression is not supported.
- The RSA key-pair size must be greater than or equal to 768.

## Information About Secure Shell Version 2 Support

To configure SSH Version 2, you should understand the following concept:

- [Secure Shell Version 2, page 2](#)
- [SNMP Trap Generation, page 3](#)
- [SSH Keyboard Interactive Authentication, page 4](#)

## Secure Shell Version 2

The Secure Shell Version 2 Support feature allows you to configure SSH Version 2.

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The command **ip ssh version** has been introduced so that you may define which version of SSH that you want to configure. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.

**Note**

SSH Version 1 is a protocol that has never been defined in a standard. If you do not want your router to fall back to the undefined protocol (Version 1), you should use the **ip ssh version** command and specify Version 2.

The **ip ssh rsa keypair-name** command was also introduced in Cisco IOS Release 12.3(4)T so that you can enable a SSH connection using RSA keys that you have configured. Previously, SSH was linked to the first RSA keys that were generated (that is, SSH was enabled when the first RSA key pair was generated). The behavior still exists, but by using the **ip ssh rsa keypair-name** command, you can overcome that behavior. If you configure the **ip ssh rsa keypair-name** command with a key-pair name, SSH is enabled if the key pair exists, or SSH will be enabled if the key pair is generated later. If you use this command to enable SSH, you are not forced to configure a host name and a domain name, which was required in SSH Version 1 of the Cisco IOS software.

**Note**

The login banner is supported in Secure Shell Version 2, but it is not supported in Secure Shell Version 1.

## Secure Shell Version 2 Enhancements

The Secure Shell Version 2 Enhancements include a number of additional capabilities such as supporting VRF aware SSH, SSH debug enhancements, and Diffie-Hellman group exchange support.

The Cisco IOS SSH implementation has traditionally used 768 bit modulus but with an increasing need for higher key sizes to accommodate Diffie-Hellman (DH) Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications a message exchange between the client and server to establish the favored DH group becomes necessary. The **ip ssh dh min size** command was introduced in Cisco IOS Release 12.4(20)T so you can configure modulus size on the SSH server. In addition to this the **ssh** command was extended to add VRF awareness to SSH client side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging has been enhanced by modifying SSH debug commands. The **debug ip ssh** command has been extended to allow you to simplify the debugging process. Previously this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the **debug ip ssh** command with a keyword messages are limited to information specified by the keyword.

## SNMP Trap Generation

Effective with Cisco IOS Release 12.4(17), Simple Network Management Protocol (SNMP) traps will be generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been turned on. For information about enabling SNMP traps, see the chapter “[Configuring SNMP Support](#)” in the *Cisco IOS Network Management Configuration Guide*.

**Note**

When configuring the **snmp-server host** command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server. For an example of an SNMP trap generation configuration, see the section “[Setting an SNMP Trap: Example](#).”

You must also turn on SNMP debugging using the **debug snmp packet** command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session. For an example of SNMP debugging, see the section “[SNMP Debugging: Example](#).”

## SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically deployed.

The following methods are currently supported:

- Password
- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)

For examples of various scenarios in which the SSH Keyboard Interactive Authentication feature has been automatically deployed, see the chapter “[SSH Keyboard Interactive Authentication: Examples](#).”

## How to Configure Secure Shell Version 2 Support

This section contains the following procedures:

- [Configuring a Router for SSH Version 2 Using a Host Name and Domain Name, page 4](#) (required)
- [Configuring a Router for SSH Version 2 Using RSA Key Pairs, page 5](#) (optional)
- [Starting an Encrypted Session with a Remote Device, page 7](#) (optional)
- [Verifying the Status of the Secure Shell Connection Using the show ssh Command, page 7](#) (optional)
- [Verifying the Secure Shell Status Using the show ip ssh Command, page 9](#) (optional)
- [Monitoring and Maintaining Secure Shell Version 2, page 10](#) (optional)

## Configuring a Router for SSH Version 2 Using a Host Name and Domain Name

To configure your router for SSH Version 2 using a host name and domain name, perform the following steps. You may also configure SSH Version 2 by using the RSA key pair configuration (See the section “[Configuring a Router for SSH Version 2 Using RSA Key Pairs](#)”).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **hostname** *hostname*
4. **ip domain-name** *name*

5. **crypto key generate rsa**
6. **ip ssh [timeout *seconds* | authentication-retries *integer*]**
7. **ip ssh version [1 | 2]**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>hostname <i>hostname</i></b>  <b>Example:</b> Router (config)# hostname cisco 7200	Configures a host name for your router.
Step 4	<b>ip domain-name <i>name</i></b>  <b>Example:</b> Router (config)# ip domain-name cisco.com	Configures a domain name for your router.
Step 5	<b>crypto key generate rsa</b>  <b>Example:</b> Router (config)# crypto key generate rsa	Enables the SSH server for local and remote authentication.
Step 6	<b>ip ssh [timeout <i>seconds</i>   authentication-retries <i>integer</i>]</b>  <b>Example:</b> Router (config)# ip ssh timeout 120	(Optional) Configures SSH control variables on your router.
Step 7	<b>ip ssh version [1   2]</b>  <b>Example:</b> Router (config)# ip ssh version 1	(Optional) Specifies the version of SSH to be run on your router.

## Configuring a Router for SSH Version 2 Using RSA Key Pairs

To enable SSH Version 2 without configuring a host name or domain name, perform the following steps. SSH Version 2 will be enabled if the key pair that you configure already exists or if it is generated later. You may also configure SSH Version 2 by using the host name and domain name configuration (See the section “[Configuring a Router for SSH Version 2 Using a Host Name and Domain Name](#)”).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ssh rsa keypair-name** *keypair-name*
4. **crypto key generate rsa usage-keys label** *key-label* **modulus** *modulus-size*
5. **ip ssh [timeout** *seconds* **| authentication-retries** *integer***]**
6. **ip ssh version 2**

## DETAILED STEPS

Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>ip ssh rsa keypair-name</b> <i>keypair-name</i>  <b>Example:</b> Router (config)# ip ssh rsa keypair-name sshkeys	Specifies which RSA keypair to use for SSH usage.  <b>Note</b> A Cisco IOS router can have many RSA key pairs.
Step 4	<b>crypto key generate rsa usage-keys label</b> <i>key-label</i> <b>modulus</b> <i>modulus-size</i>  <b>Example:</b> Router (config)# crypto key generate rsa usage-keys label sshkeys modulus 768	Enables the SSH server for local and remote authentication on the router.  For SSH Version 2, the modulus size must be at least 768 bits.  <b>Note</b> To delete the RSA key-pair, use the <b>crypto key zeroize rsa</b> command. After you have deleted the RSA key-pair, you automatically disable the SSH server.
Step 5	<b>ip ssh [timeout</b> <i>seconds</i> <b> </b> <b>authentication-retries</b> <i>integer</i> <b>]</b>  <b>Example:</b> Router (config)# ip ssh timeout 120	Configures SSH control variables on your router.
Step 6	<b>ip ssh version 2</b>  <b>Example:</b> Router (config)# ip ssh version 2	Specifies the version of SSH to be run on a router.

## Starting an Encrypted Session with a Remote Device

To start an encrypted session with a remote networking device, perform the following step. (You do not have to enable your router. SSH can be run in disabled mode.)

### Note

The device you wish to connect with must support a SSH server that has an encryption algorithm that is supported in Cisco IOS software.

### SUMMARY STEPS

1. `ssh [-v {1 | 2}] [-c {3des | aes128-cbc | aes192-cbc | aes256-cbc}] [-m {hmac-md5 | hmac-md5-96 | hmac-sha1 | hmac-sha1-96}] [1 userid] [-o numberofpasswordprompts n] [-p port-num] {ip-addr | hostname} [command]`

### DETAILED STEPS

#### Step 1

```
ssh [-v {1 | 2}] [-c {3des | aes128-cbc |
aes192-cbc | aes256-cbc}] [-m {hmac-md5 |
hmac-md5-96 | hmac-sha1 | hmac-sha1-96}] [1
userid] [-o numberofpasswordprompts n] [-p
port-num] {ip-addr | hostname} [command]
```

#### Example:

```
Router# ssh -v 2 -c aes256-cbc -m hmac-sha1-96
-l user2 10.76.82.24
```

Or

The above example adheres to the SSH Version 2 conventions. A more natural and common way to start a session is by linking the username with the hostname. For example, the following configuration example provides an end result that is identical to that of the above example:

```
Router# ssh -v 2 -c aes256-cbc -m hmac-sha1-96
user2@10.76.82.24
```

Starts an encrypted session with a remote networking device.

### Troubleshooting Tips

The **ip ssh version** command can be used for troubleshooting your SSH configuration. By changing versions, you can determine which SSH version has a problem.

## Verifying the Status of the Secure Shell Connection Using the show ssh Command

To display the status of the SSH connection on your router, use the **show ssh** command.

SUMMARY STEPS

- 1. enable
- 2. show ssh

DETAILED STEPS

Step 1	<div>enable</div> <div>Example: Router&gt; enable</div>	<div>Enables privileged EXEC mode.</div> <div><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul></div>
Step 2	<div>show ssh</div> <div>Example: Router# show ssh</div>	<div>Displays the status of SSH server connections.</div>

Examples

The following output examples from the **show ssh** command display status about various SSH Version 1 and Version 2 connections.

Version 1 and Version 2 Connections

```
Router# show ssh

Connection Version Encryption State Username
0 1.5 3DES Session started lab
Connection Version Mode Encryption Hmac State
Username
1 2.0 IN aes128-cbc hmac-md5 Session started lab
1 2.0 OUT aes128-cbc hmac-md5 Session started lab
```

Version 2 Connection with No Version 1

```
Router# show ssh

Connection Version Mode Encryption Hmac State
Username
1 2.0 IN aes128-cbc hmac-md5 Session started lab
1 2.0 OUT aes128-cbc hmac-md5 Session started lab
%No SSHv1 server connections running.
```

Version 1 Connection with No Version 2

```
Router# show ssh

Connection Version Encryption State Username
0 1.5 3DES Session started lab
%No SSHv2 server connections running.
```

# Verifying the Secure Shell Status Using the show ip ssh Command

To verify your SSH configuration, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **show ip ssh**

## DETAILED STEPS

Step 1	<b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
	<b>Example:</b> Router> enable	
Step 2	<b>show ip ssh</b>	Displays the version and configuration data for SSH.
	<b>Example:</b> Router# show ip ssh	

## Examples

The following examples from the **show ip ssh** command display the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries.

### Version 1 and Version 2 Connections

```

router# show ip ssh

3d06h: %SYS-5-CONFIG_I: Configured from console by consoleh
SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3

```

### Version 2 Connection with No Version 1

```

Router# show ip ssh

SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3

```

### Version 1 Connection with No Version 2

```

Router# show ip ssh

3d06h: %SYS-5-CONFIG_I: Configured from console by console
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3

```

## Monitoring and Maintaining Secure Shell Version 2

To display debug messages about the SSH connections, use the **debug ip ssh** command.

### SUMMARY STEPS

1. **enable**
2. **debug ip ssh**
3. **debug snmp packet**

### DETAILED STEPS

Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>debug ip ssh</b>  <b>Example:</b> Router# debug ip ssh	Displays debugging messages for SSH.
Step 3	<b>debug snmp packet</b>  <b>Example:</b> Router# debug snmp packet	Displays information about every SNMP packet sent or received by the router.

### Example

The following output from the **debug ip ssh** command shows that the digit 2 keyword has been assigned, signifying that it is an SSH Version 2 connection.

```
Router# debug ip ssh

00:33:55: SSH1: starting SSH control process
00:33:55: SSH1: sent protocol version id SSH-1.99-Cisco-1.25
00:33:55: SSH1: protocol version id is - SSH-2.0-OpenSSH_2.5.2p2
00:33:55: SSH2 1: send: len 280 (includes padlen 4)
00:33:55: SSH2 1: SSH2_MSG_KEXINIT sent

00:34:08: SSH2 1: done calc MAC out #13
00:34:08: SSH2 1: send: len 16 (includes padlen 6)
00:34:08: SSH2 1: done calc MAC out #14
00:34:08: SSH2 1: send: len 16 (includes padlen 6)
00:34:08: SSH2 1: done calc MAC out #15
00:34:08: SSH1: Session terminated normally
```

# Configuration Examples for Secure Shell Version 2 Support

This section provides the following configuration examples:

- [Configuring Secure Shell Version 1: Example, page 13](#)
- [Configuring Secure Shell Version 2: Example, page 13](#)
- [Configuring Secure Shell Versions 1 and 2: Example, page 13](#)
- [Starting an Encrypted Session with a Remote Device: Example, page 13](#)
- [Setting an SNMP Trap: Example, page 13](#)
- [SSH Keyboard Interactive Authentication: Examples, page 14](#)
- [SNMP Debugging: Example, page 16](#)
- [SSH Debugging Enhancements: Examples, page 16](#)

## Configuring Secure Shell Version 1: Example

```
Router# configure terminal
Router (config)# ip ssh version 1
c7200-25-2013(config)# end
```

## Configuring Secure Shell Version 2: Example

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip ssh version 2
Router(config)# end
```

## Configuring Secure Shell Versions 1 and 2: Example

```
Router# configure terminal
Router (config)# no ip ssh version
Router (config)# end
```

## Starting an Encrypted Session with a Remote Device: Example

```
Router# ssh -v 2 -c aes256-cbc -m hmac-sha1-160 -l shaship 10.76.82.24
```

## Setting an SNMP Trap: Example

The following shows that an SNMP trap has been set. The trap notification is generated automatically when the SSH session terminates. For an example of SNMP trap debug output, see the section [“SNMP Debugging: Example.”](#)

```
snmp-server
snmp-server host a.b.c.d public tty
```

Where a.b.c.d is the IP address of the SSH client.

## SSH Keyboard Interactive Authentication: Examples

The following are examples of various scenarios in which the SSH Keyboard Interactive Authentication feature has been automatically deployed:

### Client-Side Debugs

In the following example, client-side debugs are turned on and the maximum number of prompts = six, (three each for the SSH Keyboard Interactive Authentication method and for the password method of authentication).

```
Password:
Password:
Password:
Password:
Password:
Password: cisco123
Last login: Tue Dec 6 13:15:21 2005 from 10.76.248.213
user1@courier:~> exit
logout
[Connection to 10.76.248.200 closed by foreign host]
```

```
Router1# debug ip ssh client
```

```
SSH Client debugging is on
```

```
Router1# ssh -l lab 10.1.1.3
Password:
*Nov 17 12:50:53.199: SSH0: sent protocol version id SSH-1.99-Cisco-1.25
*Nov 17 12:50:53.199: SSH CLIENT0: protocol version id is - SSH-1.99-Cisco-1.25
*Nov 17 12:50:53.199: SSH CLIENT0: sent protocol version id SSH-1.99-Cisco-1.25
*Nov 17 12:50:53.199: SSH CLIENT0: protocol version exchange successful
*Nov 17 12:50:53.203: SSH0: protocol version id is - SSH-1.99-Cisco-1.25
*Nov 17 12:50:53.335: SSH CLIENT0: key exchange successful and encryption on
*Nov 17 12:50:53.335: SSH2 CLIENT 0: using method keyboard-interactive
Password:
Password:
Password:
*Nov 17 12:51:01.887: SSH2 CLIENT 0: using method password authentication
Password:
Password: lab
```

```
Router2>
*Nov 17 12:51:11.407: SSH2 CLIENT 0: SSH2_MSG_USERAUTH_SUCCESS message received
*Nov 17 12:51:11.407: SSH CLIENT0: user authenticated
*Nov 17 12:51:11.407: SSH2 CLIENT 0: pty-req request sent
*Nov 17 12:51:11.411: SSH2 CLIENT 0: shell request sent
*Nov 17 12:51:11.411: SSH CLIENT0: session open
```

### TACACS+ ACS Is the Backend AAA Server, ChPass Is Enabled, and a Blank Password Change Is Made

In the following example, a TACACS+ access control server (ACS) is the backend Accounting, Authentication, and Authorization (AAA) server; the ChPass feature is enabled; and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method:

```
Router1# ssh -l cisco 10.1.1.3
Password:
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123

Router2> exit
[Connection to 10.1.1.3 closed by foreign host]
```

**TACACS+ ACS Is the Backend AAA Server, ChPass Is Enabled, and the Password Is Changed on First Login**

In the following example, a TACACS+ ACS is the backend server, and the ChPass feature is enabled. The password is changed on the first login using the SSH Keyboard Interactive Authentication method:

```
Router1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Router2> exit
[Connection to 10.1.1.3 closed by foreign host]
```

```
Router1# ssh -l cisco 10.1.1.3
Password:cisco1
Your password has expired.
Enter a new one now.
New Password: cisco
Re-enter New password: cisco12
The New and Re-entered passwords have to be the same.
Try again.
New Password: cisco
Re-enter New password: cisco

Router2>
```

**TACACS+ ACS Is the Backend AAA Server, ChPass Is Enabled, and the Password Expires After Three Logins**

In the following example, a TACACS+ ACS is the backend AAA server, and the ChPass feature is enabled. The password expires after three logins using the SSH Keyboard Interactive Authentication method:

```
Router# ssh -l cisco. 10.1.1.3
Password: cisco

Router2> exit
[Connection to 10.1.1.3 closed by foreign host]

Router1# ssh -l cisco 10.1.1.3
Password: cisco

Router2> exit

Router1# ssh -l cisco 10.1.1.3
Password: cisco

Router2> exit
[Connection to 10.1.1.3 closed by foreign host]

Router1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Router2>
```

## SNMP Debugging: Example

The following is sample output using the **debug snmp packet** command. The output provides SNMP trap information for an SSH session.

```
Router1# debug snmp packet

SNMP packet debugging is on

Router1# ssh -l lab 10.0.0.2

Password:

Router2# exit

[Connection to 10.0.0.2 closed by foreign host]
Router1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2
*Jul 18 10:18:42.619: SNMP: V1 Trap, ent cisco, addr 10.0.0.1, gentrap 6, spectrap 1

Router1#
```

## SSH Debugging Enhancements: Examples

The following is sample output from the **debug ip ssh detail** command. The output provides debugging information regarding the SSH protocol and channel requests.

```
Router# debug ip ssh detail

00:04:22: SSH0: starting SSH control process
00:04:22: SSH0: sent protocol version id SSH-1.99-Cisco-1.25
00:04:22: SSH0: protocol version id is - SSH-1.99-Cisco-1.25
00:04:22: SSH2 0: SSH2_MSG_KEXINIT sent
00:04:22: SSH2 0: SSH2_MSG_KEXINIT received
00:04:22: SSH2:kex: client->server enc:aes128-cbc mac:hmac-sha1
00:04:22: SSH2:kex: server->client enc:aes128-cbc mac:hmac-sha1
00:04:22: SSH2 0: expecting SSH2_MSG_KEXDH_INIT
00:04:22: SSH2 0: SSH2_MSG_KEXDH_INIT received
00:04:22: SSH2: kex_derive_keys complete
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS sent
00:04:22: SSH2 0: waiting for SSH2_MSG_NEWKEYS
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS received
00:04:24: SSH2 0: authentication successful for lab
00:04:24: SSH2 0: channel open request
00:04:24: SSH2 0: pty-req request
00:04:24: SSH2 0: setting TTY - requested: height 24, width 80; set: height 24, width 80
00:04:24: SSH2 0: shell request
00:04:24: SSH2 0: shell message received
00:04:24: SSH2 0: starting shell for vty
00:04:38: SSH0: Session terminated normally
```

The following is sample output from the **debug ip ssh packet** command. The output provides debugging information regarding the ssh packet.

```
Router# debug ip ssh packet
```

```
00:05:43: SSH2 0: send:packet of length 280 (length also includes padlen of 4)
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: input: total packet length of 280 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 24 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: input: padlength 4 bytes
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: input: total packet length of 144 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 136 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 136 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 16 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 136 bytes, maclen 0
00:05:43: SSH2 0: input: padlength 6 bytes
00:05:43: SSH2 0: signature length 143
00:05:43: SSH2 0: send:packet of length 448 (length also includes padlen of 7)
00:05:43: SSH2 0: send:packet of length 16 (length also includes padlen of 10)
00:05:43: SSH2 0: newkeys: mode 1
00:05:43: SSH2 0: ssh_receive: 16 bytes received
00:05:43: SSH2 0: input: total packet length of 16 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 8 bytes, maclen 0
00:05:43: SSH2 0: input: padlength 10 bytes
00:05:43: SSH2 0: newkeys: mode 0
00:05:43: SSH2 0: ssh_receive: 52 bytes received
00:05:43: SSH2 0: input: total packet length of 32 bytes
00:05:43: SSH2 0: partial packet length(block size)16 bytes,needed 16 bytes, maclen 20
00:05:43: SSH2 0: MAC compared for #3 :ok
```

## Where to Go Next

You have to use a SSH remote device that supports SSH Version 2, and you have to connect to a Cisco IOS router.

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Security Command Reference* at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **debug ip ssh**
- **ip ssh min dh size**
- **ip ssh rsa keypair-name**
- **ip ssh version**
- **ssh**

# Feature Information for Secure Shell Version 2 Support

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for Secure Shell Version 2 Support

Feature Name	Releases	Feature Information
Secure Shell Version 2 Support	12.3(4)T 12.2(25)S	The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2 (SSH Version 1 support was implemented in an earlier Cisco IOS software release). SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities.
Secure Shell Version 2 Client and Server Support	12.3(7)JA 12.0(32)SY	This feature was integrated into Cisco IOS Release 12.3(7)JA.
Secure Shell Version 2 Client and Server Support	12.4(17)	The Cisco IOS image was updated to provide for the automatic generation of SNMP traps when an SSH session terminates.  For information about this feature, see the following section: <ul style="list-style-type: none"> <li>• “SNMP Trap Generation” section on page 3</li> <li>• “SNMP Debugging: Example” section on page 16</li> </ul>
SSH Keyboard Interactive Authentication	12.4(18) 12.2(33)SXH3	This feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature.  For information about this feature see the following sections: <ul style="list-style-type: none"> <li>• “SSH Keyboard Interactive Authentication” section on page 4</li> <li>• “SSH Keyboard Interactive Authentication: Examples” section on page 14</li> </ul>

**Table 1**      **Feature Information for Secure Shell Version 2 Support (continued)**

Feature Name	Releases	Feature Information
Secure Shell SSH Version 2 Client Support	Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.
Secure Shell Version 2 Enhancements	12.4(20)T	<p>The Secure Shell Version 2 Enhancements include a number of additional capabilities such as support for VRF aware SSH, SSH debug enhancements and Diffie-Hellman group 14 and group 16 exchange support.</p> <p>For information about this feature see the following sections:</p> <ul style="list-style-type: none"> <li>• <a href="#">“Secure Shell Version 2 Enhancements” section on page 3</a></li> </ul>

# SSH Terminal-Line Access

---

This feature module describes the SSH Terminal-Line Access feature and includes the following sections:

- [Feature Overview, page 1](#)
- [Supported Platforms, page 2](#)
- [Supported Standards, MIBs, and RFCs, page 4](#)
- [Prerequisites, page 4](#)
- [Configuration Tasks, page 4](#)
- [Configuration Examples, page 5](#)
- [Command Reference, page 7](#)

## Feature Overview

Cisco IOS supports reverse Telnet, which allows users to Telnet through the router—via a certain port range—to connect them to tty (asynchronous) lines. Reverse Telnet has allowed users to connect to the console ports of remote devices that do not natively support Telnet. However, this method has provided very little security because all Telnet traffic goes over the network in the clear. The SSH Terminal-Line Access feature replaces reverse Telnet with secure shell (SSH). This feature may be configured to use encryption to access devices on the tty lines, which provide users with connections that support strong privacy and session integrity.

SSH is an application and a protocol that provide secure replacement for the suite of Berkeley r-tools such as rsh, rlogin and rcp. (Cisco IOS supports rlogin.) The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. There are currently two versions of SSH available: SSH Version 1 and SSH Version 2. Only SSH Version 1 is implemented in the Cisco IOS software.

The SSH Terminal-Line Access feature enables users to configure their router with secure access and perform the following tasks:

- Connect to a router that has multiple terminal lines connected to consoles or serial ports of other routers, switches, or devices.

---

**Americas Headquarters:**  
**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

© 2007 Cisco Systems, Inc. All rights reserved.

- Simplify connectivity to a router from anywhere by securely connecting to the terminal server on a specific line.
- Allow modems attached to routers to be used for dial-out securely.
- Require authentication to each of the lines through a locally defined username and password, TACACS+, or RADIUS.

## Benefits

The SSH Terminal-Line Access feature provides users secure access to tty lines.

## Restrictions

### Console Server Requirement

To configure secure console server access, you must define each line in its own rotary and configure SSH to use SSH over the network when users wish to access each of those devices.

### Memory and Performance Impact

Replacing reverse Telnet with SSH may reduce the performance of available tty lines due to the addition of encryption and decryption processing above the vty processing. (Any cryptographic mechanism uses more memory than a regular access.)

## Related Documents

The following documents provide information related to the SSH Terminal-Line Access feature:

- Cisco IOS Dial Technologies Configuration Guide, Release 12.2
- *Cisco IOS Dial Technologies Command Reference*, Release 12.2
- *Cisco IOS Security Command Reference*, Release 12.2
- *Cisco IOS Security Configuration Guide*, Release 12.2

For more information on SSH, such as the details of the protocol, go to the SSH website at <http://www.ssh.com/>.

## Supported Platforms

This feature is supported on the following platforms:

- Cisco 1700 Series
- Cisco 2600 Series
- Cisco 3620
- Cisco 3640
- Cisco 3660
- Cisco 4500
- Cisco 12000 Series

This feature is supported on all platforms that support SSH.

# Supported Standards, MIBs, and RFCs

## Standards

No new or modified standards are supported by this feature.

## MIBs

No new or modified MIBs are supported by this feature.

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at <http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>.

## RFCs

No new or modified RFCs are supported by this feature.

## Prerequisites

Download the required image on your router. The SSH server requires you to have an IPsec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(1)T downloaded on your router; the SSH client requires you to have an IPsec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(3)T downloaded on your router. For more information on downloading a software image, refer to the *Cisco IOS Configuration Fundamentals Configuration Guide*, Release 12.2.

The SSH server requires the use of a username and password, which must be defined through the use of a local username and password, TACACS+, or RADIUS.

**Note**

---

The SSH Terminal-Line Access feature is available on any image that contains SSH.

---

## Configuration Tasks

See the following section for configuration tasks for the SSH Terminal-Line Access feature:

- [Configuring SSH Terminal-Line Access](#)

## Configuring SSH Terminal-Line Access

**Note**

---

SSH must already be configured on the router.

---

To configure a Cisco router to support reverse secure Telnet, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>line</b> <i>line-number</i> [ <i>ending-line-number</i> ]	Identifies a line for configuration and enters line configuration mode.  <b>Note</b> For router console configurations, each line must be defined in its own rotary, and SSH must be configured to listen in on each rotary.  <b>Note</b> An authentication method requiring a username and password must be configured for each line. This may be done through the use of a local username and password stored on the router, through the use of TACACS+, or through the use of RADIUS. Neither Line passwords nor the enable password are sufficient to be used with SSH.
Step 2	Router(config-line)# <b>no exec</b>	Disables exec processing on each of the lines.
Step 3	Router(config-line)# <b>login</b> { <b>local</b>   <b>authentication</b> <i>listname</i> }	Defines a login authentication mechanism for the lines.  <b>Note</b> The authentication method must utilize a username and password.
Step 4	Router(config-line)# <b>rotary</b> <i>group</i>	Defines a group of lines consisting of one or more lines.  <b>Note</b> All rotaries used must be defined, and each defined rotary must be used when SSH is enabled.
Step 5	Router(config-line)# <b>transport input</b> { <b>all</b>   <b>ssh</b> }	Defines which protocols to use to connect to a specific line of the router.
Step 6	Router(config-line)# <b>exit</b>	Exits line configuration mode.
Step 7	Router(config)# <b>ip ssh port</b> <i>portnum</i> <b>rotary</b> <i>group</i>	Enables secure network access to the tty lines. Use this command to connect the <i>portnum</i> argument with the <i>rotary group</i> argument, which is associated with a line or group of lines.  <b>Note</b> The <i>group</i> argument must correspond with the <b>rotary group</b> number chosen in Step 4.

## Verifying SSH Terminal-Line Access

To verify that this functionality is working, you can connect to a router using an SSH client.

## Configuration Examples

This section provides the following configuration examples:

- [SSH Terminal-Line Access Configuration Example](#)
- [SSH Terminal-Line Access for a Console \(Serial Line\) Ports Configuration Example](#)

## SSH Terminal-Line Access Configuration Example

The following example shows how to configure the SSH Terminal-Line Access feature on a modem used for dial-out on lines 1 through 200. To get any of the dial-out modems, use any SSH client and start a SSH session to port 2000 of the router to get to the next available modem from the rotary.

```
line 1 200
 no exec
 login authentication default
 rotary 1
 transport input ssh
 exit
ip ssh port 2000 rotary 1
```

## SSH Terminal-Line Access for a Console (Serial Line) Ports Configuration Example

The following example shows how to configure the SSH Terminal-Line Access feature to access the console or serial line interface of various devices. For this type of access, each line is put into its own rotary, and each rotary is used for a single port. In this example, lines 1 through 3 are used; the port (line) mappings of the configuration are shown in [Table 68](#).

**Table 68** Port (line) Configuration Mappings

Line Number	SSH Port Number
1	2001
2	2002
3	2003

```
line 1
 no exec
 login authentication default
 rotary 1
 transport input ssh
line 2
 no exec
 login authentication default
 rotary 2
 transport input ssh
line 3
 no exec
 login authentication default
 rotary 3
 transport input ssh

ip ssh port 2001 rotary 1 3
```

# Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Security Command Reference* at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*.

- **ip ssh port**

## **802.1X Authentication Services**

# Configuring IEEE 802.1x Port-Based Authentication

---

**First Published: December 7, 2006**

**Last Updated: January 8, 2007**

This document describes how to configure IEEE 802.1x port-based authentication on Cisco integrated services routers (ISRs). IEEE 802.1x authentication prevents unauthorized devices (supplicants) from gaining access to the network.

Cisco ISRs can combine the functions of a router, a switch, and an access point, depending on the fixed configuration or installed modules. The switch functions are provided by either built in switch ports or a plug-in module with switch ports.

## Note

---

This document describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

---

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Configuring IEEE 802.1x Port-Based Authentication](#)” section on [page 24](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Command Reference, page 23](#)
- [Feature Information for Configuring IEEE 802.1x Port-Based Authentication, page 24](#)
- [Glossary, page 29](#)

## Prerequisites for Configuring IEEE 802.1x Port-Based Authentication

The features described in this document are available only on switch ports installed in Cisco ISR routers. The IEEE 802.1x port-based authentication features are available in Cisco IOS Release 12.4(11)T on Cisco 800, 870, 1800, 2800, and 3800 series ISRs that support switch ports.

The fixed configuration Cisco 1800 series router platforms and the Cisco 870 series routers have integrated 4-port and 8-port switches.

The following cards or modules support switch ports:

- High-speed WAN interface cards (HWIC)
  - HWIC-4ESW
  - HWICD-9ESW
- EtherSwitch Network Modules
  - NM-16ESW
  - NMD-36ESW

**Note**

Not all Cisco ISR routers support all the components listed. For information about module compatibility with a specific router platform, see [Cisco EtherSwitch Modules Comparison](#).

To determine whether your router has switch ports that can be configured with the IEEE 802.1x port-based authentication feature, use the **show interfaces switchport** command.

To configure IEEE 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

# Restrictions for Configuring IEEE 802.1x Port-Based Authentication

These sections describe the configuration restrictions for these features:

- [IEEE 802.1x Authentication Configuration, page 3](#)
- [VLAN Assignment Configuration, page 4](#)
- [Guest VLAN Configuration, page 4](#)
- [Upgrading from a Previous Software Release, page 4](#)

## IEEE 802.1x Authentication Configuration

These are the IEEE 802.1x authentication configuration restrictions:

- When IEEE 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.
- If you try to change the mode (for example, from access to trunk) of an IEEE 802.1x-enabled port, an error message appears, and the port mode is not changed.
- If the VLAN to which an IEEE 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch port. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after reauthentication.

If the VLAN to which an IEEE 802.1x port is assigned is shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The IEEE 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN enabled ports, and Layer 3 routed ports, but it is not supported on these port types:
  - Dynamic-access ports—If you try to enable IEEE 802.1x authentication on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
  - Dynamic ports—If you try to enable IEEE 802.1x authentication on a dynamic port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, IEEE 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.
  - Trunk port—If you try to enable IEEE 802.1x authentication on a trunk port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, an error message appears, and the port mode is not changed.

### Note

A port in dynamic mode can negotiate with its neighbor to become a trunk port.

## VLAN Assignment Configuration

This is the restriction for configuring VLAN assignment and the guest VLAN feature on switch ports in an ISR router:

- When IEEE 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.

## Guest VLAN Configuration

- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.
- After you configure a guest VLAN for an IEEE 802.1x port to which a DHCP client is connected, you might have to get a host IP address from a DHCP server. You can change the settings for restarting the IEEE 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the IEEE 802.1x authentication process (using the **dot1x max-reauth-req** and **dot1x timeout tx-period** interface configuration commands). The amount of decrease depends on the connected IEEE 802.1x client type.

## Upgrading from a Previous Software Release

In Cisco IOS Release 12.4(11)T, the implementation for IEEE 802.1x authentication changed from the previous releases. When IEEE 802.1x authentication is enabled, information about Port Fast is no longer added to the configuration.

### Note

When you enter any IEEE 802.1x-related commands on a port, this information is automatically added to the running configuration to address any backward compatibility issues:

```
dot1xpae authenticator
```

## Information About IEEE 802.1x Port-Based Authentication

### Note

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

The IEEE 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a port before making available any services offered by the device or the network.

Until the client is authenticated, IEEE 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

These sections describe IEEE 802.1x port-based authentication:

- [IEEE 802.1x Authenticator, page 5](#)
- [IEEE 802.1x with RADIUS Accounting, page 9](#)

## IEEE 802.1x Authenticator

The following sections describe the basic authentication process:

- [Device Roles, page 5](#)
- [Authentication Initiation and Message Exchange, page 6](#)
- [Authentication Process, page 7](#)
- [Ports in Authorized and Unauthorized States, page 8](#)
- [IEEE 802.1x Host Mode, page 9](#)

## Device Roles

With IEEE 802.1x port-based authentication, the devices in the network have specific roles as shown in [Figure 1](#).

**Figure 1** IEEE 802.1x Device Roles

- *Supplicant*—Device (workstation) that requests access to the LAN and switch services and responds to requests from the router. The workstation must be running IEEE 802.1x-compliant client software such as that offered in the Microsoft Windows XP operating system. (The *supplicant* is sometimes called the client.)

### Note

To resolve Windows XP network connectivity and IEEE 802.1x authentication issues, read the Microsoft Knowledge Base article at this URL:

<http://support.microsoft.com/support/kb/articles/Q303/5/97.ASP>

- *Authentication server*—Device that performs the actual authentication of the supplicant. The authentication server validates the identity of the supplicant and notifies the router whether or not the supplicant is authorized to access the LAN and switch services. The Network Access Device (or ISR router in this instance) transparently passes the authentication messages between the supplicant and the authentication server, and the authentication process is carried out between the supplicant and the authentication server. The particular EAP method used will be decided between the supplicant and the authentication server (RADIUS server). The RADIUS security system with EAP

extensions is available in Cisco Secure Access Control Server Version 3.0 or later. RADIUS operates in a client and server model in which secure authentication information is exchanged between the RADIUS server and one or more RADIUS clients.

- *Authenticator (integrated services router (ISR) or wireless access point)*—Router that controls the physical access to the network based on the authentication status of the supplicant. The router acts as an intermediary between the supplicant and the authentication server, requesting identity information from the supplicant, verifying that information with the authentication server, and relaying a response to the supplicant. The router includes the RADIUS client, which is responsible for encapsulating and decapsulating the EAP frames and interacting with the authentication server.

When the authenticator receives EAPOL frames and relays them to the authentication server, the EAPOL is stripped and the remaining EAP frame is reencapsulated in the RADIUS format. The EAP frames are not modified during encapsulation, and the authentication server must support EAP within the native frame format. When the authenticator receives frames from the authentication server, the server's frame header is removed, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

## Authentication Initiation and Message Exchange

During IEEE 802.1x authentication, the router or the supplicant can initiate authentication. If you enable authentication on a port by using the **dot1x port-control auto** interface configuration command, the router initiates authentication when the link state changes from down to up or periodically if the port remains up and unauthenticated. The router sends an EAP-request/identity frame to the supplicant to request its identity. Upon receipt of the frame, the supplicant responds with an EAP-response/identity frame.

However, if during bootup, the supplicant does not receive an EAP-request/identity frame from the router, the supplicant can initiate authentication by sending an EAPOL-start frame, which prompts the router to request the supplicant's identity.

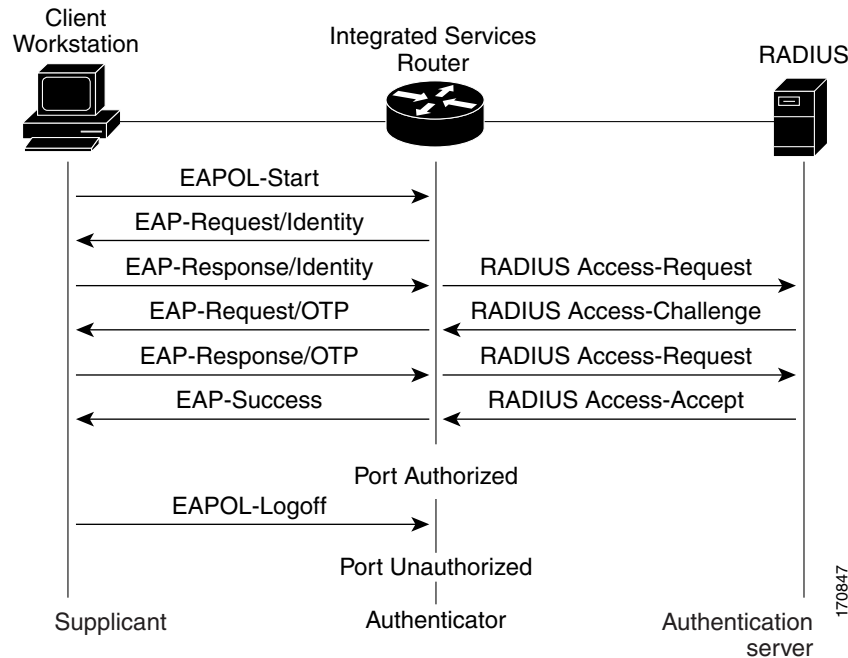

### Note

If IEEE 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the supplicant are dropped. If the supplicant does not receive an EAP-request/identity frame after three attempts to start authentication, the supplicant sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the supplicant has been successfully authenticated. For more information, see the [“Ports in Authorized and Unauthorized States” section on page 8](#).

When the supplicant supplies its identity, the router begins its role as the intermediary, passing EAP frames between the supplicant and the authentication server until authentication succeeds or fails. If the authentication succeeds, the router port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted. For more information, see the [“Ports in Authorized and Unauthorized States” section on page 8](#).

The specific exchange of EAP frames depends on the authentication method being used. [Figure 2](#) shows a message exchange initiated by the supplicant using the One-Time-Password (OTP) authentication method with a RADIUS server.

**Figure 2**      **Message Exchange**

## Authentication Process

To configure IEEE 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

The AAA process begins with authentication. When IEEE 802.1x port-based authentication is enabled and the device attempting to authenticate is IEEE 802.1x-capable (meaning it supports the supplicant functionality) these events occur:

- If the supplicant identity is valid and the IEEE 802.1x authentication succeeds, the router grants the supplicant access to the network.

The router reauthenticates a supplicant when one of these situations occurs:

- Periodic reauthentication is enabled, and the reauthentication timer expires.

You can configure the reauthentication timer to use a router-specific value or to be based on values from the RADIUS server.

After IEEE 802.1x authentication using a RADIUS server is configured, the router uses timers based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]).

The Session-Timeout RADIUS attribute (Attribute[27]) specifies the time after which reauthentication occurs.

The Termination-Action RADIUS attribute (Attribute [29]) specifies the action to take during reauthentication. The actions can be *Initialize* or *ReAuthenticate*. When the *Initialize* action is set (the attribute value is *DEFAULT*), the IEEE 802.1x session ends, and connectivity is lost during reauthentication. When the *ReAuthenticate* action is set (the attribute value is *RADIUS-Request*), the session is not affected during reauthentication.

- You manually reauthenticate the supplicant by entering the **dot1x re-authenticate interface interface-id** privileged EXEC command.

## Ports in Authorized and Unauthorized States

During IEEE 802.1x authentication, depending on the port state, the router can grant a supplicant access to the network. The port starts in the *unauthorized* state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress traffic except for IEEE 802.1x authentication, CDP, and STP packets. When a supplicant is successfully authenticated, the port changes to the *authorized* state, allowing all traffic for the supplicant to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and IEEE 802.1x protocol packets before the supplicant is successfully authenticated.

If a client that does not support IEEE 802.1x authentication connects to an unauthorized IEEE 802.1x port, the router requests the client's identity. In this situation, if the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an IEEE 802.1x-enabled supplicant connects to a port that is not running the IEEE 802.1x standard, the supplicant initiates the authentication process by sending the EAPOL-start frame. When no response is received, the supplicant sends the request for a fixed number of times. Because no response is received, the supplicant begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the **dot1x port-control** interface configuration command and these keywords:

- **force-authorized**—Disables IEEE 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client. This is the default setting.
- **force-unauthorized**—Causes the port to remain in the unauthorized state, ignoring all attempts by the supplicant to authenticate. The router cannot provide authentication services to the supplicant through the port.
- **auto**—Enables IEEE 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The router requests the identity of the supplicant and begins relaying authentication messages between the supplicant and the authentication server. Each supplicant attempting to access the network is uniquely identified by the router by using the supplicant MAC address.

If the supplicant is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated supplicant are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the router can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a supplicant logs off, it sends an EAPOL-logoff message, causing the router port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

For information about configuring IEEE 802.1x port-based authentication, see the [“Configuring IEEE 802.1x Authentication”](#) section of the “Configuring IEEE 802.1x Port-Based Authentication” chapter in the *Catalyst 3750 Switch Software Configuration Guide, 12.2(25)SEE*.

## IEEE 802.1x Host Mode

**Note**

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

You can configure an IEEE 802.1x port for single-host or for multi-host mode. In single-host mode (see [Figure 1 on page 5](#)), only one supplicant can be authenticated by the IEEE 802.1x-enabled switch port. The router detects the supplicant by sending an EAPOL frame when the port link state changes to the up state. If a supplicant leaves or is replaced with another supplicant, the router changes the port link state to down, and the port returns to the unauthorized state.

In multi-host mode, you can attach multiple hosts to a single IEEE 802.1x-enabled port. In this mode, only one of the attached supplicants must be authorized for all supplicants to be granted network access. If the port becomes unauthorized (reauthentication fails or an EAPOL-logoff message is received), the router denies network access to all of the attached supplicants.

**Note**

Cisco 870 series platforms do not support single-host mode.

For information about configuring IEEE 802.1x host mode, see the “[Configuring the Host Mode](#)” section of the “Configuring IEEE 802.1x Port-Based Authentication” chapter in the *Catalyst 3750 Switch Software Configuration Guide, 12.2(25)SEE*.

## IEEE 802.1x with RADIUS Accounting

**Note**

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

This section describes IEEE 802.1x RADIUS accounting and includes the following topics:

- [IEEE 802.1x RADIUS Accounting, page 9](#)
- [IEEE 802.1x Accounting Attribute-Value Pairs, page 11](#)

## IEEE 802.1x RADIUS Accounting

**Note**

If you plan to implement system-wide accounting, you should also configure IEEE 802.1x accounting. Moreover, you need to inform the accounting server of the system reload event when the system is reloaded to ensure that the accounting server is aware that all outstanding IEEE 802.1x sessions on this system are closed.

**Note**

To enable IEEE 802.1x accounting, you must first configure IEEE 802.1x authentication and switch-to-RADIUS server communication.

IEEE 802.1x RADIUS accounting relays important events to the RADIUS server (such as the supplicant's connection session). This session is defined as the interval beginning when the supplicant is authorized to use the port and ending when the supplicant stops using the port.

**Note**

You must configure the IEEE 802.1x supplicant to send an EAP-logoff (Stop) message to the switch when the user logs off. If you do not configure the IEEE 802.1x supplicant, an EAP-logoff message is not sent to the switch and the accompanying accounting Stop message is not sent to the authentication server. See the Microsoft Knowledge Base article at the location: <http://support.microsoft.com>. Also see the Microsoft article at this location:

<http://www.microsoft.com/technet/treeview/default.asp?url=/technet/columns/cableguy/cg0703.asp>,

and set the SupplicantMode registry to 3 and the AuthMode registry to 1.

After the supplicant is authenticated, the switch sends accounting-request packets to the RADIUS server, which responds with accounting-response packets to acknowledge the receipt of the request.

A RADIUS accounting-request packet contains one or more Attribute-Value (AV) pairs to report various events and related information to the RADIUS server. The following events are tracked:

- User successfully authenticates.
- User logs off.
- Link-down occurs on an IEEE 802.1x port.
- Reauthentication succeeds.
- Reauthentication fails.

When the port state transitions between authorized and unauthorized, the RADIUS messages are transmitted to the RADIUS server.

The switch does not log any accounting information. Instead, it sends such information to the RADIUS server, which must be configured to log accounting messages.

This is the IEEE 802.1x RADIUS accounting process

1. A user connects to a port on the router.
2. Authentication is performed.
3. VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.
4. The router sends a start message to an accounting server.
5. Reauthentication is performed, as necessary.
6. The port sends an interim accounting update to the accounting server that is based on the result of reauthentication.
7. The user disconnects from the port.
8. The router sends a stop message to the accounting server.

The switch port does not log IEEE 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.

To configure IEEE 802.1x accounting, you need to do the following tasks:

- Enable accounting in your RADIUS server.
- Enable IEEE 802.1x accounting on your switch.
- Enable AAA accounting by using the **aaa system accounting** command.

Enabling AAA system accounting along with IEEE 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. When the accounting RADIUS server receives notice of a system reload event, the server can infer that all active IEEE 802.1x sessions are appropriately closed.

Because RADIUS uses the unreliable transport protocol User Datagram Protocol (UDP), accounting messages may be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, the following system message appears:

```
Accounting message %s for session %s failed to receive Accounting Response.
```

When the stop message is not transmitted successfully, a message like the following appears:

```
00:09:55: %RADIUS-3-NOACCOUNTINGRESPONSE: Accounting message Start for session
172.20.50.145 sam 11/06/03 07:01:16 11000002 failed to receive Accounting Response.
```

Use the **show radius statistics** command to display the number of RADIUS messages that do not receive the accounting response message.

For information about configuring IEEE 802.1x RADIUS accounting, see the [“Enabling 802.1X Accounting”](#) section of the “Configuring 802.1X Port-Based Authentication” chapter in the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide, 12.2(31)SGA*.

## IEEE 802.1x Accounting Attribute-Value Pairs

The information sent to the RADIUS server is represented in the form of AV pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.)

AV pairs are automatically sent by a router that is configured for IEEE 802.1x accounting. Three types of RADIUS accounting packets are sent by a router:

- START—sent when a new user session starts
- INTERIM—sent during an existing session for updates
- STOP—sent when a session terminates

[Table 1](#) lists the AV pairs and when they are sent by the router:

**Table 1 Accounting AV Pairs**

Attribute Number	AV Pair Name	START	INTERIM	STOP
Attribute[1]	User-Name	Always	Always	Always
Attribute[4]	NAS-IP-Address	Always	Always	Always
Attribute[5]	NAS-Port	Always	Always	Always
Attribute[6]	Service-Type	Always	Always	Always
Attribute[8]	Framed-IP-Address	Never	Sometimes <sup>1</sup>	Sometimes <sup>1</sup>
Attribute[25]	Class	Always	Always	Always
Attribute[30]	Called-Station-ID	Always	Always	Always
Attribute[31]	Calling-Station-ID	Always	Always	Always
Attribute[40]	Acct-Status-Type	Always	Always	Always
Attribute[41]	Acct-Delay-Time	Always	Always	Always

**Table 1**      *Accounting AV Pairs (continued)*

Attribute Number	AV Pair Name	START	INTERIM	STOP
Attribute[42]	Acct-Input-Octets	Never	Always	Always
Attribute[43]	Acct-Output-Octets	Never	Always	Always
Attribute[44]	Acct-Session-ID	Always	Always	Always
Attribute[45]	Acct-Authentic	Always	Always	Always
Attribute[46]	Acct-Session-Time	Never	Never	Always
Attribute[47]	Acct-Input-Packets	Never	Always	Always
Attribute[48]	Acct-Output-Packets	Never	Always	Always
Attribute[49]	Acct-Terminate-Cause	Never	Never	Always
Attribute[61]	NAS-Port-Type	Always	Always	Always

1. The Framed-IP-Address AV pair is sent only if a valid Dynamic Host Control Protocol (DHCP) binding exists for the host in the DHCP snooping bindings table.

You can configure the ISR to send Cisco vendor-specific attributes (VSAs) to the RADIUS server. [Table 2](#) lists the available Cisco AV pairs.

**Note**

To enable VSAs to be sent in the accounting records you must configure the **radius-server vsa send accounting** command.

**Table 2**      *Cisco Vendor-Specific Attributes*

Attribute Number	AV Pair Name	START	INTERIM	STOP
Attribute[26,9,1]	Cisco-Avpair: connect-progress	Always	Always	Always
Attribute[26,9,2]	cisco-nas-port	Always	Always	Always
Attribute[26,9,1]	Cisco-Avpair: disc-cause	Never	Never	Always

You can view the AV pairs that are being sent by the router by entering the **debug radius accounting** privileged EXEC command. For more information about this command, see the *Cisco IOS Debug Command Reference*, Release 12.4T, at this URL:

[http://www.cisco.com/univercd/cc/td/doc/product/software/ios124/124tcr/tdb\\_r/index.htm](http://www.cisco.com/univercd/cc/td/doc/product/software/ios124/124tcr/tdb_r/index.htm)

For more information about AV pairs, see RFC 3580, *IEEE 802.1x Remote Authentication Dial In User Service (RADIUS) Usage Guidelines*.

## How to Use IEEE 802.1x Authentication With Other Features

The following sections describe how to use IEEE 802.1x Authentication in combination with other features on the switch ports on an ISR router.

- [IEEE 802.1x Authentication with VLAN Assignment, page 13](#)
- [IEEE 802.1x Authentication with Guest VLAN, page 15](#)

- [IEEE 802.1x with RADIUS-Supplied Session Timeout, page 15](#)
- [IEEE 802.1x Authentication with Voice VLAN Ports, page 16](#)
- [Enabling IEEE 802.1x SNMP Notifications, page 17](#)
- [IEEE 802.1x MIB Support, page 17](#)

## IEEE 802.1x Authentication with VLAN Assignment

**Note**

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

In Cisco IOS Release 12.4(11)T and later releases, the switch ports support IEEE 802.1x authentication with VLAN assignment. After successful IEEE 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. You can use the VLAN Assignment feature to limit network access for certain users.

The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the supplicant connected to the switch port.

This section contains the following information about IEEE 802.1x VLAN assignment:

- [Prerequisites for IEEE 802.1x VLAN Assignment, page 13](#)
- [Restrictions for IEEE 802.1x VLAN Assignment, page 13](#)
- [Configuring VLAN Assignment, page 14](#)

### Prerequisites for IEEE 802.1x VLAN Assignment

Before the VLAN Assignment feature is implemented, the following conditions must be met:

- IEEE 802.1x must be enabled on the switch port.
- EAP support must be enabled on the RADIUS server.
- AAA authorization must be configured on the port for all network-related service requests.
- The port must be successfully authenticated.

### Restrictions for IEEE 802.1x VLAN Assignment

These are the restrictions that apply to the VLAN Assignment feature:

- The switch port is always assigned to the configured access VLAN when any of the following conditions occurs:
  - No VLAN is supplied by the RADIUS server.
  - The VLAN information from the RADIUS server is not valid.
  - IEEE 802.1x authentication is disabled on the port.
  - The port is in the force authorized, force unauthorized, unauthorized, or shutdown state.

**Note**

An access VLAN is a VLAN assigned to an access port. All packets sent from or received on this port belong to this VLAN.

- Assignment to the configured access VLAN prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error. Examples of configuration errors include the following:
  - A nonexistent or malformed VLAN ID
  - Attempted assignment to a voice VLAN ID
- The IEEE 802.1x authentication with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN Membership Policy Server (VMPS).
- If the multi-host mode is enabled on an IEEE 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.
- If an IEEE 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect.

## Configuring VLAN Assignment

### Note

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

To configure VLAN assignment on a switch port, you need to perform these tasks:

- Enable AAA authorization by using the **network** keyword to allow interface configuration from the RADIUS server. For detailed instructions, see the [“Configuring RADIUS Authorization for User Privileged Access and Network Services”](#) section of the “Configuring Switch-Based Authentication” chapter in the *Catalyst 3750 Switch Software Configuration Guide, 12.2(25)SEE*.
- Enable IEEE 802.1x authentication. For detailed instructions, see the [“Configuring RADIUS Login Authentication”](#) section of the “Configuring Switch-Based Authentication” chapter in the *Catalyst 3750 Switch Software Configuration Guide, 12.2(25)SEE*.

### Note

The VLAN assignment feature is automatically enabled when you configure IEEE 802.1x authentication on an access port.

- Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the router:
  - [64] Tunnel-Type = VLAN
  - [65] Tunnel-Medium-Type = 802
  - [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID

Attribute [64] must contain the value “VLAN” (type 13). Attribute [65] must contain the value “802” (type 6). Attribute [81] specifies the VLAN name or VLAN ID assigned to the IEEE 802.1x-authenticated user.

For examples of tunnel attributes, see the [“Configuring the Switch to Use Vendor-Specific RADIUS Attributes”](#) section of the “Configuring Switch-Based Authentication” chapter in the *Catalyst 3750 Switch Software Configuration Guide, 12.2(25)SEE*.

## IEEE 802.1x Authentication with Guest VLAN

**Note**

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

You can configure a guest VLAN for each IEEE 802.1x-capable switch port on the router to provide limited services to clients, such as downloading the IEEE 802.1x client. These clients might be upgrading their system for IEEE 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an IEEE 802.1x port, the router assigns clients to a guest VLAN when the router does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

The router maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the router determines that the device connected to that interface is an IEEE 802.1x-capable client, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

In Cisco IOS Release 12.4(11)T and later releases, if devices send EAPOL packets to the router during the lifetime of the link, the router does not allow clients that fail authentication access to the guest VLAN.

**Note**

If an EAPOL packet is detected after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and IEEE 802.1x authentication restarts.

Any number of IEEE 802.1x-incapable clients are allowed access when the router port is moved to the guest VLAN. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on IEEE 802.1x ports in single-host or multi-host mode.

You can configure any active VLAN except a remote switch port analyzer (RSPAN) VLAN or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

For information about configuring a guest VLAN, see the [“Configuring a Guest VLAN”](#) section of the “Configuring IEEE 802.1x Port-Based Authentication” chapter in the *Catalyst 3750 Switch Software Configuration Guide, 12.2(25)SEE*.

## IEEE 802.1x with RADIUS-Supplied Session Timeout

**Note**

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

You can specify whether a switch port uses a locally configured or a RADIUS-provided reauthentication timeout. If the switch port is configured to use the local timeout, it reauthenticates the host when the timer expires.

If the switch port is configured to use the RADIUS-provided timeout, it looks in the RADIUS Access-Accept message for the Session-Timeout and optional Termination-Action attributes. The switch port uses the value of the Session-Timeout attribute to determine the duration of the session, and it uses the value of the Termination-Action attribute to determine the switch action when the session's timer expires.

If the Termination-Action attribute is present and its value is RADIUS-Request, the switch port reauthenticates the host. If the Termination-Action attribute is not present, or its value is Default, the switch port terminates the session.

**Note**

The supplicant on the port detects that its session has been terminated and attempts to initiate a new session. Unless the authentication server treats this new session differently, the supplicant may see only a brief interruption in network connectivity as the switch sets up a new session.

If the switch port is configured to use the RADIUS-supplied timeout, but the Access-Accept message does not include a Session-Timeout attribute, the switch port never reauthenticates the supplicant. This behavior is consistent with Cisco's wireless access points.

For details on how to configure RADIUS-provided session timeout, see the [“Configuring RADIUS-Provided Session Timeouts”](#) section in the “Configuring 802.1X Port-Based Authentication” chapter of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide, 12.2(31)SG*.

## IEEE 802.1x Authentication with Voice VLAN Ports

**Note**

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

A voice VLAN port is a special access port associated with two VLAN identifiers:

- Voice VLAN identifier (VVID) to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- Port VLAN identifier (PVID) to carry the data traffic to and from the workstation connected to the router through the IP phone. The PVID is the native VLAN of the port.

The IP phone uses the VVID for its voice traffic, regardless of the authorization state of the port. This allows the phone to work independently of IEEE 802.1x authentication.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multi-host mode, additional supplicants can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multi-host mode is enabled, the supplicant authentication affects both the PVID and the VVID.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several IP phones are connected in series, the router recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the router drops packets from unrecognized IP phones more than one hop away.

When IEEE 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.

**Note**

If you enable IEEE 802.1x authentication on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the Cisco IP phone loses connectivity to the router for up to 30 seconds.

For information about configuring IEEE 802.1x with voice VLANs, see the [“Configuring IEEE 802.1X with Voice VLAN”](#) section in the [“Configuring 802.1X Port-Based Authentication”](#) chapter of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide, 12.2(31)SG*.

## Enabling IEEE 802.1x SNMP Notifications

**Note**

This section describes IEEE 802.1x security features available only on the switch ports in a Cisco ISR.

Follow the steps below to enable Simple Network Management Protocol (SNMP) notifications for IEEE 802.1x features on the switch ports.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server enable traps dot1x**

### DETAILED STEPS

	Command	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables higher privilege levels, such as privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>snmp-server enable traps dot1x notification type</b>  <b>Example:</b> Router (config)# snmp-server enable traps dot1x no-guest-vlan	Enables SNMP logging and reporting when no Guest VLAN is configured or available.

## IEEE 802.1x MIB Support

Cisco IOS Release 12.4(11)T provides support for the following MIBs that provide SNMP access to IEEE 802.1x feature components:

- IEEE8021-PAE-MIB

- Cisco-PAE-MIB

The IEEE8021-PAE-MIB supports reporting of the following information:

- The state of the IEEE 802.1x state machine on a particular port
- Statistics associated with the state of the IEEE 802.1x state machine

The Cisco-PAE-MIB provides SNMP support for the logging and reporting of events, including:

- Port mode
- Guest VLAN number (Details the Guest VLAN number configured on a port.)
- InGuestVLAN (Indicates whether a port is in the Guest VLAN.)

## Configuration Examples for IEEE 802.1x Features

This section provides the following comprehensive configuration examples:

- [Enabling IEEE 802.1x and AAA on a Port: Example, page 18](#)
- [Enabling IEEE 802.1x RADIUS Accounting: Example, page 19](#)
- [Configuring IEEE 802.1x with Guest VLAN: Example, page 19](#)
- [Configuring RADIUS-Provided Session Timeout: Example, page 20](#)
- [Configuring IEEE 802.1x with Voice VLAN: Example, page 20](#)
- [Displaying IEEE 802.1x Statistics and Status: Example, page 20](#)

### Enabling IEEE 802.1x and AAA on a Port: Example

This example shows how to enable IEEE 802.1x and AAA on Fast Ethernet port 2/1, and how to verify the configuration:

#### Note

Whenever you configure any IEEE 802.1x parameter on a port, a dot1x authenticator is automatically created on the port. As a result **dot1x pae authenticator** appears in the configuration to ensure that IEEE 802.1x authentication still works without manual intervention on legacy configurations. The appearance of the IEEE 802.1x information in the configuration is likely to change in future releases.

This example shows how to enable IEEE 802.1x and AAA on Fast Ethernet port 2/1, and how to verify the configuration:

```
Router# configure terminal
Router(config)# dot1x system-auth-control
Router(config)# aaa new-model
Router(config)# aaa authentication dot1x default group radius
Router(config)# interface fastethernet2/1
Router(config-if)# switchport mode access
Router(config-if)# dot1x pae authenticator
Router(config-if)# dot1x port-control auto
Router(config-if)# end
Router# show dot1x interface fastethernet7/1 details
```

```

Dot1x Info for FastEthernet7/1

PAE = AUTHENTICATOR
PortControl = AUTO
ControlDirection = Both
HostMode = SINGLE_HOST
ReAuthentication = Disabled
QuietPeriod = 60
ServerTimeout = 30
SuppTimeout = 30
ReAuthPeriod = 3600 (Locally configured)
ReAuthMax = 2
MaxReq = 2
TxPeriod = 30
RateLimitPeriod = 0

Dot1x Authenticator Client List

Supplicant = 1000.0000.2e00
 Auth SM State = AUTHENTICATED
 Auth BEND SM Stat = IDLE
Port Status = AUTHORIZED

Authentication Method = Dot1x
Authorized By = Authentication Server
Vlan Policy = N/A

```

## Enabling IEEE 802.1x RADIUS Accounting: Example

This example shows how to specify the server with IP address 172.20.39.46 as the RADIUS server. The first command configures the RADIUS server, specifying port 1612 as the authorization port, 1813 as the UDP port for accounting, and rad123 as the encryption key:

```

Router# configure terminal
Router(config)# radius-server host 172.20.39.46 auth-port 1812 acct-port 1813 key rad123
Router(config)# aaa accounting dot1x default start-stop group radius
Router(config)# aaa accounting system default start-stop group radius
Router(config)# end
Router#

```

### Note

You must configure the RADIUS server to perform accounting tasks.

## Configuring IEEE 802.1x with Guest VLAN: Example

This example shows how to enable the guest VLAN feature and to specify VLAN 5 as a guest VLAN:

```

Router# configure terminal
Router(config)# interface gigabitethernet0/1
Router(config-if)# switchport mode access
Router(config-if)# dot1x pae authenticator
Router(config-if)# dot1x guest-vlan 5
Router(config-if)# dot1x port-control auto
Router(config-if)# end
Router#

```

## Configuring RADIUS-Provided Session Timeout: Example

This example assumes you have enabled IEEE 802.1x reauthentication and shows how to configure the switch port to derive the reauthentication period from the server and to verify the configuration:

```
Router# configure terminal
Router(config)# interface fastethernet7/1
Router(config-if)# switchport mode access
Router(config-if)# dot1x pae authenticator
Router(config-if)# dot1x timeout reauth-period server
Router(config-if)# end
Router#
```

## Configuring IEEE 802.1x with Voice VLAN: Example

This example shows how to enable IEEE 802.1x with voice VLAN feature on Fast Ethernet interface 5/9:

```
Router# configure terminal
Router(config)# interface fastethernet5/9
Router(config-if)# switchport access vlan 2
Router(config-if)# switchport mode access
Router(config-if)# switchport voice vlan 10
Router(config-if)# dot1x pae authenticator
Router(config-if)# dot1x port-control auto
Router(config-if)# end
Router(config)# end
Router#
```

## Displaying IEEE 802.1x Statistics and Status: Example

To display IEEE 802.1x statistics for all ports, use the **show dot1x all statistics** privileged EXEC command. To display IEEE 802.1x statistics for a specific port, use the **show dot1x statistics interface interface-id** privileged EXEC command.

To display the IEEE 802.1x administrative and operational status for the switch, use the **show dot1x all [details | statistics | summary]** privileged EXEC command. To display the IEEE 802.1x administrative and operational status for a specific port, use the **show dot1x interface interface-id** privileged EXEC command. For detailed information about the fields in these displays, see the command reference for this release.

This example shows the output of the **show dot1x all** command:

```
Router-871# show dot1x all

Sysauthcontrol Enabled
Dot1x Protocol Version 2

Dot1x Info for FastEthernet1

PAE = AUTHENTICATOR
PortControl = AUTO
ControlDirection = Both
HostMode = MULTI_HOST
ReAuthentication = Disabled
QuietPeriod = 60
ServerTimeout = 30
SuppTimeout = 30
ReAuthPeriod = 3600 (Locally configured)
```

```
ReAuthMax = 2
MaxReq = 2
TxPeriod = 30
RateLimitPeriod = 0
Router-871#
```

This example shows the output of the **show dot1x summary** command:

```
Router-871# show dot1x all summary
```

Interface	PAE	Client	Status
Fal	AUTH	000d.bcef.bfdc	AUTHORIZED

## Technical Assistance

Description	Link
The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies. Access to most tools on the Cisco Support website requires a Cisco.com user ID and password. If you have a valid service contract but do not have a user ID or password, you can register on Cisco.com.	<a href="http://www.cisco.com/techsupport">http://www.cisco.com/techsupport</a>

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Security Command Reference* at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*.

- **aaa accounting**
- **dot1x guest-vlan**
- **snmp-server enable traps**

# Feature Information for Configuring IEEE 802.1x Port-Based Authentication

Table 3 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.4(11)T or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

Table 3 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 3**      **Feature Information for Configuring IEEE 802.1x Port-Based Authentication**

Feature Name	Releases	Feature Information
IEEE 802.1x Authenticator	12.3(4)T	<p>This feature was introduced to prevent unauthorized devices (supplicants) from gaining access to the network.</p> <p>This feature is available on the following Cisco ISRs equipped with cards or modules that include switch ports:</p> <ul style="list-style-type: none"> <li>• Cisco 800 Series ISR</li> <li>• Cisco 870 Series ISR</li> <li>• Cisco 1800 Series ISR</li> <li>• Cisco 2800 Series ISR</li> <li>• Cisco 3800 Series ISR</li> </ul> <p>In Cisco IOS Release 12.4(11)T, this feature was modified to include the other features listed in <a href="#">Table 3</a>.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">IEEE 802.1x Authenticator, page 5</a></li> <li>• <a href="#">Enabling IEEE 802.1x and AAA on a Port: Example, page 18</a></li> </ul>
IEEE 802.1x RADIUS Accounting	12.4(11)T	<p>This feature relays important events to the RADIUS server (such as the supplicant's connection session). This information is used for security and billing purposes.</p> <p>In Cisco IOS Release 12.4(11)T, this feature was introduced on the following Cisco ISRs equipped with cards or modules that include switch ports:</p> <ul style="list-style-type: none"> <li>• Cisco 800 Series ISR</li> <li>• Cisco 870 Series ISR</li> <li>• Cisco 1800 Series ISR</li> <li>• Cisco 2800 Series ISR</li> <li>• Cisco 3800 Series ISR</li> </ul> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">IEEE 802.1x with RADIUS Accounting, page 9</a></li> <li>• <a href="#">Enabling IEEE 802.1x RADIUS Accounting: Example, page 19</a></li> </ul>

**Table 3**      **Feature Information for Configuring IEEE 802.1x Port-Based Authentication (continued)**

Feature Name	Releases	Feature Information
IEEE 802.1x—VLAN Assignment	12.4(11)T	<p>This feature allows the RADIUS server to send the VLAN assignment to configure the switch port.</p> <p>In Cisco IOS Release 12.4(11)T, this feature was introduced on the following Cisco ISRs equipped with cards or modules that include switch ports:</p> <ul style="list-style-type: none"> <li>• Cisco 800 Series ISR</li> <li>• Cisco 870 Series ISR</li> <li>• Cisco 1800 Series ISR</li> <li>• Cisco 2800 Series ISR</li> <li>• Cisco 3800 Series ISR</li> </ul> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">IEEE 802.1x Authentication with VLAN Assignment, page 13</a></li> <li>• <a href="#">Configuring VLAN Assignment, page 14</a></li> </ul>
IEEE 802.1x Guest VLAN	12.4(11)T	<p>This feature allows you to configure a guest VLAN for each IEEE 802.1x-capable switch port on the router to provide limited services to clients, such as downloading the IEEE 802.1x client.</p> <p>In Cisco IOS Release 12.4(11)T, this feature was introduced on the following Cisco ISRs equipped with cards or modules that include switch ports:</p> <ul style="list-style-type: none"> <li>• Cisco 800 Series ISR</li> <li>• Cisco 870 Series ISR</li> <li>• Cisco 1800 Series ISR</li> <li>• Cisco 2800 Series ISR</li> <li>• Cisco 3800 Series ISR</li> </ul> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">IEEE 802.1x Authentication with Guest VLAN, page 15</a></li> <li>• <a href="#">Configuring IEEE 802.1x with Guest VLAN: Example, page 19</a></li> </ul>

**Table 3**      **Feature Information for Configuring IEEE 802.1x Port-Based Authentication (continued)**

Feature Name	Releases	Feature Information
IEEE 802.1x RADIUS-Supplied Session Timeout	12.4(11)T	<p>This feature allows you to specify whether a switch port uses a locally configured or a RADIUS-provided reauthentication timeout.</p> <p>In Cisco IOS Release 12.4(11)T, this feature was introduced on the following Cisco ISRs equipped with cards or modules that include switch ports:</p> <ul style="list-style-type: none"><li>• Cisco 800 Series ISR</li><li>• Cisco 870 Series ISR</li><li>• Cisco 1800 Series ISR</li><li>• Cisco 2800 Series ISR</li><li>• Cisco 3800 Series ISR</li></ul> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"><li>• <a href="#">IEEE 802.1x with RADIUS-Supplied Session Timeout, page 15</a></li><li>• <a href="#">Configuring RADIUS-Provided Session Timeout: Example, page 20</a></li></ul>

**Table 3**      **Feature Information for Configuring IEEE 802.1x Port-Based Authentication (continued)**

Feature Name	Releases	Feature Information
IEEE 802.1x—Voice VLAN	12.4(11)T	<p>This feature allows you to configure a special access port associated with two VLAN identifiers:</p> <ul style="list-style-type: none"> <li>• Voice VLAN identifier (VVID) to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.</li> <li>• Port VLAN identifier (PVID) to carry the data traffic to and from the workstation connected to the router through the IP phone. The PVID is the native VLAN of the port.</li> </ul> <p>In Cisco IOS Release 12.4(11)T, this feature was introduced on the following Cisco ISRs equipped with cards or modules that include switch ports:</p> <ul style="list-style-type: none"> <li>• Cisco 800 Series ISR</li> <li>• Cisco 870 Series ISR</li> <li>• Cisco 1800 Series ISR</li> <li>• Cisco 2800 Series ISR</li> <li>• Cisco 3800 Series ISR</li> </ul> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">IEEE 802.1x Authentication with Voice VLAN Ports, page 16</a></li> <li>• <a href="#">Configuring IEEE 802.1x with Voice VLAN: Example, page 20</a></li> </ul>
IEEE 802.1x MIB Support	12.4(11)T	<p>This feature provides support for the following MIBs:</p> <ul style="list-style-type: none"> <li>• IEEE8021-PAE-MIB</li> <li>• Cisco-PAE-MIB</li> </ul> <p>In Cisco IOS Release 12.4(11)T, this feature was introduced on the following Cisco ISRs equipped with cards or modules that include switch ports:</p> <ul style="list-style-type: none"> <li>• Cisco 800 Series ISR</li> <li>• Cisco 870 Series ISR</li> <li>• Cisco 1800 Series ISR</li> <li>• Cisco 2800 Series ISR</li> <li>• Cisco 3800 Series ISR</li> </ul> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">IEEE 802.1x MIB Support, page 17</a></li> <li>• <a href="#">Enabling IEEE 802.1x SNMP Notifications, page 17</a></li> </ul>

# Glossary

**authentication server**—Entity that provides an authentication service to an authenticator. Typically, a RADIUS server operates as an authentication server, with RADIUS acting as a transport for EAP from the authenticator to the authentication server.

**authenticator**—Facilitates the authentication and granting of service to a supplicant. Typically, an authenticator transposes an EAP conversation from supplicant to authentication server. An authenticator is usually an EAP conduit, but is aware of the conversation.

**EAPOL**—Extensible Authentication Protocol over LAN. Primarily, IEEE 802.1x is an encapsulation definition for EAP over IEEE 802 media. The key protocol for the transport of an end-to-end EAP conversation via IEEE 802 media between a supplicant and an authenticator.

**IEEE 802.1x**—Authentication standard for port-based access control over any IEEE 802 or PPP media. Used primarily to identify users before allowing their traffic onto the network. IEEE 802.1x is a framework designed to address and provide port-based access control using authentication.

**supplicant**—Usually a laptop or other device that requires authentication or has to access service from a network point of attachment.

**Note**

See [Internetworking Terms and Acronyms](#) for terms not included in this glossary.

# Remote Site IEEE 802.1X Local Authentication Service

The Remote Site IEEE 802.1X Local Authentication Service feature provides the ability to configure an access point or wireless-aware router to act as a local RADIUS server. Configuring local authentication service provides a backup authentication service in the event of a WAN link or server failure.

## Feature History for the Remote Site IEEE 802.1X Local Authentication Service Feature

Release	Modification
12.2(11)JA	This feature was introduced on the Cisco IOS Release 12.2(11)JA on Cisco Aironet access points.
12.3(11)T	This feature was integrated into the Cisco IOS Release 12.3(11)T on the Cisco 2600XM, Cisco 2691, Cisco 2811, Cisco 2821, Cisco 2851, Cisco 3700 series, and Cisco 3800 series routers.

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Prerequisites for Configuring Remote Site IEEE 802.1X Local Authentication Service

Follow these guidelines when you configure an access point or wireless-aware router as a local authentication server:

- To prevent performance degradation, configure local authentication service on an access point or a wireless-aware router that does not have a high CPU load.
- Physically secure the access point or router to protect its configuration.

## Restrictions for Configuring Remote Site IEEE 802.1X Local Authentication Service

The following are restrictions of the local authentication service feature:

- The local authentication server does not synchronize its database with the main RADIUS servers. It is necessary to manually configure the local authentication server with client usernames and passwords.
- LEAP is the only supported authentication protocol.
- Although multiple local authentication servers can exist on one network, only one authentication server can be configured on any single device.

## Information About Configuring Remote Site IEEE 802.1x Local Authentication Service

On typical wireless LANs that use 802.1X authentication, access points and wireless-aware routers rely on remote site RADIUS servers to authenticate client devices. This authentication traffic must cross a WAN link. If the WAN link fails, or if the access points and routers cannot reach the RADIUS servers, then the client devices cannot access the wireless network even if their requirements for access are strictly local.

To provide for local authentication service or backup authentication service in the event of a WAN link or server failure, you can configure an access point or wireless-aware router to act as a local RADIUS server. The access point or wireless-aware router can authenticate Light Extensible Authentication Protocol (LEAP)-enabled wireless client devices and allow them to join your network.

Because the local authentication device does not synchronize its database with the main RADIUS servers, you must configure the local authentication server with client usernames and passwords. The local authentication server also permits you to specify a VLAN and a list of service set identifiers (SSIDs) that a client is allowed to use.

[Table 69](#) shows the maximum number of clients that can be configured on a local authentication server.

**Table 69**      *Maximum Number of Clients That Can be Configured on a Local Authentication Server*

Local Authentication Server	Maximum Number of Clients
Cisco Aironet Access Point 1100 and Cisco Aironet Access Point 1200	50
Cisco 2610XM, Cisco 2611XM routers	50
Cisco 2620XM, Cisco 2621XM routers	50
Cisco 2650XM, Cisco 2651XM routers	50
Cisco 2691 routers	100
Cisco 2811 routers	100
Cisco 2821 routers	100
Cisco 2851 routers	200
Cisco 3725 routers	250
Cisco 3745 routers	500
Cisco 3825 routers	500
Cisco 3845 routers	1000

**Note**

Users that are associated to the local authentication server might notice a drop in performance during authentication of client devices. However, if your wireless LAN contains only one access point, you can configure that device as both the 802.1X authenticator and the local authentication server.

You configure access points and routers to use the local authentication server when they cannot reach the main servers or when a RADIUS server is not available.

The access points and wireless-aware routers stop using the local authentication server automatically when the link to the main servers is restored.

If your local authentication server also serves client devices, you must enter the local authentication server access point or router as a network access server (NAS). When a LEAP client associates to the local authentication server access point, the access point uses itself to authenticate the client.

**Caution**

The access point or wireless-aware router that you use as an authentication server contains detailed authentication information about your wireless LAN, so you should secure it physically to protect its configuration.

## How to Configure Remote Site IEEE 802.1X Local Authentication Service

This section contains the following procedures:

- [Configuring the Local Authentication Server, page 4](#) (required)

- [Configuring User Groups on the Local Authentication Server, page 5](#) (optional)
- [Creating the User List on the Local Authentication Server, page 6](#) (required)
- [Saving the Configuration on the Local Authentication Server, page 6](#) (optional)
- [Configuring Access Points or Routers to Use the Local Authentication Server, page 7](#) (required)

## Configuring the Local Authentication Server

Perform this task to configure the access point as a local authentication server.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **radius-server local**
5. **nas ip-address key shared-key**

### DETAILED STEPS

	Command	Purpose
Step 1	Router> <b>enable</b>	Enables privileged EXEC mode.
Step 2	Router# <b>configure terminal</b>	Enters global configuration mode.
Step 3	Router(config)# <b>aaa new-model</b>	Enables AAA.
Step 4	Router(config)# <b>radius-server local</b>	Enables the access point or router as a local authentication server and enters configuration mode for the authentication server.
Step 5	Router(config-radsrv)# <b>nas ip-address key shared-key</b>	<p>Adds an access point or wireless domain services (WDS) device to the list of units that use the local authentication server. Enter the IP address of the access point or WDS device, and the shared key used to authenticate communication between the local authentication server and other access points. You must enter this shared key on the WDS devices that use the local authentication server. Each access point and candidate WDS that uses the local authentication server is a network access server (NAS).</p> <p>If an access point is the local authentication server that also serves client devices, you must enter the local authentication server access point as a NAS.</p> <p><b>Note</b> Leading spaces in the key string are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</p> <p>Repeat this step to add each access point and candidate WDS device that uses the local authentication server.</p>

## Configuring User Groups on the Local Authentication Server

Perform this optional task (beginning in local RADIUS server configuration mode) to configure user groups on the local authentication server.

### Note

If you do not wish to configure user groups on the local authentication server, skip this task and go to the [“Creating the User List on the Local Authentication Server”](#) section on page 6.

### SUMMARY STEPS

1. **group** *group-name*
2. **vlan** *vlan*
3. **ssid** *ssid*
4. **reauthentication time** *seconds*
5. **block count** *count* **time** {*seconds* | **infinite**}
6. **exit**

### DETAILED STEPS

	Command	Purpose
Step 1	Router(config-radsrv) # <b>group</b> <i>group-name</i>	Enters user group configuration mode and configures a user group to which you can assign shared settings.
Step 2	Router(config-radsrv-group) # <b>vlan</b> <i>vlan</i>	(Optional) Specifies a VLAN to be used by members of the user group. The access point moves group members into that VLAN, overriding other VLAN assignments. You can assign only one VLAN to the group.
Step 3	Router(config-radsrv-group) # <b>ssid</b> <i>ssid</i>	(Optional) Enters up to 20 service set identifiers (SSIDs) to limit members of the user group to those SSIDs. The access point checks whether the client's SSID matches an SSID in the list. If the SSID does not match, the client is disassociated.
Step 4	Router(config-radsrv-group) # <b>reauthentication time</b> <i>seconds</i>	(Optional) Configures the number of seconds after which access points should reauthenticate members of the group. The reauthentication provides users with a new encryption key. The default setting is 0, which means that group members are never required to reauthenticate.
Step 5	Router(config-radsrv-group) # <b>block count</b> <i>count</i> <b>time</b> { <i>seconds</i>   <b>infinite</b> }	(Optional) To help protect against password-guessing attacks, you can lock out group members for a length of time after a set number of incorrect passwords. <ul style="list-style-type: none"> <li>Count—The number of failed passwords that triggers a lockout of the username.</li> <li>Time—The number of seconds that the lockout should last. If you enter <b>infinite</b>, an administrator must manually unblock the locked username. For more information, see the <a href="#">“Unlocking Usernames”</a> section on page 6.</li> </ul>
Step 6	Router(config-radsrv-group) # <b>exit</b>	Returns to authenticator configuration mode.

## Unblocking Usernames

You can unblock usernames before the lockout time expires or when the lockout time is set to infinite. To unblock a locked username, enter the following command in privileged EXEC mode on the local authentication server.

```
Router# clear radius local-server user username
```

## Creating the User List on the Local Authentication Server

Perform the required task described in the following paragraphs to create a user list on the local authentication server and to configure the users that are allowed to authenticate using the local authentication server.

### Note

If you do not wish to configure users on the local authentication server, skip this task and go to the [“Saving the Configuration on the Local Authentication Server” section on page 6](#).

You must enter a username and password for each user. If you know only the NT hash value of the password, which you can often find in the authentication server database, you can enter the NT hash as a string of hexadecimal digits.

To add the user to a user group, enter the group name. If you do not specify a group, the user is not assigned to a specific VLAN and is never forced to reauthenticate.

Beginning in local RADIUS server configuration mode, enter the **user** command for each username:

```
Router(config-radsrv)# user username {password | nthash} password [group group-name]
```

## Saving the Configuration on the Local Authentication Server

Perform this optional task to save the current configuration.

### SUMMARY STEPS

1. **end**
2. **copy running-config startup-config**

### DETAILED STEPS

	Command	Purpose
Step 1	Router(config-radsrv)# <b>end</b>	Returns to privileged EXEC mode.
Step 2	Router# <b>copy running-config startup-config</b>	Saves your entries in the configuration file.

## Configuring Access Points or Routers to Use the Local Authentication Server

Perform this required task to add the local authentication server to the list of servers on the client access point or wireless-aware router.

**Note**

If your local authentication server access point also serves client devices, you must configure the local authentication server to use itself to authenticate client devices.

On the wireless devices that use the local authentication server, use the **radius-server host** command in privileged EXEC mode to enter the local authentication server as a RADIUS server. The order in which the devices attempt to use the servers matches the order in which you enter the servers in the device configuration. If you are configuring the device to use a RADIUS server for the first time, enter the main RADIUS servers first, and enter the local authentication server last.

**Note**

You must enter **1812** as the authentication port and **1813** as the accounting port. The local authentication server listens on User Datagram Protocol (UDP) port 1813 for RADIUS accounting packets. It discards the accounting packets but sends acknowledge packets back to the RADIUS clients to prevent the clients from reacting as though the server is down.

Use the **radius-server deadtime** command in global configuration mode to set an interval during which the access point or router does not attempt to use servers that do not respond, thus avoiding the wait for a request to time out before trying the next configured server. A server marked as dead is skipped by additional requests for the duration of minutes that you specify, up to 1440 (24 hours).

To remove the local authentication server from the access point or router configuration, use the **no radius-server host** command in global configuration mode.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **radius-server host** {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]
5. **aaa group server** {radius | tacacs+} group-name
6. **server ip-address auth-port 1812 acct-port 1813**
7. **aaa authentication login** named-authentication-list
8. **end**
9. **show running-config**
10. **copy running-config startup-config**

## DETAILED STEPS

	Command	Purpose
Step 1	Router> <b>enable</b>	Enables privileged EXEC mode.
Step 2	Router# <b>configure terminal</b>	Enters global configuration mode.
Step 3	Router(config)# <b>aaa new-model</b>	Enables authentication, authorization, and accounting (AAA). This step must be configured before the rest of the AAA configuration steps.
Step 4	Router(config)# <b>radius-server host</b> {hostname   ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]	<p>Specifies the IP address or hostname of the remote RADIUS server host.</p> <ul style="list-style-type: none"> <li>• (Optional) For <b>auth-port port-number</b>, specify the UDP destination port for authentication requests.</li> <li>• (Optional) For <b>acct-port port-number</b>, specify the UDP destination port for accounting requests.</li> <li>• (Optional) For <b>timeout seconds</b>, specify the time interval that the access point waits for the RADIUS server to reply before retransmitting. The range is 1 to 1000. This setting overrides the setting made using the <b>radius-server timeout</b> command in global configuration mode. If no timeout is set with the <b>radius-server host</b> command, the setting made using the <b>radius-server timeout</b> command is used.</li> <li>• (Optional) For <b>retransmit retries</b>, specify the number of times that a RADIUS request is re-sent to a server if that server is not responding or is responding slowly. The range is 1 to 1000. If no retransmit value is set using the <b>radius-server host</b> command, the setting made using the <b>radius-server retransmit</b> command in global configuration command mode is used.</li> <li>• (Optional) For <b>key string</b>, specify the authentication and encryption key used between the access point and the RADIUS daemon running on the RADIUS server.</li> </ul> <p><b>Note</b> The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the <b>radius-server host</b> command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</p> <p>To configure the access point to recognize more than one host entry associated with a single IP address, enter this command as many times as necessary, making sure to use a different UDP port number for each host. The access point software searches for hosts in the order in which you specify them. Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host.</p>
Step 5	<b>aaa group server</b> {radius   tacacs+} group-name	Defines the AAA server-group with a group name.
Step 6	Router(config-sg-radius)# <b>server ip-address auth-port 1812 acct-port 1813</b>	Defines the AAA server IP address, authentication port, and accounting port.
Step 7	Router(config)# <b>aaa authentication login named-authentication-list</b>	Creates an authentication method list for the server group.

	Command	Purpose
Step 8	Router(config)# <b>end</b>	Returns to privileged EXEC mode.
Step 9	Router# <b>show running-config</b>	Displays the current configuration for your verification.
Step 10	Router# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Verifying the Configuration for Local Authentication Service

Use the **show running-config** command in global configuration mode to verify the current configuration for local authentication service.

### SUMMARY STEPS

1. **enable**
2. **show running-config**

### DETAILED STEPS

	Command	Purpose
Step 1	Router> <b>enable</b>	Enables privileged EXEC mode.
Step 2	Router# <b>show running-config</b>	Displays the current access point operating configuration

## Monitoring and Maintaining 802.1X Local Authentication Service

To view statistics collected by the local authentication server, enter the following command in privileged EXEC mode:

```
Router# show radius local-server statistics
```

To reset local authentication server statistics to zero, enter the following command in privileged EXEC mode:

```
Router# clear radius local-server statistics
```

## Configuration Examples for Remote Site IEEE 802.1X Local Authentication Service

This section provides the following configuration examples:

- [Setting Up a Local Authentication Server: Example](#)
- [Setting Up Two Main Servers and a Local Authentication Server: Example](#)
- [Displaying Local Authentication Server Configuration: Example](#)
- [Displaying Local Authentication Server Statistics: Example](#)

## Setting Up a Local Authentication Server: Example

This example shows how to set up a local authentication server used by three access points with three user groups and several users:

```
AP# configure terminal
AP(config)# aaa new-model
AP(config)# aaa group server radius RADIUS_SERVER_GROUP
AP(config-sg-radius)# server 10.0.0.1 auth-port 1812 acct-port 1813
AP(config)# aaa authentication login RADIUS_METHOD_LIST
AP(config)# radius-server host 10.0.0.1 auth-port 1812 acct-port 1813 key 110337
AP(config)# radius-server local
AP(config-radsrv)# nas 10.91.6.159 key 110337
AP(config-radsrv)# nas 10.91.6.162 key 110337
AP(config-radsrv)# nas 10.91.6.181 key 110337
AP(config-radsrv)# group clerks
AP(config-radsrv-group)# vlan 87
AP(config-radsrv-group)# ssid batman
AP(config-radsrv-group)# ssid robin
AP(config-radsrv-group)# reauthentication time 1800
AP(config-radsrv-group)# block count 2 time 600
AP(config-radsrv-group)# group cashiers
AP(config-radsrv-group)# vlan 97
AP(config-radsrv-group)# ssid deer
AP(config-radsrv-group)# ssid antelope
AP(config-radsrv-group)# ssid elk
AP(config-radsrv-group)# reauthentication time 1800
AP(config-radsrv-group)# block count 2 time 600
AP(config-radsrv-group)# group managers
AP(config-radsrv-group)# vlan 77
AP(config-radsrv-group)# ssid mouse
AP(config-radsrv-group)# ssid chipmunk
AP(config-radsrv-group)# reauthentication time 1800
AP(config-radsrv-group)# block count 2 time 600
AP(config-radsrv-group)# exit
AP(config-radsrv)# user jsmith password twain74 group clerks
AP(config-radsrv)# user stpatrick password snake100 group clerks
AP(config-radsrv)# user nick password uptown group clerks
AP(config-radsrv)# user sam password rover32 group cashiers
AP(config-radsrv)# user patsy password crowder group cashiers
AP(config-radsrv)# user carl password 272165 group managers
AP(config-radsrv)# user vic password lid178 group managers
AP(config-radsrv)# end
```

## Setting Up Two Main Servers and a Local Authentication Server: Example

This example shows how to set up two main servers and a local authentication server with a server deadline of 10 minutes:

```
Router(config)# aaa new-model
Router(config)# aaa group server radius RADIUS_SERVER_GROUP
Router(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Router(config-sg-radius)# server 172.10.0.1 auth-port 1645 acct-port 1646
Router(config-sg-radius)# server 10.91.6.151 auth-port 1812 acct-port 1813
Router(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001 key 77654
Router(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646 key 77654
Router(config)# radius-server host 10.91.6.151 auth-port 1812 acct-port 1813 key 110337
Router(config)# radius-server deadline 10
```

In this example, if the WAN link to the main servers fails, the access point or wireless-aware router completes these steps when a LEAP-enabled client device associates:

1. It tries the first server, times out multiple times, and marks the first server as dead.
2. It tries the second server, times out multiple times, and marks the second server as dead.
3. It tries and succeeds using the local authentication server.

If another client device needs to authenticate during the 10-minute deadtime interval, the access point skips the first two servers and tries the local authentication server first. After the deadtime interval, the access point tries to use the main servers for authentication. When setting a deadtime, you must balance the need to skip dead servers with the need to check the WAN link and begin using the main servers again as soon as possible.

Each time an access point or wireless-aware router tries to use the main servers while they are down, the client device that is trying to authenticate might report an authentication timeout. The client device retries and succeeds when the main servers time out and the access point or wireless-aware router tries the local authentication server. You can extend the timeout value on Cisco client devices to accommodate expected server timeouts.

## Displaying Local Authentication Server Configuration: Example

The following is sample output for configuration of a local authentication server on the Cisco 2621 router.

```
2621-1# show run

## Displaying Local Authentication Server Statistics: Example

The following is sample output for configuration for the **show radius local-server statistics** command:

```
router-2621-1# show radius local-server statistics
Successes : 11262 Unknown usernames : 0
Client blocks : 0 Invalid passwords : 8
Unknown NAS : 0 Invalid packet from NAS: 0

NAS : 10.0.0.1
Successes : 11262 Unknown usernames : 0
Client blocks : 0 Invalid passwords : 8
Corrupted packet : 0 Unknown RADIUS message : 0
No username attribute : 0 Missing auth attribute : 0
Shared key mismatch : 0 Invalid state attribute: 0
Unknown EAP message : 0 Unknown EAP auth type : 0

Maximum number of configurable users: 50, current user count: 11
Username Successes Failures Blocks
vayu-ap-1 2235 0 0
vayu-ap-2 2235 0 0
vayu-ap-3 2246 0 0
vayu-ap-4 2247 0 0
vayu-ap-5 2247 0 0
vayu-11 3 0 0
vayu-12 5 0 0
vayu-13 5 0 0
vayu-14 30 0 0
vayu-15 3 0 0
scm-test 1 8 0

router-2621-1#
```

The first section shows cumulative statistics from the local authentication server. The second section shows statistics for each access point (NAS) that is authorized to use the local authentication server. The third section shows statistics for individual users. If a user is blocked and the lockout time is set to infinite, *Blocked* appears at the end of the line of statistics for that user. If the lockout time is not set to infinite, *Unblocked in x seconds* appears at the end of the statistics line for that user.

## MIBs

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

<http://tools.cisco.com/ITDIT/MIBS/servlet/index>

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

# VPN Access Control Using 802.1X Authentication

---

**First Published: August 11, 2003**

**Last Updated: June 2, 2006**

The home access router provides connectivity to the corporate network via a Virtual Private Network (VPN) tunnel through the Internet. In the home LAN, apart from the employee, other members of the household may also be using the same access router. The VPN Access Control Using 802.1X Authentication feature allows enterprise employees to access their enterprise networks from home while allowing other household members to access only the Internet. The feature uses the IEEE 802.1X protocol framework to achieve the VPN access control. The authenticated employee has access to the VPN tunnel and others (unauthenticated users on the same LAN) have access only to the Internet.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for VPN Access Control Using 802.1X Authentication”](#) section on [page 33](#).

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

- [Command Reference, page 32](#)
- [Feature Information for VPN Access Control Using 802.1X Authentication, page 33](#)

## Prerequisites for VPN Access Control Using 802.1X Authentication

- The PCs connecting behind the router should have 802.1X clients running on them.
- You should know how to configure authentication, authorization, and accounting (AAA) and RADIUS.
- You should be familiar with IP Security (IPSec).
- You should be familiar with Dynamic Host Configuration Protocol (DHCP).
- You should know how to configure user lists on a Cisco access control server (ACS).

## Restrictions for VPN Access Control Using 802.1X Authentication

- Easy VPN is not supported.
- VLAN interfaces are currently not supported.
- If there is a switch located between the router and the supplicant (client PC), the Extensible Authentication Protocol over LAN (EAPOL) frames will not reach the router because the switch discards them.

## Information About VPN Access Control Using 802.1X Authentication

To configure the VPN Access Control Using 802.1X Authentication feature, you should understand the following concepts:

- [How VPN Control Using 802.1X Authentication Works, page 2](#)
- [802.1X Supplicant Support, page 4](#)
- [Authentication Using Passwords and MD5, page 5](#)

## How VPN Control Using 802.1X Authentication Works

The home access router provides connectivity to the corporate network via a VPN tunnel through the Internet. In the home LAN, both authenticated (employee) and unauthenticated (other household members) users exist, and both have access to the corporate VPN tunnel. Currently there is no existing mechanism to prevent the unauthenticated user from accessing the VPN tunnel.

To distinguish between the users, the VPN Access Control Using 802.1X Authentication feature uses the IEEE 802.1X protocol that allows end hosts to send user credentials on Layer 2 of the network operating system. Unauthenticated traffic users will be allowed to pass through the Internet but will be blocked from accessing the corporate VPN tunnel. The VPN Access Control Using 802.1X feature expands the scope of the 802.1X standard to authenticate devices rather than ports, meaning that multiple devices can be independently authenticated for any given port. This feature separates traffic from authenticated and unauthenticated users so that separate access policies can be applied.

When an 802.1X-capable host starts up, it will initiate the authentication phase by sending the EAPOL-Start 802.1X protocol data unit (PDU) to the reserved IEEE multicast MAC address (01-80-C2-00-00-03) with the Ethernet type or length set to 0x888E.

All 802.1X PDUs will be identified as such by the Ethernet driver and will be enqueued to be handled by an 802.1X process. On some platforms, Ethernet drivers have to program the interface address filter so that EAPOL packets can be accepted.

On the router, the receipt of the EAPOL-Start message will result in the source MAC address being “remembered,” and an EAPOL-request or identity PDU being sent to the host. The router will send all host-addressed PDUs to the individual MAC address of the host rather than to the multicast address.

## 802.1X Authentication Sample Topology and Configuration

Figure 1 illustrates a typical scenario in which VPN access control using 802.1X authentication is in place.

**Figure 1** Typical 802.1X Authentication Setup

In Figure 1, all the PCs are 802.1X capable hosts, and the Cisco router is an authenticator. All the PCs are connected to the built-in hub or to an external hub. If a PC does not support 802.1X authentication, MAC-based authentication is supported on the Cisco router.

### Note

- You can have any kind of connectivity or network beyond the Cisco router WAN.
- If there is a switch located between the router and the supplicant (client PC), the EAPOL frames will not reach the router because the switch discards them.
- A supplicant is an entity at one end of a point-to-point LAN segment that is being authenticated by an authenticator that is attached to the other end of that link.

## Converged 802.1X Authenticator Support

The Cisco IOS commands in Cisco IOS Release 12.4(6)T for 802.1X authenticators have been standardized to work the same way on various Cisco IOS platforms.

## 802.1X Supplicant Support

There are deployment scenarios in which a network device (a router acting as an 802.1X authenticator) is placed in an unsecured location and cannot be trusted as an authenticator. This scenario requires that a network device be able to authenticate itself against another network device. The 802.1X supplicant support functionality provides the following solutions for this requirement:

- An Extensible Authentication Protocol (EAP) framework has been included so that the supplicant has the ability to “understand” and “respond” to EAP requests. EAP-Message Digest 5 (EAP-MD5) is currently supported.
- Two network devices that are connected through an Ethernet link can act as a supplicant and as an authenticator simultaneously, thus providing mutual authentication capability.
- A network device that is acting as a supplicant can authenticate itself with more than one authenticator (that is, a single port on a supplicant can be connected to multiple authenticators).

The following illustration is an example of 802.1X supplicant support. The illustration shows that a single supplicant port has been connected to multiple authenticators. Router A is acting as an authenticator to devices that are sitting behind it on the LAN while those devices are acting as supplicants. At the same time, Router B is an authenticator to Router A (which is acting as a supplicant). The RADIUS server is located in the enterprise network.

When Router A tries to authenticate devices on the LAN, it needs to “talk” to the RADIUS server, but before it can allow access to any of the devices that are sitting behind it, it has to prove its identity to Router B. Router B checks the credential of Router A and gives access.

**Figure 2** Multiple Instances of Supplicant Support

121307

## Converged 802.1X Supplicant Support

The Cisco IOS commands in Cisco IOS Release 12.4(6)T for 802.1X supplicants have been standardized to work the same way on various Cisco IOS platforms.

## Authentication Using Passwords and MD5

For information about using passwords and Message Digest 5 (MD5), see the following document on Cisco.com:

- [Improving Security on Cisco Routers](#)

## How to Configure VPN Access Control Using 802.1X Authentication

This section includes the following procedures:

- [Configuring an AAA RADIUS Server, page 5](#)
- [Configuring a Router, page 5](#)
- [Configuring a PC, page 19](#)
- [Monitoring VPN Access Control Using 802.1X Authentication, page 21](#)
- [Verifying VPN Access Control Using 802.1X Authentication, page 23](#)

### Configuring an AAA RADIUS Server

To configure an AAA RADIUS server, perform the following steps.

- 
- |               |                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>Configure entries for the network access server and associated shared secrets.</b>                              |
|               | <b>Note</b> The AAA server can be FreeRADIUS or Cisco Secure ACS or any other similar product with 802.1X support. |
| <b>Step 2</b> | <b>Add the username and configure the password of the user.</b>                                                    |
| <b>Step 3</b> | <b>Configure a global or per-user authentication scheme.</b>                                                       |
- 

### Configuring a Router

This section contains the following procedures:

- [Enabling 802.1X Authentication, page 6](#) (required)
- [Configuring Router and RADIUS Communication, page 7](#) (required)
- [Configuring 802.1X Parameters \(Retransmissions and Timeouts\), page 8](#) (optional)
- [Configuring the Identity Profile, page 11](#) (required)
- [Configuring the Virtual Template and DHCP, page 12](#) (required)
- [Configuring the Necessary Access Control Policies, page 17](#) (optional)
- [Configuring a Router As a Supplicant, page 17](#) (optional)

## Enabling 802.1X Authentication

To enable 802.1X port-based authentication, you should configure the router so that it can communicate with the AAA server, enable 802.1X globally, and enable 802.1X on the interface. To enable 802.1X port-based authentication, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication dot1x default group radius**
5. **dot1x system-auth-control**
6. **identity profile default**
7. **interface type slot/port**
8. **dot1x port-control auto**

### DETAILED STEPS

	Command	Description
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>aaa new-model</b>  <b>Example:</b> Router (config)# aaa new-model	Enables AAA.
Step 4	<b>aaa authentication dot1x default group radius</b>  <b>Example:</b> Router (config)# aaa authentication dot1x default group radius	Creates an 802.1X port-based authentication method list.
Step 5	<b>dot1x system-auth-control</b>  <b>Example:</b> Router (config)# dot1x system-auth-control	Globally enables 802.1X port-based authentication.
Step 6	<b>identity profile default</b>  <b>Example:</b> Router (config)# identity profile default	Creates an identity profile and enters dot1x profile configuration mode.

	Command	Description
Step 7	<b>interface</b> <i>type slot/port</i>  <b>Example:</b> Router (config)# interface fastethernet 5/1	Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.
Step 8	<b>dot1x port-control auto</b>  <b>Example:</b> Router (config-if)# dot1x port-control auto	Enables 802.1X port-based authentication on the interface.

## Example

This section provides the following examples:

- [802.1X Configuration](#)
- [Verifying 802.1X Authentication](#)

### 802.1X Configuration

The following example shows that 802.1X authentication has been configured on a router:

```
Router# configure terminal
Router(config)# aaa new-model
Router(config)# aaa authentication dot1x default group radius
Router(config)# dot1x system-auth-control
Router(config)# interface fastethernet 5/1
Router(config-if)# dot1x port-control auto
```

### Verifying 802.1X Authentication

The following **show dot1x** command sample output shows that 802.1X authentication has been configured on a router:

```
Router# show dot1x all

PortControl = AUTO
ReAuthentication = Disabled
ReAuthPeriod = 3600 Seconds
ServerTimeout = 30 Seconds
SuppTimeout = 30 Seconds
QuietWhile = 120 Seconds
MaxReq = 2
```

## Configuring Router and RADIUS Communication

To configure RADIUS server parameters, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip radius source-interface** *interface-name*
4. **radius-server host** {*hostname* | *ip-address*}
5. **radius-server key** *string*

## DETAILED STEPS

	Command	Description
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>ip radius source-interface</b> <i>interface-name</i>  <b>Example:</b> Router (config)# ip radius source-interface ethernet1	Forces RADIUS to use the IP address of a specified interface for all outgoing RADIUS packets.
Step 4	<b>radius-server host</b> ( <i>hostname</i>   <i>ip-address</i> )  <b>Example:</b> Router (config)# radius-server host 172.16.39.46	Configures the RADIUS server host name or IP address of the router. <ul style="list-style-type: none"><li>To use multiple RADIUS servers, reenter this command for each server.</li></ul>
Step 5	<b>radius-server key</b> <i>string</i>  <b>Example:</b> Router (config)# radius-server key radiuskey	Configures the authorization and encryption key used between the router and the RADIUS daemon running on the RADIUS server. <ul style="list-style-type: none"><li>The key is a text string that must match the encryption key used on the RADIUS server.</li></ul>

## Example

The following example shows that RADIUS server parameters have been configured on the router:

```
Router# configure terminal
Router(config)# ip radius source-interface ethernet1
Router(config)# radius-server host 172.16.39.46
Router(config)# radius-server key radiuskey
```

## Configuring 802.1X Parameters (Retransmissions and Timeouts)

Various 802.1X retransmission and timeout parameters can be configured. Because all of these parameters have default values, configuring them is optional. To configuring the retransmission and timeout parameters, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **dot1x max-req** *number-of-retries*

5. **dot1x port-control** [auto | force-authorized | force-unauthorized]
6. **dot1x control-direction** {both | in}
7. **dot1x reauthentication**
8. **dot1x timeout tx-period** *seconds*
9. **dot1x timeout server-timeout** *seconds*
10. **dot1x timeout reauth-period** *seconds*
11. **dot1x timeout quiet-period** *seconds*
12. **dot1x timeout ratelimit-period** *seconds*

## DETAILED STEPS

	Command	Description
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface</b> <i>type slot/port</i>  <b>Example:</b> Router (config)# interface ethernet 0/1	Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.
Step 4	<b>dot1x max-req</b> <i>number-of-retries</i>  <b>Example:</b> Router (config-if)# dot1x max-req 3	Sets the maximum number of times that the router sends an EAP request/identity frame (assuming that no response is received) to the supplicant before concluding that the supplicant does not support 802.1X.
Step 5	<b>dot1x port-control</b> [auto   force-authorized   force-unauthorized]  <b>Example:</b> Router (config-if)# dot1x port-control auto	Sets the port control value. <ul style="list-style-type: none"> <li><b>auto (optional)</b>—Authentication status of the supplicant will be determined by the authentication process.</li> <li><b>force-authorized (optional)</b>—All the supplicants on the interface will be authorized. The <b>force-authorized</b> keyword is the default.</li> <li><b>force-unauthorized (optional)</b>—All the supplicants on the interface will be unauthorized.</li> </ul>
Step 6	<b>dot1x control-direction</b> {both   in}  <b>Example:</b> Router (config-if)# dot1x control-direction both	Changes the port control to unidirectional or bidirectional.

	Command	Description
Step 7	<b>dot1x reauthentication</b>  <b>Example:</b> Router (config-if)# dot1x reauthentication	Enables periodic reauthentication of the supplicants on the interface.  <ul style="list-style-type: none"> <li>The reauthentication period can be set using the <b>dot1x timeout</b> command.</li> </ul>
Step 8	<b>dot1x timeout tx-period</b> <i>seconds</i>  <b>Example:</b> Router (config-if)# dot1x timeout tx-period 60	Sets the timeout for supplicant retries.  <ul style="list-style-type: none"> <li>If an 802.1X packet is sent to the supplicant and the supplicant does not send a response, the packet will be sent again after the time that was set using the <i>seconds</i> argument.</li> <li>The value is 1 through 65535 seconds. The default is 30 seconds.</li> </ul>
Step 9	<b>dot1x timeout server-timeout</b> <i>seconds</i>  <b>Example:</b> Router (config-if)# dot1x timeout server-timeout 60	Sets the timeout for RADIUS retries.  <ul style="list-style-type: none"> <li>If an 802.1X packet is sent to the server, and the server does not send a response, the packet will be sent again after the time that was set using the <i>seconds</i> argument.</li> <li>The value is from 1 to 65535 seconds. The default is 30 seconds.</li> </ul>
Step 10	<b>dot1x timeout reauth-period</b> <i>seconds</i>  <b>Example:</b> Router (config-if)# dot1x timeout reauth-period 1800	Sets the time after which an automatic reauthentication should be initiated.  <ul style="list-style-type: none"> <li>The value is from 1 to 65535 seconds. The default is 3600 seconds.</li> </ul>
Step 11	<b>dot1x timeout quiet-period</b> <i>seconds</i>  <b>Example:</b> Router (config-if)# dot1x timeout quiet-period 600	The time after which authentication is restarted after the authentication has failed.  <ul style="list-style-type: none"> <li>The value is from 1 to 65535 seconds. The default is 120 seconds.</li> </ul>
Step 12	<b>dot1x timeout ratelimit-period</b> <i>seconds</i>  <b>Example:</b> Router (config-if)# dot1x timeout ratelimit-period 60	The rate limit period throttles the EAP-START packets from misbehaving supplicants.  <ul style="list-style-type: none"> <li>The value is from 1 to 65535 seconds.</li> </ul>

## Example

The following configuration example shows that various retransmission and timeout parameters have been configured:

```
Router# configure terminal
Router(config)# interface ethernet 0
Router(config-if)# dot1x port-control auto
Router(config-if)# dot1x reauthentication
Router(config-if)# dot1x timeout reauth-period 1800
Router(config-if)# dot1x timeout quiet-period 600
Router(config-if)# dot1x timeout supp-timeout 60
Router(config-if)# dot1x timeout server-timeout 60
```

## Configuring the Identity Profile

The **identity profile default** command allows you to configure the static MAC addresses of the client that do not support 802.1X and to authorize or unauthorize them statically. The VPN Access Control Using 802.1X Authentication feature allows authenticated and unauthenticated users to be mapped to different interfaces. Under the **dot1x profile** configuration mode, you can specify the virtual template interface that should be used to create the virtual-access interface to which unauthenticated supplicants will be mapped. To specify which virtual template interface should be used to create the virtual access interface, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **identity profile default**
4. **description** text *line-of-description*
5. **template** *virtual-template*
6. **device** [authorize | not-authorize] mac-address *mac-address*
7. **device authorize** type *device-type*

### DETAILED STEPS

	Command	Description
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>identity profile default</b>  <b>Example:</b> Router (config)# identity profile default	Creates an identity profile and enters identity profile configuration mode.
Step 4	<b>description</b> <i>line-of-description</i>  <b>Example:</b> Router (config-identity-prof)# description description 1	Associates descriptive text with the profile.
Step 5	<b>template</b> <i>virtual-template</i>  <b>Example:</b> Router (config-identity-prof)# template virtual-template 1	Specifies the virtual template interface that will serve as the configuration clone source for the virtual interface that is dynamically created for authenticated users.

	Command	Description
Step 6	<b>device</b> [ <b>authorize</b>   <b>not-authorize</b> ] <b>mac-address</b> <i>mac-address</i>  <b>Example:</b> Router (config-identity-prof)# <b>device authorize</b> <b>mac-address</b> <i>mac-address</i> H.H.H	Statically authorizes or unauthorizes a supplicant (by giving its MAC address) if the supplicant does not “understand” 802.1X.
Step 7	<b>device authorize type</b> <i>device-type</i>  <b>Example:</b> Router (config-identity-prof)# <b>device authorize type</b> <b>cisco ip phone</b>	Statically authorizes or unauthorizes a device type.

### Example

The following example shows that Cisco IP phones and a specific MAC address have been statically authorized:

```
Router# configure terminal
Router (config)# identity profile default
Router(config-lx-prof)# description put the description here
Router(config-lx-prof)# template virtual-template1
Router(config-lx-prof)# device authorize type cisco ip phone
Router(config-lx-prof)# device authorize mac-address 0001.024B.B4E7
```

## Configuring the Virtual Template and DHCP

The VPN Access Control Using 802.1X Authentication feature can be configured with one DHCP pool or two. If there are two pools, the unauthenticated and authenticated devices will get their addresses from separate DHCP pools. For example, the public pool can have an address block that has only local significance, and the private pool can have an address that is routable over the VPN tunnel. To configure your router for a private pool and for a public pool, perform the following steps.

### SUMMARY STEPS

#### Configuring the Identity Profile

1. **enable**
2. **configure terminal**
3. **identity profile default**
4. **description** *description-string*
5. **template** *virtual-template*
6. **exit**

#### Configuring the DHCP Private Pool

1. **ip dhcp pool** *name*
2. **network** *network-number* [*mask*]
3. **default-router** *address*

**Configuring the DHCP Public Pool**

1. **ip dhcp pool** *name*
2. **network** *network-number* [*mask*]
3. **default-router** *address*
4. **exit**

**Configuring the Interface**

1. **configure terminal**
2. **interface** *type slot/port*
3. **ip address** *ip-address mask* [*secondary*]
4. **interface virtual-template** *number*
5. **ip address** *ip-address mask* [*secondary*]
6. **exit**

**Configuring an Interface Without Assigning an Explicit IP Address to the Interface**

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **ip unnumbered** *type number*

**DETAILED STEPS****Configuring the Identity Profile**

	Command	Description
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>identity profile default</b>  <b>Example:</b> Router (config)# identity profile default	Creates an identity profile and enters identity profile configuration mode.
Step 4	<b>description</b> <i>description-string</i>  <b>Example:</b> Router (config-identity-prof)# description description_string_goes_here	Associates descriptive text with the identity profile.

	Command	Description
Step 5	<b>template</b> <i>virtual-template</i>  <b>Example:</b> Router (config-identity-prof)# template virtualtemplate1	Specifies the virtual template interface that will serve as the configuration clone source for the virtual interface that is dynamically created for authenticated users.
Step 6	<b>exit</b>  <b>Example:</b> Router (config-identity-prof)# exit	Exits identity profile configuration mode.

### Configuring the DHCP Private Pool

	Command	Description
Step 1	<b>ip dhcp pool</b> <i>name</i>  <b>Example:</b> Router (config)# ip dhcp pool private	Configures a DHCP private address pool on a Cisco IOS DHCP server and enters DHCP pool configuration mode.
Step 2	<b>network</b> <i>network-number [mask]</i>  <b>Example:</b> Router (config-dhcp)# network 10.0.0.1 255.0.0.0	Configures the subnet number and mask for a DHCP private address pool on a Cisco IOS DHCP server.
Step 3	<b>default-router</b> <i>address</i>  <b>Example:</b> Router (config-dhcp)# default-router 10.2.2.2	Specifies the default router list for a DHCP client.

### Configuring the DHCP Public Pool

	Command	Description
Step 1	<b>ip dhcp pool</b> <i>name</i>  <b>Example:</b> Router (config-dhcp)# ip dhcp pool public	Configures the DHCP public address pool on a Cisco IOS DHCP server.
Step 2	<b>network</b> <i>network-number [mask]</i>  <b>Example:</b> Router (config-dhcp)# network 10.4.4.255.0.0.0	Configures the subnet number and mask for a DHCP public address pool on a Cisco IOS DHCP server.

	Command	Description
Step 3	<b>default-router</b> <i>address</i>  <b>Example:</b> Router (config-dhcp)# default-router 10.12.12.12	Specifies the default router list for a DHCP client.
Step 4	<b>exit</b>  <b>Example:</b> Router (config-dhcp)# exit	Exits DHCP pool configuration mode.

### Configuring the Interface

	Command	Description
Step 1	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 2	<b>interface</b> <i>type slot/port</i>  <b>Example:</b> Router (config)# interface loopback 0/1	Enters interface configuration mode and specifies the interface to be enabled.
Step 3	<b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]  <b>Example:</b> Router (config-if)# ip address 10.5.5.5 255.255.255.0	Sets the private IP address for the interface.
Step 4	<b>interface virtual-template</b> <i>number</i> Router (config-if)# interface virtual-template 1	Creates a virtual template interface that can be configured and applied dynamically in creating virtual access interfaces.
Step 5	<b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]  <b>Example:</b> Router (config-if)# ip address 10.6.6.6 255.255.255.0	Sets the public IP address for the interface.
Step 6	<b>exit</b>  <b>Example:</b> Router (config-if)# exit	Exits interface configuration mode.

## Configuring an Interface Without Assigning an Explicit IP Address to the Interface

	Command	Description
Step 1	<b>enable</b>  <b>Example:</b> Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface type slot/port</b>  <b>Example:</b> Router (config)# interface virtual-template 1/2	Enters interface configuration mode and specifies the interface to be enabled.
Step 4	<b>ip unnumbered type number</b>  <b>Example:</b> Router (config-if)# ip unnumbered loopback 0	Enables IP processing on an interface without assigning an explicit IP address to the interface.

## Example

The following example shows that the identity profile associates virtual-template1 with unauthenticated supplicants. Virtual-template1 gets its IP address from interface loopback 0, and unauthenticated supplicants are associated with a public pool. Authenticated users are associated with a private pool.

```
Router(config)# identity profile default
Router(config-lx-prof)# description put the description here
Router(config-lx-prof)# template virtual-template1
Router(config-lx-prof)# exit
```

```
Router(config)# ip dhcp pool private
Router(config-dhcp)# network 10.0.0.1 255.0.0.0
Router(config-dhcp)# default-router 10.2.2.2
Router(config-dhcp)# exit
```

```
Router(config)#ip dhcp pool public
Router(config-dhcp)# network 10.4.4.4 255.0.0.0
Router(config-dhcp)# default-router 10.12.12.12
Router(config-dhcp)# exit
```

```
Router(config)# interface loopback0
Router(config-if)# ip address 10.5.5.5 255.255.255.0
Router(config-if)# interface ethernet0
Router(config-if)# ip address 10.6.6.6 255.255.255.0
Router(config-if)# exit
```

```
Router(config)# interface virtual-template1
Router(config-if)# ip unnumbered loopback 0
```

## Configuring the Necessary Access Control Policies

802.1X authentication separates traffic from authenticated and unauthenticated devices. Traffic from authenticated devices transit via the physical interface, and unauthenticated traffic transits via the Virtual-Template1. Therefore, different policies can be applied on each interface. The configuration will also depend on whether two DHCP pools or a single DHCP pool is being used. If a single DHCP pool is being used, access control can be configured on Virtual-Template1, which will block any traffic from going to the networks to which unauthenticated devices should not have access. These networks (to which unauthenticated devices should not have access) could be the corporate subnetworks protected by the VPN or encapsulated by generic routing encapsulation (GRE). There can also be access control that restricts the access between authenticated and unauthenticated devices.

If two pools are configured, the traffic from a non-trusted pool is routed to the Internet using Network Address Translation (NAT), whereas trusted pool traffic is forwarded via a VPN tunnel. The routing can be achieved by configuring ACLs used by NAT and VPN accordingly.

For an example of an access control policy configuration, see the “[Access Control Policies: Example](#)” section.

## Configuring a Router As a Supplicant

To configure a router to act as a supplicant, you have to first configure the identity profile that the supplicant will use to obtain its EAP credentials. Then you have to configure the interface as a supplicant Port Access Entity (PAE) type. To configure a router as a supplicant, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dot1x credentials** *name*
4. **username** *name*
5. **password** [**0** | **7**] *password*
6. **description** *text*
7. **exit**
8. **interface** *type number*
9. **dot1x pae supplicant**
10. **exit**
11. **exit**

## DETAILED STEPS

	Command	Description
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>dot1x credentials name</b>  <b>Example:</b> Router (config)# dot1x credentials basic-user	Specifies which 802.1X credential profile to use when configuring a supplicant and enters dot1x credentials configuration mode.
Step 4	<b>username name</b>  <b>Example:</b> Router (config-dot1x-creden)# username router1	Specifies the username for an 802.1X credentials profile.
Step 5	<b>password [0   7] password</b>  <b>Example:</b> Router (config-dot1x-creden)# password secret	Specifies the password for an 802.1X credentials profile.
Step 6	<b>description text</b>  <b>Example:</b> Router (config-dot1x-creden)# description This credentials profile should be used for most configured ports	Specifies a description for an 802.1X profile.
Step 7	<b>exit</b>  <b>Example:</b> Router (config-dot1x-creden)# exit	Exits dot1x credentials configuration mode.
Step 8	<b>interface type number</b>  <b>Example:</b> Router# interface Ethernet1	Configures an interface type and enters interface configuration mode.
Step 9	<b>dot1x pae supplicant</b>  <b>Example:</b> Router (config-if)# dot1x pae supplicant	Sets the PAE type. <ul style="list-style-type: none"><li>The <b>supplicant</b> keyword specifies that the interface will be acting only as a supplicant and will not respond to messages that are meant for an authenticator.</li></ul>

	Command	Description
Step 10	<b>exit</b>  <b>Example:</b> Router (config-if)# exit	Exits interface configuration mode.
Step 11	<b>exit</b>  <b>Example:</b> Router (config-dot1x-creden)# exit	Exits global configuration mode.

## Configuring a PC

This section includes the following procedures.

- [Configuring a PC for VPN Access Control Using 802.1X Authentication, page 19](#)
- [Enabling 802.1X Authentication on a Windows 2000/XP PC, page 19](#)
- [Enabling 802.1X Authentication on a Windows 2000 PC, page 19](#)
- [Enabling 802.1X Authentication on a Windows XP PC, page 20](#)
- [Enabling 802.1X Authentication on Windows 2000 and Windows XP PCs, page 20](#)

## Configuring a PC for VPN Access Control Using 802.1X Authentication

To configure your PC for VPN Access Control Using 802.1X Authentication, perform the following steps.

- 
- |               |                        |
|---------------|------------------------|
| <b>Step 1</b> | Enable 802.1X for MD5. |
| <b>Step 2</b> | Enable DHCP.           |
- 

## Enabling 802.1X Authentication on a Windows 2000/XP PC

802.1X implementation on a Windows 2000/XP PC is unstable. A more stable 802.1X client, AEGIS (beta) for Microsoft Windows, is available at the Meetinghouse Data Communications website at [www.mtghouse.com](http://www.mtghouse.com).

## Enabling 802.1X Authentication on a Windows 2000 PC

To enable 802.1X authentication on your Windows 2000 PC, perform the following steps.

- 
- |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>Make sure that the PC has at least Service Pack 3.</b></p> <p>Go to the page “Microsoft 802.1x Authentication Client” on the Microsoft Windows 2000 website at the following URL:</p> <p><a href="http://www.microsoft.com/windows2000/server/evaluation/news/bulletins/8021xclient.asp">http://www.microsoft.com/windows2000/server/evaluation/news/bulletins/8021xclient.asp</a>.</p> <p>At the above site, download and install 802.1X client for Windows 2000.</p> |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

If the above site is unavailable, search for the “Q313664: Recommended Update” page on the Microsoft Windows 2000 website at the following URL:  
<http://www.microsoft.com/windows2000/downloads/recommended/q313664/default.asp>

- Step 2** Reboot your PC after installing the client.
- Step 3** Go to the Microsoft Windows registry and add or install the following entry:  
“HKLM\Software\Microsoft\EAPOL\Parameters\General\Global\SupplicantMode REG\_DWORD 3”  
 (“SupplicantMode” key entry is not there by default under Global option in the registry. So add a new entry named “SupplicantMode” as REG\_DWORD and then set its value to 3.)
- Step 4** Reboot your PC.
- 

## Enabling 802.1X Authentication on a Windows XP PC

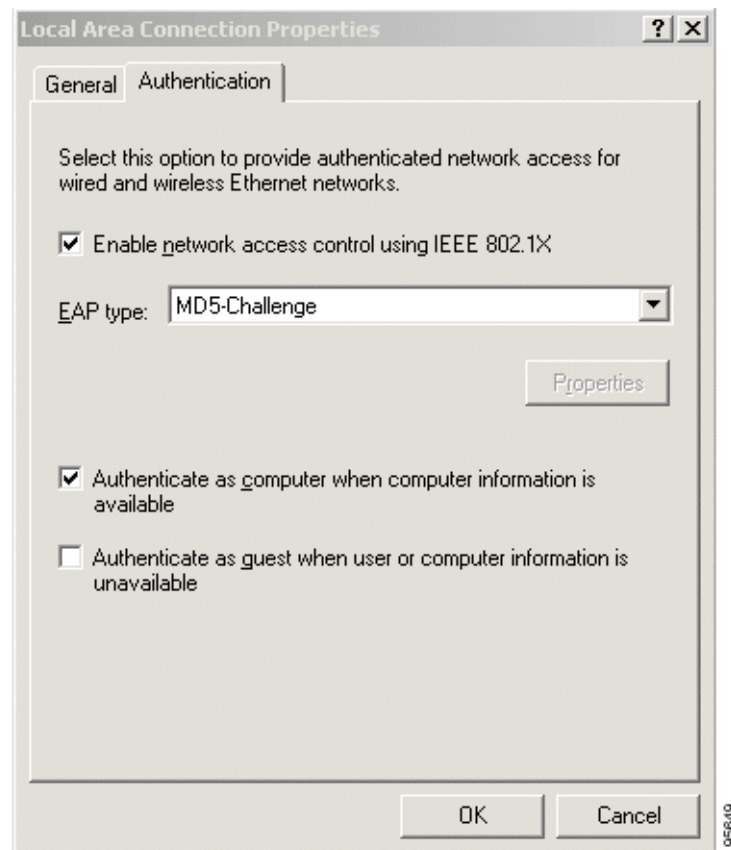

To enable 802.1X authentication on a Windows XP PC, perform the following steps.

- Step 1** Go to the Microsoft Windows registry and install the following entry there:  
“HKLM\Software\Microsoft\EAPOL\Parameters\General\Global\SupplicantMode REG\_DWORD 3”
- Step 2** Reboot your PC.
- 

## Enabling 802.1X Authentication on Windows 2000 and Windows XP PCs

To enable 802.1X authentication on Windows 2000 and Windows XP PCs, that is, if you are operating both at the same time, perform the following steps.

- Step 1** Open the Network and Dial-up Connections window on your computer.
- Step 2** Right-click the Ethernet interface (Local Area Connection) to open the properties window. It should have a tab called “Authentication.”
- Click the Authentication tab. Select the check box titled “Enable network access control using IEEE 802.1X.”
- In a short period of time you should see a dialog box (for Windows 2000) or a floating window asking you to select it. Select it, and when the next window appears, enter the username and password in this dialog box. See [Figure 3](#).
-

**Figure 3** *Local Area Connection Properties Window*

## Monitoring VPN Access Control Using 802.1X Authentication

To monitor VPN Access Control Using 802.1X Authentication, perform the following steps. The commands shown in the steps may be used one at a time and in no particular order.

### SUMMARY STEPS

1. **enable**
2. **clear dot1x**
3. **clear eap** [sessions [credentials *credentials-name* | interface *interface-name* | method *method-name* | transport *transport-name*]]
4. **debug dot1x** [aaa | all | process | rxdata | state-machine | txdata | vlan]
5. **debug eap** [all | method] [authenticator | peer] {all | errors | events | packets | sm}
6. **dot1x initialize** [interface *interface-name*]
7. **dot1x re-authenticate** *interface-type interface-number*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	clear dot1x  <b>Example:</b> Router# clear dot1x	Clears 802.1X interface information.
Step 3	<b>clear eap</b> [ <b>sessions</b> [ <b>credentials</b> <i>credentials-name</i>   <b>interface</b> <i>interface-name</i>   <b>method</b> <i>method-name</i>   <b>transport</b> <i>transport-name</i> ]]  <b>Example:</b> Router# clear eap sessions credentials type1	Clears EAP information on a switch or for a specified port.
Step 4	<b>debug dot1x</b> [ <b>aaa</b>   <b>all</b>   <b>process</b>   <b>rxdata</b>   <b>state-machine</b>   <b>txdata</b>   <b>vlan</b> ]  <b>Example:</b> Router# debug dot1x all	Displays 802.1X debugging information. <ul style="list-style-type: none"> <li><b>aaa</b>—Information is provided for AAA communications.</li> <li><b>all</b>—All 802.1X debugging messages are turned on.</li> <li><b>process</b>—Information is provided regarding the 802.1X process.</li> <li><b>rxdata</b>—Information is provided for packets that have been received from clients.</li> <li><b>state-machine</b>—Information is provided regarding the 802.1X state-machine.</li> <li><b>txdata</b>—Information is provided regarding packets that have been transmitted to clients.</li> <li><b>vlan</b>—Information is provided regarding the MAC address-based VLAN operation.</li> </ul> <div>  <b>Note</b> VLAN interfaces are currently not supported. </div>
Step 5	<b>debug eap</b> [ <b>all</b>   <i>method</i> ] [ <b>authenticator</b>   <b>peer</b> ] { <b>all</b>   <b>errors</b>   <b>events</b>   <b>packets</b>   <b>sm</b> }  <b>Example:</b> Router# debug eap all	Displays information about EAP.

	Command or Action	Purpose
Step 6	dot1x initialize [interface <i>interface-name</i> ] Router# dot1x initialize interface ethernet 0	Initializes an interface.
Step 7	dot1x re-authenticate <i>interface-type</i> <i>interface-number</i>  <b>Example:</b> Router# dot1x re-authenticate ethernet 0	Reauthenticates all the authenticated devices that are attached to the specified interface.

## Verifying VPN Access Control Using 802.1X Authentication

To verify VPN Access Control Using 802.1X Authentication, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **show dot1x** [interface *interface-name* [details]]
3. **show eap registrations** [method | transport]
4. **show eap sessions** [credentials *credentials-name* | interface *interface-name* | method *method-name* | transport *transport-name*]

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>show dot1x</b> [interface <i>interface-name</i> [details]]  <b>Example:</b> Router# show dot1x interface ethernet details	Shows details for an identity profile.
Step 3	<b>show eap registrations</b> [method   transport]  <b>Example:</b> Router# show eap registrations method	Displays EAP registration information.
Step 4	<b>show eap sessions</b> [credentials <i>credentials-name</i>   interface <i>interface-name</i>   method <i>method-name</i>   transport <i>transport-name</i> ]  <b>Example:</b> Router# show eap sessions interface gigabitethernet1/0/1	Displays active EAP session information.

# Configuration Examples for VPN Access Control Using 802.1X Authentication

This section includes the following example:

- [Typical VPN Access Control Using 802.1X Configuration: Example, page 24](#)
- [Access Control Policies: Example, page 28](#)
- [Router Acting As a Supplicant: Example, page 29](#)

## Typical VPN Access Control Using 802.1X Configuration: Example

The following sample output shows that VPN access control using 802.1X authentication has been configured. Output is shown for the router and for the gateway.

### Router

## Feature Information for VPN Access Control Using 802.1X Authentication

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

### Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for VPN Access Control Using 802.1X Authentication

Feature Name	Releases	Feature Information
VPN Access Control Using 802.1X Authentication	12.3(2)XA	The VPN Access Control Using 802.1X Authentication feature was introduced. This feature allows enterprise employees to access their enterprise networks from home while allowing other household members to access only the Internet.

**Table 1** Feature Information for VPN Access Control Using 802.1X Authentication (continued)

Feature Name	Releases	Feature Information
VPN Access Control Using 802.1X Authentication	12.3(4)T	This feature was integrated into Cisco IOS Release 12.3(4)T, and the following platform support was added: Cisco 1751, Cisco 2610XM – Cisco 2611XM, Cisco 2620XM – Cisco 2621XM, Cisco 2650XM – Cisco 2651XM, Cisco 2691, Cisco 3640, Cisco 3640A, and Cisco 3660.
802.1X Supplicant Support	12.3(11)T	802.1X supplicant support was added.
Converged 802.1X Authenticator and Converged 802.1X Supplicant Support	12.4(6)T	Converged 802.1X authenticator and converged 802.1X supplicant support was added. (This update is a standardization of Cisco IOS 802.1X commands for various Cisco IOS platforms. This is no change in 802.1X features.)  Affected commands include the following: <b>clear eap</b> , <b>debug dot1x</b> , <b>debug eap</b> , <b>description (dot1x credentials)</b> , <b>dot1x control-direction</b> , <b>dot1x credentials</b> , <b>dot1x default</b> , <b>dot1x host-mode</b> , <b>dot1x max-reauth-req</b> , <b>dot1x max-start</b> , <b>dot1x multiple-hosts</b> , <b>dot1x timeout</b> , <b>eap</b> , <b>identity profile</b> , <b>password (dot1x credentials)</b> , <b>show eap registrations</b> , <b>show eap sessions</b> , and <b>username</b>
VPN Access Control Using 802.1X Authentication	12.4(4)XC	Various 802.1X commands were integrated into Cisco IOS Release 12.4(4)XC for Cisco 870 Integrated Services Routers (ISRs) only.  Affected commands include the following: <b>dot1x control-direction</b> , <b>dot1x default</b> , <b>dot1x guest-vlan</b> , <b>dot1x host-mode</b> , <b>dot1x max-reauth-req</b> , <b>dot1x max-req</b> , <b>dot1x max-start</b> , <b>dot1x pae</b> , <b>dot1x port-control</b> , <b>dot1x re-authenticate (privileged EXEC)</b> , <b>dot1x reauthentication</b> , <b>dot1x system-auth-control</b> , <b>dot1x timeout</b> , <b>macro global</b> , <b>macro name</b> , and <b>show ip igmp snooping</b>

## **SSL VPN**

# SSL VPN

---

**First Published: February 27, 2006**

**Last Updated: July 11, 2008**

The SSL VPN feature (also known as WebVPN) provides support, in Cisco IOS software, for remote user access to enterprise networks from anywhere on the Internet. Remote access is provided through a Secure Socket Layer- (SSL-) enabled SSL VPN gateway. The SSL VPN gateway allows remote users to establish a secure Virtual Private Network (VPN) tunnel using a web browser. This feature provides a comprehensive solution that allows easy access to a broad range of web resources and web-enabled applications using native HTTP over SSL (HTTPS) browser support. SSL VPN delivers three modes of SSL VPN access: clientless, thin-client, and full-tunnel client support.

This document is primarily for system administrators. If you are a remote user, see the document *SSL VPN Remote User Guide*.

## Note

The Cisco AnyConnect VPN Client is introduced in Cisco IOS Release 12.4(15)T. This feature is the next-generation SSL VPN Client. If you are using Cisco software before Cisco IOS Release 12.4(15)T, you should be using SSL VPN Client and see GUI for the SSL VPN Client when you are web browsing. However, if you are using Cisco software Release 12.4(15)T or later, you should be using Cisco AnyConnect VPN Client and see GUI for Cisco AnyConnect VPN Client when you are web browsing.

For “What’s New” information about SSL VPN features by release, see the section “[Finding Feature Information in This Module](#),” which follows.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for SSL VPN](#)” section on page 104.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Notices, page 110](#)

## Prerequisites for SSL VPN

- To securely access resources on a private network behind an SSL VPN gateway, the remote user of an SSL VPN service must have the following:
  - An account (login name and password)
  - An SSL-enabled browser (for example, Internet Explorer, Netscape, Mozilla, or FireFox)
  - Operating system support

---

**Note** Later versions of the following software are also supported.

---

- Microsoft Windows 2000, Windows XP, or Windows Vista
- Macintosh OS X 10.4.6
- Linux (Redhat RHEL 3.0 +, FEDORA 5, or FEDORA 6)
- SSL VPN-supported browser—The following browsers have been verified for SSL VPN. Other browsers might not fully support SSL VPN features.

---

**Note** Later versions of the following software are also supported.

---

- Internet Explorer 6.0 or 7.0
- Firefox 2.0 (Windows and Linux)
- Safari 2.0.3
- “Thin Client” support used for TCP port-forwarding applications requires administrative privileges on the computer of the remote user.
- “Tunnel mode” for Cisco SSL VPN requires administrative privileges for initial installation of the full tunnel client.
- The remote user must have local administrative privileges to use thin client or full tunnel client features.

- The SSL VPN gateway and context configuration must be completed before a remote user can access resources on a private network behind an SSL VPN. This configuration is shown in the section “[How to Configure SSL VPN Services on a Router](#).”

**ACL Support**

- Before configuring this feature, the time range should have already been configured.

**Single SignOn (SSO) Netegrity Cookie Support**

- A Cisco plug-in must be installed on a Netegrity SiteMinder server.

## Restrictions for SSL VPN

- URLs referred by the Macromedia Flash player cannot be modified for secure retrieval by the SSL VPN gateway.

**Cisco AnyConnect VPN Client**

CiscoAnyConnect VPN Client does not support the following:

- Datagram Transport Layer Security (DTLS) with SSL connections
- Standalone Mode (Cisco IOS Release 12.4(20)T and later versions)
- IPsec
- IPv6 VPN access
- Compression support
- Language translation (localization)
- Client-side authentication
- Adaptive Security Appliance (ASA) and Adaptive Security Device Manager (ASDM) and any command-line interface (CLI) associated with them
- Adjusting Maximum Transmission Unit (MTU) size
- Sequencing

**Thin Client Control List Support**

- Although there is no limitation on the maximum number of filtering rules that can be applied for each access control list (ACL) entry, keeping the number below 50 should have no impact on router performance.

**HTTP Proxy**

- This feature works only with Microsoft Internet Explorer.
- This feature will not work if the browser proxy setup cannot be modified because of any security policies that have been placed on the client workstation.

# Information About SSL VPN

To configure SSL VPN, you should understand the following concepts:

- [SSL VPN Overview, page 4](#)
- [Modes of Remote Access, page 5](#)
- [SSL VPN Features, page 10](#)
- [Other SSL VPN Features, page 23](#)
- [Platform Support, page 26](#)

## SSL VPN Overview

Cisco IOS SSL VPN provides SSL VPN remote-access connectivity from almost any Internet-enabled location using only a web browser that natively supports SSL encryption. This feature allows your company to extend access to its secure enterprise network to any authorized user by providing remote-access connectivity to corporate resources from any Internet-enabled location.

Cisco IOS SSL VPN can also support access from noncorporate-owned machines, including home computers, Internet kiosks, and wireless hot spots. These locations are difficult places to deploy and manage VPN client software and remote configuration required to support IPsec VPN connections.

[Figure 1](#) shows how a mobile worker (the lawyer at the courthouse) can access protected resources from the main office and branch offices. Site-to-site IPsec connectivity between the main and remote sites is unaltered. The mobile worker needs only Internet access and supported software (web browser and operating system) to securely access the corporate network.

**Figure 1** *Secure SSL VPN Access Model*

SSL VPN delivers the following three modes of SSL VPN access:

- *Clientless*—Clientless mode provides secure access to private web resources and will provide access to web content. This mode is useful for accessing most content that you would expect to access in a web browser, such as Internet access, databases, and online tools that employ a web interface.
- *Thin Client* (port-forwarding Java applet)—Thin client mode extends the capability of the cryptographic functions of the web browser to enable remote access to TCP-based applications such as Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP), Internet Message Access protocol (IMAP), Telnet, and Secure Shell (SSH).
- *Tunnel Mode*—Full tunnel client mode offers extensive application support through its dynamically downloaded Cisco AnyConnect VPN Client (next-generation SSL VPN Client) for SSL VPN. Full tunnel client mode delivers a lightweight, centrally configured and easy-to-support SSL VPN tunneling client that provides network layer access to virtually any application.

SSL VPN application accessibility is somewhat constrained relative to IPsec VPNs; however, SSL-based VPNs provide access to a growing set of common software applications, including web page access, web-enabled services such as file access, e-mail, and TCP-based applications (by way of a downloadable thin-client applet). SSL-based VPN requires slight changes to user workflow because some applications are presented through a web browser interface, not through their native GUI. The advantage for SSL VPN comes from accessibility from almost any Internet-connected system without needing to install additional desktop software.

## Modes of Remote Access

This section includes the following:

- [Remote Access Overview, page 5](#)
- [Clientless Mode, page 6](#)
- [Thin-Client Mode, page 7](#)
- [Tunnel Mode, page 9](#)

## Remote Access Overview

End-user login and authentication is performed by the web browser to the secure gateway using an HTTP request. This process creates a session that is referenced by a cookie. After authentication, the remote user is shown a portal page that allows access to the SSL VPN networks. All requests sent by the browser include the authentication cookie. The portal page provides all the resources available on the internal networks. For example, the portal page could provide a link to allow the remote user to download and install a thin-client Java applet (for TCP port forwarding) or a tunneling client.

[Figure 2](#) shows an overview of the remote access modes.

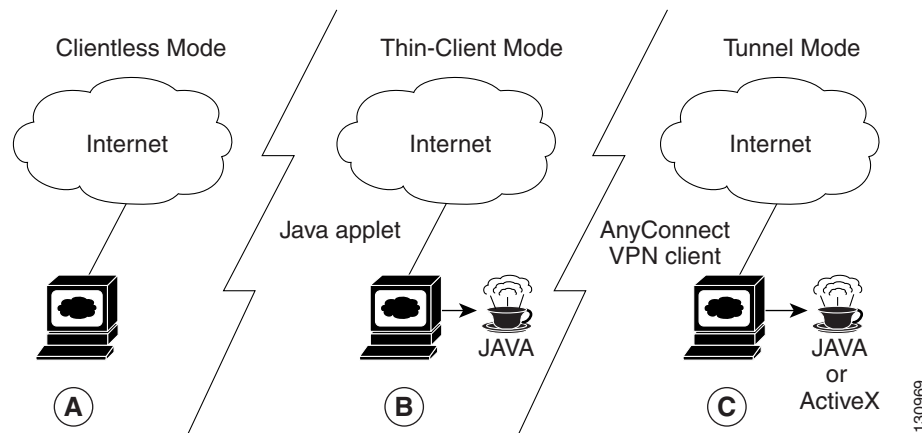

**Figure 2** *Modes of Remote Access Overview*

Table 1 summarizes the level of SSL VPN support that is provided by each access mode.

**Table 1** *Access Mode Summary*

A Clientless Mode	B Thin-Client Mode	C Tunnel Mode
<ul style="list-style-type: none"> <li>• Browser-based (clientless)</li> <li>• Microsoft Windows or Linux</li> <li>• Web-enabled applications, file sharing, Outlook Web Access</li> <li>• Gateway performs address or protocol conversion and content parsing and rewriting</li> </ul>	<ul style="list-style-type: none"> <li>• TCP port forwarding</li> <li>• Uses Java Applet</li> <li>• Extends application support</li> <li>• Telnet, e-mail, SSH, Meeting Maker, Sametime Connect</li> <li>• Static port-based applications</li> </ul>	<ul style="list-style-type: none"> <li>• Works like “clientless” IPsec VPN</li> <li>• Tunnel client loaded through Java or ActiveX (approximately 500 kB)</li> <li>• Application agnostic—supports all IP-based applications</li> <li>• Scalable</li> <li>• Local administrative permissions required for installation</li> </ul>

## Clientless Mode

In clientless mode, the remote user accesses the internal or corporate network using the web browser on the client machine. The PC of the remote user must run the Windows 2000, Windows XP, or Linux operating systems.

The following applications are supported in clientless mode:

- Web browsing (using HTTP and secure HTTP [HTTPS])—provides a URL box and a list of web server links in the portal page that allows the remote user to browse the web.
- File sharing (using common Internet file system [CIFS])—provides a list of file server links in the portal page that allows the remote user to do the following operations:
  - Browse a network (listing of domains)
  - Browse a domain (listing of servers)
  - Browse a server (listing of shares)
  - List the files in a share
  - Create a new file

- Create a directory
- Rename a directory
- Update a file
- Download a file
- Remove a file
- Rename a file

**Note**

Linux requires that the Samba application is installed before CIFS file shares can be remotely accessed.

- Web-based e-mail, such as Microsoft Outlook Web Access (OWA) 2003 (using HTTP and HTTPS) with Web Distributed Authoring and Versioning (WebDAV) extensions—provides a link that allows the remote user to connect to the exchange server and read web-based e-mail.

## Thin-Client Mode

Thin-client mode, also called TCP port forwarding, assumes that the client application uses TCP to connect to a well-known server and port. In thin-client mode, the remote user downloads a Java applet by clicking the link provided on the portal page, or the Java applet is downloaded automatically (see [“Options for Configuring HTTP Proxy and the Portal Page”](#) and [“Options for Configuring HTTP Proxy and the Portal Page”](#)). The Java applet acts as a TCP proxy on the client machine for the services that you configure on the gateway.

The applications that are supported in thin-client mode are mainly e-mail-based (SMTP, POP3, and Internet Map Access Protocol version 4 [IMAP4] applications).

**Note**

The TCP port-forwarding proxy works only with the Sun Microsystems Java Runtime Environment (JRE) version 1.4 or later versions. A Java applet is loaded through the browser that verifies the JRE version. The Java applet will refuse to run if a compatible JRE version is not detected.

The Java applet initiates an HTTP request from the remote user client to the SSL VPN gateway. The name and port number of the internal e-mail server is included in the HTTP request (POST or CONNECT). The SSL VPN gateway creates a TCP connection to that internal e-mail server and port.

The Java applet starts a new SSL connection for every client connection.

You should observe the following restrictions when using thin-client mode:

- The remote user must allow the Java applet to download and install.
- You cannot use thin-client mode for applications such as FTP, where the ports are negotiated dynamically. You can use TCP port forwarding only with static ports.

**Note**

There is a known compatibility issue with the encryption type and Java. If the Java port-forwarding applet does not download properly and the configuration line **ssl encryption 3des-sha1 aes-sha1** is present, you should remove the line from the webvpn gateway subconfiguration.

## Options for Configuring HTTP Proxy and the Portal Page

Effective with Cisco IOS Release 12.4(11)T, administrators have more options for configuring the HTTP proxy and the portal page. If HTTP proxy is enabled, the Java applet acts as the proxy for the browser of the user, thereby connecting the client workstation with the gateway. The home page of the user (as defined by the user group) is opened automatically or, if configured by the administrator, the user is directed to a new website.

HTTP proxy supports both HTTP and HTTPS.

### Benefits of Configuring HTTP Proxy

HTTP supports all client-side web technologies (including HTML, Cascading Style Sheets [CSS], JavaScript, VBScript, ActiveX, Java, and flash), HTTP Digest authentication, and client certificate authentication. Remote users can use their own bookmarks, and there is no limit on cookies. Because there is no mangling involved and the client can cache the objects, performance is much improved over previous options for configuring the HTTP proxy and portal page.

### Illustrations of Port Forwarding with and Without an HTTP Proxy Configuration

Figure 3 illustrates TCP port forwarding without HTTP proxy configured.

**Figure 3** TCP Port Forwarding Without HTTP Proxy Configured

In Figure 3, the following steps must occur:

1. User downloads the proxy applet.
2. Applet updates the registry to add HTTP as a Remote Procedure Call (RPC) transport.
3. Applet examines the registry to determine the exchange (and local catalog) server and create server entries that refer to those servers.
4. Applet opens local port 80 and listens for connections.
5. User starts Outlook, and Outlook connects to 10.0.0.254:80.
6. Applet opens a connection to the secure gateway and delivers the requests from Outlook.
7. Secure gateway examines the requests to determine the end-point exchange server.
8. Data flows from Outlook, through the applet and the secure gateway, to the exchange server.
9. User terminates Outlook.

10. User closes the applet. Before closing, the applet undoes configuration Steps 3 and 4.

Figure 4 illustrates TCP port forwarding when HTTP proxy is configured.

**Figure 4** HTTP Proxy

In Figure 4, the following steps occur:

1. Proxy applet is downloaded automatically.
2. Applet saves the original proxy configuration of the browser.
3. Applet updates the proxy configuration of the browser to be the local loopback address with an available local port (by default, port 8080).
4. Applet opens the available local port and listens for connections.
5. Applet, if so configured, opens the home page of the user, or the user browses to a new website.
6. Applet accepts and looks at the HTTP or HTTPS request to determine the destination web server.
7. Applet opens a connection to the secure gateway and delivers the requests from the browser.
8. Secure gateway examines the requests to determine the end-point web server.
9. Data flows from the browser, through the applet and the secure gateway, to the web server.
10. User closes applet. Before closing, the applet undoes configuration Steps 2 and 3.

**Note**

HTTP proxy can also be enabled on a AAA server. See the section “[SSL VPN RADIUS Attribute-Value Pairs](#)” (port-forward-http-proxy and port-forward-http-proxy-url attributes).

## Tunnel Mode

In a typical clientless remote access scenario, remote users establish an SSL tunnel to move data to and from the internal networks at the application layer (for example, web and e-mail). In tunnel mode, remote users use an SSL tunnel to move data at the network (IP) layer. Therefore, tunnel mode supports most IP-based applications. Tunnel mode supports many popular corporate applications (for example, Microsoft Outlook, Microsoft Exchange, Lotus Notes E-mail, and Telnet).

The tunnel connection is determined by the group policy configuration. The Cisco AnyConnect VPN Client is downloaded and installed on the remote user PC, and the tunnel connection is established when the remote user logs into the SSL VPN gateway.

By default, the Cisco AnyConnect VPN Client is removed from the client PC after the connection is closed. However, you have the option to keep the Cisco AnyConnect VPN Client installed on the client PC.

## SSL VPN Features

SSL VPN includes the following features:

- [Access Control Enhancements, page 10](#)
- [AnyConnect Client Support, page 10](#)
- [Application ACL Support, page 11](#)
- [Automatic Applet Download, page 11](#)
- [Backend HTTP Proxy, page 11](#)
- [Front-Door VRF Support, page 11](#)
- [Full-Tunnel CEF Support, page 12](#)
- [GUI Enhancements, page 12](#)
- [Netegrity Cookie-Based Single SignOn Support, page 18](#)
- [NTLM Authentication, page 18](#)
- [RADIUS Accounting, page 18](#)
- [Stateless High Availability with Hot Standby Router Protocol, page 19](#)
- [TCP Port Forwarding and Thin Client, page 20](#)
- [URL Obfuscation, page 22](#)
- [URL Rewrite Splitter, page 22](#)
- [User-Level Bookmarking, page 22](#)

### Access Control Enhancements

Effective with Cisco IOS Release 12.4(20)T, administrators can configure automatic authentication and authorization for users. Users provide their usernames and passwords via the gateway page URL and do not have to reenter their usernames and passwords from the login page. Authorization is enhanced to support more generic authorization, including local authorization. In previous releases, only RADIUS authorization was supported.

For information about configuring this feature, see the section “[Configuring Automatic Authentication and Authorization](#).”

### AnyConnect Client Support

Effective with Cisco IOS Release 12.4(20)T, AnyConnect Client support has been added for several client-side platforms, such as Microsoft Windows, Apple-Mac, and Linux. The ability to install AnyConnect in a standalone mode is also added. In addition, the Release 12.4(20)T allows you to install multiple AnyConnect VPN client packages to a gateway. For information on configuring multiple packages, see the section “[Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files](#).”

## Application ACL Support

Effective with Cisco IOS Release 12.4(11)T, this feature provides administrators with the flexibility to fine-tune access control on the application layer level, for example, on the basis of a URL.

For information about configuring this feature, see the sections “[Configuring ACL Rules](#)” and “[Associating an ACL Attribute with a Policy Group](#).”

## Automatic Applet Download

Effective with Cisco IOS Release 12.4(9)T, administrators have the option of automatically downloading the port-forwarding Java applet. This feature must be configured on a group policy basis.

**Note**

Users still have to allow the Java applet to be downloaded. The dialog box pops up, asking for permission.

To configure the automatic download, see the section “[Configuring an SSL VPN Policy Group](#).”

## Backend HTTP Proxy

This feature, added in Cisco IOS Release 12.4(20)T, allows administrators to route user requests through a backend HTTP proxy, providing more flexibility and controllability than routing requests through internal web servers. This feature adds the following new authentication, authorization, and accounting (AAA) attributes:

```
http-proxy-server
http-proxy-server-port
```

For information about configuring this feature, see the section “[Configuring a Backend HTTP Proxy](#).”

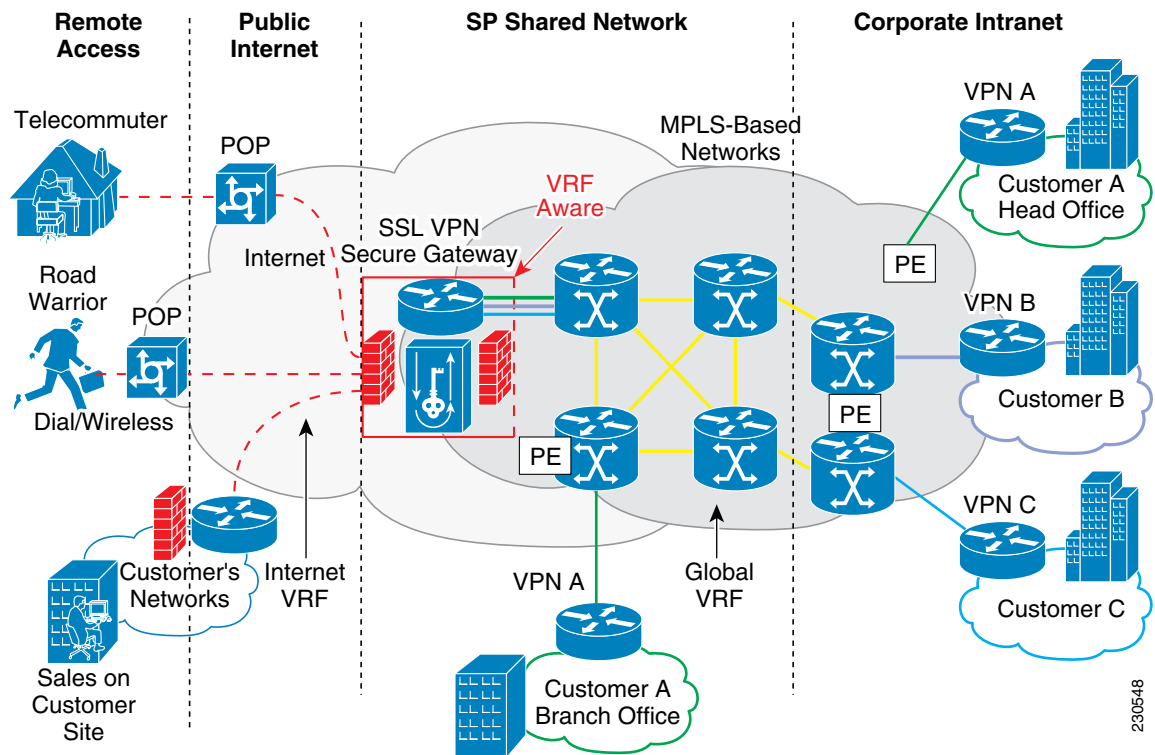

## Front-Door VRF Support

Effective with Cisco IOS Release 12.4(15)T, front-door virtual routing and forwarding (FVRF) support, coupled with the already supported internal virtual routing and forwarding (IVRF), provides for increased security. The feature allows the SSL VPN gateway to be fully integrated into a Multiprotocol Label Switching (MPLS) or non-MPLS network (wherever the VRFs are deployed). The virtual gateway can be placed into a VRF that is separate from the Internet to avoid internal MPLS and IP network exposure. This placement reduces the vulnerability of the router by separating the Internet routes or the global routing table. Clients can now reach the gateway by way of the FVRF, which can be separate from the global VRF. The backend, or IVRF, functionality remains the same.

This FVRF feature provides for overlapping IP addresses.

[Figure 5](#) is a scenario in which FVRF has been applied.

**Figure 5** Scenario in Which FVRF Has Been Applied

To configure FVRF, see [“Configuring FVRF” section on page 75](#).

## Full-Tunnel CEF Support

Effective with Cisco IOS Release 12.4(20)T, Full-Tunnel Cisco Express Forwarding (CEF) support has been added for better throughput performance than in earlier releases. This feature is enabled by default. To turn off full-tunnel CEF support, use the **no webvpn cef** command.

### Note

To take full advantage of CEF support, the hardware crypto engine is required.

For an example of output showing CEF-processed packets, see the section [“CEF-Processed Packets: Example, page 90.”](#)

## GUI Enhancements

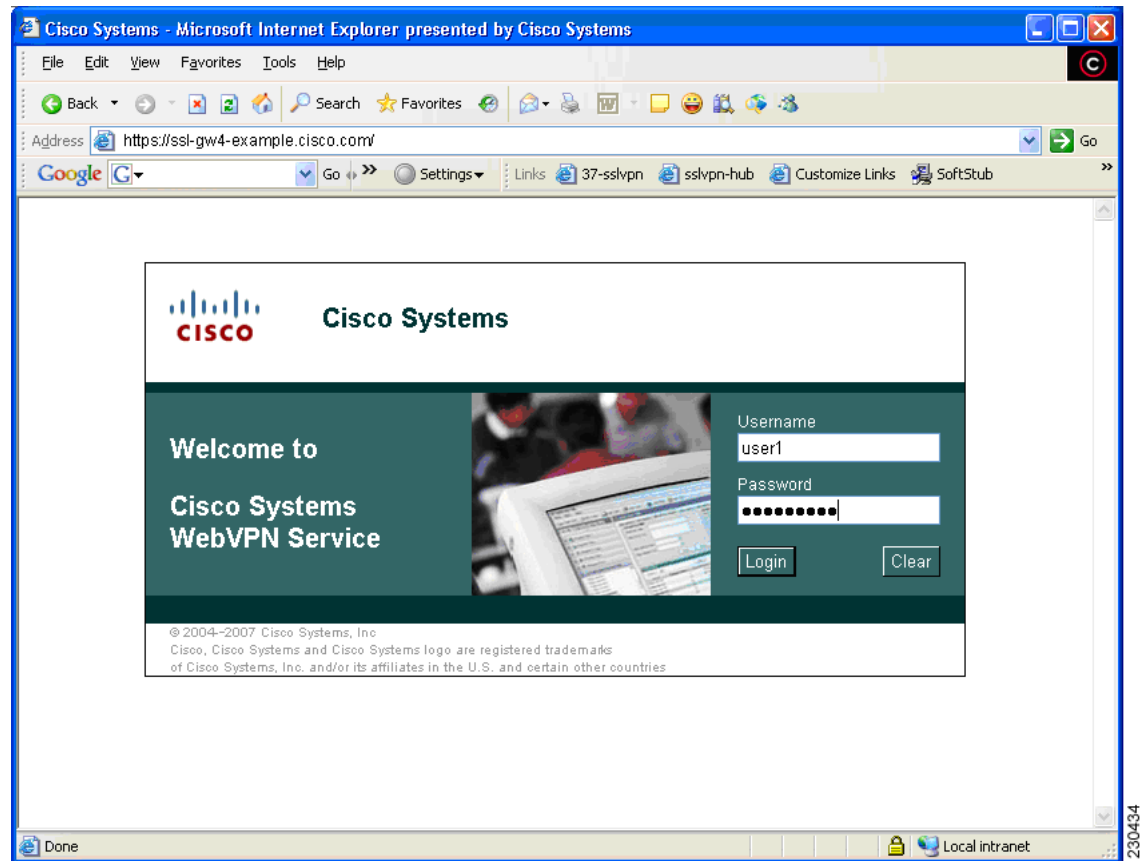

In Cisco IOS Release 12.4(15)T, ergonomic improvements were made to the GUI user interface of the Cisco IOS SSL VPN gateway. The improved customization of the user interface provides for greater flexibility and the ability to tailor portal pages for individualized looks. Enhancements were made to the following web screens:

- Login screen
- Portal page

## Login Screen

Figure 6 is an example of a typical login screen.

**Figure 6** Typical Login Screen

## Banner

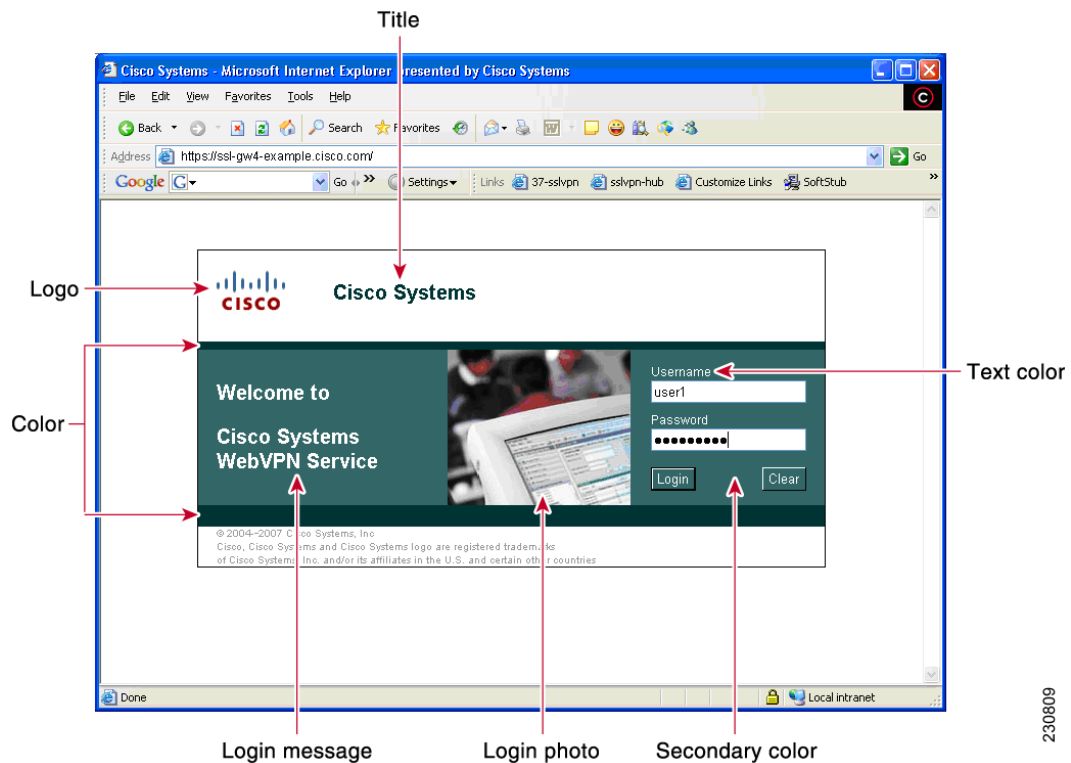

The banner is a small pop-up box (see Figure 7) that appears after the user is logged in and before the portal page appears.

The message in the pop-up box is configured using the **banner** command.

**Figure 7**      **Banner**

## Customizing a Login Page

Login screens can be customized by an administrator. [Figure 8](#) shows the fields that can be customized. For information about setting various elements of the login page, see the document [Cisco IOS Security Command Reference](#), Release 12.4T, for the `logo`, `title`, `title-color`, `login-message`, `text-color`, `secondary-color`, `login-photo`, and `color` commands.

**Figure 8**      **Login Page with Callouts of the Fields That Can Be Customized**

230809

## Portal Page

The portal page ([Figure 9](#)) is the main page for the SSL VPN functionality. You can customize this page to contain the following:

- Custom logo (the default is the Cisco bridge logo)
- Custom title (the default is “WebVPN Services”)
- Custom banner (the default is an empty string)
- Custom colors (the default is a combination of white and greens)
- List of web server links (can be customized)

---

**Note** The Bookmark links are listed under the Personal folder, and the server links are listed under Network File in [Figure 9](#).

---

- URL entry box (may be present or can be hidden using the **hide-url-bar** command)
- Thin Client link (may or may not be present)

---

**Note** The Application Access box allows you to download and install the Tunnel Connection and Thin Client Application.

---

- Links for Help, Home (that is, the portal page), and Logout

Items that you have not configured are not displayed on the portal page.

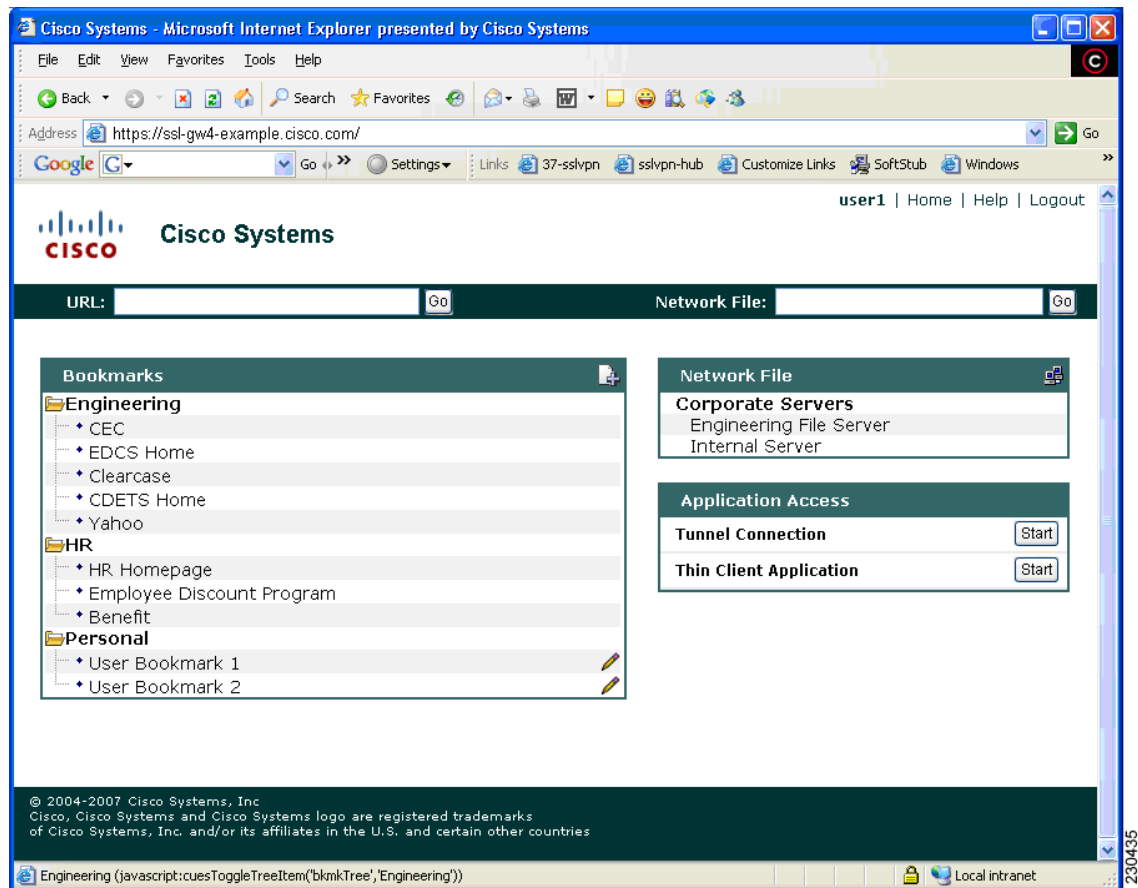

---

**Note** E-mail access is supported by thin-client mode, which is downloaded using the Thin Client link.

---

[Figure 9](#) is an example of a typical portal page.

**Figure 9** Typical Portal Page

### Customizing a Portal Page

Portal pages can be customized by an administrator. Figure 10 shows various fields, including the fields that can be customized by an administrator. The fields that can be customized by an administrator are as follows:

- Title
- Logo
- Secondary color
- Administrator-defined bookmarks
- Color

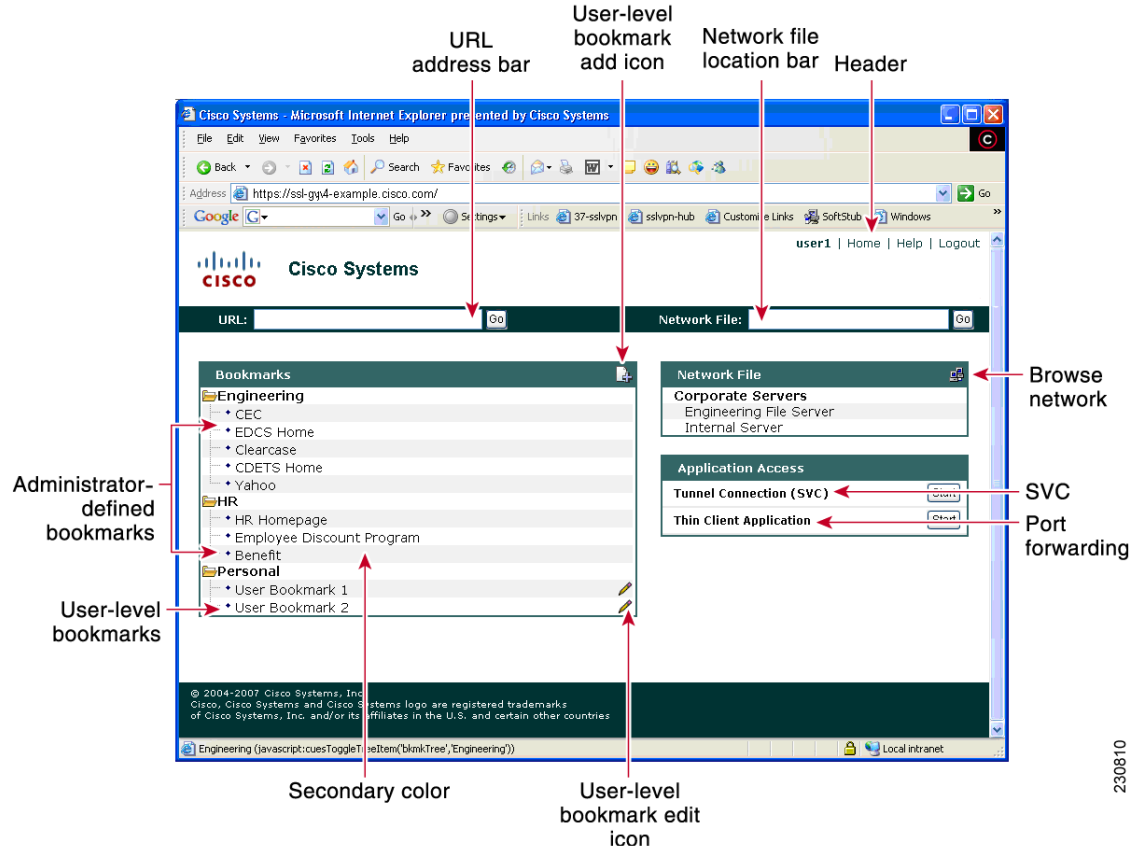

**Figure 10** Portal Page with Callouts of Various Fields, Including Those That Can Be Customized

Table 2 provides information about various fields on the portal page. For information about setting elements such as color or titles, see command information in the [Cisco IOS Security Command Reference](#), Release 12.4T, for the **logo**, **title**, **title-color**, **functions**, **port-forward**, **color**, **secondary-text-color**, **url-list**, **secondary-color**, and **hide-url-bar** commands.

**Table 2** Information About Fields on the Portal Page

Field	Description
User-level bookmark add icon	If a user clicks it, a dialog box is added so that a new bookmark can be added to the Personal folder.
Network File location bar	A user can enter the file server here. Both of the <b>functions file-access</b> and <b>functions file-entry</b> commands must be configured for the input box to appear.
Header	Shares the same color value as the title.
Last login	Timestamp of the last login.
Browse network	Allows a user to browse the file network. Both commands <b>functions file-access</b> and <b>functions file-browse</b> must be configured for the icon to appear.
Tunnel Connection	A user can choose when to start the tunnel connection by configuring the <b>functions svc-enabled</b> command.

**Table 2**      **Information About Fields on the Portal Page (continued)**

Field	Description
Port forwarding	Downloads the applet and starts port forwarding.
User-level bookmark edit icon	Allows a user to edit or delete an existing bookmark.
User-level bookmarks	<p>A user can add a bookmark by using the plus icon (see below)</p>  <p>on the bookmark panel or toolbar. See the document <i>SSL VPN Remote User Guide</i> for information about the toolbar. A new window is opened when the link is clicked.</p>
Administrator-defined bookmarks	Administrator-defined URL lists cannot be edited by the user.
URL address bar	A new window is opened when a user clicks Go.

## Netegrity Cookie-Based Single SignOn Support

The Netegrity SiteMinder product provides a Single SignOn (SSO) feature that allows a user to log on a single time for various web applications. The benefit of this feature is that users are prompted to log on only once. This feature is accomplished by setting a cookie in the browser of a user when the user initially logs on.

Effective with Cisco IOS Release 12.4(11)T, Netegrity cookie-based SSO is integrated with SSL VPN. It allows administrators to configure an SSO server that sets a SiteMinder cookie in the browser of a user when the user initially logs on. This cookie is validated by a SiteMinder agent on subsequent user requests to resources that are protected by a SiteMinder realm. The agent decrypts the cookie and verifies whether the user has already been authenticated.

For information about configuring SSO Netegrity Cookie Support and associating it with a policy group using the CLI, see the sections “[Configuring SSO Netegrity Cookie Support for a Virtual Context](#)” and “[Associating an SSO Server with a Policy Group](#),” respectively.

An SSO server can also be associated with a policy group using RADIUS attributes, as in the following example:

```
webvpn:sso-server-name=server1
```

For a list of RADIUS attribute-value (AV) pairs that support SSL VPN, see the section “[Configuring RADIUS Attribute Support for SSL VPN](#).”

## NTLM Authentication

NT LAN Manager (NTLM) is supported for SSL VPN effective with Cisco IOS Release 12.4(9)T. The feature is configured by default.

## RADIUS Accounting

Effective with Cisco IOS Release 12.4(9)T, this feature provides for RADIUS accounting of SSL VPN user sessions.

For information about configuring SSL VPN RADIUS accounting for SSL VPN user sessions, see the section “[Configuring RADIUS Accounting for SSL VPN User Sessions](#).”

For more information about configuring RADIUS accounting, see the “Configuring RADIUS” chapter in the *Cisco IOS Security Configuration Guide*, Release 12.4 at the following URL:

[http://www.cisco.com/univercd/cc/td/doc/product/software/ios124/124cg/hsec\\_c/part10/ch05/index.htm](http://www.cisco.com/univercd/cc/td/doc/product/software/ios124/124cg/hsec_c/part10/ch05/index.htm)

For a list of RADIUS AV pairs that support SSL VPN, see the section “[Configuring RADIUS Attribute Support for SSL VPN](#).”

## Stateless High Availability with Hot Standby Router Protocol

Hot Standby Router Protocol (HSRP) provides high network availability by routing IP traffic from hosts on ethernet networks without having to rely on the availability of any single router. HSRP is particularly useful for hosts that do not support a router discovery protocol, such as ICMP Router Discovery Protocol (IRDP), and that do not have the functionality to switch to a new router when their selected router reloads or loses power. Without this functionality, a router that loses its default gateway because of a router failure is unable to communicate with the network.

HSRP is configurable on LAN interfaces using standby command-line interface (CLI). It is now possible to use the standby IP address from an interface as the local IPsec identity, or local tunnel endpoint.

By using the standby IP address as the SSL VPN gateway address, failover can be applied to VPN routers by using HSRP. Remote SSLVPN users connect to the local VPN gateway using the standby address that belongs to the active device in the HSRP group. In the event of failover, the standby device takes over ownership of the standby IP address and begins to service remote VPN users.

Using the Stateless High Availability with Hot Standby Router Protocol feature, the remote user has to be aware of only the HSRP standby address instead of a list of gateway addresses.

[Figure 11](#) shows the enhanced HSRP functionality topology. Traffic is serviced by the active Router P, the active device in the standby group. In the event of failover, traffic is diverted to Router S, the original standby device. Router S assumes the role of the new active router and takes ownership of the standby IP address.

**Figure 11**      **Stateless High Availability with HSRP for SSL VPN**

For information about configuring Stateless High Availability with HSRP, see [“Configuring Stateless High Availability with HSRP for SSL VPN” section on page 80.](#)

**Note**

In case of a failover, HSRP does not facilitate SSL VPN state information transference between VPN gateways. Without this state transference, existing SSL VPN sessions with the remote users will be deleted, requiring users to reauthenticate and establish SSL VPN sessions with the new active gateway.

## TCP Port Forwarding and Thin Client

**Note**

This feature requires the JRE version 1.4 or later releases to properly support SSL connections.

**Note**

Because this feature requires installing JRE and configuring the local clients, and because doing so requires administrator permissions on the local system, it is unlikely that remote users will be able to use applications when they connect from public remote systems.

When the remote user clicks the Start button of the Thin Client Application (under “Application Access”), a new window is displayed. This window initiates the downloading of a port-forwarding applet. Another window is then displayed. This window asks the remote user to verify the certificate with which this applet is signed. When the remote user accepts the certificate, the applet starts running, and port-forwarding entries are displayed (see [Figure 12](#)). The number of active connections and bytes that are sent and received is also listed on this window.

**Note**

When remote users launch Thin Client, their system may display a dialog box regarding digital certificates, and this dialog box may appear behind other browser windows. If the remote user connection hangs, tell the remote user to minimize the browser windows to check for this dialog box.

You should have configured IP addresses, Domain Name System (DNS) names, and port numbers for the e-mail servers. The remote user can then launch the e-mail client, which is configured to contact the above e-mail servers and send and receive e-mails. POP3, IMAP, and SMTP protocols are supported.

The window attempts to close automatically if the remote user is logged out using JavaScript. If the session terminated and a new port forwarding connection is established, the applet displays an error message.

**Figure 12** TCP Port Forwarding Page**Caution**

Users should always close the Thin Client window when finished using applications by clicking the close icon. Failure to quit the window properly can cause Thin Client or the applications to be disabled. See the section “Application Access—Recovering from Hosts File Errors” in the document SSL VPN Remote User Guide.

[Table 3](#) lists remote system requirements for Thin Client.

**Table 3** SSL VPN Remote System Thin Client Requirements

Remote User System Requirements	Specifications or Use Suggestions
Client applications installed.	—
Cookies enabled on browser.	—
Administrator privileges.	You must be the local administrator on your PC.
Sun Microsystems JRE version 1.4 or later installed.	SSL VPN automatically checks for JRE whenever the remote user starts Thin Client. If it is necessary to install JRE, a pop-up window displays directing remote users to a site where it is available.

**Table 3**      **SSL VPN Remote System Thin Client Requirements (continued)**

Remote User System Requirements	Specifications or Use Suggestions
<p>Client applications configured, if necessary.</p> <p><b>Note</b>    The Microsoft Outlook client does not require this configuration step.</p>	<p>To configure the client application, use the locally mapped IP address and port number of the server. To find this information, do the following:</p> <ul style="list-style-type: none"> <li>• Start SSL VPN on the remote system and click the Thin Client link on the SSL VPN home page. The Thin Client window is displayed.</li> <li>• In the Name column, find the name of the server that you want to use, and then identify its corresponding client IP address and port number (in the Local column).</li> <li>• Use this IP address and port number to configure the client application. The configuration steps vary for each client application.</li> </ul>
Windows XP SP2 patch.	<p>If you are running Windows XP SP2, you must install a patch from Microsoft that is available at the following address:</p> <p><a href="http://support.microsoft.com/?kbid=884020">http://support.microsoft.com/?kbid=884020</a></p> <p>This problem is a known Microsoft issue.</p>

## URL Obfuscation

The URL Obfuscation feature provides administrators with the ability to obfuscate, or mask, sensitive portions of an enterprise URL, such as IP addresses, hostnames, or part numbers. For example, if URL masking is configured for a user, the URL in the address bar could have the port and hostname portion garbled, as in this example:

`https://slvpn-gateway.examplecompany.com/http/cF9HxnBjRmSFzBWpDtfXfigzL559MQo51Qj/cgi-bin/submit.p`

For information about configuring this feature, see the section “[Associating an SSO Server with a Policy Group](#).”

## URL Rewrite Splitter

Effective with Cisco IOS Release 12.4(20)T, the URL Rewrite Splitter feature allows administrators to mangle selective URLs. Mangling is a CPU-intensive and time-consuming process, so mangling only selective URLs can result in a savings of memory and time.

For information about configuring this feature, see the section “[Configuring a URL Rewrite Splitter](#).”

## User-Level Bookmarking

Effective with Cisco IOS Release 12.4(15)T, users can bookmark URLs while connected through an SSL VPN tunnel. Users can access the bookmarked URLs by clicking the URLs.

User-level bookmarking is turned by default. There is no way to turn it off. To set the storage location, administrators can use the **user-profile location** command. If the **user-profile location** command is not configured, the location `flash:/webvpn/{context name}/` is used.

## Other SSL VPN Features

Table 4 lists the requirements for various SSL VPN features.

**Table 4** *SSL VPN Remote User System Requirements*

Task	Remote User System Requirements	Additional Information
Web Browsing	Username and passwords for protected websites	Users should log out on SSL VPN sessions when they are finished.
		<p>The look and feel of web browsing with SSL VPN might be different from what users are accustomed to. For example, when they are using SSL VPN, the following should be noted:</p> <ul style="list-style-type: none"> <li>• The SSL VPN title bar appears above each web page.</li> <li>• Websites can be accessed as follows: <ul style="list-style-type: none"> <li>– Entering the URL in the Enter Web Address field on the SSL VPN home page</li> <li>– Clicking a preconfigured website link on the SSL VPN home page</li> <li>– Clicking a link on a webpage accessed by one of the previous two methods</li> </ul> </li> </ul> <p>Also, depending on how a particular account was configured, the following might have occurred:</p> <ul style="list-style-type: none"> <li>• Some websites are blocked.</li> <li>• Only the websites that appear as links on the SSL VPN home page are available.</li> </ul>
Network Browsing and File Management	File permissions configured for shared remote access	Only shared folders and files are accessible through SSL VPN.
	Server name and passwords are necessary for protected file servers	
	Domain, workgroup, and server names where folders and files reside	A user might not be familiar with how to locate his or her files through the network of an organization.
	<p><b>Note</b> The user should not interrupt the Copy File to Server operation or navigate to a different window while the copying is in progress. Interrupting this operation can cause an incomplete file to be saved on the server.</p>	

**Table 4**      **SSL VPN Remote User System Requirements (continued)**

Task	Remote User System Requirements	Additional Information
Using e-mail: Thin Client	Same requirements as for Thin Client (see the <a href="#">“TCP Port Forwarding and Thin Client”</a> section on page 20)	To use e-mail, users must start Thin Client from the SSL VPN home page. The e-mail client is then available for use.
	<b>Note</b> If a user is using an IMAP client and loses the e-mail server connection or is unable to make a new connection, the user should close the IMAP application and restart SSL VPN.	
	Other Mail Clients	Microsoft Outlook Express versions 5.5 and 6.0 have been tested.  SSL VPN should support other SMTPS, POP3S, or IMAP4S e-mail programs, such as Netscape Mail, Lotus Notes, and Eudora, but they have not been verified.

**Table 4** *SSL VPN Remote User System Requirements (continued)*

Task	Remote User System Requirements	Additional Information
Using e-mail: Web Access	Web-based e-mail product installed	<p>Supported products are as follows:</p> <ul style="list-style-type: none"> <li>OWA 5.5, 2000, and 2003</li> </ul> <p>Netscape, Mozilla, and Internet Explorer are supported with OWA 5.5 and 2000.</p> <p>Internet Explorer 6.0 or later version is required with OWA 2003. Netscape and Mozilla are supported with OWA 2003.</p> <ul style="list-style-type: none"> <li>Lotus Notes</li> </ul> <p>Operating system support:</p> <p> <b>Note</b> Later versions of the following browsers are also supported.</p> <ul style="list-style-type: none"> <li>Microsoft Windows 2000, Windows XP, or Windows Vista</li> <li>Macintosh OS X 10.4.6</li> <li>Linux (Redhat RHEL 3.0 +, FEDORA 5, or FEDORA 6)</li> </ul> <p>SSL VPN-supported browser:</p> <p>The following browsers have been verified for SSL VPN. Other browsers might not fully support SSL VPN features.</p> <p> <b>Note</b> Later versions of the following software are also supported.</p> <ul style="list-style-type: none"> <li>Internet Explorer 6.0 or 7.0</li> <li>Firefox 2.0 (Windows and Linux)</li> <li>Safari 2.0.3</li> </ul> <p>Other web-based e-mail products should also work, but they have not been verified.</p>
Using the Cisco Tunnel Connection		To retrieve Tunnel Connection log messages using the Windows Event Viewer, go to Program Files > Administrative Tools > Event Viewer in Windows.
Using Secure Desktop Manager	A Secure Desktop Manager-supported browser	<p>On Microsoft Windows:</p> <ul style="list-style-type: none"> <li>Internet Explorer version 6.0 or 7.0</li> <li>Netscape version 7.2</li> </ul> <p>On Linux:</p> <ul style="list-style-type: none"> <li>Netscape version 7.2</li> </ul>

**Table 4** *SSL VPN Remote User System Requirements (continued)*

Task	Remote User System Requirements	Additional Information
Using Cache Cleaner or Secure Desktop	A Cisco Secure Desktop-supported browser	Any browser supported for Secure Desktop Manager.

## Platform Support

For information about platform support for the SSL VPN feature, see the data sheet [Cisco IOS SSL VPN](#) (“Feature Availability” section).

## Licensing

Cisco IOS SSL VPN is a licensed feature available on Cisco routers running the Cisco IOS Advanced Security feature set. Each security bundle entitles you to a certain number of free users. Beyond that, you need to purchase additional feature licenses. For more information about licensing, see the bulletin [Cisco IOS SSL VPN Licensing Information](#).

# How to Configure SSL VPN Services on a Router

This section contains the following tasks and shows whether they are required or optional:

### Configuring and Enabling SSL VPN Services

- [Configuring an SSL VPN Gateway, page 27](#) (required)
- [Configuring a Generic SSL VPN Gateway, page 29](#) (optional)
- [Configuring an SSL VPN Context, page 30](#) (required)
- [Configuring an SSL VPN Policy Group, page 34](#) (required)

### Configuring AAA-Related Features for SSL VPN

- [Configuring Local AAA Authentication for SSL VPN User Sessions, page 37](#) (optional)
- [Configuring AAA for SSL VPN Users Using a Secure Access Control Server, page 38](#) (optional)
- [Configuring RADIUS Accounting for SSL VPN User Sessions, page 40](#) (optional)
- [Monitoring and Maintaining RADIUS Accounting for an SSL VPN Session, page 41](#) (optional)
- [Configuring RADIUS Attribute Support for SSL VPN, page 41](#) (optional)

### Customizing and Enabling SSL VPN Features

- [Configuring a URL List for Clientless Remote Access, page 44](#) (optional)
- [Configuring Microsoft File Shares for Clientless Remote Access, page 46](#) (optional)
- [Configuring Citrix Application Support for Clientless Remote Access, page 49](#) (optional)
- [Configuring Application Port Forwarding, page 50](#) (optional)
- [Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files, page 53](#) (optional)
- [Configuring Cisco Secure Desktop Support, page 55](#) (optional)

- [Configuring Cisco AnyConnect VPN Client Full Tunnel Support, page 56](#) (optional)
- [Configuring Advanced SSL VPN Tunnel Features, page 61](#) (optional)
- [Configuring VRF Virtualization, page 64](#) (optional)
- [Configuring ACL Rules, page 65](#) (optional)
- [Associating an ACL Attribute with a Policy Group, page 68](#) (optional)
- [Configuring SSO Netegrity Cookie Support for a Virtual Context, page 69](#) (optional)
- [Associating an SSO Server with a Policy Group, page 71](#) (optional)
- [Configuring URL Obfuscation \(Masking\), page 71](#) (optional)
- [Adding a CIFS Server URL List to an SSL VPN Context and Attaching It to a Policy Group, page 72](#) (optional)
- [Configuring User-Level Bookmarks, page 74](#) (optional)
- [Configuring FVRF, page 75](#) (optional)
- [Disabling Full-Tunnel CEF, page 76](#) (optional)
- [Configuring Automatic Authentication and Authorization, page 77](#) (optional)
- [Configuring a URL Rewrite Splitter, page 78](#) (optional)
- [Configuring a Backend HTTP Proxy, page 79](#) (optional)
- [Configuring Stateless High Availability with HSRP for SSL VPN, page 80](#) (optional)

#### Monitoring and Maintaining SSL VPN Features

- [Using SSL VPN Clear Commands, page 81](#) (optional)
- [Verifying SSL VPN Configurations, page 82](#) (optional)
- [Using SSL VPN Debug Commands, page 84](#) (optional)

## Configuring an SSL VPN Gateway

The SSL VPN gateway acts as a proxy for connections to protected resources. Protected resources are accessed through an SSL-encrypted connection between the gateway and a web-enabled browser on a remote device, such as a personal computer. Entering the **webvpn gateway** command places the router in SSL VPN gateway configuration mode. The following are accomplished in this task:

- The gateway is configured with an IP address.
- A port number is configured to carry HTTPS traffic (443 is default).
- A hostname is configured for the gateway.
- Crypto encryption and trust points are configured.
- The gateway is configured to redirect HTTP traffic (port 80) over HTTPS.
- The gateway is enabled.

## SSL VPN Encryption

The SSL VPN provides remote-access connectivity from almost any Internet-enabled location using only a web browser and its native SSL encryption. The **ssl encryption** command is configured to restrict the encryption algorithms that SSL uses in Cisco IOS software.

**Note**

There is a known compatibility issue with the encryption type and Java. If the Java port-forwarding applet does not download properly and the configuration line **ssl encryption 3des-sha1 aes-sha1** is present, you should remove the line from the webvpn gateway subconfiguration.

## SSL VPN Trustpoints

The configuration of the **ssl trustpoint** command is required only if you need to configure a specific CA certificate. A self-signed certificate is automatically generated when an SSL VPN gateway is put in service.

### SUMMARY STEPS

#### Required Steps

1. **enable**
2. **configure terminal**
3. **webvpn gateway** *name*

#### Optional Steps

4. **hostname** *name*
5. **ip address** *number* [*port number*] [*standby name*]
6. **http-redirect** [*port number*]
7. **ssl encryption** [*3des-sha1*] [*aes-sha1*] [*rc4-md5*]
8. **ssl trustpoint** *name*
9. **inservice**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn gateway</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn gateway GW_1	Enters webvpn gateway configuration mode to configure an SSL VPN gateway. <ul style="list-style-type: none"><li>• Only one gateway is configured in an SSL VPN-enabled network.</li></ul>
Step 4	<b>hostname</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-gateway)# hostname VPN_1	Configures the hostname for an SSL VPN gateway.

	Command or Action	Purpose
Step 5	<b>ip address</b> <i>number</i> [ <b>port</b> <i>number</i> ] [ <b>standby</b> <i>name</i> ]  <b>Example:</b> Router(config-webvpn-gateway)# ip address 10.1.1.1	Configures a proxy IP address on an SSL VPN gateway. <ul style="list-style-type: none"> <li><b>port</b>—Specifies the port number for proxy traffic. A number from 1 to 65535 can be entered for this argument.</li> <li><b>standby</b>—Indicates that the gateway is standby. A redundancy group name must be entered for the <i>name</i> argument.</li> </ul>
Step 6	<b>http-redirect</b> [ <b>port</b> <i>number</i> ]  <b>Example:</b> Router(config-webvpn-gateway)# http-redirect	Configures HTTP traffic to be carried over HTTPS. <ul style="list-style-type: none"> <li>When this command is enabled, the SSL VPN gateway listens on port 80 and redirects HTTP traffic over port 443 or the port number specified with the <b>port</b> keyword.</li> </ul>
Step 7	<b>ssl encryption</b> [ <b>3des-sha1</b> ] [ <b>aes-sha1</b> ] [ <b>rc4-md5</b> ]  <b>Example:</b> Router(config-webvpn-gateway)# ssl encryption rc4-md5	Specifies the encryption algorithm that the SSL protocol uses for SSL VPN connections. <ul style="list-style-type: none"> <li>The ordering of the algorithms specifies the preference.</li> </ul>
Step 8	<b>ssl trustpoint</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-gateway)# ssl trustpoint CA_CERT	(Optional if a self-signed certificate is to be used.) Configures the certificate trust point on an SSL VPN gateway.  <b>Tip</b> Entering the <b>no</b> form of this command configures the SSL VPN gateway to revert to using an autogenerated self-signed certificate.
Step 9	<b>inservice</b>  <b>Example:</b> Router(config-webvpn-gateway)# inservice	Enables an SSL VPN gateway.  A gateway cannot be enabled or put “in service” until a proxy IP address has been configured.

## What to Do Next

SSL VPN context and policy group configurations must be configured before an SSL VPN gateway can be operationally deployed. Proceed to the section “[Configuring an SSL VPN Context](#)” to see information on SSL VPN context configuration.

## Configuring a Generic SSL VPN Gateway

To configure a generic SSL VPN gateway, perform the following steps in privileged EXEC mode.

### Note

The advantage of this configuration over the one in the configuration task “[Configuring an SSL VPN Gateway](#)” is that basic commands and context can be configured quickly using just the **webvpn enable** command.

## SUMMARY STEPS

1. **enable**
2. **webvpn enable** *gateway\_IP-address*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>webvpn enable name</b> <i>gateway_IP-address</i>  <b>Example:</b> Router# configure terminal	Enables an SSL VPN gateway.

## Configuring an SSL VPN Context

The SSL VPN context defines the virtual configuration of the SSL VPN. Entering the **webvpn context** command places the router in SSL VPN configuration mode. The following are accomplished in this task:

- A gateway and domain is associated.
- The AAA authentication method is specified.
- A group policy is associated.
- The remote user portal (web page) is customized.
- A limit on the number users sessions is configured.
- The context is enabled.

## Context Defaults

The **ssl authenticate verify all** command is enabled by default when a context configuration is created. The context cannot be removed from the router configuration while an SSL VPN gateway is in an enabled state (in service).

## Configuring a Virtual Host

A virtual hostname is specified when multiple virtual hosts are mapped to the same IP address on the SSL VPN gateway (similar to the operation of a canonical domain name). The virtual hostname differentiates host requests on the gateway. The host header in the HTTP message is modified to direct traffic to the virtual host. The virtual hostname is configured with the **gateway** command in webvpn context configuration mode.

## Prerequisites

The SSL VPN gateway configuration has been completed.

## SUMMARY STEPS

### Required Steps

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*

### Optional Steps

4. **aaa authentication** { **domain** *name* | **list** *name* }
5. **policy group** *name*
6. **exit**
7. **default-group-policy** *name*
8. **exit**
9. **gateway** *name* [**domain** *name* | **virtual-host** *name*]
10. **inservice**
11. **login-message** [*message-string*]
12. **logo** [**file** *filename* | **none**]
13. **max-users** *number*
14. **secondary-color** *color*
15. **secondary-text-color** { **black** | **white** }
16. **title** [*title-string*]
17. **title-color** *color*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
	<b>Example:</b> Router> enable	
Step 2	<b>configure terminal</b>	Enters global configuration mode.
	<b>Example:</b> Router# configure terminal	

	Command or Action	Purpose
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.  <b>Tip</b> The context can be optionally named using the domain or virtual hostname. This is recommended as a best practice. It simplifies the management of multiple context configurations.
Step 4	<b>aaa authentication</b> { <i>domain name</i>   <b>list</b> <i>name</i> }  <b>Example:</b> Router(config-webvpn-context)# aaa authentication domain SERVER_GROUP	Specifies a list or method for SSL VPN remote-user authentication.  <b>Tip</b> If this command is not configured, the SSL VPN gateway will use global authentication, authorization, and accounting (AAA) parameters (if configured) for remote-user authentication.
Step 5	<b>policy group</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# policy group ONE	Creates a policy group within the SSL VPN context and enters webvpn group policy configuration mode.  <ul style="list-style-type: none"> <li>Used to define a policy that can be applied to the user.</li> </ul>
Step 6	<b>exit</b>  <b>Example:</b> Router(webvpn-group-policy)# exit	Exits webvpn group policy configuration mode.
Step 7	<b>default-group-policy</b> <i>name</i>  <b>Example:</b> Router(webvpn-group-policy)# default-group-policy ONE	Associates a a group policy with an SSL VPN context configuration.  <ul style="list-style-type: none"> <li>This command is configured to attach the policy group to the SSL VPN context when multiple group policies are defined under the context.</li> <li>This policy will be used as default, unless a AAA server pushes an attribute that specifically requests another group policy.</li> </ul>
Step 8	<b>exit</b>  <b>Example:</b> Router(webvpn-group-policy)# exit	Exits webvpn group policy configuration mode.
Step 9	<b>gateway</b> <i>name</i> [ <i>domain name</i>   <b>virtual-host</b> <i>name</i> ]  <b>Example:</b> Router(config-webvpn-context)# gateway GW_1 domain cisco.com	Associates an SSL VPN gateway with an SSL VPN context.  <ul style="list-style-type: none"> <li>The gateway configured in the first configuration task table is associated with the SSL VPN context in this configuration step.</li> </ul>
Step 10	<b>inservice</b>  <b>Example:</b> Router(config-webvpn-gateway)# inservice	Enables an SSL VPN context configuration.  <ul style="list-style-type: none"> <li>The context is put “in service” by entering this command. However, the context is not operational until it is associated with an enabled SSL VPN gateway.</li> </ul>

	Command or Action	Purpose
Step 11	<b>login-message</b> <i>[message-string]</i>  <b>Example:</b> Router(config-webvpn-context)# login-message "Please enter your login credentials"	Configures a message for the user login text box displayed on the login page.
Step 12	<b>logo</b> [ <b>file</b> <i>filename</i>   <b>none</b> ]  <b>Example:</b> Router(config-webvpn-context)# logo file flash:/mylogo.gif	Configures a custom logo to be displayed on the login and portal pages of an SSL VPN. <ul style="list-style-type: none"> <li>The source image file for the logo is a gif, jpg, or png file that is up to 255 characters in length (filename) and up to 100 KB in size.</li> <li>The file is referenced from a local file system, such as flash memory. An error message will be displayed if the file is not referenced from a local file system.</li> <li>No logo will be displayed if the image file is removed from the local file system.</li> </ul>
Step 13	<b>max-users</b> <i>number</i>  <b>Example:</b> Router(config-webvpn-context)# max-users 500	Limits the number of connections to an SSL VPN that will be permitted.
Step 14	<b>secondary-color</b> <i>color</i>  <b>Example:</b> Router(config-webvpn-context)# secondary-color darkseagreen Router(config-webvpn-context)# secondary-color #8FBC8F Router(config-webvpn-context)# secondary-color 143,188,143	Configures the color of the secondary title bars on the login and portal pages of an SSL VPN. <ul style="list-style-type: none"> <li>The value for the <i>color</i> argument is entered as a comma-separated red, green, blue (RGB) value, an HTML color value (beginning with a pound sign [#]), or the name of the color that is recognized in HTML (no spaces between words or characters). The value is limited to 32 characters. The value is parsed to ensure that it matches one of the following formats (using Perl regex notation): <ul style="list-style-type: none"> <li><code>\#/x{6}</code></li> <li><code>\d{1,3},\d{1,3},\d{1,3}</code> (and each number is from 1 to 255)</li> <li><code>\w+</code></li> </ul> </li> <li>The default color is purple.</li> <li>The example shows the three forms that the color can be configured.</li> </ul>
Step 15	<b>secondary-text-color</b> { <b>black</b>   <b>white</b> }  <b>Example:</b> Router(config-webvpn-context)# secondary-text-color white	Configures the color of the text on the secondary bars of an SSL VPN. <ul style="list-style-type: none"> <li>The color of the text on the secondary bars must be aligned with the color of the text on the title bar.</li> <li>The default color is black.</li> </ul>

Command or Action	Purpose
<p><b>Step 16</b> <code>title [title-string]</code></p> <p><b>Example:</b>  Router(config-webvpn-context)# title "Secure  Access: Unauthorized users prohibited"</p>	<p>Configures the HTML title string that is shown in the browser title and on the title bar of an SSL VPN.</p> <ul style="list-style-type: none"> <li>The optional form of the <b>title</b> command is entered to configure a custom text string. If this command is issued without entering a text string, a title will not be displayed in the browser window. If the <b>no</b> form of this command is used, the default title string "WebVPN Service" is displayed.</li> </ul>
<p><b>Step 17</b> <code>title-color color</code></p> <p><b>Example:</b>  Router(config-webvpn-context)# title-color  darkseagreen  Router(config-webvpn-context)# title-color #8FBC8F  Router(config-webvpn-context)# title-color  143,188,143</p>	<p>Specifies the color of the title bars on the login and portal pages of an SSL VPN.</p> <ul style="list-style-type: none"> <li>The value for the <i>color</i> argument is entered as a comma-separated red, green, blue (RGB) value, an HTML color value (beginning with a pound sign [#]), or the name of the color that is recognized in HTML (no spaces between words or characters). The value is limited to 32 characters. The value is parsed to ensure that it matches one of the following formats (using Perl regex notation): <ul style="list-style-type: none"> <li><code>\#/x{6}</code></li> <li><code>\d{1,3},\d{1,3},\d{1,3}</code> (and each number is from 1 to 255)</li> <li><code>\w+</code></li> </ul> </li> <li>The default color is purple.</li> <li>The example shows the three forms that can be used to configure the title color.</li> </ul>

## What to Do Next

an SSL VPN policy group configuration must be defined before an SSL VPN gateway can be operationally deployed. Proceed to the next section to see information on SSL VPN policy group configuration.

## Configuring an SSL VPN Policy Group

The policy group is a container that defines the presentation of the portal and the permissions for resources that are configured for a group of remote users. Entering the **policy group** command places the router in webvpn group policy configuration mode. After it is configured, the group policy is attached to the SSL VPN context configuration by configuring the **default-group-policy** command. The following tasks are accomplished in this configuration:

- The presentation of the SSL VPN portal page is configured.
- A NetBIOS server list is referenced.
- A port-forwarding list is referenced.
- The idle and session timers are configured.
- A URL list is referenced.

## Outlook Web Access 2003

OWA 2003 is supported by the SSL VPN gateway upon completion of this task. The Outlook Exchange Server must be reachable by the SSL VPN gateway via TCP/IP.

## URL-List Configuration

A URL list can be configured under the SSL VPN context configuration and then separately for each individual policy group configuration. Individual URL list configurations must have unique names.

### SUMMARY STEPS

#### Required Steps

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **policy group** *name*

#### Optional Steps

5. **banner** *string*
6. **hide-url-bar**
7. **nbns-list** *name*
8. **port-forward** *name* [**auto-download**] | [**http-proxy** [**proxy-url** {*homepage-url*}]]
9. **timeout** {**idle** *seconds* | **session** *seconds*}
10. **url-list** *name*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>policy group</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# policy group ONE	Enters webvpn group policy configuration mode to configure a group policy.

	Command or Action	Purpose
Step 5	<b>banner</b> <i>string</i>  <b>Example:</b> Router(config-webvpn-group)# banner "Login Successful"	Configures a banner to be displayed after a successful login.
Step 6	<b>hide-url-bar</b>  <b>Example:</b> Router(config-webvpn-group)# hide-url-bar	Prevents the URL bar from being displayed on the SSL VPN portal page.
Step 7	<b>nbns-list</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-group)# nbns-list SERVER_LIST	Attaches a NetBIOS Name Service (NBNS) server list to a policy group configuration. <ul style="list-style-type: none"> <li>The NBNS server list is first defined in SSL VPN NBNS list configuration mode.</li> </ul>
Step 8	<b>port-forward</b> <i>name</i> [ <b>auto-download</b> ]   [ <b>http-proxy</b> [ <b>proxy-url</b> { <i>homepage-url</i> }]]  <b>Example:</b> Router(config-webvpn-group)# port-forward EMAIL auto-download http-proxy proxy-url "http://www.example.com"	Attaches a port-forwarding list to a policy group configuration. <ul style="list-style-type: none"> <li><b>auto-download</b>—(Optional) Allows for automatic download of the port-forwarding Java applet on the portal page of a website.</li> <li><b>http-proxy</b>—(Optional) Allows the Java applet to act as a proxy for the browser of the user.</li> <li><b>proxy-url</b>—(Optional) Page at this URL address opens as the portal (home) page of the user.</li> <li><i>homepage-url</i>—URL of the homepage.</li> </ul>
Step 9	<b>timeout</b> { <b>idle</b> <i>seconds</i>   <b>session</b> <i>seconds</i> }  <b>Example:</b> Router(config-webvpn-group)# timeout idle 1800 Router(config-webvpn-group)# timeout session 36000	Configures the length of time that a remote user session can remain idle or the total length of time that the session can remain connected. <ul style="list-style-type: none"> <li>Upon expiration of either timer, the remote user connection is closed. The remote user must login (reauthenticate) to access the SSL VPN.</li> </ul>
Step 10	<b>url-list</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-group)# url-list ACCESS	Attaches a URL list to policy group configuration.

## What to Do Next

At the completion of this task, the SSL VPN gateway and context configurations are operational and enabled (in service), and the policy group has been defined. The SSL VPN gateway is operational for clientless remote access (HTTPS only). Proceed to the next section to see information about configuring AAA for remote-user connections.

## Configuring Local AAA Authentication for SSL VPN User Sessions

The steps in this task show how to configure a local AAA database for remote-user authentication. AAA is configured in global configuration mode. In this task, the **aaa authentication** command is not configured under the SSL VPN context configuration. Omitting this command from the SSL VPN context configuration causes the SSL VPN gateway to use global authentication parameters by default.

### Prerequisites

SSL VPN gateway and context configurations are enabled and operational.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **username {name secret [0 | 5] password}**
5. **aaa authentication login default local**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>aaa new-model</b>  <b>Example:</b> Router(config)# aaa new-model	Enables the AAA access control model.
Step 4	<b>username {name secret [0   5] password}</b>  <b>Example:</b> Router(config)# username USER1 secret 0 PsW2143	Establishes a username based authentication system. <ul style="list-style-type: none"><li>• Entering <b>0</b> configures the password as clear text.</li><li>• Entering <b>5</b> encrypts the password.</li></ul>
Step 5	<b>aaa authentication login default local</b>  <b>Example:</b> Router(config)# aaa authentication login default local	Configures local AAA authentication.

## What to Do Next

The database that is configured for remote-user authentication on the SSL VPN gateway can be a local database, as shown in this task, or the database can be accessed through any RADIUS or TACACS+ AAA server.

It is recommended that you use a separate AAA server, such as a Cisco ACS. A separate AAA server provides a more robust security solution. It allows you to configure unique passwords for each remote user and accounting and logging for remote-user sessions. Proceed to the next section to see more information.

## Configuring AAA for SSL VPN Users Using a Secure Access Control Server

The steps in this task show how to configure AAA using a separate RADIUS or TACACS+ server. AAA is configured in global configuration mode. The authentication list/method is referenced in the SSL VPN context configuration with the **aaa authentication** command. The steps in this task configure AAA using a RADIUS server.

### Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
- A RADIUS or TACACS+ AAA server is operational and reachable from the SSL VPN gateway.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa group server** {*radius group-name* | *tacacs+ group-name*}
5. **server** *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*]
6. **exit**
7. **aaa authentication login** {**default** | *list-name*} *method1* [*method2...*]
8. **radius-server host** {*hostname* | *ip-address*} [**auth-port** *port-number*] [**acct-port** *port-number*] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*] [**alias**{*hostname* | *ip-address*}]
9. **webvpn context** *name*
10. **aaa authentication** {**domain** *name* | **list** *name*}

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>aaa new-model</b>  <b>Example:</b> Router(config)# aaa new-model	Enables the AAA access control model.
Step 4	<b>aaa group server</b> {radius group-name   tacacs+ group-name}  <b>Example:</b> Router(config)# aaa group server radius myServer	Configures a RADIUS or TACACS+ server group and specifies the authentication list or method, and enters server-group configuration mode.
Step 5	<b>server ip-address</b> [auth-port port-number] [acct-port port-number]  <b>Example:</b> Router(config-sg-radius)# server 10.1.1.20 auth-port 1645 acct-port 1646	Configures the IP address of the AAA group server.
Step 6	<b>exit</b>  <b>Example:</b> Router(config-sg-radius)# exit	Exits server-group configuration mode.
Step 7	<b>aaa authentication login</b> {default   list-name} method1 [method2...]  <b>Example:</b> Router(config)# aaa authentication login default local group myServer	Sets AAA login parameters.
Step 8	<b>radius-server host</b> {hostname   ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string] [alias {hostname   ip-address}]  <b>Example:</b> Router(config)# radius-server host 10.1.1.20 auth-port 1645 acct-port 1646	Specifies a host as the group server.

	Command or Action	Purpose
Step 9	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters SSL VPN configuration mode to configure the SSL VPN context.
Step 10	<b>aaa authentication</b> { <b>domain</b> <i>name</i>   <b>list</b> <i>name</i> }  <b>Example:</b> Router(config-webvpn-context)# aaa authentication domain myServer	Configures AAA authentication for SSL VPN sessions.

## What to Do Next

Proceed to the section “[Configuring RADIUS Attribute Support for SSL VPN](#)” to see RADIUS attribute-value pair information introduced to support this feature.

## Configuring RADIUS Accounting for SSL VPN User Sessions

To configure RADIUS accounting for SSL VPN user sessions, perform the following steps.

### Prerequisites

- Before configuring RADIUS accounting for SSL VPN user sessions, you should first have configured AAA-related commands (in global configuration mode) and have set the accounting list.

### SUMMARY STEPS

- enable**
- configure terminal**
- aaa new-model**
- webvpn aaa accounting list** *aaa-list*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	<b>aaa new-model</b>  <b>Example:</b> Router(config)# aaa new-model	Enables the AAA access control model.
Step 4	<b>webvpn aaa accounting-list aaa-list</b>  <b>Example:</b> Router(config)# webvpn aaa accounting-list SSL VPNaaa	Enables AAA accounting when you are using RADIUS for SSL VPN sessions.

## Monitoring and Maintaining RADIUS Accounting for an SSL VPN Session

To monitor and maintain your RADIUS accounting configuration, perform the following steps (the **debug** commands can be used together or individually).

### SUMMARY STEPS

1. **enable**
2. **debug webvpn aaa**
3. **debug aaa accounting**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>debug webvpn aaa</b>  <b>Example:</b> Router# debug webvpn aaa	Enables SSL VPN session monitoring for AAA.
Step 3	<b>debug aaa accounting</b>  <b>Example:</b> Router# debug aaa accounting	Displays information on accountable events as they occur.

## Configuring RADIUS Attribute Support for SSL VPN

This section lists RADIUS attribute-value (AV) pair information introduced to support SSL VPN. For information on using RADIUS AV pairs with Cisco IOS software, see the “Configuring RADIUS” chapter in the *Cisco IOS Security Configuration Guide, Release 12.4* at the following URL:

[http://www.cisco.com/en/US/customer/products/ps6350/products\\_configuration\\_guide\\_chapter09186a00804ec61e.html](http://www.cisco.com/en/US/customer/products/ps6350/products_configuration_guide_chapter09186a00804ec61e.html)

Table 5 shows information about SSL VPN RADIUS attribute-value pairs.

**Note**

All SSL VPN attributes (except for the standard IETF RADIUS attributes) start with **webvpn:** as follows:

```
webvpn:urllist-name=cisco
webvpn:nbnslist-name=cifs
webvpn:default-domain=cisco.com
```

**Table 5** *SSL VPN RADIUS Attribute-Value Pairs*

Attribute	Type of Value	Values	Default
addr (Framed-IP-Address <sup>1</sup> )	ipaddr	<i>IP_address</i>	
addr-pool	string	<i>name</i>	
auto-applet-download	integer	0 (disable) 1 (enable) <sup>2</sup>	0
banner	string		
citrix-enabled	integer	0 (disable) 1 (enable) <sup>3</sup>	0
default-domain	string		
dns-servers	ipaddr	<i>IP_address</i>	
dpd-client-timeout	integer (seconds)	0 (disabled)–3600	300
dpd-gateway-timeout	integer (seconds)	0 (disabled)–3600	300
file-access	integer	0 (disable) 1 (enable) <sup>3</sup>	0
file-browse	integer	0 (disable) 1 (enable) <sup>3</sup>	0
file-entry	integer	0 (disable) 1 (enable) <sup>3</sup>	0
hide-urlbar	integer	0 (disable) 1 (enable) <sup>3</sup>	0
home-page	string		
idletime (Idle-Timeout <sup>1</sup> )	integer (seconds)	0–3600	2100
ie-proxy-exception	string	<i>DNS_name</i>	
	ipaddr	<i>IP_address</i>	
ie-proxy-server	ipaddr	<i>IP_address</i>	
inacl	integer	1–199, 1300–2699	
	string	<i>name</i>	
keep-svc-installed	integer	0 (disable) 1 (enable) <sup>3</sup>	1
nbnslist-name	string	<i>name</i>	

**Table 5** *SSL VPN RADIUS Attribute-Value Pairs (continued)*

Attribute	Type of Value	Values	Default
netmask (Framed-IP-Netmask <sup>1</sup> )	ipaddr	<i>IP_address_mask</i>	
port-forward-auto	integer	0 (disable) 1 (enable)	If this AV pair is not configured, the default is whatever was configured for the group policy.  If this AV pair is configured with an integer of 1, the 1 will override a group policy value of 0.
port-forward-http-proxy	integer	0 (disable) 1 (enable)	HTTP proxy is not enabled.  If this AV pair is configured with an integer of 1, the 1 will override a group policy value of 0.
port-forward-http-proxy-url	string	URL address (for example, <i>http://example.com</i> )	
port-forward-name	string	<i>name</i>	
primary-dns	ipaddr	<i>IP_address</i>	
rekey-interval	integer (seconds)	0–43200	21600
secondary-dns	ipaddr	<i>IP_address</i>	
split-dns	string		
split-exclude <sup>4</sup>	ipaddr ipaddr	<i>IP_address</i> <i>IP_address_mask</i>	
	word	local-lans	
split-include <sup>4</sup>	ipaddr ipaddr	<i>IP_address</i> <i>IP_address_mask</i>	
sso-server-name	string	<i>name</i>	

**Table 5**      **SSL VPN RADIUS Attribute-Value Pairs (continued)**

Attribute	Type of Value	Values	Default
svc-enabled <sup>5</sup>	integer	0 (disable) 1 (enable) <sup>3</sup>	0
svc-ie-proxy-policy	word	none, auto, bypass-local	
svc-required <sup>5</sup>	integer	0 (disable) 1 (enable) <sup>3</sup>	0
timeout (Session-Timeout <sup>1</sup> )	integer (seconds)	1–1209600	43200
urllist-name	string	<i>name</i>	
user-vpn-group	string	<i>name</i>	
wins-server-primary	ipaddr	<i>IP_address</i>	
wins-servers	ipaddr	<i>IP_address</i>	
wins-server-secondary	ipaddr	<i>IP_address</i>	

1. Standard IETF RADIUS attributes.
2. Any integer other than 0 enables this feature.
3. Any integer other than 0 enables this feature.
4. You can specify either split-include or split-exclude, but you cannot specify both options.
5. You can specify either svc-enable or svc-required, but you cannot specify both options.

## What to Do Next

Proceed to the next section to see information about customizing the URL list configured in Step 10 of the section “[Configuring an SSL VPN Policy Group](#).”

## Configuring a URL List for Clientless Remote Access

The steps in this configuration task show how to configure a URL list. The URL list, as the name implies, is a list of HTTP URLs that are displayed on the portal page after a successful login. The URL list is configured in webvpn context configuration and webvpn group policy configuration modes.

## Prerequisites

SSL VPN gateway and context configurations are enabled and operational.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **url-list** *name*
5. **heading** *text-string*
6. **url-text** {*name* **url-value** *url*}

7. **exit**
8. **policy group** *name*
9. **url-list** *name*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>url-list</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# url-list ACCESS	Enters enter webvpn URL list configuration mode to configure the list of URLs to which a user has access on the portal page of an SSL VPN.
Step 5	<b>heading</b> <i>text-string</i>  <b>Example:</b> Router(config-webvpn-url)# heading "Quick Links"	Configures the heading that is displayed above URLs listed on the portal page of an SSL VPN. <ul style="list-style-type: none"> <li>The URL list heading entered as a text string. The heading must be entered inside of quotation marks if it contains spaces.</li> </ul>
Step 6	<b>url-text</b> { <i>name</i> <b>url-value</b> <i>url</i> }  <b>Example:</b> Router(config-webvpn-url)# url-text "Human Resources" url-value hr.mycompany.com	Adds an entry to a URL list.
Step 7	<b>exit</b>  <b>Example:</b> Router(config-webvpn-url)# exit	Exits webvpn URL list configuration mode, and enters SSL VPN context configuration mode.
Step 8	<b>policy group</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# policy group ONE	Enters webvpn group policy configuration mode to configure a group policy.
Step 9	<b>url-list</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-group)# url-list ACCESS	Attaches the URL list to the policy group configuration.

## What to Do Next

Proceed to the next section to see information about configuring clientless remote access to file shares.

## Configuring Microsoft File Shares for Clientless Remote Access

In clientless remote access mode, files and directories created on Microsoft Windows servers can be accessed by the remote client through the HTTPS-enabled browser. When enabled, a list of file server and directory links are displayed on the portal page after login. The administrator can customize permissions on the SSL VPN gateway to provide limited read-only access for a single file or full-write access and network browsing capabilities. The following access capabilities can be configured:

- Network browse (listing of domains)
- Domain browse (listing of servers)
- Server browse (listing of shares)
- Listing files in a share
- Downloading files
- Modifying files
- Creating new directories
- Creating new files
- Deleting files

## Common Internet File System Support

CIFS is the protocol that provides access to Microsoft file shares and support for common operations that allow shared files to be accessed or modified.

## NetBIOS Name Service Resolution

Windows Internet Name Service (WINS) uses NetBIOS name resolution to map and establish connections between Microsoft servers. A single server must be identified by its IP address in this configuration. Up to three servers can be added to the configuration. If multiple servers are added, one server should be configured as the master browser.

## Samba Support

Microsoft file shares can be accessed through the browser on a Linux system that is configured to run Samba.

## Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
- A Microsoft file server is operational and reachable from the SSL VPN gateway over TCP/IP.

## Restrictions

- Only file shares configured on Microsoft Windows 2000 or XP servers are supported.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **nbns-list** *name*
5. **nbns-server** *ip-address* [**master**] [**timeout** *seconds*] [**retries** *number*]
6. **exit**
7. **policy group** *name*
8. **nbns-list** *name*
9. **functions** { **file-access** | **file-browse** | **file-entry** | **svc-enabled** | **svc-required** }

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>nbns-list</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# nbns-list SERVER_LIST	Enters webvpn nbnslist configuration mode to configure an NBNS server list for CIFS name resolution.
Step 5	<b>nbns-server</b> <i>ip-address</i> [ <b>master</b> ] [ <b>timeout</b> <i>seconds</i> ] [ <b>retries</b> <i>number</i> ]  <b>Example:</b> Router(config-webvpn-nbnslist)# nbns-server 172.16.1.1 master Router(config-webvpn-nbnslist)# nbns-server 172.16.2.2 timeout 10 retries 5 Router(config-webvpn-nbnslist)# nbns-server 172.16.3.3 timeout 10 retries 5	Adds a server to an NBNS server list and enters webvpn nbnslist configuration mode. <ul style="list-style-type: none"><li>The server specified with the <i>ip-address</i> argument can be a primary domain controller (PDC) in a Microsoft network.</li><li>When multiple NBNS servers are specified, a single server is configured as master browser.</li><li>Up to three NBNS server statements can be configured.</li></ul>

	Command or Action	Purpose
Step 6	<b>exit</b>  <b>Example:</b> Router(config-webvpn-nbnslist)# exit	Exits webvpn nbnslist configuration mode and enters webvpn context configuration mode.
Step 7	<b>policy group</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# policy group ONE	Enters webvpn group policy configuration mode to configure a group policy.
Step 8	<b>nbns-list</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-group)# nbns-list SERVER_LIST	Attaches a NBNS server list to a policy group configuration.
Step 9	<b>functions</b> { <b>file-access</b>   <b>file-browse</b>   <b>file-entry</b>   <b>svc-enabled</b>   <b>svc-required</b> }  <b>Example:</b> Router(config-webvpn-group)# functions file-access Router(config-webvpn-group)# functions file-browse Router(config-webvpn-group)# functions file-entry	Configures access for Microsoft file shares. <ul style="list-style-type: none"> <li>Entering the <b>file-access</b> keyword enables network file share access. File servers in the server list are listed on the SSL VPN portal page when this keyword is enabled.</li> <li>Entering the <b>file-browse</b> keyword enables browse permissions for server and file shares. The file-access function must be enabled in order to also use this function.</li> <li>Entering the <b>file-entry</b> keyword enables “modify” permissions for files in the shares listed on the SSL VPN portal page.</li> </ul>

## Examples

### NBNS Server List Example

The following example, starting in global configuration mode, configures a server list for NBNS resolution:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# nbns-list SERVER_LIST
Router(config-webvpn-nbnslist)# nbns-server 172.16.1.1 master
Router(config-webvpn-nbnslist)# nbns-server 172.16.2.2 timeout 10 retries 5
Router(config-webvpn-nbnslist)# nbns-server 172.16.3.3 timeout 10 retries 5
Router(config-webvpn-nbnslist)# exit
```

### File Share Permissions Example

The following example attaches the server list to and enables full file and network access permissions for policy group ONE:

```
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# nbns-list SERVER_LIST
Router(config-webvpn-group)# functions file-access
Router(config-webvpn-group)# functions file-browse
Router(config-webvpn-group)# functions file-entry
Router(config-webvpn-group)# end
```

## What to Do Next

Proceed to the next section to see information about configuring clientless remote access for Citrix-enabled applications.

## Configuring Citrix Application Support for Clientless Remote Access

Clientless Citrix support allows the remote user to run Citrix-enabled applications through the SSL VPN as if the application were locally installed (similar to traditional thin-client computing). Citrix applications run on a MetaFrame XP server (or server farm). The SSL VPN gateway provides access to the remote user. The applications run in real time over the SSL VPN. This task shows how to enable Citrix support for policy group remote users.

### ICA Client

The Independent Computing Architecture (ICA) client carries keystrokes and mouse clicks from the remote user to the MetaFrame XP server. ICA traffic is carried over TCP port number 1494. This port is opened when a Citrix application is accessed. If multiple application are accessed, the traffic is carried over a single TCP session.

### Prerequisites

- A Citrix Metaframe XP server is operational and reachable from the SSL VPN gateway over TCP/IP.
- SSL VPN gateway and context configurations are enabled and operational.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* {**permit** | **deny**} *protocol source destination*
4. **webvpn context** *name*
5. **policy group** *name*
6. **citrix enabled**
7. **filter citrix** *extended-acl*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode.
	<b>Example:</b> Router> enable	<ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>	Enters global configuration mode.
	<b>Example:</b> Router# configure terminal	

	Command or Action	Purpose
Step 3	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } <i>protocol source destination</i>  <b>Example:</b> Router(config)# access-list 100 permit ip 192.168.1.0 0.255.255.255 any	Configures the access list mechanism for filtering frames by protocol type or vendor code.
Step 4	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 5	<b>policy group</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# policy group ONE	Enters webvpn group policy configuration mode to configure a group policy.
Step 6	<b>citrix enabled</b>  <b>Example:</b> Router(config-webvpn-group)# citrix enabled	Enables Citrix application support for remote users in a policy group.
Step 7	<b>filter citrix</b> <i>extended-acl</i>  <b>Example:</b> Router(config-webvpn-group)# filter citrix 100	Configures a Citrix Thin Client filter. <ul style="list-style-type: none"> <li>An extended access list is configured to define the Thin Client filter. This filter is used to control remote user access to Citrix applications.</li> </ul>

## Examples

The following example, starting in global configuration mode, enables Citrix application support for remote users with a source IP address in the 192.168.1.0/24 network:

```
Router(config)# access-list 100 permit ip 192.168.1.0 0.255.255.255 any
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# citrix enabled
Router(config-webvpn-group)# filter citrix 100
```

## What to Do Next

Support for standard applications that use well-known port numbers, such as e-mail and Telnet, can be configured using the port forwarding feature. Proceed to the next section to see more information.

## Configuring Application Port Forwarding

Application port forwarding is configured for thin client mode SSL VPN. Port forwarding extends the cryptographic functions of the SSL-protected browser to provide remote access to TCP and UDP-based applications that use well-known port numbers, such as POP3, SMTP, IMAP, Telnet, and SSH.

When port forwarding is enabled, the hosts file on the SSL VPN client is modified to map the application to the port number configured in the forwarding list. The application port mapping is restored to default when the user terminates the SSL VPN session.

## Administrative Privileges on the Remote Client

When enabling port forwarding, the SSL VPN gateway will modify the hosts file on the PC of the remote user. Some software configurations and software security applications will detect this modification and prompt the remote user to select “Yes” to permit. To permit the modification, the remote user must have local administrative privileges.

### Note

There is a known compatibility issue with the encryption type and Java. If the Java port-forwarding applet does not download properly and the configuration line **ssl encryption 3des-sha1 aes-sha1** is present, you should remove the line from the webvpn gateway subconfiguration.

## Prerequisites

SSL VPN gateway and SSL VPN context configurations are enabled and operational.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **port-forward** *name*
5. **local-port** {*number* **remote-server** *name* **remote-port** *number* **description** *text-string*}
6. **exit**
7. **policy group** *name*
8. **port-forward** *name*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.

	Command or Action	Purpose
Step 4	<b>port-forward</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# port-forward EMAIL	Enters webvpn port-forward list configuration mode to configure a port forwarding list.
Step 5	<b>local-port</b> { <i>number</i> <b>remote-server</b> <i>name</i> <b>remote-port</b> <i>number</i> <b>description</b> <i>text-string</i> }  <b>Example:</b> Router(config-webvpn-port-fwd)# local-port 30016 remote-server mail.company.com remote-port 110 description POP3	Remaps (forwards) an application port number in a port forwarding list. <ul style="list-style-type: none"> <li>The remote port number is the well-known port to which the application listens. The local port number is the entry configured in the port forwarding list. A local port number can be configured only once in a given port forwarding list.</li> </ul>
Step 6	<b>exit</b>  <b>Example:</b> Router(config-webvpn-port-fwd)# exit	Exits webvpn port-forward list configuration mode, and enters webvpn context configuration mode.
Step 7	<b>policy group</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# policy group ONE	Enters webvpn group policy configuration mode to configure a group policy.
Step 8	<b>port-forward</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-group)# port-forward EMAIL	Attaches a port forwarding list to a policy group configuration.

## Examples

The following example, starting in global configuration mode, configures port forwarding for well-known e-mail application port numbers:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# port-forward EMAIL
Router(config-webvpn-port-fwd)# local-port 30016 remote-server mail1.company.com
remote-port 110 description POP3
Router(config-webvpn-port-fwd)# local-port 30017 remote-server mail2.company.com
remote-port 25 description SMTP
Router(config-webvpn-port-fwd)# local-port 30018 remote-server mail3.company.com
remote-port 143 description IMAP
Router(config-webvpn-port-fwd)# exit
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# port-forward EMAIL
Router(config-webvpn-group)# end
```

## Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files

The SSL VPN gateway is preconfigured to distribute Cisco Secure Desktop (CSD) and/or Cisco AnyConnect VPN Client software package files to remote users. The files are distributed only when CSD or Cisco AnyConnect VPN Client support is needed. The administrator performs the following tasks to prepare the gateway:

- The current software package is downloaded from [www.cisco.com](http://www.cisco.com).
- The package file is copied to a local file system.
- The package file is installed for distribution by configuring the **webvpn install** command.

**Note**

---

Effective with Cisco IOS Release 12.4(20)T, multiple packages can be downloaded to a gateway.

---

### Remote Client Software Installation Requirements

The remote user must have administrative privileges, and the JRE for Windows version 1.4 or later must be installed before the CSD client package can be installed.

For Cisco AnyConnect VPN Client software installation, the remote user must have either the Java Runtime Environment for Windows (version 1.4 or later), or the browser must support or be configured to permit Active X controls.

### Software Package Download

The latest versions of the CSD and Cisco AnyConnect VPN Client software packages should be installed for distribution on the SSL VPN gateway.

The CSD software package can be downloaded at the following URL:

- <http://www.cisco.com/cgi-bin/tablebuild.pl/securedesktop>

The Cisco AnyConnect VPN Client software package can be downloaded at the following URL:

- <http://www.cisco.com/cgi-bin/tablebuild.pl/anyconnect>

The Cisco SSL VPN Client software package can be downloaded at the following URL:

- <http://www.cisco.com/cgi-bin/tablebuild.pl/sslvpnclient>

**Note**

---

You will be prompted to enter your login name and password to download these files from Cisco.com.

---

### Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
- Software installation packages are copied to a local files system, such as flash memory.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn install** [*csd location-name* | *svc location-name* [**sequence** *sequence-number*]]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn install</b> [ <i>csd location-name</i>   <i>svc location-name</i> [ <b>sequence</b> <i>sequence-number</i> ]]  <b>Example:</b> Router(config)# webvpn install svc flash:/webvpn/svc.pkg	Installs a CSD or Cisco AnyConnect VPN Client package file to an SSL VPN gateway for distribution to remote users. <ul style="list-style-type: none"><li>• The CSD and Cisco AnyConnect VPN Client software packages are pushed to remote users as access is needed.</li><li>• The <b>sequence</b> keyword and <i>sequence-number</i> argument are used to install multiple packages to a gateway.</li></ul>

## Examples

The following example, starting in global configuration mode, installs the Cisco AnyConnect VPN Client package to an SSL VPN gateway:

```
Router(config)# webvpn install svc flash:/webvpn/svc.pkg
SSL VPN Package SSL-VPN-Client : installed successfully
```

The following example, starting in global configuration mode, installs the CSD package to an SSL VPN gateway:

```
Router(config)# webvpn install csd flash:/securedesktop_10_1_0_9.pkg
SSL VPN Package Cisco-Secure-Desktop : installed successfully
```

The following example shows that Package B is being installed to an SSL VPN gateway:

```
Router (config)# webvpn install svc flash:/webvpn/packageB sequence 2
```

## What to Do Next

Support for CSD and Cisco AnyConnect VPN Client can be enabled for remote users after the gateway has been prepared to distribute CSD or Cisco AnyConnect VPN Client software.

## Configuring Cisco Secure Desktop Support

CSD provides a session-based interface where sensitive data can be shared for the duration of an SSL VPN session. All session information is encrypted. All traces of the session data are removed from the remote client when the session is terminated, even if the connection is terminated abruptly. CSD support for remote clients is enabled in this task.

### Java Runtime Environment

The remote user (PC or device) must have administrative privileges, and the JRE for Windows version 1.4 or later must be installed before the CSD client packages can be installed.

### Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
- The CSD software package is installed for distribution on the SSL VPN gateway.  
See the “[Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files](#)” section if you have not already prepared the SSL VPN gateway to distribute CSD software.

### Restrictions

- Only Microsoft Windows 2000, Windows XP, Windows Vista, Apple-Mac, and Linux are supported on the remote client.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **csd enable**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
	<b>Example:</b> Router> enable	
Step 2	<b>configure terminal</b>	Enters global configuration mode.
	<b>Example:</b> Router# configure terminal	

	Command or Action	Purpose
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>csd enable</b>  <b>Example:</b> Router(config-webvpn-context)# csd enable	Enables CSD support for SSL VPN sessions.

## What to Do Next

Upon completion of this task, the SSL VPN gateway has been configured to provide clientless and thin client support for remote users. The SSL VPN feature also has the capability to provide full VPN access (similar to IPsec). Proceed to the next section to see more information.

## Configuring Cisco AnyConnect VPN Client Full Tunnel Support

The Cisco AnyConnect VPN Client is an application that allows a remote user to establish a full VPN connection similar to the type of connection that is established with an IPsec VPN. Cisco AnyConnect VPN Client software is pushed (downloaded) and installed automatically on the PC of the remote user. The Cisco AnyConnect VPN Client uses SSL to provide the security of an IPsec VPN without the complexity required to install IPsec in your network and on remote devices. The following tasks are completed in this configuration:

- An access list is applied to the tunnel to restrict VPN access.
- Cisco AnyConnect VPN Client tunnel support is enabled.
- An address pool is configured for assignment to remote clients.
- The default domain is configured.
- DNS is configured for Cisco AnyConnect VPN Client tunnel clients.
- Dead peer timers are configured the SSL VPN gateway and remote users.
- The login home page is configured.
- The Cisco AnyConnect VPN Client software package is configured to remain installed on the remote client.
- Tunnel key refresh parameters are defined.

## Remote Client Software from the SSL VPN Gateway

The Cisco AnyConnect VPN Client software package is pushed from the SSL VPN gateway to remote clients when support is needed. The remote user (PC or device) must have either the Java Runtime Environment for Windows (version 1.4 later), or the browser must support or be configured to permit Active X controls. In either scenario, the remote user must have local administrative privileges.

## The Address Pool

The address pool is first defined with the **ip local pool** command in global configuration mode. The standard configuration assumes that the IP addresses in the pool are reachable from a directly connected network.

### Address Pools for Nondirectly Connected Networks

If you need to configure an address pool for IP addresses from a network that is not directly connected, perform the following steps:

1. Create a local loopback interface and configure it with an IP address and subnet mask from the address pool.
2. Configure the address pool with the **ip local pool** command. The range of addresses must fall under the subnet mask configured in Step 1.
3. Set up the route. If you are using the Routing Information Protocol (RIP), configure the **router rip** command and then the **network** command, as usual, to specify a list of networks for the RIP process. If you are using the Open Shortest Path First (OSPF) protocol, configure the **ip ospf network point-to-point** command in the loopback interface. As a third choice (instead of using the RIP or OSPF protocol), you can set up static routes to the network.
4. Configure the **svc address-pool** command with the name configured in Step 2.

See the examples in this section for a complete configuration example.

## A Manual Entry to the IP Forwarding Table

If the SSL VPN software client is unable to update the IP forwarding table on the PC of the remote user, the following error message will be displayed in the router console or syslog:

```
Error : SSL VPN client was unable to Modify the IP forwarding table
```

This error can occur if the remote client does not have a default route. You can work around this error by performing the following steps:

1. Open a command prompt (DOS shell) on the remote client.
2. Enter the **route print** command.
3. If a default route is not displayed in the output, enter the **route** command followed by the **add** and **mask** keywords. Include the default gateway IP address at the end of the route statement. See the following example:

```
C:\>route ADD 0.0.0.0 MASK 0.0.0.0 10.1.1.1
```

## Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
- The Cisco AnyConnect VPN Client software package is installed for distribution on the SSL VPN gateway.
- The remote client has administrative privileges. Administrative privileges are required to download the SSL VPN software client.

See the “[Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files](#)” section if you have not already prepared the SSL VPN gateway to distribute SSL VPN software.

## Restrictions

Only Microsoft Windows 2000, Windows XP, Windows Vista, Apple-Mac, and Linux are supported on the remote client.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **policy group** *name*
5. **filter tunnel** *extended-acl*
6. **functions** {file-access | file-browse | file-entry | svc-enabled | svc-required }
7. **svc address-pool** *name*
8. **svc default-domain** *name*
9. **svc dns-server** {primary | secondary } *ip-address*
10. **svc dpd-interval** {client | gateway } *seconds*
11. **svc homepage** *string*
12. **svc keep-client-installed**
13. **svc rekey** {method {new-tunnel | ssl } | time *seconds*}

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>policy group</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# policy group ONE	Enters webvpn group policy configuration mode to configure a group policy.
Step 5	<b>filter tunnel</b> <i>extended-acl</i>  <b>Example:</b> Router(config-webvpn-group)# filter tunnel 101	Configures an SSL VPN tunnel access filter. <ul style="list-style-type: none"><li>• The tunnel access filter is used control network and application level access. The tunnel filter is also defined in an extended access list.</li></ul>

	Command or Action	Purpose
Step 6	<p><b>functions</b> {<b>file-access</b>   <b>file-browse</b>   <b>file-entry</b>   <b>svc-enabled</b>   <b>svc-required</b>}</p> <p><b>Example:</b>  Router(config-webvpn-group)# functions  svc-enabled  Router(config-webvpn-group)# functions  svc-required</p>	<p>Configures Cisco AnyConnect VPN Client tunnel mode support.</p> <ul style="list-style-type: none"> <li>Entering the <b>svc-enabled</b> keyword enables tunnel support for the remote user. If the Cisco AnyConnect VPN Client software package fails to install, the remote user can continue to use clientless mode or thin-client mode.</li> <li>Entering the <b>svc-required</b> keyword enables only tunnel support for the remote user. If the Cisco AnyConnect VPN Client software package fails to install (on the PC of the remote user), the other access modes cannot be used.</li> </ul>
Step 7	<p><b>svc address-pool</b> <i>name</i></p> <p><b>Example:</b>  Router(config-webvpn-group)# svc address-pool  ADDRESSES</p>	<p>Configures configure a pool of IP addresses to assign to remote users in a policy group.</p> <ul style="list-style-type: none"> <li>The address pool is first defined with the <b>ip local pool</b> command in global configuration mode.</li> <li>If you are configuring an address pool for a network that is not directly connected, an address from the pool must be configured on a locally loopback interface. See the third example at the end of this section.</li> </ul>
Step 8	<p><b>svc default-domain</b> <i>name</i></p> <p><b>Example:</b>  Router(config-webvpn-group)# svc default-domain  cisco.com</p>	<p>Configures the default domain for a policy group.</p>
Step 9	<p><b>svc dns-server</b> {<b>primary</b>   <b>secondary</b>} <i>ip-address</i></p> <p><b>Example:</b>  Router(config-webvpn-group)# svc dns-server  primary 192.168.3.1  Router(config-webvpn-group)# svc dns-server  secondary 192.168.4.1</p>	<p>Configures DNS servers for policy group remote users.</p>
Step 10	<p><b>svc dpd-interval</b> {<b>client</b>   <b>gateway</b>} <i>seconds</i></p> <p><b>Example:</b>  Router(config-webvpn-group)# svc dpd-interval  gateway 30  Router(config-webvpn-group)# svc dpd-interval  client 300</p>	<p>Configures the dead peer detection (DPD) timer value for the gateway or client.</p> <ul style="list-style-type: none"> <li>The DPD timer is reset every time a packet is received over the SSL VPN tunnel from the gateway or remote user.</li> </ul>
Step 11	<p><b>svc homepage</b> <i>string</i></p> <p><b>Example:</b>  Router(config-webvpn-group)# svc homepage  www.cisco.com</p>	<p>Configures configure the URL of the web page that is displayed upon successful user login.</p> <ul style="list-style-type: none"> <li>The <i>string</i> argument is entered as an HTTP URL. The URL can be up to 255 characters in length.</li> </ul>

	Command or Action	Purpose
Step 12	<b>svc keep-client-installed</b>  <b>Example:</b> Router(config-webvpn-group)# svc keep-client-installed	Configures the remote user to keep Cisco AnyConnect VPN Client software installed when the SSL VPN connection is not enabled.
Step 13	<b>svc rekey {method {new-tunnel   ssl}   time seconds}</b>  <b>Example:</b> Router(config-webvpn-group)# svc rekey method new-tunnel Router(config-webvpn-group)# svc rekey time 3600	Configures the time and method that a tunnel key is refreshed for policy group remote users. <ul style="list-style-type: none"> <li>The tunnel key is refreshed by renegotiating the SSL connection or initiating a new tunnel connection.</li> <li>The time interval between tunnel refresh cycles is configured in seconds.</li> </ul>

## Examples

### Tunnel Filter Configuration

The following example, starting in global configuration mode, configures a deny access filter for any host from the 172.16.2/24 network:

```
Router(config)# access-list 101 deny ip 172.16.2.0 0.0.0.255 any
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# filter tunnel 101
Router(config-webvpn-group)# end
```

### Address Pool (Directly Connected Network) Configuration

The following example, starting in global configuration mode, configures the 192.168.1/24 network as an address pool:

```
Router(config)# ip local pool ADDRESSES 192.168.1.1 192.168.1.254
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# svc address-pool ADDRESSES
Router(config-webvpn-group)# end
```

### Address Pool (Nondirectly Connected Network) Configuration

The following example, starting in global configuration mode, configures the 172.16.1/24 network as an address pool. Because the network is not directly connected, a local loopback interface is configured.

```
Router(config)# interface loopback 0
Router(config-int)# ip address 172.16.1.126 255.255.255.0
Router(config-int)# no shutdown
Router(config-int)# exit
Router(config)# ip local pool ADDRESSES 172.16.1.1 172.16.1.254
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# svc address-pool ADDRESSES
Router(config-webvpn-group)# end
```

### Full Tunnel Configuration

The following example, starting in global configuration mode, configures full Cisco AnyConnect VPN Client tunnel support on an SSL VPN gateway:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# functions svc-enabled
Router(config-webvpn-group)# functions svc-required
Router(config-webvpn-group)# svc default-domain cisco.com
Router(config-webvpn-group)# svc dns-server primary 192.168.3.1
Router(config-webvpn-group)# svc dns-server secondary 192.168.4.1
Router(config-webvpn-group)# svc dpd-interval gateway 30
Router(config-webvpn-group)# svc dpd-interval client 300
Router(config-webvpn-group)# svc homepage www.cisco.com
Router(config-webvpn-group)# svc keep-client-installed
Router(config-webvpn-group)# svc rekey method new-tunnel
Router(config-webvpn-group)# svc rekey time 3600
Router(config-webvpn-group)# end
```

## What to Do Next

Proceed to the next section to see advanced Cisco AnyConnect VPN Client tunnel configuration information.

## Configuring Advanced SSL VPN Tunnel Features

This section describes advanced Cisco AnyConnect VPN Client tunnel configurations. The following configuration steps are completed in this task:

- Split tunnel support and split DNS resolution are enabled on the SSL VPN gateway.
- SSL VPN gateway support for Microsoft Internet Explorer proxy settings is configured.
- WINS resolution is configured for Cisco AnyConnect VPN Client tunnel clients.

### Microsoft Internet Explorer Proxy Configuration

The SSL VPN gateway can be configured to pass or bypass Microsoft Internet Explorer (MSIE) proxy settings. Only HTTP proxy settings are supported by the SSL VPN gateway. MSIE proxy settings have no effect on any other supported browser.

### Split Tunneling

Split tunnel support allows you to configure a policy that permits specific traffic to be carried outside of the Cisco AnyConnect VPN Client tunnel. Traffic is either included (resolved in tunnel) or excluded (resolved through the Internet Service Provider [ISP] or WAN connection). Tunnel resolution configuration is mutually exclusive. An IP address cannot be both included and excluded at the same time. Entering the **local-lans** keyword permits the remote user to access resources on a local LAN, such as network printer.

### Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.

- The Cisco AnyConnect VPN Client software package is installed for distribution on the SSL VPN gateway.

## Restrictions

- Only Microsoft Windows 2000, Windows XP, Windows Vista, Apple-Mac, and Linux are supported on the remote client.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **policy group** *name*
5. **svc split exclude** { *ip-address mask* | **local-lans** } | **include** *ip-address mask* }
6. **svc split dns** *name*
7. **svc msie-proxy** { **exception** *host* | **option** { **auto** | **bypass-local** | **none** } }
8. **svc msie-proxy server** *host*
9. **svc wins-server** { **primary** | **secondary** } *ip-address*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>policy group</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# policy group ONE	Enters webvpn group policy configuration mode to configure a group policy.

	Command or Action	Purpose
Step 5	<b>svc split exclude</b> {{ip-address mask   local-lans}   <b>include</b> ip-address mask}  <b>Example:</b> Router(config-webvpn-group)# <b>svc split exclude</b> 192.168.1.1 0.0.0.255 Router(config-webvpn-group)# <b>svc split include</b> 172.16.1.0 255.255.255.0	Configures split tunneling for policy group remote users. <ul style="list-style-type: none"> <li>Split tunneling is configured to include or exclude traffic in the Cisco AnyConnect VPN Client tunnel. Traffic that is included is sent over the SSL VPN tunnel. Traffic that is excluded is resolved outside of the tunnel.</li> <li>Exclude and include statements are configured with IP address/wildcard mask pairs.</li> </ul>
Step 6	<b>svc split dns</b> name  <b>Example:</b> Router(config-webvpn-group)# <b>svc split dns</b> www.cisco.com Router(config-webvpn-group)# <b>svc split dns</b> my.company.com	Configures the SSL VPN gateway to resolve the specified fully qualified DNS names through the Cisco AnyConnect VPN Client tunnel. <ul style="list-style-type: none"> <li>A default domain was configured in the previous task with the <b>svc default-domain</b> command. DNS names configured with the <b>svc split dns</b> command are configured in addition.</li> <li>Up to 10 split DNS statements can be configured.</li> </ul>
Step 7	<b>svc msie-proxy</b> {exception host   <b>option</b> {auto   bypass-local   none}}  <b>Example:</b> Router(config-webvpn-group)# <b>svc msie-proxy</b> option auto Router(config-webvpn-group)# <b>svc msie-proxy</b> exception www.cisco.com Router(config-webvpn-group)# <b>svc msie-proxy</b> exception 10.20.20.1	Configures MSIE browser proxy settings for policy group remote users. <ul style="list-style-type: none"> <li>Entering the <b>option auto</b> keywords configures the browser of the remote user to auto-detect proxy settings.</li> <li>Entering the <b>option bypass-local</b> keywords configures local addresses to bypass the proxy.</li> <li>Entering the <b>option none</b> keywords configures the browser on the remote client to not use a proxy.</li> </ul>
Step 8	<b>svc msie-proxy server</b> host  <b>Example:</b> Router(config-webvpn-group)# <b>svc msie-proxy</b> server 10.10.10.1:80	Specifies an MSIE proxy server for policy group remote users. <ul style="list-style-type: none"> <li>The proxy server is specified by entering an IP address or a fully qualified domain name.</li> </ul>
Step 9	<b>svc wins-server</b> {primary   secondary} ip-address  <b>Example:</b> Router(config-webvpn-group)# <b>svc wins-server</b> primary 172.31.1.1 Router(config-webvpn-group)# <b>svc wins-server</b> secondary 172.31.2.1	Configures WINS servers for policy group remote users.

## Examples

### Split DNS Configuration

The following example, starting in global configuration mode, configures the following DNS names to be resolved in the Cisco AnyConnect VPN Client tunnel:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# svc split dns www.example.com
```

```
Router(config-webvpn-group) # svc split dns my.company.com
```

### Including and Excluding IP Prefixes

The following example configures a list of IP addresses to be resolved over the tunnel (included) and a list to be resolved outside of the tunnel (excluded):

```
Router(config-webvpn-group) # svc split exclude 192.168.1.0 255.255.255.0
Router(config-webvpn-group) # svc split include 172.16.1.0 255.255.255.0
```

### MSIE Proxy Configuration

The following example configures MSIE proxy settings:

```
Router(config-webvpn-group) # svc msie-proxy option auto
Router(config-webvpn-group) # svc msie-proxy exception www.example.com
Router(config-webvpn-group) # svc msie-proxy exception 10.20.20.1
Router(config-webvpn-group) # svc msie-proxy server 10.10.10.1:80
```

### WINS Server Configuration

The following example configures primary and secondary WINS servers for the policy group:

```
Router(config-webvpn-group) # svc wins-server primary 172.31.1.1
Router(config-webvpn-group) # svc wins-server secondary 172.31.2.1
Router(config-webvpn-group) # svc wins-server secondary 172.31.3.1
Router(config-webvpn-group) # end
```

## Configuring VRF Virtualization

VRF Virtualization allows you to associate a traditional VRF with an SSL VPN context configuration. This feature allows you to apply different configurations and reuse address space for different groups of users in your organization.

### Prerequisites

- A VRF has been configured in global configuration mode.
- SSL VPN gateway and context configurations are enabled and operational.
- A policy group has been configured and associated with the WebVPN context.

### Restrictions

- Only a single VRF can be configured for each SSL VPN context configuration.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context *name***
4. **vrf-name *name***

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router(config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>vrf-name</b> <i>name</i>  <b>Example:</b> Router(config-webvpn-context)# vrf-name BLUE	Associates a VRF with an SSL VPN context.

## Examples

The following example, starting in global configuration mode, associates the VRF under the SSL VPN context configuration:

```
Router(config)# ip vrf BLUE
Router(config-vrf)# rd 10.100.100.1
Router(config-vrf)# exit
Router(config)# webvpn context BLUE
Router(config-webvpn-context)# policy group BLUE
Router(config-webvpn-group)# exit
Router(config-webvpn-context)# default-group-policy BLUE
Router(config-webvpn-context)# vrf-name BLUE
Router(config-webvpn-context)# end
```

## Configuring ACL Rules

To configure ACL rules on the application layer level for an individual user, perform the following tasks.

### Note

- The ACL rules can be overridden for an individual user when the user logs on to the gateway (using AAA policy attributes).
- If a user session has no ACL attribute configured, all application requests from that user session are permitted by default.

## Prerequisites

Before configuring the ACL rules, you must have first configured the time range using the **time-range** command (this prerequisite is in addition to optionally configuring the time range, in the task table below, as part of the **permit** or **deny** entries).

## Restrictions

There is no limitation on the maximum number of filtering rules that can be configured for each ACL entry, but keeping the number below 50 should have no significant impact on router performance.

## SUMMARY STEPS

### Required Steps

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **acl** *acl-name*
5. **permit** [url [any | *url-string*]] [ip | tcp | udp | http | https | cifs] [any | *source-ip source-mask*] [any | *destination-ip destination-mask*] [**time-range** *time-range-name*] [syslog]  
or  
**deny** [url [any | *url-string*]] [ip | tcp | udp | http | https | cifs] [any | *source-ip source-mask*] [any | *destination-ip destination-mask*] [**time-range** *time-range-name*] [syslog]

### Optional Steps

6. **add position** *acl-entry*
7. **error-url** *access-deny-page-url*
8. **error-msg** *message-string*
9. **list**

## DETAILED STEPS

	Command or Action	Purpose
<b>Required Steps</b>		
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>acl</b> <i>acl-name</i>  <b>Example:</b> Router (config-webvpn-context)# acl acl1	Defines the ACL and enters webvpn acl configuration modes.
Step 5	<b>permit</b> [ <i>url</i> [ <i>any</i>   <i>url-string</i> ]] [ <i>ip</i>   <i>tcp</i>   <i>udp</i>   <i>http</i>   <i>https</i>   <i>cifs</i> ] [ <i>any</i>   <i>source-ip</i> <i>source-mask</i> ] [ <i>any</i>   <i>destination-ip</i> <i>destination-mask</i> ] <b>time-range</b> { <i>time-range-name</i> } [ <i>syslog</i> ]  or  <b>deny</b> [ <i>url</i> [ <i>any</i>   <i>url-string</i> ]] [ <i>ip</i>   <i>tcp</i>   <i>udp</i>   <i>http</i>   <i>https</i>   <i>cifs</i> ] [ <i>any</i>   <i>source-ip</i> <i>source-mask</i> ] [ <i>any</i>   <i>destination-ip</i> <i>destination-mask</i> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <i>syslog</i> ]  <b>Example:</b> Router (config-webvpn-acl)# permit url any	Sets conditions in a named SSL VPN access list that will permit or deny packets.
<b>Optional Steps</b>		
Step 6	<b>add</b> <i>position acl-entry</i>  <b>Example:</b> Router (config-webvpn-acl)# add 3 permit url any	Adds an ACL entry at a specified position.
Step 7	<b>error-url</b> <i>access-deney-page-url</i>  <b>Example:</b> Router (config-webvpn-acl)# error-url "http://www.example.com"	Defines a URL as an ACL violation page. <ul style="list-style-type: none"> <li>If the <b>error-url</b> command is configured, the user is redirected to a predefined URL for every request that is not allowed. If the <b>error-url</b> command is not configured, the user gets a standard, gateway-generated error page.</li> </ul>
Step 8	<b>error-msg</b> <i>message-string</i>  <b>Example:</b> Router (config-webvpn-acl)# error-msg "If you have any questions, please contact <a href=mailto:employee1@example.com>Employee1</a>."	Displays a specific error message when a user logs on and his or her request is denied.
Step 9	<b>list</b>  <b>Example:</b> Router (config-webvpn-acl)# list	Lists the currently configured ACL entries sequentially and assigns a position number.

## Associating an ACL Attribute with a Policy Group

To associate an ACL attribute with a policy group, perform the following steps.

### Note

- Associating an ACL attribute for an individual user must be performed as part of a AAA operation.
- The ACL rules can be overridden for an individual user when the user logs on to the gateway (using AAA policy attributes).
- If a user session has no ACL attribute configured, all application requests from that user session are permitted by default.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **policy group** *name*
5. **exit**
6. **acl** *acl-name*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn context context1	Configures the SSL VPN context and enters webvpn context configuration mode.
Step 4	<b>policy group</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-context)# policy group group1	Defines a policy that can be applied to the user and enters webvpn policy group configuration mode.

	Command or Action	Purpose
Step 5	<b>exit</b>  <b>Example:</b> Router (config-webvpn-group)# exit	Exits webvpn policy group configuration mode.
Step 6	<b>acl acl-name</b>  <b>Example:</b> Router (config-webvpn-context)# acl acl1	Defines the ACL and enters webvpn acl configuration mode.

## Monitoring and Maintaining ACLs

To monitor and maintain your ACL configuration, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **debug webvpn acl**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>debug webvpn acl</b>  <b>Example:</b> Router# debug webvpn acl	Displays information about ACLs.

## Configuring SSO Netegrity Cookie Support for a Virtual Context

To configure SSO Netegrity cookie support, perform the following steps.

### Prerequisites

- A Cisco plug-in must first be installed on a Netegrity server.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context name**
4. **sso-server name**

5. **web-agent-url** *url*
6. **secret-key** *key-name*
7. **max-retry-attempts** *number-of-retries*
8. **request-timeout** *number-of-seconds*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>sso-server</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-context)# sso-server "test-sso-server"	Creates a SSO server name under an SSL VPN context and enters webvpn sso server configuration mode
Step 5	<b>web-agent-url</b> <i>url</i>  <b>Example:</b> Router (config-webvpn-sso-server)# web-agent-url http://www.example.comwebvpn/	Configures the Netegrity agent URL to which SSO authentication requests will be dispatched.
Step 6	<b>secret-key</b> <i>key-name</i>  <b>Example:</b> Router (config-webvpn-sso-server)# secret-key "12345"	Configures the policy server secret key that is used to secure authentication requests.
Step 7	<b>max-retry-attempts</b> <i>number-of-retries</i>  <b>Example:</b> Router (config-webvpn-sso-server)# max-retry-attempts 3	Sets the maximum number of retries before SSO authentication fails.
Step 8	<b>request-timeout</b> <i>number-of-seconds</i>  <b>Example:</b> Router (config-webvpn-sso-server)# request-timeout 15	Sets the number of seconds before an authentication request times out.

## Associating an SSO Server with a Policy Group

To associate an SSO server with a policy group, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **policy group** *name*
5. **sso-server** *name*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn context context1	Configures the SSL VPN context and enters webvpn context configuration mode.
Step 4	<b>policy group</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-context)# policy group ONE	Configures a group policy and enters webvpn group policy configuration mode.
Step 5	<b>sso-server</b> <i>name</i>  <b>Example:</b> Router (config-group-webvpn)# sso-server "test-sso-server"	Attaches an SSO server to a policy group.

## Configuring URL Obfuscation (Masking)

To configure URL obfuscation, masking, for a policy group, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **policy group** *name*
5. **mask-urls**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn context context1	Configures the SSL VPN context and enters webvpn context configuration mode.
Step 4	<b>policy group</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-context)# policy group ONE	Configures a group policy and enters group policy configuration mode.
Step 5	<b>mask-urls</b>  <b>Example:</b> Router (config-webvpn-group)# mask-urls	Obfuscates, or masks, sensitive portions of an enterprise URL, such as IP addresses, hostnames, or port numbers.

## Adding a CIFS Server URL List to an SSL VPN Context and Attaching It to a Policy Group

To add a CIFS server URL list to an SSL VPN context and attach it to a policy group, perform the following steps.

### Prerequisites

Before adding a CIFS server URL list to an SSL VPN context, you must have already set up the Web VPN context using the **webvpn context** command, and you must be in webvpn context configuration mode.

## SUMMARY STEPS

1. **cifs-url-list** *name*
2. **heading** *text-string*
3. **url-text** *name*
4. **exit**
5. **policy group** *name*
6. **cifs-url-list** *name*
7. **exit**
8. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>cifs-url-list</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-context) cifs-url-list c1	Enters webvpn URL list configuration mode to configure a list of CIFS server URLs to which a user has access on the portal page of an SSL VPN.
Step 2	<b>heading</b> <i>text-string</i>  <b>Example:</b> Router (config-webvpn-url) heading "cifs-url"	Configures the heading that is displayed above URLs listed on the portal page of an SSL VPN.
Step 3	<b>url-text</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-url)# url-text "SSLVPN-SERVER2" url-value "\\SLVPN-SERVER2"	Adds an entry to a URL list. <ul style="list-style-type: none"><li>• More than one entry can be added by reentering the <b>url-text</b> command for each subsequent entry.</li></ul>
Step 4	<b>exit</b>  <b>Example:</b> Router (config-webvpn-url)# exit	Exits webvpn URL list configuration mode.
Step 5	<b>policy group</b> <i>name</i>  <b>Example:</b> Router (config)# policy group ONE	Enters webvpn group policy configuration mode to configure a group policy.
Step 6	<b>cifs-url-list</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-group)# cifs-url-list "c1"	Attaches a URL list to a policy group.

	Command or Action	Purpose
Step 7	<b>exit</b>  <b>Example:</b> Router (config-webvpn-group)# exit	Exits webvpn group policy configuration mode.
Step 8	<b>exit</b>  <b>Example:</b> Router (config)# exit	Exits global configuration mode.

## Configuring User-Level Bookmarks

To configure user-level bookmarks, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **user-profile location flash:***directory*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn context context1	Configures the SSL VPN context and enters webvpn context configuration mode.
Step 4	<b>user-profile location flash:</b> <i>directory</i>  <b>Example:</b> Router (config-webvpn-context)# user-profile location flash:webvpn/sslvpn/vpn_context/	Stores bookmarks on a directory.

## Configuring FVRF

To configure FVRF so that the SSL VPN gateway is fully integrated into an MPLS network, perform the following steps.

### Prerequisites

As the following configuration task shows, IP VRF must be configured before the FVRF can be associated with the SSL VPN gateway. For more information about configuring IP VRF, see the subsection “Configuring IP VRF (**ip vrf** command)” in the “[Related Documents](#)” section.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **exit**
5. **webvpn gateway** *name*
6. **vrfname** *name*
7. **exit**
8. **exit**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>ip vrf</b> <i>vrf-name</i>  <b>Example:</b> Router (config)# ip vrf vrf_1	Defines a VPN VRF instance and enters VRF configuration mode.  <b>Note</b> The <i>vrf-name</i> argument specified here must be the same as the name argument in Step 6.
Step 4	<b>exit</b>  <b>Example:</b> Router (config-vrf)# exit	Exits VRF configuration mode.

	Command or Action	Purpose
Step 5	<b>webvpn gateway</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn gateway mygateway	Enters webvpn gateway configuration mode to configure an SSL VPN gateway.
Step 6	<b>vrfname</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-gateway)# vrfname vrf_1	Associates a VPN FVRF with an SSL VPN gateway.  <b>Note</b> The <i>name</i> argument here must be the same as the <i>vrf-name</i> argument in Step 3.
Step 7	<b>exit</b>  <b>Example:</b> Router (config-webvpn-gateway)# exit	Exits webvpn gateway configuration mode.
Step 8	<b>exit</b>  <b>Example:</b> Router (config)# exit	Exits global configuration mode.

## Disabling Full-Tunnel CEF

To disable full-tunnel CEF support, perform the following tasks:

**Note** The command **no webvpn cef** disables all Web VPN CEF support, not just full-tunnel CEF support.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no webvpn cef**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	<b>no webvpn cef</b>	Disables full-tunnel CEF support.
	<b>Example:</b> Router (config)# no webvpn cef	<b>Note</b> The <b>webvpn cef</b> command is enabled by default.

## Configuring Automatic Authentication and Authorization

To configure automatic authentication and authorization so that a user needs to log in only one time, at login, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **aaa authentication auto**
5. **authorization list** *name*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode.
	<b>Example:</b> Router> enable	<ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>	Enters global configuration mode.
	<b>Example:</b> Router# configure terminal	
Step 3	<b>webvpn context</b> <i>name</i>	Enters webvpn context configuration mode to configure the SSL VPN context.
	<b>Example:</b> Router (config)# webvpn context context1	
Step 4	<b>aaa authentication auto</b>	Allows automatic authentication for users. Users provide their usernames and passwords via the gateway page URL and do not have to again enter their usernames and passwords from the login page.
	<b>Example:</b> Router (config-webvpn-context)# aaa authentication auto	
Step 5	<b>aaa authorization list</b> <i>name</i>	Allows user attributes to get “pushed” during authentication.
	<b>Example:</b> Router (config-webvpn-context)# aaa authorization list 11	<ul style="list-style-type: none"> <li>• <i>name</i>—Name of the list to be automatically authorized.</li> </ul>

## Configuring a URL Rewrite Splitter

To configure a URL rewrite splitter, perform the following tasks.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **url rewrite**
5. **host** *host-name*
6. **ip** *ip-address*
7. **unmatched-action** [**direct-access** | **redirect**]

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.
Step 4	<b>url rewrite</b>  <b>Example:</b> Router (config-webvpn-context)# url rewrite	Allows you to mangle selective URL requests and enters URL rewrite mode. <b>Note</b> One of the commands <b>host</b> or <b>ip</b> is required. The <b>unmatched-action</b> command is optional.
Step 5	<b>host</b> <i>host-name</i>  <b>Example:</b> Router (config-webvpn-url-rewrite)# host www.examplecompany.com	Hostname of the site to be mangled. <b>Note</b> One of the commands <b>host</b> or <b>ip</b> is required. The <b>unmatched-action</b> command is optional.

	Command or Action	Purpose
Step 6	<b>ip</b> <i>ip-address</i>  <b>Example:</b> Router (config-webvpn-url-rewrite)# ip 10.1.1.0 255.255.0.0	IP address of the site to be mangled.  <b>Note</b> One of the commands <b>host</b> or <b>ip</b> is required. The <b>unmatched-action</b> command is optional.
Step 7	<b>unmatched-action</b> [ <b>direct-access</b>   <b>redirect</b> ]  <b>Example:</b> Router (config-webvpn-url-rewrite)# unmatched-action direct-access	(Optional) Defines the action for the request to the public website.  <ul style="list-style-type: none"> <li><b>direct-access</b>—Provides the user with direct access to the URL. In addition, the user receives an information page stating that he or she can access the URL directly.</li> <li><b>redirect</b>—Provides the user with direct access to the URL, but the user does not receive the information page.</li> </ul>

## Configuring a Backend HTTP Proxy

To configure a backend HTTP proxy, perform the following tasks.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **webvpn context** *name*
4. **policy group** *name*
5. **http proxy-server** {*ip-address* | *dns-name*} **port** *port-number*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode.  <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>webvpn context</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn context context1	Enters webvpn context configuration mode to configure the SSL VPN context.

	Command or Action	Purpose
Step 4	<b>policy group</b> <i>name</i>  <b>Example:</b> Router (config-webvpn-context)# <b>policy group</b> g1	Enters webvpn group policy configuration mode to configure a group policy.
Step 5	<b>http proxy-server</b> { <i>ip-address</i>   <i>dns-name</i> } <b>port</b> <i>port-number</i>  <b>Example:</b> Router (config-webvpn-context)# <b>http proxy-server</b> 10.1.1.1 <b>port</b> 2034	Allows user requests to go through a backend HTTP proxy. <ul style="list-style-type: none"> <li><i>ip-address</i>—IP address of the proxy server.</li> <li><i>dns-name</i>—Domain Name System (DNS) of the proxy server.</li> <li><b>port</b> <i>port-number</i>—Proxy port number.</li> </ul>

## Configuring Stateless High Availability with HSRP for SSL VPN

To configure stateless High Availability with HSRP for SSL VPN, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **standby number ip** *ip-address*
5. **standby number name** *standby-name*
6. **exit**
7. **webvpn gateway** *name*
8. **ip address number port** *port-number* **standby** *name*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# <b>configure terminal</b>	Enters global configuration mode.
Step 3	<b>interface</b> <i>type slot/port</i>  <b>Example:</b> Router (config)# <b>interface</b> gateway 0/0	Configures an interface type and enters interface configuration mode.

	Command or Action	Purpose
Step 4	<b>standby</b> <i>number</i> <b>ip</b> <i>ip-address</i>  <b>Example:</b> Router (config-if)# standby 0 ip 10.1.1.1	Configures a standby IP address.
Step 5	<b>standby</b> <i>number</i> <b>name</b> <i>standby-name</i>  <b>Example:</b> Router (config-if)# standby 0 name SSLVPN	Configures a standby name.
Step 6	<b>exit</b>  <b>Example:</b> Router (config-if)# exit	Exits interface configuration mode.
Step 7	<b>webvpn gateway</b> <i>name</i>  <b>Example:</b> Router (config)# webvpn gateway Gateway1	Enters webvpn gateway configuration mode to configure an SSL VPN gateway.
Step 8	<b>ip address</b> <i>ip-address</i> <b>port</b> <i>port-number</i> <b>standby</b> <i>name</i>  <b>Example:</b> Router (config)# ip address 10.1.1.1 port 443 standby SSLVPN	Configures a standby IP address as the proxy IP address on an SSL VPN gateway.  <b>Note</b> The IP address configured here must be the same as the IP address that was configured as the standby IP address ( <b>standby number ip ip-address</b> ).

## Using SSL VPN Clear Commands

This section describes **clear** commands that are used to perform the following tasks:

- Clear NBNS cache information
- Clear remote user sessions
- Clear (or reset) SSL VPN application and access counters

### SUMMARY STEPS

1. **enable**
2. **clear webvpn nbns** [**context** {*name* | **all**}]
3. **clear webvpn session** [**user** *name*] **context** {*name* | **all**}
4. **clear webvpn stats** [[**cifs** | **citrix** | **mangle** | **port-forward** | **sso** | **tunnel**] [**context** {*name* | **all**}]]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>clear webvpn nbns</b> [ <b>context</b> { <i>name</i>   <b>all</b> }]  <b>Example:</b> Router# clear webvpn nbns context all	Clears the NBNS cache on an SSL VPN gateway.
Step 3	<b>clear webvpn session</b> [ <b>user</b> <i>name</i> ] <b>context</b> { <i>name</i>   <b>all</b> }  <b>Example:</b> Router# clear webvpn session context all	Clears SSL VPN remote user sessions.
Step 4	<b>clear webvpn stats</b> [[ <b>cifs</b>   <b>citrix</b>   <b>mangle</b>   <b>port-forward</b>   <b>sso</b>   <b>tunnel</b> ] [ <b>context</b> { <i>name</i>   <b>all</b> }]]  <b>Example:</b> Router# clear webvpn stats	Clears SSL VPN application and access counters.

## Verifying SSL VPN Configurations

This section describes show commands that are used to verify the following:

- SSL VPN gateway configuration
- SSL VPN context configuration
- CSD and Cisco AnyConnect VPN Client installation status
- NetBIOS name services information
- SSL VPN group policy configuration
- SSL VPN user session information
- SSL VPN application statistics

## SUMMARY STEPS

1. **enable**
2. **show webvpn context** [*name*]
3. **show webvpn gateway** [*name*]
4. **show webvpn install** {**file** *name* | **package** {**csd** | **svc**} | **status** {**csd** | **svc**}}
5. **show webvpn nbns** {**context** {**all** | *name*}}
6. **show webvpn policy group** *name* **context** {**all** | *name*}

7. **show webvpn session** {[*user name*] context {**all** | *name*}}
8. **show webvpn stats** [**cifs** | **citrix** | **mangle** | **port-forward** | **sso** | **tunnel**] [**detail**] [context {**all** | *name*}]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>show webvpn context</b> [ <i>name</i> ]  <b>Example:</b> Router# show webvpn context	Displays the operational status and configuration parameters for SSL VPN context configurations.
Step 3	<b>show webvpn gateway</b> [ <i>name</i> ]  <b>Example:</b> Router# show webvpn gateway	Displays the status of the SSL VPN gateway.
Step 4	<b>show webvpn install</b> { <b>file</b> <i>name</i>   <b>package</b> { <b>csd</b>   <b>svc</b> }   <b>status</b> { <b>csd</b>   <b>svc</b> }}  <b>Example:</b> Router# show webvpn install status csd	Displays the installation status of Cisco AnyConnect VPN Client or CSD client software packages.
Step 5	<b>show webvpn nbns</b> { <b>context</b> { <b>all</b>   <i>name</i> }}  <b>Example:</b> Router# show webvpn nbns context all	Displays information in the NetBIOS Name Service (NBNS) cache.
Step 6	<b>show webvpn policy group</b> <i>name</i> <b>context</b> { <b>all</b>   <i>name</i> }  <b>Example:</b> Router# show webvpn policy group ONE context all	Displays the context configuration associated with a policy group.
Step 7	<b>show webvpn session</b> {[ <i>user name</i> ] <b>context</b> { <b>all</b>   <i>name</i> }}  <b>Example:</b> Router# show webvpn session context all	Displays SSL VPN user session information.
Step 8	<b>show webvpn stats</b> [ <b>cifs</b>   <b>citrix</b>   <b>mangle</b>   <b>port-forward</b>   <b>sso</b>   <b>tunnel</b> ] [ <b>detail</b> ] [context { <b>all</b>   <i>name</i> }]  <b>Example:</b> Router# show webvpn stats tunnel detail context all	Displays SSL VPN application and network statistics.

## Using SSL VPN Debug Commands

To monitor and manage your SSL VPN configurations, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **debug webvpn** [verbose] [aaa | acl | cifs | citrix [verbose] | cookie [verbose] | count | csd | data | dns | emweb [state] | entry context-name [source ip [network-mask] | user username] | http [authentication | trace | verbose] | package | sdps [level number] | sock [flow] | sso | timer | trie | tunnel [traffic acl-number | verbose] | url-disp | webservice [verbose]]

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>debug webvpn</b> [verbose] [aaa   acl   cifs   citrix [verbose]   cookie [verbose]   count   csd   data   dns   emweb [state]   entry context-name [source ip [network-mask]   user username]   http [authentication   trace   verbose]   package   sdps [level number]   sock [flow]   sso   timer   trie   tunnel [traffic acl-number   verbose]   url-disp   webservice [verbose]]  <b>Example:</b> Router# debug webvpn	Enables the display of debug information for SSL VPN applications and network activity.

## Remote User Guide

For information specifically for the remote user, see the document *SSL VPN Remote User Guide*.

## Configuration Examples for SSL VPN

This section includes the following configuration examples:

- [Configuring a Generic SSL VPN Gateway: Example, page 85](#)
- [Configuring an ACL: Example, page 85](#)
- [Configuring HTTP Proxy: Example, page 86](#)
- [RADIUS Accounting for SSL VPN Sessions: Example, page 86](#)
- [URL Obfuscation \(Masking\): Example, page 87](#)
- [Adding a CIFS Server URL List and Attaching It to a Policy List: Example, page 87](#)
- [Typical SSL VPN Configuration: Example, page 88](#)

- [CEF-Processed Packets: Example, page 90](#)
- [Multiple AnyConnect VPN Client Package Files: Examples, page 90](#)
- [Local Authorization: Example, page 91](#)
- [URL Rewrite Splitter: Example, page 91](#)
- [Backend HTTP Proxy: Example, page 92](#)
- [Stateless High Availability with HSRP: Example, page 92](#)
- [debug Command Output: Examples, page 93](#)
- [show Command Output: Examples, page 93](#)

## Configuring a Generic SSL VPN Gateway: Example

The following output example shows that a generic SSL VPN gateway has been configured in privileged EXEC mode:

```
Router# show running-config

webvpn gateway SSL_gateway2
 ip address 10.1.1.1. port 442
 ssl trustpoint TP_self_signed _4138349635
 inservice
!
webvpn context SSL_gateway2
 ssl authenticate verify all
!
!
policy group default
default-group-policy default
 gateway SSL_gateway2
inservice
```

## Configuring an ACL: Example

The following output example shows the ACL is “acl1.” It has been associated with policy group “default.”

```
Router# show running-config

webvpn context context1
 ssl authenticate verify all
!
acl "acl1"
 error-msg "warning!!!..."
 permit url "http://www.example1.com"
 deny url "http://www.example2.com"
 permit http any any
!
nbns-list l1
 nbns-server 10.1.1.20
!
cifs-url-list "c1"
 heading "cifs-url"
 url-text "SSL VPN-SERVER2" url-value "\\SSL VPN-SERVER2"
 url-text "SSL-SERVER2" url-value "\\SSL-SERVER2"
!
```

```

policy group default
 acl "acl1"
 cifs-url-list "c1"
 nbns-list "l1"
 functions file-access
 functions file-browse
 functions file-entry
default-group-policy default
gateway public
inservice
!

```

## Configuring HTTP Proxy: Example

The following output example shows that HTTP proxy has been configured and that the portal (home) page from URL “http://www.example.com” will automatically download the home page of the user:

Router# **show running-config**

```

webvpn context myContext
 ssl authenticate verify all
 !
 !
 port-forward "email"
 local-port 20016 remote-server "ssl-server1.SSL VPN-ios.com" remote-port 110
 description "POP-ssl-server1"
 !
 policy group myPolicy
 port-forward "email" auto-download http-proxy proxy-url "http://www.example.com"
 inservice

```

## RADIUS Accounting for SSL VPN Sessions: Example

The following output example shows that RADIUS accounting has been configured for SSL VPN user sessions:

Router# **show running-config**

```

version 12.4
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname host1
!
aaa new-model
!
!
aaa accounting network SSL VPNaaa start-stop group radius
aaa accounting update periodic 1
aaa session-id common
ip subnet-zero
ip cef
!
!
no ip domain lookup
ip domain name cisco.com
ip name-server 172.16.2.133
ip name-server 172.16.11.48
!

```

```

line con 0
 exec-timeout 0 0
line aux 0
line vty 0 4
!
!
webvpn gateway GW1
 ip address 172.19.216.141 port 443
 inservice
!
webvpn gateway SSL VPN
 no inservice
!
webvpn install svc flash:/webvpn/svc.pkg
webvpn aaa accounting-list SSL VPNaaa
!
webvpn context Default_context
 ssl encryption
 ssl authenticate verify all
!
 no inservice
!
!

```

## URL Obfuscation (Masking): Example

The following output example shows that URL obfuscation (masking) has been configured for policy group “gp\_urlobf.”

Router: **show running-config**

```

!
!
policy group gp_urlobf
 mask-urls
 default-group-policy gp_urlobf
 gateway gw domain dom
 inservice
!
!

```

## Adding a CIFS Server URL List and Attaching It to a Policy List: Example

The following output example shows that the CIFS server URLs “SSLVPN-SERVER2” and “SSL-SERVER2” have been added as portal page URLs to which a user has access. The output also shows that the two servers have been attached to a policy group.

```

webvpn context context_1
 ssl authenticate verify all
!
 acl "acl1"
 error-msg "warning!!!..."
 permit url "http://www.example1.com"
 deny url "http://www.example2.com"
 permit http any any
!
 nbns-list 11
 nbns-server 10.1.1.20

```

```

!
cifs-url-list "c1"
 heading "cifs-url"
 url-text "SSLVPN-SERVER2" url-value "\\SSLVPN-SERVER2"
 url-text "SSL-SERVER2" url-value "\\SSL-SERVER2"
!
policy group default
 acl "acl1"
 cifs-url-list "c1"
 nbns-list "l1"
 functions file-access
 functions file-browse
 functions file-entry
default-group-policy default
gateway public
inservice
!

```

## Typical SSL VPN Configuration: Example

The following output is an example of an SSL VPN configuration that includes most of the features that are available using SSL VPN:

Router# **show running-config**

```

hostname sslvpn
!
!
aaa new-model
!
!
aaa authentication login default local group radius
!
!
crypto pki trustpoint Gateway
 enrollment selfsigned
 ip-address 192.168.22.13
 revocation-check crl
 rsakeypair keys 1024 1024
!
!
crypto pki certificate chain Gateway
 certificate self-signed 02
!
!
interface Loopback0
 ip address 10.10.10.1 255.255.255.0
!
!
interface GigabitEthernet0/1
 ip address 192.168.22.14 255.255.255.0 secondary
 ip address 192.168.22.13 255.255.255.0
 duplex auto
 speed auto
 media-type rj45
!
!
ip local pool svc-pool 10.10.10.100 10.10.10.110
!
!
ip radius source-interface FastEthernet1/1
!

```

```

!
webvpn gateway ssl-vpn
 ip address 192.168.22.13 port 443
 http-redirect port 80
 ssl trustpoint Gateway
 inservice
!
! The following line is required for SSLVPN Client.
webvpn install svc flash:/webvpn/svc.pkg
!
! The following line is required for Cisco Secure Desktop.
webvpn install csd flash:/webvpn/sdesktop.pkg
!
webvpn context ssl-vpn
 ssl authenticate verify all
!
 url-list "sslvpn-dt"
 url-text "sslvpn-dt" url-value "http://10.1.1.40"
 url-text "Exchange Server" url-value "http://10.1.1.40/exchange"
!
 sso-server "netegrity"
 web-agent-url "http://10.1.1.37/vpnauth/"
 secret-key "sslvpn1"
 retries 3
 timeout 15
!
 nbns-list cifs
 nbns-server 10.1.1.40
!
 port-forward "mail_test"
 local-port 30016 remote-server "mail.sslvpn-dt.com" remote-port 143 description
"IMAP-test"
 local-port 30017 remote-server "mail.sslvpn-dt.com" remote-port 110 description
"POP3-test"
 local-port 30018 remote-server "mail.sslvpn-dt.com" remote-port 25 description
"SMTP-test"
!
 policy group default
! The following line applies the URL list.
 url-list "sslvpn-dt"
! The following line applies TCP port forwarding.
 port-forward "mail_test"
! The following line applies CIFS.
 nbns-list "cifs"
! The following line enables CIFS functionality.
 functions file-access
! The following line enables CIFS functionality.
 functions file-browse
! The following line enables CIFS functionality.
 functions file-entry
! The following line enables SSLVPN Client.
 functions svc-enabled
! The following line enables clientless Citrix.
 citrix enabled
 default-group-policy default
! The following line maps this context to the virtual gateway and defines the domain to
use.
 gateway ssl-vpn domain sslvpn
! The following line enables Cisco Secure Desktop.
 csd enable
 inservice

```

```
!
!
end
```

## CEF-Processed Packets: Example

The following output example from the **show webvpn stats** command shows information about CEF-processed packets:

```
Router# show webvpn stats
```

```
User session statistics:
 Active user sessions : 56 AAA pending reqs : 0
 Peak user sessions : 117 Peak time : 00:13:19
 Active user TCP conns : 0 Terminated user sessions : 144
 Session alloc failures : 0 Authentication failures : 0
 VPN session timeout : 0 VPN idle timeout : 0
 User cleared VPN sessions : 0 Exceeded ctx user limit : 0
 Exceeded total user limit : 0
 Client process rcvd pkts : 1971 Server process rcvd pkts : 441004
 Client process sent pkts : 921291 Server process sent pkts : 2013
 Client CEF received pkts : 1334 Server CEF received pkts : 951610
 Client CEF rcv punt pkts : 0 Server CEF rcv punt pkts : 779
 Client CEF sent pkts : 1944439 Server CEF sent pkts : 0
 Client CEF sent punt pkts : 21070 Server CEF sent punt pkts : 0
```

## Multiple AnyConnect VPN Client Package Files: Examples

The following example shows that three AnyConnect VPN Client packages have been installed to a gateway and shows the resulting **show webvpn install** command output:

```
Router (config)# webvpn install svc vpn-Darwin_i386-Release-2.0.0077-k9.pkg sequence 6
Router (config)# webvpn install svc vpn-Darwin_powerpc-Release-2.0.0077-k9.pkg sequence 8
Router (config)# webvpn install svc svc_1.pkg sequence 4
```

```
Router# show webvpn install status svc
```

```
SSLVPN Package SSL-VPN-Client version installed:
```

```
CISCO STC win2k+
```

```
2,0,0148
```

```
Fri 12/29/2006 19:13:56.37
```

```
SSLVPN Package SSL-VPN-Client version installed:
```

```
CISCO STC Darwin_i386
```

```
2,0,0
```

```
Wed Nov 8 04:01:57 MST 2006
```

```
SSLVPN Package SSL-VPN-Client version installed:
```

```
CISCO STC Darwin_powerpc
```

```
2,0,0
```

```
Wed Nov 8 03:54:50 MST 2006
```

The following example shows (1) that three AnyConnect VPN client packages have been configured and (2) typical output from the **show-running config** command:

```
Router# show running-config | begin webvpn

webvpn install svc flash:/webvpn/svc_4.pkg sequence 4
!
webvpn install svc flash:/webvpn/svc_6.pkg sequence 6
!
webvpn install svc flash:/webvpn/svc_9.pkg sequence 9
```

## Local Authorization: Example

The following example shows that local authorization has been configured:

```
aaa new-model
!
aaa authentication login default local
aaa authorization network default local
!
aaa attribute list 12
 attribute type banner "user2"
!
aaa attribute list 11
 attribute type banner "user1"
 attribute type urllist-name "my-url-list"
!
username user1 password 0 passwd1
username user1 aaa attribute list 11
username user2 password 0 passwd2
username user2 aaa attribute list 12
!
webvpn context best
 ssl authenticate verify all
 !
 url-list "my-url-list"
 heading "external url"
 url-text "google" url-value "http://www.google.com"
 !
 policy group default
 default-group-policy default
 aaa authorization list default
 gateway public domain d1
 inservice
```

## URL Rewrite Splitter: Example

The following example shows that URL mangling has been configured for a specific host and IP address. The unmatched action has been defined as direct access.

```
webvpn context e1
!
url rewrite
 host "www.examplecompany.com"
 ip 10.1.0.0 255.255.0.0
 unmatched-action direct-access
!
```

## Backend HTTP Proxy: Example

The following example shows that a backend HTTP proxy has been configured:

```
webvpn context e1
!
 policy group g1
 http proxy-server "1.1.1.1" port 2034
 default-group-policy g1
```

## Stateless High Availability with HSRP: Example

Figure 13 shows the topology of a typical stateless High Availability with HSRP setup. Router 1 and Router 2 are configured for HSRP on Gateway Webvpn. The example below Figure 11 shows the actual configuration.

**Figure 13**      *Stateless High Availability with HSRP Setup*

### Router 1 Configuration

```
Router# configure terminal
Router (config)# interface gateway 0/1
Router (config-if)# standby 0 ip 10.1.1.1
Router (config-if)# standby 0 name SSLVPN
Router (config-if)# exit
Router (config)# webvpn gateway Webvpn
Router (config-webvpn-gateway)# ip address 10.1.1.1 port 443 standby SSLVPN
```

### Router 2 Configuration

```
Router# configure terminal
Router (config)# interface gateway 0/0
Router (config-if)# standby 0 ip 10.1.1.1
Router (config-if)# standby 0 name SSLVPN2
Router (config-if)# exit
Router (config)# webvpn gateway Webvpn
Router (config-webvpn-gateway)# ip address 10.1.1.1 port 443 standby SSLVPNhigh2
```

## debug Command Output: Examples

### Configuring SSO: Example

The following output example displays ticket creation, session setup, and response handling information for an SSO configuration:

Router# **debug webvpn sso**

```
*Jun 12 20:37:01.052: WV-SSO: Redirect to SSO web agent URL -
http://example.examplecompany.com/vpnauth/
*Jun 12 20:37:01.052: WV-SSO: Set session cookie with SSO redirect
*Jun 12 20:37:01.056: WV-SSO: Set SSO auth flag
*Jun 12 20:37:01.056: WV-SSO: Attach credentials - building auth ticket
*Jun 12 20:37:01.060: WV-SSO: user: [user11], secret: [secret123], version: [1.0], login
time: [BCEFC86D], session key: [C077F97A], SHA1 hash :
[B07D0A924DB33988D423AE9F937C1C5A66404819]
*Jun 12 20:37:01.060: WV-SSO: auth_ticket :
user11:1.0@C077F97A@BCEFC86D@B07D0A924DB33988D423AE9F937C1C5A66404819
*Jun 12 20:37:01.060: WV-SSO: Base64 credentials for the auth_ticket:
dXNlcjExOjEuMEBDMDc3Rjk3QUBCQ0VGQzg2REBCMDdEMEE5MjREQjMzOTg4RDQyM0FFOUY5MzdDMUM1QTY2NDA0OD
E5
*Jun 12 20:37:01.060: WV-SSO: Decoded credentials =
user11:1.0@C077F97A@BCEFC86D@B07D0A924DB33988D423AE9F937C1C5A66404819
*Jun 12 20:37:01.060: WV-SSO: Starting SSO request timer for 15-second

*Jun 12 20:37:01.572: WV-SSO: SSO auth response rcvd - status[200]
*Jun 12 20:37:01.572: WV-SSO: Parsed non-SM cookie: SMCHALLENGE
*Jun 12 20:37:01.576: WV-SSO: Parsed SMSESSION cookie
*Jun 12 20:37:01.576: WV-SSO: Sending logon page after SSO auth success
```

## show Command Output: Examples

The following examples display information about various SSL VPN features and scenarios:

- [show webvpn context Example, page 94](#)
- [show webvpn context name Example, page 94](#)
- [show webvpn gateway Example, page 94](#)
- [show webvpn gateway name Example, page 94](#)
- [show webvpn install file Example, page 94](#)
- [show webvpn install package svc Example, page 95](#)
- [show webvpn install status svc Example, page 95](#)
- [show webvpn nbns context all Example, page 95](#)
- [show webvpn policy Example, page 95](#)
- [show webvpn policy Example \(with NTLM disabled\), page 96](#)
- [show webvpn session Example, page 96](#)
- [show webvpn session user Example, page 96](#)
- [show webvpn stats Example, page 97](#)
- [show webvpn stats sso Examples, page 99](#)
- [F VRF show Command Output Example, page 99](#)

**show webvpn context Example**

The following is sample output from the **show webvpn context** command:

```
Router# show webvpn context
```

```
Codes: AS - Admin Status, OS - Operation Status
 VHost - Virtual Host
```

Context Name	Gateway	Domain/VHost	VRF	AS	OS
-----	-----	-----	-----	-----	-----
Default_context	n/a	n/a	n/a	down	down
con-1	gw-1	one	-	up	up
con-2	-	-	-	down	down

**show webvpn context name Example**

The following is sample output from the **show webvpn context** command, entered with the name of a specific SSL VPN context:

```
Router# show webvpn context context1
```

```
Admin Status: up
Operation Status: up
CSD Status: Disabled
Certificate authentication type: All attributes (like CRL) are verified
AAA Authentication List not configured
AAA Authentication Domain not configured
Default Group Policy: PG_1
Associated WebVPN Gateway: GW_ONE
Domain Name: DOMAIN_ONE
Maximum Users Allowed: 10000 (default)
NAT Address not configured
VRF Name not configured
```

**show webvpn gateway Example**

The following is sample output from the **show webvpn gateway** command:

```
Router# show webvpn gateway
```

Gateway Name	Admin	Operation
-----	-----	-----
GW_1	up	up
GW_2	down	down

**show webvpn gateway name Example**

The following is sample output from the **show webvpn gateway** command, entered with a specific SSL VPN gateway name:

```
Router# show webvpn gateway GW_1
```

```
Admin Status: up
Operation Status: up
IP: 10.1.1.1, port: 443
SSL Trustpoint: TP-self-signed-26793562
```

**show webvpn install file Example**

The following is sample output from the **show webvpn install** command, entered with the **file** keyword:

```
Router# show webvpn install file \webvpn\stc\version.txt
```

```
SSL VPN File \webvpn\stc\version.txt installed:
CISCO STC win2k+ 1.0.0
```

```
1,1,0,116
Fri 06/03/2005 03:02:46.43
```

### show webvpn install package svc Example

The following is sample output from the **show webvpn install** command, entered with the **package svc** keywords:

```
Router# show webvpn install package svc

SSL VPN Package SSL-VPN-Client installed:
File: \webvpn\stc\1\binaries\detectvm.class, size: 555
File: \webvpn\stc\1\binaries\java.htm, size: 309
File: \webvpn\stc\1\binaries\main.js, size: 8049
File: \webvpn\stc\1\binaries\ocx.htm, size: 244
File: \webvpn\stc\1\binaries\setup.cab, size: 176132
File: \webvpn\stc\1\binaries\stc.exe, size: 94696
File: \webvpn\stc\1\binaries\stcjava.cab, size: 7166

File: \webvpn\stc\1\index.html, size: 4725
File: \webvpn\stc\2\index.html, size: 325
File: \webvpn\stc\version.txt, size: 63
Total files: 18
```

### show webvpn install status svc Example

The following is sample output from the **show webvpn install** command, entered with the **status svc** keywords:

```
Router# show webvpn install status svc

SSL VPN Package SSL-VPN-Client version installed:
CISCO STC win2k+ 1.0.0
1,0,2,127
Fri 07/22/2005 12:14:45.43
```

### show webvpn nbns context all Example

The following sample output from the **show webvpn nbns** command, entered with the **context all** keywords:

```
Router# show webvpn nbns context all

NetBIOS name IP Address Timestamp

0 total entries
NetBIOS name IP Address Timestamp

0 total entries
NetBIOS name IP Address Timestamp

0 total entries
```

### show webvpn policy Example

The following is sample output from the **show webvpn policy** command:

```
Router# show webvpn policy group ONE context all
```

```

WEBVPN: group policy = ONE ; context = SSL VPN
 idle timeout = 2100 sec
 session timeout = 43200 sec
 citrix disabled
 dpd client timeout = 300 sec
 dpd gateway timeout = 300 sec
 keep SSL VPN client installed = disabled
 rekey interval = 3600 sec
 rekey method =
 lease duration = 43200 sec
WEBVPN: group policy = ONE ; context = SSL VPN_TWO
 idle timeout = 2100 sec
 session timeout = 43200 sec
 citrix disabled
 dpd client timeout = 300 sec
 dpd gateway timeout = 300 sec
 keep SSL VPN client installed = disabled
 rekey interval = 3600 sec
 rekey method =
 lease duration = 43200 sec

```

### show webvpn policy Example (with NTLM disabled)

The following is sample output from the **show webvpn policy** command. NTLM authentication has been disabled.

```
Router# show webvpn policy group ntlm context ntlm
```

```

WEBVPN: group policy = ntlm; context = ntlm
 url list name = "ntlm-server"
 idle timeout = 2100 sec
 session timeout = 43200 sec
 functions =
 httpauth-disabled
 file-access
 svc-enabled

 citrix disabled
 dpd client timeout = 300 sec
 dpd gateway timeout = 300 sec
 keep SSL VPN client installed = disabled
 rekey interval = 3600 sec
 rekey method =
 lease duration = 43200 sec

```

### show webvpn session Example

The following is sample output from the **show webvpn session** command. The output is filtered to display user session information for only the specified context.

```
Router# show webvpn session context SSL VPN
```

```

WebVPN context name: SSL VPN
Client_Login_Name Client_IP_Address No_of_Connections Created Last_Used
user1 10.2.1.220 2 04:47:16 00:01:26
user2 10.2.1.221 2 04:48:36 00:01:56

```

### show webvpn session user Example

The following is sample output from the **show webvpn session** command. The output is filtered to display session information for a specific user.

```
Router# show webvpn session user user1 context all
```

```

WebVPN user name = user1 ; IP address = 10.2.1.220; context = SSL VPN
No of connections: 0
Created 00:00:19, Last-used 00:00:18
CSD enabled
CSD Session Policy
 CSD Web Browsing Allowed
 CSD Port Forwarding Allowed
 CSD Full Tunneling Disabled
 CSD FILE Access Allowed
User Policy Parameters
 Group name = ONE
Group Policy Parameters
 url list name = "Cisco"
 idle timeout = 2100 sec
 session timeout = 43200 sec
 port forward name = "EMAIL"
 tunnel mode = disabled
 citrix disabled
 dpd client timeout = 300 sec
 dpd gateway timeout = 300 sec
 keep stc installed = disabled
 rekey interval = 3600 sec
 rekey method = ssl
 lease duration = 3600 sec

```

### show webvpn stats Example

The following is sample output from the **show webvpn stats** command entered with the **detail** and **context** keywords:

```
Router# show webvpn stats detail context SSL VPN
```

```
WebVPN context name : SSL VPN
```

```
User session statistics:
```

Active user sessions	: 0	AAA pending reqs	: 0
Peak user sessions	: 0	Peak time	: never
Active user TCP conns	: 0	Terminated user sessions	: 0

### show webvpn stats sso Examples

The following output example displays statistics for an SSO server:

```
webvpn# show webvpn stats sso
```

Single Sign On statistics:

```

Auth Requests : 4 Pending Auth Requests :0
Successful Requests : 1 Failed Requests :3
Retranmissions : 0 DNS Errors :0
Connection Errors : 0 Request Timeouts :0
Unknown Responses :

```

The following output example displays extra information about SSO servers that are configured for the SSL VPN context:

```
Router# show webvpn context test_sso
```

```

Context SSO server: sso-server
Web agent URL : "http://example1.examplecompany.com/vpnauth/"
Policy Server Secret : "Secret123"
Request Re-tries : 5, Request timeout: 15-second

```

The following output example displays extra information about a SSO server that is configured for the policy group of the SSL VPN context:

```
Router# show webvpn policy group sso context test_sso
```

```

WV: group policy = sso ; context = test_sso
idle timeout = 2100 sec
session timeout = 43200 sec
sso server name = "server1"
citrix disabled
dpd client timeout = 300 sec
dpd gateway timeout = 300 sec
keep SSL VPN client installed = disabled
rekey interval = 3600 sec
rekey method =
lease duration = 43200 sec

```

### F VRF show Command Output Example

The following output example shows that FVRF has been configured:

```
Router# show webvpn gateway mygateway
```

```

Admin Status: down
Operation Status: down
Error and Event Logging: Disabled
GW IP address not configured
SSL Trustpoint: TP-self-signed-788737041
FVRF Name: vrf_1

```

# Additional References

# Feature Information for SSL VPN

Table 6 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 6 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 6** Feature Information for SSL VPN

Feature Name	Release	Feature Information
SSL VPN	12.4(6)T	<p>This feature enhances SSL VPN support in Cisco IOS software. This feature provides a comprehensive solution that allows easy access to a broad range of web resources and web-enabled applications using native HTTP over SSL (HTTPS) browser support. SSL VPN introduced three modes of SSL VPN access: clientless, thin-client, and full-tunnel client support.</p> <p>The following command was introduced in Cisco IOS Release 12.4(15)T: <b>cifs-url-list</b>.</p>
Access Control Enhancements	12.4(20)T	<p>This feature allows administrators to configure automatic authentication and authorization for users. Users provide their usernames and passwords via the gateway page URL and do not have to reenter their usernames and passwords from the login page. Authorization is enhanced to support more generic authorization, including local authorization.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Access Control Enhancements, page 10</a></li> <li>• <a href="#">Configuring Automatic Authentication and Authorization, page 77</a></li> <li>• <a href="#">Local Authorization: Example, page 91</a></li> </ul> <p>The following commands were introduced by this feature: <b>aaa authentication auto</b> and <b>aaa authorization list</b></p>

**Table 6**      **Feature Information for SSL VPN (continued)**

Application ACL Support	12.4(11)T	<p>This feature provides administrators with the flexibility to fine tune access control on the Application Layer level.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Application ACL Support, page 11</a></li> <li>• <a href="#">Configuring ACL Rules, page 65</a></li> <li>• <a href="#">Associating an ACL Attribute with a Policy Group, page 68</a></li> <li>• <a href="#">Configuring an ACL: Example, page 85</a></li> </ul> <p>The following commands were introduced by this feature: <b>acl</b>, <b>add</b>, <b>error-msg</b>, <b>error-url</b>, and <b>list</b>.</p>
Auto Applet Download	12.4(9)T	<p>This feature provides administrators with the option of automatically downloading the port-forwarding applet under the policy group.</p> <p>The following section provides information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Options for Configuring HTTP Proxy and the Portal Page, page 8</a></li> </ul> <p>The following command was modified by this feature: <b>port-forward (policy group)</b></p>
Backend HTTP Proxy	12.4(20)T	<p>This feature allows administrators to route user requests through a backend HTTP proxy, providing more flexibility and controllability than routing through internal web servers.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Backend HTTP Proxy, page 11</a></li> <li>• <a href="#">Configuring a Backend HTTP Proxy, page 79</a></li> <li>• <a href="#">Backend HTTP Proxy: Example, page 92</a></li> </ul> <p>The following command was added by this feature: <b>http proxy-server</b></p>

**Table 6**      **Feature Information for SSL VPN (continued)**

Cisco AnyConnect VPN Client	12.4(15)T	<p>This feature is the next-generation SSL VPN Client. The feature provides remote users with secure VPN connections to the router platforms supported by SSL VPN and to the Cisco 5500 Series Adaptive Security Appliances.</p> <p>Users having Cisco IOS software releases before Release 12.4(15)T see SSL VPN Client GUI. Users having Release 12.4(15)T and later releases see Cisco AnyConnect VPN Client GUI.</p> <p>The task configurations in this document for tunnel mode apply to SVC and AnyConnect VPN Client.</p> <p>For more information about the Cisco AnyConnect VPN Client feature, see the documents <a href="#">Cisco AnyConnect VPN Client Administrator Guide</a> and <a href="#">Release Notes for Cisco AnyConnect VPN Client, Version 2.0</a>.</p> <p><b>Note</b> Many of the features listed in the documents <i>Cisco AnyConnect VPN Client Administrator Guide</i> and <i>Release Notes for Cisco AnyConnect VPN Client, Version 2.0</i> apply only to the Cisco ASA 5500 Series Adaptive Security Appliances. For a list of features that do not currently apply to other Cisco platforms, see the restriction in the “<a href="#">Cisco AnyConnect VPN Client</a>” section on page 3 of this document.</p>
AnyConnect Client Support	12.4(20)T	<p>Effective with this release, AnyConnect Client adds support for several client-side platforms, such as Microsoft Windows, Apple-Mac, and Linux. The ability to install AnyConnect in a standalone mode is also added. In addition, this feature allows multiple SSL VPN client package files to be configured on a gateway.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">AnyConnect Client Support, page 10</a></li> <li>• <a href="#">Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files, page 53</a></li> <li>• <a href="#">Multiple AnyConnect VPN Client Package Files: Examples, page 90</a></li> </ul> <p>The following command was modified by this feature: <b>webvpn install</b></p>

**Table 6**      **Feature Information for SSL VPN (continued)**

Debug Infrastructure	12.4(11)T	<p>Updates to the <b>webvpn debug</b> command provide administrators with the ability to turn debugging on for any one user or group.</p> <p>The following keywords were introduced by this feature: <b>acl</b>, <b>entry</b>, <b>sso</b>, and <b>verbose</b>.</p> <p>The following keyword options were added for the <b>http</b> keyword: <b>authentication</b>, <b>trace</b>, and <b>verbose</b>.</p> <p>The <b>verbose</b> keyword option was added for the <b>citrix</b>, <b>cookie</b>, <b>tunnel</b>, and <b>webservice</b> keywords.</p> <p>The <b>port-forward</b> keyword was deleted effective with this release, and the <b>detail</b> keyword option for the <b>tunnel</b> keyword was deleted.</p>
Front-Door VRF Support	12.4(15)T	<p>Coupled with the already supported internal VRF, this feature allows the SSL VPN gateway to be fully integrated into an MPLS network.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Front-Door VRF Support, page 11</a></li> <li>• <a href="#">Configuring FVRF, page 75</a></li> </ul>
Full-Tunnel CEF Support	12.4(20)T	<p>This feature provides better performance for full-tunnel packets.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Full-Tunnel CEF Support, page 12</a></li> <li>• <a href="#">Disabling Full-Tunnel CEF, page 76</a></li> <li>• <a href="#">CEF-Processed Packets: Example, page 90</a></li> </ul>
GUI Enhancements	12.4(15)T	<p>These enhancements provide updated examples and explanation of the Web VPN GUIs.</p> <p>The following section provides information about these updates:</p> <ul style="list-style-type: none"> <li>• <a href="#">GUI Enhancements, page 12</a></li> </ul>

**Table 6**      **Feature Information for SSL VPN (continued)**

Netegrity Cookie-Based Single SignOn (SSO) Support	12.4(11)T	<p>This feature allows administrators to configure a SSO server that sets a SiteMinder cookie in the browser of a user when the user initially logs on. The benefit of this feature is that users are prompted to log on only a single time</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Netegrity Cookie-Based Single SignOn Support, page 18</a></li> <li>• <a href="#">Configuring SSO Netegrity Cookie Support for a Virtual Context, page 69</a></li> <li>• <a href="#">Associating an SSO Server with a Policy Group, page 71</a></li> </ul> <p>The following commands were modified for this feature: <b>clear webvpn stats</b>, <b>debug webvpn</b>, <b>show webvpn policy</b>, <b>show webvpn context</b>, and <b>show webvpn stats</b>.</p> <p>The following commands were added for this feature: <b>max-retry-attempts</b>, <b>request-timeout</b>, <b>secret-key</b>, <b>sso-server</b>, and <b>web-agent-url</b>.</p>
NTLM Authentication	12.4(9)T	<p>This feature provides NT LAN Manager (NTLM) authentication support.</p> <p>The following section provides information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">NTLM Authentication, page 18</a></li> </ul> <p>The following command was modified by this feature: <b>functions</b></p>
Port-Forward Enhancements	12.4(11)T	<p>This feature provides administrators with more options for configuring HTTP proxy and portal pages.</p> <p>The following section provides information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Options for Configuring HTTP Proxy and the Portal Page, page 8</a></li> </ul> <p>The following commands were added for this feature: <b>acl</b>, <b>add</b>, <b>deny</b>, <b>error-msg</b>, <b>error-url</b>, <b>list</b>, and <b>permit</b>.</p>

**Table 6**      **Feature Information for SSL VPN (continued)**

RADIUS Accounting	12.4(9)T	<p>This feature provides for RADIUS accounting for SSL VPN sessions.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">RADIUS Accounting, page 18</a></li> <li>• <a href="#">Configuring RADIUS Accounting for SSL VPN User Sessions, page 40</a></li> <li>• <a href="#">RADIUS Accounting for SSL VPN Sessions: Example, page 86</a></li> </ul> <p>The following command was added by this feature: <b>webvpn aaa accounting-list</b></p>
Stateless High Availability with Hot Standby Router Protocol (HSRP)	12.4(20)T	<p>This feature allows stateless failover to be applied to VPN routers by using HSRP.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Stateless High Availability with Hot Standby Router Protocol, page 19</a></li> <li>• <a href="#">Configuring Stateless High Availability with HSRP for SSL VPN, page 80</a></li> <li>• <a href="#">Stateless High Availability with HSRP: Example, page 92</a></li> </ul> <p>The following command was modified by this feature: <b>ip address</b></p>
URL Obfuscation	12.4(11)T	<p>This feature provides administrators with the ability to obfuscate, or mask, sensitive portions of an enterprise URL, such as IP addresses, hostnames, or port numbers.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">URL Obfuscation, page 22</a></li> <li>• <a href="#">Configuring URL Obfuscation (Masking), page 71</a></li> <li>• <a href="#">URL Obfuscation (Masking): Example, page 87</a></li> </ul> <p>The following command was added by this feature: <b>mask-urls</b></p>

**Table 6**      **Feature Information for SSL VPN (continued)**

URL Rewrite Splitter	12.4(20)T	<p>This feature allows administrators to selectively mangle requests to the gateway.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">URL Rewrite Splitter, page 22</a></li> <li>• <a href="#">Configuring a URL Rewrite Splitter, page 78</a></li> <li>• <a href="#">URL Rewrite Splitter: Example, page 91</a></li> </ul> <p>The following commands were added by this feature: <b>host</b>, <b>ip</b>, <b>unmatched-action</b>, and <b>url rewrite</b></p>
User-Level Bookmarking	12.4(15)T	<p>This feature allows a user to bookmark URLs while connected through an SSL VPN tunnel.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">User-Level Bookmarking, page 22</a></li> <li>• <a href="#">Configuring User-Level Bookmarks, page 74</a></li> </ul> <p>The following command was added by this feature: <b>user-profile location</b></p>

# SSL VPN Remote User Guide

---

**First Published: February 27, 2006**

**Last Updated: March 6, 2008**

The SSL VPN feature (also known as WebVPN) provides support, in Cisco IOS software, for remote user access to enterprise networks from anywhere on the Internet. Remote access is provided through a Secure Socket Layer- (SSL-) enabled SSL Virtual Private Network (VPN) gateway. The SSL VPN gateway allows remote users to establish a secure VPN tunnel using a web browser. This feature provides a comprehensive solution that allows easy access to a broad range of web resources and web-enabled applications using native HTTP over SSL (HTTPS) browser support.

This document describes how a remote user, whose enterprise network is configured for SSL VPN, can access the network by launching a browser and connecting to the SSL VPN gateway.

For information about SSL VPN from the point of view of a system administrator, see the document [SSL VPN](#).

**Note**

The Cisco AnyConnect VPN Client is introduced in Cisco IOS Release 12.4(15)T. This feature is the next-generation SSL VPN Client. If you are using Cisco software before Cisco IOS Release 12.4(15)T, you should use SSL VPN Client and see GUI for the SSL VPN Client when you are web browsing. However, if you are using Cisco software Release 12.4(15)T or later, you should use Cisco AnyConnect VPN Client and see GUI for Cisco AnyConnect VPN Client when you are web browsing.

For “What’s New” information about SSL VPN features by release, see the [“Feature Information for SSL VPN for Remote Users” section on page 23](#).

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for SSL VPN for Remote Users” section on page 23](#).*

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Restrictions for SSL VPN Remote User Guide, page 3](#)
- [Usernames and Passwords, page 3](#)
- [Remote User Interface, page 4](#)
- [Security Tips, page 17](#)
- [Troubleshooting Guidelines, page 20](#)
- [Additional References, page 21](#)
- [Feature Information for SSL VPN for Remote Users, page 23](#)
- [Notices, page 24](#)

## SSL VPN Prerequisites for the Remote User

The following prerequisites are required to start SSL VPN on a PC or device:

- Connection to the Internet—Any Internet connection is supported, including:
  - Home DSL, cable, or dial-ups
  - Public kiosks
  - Hotel connections
  - Airport wireless nodes
  - Internet cafes
- Operating system support

---

**Note** Later versions of the following software are also supported.

---

- Microsoft Windows 2000, Windows XP, or Windows Vista
- Macintosh OS X 10.4.6
- Linux (Redhat RHEL 3.0 +, FEDORA 5, or FEDORA 6)
- SSL VPN-supported browser—The following browsers have been verified for SSL VPN. Other browsers might not fully support SSL VPN features.

---

**Note** Later versions of the following software are also supported.

---

- Internet Explorer 6.0 or 7.0
- Firefox 2.0 (Windows and Linux)
- Safari 2.0.3
- Cookies enabled—Cookies must be enabled on the browser to access applications through port forwarding.

- Pop-ups enabled—Pop-ups should be enabled on the browser to display the floating SSL VPN toolbar and timeout warnings. If pop-ups are blocked, change the browser setting and click the SSL VPN floating toolbar icon on the in-page toolbar to display the floating toolbar.  
If pop-ups are disabled on the browser, SSL VPN does not warn you before disconnecting because of an idle timeout or a maximum connect time.
- URL for SSL VPN—An HTTPS address in the following form:  
`https://address`  
where *address* is the IP address or Domain Name System (DNS) hostname of an interface of the SSL VPN gateway, for example `https://10.89.192.163` or `https://vpn.company.com`.
- SSL VPN username and password

## Restrictions for SSL VPN Remote User Guide

### Cisco AnyConnect VPN Client

CiscoAnyConnect VPN Client does not support the following:

- Adaptive Security Appliance (ASA) and Adaptive Security Device Manager (ASDM) and any command-line interface (CLI) associated with the them
- Adjusting Maximum Transmission Unit (MTU) size
- Client-side authentication
- Compression support
- Datagram Transport Layer Security (DTLS) with SSL connections
- IPv6 VPN access
- Language Translation (localization)
- (Optional) Local printer—SSL VPN does not support printing in clientless mode from a web browser to a network printer. However, printing to a local printer is supported.
- Sequencing
- Standalone Mode

## Username and Passwords

[Table 1](#) lists the type of usernames and passwords that SSL VPN users might have to know.

**Table 1** *Usernames and Passwords for SSL VPN Users*

Login Username/ Password Type	Purpose	Entered When
Computer	Access the computer	Starting the computer
Internet Provider	Access the Internet	Connecting to an Internet provider
SSL VPN	Access the remote network	Starting SSL VPN
File Server	Access the remote file server	Using the SSL VPN file browsing feature to access a remote file server

**Table 1**      *Username and Passwords for SSL VPN Users (continued)*

<b>Login Username/ Password Type</b>	<b>Purpose</b>	<b>Entered When</b>
Corporate Application Login	Access the firewall-protected internal server	Using the SSL VPN web browsing feature to access an internal protected website
Mail Server	Access the remote mail server via SSL VPN	Sending or receiving e-mail messages

## Remote User Interface

If your enterprise network has been configured for SSL VPN, you can access the network by launching a browser and connecting to the SSL VPN gateway. Present your credentials and authenticate, and then a portal page (home page) of the enterprise site is displayed. The portal page displays SSL VPN features (for example, e-mail and web browsing) to which you have access on the basis of your credentials. If you have access to all features enabled on the SSL VPN gateway, the home page will provide access links.

The following sections explain the remote user interface in more detail:

- [Page Flow, page 4](#)
- [Initial Connection, page 5](#)
- [Login Page, page 5](#)
- [Certificate Authentication, page 6](#)
- [Logout Page, page 6](#)
- [Portal Page, page 7](#)
- [Remote Servers, page 9](#)
- [Toolbar, page 9](#)
- [Session Timeout, page 12](#)
- [TCP Port Forwarding and Thin Client, page 13](#)
- [Tunnel Connection, page 15](#)
- [User-Level Bookmarking, page 15](#)

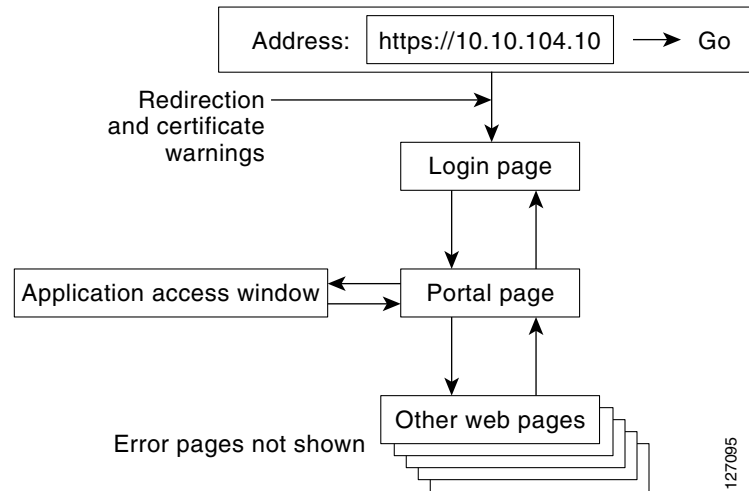

## Page Flow

This section describes the page flow process (see [Figure 1](#)) for a SSL VPN session. When you enter the HTTPS URL (<https://address>) into your browser, you are then redirected to <https://address/index.html>, where the login page is located.

### Note

Depending on the configuration of the browser, this redirection may display a warning message in your browser, which indicates that you are being redirected to a secure connection.

**Figure 1**      **Page Flow**

## Initial Connection

When you connect for the first time, you might be presented with one of the following scenarios:

- [503 Service Unavailable Message, page 5](#)
- [SSL/TLS Certificate, page 5](#)
- [Web Browsing, page 10](#)

### 503 Service Unavailable Message

You might see a “503 Service Unavailable” message if the gateway is experiencing high traffic loads. If you receive this message, try to connect again later.

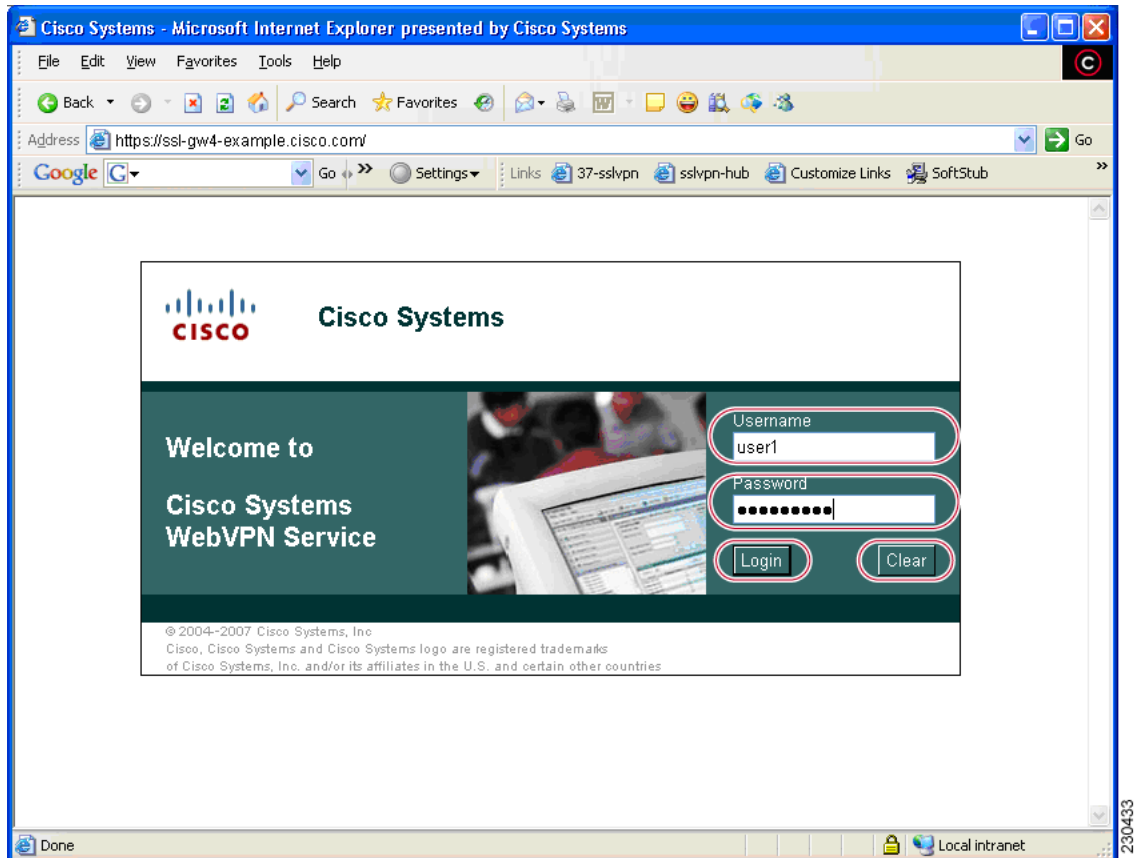

### SSL/TLS Certificate

When the HTTPS connection is established, a warning about the SSL/Transport Layer Security (TLS) certificate may display. If the warning displays, you should install this certificate. If the warning does not display, the system already has a certificate that the browser trusts.

You are then connected to the login page.

## Login Page

The default login page ([Figure 2](#)) prompts you to enter your username and password, which are entered into an HTML form. If an authentication failure occurs, the login page displays an error message.

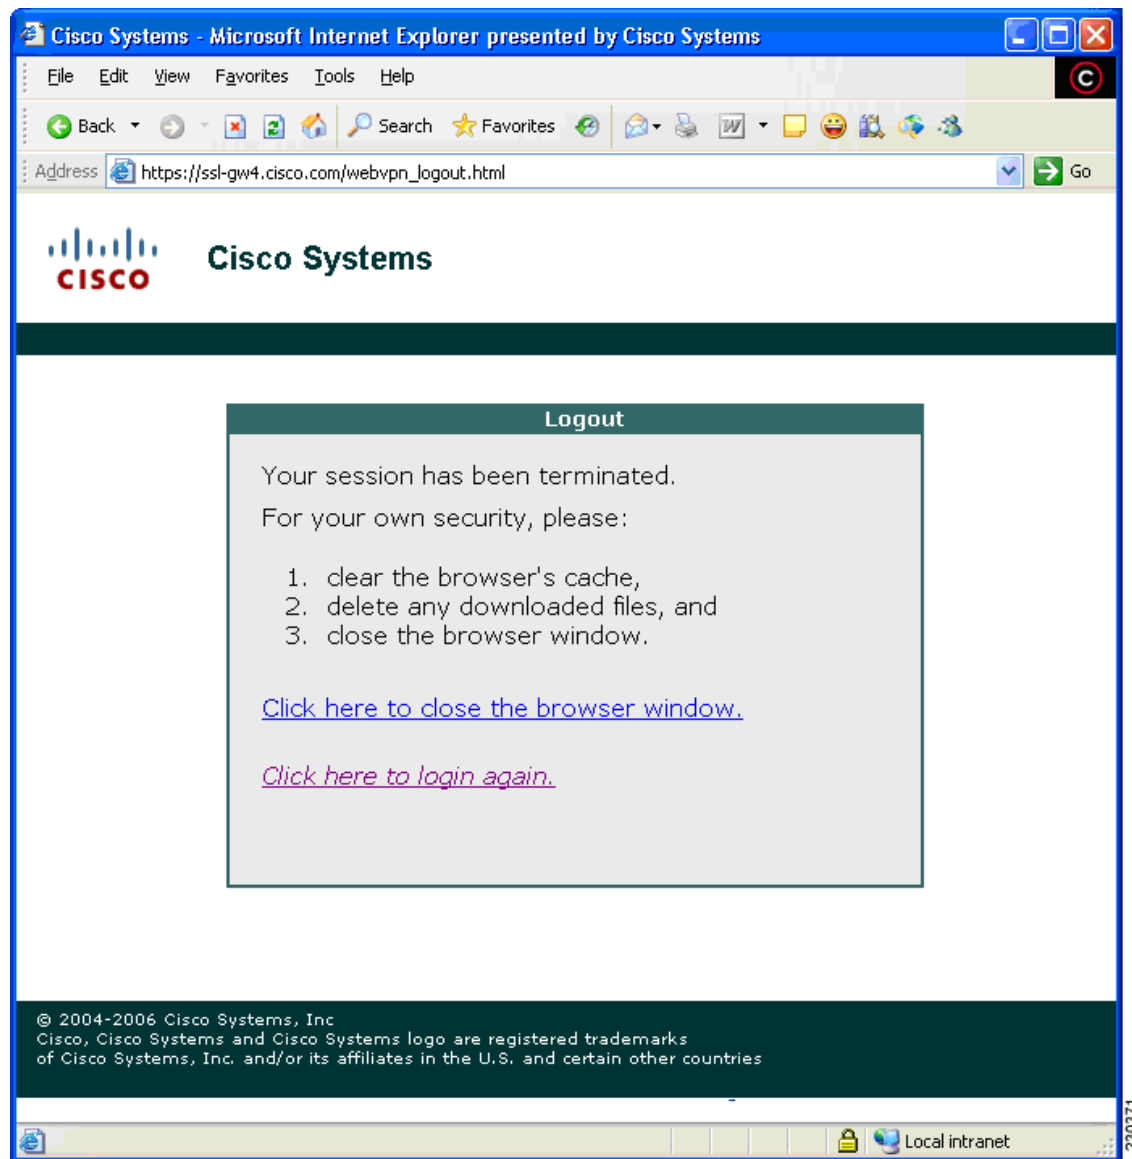

**Figure 2**      **Default Login Page**

## Certificate Authentication

Client certificate authentication is not supported. Only username and password authentication is supported.

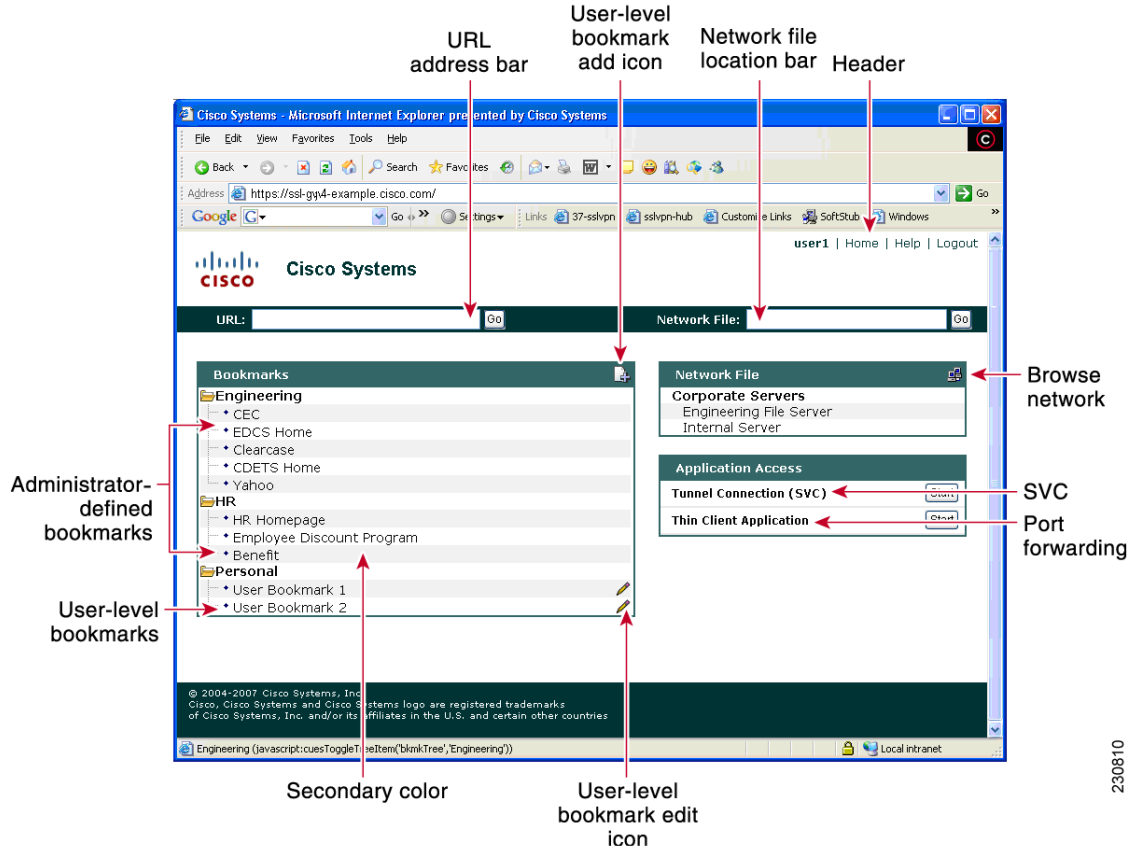

## Logout Page

The logout page ([Figure 3](#)) displays if you click the logout link or if the session terminates because of an idle timeout or a maximum connection time.

**Figure 3 Logout Page**

## Portal Page

The portal page (Figure 4) is the main page for the SSL VPN functionality. See the callouts for functions that exist for administrators and users.

**Figure 4**      **Portal Page**

230810

Table 2 provides information about various fields on the portal page.

**Table 2**      **Information About Fields on the Portal Page**

Field	Description
Administrator-defined bookmarks	Administrator-defined URL lists that cannot be edited by the user.
Browse network	Allows you to browse the file network.
Header	Shares the same color value as the “Title.” Set by the administrator.
Network File location bar	Allows you to access the network share or folder directly by entering \\server\share\folder.
Port forwarding	Downloads the applet and starts port forwarding.
Tunnel connection	Allows you to download the tunnel client and to install tunnel connect.
URL address bar	A new window is opened when you click <b>Go</b> .
User-level bookmark add icon	Clicking the icon opens a dialog box so you can add a new bookmark to the Personal folder.

**Table 2**      **Information About Fields on the Portal Page (continued)**

Field	Description
User-level bookmark edit icon	Allows you to edit or delete an existing bookmark.
User-level bookmarks	<p>You can add a bookmark by using the plus icon (see below)</p> <div data-bbox="862 428 924 493" data-label="Image"></div> <p>on the bookmark panel or toolbar. See the <a href="#">“Toolbar” section on page 9</a> for information about the toolbar. A new window is opened when the link is clicked.</p>

## Remote Servers

You may enter an address or URL path of a website that you want to visit in the text box on the portal page. Pages from the remote server are displayed in the browser window. You can then browse to other links on the page.

## Toolbar

A toolbar has been introduced to help you access the SSL VPN functionalities that are outside the portal page. The toolbar is in the upper right corner of [Figure 5](#) and is outlined in red.

**Figure 5** Website with a Toolbar

The toolbar is expanded below in [Figure 6](#). The sections that follow it explain how to use the toolbar icons.

**Figure 6** Toolbar

## Web Browsing

The web browser is the plus icon (see [Figure 7](#)).

**Figure 7** Web Browsing Icon

If you click the web browsing icon (see [Figure 7](#)), the toolbar expands so that you can enter a URL (see [Figure 8](#)).

**Figure 8** *URL Bar*

When a remote user goes to a URL through the URL address bar, the window that is already open is used for display.

## Moving the Toolbar

The push-pin icon (see [Figure 9](#)) allows you to move the toolbar to the right or left side of the portal page.

**Figure 9** *Toolbar Repositioning*

## Returning to the Portal Page

The house icon allows you to return to the portal page (see [Figure 10](#)).

**Figure 10** *Return to the Portal Page*

If the portal page is present in the parent window and you click to return to the portal page, your screen jumps back (sets the focus) to that window; otherwise, the current page is loaded with the portal page.

## Adding the Current Page to the Personal Bookmark Folder

You can add the current page to your personal bookmark folder by clicking the page-with-a-plus icon (see [Figure 11](#)).

**Figure 11** *Adding Current Page to Personal Bookmark Folder*

## Displaying the Help Page

You can display the help page by clicking the question mark icon (see [Figure 12](#)).

**Figure 12**      **Help Page**

## Logging Out

The door icon (see [Figure 13](#)) allows you to log out.

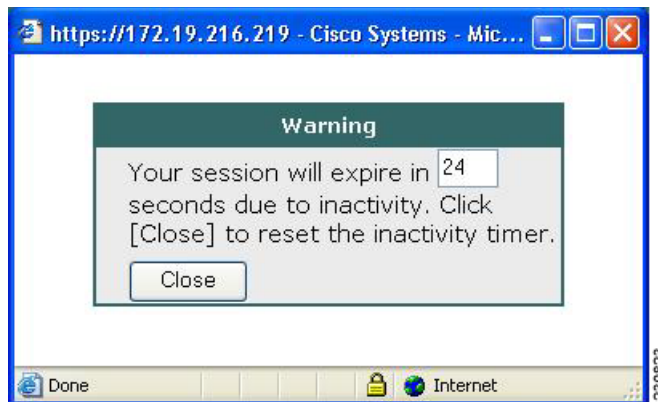

**Figure 13**      **Log Out**

## Session Timeout

You receive a warning message approximately 1 minute before the session is set to expire, and you receive another message when the session expires. On the workstation, the local time indicates when the message was displayed.

The first message will be similar to the following:

“Your session will expire in x seconds due to inactivity. Click Close to reset the inactivity timer. (browser time and date)” (See [Figure 14](#) below.)

**Figure 14**      **Session Expiration Message**

The last message, as shown below in [Figure 15](#), displays when the time runs out (depending on whether the reason of the session termination is known):

**Figure 15**      *Session Inactivity or Timeout Window*

## TCP Port Forwarding and Thin Client

**Note**

This feature requires the Java Runtime Environment (JRE) version 1.4 or later releases to properly support SSL connections.

**Note**

Because this feature requires installing JRE and configuring the local clients, and because doing so requires administrator permissions on the local system, it is unlikely that you can use applications when you connect from public remote systems.

When you click the Start button of the Thin Client application (under Application Access), a new window is displayed. This window initiates the downloading of a port-forwarding applet. Another window is then displayed. This window asks you to verify the certificate with which this applet is signed. When you accept the certificate, the applet starts running, and port-forwarding entries are displayed (see [Figure 16](#)). The number of active connections and bytes that are sent and received is also listed on this window.

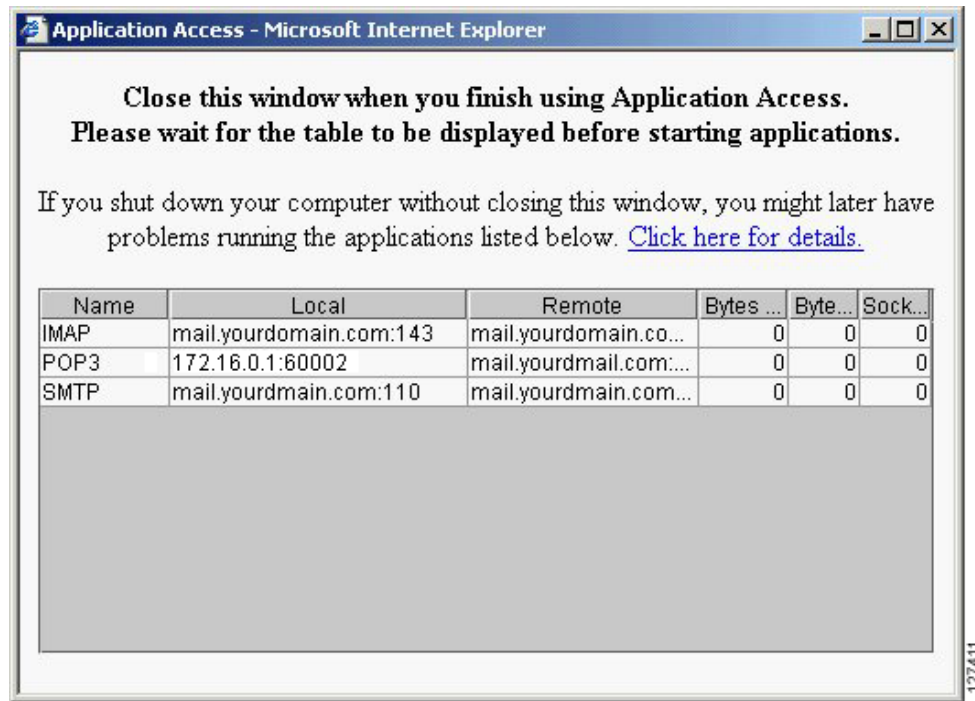

**Note**

When you click the Thin Client link, your system may display a dialog box regarding digital certificates, and this dialog box may appear behind other browser windows. If your connection hangs, minimize the browser windows to find this dialog box.

The administrator should have configured IP addresses, DNS names, and port numbers for the e-mail servers. If they are configured, you can launch the e-mail client, which is configured to contact these e-mail servers and send and receive e-mails. Point of Presence3 (POP3), Internet Message Access Protocol (IMAP), and Simple Mail Transfer Protocol (SMTP) protocols are supported.

The window attempts to close automatically if you are logged out using JavaScript. If the session terminated and a new port forwarding connection is established, the applet displays an error message.

**Figure 16** TCP Port Forwarding Page**Caution**

You should always close the Thin Client window when you finish using applications by clicking the close icon. Failure to quit the window properly can cause Thin Client or the applications to be disabled. See the “[Thin Client—Recovering from Hosts File Error](#)” section on page 18 for details.

Table 3 lists the requirements for Thin Client (Port Forwarding) on your PC or device.

**Table 3** SSL VPN Remote System Thin Client Requirements

Remote User System Requirements	Specifications or Use Suggestions
Client applications installed	—
Cookies enabled on browser	—
Administrator privileges	You must be the local administrator on your PC.
Sun Microsystems JRE version 1.4 or later installed	SSL VPN automatically checks for JRE whenever you start Thin Client. If it is necessary to install JRE, a pop-up window displays, directing you to a site where it is available.

**Table 3**      **SSL VPN Remote System Thin Client Requirements (continued)**

Remote User System Requirements	Specifications or Use Suggestions
Client applications configured, if necessary <b>Note</b> The Microsoft Outlook client does not require this configuration step.	To configure the client application, use the locally mapped IP address and port number of the server. To find this information, do the following: <ul style="list-style-type: none"> <li>• Start SSL VPN on the remote system and click the Thin Client link on the SSL VPN home page. The Thin Client window is displayed.</li> <li>• In the Name column, find the name of the server that you want to use, and then identify its corresponding client IP address and port number (in the Local column).</li> <li>• Use this IP address and port number to configure the client application. The configuration steps vary for each client application.</li> </ul>
Windows XP SP2 patch	If you are running Windows XP SP2, you must install a patch from Microsoft that is available at the following address: <a href="http://support.microsoft.com/?kbid=884020">http://support.microsoft.com/?kbid=884020</a> This problem is a known Microsoft issue.

## Tunnel Connection

In a typical clientless remote access scenario, you establish an SSL tunnel to move data to and from the internal networks at the application layer (for example, web and e-mail). In tunnel mode, you use an SSL tunnel to move data at the network (IP) layer. Therefore, tunnel mode supports most IP-based applications. Tunnel mode supports many popular corporate applications (for example, Microsoft Outlook, Microsoft Exchange, Lotus Notes E-mail, and Telnet).

The tunnel connection is determined by the group policy configuration. The Cisco AnyConnect VPN Client (next-generation SSL VPN Client) is downloaded and installed on your PC, and the tunnel connection is established after the installation.

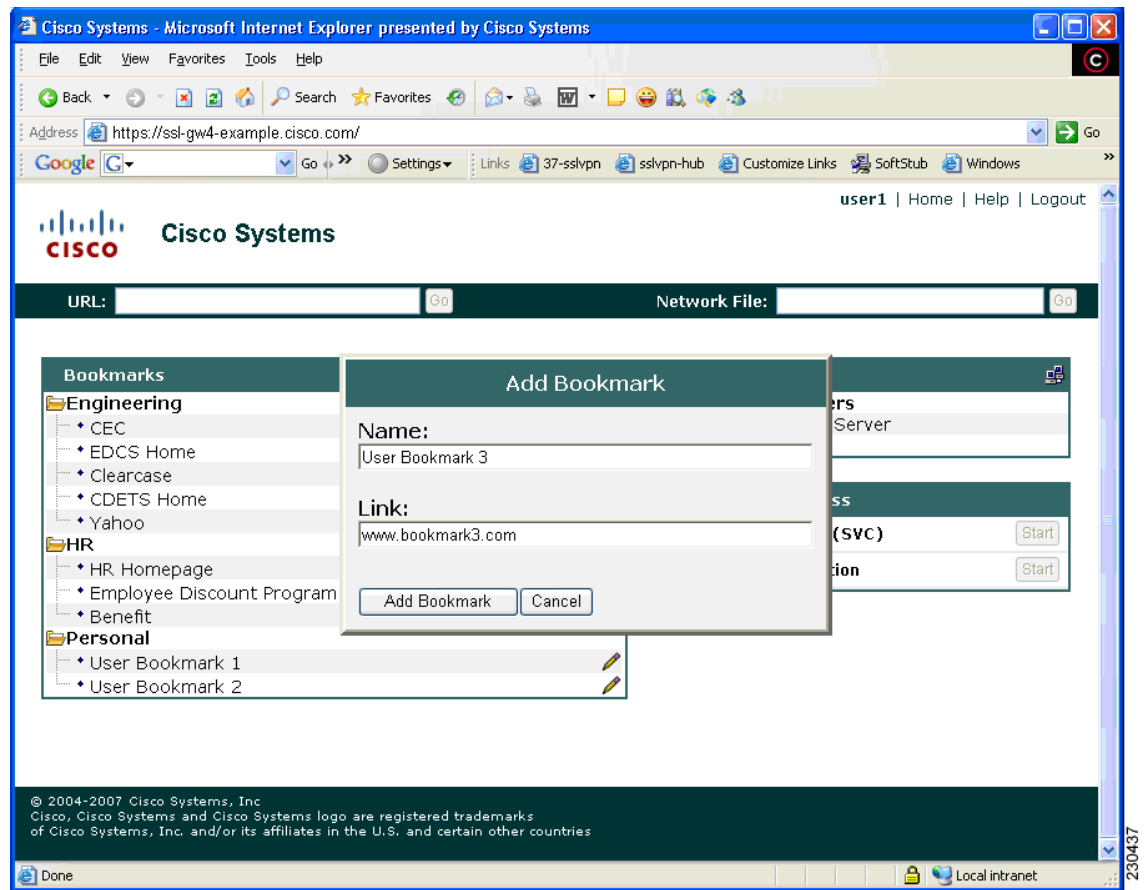

By default, Cisco AnyConnect VPN Client is removed from your PC after the connection is closed. However, you have the option to keep the Cisco AnyConnect VPN Client installed on your PC.

## User-Level Bookmarking

Effective with Cisco IOS Release 12.4(15)T, you can bookmark URLs while connected through an SSL VPN tunnel. You can access the bookmarked URLs by clicking the URL.

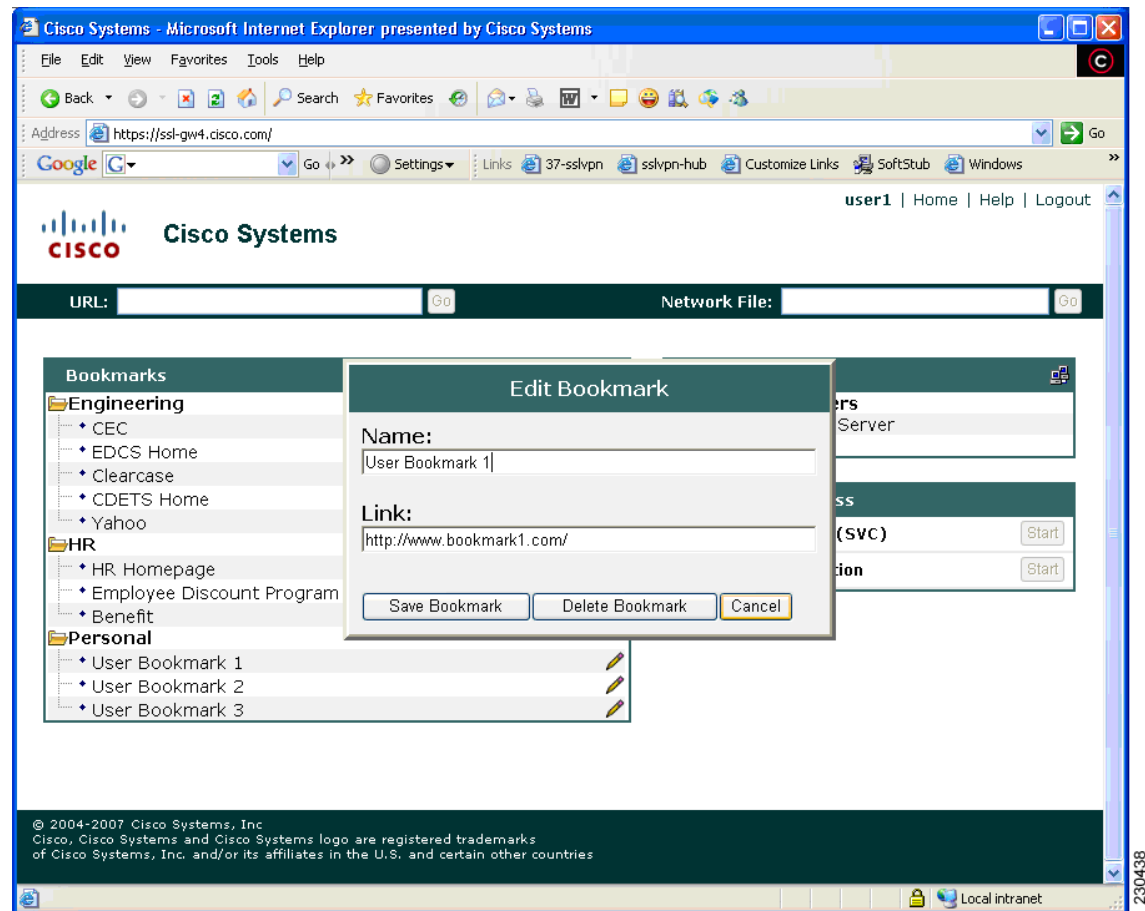

### Adding a Bookmark

Figure 17 shows a typical web page to which a bookmark can be added.

**Figure 17 Add Bookmark**

## Editing a Bookmark

Figure 18 shows a typical web page to which a bookmark can be edited.

**Figure 18**      **Edit Bookmark**

## Security Tips

You should always log out from the SSL VPN session when you are finished. (To log out of SSL VPN, click the logout icon on the SSL VPN toolbar or quit the browser.)

Using SSL VPN does not ensure that communication with every site is secure. SSL VPN ensures the security of data transmission between your PC or workstation and the SSL VPN gateway on the corporate network. If you then access a non-HTTPS web resource (located on the Internet or on the internal network), the communication from the corporate SSL VPN gateway to the destination web server is not secured.

## Browser Caching and Security Implications

If you access SSL VPN through a public or shared Internet system, such as an Internet cafe or kiosk, to ensure the security of your information after terminating or logging out of the SSL VPN session, you must delete all files that you have saved on the PC during the SSL VPN session. These files are not removed automatically upon disconnect.

**Note**

SSL VPN does not save the content of web pages viewed during the session. However, for additional security, we recommend that you clear your browser cache. Deleting content from a PC does not ensure that it cannot be recovered; keep this fact in mind when downloading sensitive data.

## Thin Client—Recovering from Hosts File Error

It is important that you close the Thin Client window properly by clicking the close icon. If you do not close the window properly, the following could occur:

- The next time you try to start Thin Client, it might be disabled; you will receive a “Backup HOSTS File Found” error message.
- The applications might be disabled or might malfunction even when you are running them locally.

These errors can result if you terminate the Thin Client window in any improper way:

- The browser crashes while using Thin Client.
- A power outage or system shutdown occurs while using Thin Client.
- You minimize the Thin Client window and then shut down the computer with the window active (but minimized).

## How SSL VPN Uses the Hosts File

The hosts file on your system maps IP addresses to hostnames. When you start Thin Client, SSL VPN modifies the hosts file by adding SSL VPN-specific entries. When you stop Thin Client by properly closing the Thin Client window, SSL VPN returns the hosts file to its original state. The hosts file goes through the following states:

- Before invoking Thin Client, the hosts file is in its original state.
- When Thin Client starts, SSL VPN does the following:
  1. Copies the hosts file to hosts.webvpn and creates a backup.
  2. Edits the hosts file, inserting SSL VPN-specific information.
- When Thin Client stops, SSL VPN does the following:
  1. Copies the backup file to the hosts file, restoring the hosts file to its original state.
  2. Deletes hosts.webvpn.
- After finishing Thin Client, the hosts file is in its original state.

## What Happens If You Stop Thin Client Improperly

If you improperly terminate Thin Client, the hosts file is left in the SSL VPN-customized state. SSL VPN checks for this possibility the next time you start Thin Client by searching for a hosts.webvpn file. If SSL VPN finds the file, you receive a “Backup HOSTS File Found” error message, and Thin Client is temporarily disabled.

If you improperly shut down Thin Client, you leave the remote access client or server applications in a suspended state. If you start these applications without using SSL VPN, the applications might malfunction. You might find that hosts that you normally connect to are unavailable. This situation could commonly occur if you run applications remotely from home, fail to quit the Thin Client window before shutting down the computer, and then try to run the applications later from the office.

## What to Do

To reenable Thin Client or malfunctioning applications, you should do the following:

- If you can connect to your remote access server, you should follow the steps in the [“Reconfiguring the Hosts File Automatically Using SSL VPN” section on page 19](#).
- If you cannot connect to your remote access server from your current location or if you have made custom edits to the hosts file, you should follow the steps in the [“Reconfiguring the Hosts File Manually” section on page 19](#).

### Reconfiguring the Hosts File Automatically Using SSL VPN

If you can connect to your remote access server, you should follow these steps to reconfigure the hosts file and reenable both Thin Client and the applications:

- 
- Step 1** Start SSL VPN and log in. The portal page opens.
- Step 2** Click the Applications Access link. A “Backup HOSTS File Found” message displays.
- Step 3** Choose one of the following options:
- Restore from backup—SSL VPN forces a proper shutdown. SSL VPN copies the hosts.webvpn backup file to the hosts file, restoring it to its original state, and then deletes the hosts.webvpn backup file. You then have to restart Thin Client.
  - Do nothing—Thin Client does not start. You are returned to the remote access home page.
  - Delete backup—SSL VPN deletes the hosts.webvpn file, leaving the hosts file in its SSL VPN-customized state. The original hosts file settings are lost. Then Thin Client starts, using the SSL VPN-customized hosts file as the new original. Choose this option only if you are unconcerned about losing hosts file settings. If you edited the hosts file after Thin Client has shut down improperly, choose one of the other options, or edit the hosts file manually. (See the [“Reconfiguring the Hosts File Manually” section on page 19](#).)
- 

### Reconfiguring the Hosts File Manually

If you cannot connect to your remote access server from your current location, or if you have customized the hosts file and do not want to lose your edits, you should follow these steps to reconfigure the hosts file and reenable both Thin Client and the applications:

- 
- Step 1** Locate and edit your hosts file.
- Step 2** Check to see if any lines contain the “added by WebVpnPortForward” string.

If any lines contain this string, your hosts file is customized for SSL VPN. If your hosts file is customized, it looks similar to the following example:

```
10.23.0.3 server1 # added by WebVpnPortForward
10.23.0.3 server1.example.com emailxyz.com # added by WebVpnPortForward
10.23.0.4 server2 # added by WebVpnPortForward
10.23.0.4 server2.example.com.emailxyz.com # added by WebVpnPortForward
10.23.0.5 server3 # added by WebVpnPortForward
10.23.0.5 server3.example.com emailxyz.com # added by WebVpnPortForward

Copyright (c) 1993-1999 Microsoft Corp.
#
This is a sample HOSTS file used by Microsoft TCP/IP for Windows.
#
This file contains the mappings of IP addresses to hostnames. Each
```

```
entry should be kept on an individual line. The IP address should
be placed in the first column followed by the corresponding hostname.
The IP address and the hostname should be separated by at least one
space.
#
Additionally, comments (such as these) may be inserted on individual
lines or following the machine name denoted by a '#' symbol.
#
For example:
#
172.16.102.97 rhino.acme.com # source server
192.168.63.10 x.acme.com # x client host

```

10.23.0.1            localhost

- Step 3**    Delete the lines that contain the “# added by WebVpnPortForward” string.
- Step 4**    Save and close the file.
- Step 5**    Start SSL VPN and log in. Your home page appears.
- Step 6**    Click the Thin Client link. The Thin Client window appears. Thin Client is now enabled.
- 

## Troubleshooting Guidelines

Table 4 provides a list of messages notifying you of various problems, causes, and fixes.

**Table 4**            *Troubleshooting Guidelines*

Message	Cause	Fix
The request to {url} is not allowed. WebVPN has dropped the request. If you have any questions, please ask {...}.	The administrator does not allow you to access a particular URL.	Contact the administrator.
Unable to connect to server {server name}. The server may not exist, or access to it may not be allowed.	Problem with the server.	Check the server name or contact the administrator if it persists.
Unable to find the server {server or url}. The server may not exist, or access to it may not be allowed.	DNS cannot resolve the server name or URL location.	Check the URL address or contact the administrator if it persists.
This (client) machine does not match any identification of a WebVPN user. Please contact your WebVPN provider for assistance.	The client computer does not match any profile of Cisco Secure Desktop (CSD).	Contact the administrator.
This (client) machine does not have the web access privilege. Please contact your WebVPN provider for assistance.	The client computer does not meet the security criteria of having web access functionality through the SSL VPN gateway.	Check the URL to the gateway or contact the administrator if it persists.

**Table 4**      **Troubleshooting Guidelines (continued)**

Message	Cause	Fix
CSD is enabled, but not installed. Please contact your WebVPN provider for assistance.	The CSD has been enabled on the gateway, but it is not available.	Contact the administrator.
The requested information is not available.	Various causes.	Contact the administrator.

# Feature Information for SSL VPN for Remote Users

Table 5 lists the release history for this feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 5 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 5** Feature Information for SSL VPN Remote User Guide

Feature Name	Releases	Feature Information
SSL VPN Remote User Guide	12.4(6)T	This section was originally included in the <a href="#">SSL VPN</a> feature document.
Cisco AnyConnect VPN Client	12.4(15)T	<p>This feature is the next-generation SSL VPN Client. The feature provides remote users with secure VPN connections to the router platforms supported by SSL VPN and to the Cisco 5500 Series Adaptive Security Appliances.</p> <p><b>Note</b> Users who are using Cisco IOS software releases before Release 12.4(15)T see the SSL VPN Client GUI interface when they are web browsing. Users who are using Cisco IOS software Release 12.4(15)T and later see the Cisco AnyConnect VPN Client GUI when they are web browsing.</p> <p><b>Note</b> See the restrictions in the “<a href="#">Cisco AnyConnect VPN Client</a>” section on page 3 for features not currently supported by Cisco AnyConnect VPN Client on platforms other than the Cisco ASA 5500 series Adaptive Security Appliance.</p>

**Table 5**      **Feature Information for SSL VPN Remote User Guide (continued)**

Feature Name	Releases	Feature Information
GUI Enhancements	12.4(15)T	<p>These enhancements provide updated examples and explanation of the Web VPN GUIs.</p> <p>The following sections provide information about these updates:</p> <ul style="list-style-type: none"> <li>• <a href="#">Page Flow, page 4</a></li> <li>• <a href="#">Initial Connection, page 5</a></li> <li>• <a href="#">Login Page, page 5</a></li> <li>• <a href="#">Certificate Authentication, page 6</a></li> <li>• <a href="#">Logout Page, page 6</a></li> <li>• <a href="#">Portal Page, page 7</a></li> <li>• <a href="#">Remote Servers, page 9</a></li> <li>• <a href="#">Toolbar, page 9</a></li> <li>• <a href="#">Session Timeout, page 12</a></li> <li>• <a href="#">TCP Port Forwarding and Thin Client, page 13</a></li> <li>• <a href="#">Tunnel Connection, page 15</a></li> <li>• <a href="#">User-Level Bookmarking, page 15</a></li> </ul>

## Notices

The following notices pertain to this software license.

### OpenSSL/Open SSL Project

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (<http://www.openssl.org/>).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

### License Issues

The OpenSSL toolkit stays under a dual license, i.e. both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact [openssl-core@openssl.org](mailto:openssl-core@openssl.org).

#### OpenSSL License:

## **Threat Information Distribution Protocol (TIDP) and TMS**

# Threat Information Distribution Protocol

---

**First Published: February 27, 2006**

**Last Updated: March 20, 2006**

Threat Information Distribution Protocol (TIDP) provides a rapid and secure mechanism to distribute security threat information. TIDP is designed to support large groups of devices throughout the network. TIDP supports peer authentication and message encryption. TIDP is the distribution layer protocol for TIDP-Based Mitigation Services (TMS). TMS provides the framework to rapidly and efficiently distribute threat information to devices across the network. This document describes TIDP configuration. TIDP must be configured before TMS.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for TIDP” section on page 25](#)

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Contents

- [Prerequisites for TIDP, page 2](#)
- [Restrictions for TIDP, page 2](#)
- [Information About TIDP, page 2](#)
- [How to Configure TIDP, page 4](#)
- [Configuration Examples for TIDP, page 20](#)
- [Additional References, page 22](#)
- [Command Reference, page 24](#)

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

© 2007 Cisco Systems, Inc. All rights reserved.

## Prerequisites for TIDP

- You should have a clear understanding of the physical topology and traffic patterns in your network before deploying TIDP and TMS.
- All devices, configured to run TIDP, must be reachable by TIDP peers via TCP/IP.

## Restrictions for TIDP

- In Cisco IOS Release 12.4(6)T, you can configure only a single controller for each TIDP group.
- Only a physical interface with a fixed IP address can be configured with the **tidp source** command.

## Information About TIDP

You should understand the following concepts, before configuring TIDP and TMS:

- [Threat Information Distribution Protocol, page 2](#)
- [TIDP-Based Mitigation Services, page 4](#)

## Threat Information Distribution Protocol

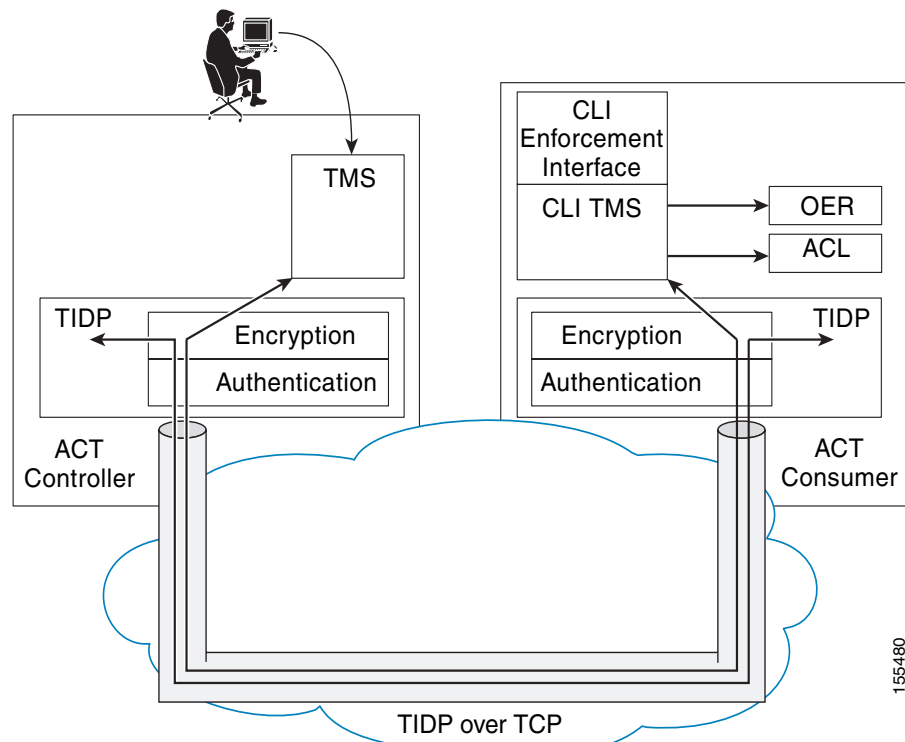

TIDP is a light-weight protocol that provides a rapid, scalable, and secure mechanism to distribute threat information to large groups of devices in the network. TIDP is configured on a per-group basis. Messages are bound to each group but can also be delivered to multiple groups. TIDP is deployed in a star or hub-and-spoke topology, similar to a client/server configuration, in which a controller supports multiple consumers. The controller is configured to peer with all consumers in the group. The consumers peer only with the controller and optionally with each other. [Figure 1](#) shows a sample topology.

**Figure 1**      *The Controller Peers with all Consumers*

## Secure Message Authentication and Encryption

TIDP was designed to be secure. TIDP messages are protected by peer authentication and can be optionally encrypted to prevent the message payload from being viewed or altered. Authentication and encryption are configured with inbound and outbound keys. TIDP can be configured to use AES-128, HMAC-SHA1-160, and RSA key generation. [Figure 2](#) shows TIDP message transport and distribution.

**Figure 2** TMS Service Run Over TIDP

## TIDP-Based Mitigation Services

TIDP is designed to run over only TCP as the transport layer protocol. TIDP is the distribution layer protocol for TIDP-Based Mitigation Services (TMS). TMS provides the framework to rapidly and efficiently distribute threat information to devices across the network.

The TMS framework transports messages that contain specific threat information about suspect traffic and associated mitigation enforcement actions to all devices in the network. Threat Information Messages (TIMs) are distributed throughout the network in near real time. TIMs are distributed from a central device, the TMS controller. TMS consumers are devices configured to receive TIMs. Each consumer can be configured with a unique rule set to locally enforce mitigation actions based on local requirements. Each rule set is customizable and can be modified on demand.

### Note

This document describes TIDP configuration. TIDP must be configured before TMS. For information about TMS, see [TIDP-Based Mitigation Services](#) documentation.

## How to Configure TIDP

This section contains the following tasks:

- [Generating an RSA Key Pair, page 5](#) (optional)

- [Configuring the Remote Peer to Use the RSA Key, page 7](#) (optional)
- [Configuring TIDP Authentication and Encryption Keys, page 9](#) (required)
- [Configuring a TIDP Group, page 13](#) (required)
- [Configuring the Source Interface and Enabling TIDP, page 15](#) (required)
- [Sending a Test Message to Verify that TIDP is Operational, page 17](#) (optional)
- [Using Privileged EXEC Commands to Verify and Troubleshoot TIDP, page 18](#) (optional)

## Generating an RSA Key Pair

This configuration task is optional. The steps in this task show how to generate the RSA key pair and then display the key so that the public key can be copied and input into the remote peer (receiving device).

### Prerequisites

Before configuring the **crypto key generate rsa** command, ensure that your router has a hostname and IP domain name configured (with the **hostname** and **ip domain-name** commands). You will be unable to complete the **crypto key generate rsa** command without a hostname and IP domain name.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto key generate rsa** {general-keys | usage-keys} [label *key-label*] [exportable] [modulus *modulus-size*] [storage *device*:]
4. **exit**
5. **show crypto key mypubkey rsa**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>crypto key generate rsa {general-keys   usage-keys} [label key-label] [exportable] [modulus modulus-size] [storage device:]</b>  <b>Example:</b> Router(config)# crypto key generate rsa general-keys label CRYPTO_KEY_1 modulus 512	Generates an RSA key pair.
Step 4	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode and enters privileged EXEC mode.
Step 5	<b>show crypto key mypubkey rsa</b>  <b>Example:</b> Router# show crypto key mypubkey rsa	Displays the RSA public keys of your router.

## Examples

The following example, starting in global configuration mode, shows how to generate and display an RSA key pair:

```
Router(config)# crypto key generate rsa general-keys label CRYPTO_KEY_1 modulus 512
The name for the keys will be: crypto_key_1
```

```
% The key modulus size is 512 bits
% Generating 512 bit RSA keys, keys will be non-exportable...[OK]
```

```
Router(config)# exit
Router# show crypto key mypubkey rsa
```

```
% Key pair was generated at: 12:45:16 PST Jan 1 2006
Key name: CRYPTO_KEY_1
Storage Device: not specified
Usage: General Purpose Key
Key is not exportable.
Key Data:
 305C300D 06092A86 4886F70D 01010105 00034B00 30480241 00AD3E88 3B3489CB

471AFCD5 0EB86242 F3F8E741 53C3C14E D20916CF 2BC33422 B5020301 0001
```

## Troubleshooting Tips

See the [Cisco IOS Security Configuration Guide, Release 12.4T](#) for information about crypto key configuration and troubleshooting.

## What to Do Next

The public portion of the key that was generated in this task must be entered on the remote peer. Proceed to the next section for more information.

## Configuring the Remote Peer to Use the RSA Key

This task shows how to enter the senders public RSA key on the remote peer. This task is required if an RSA key is configured for TIDP authentication on the sending device.

## Prerequisites

The IP host statement in this task is optional. The remote peer will attempt to use domain name system (DNS) to resolve the name of the RSA key in the public key chain. If the remote peer is not configured to use DNS resolution, then the sending peer must be identified by configuring the **ip host** command on the remote peer. Configuration of the **ip host** command is optional in this task table.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip host** {rsa-key-name ip-address}
4. **crypto key pubkey-chain rsa**
5. **named-key** key-name [encryption | signature]
6. **address** ip-address
7. **key-string** text-key
8. **quit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>ip host</b> {rsa-key-name ip-address}  <b>Example:</b> Router(config) ip host CRYPTO_KEY_1 10.1.1.1	(Optional) Configures a static hostname-to-address mapping in the host cache. <ul style="list-style-type: none"><li>This command is required only if DNS resolution is not configured.</li></ul>
Step 4	<b>crypto key pubkey-chain rsa</b>  <b>Example:</b> Router(config)# crypto key pubkey-chain rsa	Enters public key configuration mode to specify an RSA public key for a remote device.
Step 5	<b>named-key</b> key-name [ <b>encryption</b>   <b>signature</b> ]  <b>Example:</b> Router(config-pubkey-chain)# named-key CRYPTO_KEY_1 signature	Places the router in Crypto public key chain configuration mode. <ul style="list-style-type: none"><li>The name of the RSA key configured on the remote peer is entered.</li></ul>
Step 6	<b>address</b> ip-address  <b>Example:</b> Router(config-pubkey-key)# address 10.1.1.1	Specifies the IP address of the remote peer that generated the RSA public key.
Step 7	<b>key-string</b> text-key  <b>Example:</b> Router(config-pubkey-key)# key-string	Specifies the RSA public key of the remote peer. <ul style="list-style-type: none"><li>You will be prompted to enter the public key.</li></ul>
Step 8	<b>quit</b>  <b>Example:</b> Router(config-pubkey) quit	Exits Hex-key input mode, and enters Crypto public key chain configuration mode.

## Examples

The following example, starting in global configuration mode, configures the remote peer to process the RSA key generated in the first configuration task:

```
Router(config)# ip host CRYPTO_KEY_1 10.1.1.1
Router(config)# crypto key pubkey-chain rsa
Router(config-pubkey-chain)# named-key CRYPTO_KEY_1 signature
Router(config-pubkey-key)# address 10.1.1.1
Router(config-pubkey-key)# key-string
Enter a public key as a hexadecimal number
```

```
Router(config-pubkey)# 305C300D 06092A86 4886F70D 01010105 00034B00 30480241 00AD3E88
3B3489CB
Router(config-pubkey)# A4F77002 97FC4BEC 9AAFE414 973E7B38 B047EACE 5B4857BC 2606EEA3
6704041A
Router(config-pubkey)# 1F6D9659 89070D18 F4358111 90905012 53EEF5E0 5F41B3FD AB020301 0001
Router(config-pubkey)# quit
```

## Troubleshooting Tips

See the [Cisco IOS Security Configuration Guide, Release 12.4T](#) for information about crypto key configuration and troubleshooting.

## What to Do Next

Proceed to the next section for information on configuring the RSA key for TIDP peer authentication.

## Configuring TIDP Authentication and Encryption Keys

The steps in this task show how to configure TIDP peer authentication and message encryption. Peer authentication is required. Message encryption is optional. TIDP can be configured to use AES-128, HMAC-SHA1-160, and RSA key generation.

### Peer Authentication

TIDP peers are authenticated by configuring an RSA public key or by configuring an authentication string. The authentication string can be encrypted or transmitted as clear text. TIDP performs authentication by signing sent messages and verifying the signature in received messages. Two sets of authentication keys are configured for each TIDP group, a send key and receive key. If a message fails authentication, the invalid message counter is increased incrementally. This counter is displayed in the output of the **show tidp detail** command.

### Message Encryption

TIDP messages can be optionally encrypted to prevent the contents from being viewed or altered. Two sets of encryption keys are configured for each TIDP group, a send key and receive key.

### Locally Encrypting Message and Authentication Strings

A message or authentication string can be encrypted in the router configuration file so that encryption and/or authentication is not compromised for the TIDP group if one peer is compromised. The key string is saved as clear text when the **0** keyword is entered after the **key-string** argument. The key string text is encrypted if the **6** keyword is entered. Configuring the **password encryption aes** command in Global configuration mode will automatically encryption all key-strings in the router configuration file.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tidp key-set name**

4. **authentication-key send** {**key-string** [0 | 6] *string-text* | **keypair-name** *name*}
5. **authentication-key receive** {**key-string** [0 | 6] *string-text* | **pubkey-name** *name*}
6. **encryption-key receive** {**key-string** [0 | 6] *string-text*}
7. **encryption-key send** {**key-string** [0 | 6] *string-text*}
8. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>tidp key-set name</b>  <b>Example:</b> Router(config)# tidp key-set KEY_1	Enters TIDP key-set configuration mode to configure a key-set for TIDP peer authentication and/or message encryption. <ul style="list-style-type: none"> <li>Authentication and encryption keys are configured in send and receive pairs.</li> <li>Authentication must be configured before a TIDP group can be activated.</li> <li>Encryption key configuration is optional.</li> </ul>
Step 4	<b>authentication-key send {key-string [0   6] string-text   keypair-name name}</b>  <b>Example:</b> Router(config-tidp-ks)# authentication-key send keypair-name CRYPTO_KEY_1	Configures an authentication key for sent TIDP messages. <ul style="list-style-type: none"> <li>The authentication key can be configured as an RSA key, an encrypted text string, or as clear text.</li> <li>There is a 32 character limit for configuring text strings.</li> <li>Entering the <b>0</b> keyword configures a clear text string. Entering the <b>6</b> keyword configures an encrypted text string.</li> <li>In the example, an authentication is configured using the RSA key pair that was generated in the first task.</li> </ul>
Step 5	<b>authentication-key receive {key-string [0   6] string-text   pubkey-name name}</b>  <b>Example:</b> Router(config-tidp-ks)# authentication-key receive key-string 6 Aa1Bb2Cc3	Configures an authentication key for received TIDP messages. <ul style="list-style-type: none"> <li>The receive key must match the send key configured on the remote peer in order for authentication to occur.</li> <li>In the example, the <b>6</b> keyword is entered to encrypt the authentication string.</li> </ul>
Step 6	<b>encryption-key send {key-string [0   6] string-text}</b>  <b>Example:</b> Router(config-tidp-ks)# encryption-key receive Dd4Ee5Ff6	(Optional) Configures an encryption key to encrypt the contents of received TIDP messages. <ul style="list-style-type: none"> <li>Entering the <b>6</b> keyword encrypt the key-string in the router configuration file. The key string is saved as clear text by default.</li> </ul>

	Command or Action	Purpose
Step 7	<b>encryption-key send</b> {key-string [0   6] string-text} <p><b>Example:</b>  Router(config-tidp-ks)# encryption-key send  Gg7Hh8Ii9</p>	Configures an encryption key to decrypt the contents of received TIDP messages. <ul style="list-style-type: none"> <li>The receive key must match the send key configured on the remote peer in order for authentication to occur.</li> </ul>
Step 8	<b>exit</b> <p><b>Example:</b>  Router(config-tidp-ks)# exit</p>	Exits TIDP key-set configuration mode, and enters global configuration mode.

## Examples

The following examples, starting in global configuration mode, configure an encryption key and authentication key between two TIDP peers.

### Sending Peer Key-Set

```
Router(config)# _tidp key-set KEY_1
Router(config-tidp-ks)# authentication-key send keypair-name CRYPTO_KEY_1
Router(config-tidp-ks)# encryption-key send key-string 6 Aa1Bb2Cc3
Router(config-tidp-ks)# exit
```

### Receiving Peer Key-Set

```
Router(config)# _tidp key-set KEY_2
Router(config-tidp-ks)# authentication-key receive pub-key CRYPTO_KEY_1
Router(config-tidp-ks)# encryption-key receive key-string 6 Aa1Bb2Cc3
Router(config-tidp-ks)# exit
```

## Troubleshooting Tips

If a connection has been established, then the existing authentication and/or encryption keys are compatible. If a connection is not established, verify the following:

- The peer is reachable via TCP/IP.
- The authentication key is properly configured on the sender and receiver. Also, verify the encryption key configuration, if one is configured.

If these tips do not resolve the problem, then you should check syslog for CONNFAIL error messages from the peer initiating the connection. The following debug command can also be helpful in troubleshooting a TIDP connection problem:

- Enabling the **debug tidp test** command allows you to send TIDP test messages. This command must be enabled on both the sender and receiver.
- Enabling the **debug tidp registration** command is helpful for troubleshooting authentication/encryption key mismatches.
- Enabling the **debug tidp packets** is helpful for troubleshooting key mismatches and general communication problems.

## What to Do Next

The next task is to configure a TIDP group. Proceed to the next task for more information.

## Configuring a TIDP Group

TIDP groups are designed to manage the distribution of threat information to TIDP consumers. The steps in this task show the following:

- TIDP group creation
- Associating the group with a key set for peer authentication and/or message encryption
- Configuring the time interval at which TIDP registers peers
- TIDP group activation

## TIDP Groups

TIDP is deployed in groups following a star topology. Each group is configured with at least one TIDP controller. The controller is configured to communicate with each TIDP consumer. The consumer is configured to communicate only with the controller. Each group can have a maximum of 250 consumers. Each consumer can be a member of up to 64 groups.

## Prerequisites

Peer authentication is required and must be configured before a TIDP group can be activated. A key-set is first configured with the **tidp key-set** command in global configuration mode. The authentication and encryption keys are associated with the TIDP group by configuring the **key-set** command in Step 4.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tidp group** *number*
4. **key-set** *name*
5. **peer** *ip-address*
6. **registration retry-interval** {**min** *interval* **max** *interval*}
7. **active**
8. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>tidp group</b> <i>number</i>  <b>Example:</b> Router(config)# tidp group 10	Creates the TIDP group, and enters TIDP group configuration mode.
Step 4	<b>key-set</b> <i>name</i>  <b>Example:</b> Router(config-tidp-grp)# key-set KEY_1	Associates a key-set with a TIDP group. <ul style="list-style-type: none"> <li>A valid key-set must be associated before the group can be activated.</li> </ul>
Step 5	<b>peer</b> <i>ip-address</i>  <b>Example:</b> Router(config-tidp-grp)# peer 10.1.1.2	Configures a TIDP peer as a member of a TIDP group. <ul style="list-style-type: none"> <li>The IP address of the interface that is configured as the TIDP source on the remote peer is entered for the <i>ip-address</i> argument.</li> <li>The TIDP peer must be reachable via TCP/IP before it can be configured to be a member of a TIDP group.</li> </ul>
Step 6	<b>registration retry-interval</b> { <i>min interval max interval</i> }  <b>Example:</b> Router(config-tidp-grp)# registration retry-interval min 30 max 600	Configures the length of time and number of attempts for TIDP group registration. <ul style="list-style-type: none"> <li>By default, TIDP will attempt register group members once every 60 seconds for up to 1 hour or until all group members have been registered.</li> <li>Registration timers are reset to zero when this command is configured or reconfigured.</li> <li>The example configures TIDP to attempt peer registration every 30 seconds for up to 10 minutes.</li> </ul>
Step 7	<b>active</b>  <b>Example:</b> Router(config-tidp-grp)# active	Activates the TIDP group. <ul style="list-style-type: none"> <li>The group cannot be activated until a key-set with valid authentication key is associated with the <b>key-set</b> command.</li> </ul>
Step 8	<b>exit</b>  <b>Example:</b> Router(config-tidp-grp)# exit	Exits TIDP Group configuration mode, and enters global configuration mode.

## Examples

The following examples, starting in global configuration mode, configure TIDP group number 10 on a controller and consumer:

#### Controller (10.1.1.1)

```
Router(config)# tidp key-set KEY_1
Router(config-tidp-ks)# authentication-key receive key-string Aa1Bb2Cc3
Router(config-tidp-ks)# authentication-key send key-string Dd4Ee5Ff6
Router(config-tidp-ks)# exit
Router(config)# tidp group 10
Router(config-tidp-grp)# key-set KEY_1
Router(config-tidp-grp)# registration retry-interval min 30 max 600
Router(config-tidp-grp)# peer 10.1.1.2
Router(config-tidp-grp)# peer 10.1.1.3
Router(config-tidp-grp)# peer 10.1.1.4
Router(config-tidp-grp)# active
Router(config-tidp-grp)# exit
```

#### Consumer (10.1.1.2)

```
Router(config)# tidp-set KEY_2
Router(config-tidp-ks)# authentication-key receive key-string Dd4Ee5Ff6
Router(config-tidp-ks)# authentication-key send key-string Aa1Bb2Cc3
Router(config-tidp-ks)# exit
Router(config)# tidp group 10
Router(config-tidp-grp)# key-set KEY_2
Router(config-tidp-grp)# peer 10.1.1.1
Router(config-tidp-grp)# active
Router(config-tidp-grp)# exit
```

## What to Do Next

An interface must be configured as the source for TIDP communication before TIDP can be enabled. Proceed to the next section for more information.

## Configuring the Source Interface and Enabling TIDP

The steps in this task show how to configure the source interface for TIDP communication and enable TIDP globally on a router.

### Enabling and Disabling TIDP

The source interface must be configured before TIDP can be enabled globally on a router. The source interface cannot be reconfigured while TIDP is enabled. TIDP can be disabled globally on a router by entering the **no** form of the **tidp enable** command. The TIDP configuration is not removed from the router configuration file when the **no** form of this command is entered.

### Prerequisites

A physical interface, configured with a fixed IP address, must be in an enabled state and reachable by TIDP peers via TCP/IP.

## Restrictions

An interface that is configured with a dynamic IP address cannot be configured as the TIDP source interface.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tidp source *ip-address***
4. **tidp enable**
5. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>tidp source <i>ip-address</i></b>  <b>Example:</b> Router(config)# tidp source 10.1.1.1	Configures the source interface for TIDP communication. <ul style="list-style-type: none"><li>The source interface must be a physical interface with a fixed IP address.</li></ul>
Step 4	<b>tidp enable</b>  <b>Example:</b> Router(config)# tidp enable	Enables TIDP globally on a router. <ul style="list-style-type: none"><li>Entering the <b>no</b> form disables TIDP without removing the TIDP configuration from the router configuration file.</li></ul>
Step 5	<b>end</b>  <b>Example:</b> Router(config)# end	Exits global configuration mode, and enters privileged EXEC mode.

## Examples

The following example, starting in global configuration mode, configures interface Ethernet 0/0 as the source interface for communication with TIDP peers:

```
Router(config)# interface Ethernet 0/0
Router(config-if)# ip address 10.1.1.1 255.255.255.0
Router(config-if)# no shutdown
Router(config-if)# exit
Router(config)# tidp source 10.1.1.1
Router(config)# end
```

## What to Do Next

Configuring the source interface and enabling TIDP completes TIDP configuration. Proceed to the next sections to see information about verifying and troubleshooting TIDP. For information on configuring TMS, see [TIDP-Based Mitigation Services](#) documentation.

## Sending a Test Message to Verify that TIDP is Operational

The steps in this task show how to verify the operational status of TIDP.

### Enabling the TIDP Test CLI

The **test tidp** command is used to transmit a text message to a TIDP group or peer. The **test tidp** command is not visible or configurable until the **debug tidp** command has been entered with the **test** keyword. TIDP test debugging must be enabled on the source and destination devices.

#### SUMMARY STEPS

1. **enable**
2. **debug tidp test**
3. **test tidp send group** *number* [**peer** *ip-address*] *message-string*

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>debug tidp test</b>  <b>Example:</b> Router# debug tidp test	Enables the TIDP test CLI.
Step 3	<b>test tidp send group</b> <i>number</i> [ <b>peer</b> <i>ip-address</i> ] <i>message-string</i>  <b>Example:</b> Router# test tidp send group 10 Group_Message	Sends a test message to a TIDP group or peer. <ul style="list-style-type: none"> <li>• An alphanumeric text message up to 35 characters in length can be sent. White space is not permitted in the message string.</li> </ul>

## Examples

The following example shows a test message sent to the 10.1.1.2 peer in TIDP group 10:

#### Sender (10.1.1.1)

```
Router1# debug tidp test
```

```
TIDP test debugging is on
```

```
Router1# test tidp send group 10 peer 10.1.1.2 Unicast_Test_Message
```

**Receiver (10.1.1.2)**

```
Router2# debug tidp test
TIDP test debugging is on
Router2#
03:36:03: TIDP msg from 10.1.1.1, group 10: 'Unicast_Test_Message'
```

## Troubleshooting Tips

If a test message is not received by a group or peer, you should verify the following:

- The **debug tidp test** command has been enabled on the sender and receiver.
- The source interface on each device is enabled and reachable via TCP/IP.
- There are no errors or inconsistencies in sending and receiving authentication and/or encryption keys.

## What to Do Next

Proceed to the next section to see information about verifying and troubleshooting TIDP.

## Using Privileged EXEC Commands to Verify and Troubleshoot TIDP

This section describes **clear**, **debug**, and **show** commands that are used to verify the operational status and configuration of TIDP. All commands in this section are optional.

### SUMMARY STEPS

1. **enable**
2. **clear tidp counters** [group {*number* | **all**}]
3. **debug tidp** {errors | events | packets | registration | test}
4. **show tidp** [detail]
5. **show tidp group** {*number* | **all**} [detail]
6. **show tidp key-set** [*name*]
7. **show tidp peer** {*ip-address* | **all**}

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>clear tidp counters</b> [ <b>group</b> { <i>number</i>   <b>all</b> }]  <b>Example:</b> Router# clear tidp counters	Clears TIDP counters and message statistics. <ul style="list-style-type: none"> <li>The example clears all counters and messages statistics.</li> </ul>
Step 3	<b>debug tidp</b> { <b>errors</b>   <b>events</b>   <b>packets</b>   <b>registration</b>   <b>test</b> }  <b>Example:</b> Router# debug tidp events	Enables TIDP debugging.
Step 4	<b>show tidp</b> [ <b>detail</b> ]  <b>Example:</b> Router# show tidp	Displays the status of TIDP. <ul style="list-style-type: none"> <li>This command displays the operational status, source interface, and groups of which this device is a member.</li> <li>Entering the <b>detail</b> keyword displays the same information but also includes message statistics.</li> </ul>
Step 5	<b>show tidp group</b> { <i>number</i>   <b>all</b> } [ <b>detail</b> ]  <b>Example:</b> Router# show tidp group all	Displays information about TIDP groups. <ul style="list-style-type: none"> <li>This command displays the active status, total number of registered and unregistered peer, registration timer values, and associated key-set.</li> <li>Entering the <b>detail</b> keyword displays group message statistics.</li> </ul>
Step 6	<b>show tidp key-set</b> [ <i>name</i> ]  <b>Example:</b> Router# show tidp key-set	Displays information about locally configured key-sets. <ul style="list-style-type: none"> <li>The group associated with the key-set is displayed in the output.</li> <li>The example displays all locally configured key-sets.</li> </ul>
Step 7	<b>show tidp peer</b> { <i>ip-address</i>   <b>all</b> }  <b>Example:</b> Router# show tidp peer all	Displays information about TIDP peers. <ul style="list-style-type: none"> <li>The output of this command displays connection status, group membership, and message statistics for a single TIDP peer or all peers.</li> </ul>

## Examples

The following is sample output from the **show tidp** command:

```
Router# show tidp

Global TIDP information:
TIDP status: enabled
TIDP source: 10.1.1.1
```

TIDP groups: 1 (1 active, 0 inactive)

The following is sample output from the **show tidp group** command:

```
Router# show tidp group 10
```

```
TIDP Group 10:
 Group status: active
 Total registered peers: 2
 Total unregistered peers: 1
 Registration retry interval - min: 60, max: 3600
 Key-set: KEY_1
```

The following is sample output for the **show tidp key-set** command:

```
Router# show tidp key-set KEY_1
```

```
TIDP keyset KEY_1:
 Groups:
 10
```

The following is sample output for the **show tidp peer** command:

```
Router# show tidp peer 10.1.1.3
```

```
TIDP Peer 10.1.1.3:
 Peer state: Connected
 Configured in groups:
 10
 Total messages received: 1
 Total messages transmitted: 1
 Total messages transmit dropped: 0
 Duplicate messages received: 0
 Replayed messages received: 0
```

## Configuration Examples for TIDP

This section provides TIDP controller and consumer examples. These configurations are similar to each other. The main difference is that TIDP peering is configured between the controller and each peer. However, the TIDP consumers are configured to peer only with the controller and not other peers.

- [TIDP Controller: Example, page 20](#)
- [TIDP Consumer: Example, page 21](#)

### TIDP Controller: Example

Ethernet 0/0 is configured as the source interface for TIDP communication.

```
Router(config)# interface Ethernet 0/0
Router(config-if)# ip address 10.1.1.1 255.255.255.0
Router(config-if)# no shutdown
Router(config-if)# exit
Router(config)# tidp source 10.1.1.1
```

An RSA key named CRYPTO\_KEY\_1 is generated.

```
Router(config)# crypto key generate rsa general-keys label CRYPTO_KEY_1 modulus 512
The name for the keys will be: crypto_key_1
```

```
% The key modulus size is 512 bits
% Generating 512 bit RSA keys, keys will be non-exportable...[OK]
```

```
Router(config)# exit
```

Key-set KEY\_1 is configured with an authentication and encryption key-set. The RSA key in generated in the previous step is configured as the sender authentication key.

```
Router(config)# tidp key-set KEY_1
Router(config-tidp-ks)# authentication-key send keypair-name CRYPTO_KEY_1
Router(config-tidp-ks)# authentication-key receive key-string 6 Aa1Bb2Cc3
Router(config-tidp-ks)# encryption-key receive key-string 6 Dd4Ee5Ff6
Router(config-tidp-ks)# encryption-key send key-string 6 Gg7Hh8Ii9
Router(config-tidp-ks)# exit
```

TIDP group 10 is configured and activated. KEY\_1 is associated with group 10. The peer registration timers are configured to register unregistered peer at 30 second intervals for up to 10 minutes. Remote peers in the 10.1.1/24 network are configured as TIDP peers.

```
Router(config)# tidp group 10
Router(config-tidp-grp)# key-set KEY_1
Router(config-tidp-grp)# registration retry-interval min 30 max 600
Router(config-tidp-grp)# peer 10.1.1.2
Router(config-tidp-grp)# peer 10.1.1.3
Router(config-tidp-grp)# peer 10.1.1.4
Router(config-tidp-grp)# active
Router(config-tidp-grp)# exit
```

TIDP is enabled globally on the router. This is the final step of the TIDP configuration.

```
Router(config)# tidp enable
```

## TIDP Consumer: Example

Ethernet 0/0 is configured as the source interface for TIDP communication.

```
Router(config)# interface Ethernet 0/0
Router(config-if)# ip address 10.1.1.2 255.255.255.0
Router(config-if)# no shutdown
Router(config-if)# exit
Router(config)# tidp source 10.1.1.2
```

The TIDP consumer is configured to process the RSA key generated on the controller. An IP host statement is entered to configure a static hostname-to-IP-address mapping.

```
Router(config)# ip host CRYPTO_KEY_1 10.1.1.1
Router(config)# crypto key pubkey-chain rsa
Router(config-pubkey-chain)# named-key CRYPTO_KEY_1 signature
Router(config-pubkey-key)# address 10.1.1.1
Router(config-pubkey-key)# key-string
Enter a public key as a hexadecimal number

Router(config-pubkey)# 305C300D 06092A86 4886F70D 01010105 00034B00 30480241 00AD3E88
3B3489CB
Router(config-pubkey)# A4F77002 97FC4BEC 9AAFE414 973E7B38 B047EACE 5B4857BC 2606EEA3
6704041A
Router(config-pubkey)# 1F6D9659 89070D18 F4358111 90905012 53EEF5E0 5F41B3FD AB020301 0001
Router(config-pubkey)# quit
Router(config-pubkey-key)# exit
Router(config-pubkey-chain)# exit
```

Key-set KEY\_2 is configured with an authentication and encryption key-set. The RSA key in processed in the previous step is configured as the receiving authentication key.

```
Router(config)# tidp key-set KEY_2
Router(config-tidp-ks) # authentication-key receive pubkey-name CRYPTO_KEY_1
Router(config-tidp-ks) # authentication-key send key-string 6 Aa1Bb2Cc3
Router(config-tidp-ks) # encryption-key receive key-string 6 Dd4Ee5Ff6
Router(config-tidp-ks) # encryption-key send key-string 6 Gg7Hh8Ii9
Router(config-tidp-ks) # exit
```

TIDP group 10 is configured and activated. KEY\_2 is associated with group 10. Peering is established only with the TIDP controller.

```
Router(config)# tidp group 10
Router(config-tidp-grp) # key-set KEY_2
Router(config-tidp-grp) # peer 10.1.1.1
Router(config-tidp-grp) # active
Router(config-tidp-grp) # exit
```

TIDP is enabled globally on the router.

```
Router(config)# tidp enable
```

## Where to Go Next

This document describes the configuration of TIDP. After TIDP is up and running, see TIDP-Based Mitigation Services (TMS) documentation for information about configuring TMS.

# Command Reference

The following commands are introduced or modified in the feature or features

- **active**
- **authentication-key receive**
- **authentication-key send**
- **clear tidp counters**
- **debug tidp**
- **encryption-key receive**
- **encryption-key send**
- **key-set**
- **peer**
- **registration retry-interval (TIDP)**
- **show tidp**
- **show tidp group**
- **show tidp key-set**
- **show tidp peer**
- **test tidp**
- **tidp enable**
- **tidp group**
- **tidp key-set**
- **tidp source**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Feature Information for TIDP

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1**      **Feature Information for TIDP**

<b>TIDP-Based Mitigation Services</b>	12.4(6)T	TIDP provides a rapid and secure mechanism to distribute security threat information. TIDP is designed to support large groups of devices throughout the network. TIDP supports peer authentication and message encryption. TIDP is the distribution layer protocol for TIDP Based Mitigation Services (TMS). TMS provides the framework to rapidly and efficiently distribute threat information to devices across the network.

# TIDP Based Mitigation Services

---

**First Published: February 27, 2006**

**Last Updated: March 20, 2006**

Threat Information Distribution Protocol (TIDP) is the distribution layer protocol for TIDP Based Mitigation Services (TMS). TMS provides the framework to rapidly and efficiently distribute threat information to devices across the network. The TMS framework transports messages that contain specific threat information about suspect traffic and associated mitigation enforcement actions to all devices in the network. Threat Information Messages (TIMs) are distributed throughout the network in near real time. TIMs are distributed from a central device, the TMS controller. TMS consumers are devices configured to receive TIMs. Each consumer can be configured with a unique rule set to locally enforce mitigation actions based on local requirements. Local rule sets can be customized on demand.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for TMS](#)” section on [page 66](#)*

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Prerequisites for TMS

- You should have a clear understanding of the physical topology and traffic patterns in your network before deploying TIDP and TMS.
- This document assumes that all devices, on which TMS services are to be deployed, have been preconfigured to run TIDP. If TIDP has not been configured, use the following document to configure TIDP before continuing with TMS configuration: [Threat Information Distribution Protocol](#).

## Restrictions for TMS

The following restrictions apply to TMS in Cisco IOS Release 12.4(6)T:

- High availability (HA) features are not supported.
- Only one controller can be configured for each TMS group. However, up to 250 consumers can be configured in one or more groups. Up to 64 groups can be configured in a network.

## Information About TMS

You should understand the following concepts, before configuring TMS:

- [Threat Information Distribution Protocol, page 2](#)
- [TIDP Based Mitigation Services, page 3](#)
- [Threat Information Messages, page 4](#)
- [TMS Protocol Configuration, page 5](#)
- [Mitigation Enforcement Actions, page 6](#)
- [TMS Rules Engine Configuration, page 7](#)
- [Local Device Exceptions, page 8](#)
- [TMS System Logging, page 8](#)

## Threat Information Distribution Protocol

TIDP Based Mitigation Services (TMS) run over Threat Information Distribution Protocol (TIDP). TIDP is the distribution layer protocol that runs over of TCP (transport layer protocol). TIDP distributes Threat Information Messages (TIMs), for TMS, across the network in near real time.

[Figure 1](#) shows TIDP distribution and transport.

**Figure 1** *TMS Service Run over TIDP*

TIDP is designed to be a scalable and secure. TIDP supports point-to-point and point-to-multipoint communication. TIDP provides secure communication and message distribution. Message authentication is configured for all TIDP peering sessions. The message payload can be optionally encrypted to protect the contents. Authentication and encryption are configured using AES-128, HMAC-SHA1-160, or RSA key generation. TIDP is designed with replay protection (an attack that reuses old TCP sequence numbers to flood packets).

## TIDP Based Mitigation Services

TMS provides the framework to rapidly and efficiently distribute Threat Information Messages (TIMs) to devices across the network. The network administrator distributes one or more TIMs from a central location, such as the network operations center (NOC). The TMS framework transports TIMs that contain specific threat information about suspect traffic and an associated mitigation enforcement actions to all devices in the network. [Figure 2](#) shows TMS message distribution.

**Figure 2** *Threat Information Messages are Distributed over the TMS Framework*

TMS provides a scalable point-to-point or point-to-multipoint framework. A TIM can be sent from the TMS controller to a single device (TMS consumer) or all devices in the network. Each TIM message is structured to identify suspect traffic and to enforce a mitigation action.

TMS is configured on a per group basis. A single device is configured as the TMS controller. The controller is the central point in the network for TMS message distribution. The controller packages and distributes TIMs to TMS consumers. All other devices in the group are configured as consumers. A controller can support 250 TMS consumers in one or more TMS groups. Up to 64 TMS groups can be configured in a network.

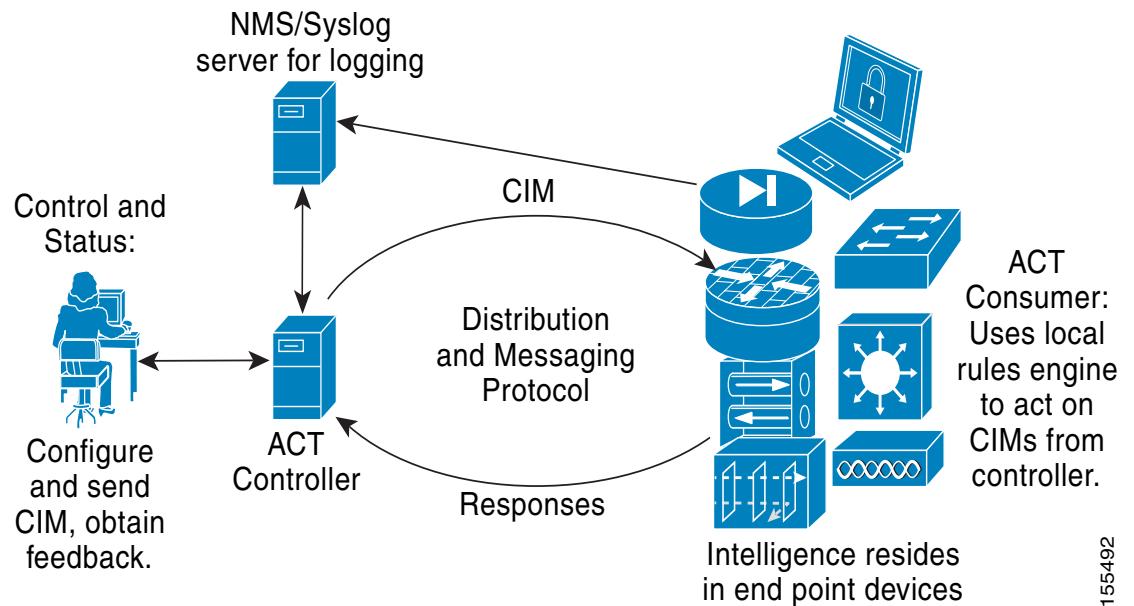

The consumer is any device that is configured to receive and process TIMs and send status to the controller. The mitigation enforcement action is applied based on rules in the TIM. Each consumer can be optionally configured with a individual rule set (TMS Rules Engine) customized to fit local requirements.

## Threat Information Messages

Each Threat Information Message (TIM) is identified by a threat ID, owner ID, and version number. The TIM is configured to identify suspect traffic. This traffic can be a single host IP address or entire major network range. The TIM is configured with a mitigation enforcement action that is associated with suspect traffic.

Each TIM is created in a threat definition file. The threat definition file is authored in a text or XML editor. The threat definition file must comply with Extensible Markup Language (XML) version 1.0 syntax. Each threat definition file can be up to 64 kb in size. A typical TIM is between 800 and a 1000 bytes. Each TMS group can support up to 256 active TIMs.

**Figure 3** *TIMs are Distributed from the TMS Controller*

The threat definition file is loaded to the TMS controller from a local storage device, such as ATA or linear flash memory. The file can also be loaded from a reachable host (using FTP, HTTPS, RCP, or TFTP protocols). This action places the TIMs contained within the threat definition file into the “loaded” database. The TIMs are then distributed (sent) from the controller to TMS consumers by the network administrator. Sending a TIM activates and places the TIM in the active database.

## TMS Protocol Configuration

TMS protocol operation, on the controller or consumer, is configured in a TMS type service policy using the Modular QoS CLI (MQC). The TMS type service policy is configured with TMS type class, parameter, and policy maps.

- The *TMS type class map* identifies TMS group consumers a traffic class.
- The *TMS type parameter map* is a container for TMS protocol-specific configuration parameters.
  - On the controller, TMS protocol operation timers, such as the heartbeat (keepalive) and message timers are configured.
  - On the consumer, the controller is identified and the controller registration timer is configured.
  - TMS event logging is enabled on both the controller and consumer.

- The *TMS type policy map* binds (or attaches) the class and parameter maps. The policy map is attached to the global consumer or controller process, which activates the TMS type service policy.

**Tip**

Default values for unconfigured parameter map commands are displayed in the router configuration file when a parameter map is created.

## Mitigation Enforcement Actions

The mitigation enforcement action is defined globally in the TIM. It is associated with suspect traffic and conditionally enforced depending on the configuration of the TIM or the configuration rule on the TMS consumer (Custom rules are configured on TMS consumers in a mitigation type parameter map).

In a TIM, the enforcement action is configured as a block or redirect. The redirect rule can be configured to route null0 (blackhole) or route to a specific host IP address for collection and analysis or to host IP address configured as a sinkhole. The TIM can be also configured to use a mitigation enforcement action defined in a mitigation type parameter map on a TMS consumer.

### Block Rule

The block mitigation enforcement action drops suspect traffic when suspect traffic meets all conditions of the rule. The behavior of this action is similar to a deny access list.

### Redirect Rule

The redirect enforcement action is configured to route to null0 or to route to a specific host. Cisco IOS Optimized Edge Routing (OER) dynamically controls and implements redirect mitigation enforcement rules. Support for OER is automatically provided in Cisco IOS software images that support TMS. No explicit OER configuration is required. OER will function as if an OER master controller and border router processes has been configured on the TMS consumer.

Cisco IOS OER can also be explicitly configured on TMS consumers. However, the following caveats have been observed:

- Active threats on the TMS consumer must be resynchronized if you change the role that the consumer performs in the OER managed network. For example, if you reconfigure a border router to also perform OER master controller functions or vice versa.
- If multiple TIMs are configured with the same match criteria but different next-hop addresses. The next hop from the first threat will be selected.

Figure 4 shows a typical example where sinkhole routing is used.

**Figure 4** Typical OER Route to Sinkhole Example

The OER master controller process advertises the sinkhole router as the next hop for the 192.168.1.1 host, which is under attack.

## TMS Rules Engine Configuration

The TMS Rules Engine is a flexible mechanism that allows you to apply custom rules on individual consumers. A TIM can be configured to take the next-hop variable from a rules engine configuration, or a custom rule can be configured to override a mitigation enforcement action sent in a TIM from the TMS controller.

Using the TMS Rules Engine, you can configure a local rule to route traffic to a null0, route traffic to a specific interface for collection and analysis, configure a nonstandard primitive, or configure the local device to ignore an enforcement action sent by the controller.

### Note

Nonstandard primitives are predefined in the threat definition file that is loaded on the TMS controller.

The TMS Rules Engine is configured with a mitigation type service policy. The mitigation type service policy is created by configuring and linking mitigation type parameter and class maps to a mitigation type policy map.

- The *mitigation type class map* is used to define threat primitive and priority traffic matching conditions.
- The *mitigation type parameter map* contains the next-hop variable in the mitigation type service policy.
- The mitigation type policy map is used to attach the class and parameter maps.
- The *mitigation type policy map* is configured to bind mitigation type class and parameter maps together, creating a mitigation type service policy.

The mitigation type service policy is activated by attaching the mitigation type policy-map to the TMS type policy map in policy-map class configuration mode. The TMS type policy map is then attached to the global consumer configuration by configuring the **service-policy** command in TMS Consumer configuration mode.

## Local Device Exceptions

Local device exceptions are configured only on TMS consumers. A local device exception is an override configured for a specific host IP address or network. The TMS consumer negates a mitigation enforcement action sent from the controller or from a mitigation type service policy configured on the consumer.

For example, traffic from the 192.168.1.0/24 network is considered to be suspect. So, an ACL drop enforcement action is configured for all traffic sourced from this network. However, a device with a host address in this range (192.168.1.55) has to transit over a specific consumer. A local device exception is configured on the consumer to override ACL drop enforcement action.

## TMS System Logging

TMS system logging is enabled in the TMS type parameter map configuration. It is disabled by default.

### Controller System Logging Messages

This feature introduces the following system logging messages on the controller.

- TMS controller configuration status notification:  
12:58:02: %TMS-6-GROUP: CONTROLLER| Group=1| Host=10.3.3.1| Status=CONFIGURED
- Consumer registration notification:  
11:56:44: %TMS-6-DEVICE: CONTROLLER| Group=1| Host=10.3.3.2| Status=REGISTERED
- Consumer deregistration notification:  
12:52:55: %TMS-6-DEVICE: CONTROLLER| Group=1| Host=10.3.3.2| Status=DEREGISTERED
- Consumer threat send/reset/status notification:  
12:30:47: %TMS-6-RESET: CONTROLLER| Group=1| Device=10.3.3.2| Action=Delete| Start TID=1| End TID=1  
12:30:47: %TMS-6-THREATSTATUS: CONTROLLER| Group=1| Device=10.3.3.2| Threat=1| Status=Threat deleted

### Consumer System Logging Messages

This feature introduces the following system logging messages on the consumer.

- TMS consumer configuration status notification:

```
Feb 27 02:53:02.620: %TMS-6-GROUP: CONSUMER| Group=2| Host=10.3.3.2| Status=CONFIGURED
```

- Consumer registration notification:

```
*Feb 27 02:00:42.213: %TMS-6-DEVICE: CONSUMER| Group=1| Host=10.3.3.1| Status=REG
Requested
```

```
*Feb 27 02:00:42.241: %TMS-6-DEVICE: CONSUMER| Group=1| Host=10.3.3.1|
Status=REGISTERED
```

- Consumer response to send/reset/status message sent from the controller:

```
*Feb 27 02:34:40.417: %TMS-6-RESET: CONSUMER| Group=1| Device=10.3.3.1| Action=Delete|
Start TID=1| End TID=1
```

```
*Feb 27 02:34:40.425: %TMS-6-THREATSTATUS: CONSUMER| Group=1| Device=10.3.3.1|
Threat=1| Status=Threat deleted
```

- Consumer response to a resynchronization request sent from the controller:

```
*Feb 27 02:48:06.224: %TMS-6-THREAT: CONSUMER| Group=1| Device=10.3.3.1| TID=1
```

```
*Feb 27 02:48:06.232: %TMS-6-THREATSTATUS: CONSUMER| Group=1| Device=10.3.3.1|
Threat=1| Status=Redirect 192.168.2.1
```

TMS syslog messages are processed by Cisco IOS software based on global logging configuration. To modify system, terminal, destination, and other system global logging parameters, use the logging commands in global configuration mode. For more information about global system logging configuration, see the “Troubleshooting, Logging, and Fault Management” section of the *Cisco IOS Network Management Configuration Guide*, Release 12.4.

# How to Configure TMS

This section contains the following tasks:

## Configuring a TMS Type Service Policy

- [Configuring the TMS Type Parameter Map on a Controller, page 10](#) (required)
- [Configuring a TMS Type Parameter Map on a Consumer, page 13](#) (required)
- [Configuring the TMS Type Class Map on a Controller or Consumer, page 16](#) (required)
- [Configuring the TMS Type Policy Map on a Controller or Consumer, page 17](#) (required)

## Attaching the TMS Type Service Policy to a Global TMS Process

- [Attaching the Service Policy to a Global TMS Controller Process, page 19](#) (required)
- [Attaching the Service Policy to a Global TMS Consumer Process, page 21](#) (required)

## Registering and Deregistering a TMS Consumer

- [Registering and Deregistering a TMS Consumer, page 24](#) (optional)

## Managing Threat Information Messages on a TMS Controller

- [Configuring an XML Threat Definition File, page 26](#) (required)
- [Loading a Threat Definition File on a TMS Controller, page 31](#) (required)
- [Sending Threat Information Messages from the Controller to a TMS Consumer, page 33](#) (required)
- [Synchronizing the Threat Status of a Consumer with the TMS Group, page 35](#) (optional)
- [Managing Threat Information Messages on a Consumer from the Controller, page 36](#) (optional)
- [Sending a Status Request Message to Consumers from the TMS Controller, page 38](#) (optional)
- [Unloading a Threat Information Messages from the Loaded Database, page 40](#) (optional)

## Managing Threat Information Messages on a TMS Consumer

- [Configuring the TMS Rules Engine on a Consumer, page 41](#) (optional)
- [Configuring Local Device Exceptions on a Consumer, page 48](#) (optional)
- [Clearing Threat Information Messages on a Consumer, page 51](#) (optional)

## Verifying and Debugging TMS Configuration

- [Verifying TMS Configuration and Threat Status on a Controller or Consumer, page 52](#) (optional)
- [Enabling TMS Debug Messages on a Controller or Consumer, page 55](#) (optional)

## Configuring the TMS Type Parameter Map on a Controller

The steps in this task show how to configure a TMS type parameter map on a controller. The TMS type parameter map is a container for TMS protocol-specific configuration parameters. A TMS type parameter map is configured on the controller and on each consumer. On the controller, the heartbeat (keepalive) and threat message timers are configured. Entering the **parameter-map type tms** command places the router in parameter-map configuration mode.

## TMS Event Logging

The **logging tms events** command is entered in a TMS type parameter map on the consumer and/or controller. TMS system logging is disabled by default. TMS syslog messages are processed by Cisco IOS software based on global logging configuration. To modify system, terminal, destination, and other system global logging parameters, use the logging commands in global configuration mode. For more information about global system logging configuration, see the “Troubleshooting, Logging, and Fault Management” section of the *Cisco IOS Network Management Configuration Guide*, Release 12.4.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type tms {name}**
4. **heartbeat retry count {number}**
5. **heartbeat retry interval {time}**
6. **message retry count {number}**
7. **message retry interval {time}**
8. **logging tms events**
9. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>parameter-map type tms name</b>  <b>Example:</b> Router(config)# parameter-map type tms TMS_PAR_1	Configures a TMS type parameter map.  <b>Tip</b> Default values for unconfigured parameter map commands are displayed in the router configuration file when a parameter map is created.
Step 4	<b>heartbeat retry count {number}</b>  <b>Example:</b> Router(config-profile)# heartbeat retry count 5	Configures the number of times that heart beat messages are sent from a TMS controller to a consumer. <ul style="list-style-type: none"> <li>The heart beat message timer is configured on the TMS controller to regulate the frequency and interval of the transmission of heart beat (keepalive) messages.</li> <li>A number from 1 to 5 is entered for the <i>number</i> argument. The default number is 2.</li> <li>The controller is configured to send up to 5 heart beat messages to a nonresponsive peer in this example.</li> </ul>
Step 5	<b>heartbeat retry interval {time}</b>  <b>Example:</b> Router(config-profile)# heartbeat retry interval 60	Configures the time interval between the transmission of heart beat messages. <ul style="list-style-type: none"> <li>The <i>time</i> argument is configured in seconds. A number from 60 to 3000 is entered. The default time interval is 120 seconds.</li> <li>The controller is configured to send heart beat messages at 60 second intervals in this example.</li> </ul>
Step 6	<b>message retry count {number}</b>  <b>Example:</b> Router(config-profile)# message retry count 3	Configures the number of times that a threat message is sent from a TMS controller to a consumer. <ul style="list-style-type: none"> <li>The threat message timer is configured on the TMS controller to regulate the frequency and interval that the controller attempts to send threat messages to a nonresponsive peer.</li> <li>A number from 0 to 5 is entered for the <i>number</i> argument. The default number is 5.</li> <li>The controller is configured to send a threat message up to 3 times to a nonresponsive consumer in this example.</li> </ul>

	Command or Action	Purpose
Step 7	<b>message retry interval</b> {time}  <b>Example:</b> Router(config-profile)# message retry interval 15	Configures the time interval between the transmission of threat messages. <ul style="list-style-type: none"> <li>The <i>time</i> argument is configured in seconds. A number from 3 to 300 is entered. The default time interval 10 seconds.</li> <li>The controller is configured to send threat messages at 15 second intervals to a nonresponsive consumer in this example.</li> </ul>
Step 8	<b>logging tms events</b>  <b>Example:</b> Router(config-profile)# logging tms events	Enables TMS event logging on the controller. <ul style="list-style-type: none"> <li>TMS specific events are logged to syslog in this example.</li> </ul>
Step 9	<b>exit</b>  <b>Example:</b> Router(config-profile)# exit	Exits parameter-map configuration mode, and enters global configuration mode.

## Examples

The following example, starting in global configuration mode, configures a TMS type parameter map on a controller:

```
Router(config)# parameter-map type tms TMS_PAR_1
Router(config-profile)# logging tms events
Router(config-profile)# heartbeat retry interval 60
Router(config-profile)# heartbeat retry count 3
Router(config-profile)# message retry interval 15
Router(config-profile)# message retry count 5
Router(config-profile)# exit
```

## What to Do Next

A TMS type parameter map must also be configured on each consumer. Proceed to the next section to see more information.

## Configuring a TMS Type Parameter Map on a Consumer

The steps in this task show how to configure a TMS type parameter map on a consumer. A TMS type parameter map is configured on the controller and on each consumer. On the consumer, it is configured to identify the controller to and to set registration timers. Entering the **parameter-map type tms** command places the router in parameter-map configuration mode.

## TMS Event Logging

The **logging tms events** command is entered in a TMS type parameter map on the consumer and/or controller. TMS system logging is disabled by default. TMS syslog messages are processed by Cisco IOS software based on global logging configuration. To modify system, terminal, destination, and other

system global logging parameters, use the logging commands in global configuration mode. For more information about global system logging configuration, refer to the “Troubleshooting and Fault Management” section of the *Cisco IOS Network Management Configuration Guide*, Release 12.4.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type tms {name}**
4. **controller ipv4 {ip-address}**
5. **registration retry count {number}**
6. **registration retry interval {time}**
7. **logging tms events**
8. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>parameter-map type tms name</b>  <b>Example:</b> Router(config)# parameter-map type tms TMS_PAR_2	Configures a TMS type parameter map. <p><b>Tip</b> Default values for unconfigured parameter map commands are displayed in the router configuration file when a parameter map is created.</p>
Step 4	<b>controller ipv4 {ip-address}</b>  <b>Example:</b> Router(config-profile)# controller ipv4 10.1.1.1	Specifies the TMS controller in the parameter map of a TMS consumer. <ul style="list-style-type: none"> <li>The 10.1.1.1 host IP address is configured as the TMS controller in this example.</li> </ul> <p><b>Tip</b> The IP address that is configured in this step is the IP address that was configured as the source interface in the TIDP configuration on the TMS controller.</p>
Step 5	<b>registration retry count {number}</b>  <b>Example:</b> Router(config-profile)# registration retry count 5	Configures the number of times that an implicit TMS registration message is sent from a TMS controller to a controller. <ul style="list-style-type: none"> <li>The TMS consumer must register before the controller will send threat messages. Implicit registration messages are sent when a TMS type service policy is activated on the consumer or when the consumer is deregistered (by the administrator) from the controller.</li> <li>A number from 1 to 5 is entered for the <i>number</i> argument. The default number is 3.</li> <li>The consumer is configured to send a registration message to a controller up to 5 times or until successfully registered in this example.</li> </ul>
Step 6	<b>registration retry interval {time}</b>  <b>Example:</b> Router(config-profile)# registration retry interval 60	Configures the time interval between the transmission of registration messages. <ul style="list-style-type: none"> <li>The <i>time</i> argument is configured in seconds. A number from 30 to 3000 is entered. The default time interval is 180 seconds.</li> <li>The consumer is configured to registration messages at 60 second intervals in this example.</li> </ul>

	Command or Action	Purpose
Step 7	<b>logging tms events</b>  <b>Example:</b> Router(config-profile)# logging tms events	Enables logging for TMS events on a TMS controller or consumer.  <ul style="list-style-type: none"> <li>TMS specific events are logged to syslog in this example.</li> </ul>
Step 8	<b>exit</b>  <b>Example:</b> Router(config-profile)# exit	Exits parameter-map configuration mode, and enters global configuration mode.

## Examples

The following example, starting in global configuration mode, configures a TMS type parameter map on a consumer:

```
Router(config)# parameter-map type tms TMS_PAR_2
Router(config-profile)# controller ipv4 10.1.1.1
Router(config-profile)# logging tms events
Router(config-profile)# registration retry count 5
Router(config-profile)# registration retry interval 60
Router(config-profile)# exit
```

## What to Do Next

The next step is to identify the TIDP group, over which TMS services are to be configured. Proceed to the next section to see more information.

## Configuring the TMS Type Class Map on a Controller or Consumer

The steps in this task show how to configure a TMS type class map to define a TMS group as a class of traffic. A single TMS group or range of groups are configured with the **match tidp-group** command. This task is performed on the controller and on each consumer.

## Prerequisites

TIDP is operational on the controller and all consumers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type tms {[match-any] name}**
4. **match tidp-group number [- number]**
5. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>class-map type tms {[match-any] name}</b>  <b>Example:</b> Router(config)# class-map type tms TMS_CLASS_1	Configures a TMS type class map to define a TMS group as a class of traffic.
Step 4	<b>match tidp-group number [- number]</b>  <b>Example:</b> Router(config-cmap)# match tidp group 10	Defines a TMS group or a range of groups as match criteria in a class map. <ul style="list-style-type: none"> <li>TMS group 10 is defined in this example.</li> </ul>
Step 5	<b>exit</b>  <b>Example:</b> Router(config-cmap)# exit	Exits class-map configuration mode, and enters global configuration mode.

## Examples

The following example, starting in global configuration mode, configures groups 10 through 20 and group 30 as match criteria in the TMS\_CLASS\_1 class map:

```
Router(config)# class-map type tms TMS_CLASS_1
Router(config-cmap)# match tidp group 10 - 20
Router(config-cmap)# match tidp group 30
Router(config-cmap)# exit
```

## What to Do Next

The next step is to attach the TMS type class and parameter maps to a TMS type policy map. Proceed to the next section to see more information.

## Configuring the TMS Type Policy Map on a Controller or Consumer

The steps in this task show how to configure a TMS type policy map. The TMS policy map is configured to bind (attach) TMS type class and parameter maps. Any number of class maps, with different parameter maps, can be attached to the policy map. This task is performed on the controller and on each consumer.

## Prerequisites

A TMS type class and parameter map is configured.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type control tms {name}**
4. **class {class-name | class-default}**
5. **mitigation {parameter-map}**
6. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>policy-map type control tms {name}</b>  <b>Example:</b> Router(config)# policy-map type control tms TMS_POL_1	Configures a TMS type policy map.
Step 4	<b>class {class-name   class-default}</b>  <b>Example:</b> Router(config-pmap)# class TMS_CLASS_1	Defines the TMS traffic class (TMS group) to attach to the policy map. <ul style="list-style-type: none"><li>• The <i>class-name</i> argument must be configured in this step.</li></ul>
Step 5	<b>mitigation {parameter-map}</b>  <b>Example:</b> Router(config-pmap-c)# mitigation TMS_PAR_1	Attaches the TMS parameter map to the class map under the policy map.
Step 6	<b>end</b>  <b>Example:</b> Router(config-pmap-c)# end	Exits policy-map class configuration mode, and enters privileged EXEC mode.

## Examples

The following example, starting in global configuration mode, attaches TMS type class and parameter maps to a TMS type policy map:

```
Router(config)# parameter-map type tms TMS_PAR_1
Router(config-profile)# logging tms events
Router(config-profile)# exit
Router(config)# class-map type tms TMS_CLASS_1
Router(config-cmap)# match tidp-group 10
Router(config-cmap)# exit
Router(config)# policy-map type control tms TMS_POL_1
Router(config-pmap)# class TMS_CLASS_1
Router(config-pmap-c)# mitigation TMS_PAR_1
Router(config-pmap-c)# end
```

## What to Do Next

The next step is to attach the policy map to the global TMS controller or consumer process. Proceed to the next section to see more information.

## Attaching the Service Policy to a Global TMS Controller Process

The TMS type service policy that was configured in the first three configuration tasks is attached to a global TMS controller process in this task.

## Configuring the TMS Controller Identifier

The **identifier** command is configured to assign a unique ID number to a TMS controller. In Cisco IOS Release 12.4(6)T, only a single controller can be configured in each group. Identifier configuration is required only when multiple controllers are configured in a single TMS group.

## Prerequisites

- A TMS type service policy has been configured.
- TIDP is operational on the controller and all consumers.

## Restrictions

- Only a single TMS type policy map can be attached to the global TMS controller or consumer process. However, you can configure multiple TMS type class maps and associate these maps under the same TMS type policy map. Each class map can be configured with the same parameter map or a different parameter map.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tms controller**
4. **service-policy type tms {policy-map}**
5. **identifier {number}**
6. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>tms controller</b>  <b>Example:</b> Router(config)# tms controller	Configures a networking device as a TMS controller.
Step 4	<b>service-policy type tms {policy-map}</b>  <b>Example:</b> Router(cfg-tms-ctrl)# service-policy type tms TMS_POL_1	Attaches a TMS type service policy to a TMS consumer process.
Step 5	<b>identifier {number}</b>  <b>Example:</b> Router(cfg-tms-ctrl)# identifier 1000	(Optional) Configures a unique identifier for a TMS controller. <ul style="list-style-type: none"><li>A number from 1 to 4294967295 can be entered for the <i>number</i> argument.</li></ul> <b>Note</b> This configuration step is not required in Cisco IOS Release 12.4(6)T.
Step 6	<b>end</b>  <b>Example:</b> Router(cfg-tms-cons)# end	Exits TMS consumer configuration mode, and enters privileged EXEC mode.

## Examples

The following example, starting in global configuration mode, configures a global TMS controller process, attaches a TMS type policy map:

```
Router(config)# tms controller
Router(cfg-tms-ctrl)# service-policy type tms TMS_POL_1
Router(cfg-tms-ctrl)# end
```

## Troubleshooting Tips

If the controller is unable to send threat messages to the consumer, perform the following steps:

1. Verify the registration status of the consumers by entering the **show tms controller** command. A registered consumer will be listed as “Registered Successfully” in the “Status” column. If the Status column displays “Configured Available”, then the controller is activated and waiting for a consumer to send a registration message.

2. If a consumer does not register successfully, use the **ping** command to send extended pings to the consumer to verify reachability.
3. If the consumer is reachable from the controller, enter the **tms consumer register** command on the consumer.
4. If the controller and consumers are properly configured and reachable via TCP/IP but the consumer is still unable to register with the controller, enable the **debug tms controller error** command to display related error messages.

## What to Do Next

A TMS type policy map must also be attached to a global TMS consumer process. Proceed to the next section to see more information.

## Attaching the Service Policy to a Global TMS Consumer Process

The TMS type service policy that was configured in the first three configuration tasks is attached to a global TMS consumer process in this task. Attaching the service policy activates a TMS consumer.

## Consumer Registration

The TMS consumer must register with the TMS controller before the controller can send Threat Information Messages (TIMs). Implicit registration requests are automatically sent to the controller when a TMS type service policy is activated on the consumer.

By default, a TMS consumer sends a registration request message to the TMS controller once every 3 minutes for up to 3 times or until successfully registered. If the consumer is a member of multiple groups, it will send a separate registration request messages to the controller of each group.

**Tip**

Explicit registration is configured by entering the **tms consumer registration** command on a TMS consumer in privileged EXEC mode. This command is unaffected by registration timer configuration and can be used to register the consumer with the controller at any time.

## Configuring Device Exceptions

The **exception access-group** command is configured to attach a local device exception to a TMS consumer process. A local device exception is an override configured on the TMS consumer that negates a enforcement action sent from the TMS controller or from a TMS Rules Engine configuration (mitigation type service policy) configured on the TMS consumer.

For example, traffic from the 192.168.1.0/24 network is considered to be suspect. So, an ACL drop mitigation enforcement action is configured for all traffic sourced from this network. However, a device with a host address in this range (192.168.1.55) needs to transit over a specific consumer. A local device exception is configured on the consumer to override ACL drop enforcement action.

The device exception is configured locally. A host IP address (or any other subset of the network) is defined in an extended access list and then referenced by the **exception access-group** command. The **tms-class** command is configured to associate an interface with the device exception. The enforcement action configured on the controller is not applied to traffic that is permitted by the access list.

## Prerequisites

- A TMS type service policy has been configured.
- TIDP is operational on the controller and all consumers.

## Restrictions

- Only a single TMS type policy map can be attached to the global TMS controller or consumer process. However, you can configure multiple TMS type class maps and associate these maps under the same TMS type policy map. Each class map can be configured with the same parameter map or a different parameter map.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tms consumer**
4. **service-policy type tms** {*policy-map*}
5. **exception access-group** {*extended-acl*}
6. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>tms consumer</b>  <b>Example:</b> Router(config)# tms consumer	Enters TMS consumer configuration mode to configure a consumer.
Step 4	<b>service-policy type tms {policy-map}</b>  <b>Example:</b> Router(cfg-tms-cons)# service-policy type tms TMS_POL_1	Binds a TMS type service policy to a TMS consumer process.
Step 5	<b>exception access-group {named-acl}</b>  <b>Example:</b> Router(cfg-tms-cons)# exception access-group NAMED_ACL	Configures a device exception in a global TMS consumer configuration.
Step 6	<b>end</b>  <b>Example:</b> Router(cfg-tms-cons)# end	Exits TMS consumer configuration mode, and enters privileged EXEC mode.

## Examples

The following example, starting in global configuration mode, configures a global TMS consumer process, attaches a TMS type policy map, and configures a device exception:

```
Router(config)# ip access-list extended NAMED_ACL
Router(config-ext-nacl)# permit tcp host 192.168.1.55 any
Router(config-ext-nacl)# exit
Router(config)# interface Ethernet 0/0
Router(config-if)# ip access-group NAMED_ACL in
Router(config-if)# tms-class
Router(config-if)# exit
Router(config)# tms consumer
Router(cfg-tms-cons)# exception access-group NAMED_ACL
Router(cfg-tms-cons)# service-policy type tms TMS_POL_1
Router(cfg-tms-cons)# end
```

## Troubleshooting Tips

If the consumer does not receive threat messages from the controller, perform the following steps:

1. Verify the registration status of the consumer by entering the **show tms consumer** command. A registered consumer will be listed as “Registered Successfully” in the “Status” column. If logging is enabled, the syslog output will show registered consumers as REGISTERED.
2. If a consumer does not register successfully, use the **ping** command to send extended pings to the controller (defined in the TMS type parameter map) to verify reachability.
3. If the controller is reachable from the consumer, use the **tms consumer register** command to explicitly register the consumer with the controller.
4. If the controller and consumers are properly configured and reachable via TCP/IP but the consumer is still unable to register with the controller, enable the **debug tms consumer error** command to display related error messages.

## What to Do Next

A consumer must be registered with the controller to receive TIMs. Implicit registration occurs automatically when this task is completed. A consumer can be explicitly registered or deregistered at any time. Proceed to the next section to see more information.

## Registering and Deregistering a TMS Consumer

This task is optional. The steps in this task shows how to register or deregister a consumer with a controller. All commands described in this section are entered in privileged EXEC mode.

### Implicit Synchronization

Implicit synchronization (resync) messages are sent between the controller and consumer when the **tms consumer register** command is entered. Implicit synchronization ensures that the consumer has received all threats that have been configured its TMS group. Threats remain active until they are removed by the controller or until the consumer is deregistered.

### Prerequisites

- TIDP and TMS is operational on the controller and all consumers.

### SUMMARY STEPS

1. **enable**
2. **tms consumer register {group group-id controller ipv4 ip-address}**
3. **tms consumer deregister {group group-id controller ipv4 ip-address}**
4. **tms controller deregister {group group-id consumer ipv4 ip-address}**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>tms consumer register {group group-id controller ipv4 ip-address}</b>  <b>Example:</b> Router# tms consumer register group 10 controller ipv4 10.1.1.1	(Required) Registers the consumer with a controller. This command is entered on a consumer. <ul style="list-style-type: none"> <li>The <i>group-id</i> is entered as a number from 1 to 4294967295.</li> </ul>
Step 3	<b>tms consumer deregister {group group-id controller ipv4 ip-address}</b>  <b>Example:</b> Router# tms consumer deregister group 10 controller ipv4 10.1.1.1	(Optional) Deregisters the consumer from a controller. This command is entered on a consumer. <ul style="list-style-type: none"> <li>Threats sent to a deregistered consumer are deleted.</li> </ul>
Step 4	<b>tms controller deregister {group group-id consumer ipv4 ip-address}</b>  <b>Example:</b> Router# tms controller deregister group 10 consumer ipv4 10.1.1.2	Deregisters the consumer from a controller. This command is entered on a controller. <ul style="list-style-type: none"> <li>Threats sent to a deregistered consumer are deleted.</li> </ul>

## Examples

The following example registers a TMS consumer with a TMS controller:

```
Router# tms consumer register group 10 controller ipv4 10.1.1.1
```

The following example deregisters the 10.1.1.2 consumer from the controller:

```
Router# tms controller deregister group 10 consumer ipv4 10.1.1.2
```

## Troubleshooting Tips

If the consumer is unable to register with the controller, perform the following steps:

1. Verify registration status by entering the **show tms controller** command on the controller or the **show tms consumer** command on the consumer.
2. Use the **ping** command to send extended pings to the controller to verify reachability.
3. If the controller and consumers are properly configured and reachable via TCP/IP but the consumer is still unable to register with the controller, enable the **debug tms consumer error** command to display related error messages.

## What to Do Next

At completion of this task, the framework and services for distributing threat messages is complete and operational. Proceed to the next section to see information on configuring a threat definition file.

## Configuring an XML Threat Definition File

The steps in this task show how to configure an XML threat definition file. The threat definition file is a container for Threat Information Messages (TIMs). The threat definition file first is configured in a text or XML editor. The threat definition file loaded to the TMS controller. TIMs are then distributed to TMS consumers.

### XML Version 1.0 Syntax

The syntax of the threat definition file must comply with Extensible Markup Language (XML) version 1.0 syntax. For information about version 1.0 XML syntax, refer to the following document:

- <http://www.w3.org/TR/REC-xml/>

### Threat Definition File Syntax Guidelines

The following list describes required and optional syntax for the threat definition file:

- The threat file must contain descriptions for one or more threats
- Threat details are encoded in XML notation
- The threat file itself should begin with the following version encoding:  
`<?xml version="1.0" encoding="utf-8"?>`
- XML tags are represented by **bold** text
- Attribute syntax is represented by *italic* text
- Each threat is uniquely identified by the owner ID, threat ID, and version number
- Each threat should start with a threat tag, which contains the owner/threat ID/version values
- The following XML tags are mandatory for every threat:  
**threat**, **threat\_info**, **primitive** and **tcdf**
- The following XML tags are optional for every threat:  
**condition** and **parameter**

### Threat File Tag Descriptions

This section describes required and optional XML tags.

#### **threat (required)**

The **threat** tag must follow the XML version tag. This tag has the following three required attributes:

**threat\_info (required)**

The **threat\_info** tag contains the Event Risk Rating (ERR) attribute. The ASR field in this tag is used to set the priority of the threat. The priority is configured with a number from 1 to 5. The priority implies no preference or hierarchy. It simply provides 5 levels of independent classification for threat messages.

**Tip**

The ASR field maps directly to the **match priority** command. It is configured on the consumer to match the ASR field to a traffic class in a mitigation type service policy (TMS Rule Engine configuration).

**Note**

In Cisco IOS Release 12.4(6)T, the threat priority cannot be configured in the TMS Rules Engine (mitigation type service policy). However, priority values can be with the **match priority** command.

**primitive (required)**

The **primitive** tag contains the *primitive* attribute. The *primitive* attribute defines the mitigation enforcement action: *block*, *redirect*, or a nonstandard (user-defined) primitive. The nonstandard primitive is configured with any string value. *Block* and *redirect* are standard primitives. Any other value is interpreted as a nonstandard.

**Tip**

The *primitive* attribute maps directly to the **match primitive** command. It is configured on a consumer to match the mitigation enforcement action to a traffic class in a mitigation type service policy.

**parameter (optional)**

The **parameter** tag is a container for the next-hop variable of the mitigation enforcement action. The next-hop variable is defined in a nested **redirect** tag. The next hop is configured to route to a specific IPv4 host address or to the null0 interface (black hole).

The *profile* attribute is defined to configure the threat to take the next hop from a mitigation type parameter map configured on the consumer.

**Tip**

The *profile* attribute maps directly to the name of the mitigation type parameter map configured on the TMS consumer. The **variable** command is configured in the parameter-map to define the next hop. The **parameter** tag can be configured with either the *profile* attribute or a nested **redirect** tag but not both.

**condition (optional)**

The **condition** tag is used to define a conditional enforcement rule on an interface for a mitigation action. The mitigation action is enforced on the interface when any condition (first match) or all conditions (strict match) are met.

- The **condition** tag should have at least one **match** tag.
- A **match** tag must be configured with the attribute of type “all” or “any.”
- A **match** tag can contain nested **match** tags, or it can contain the **device\_class**, **sub\_device\_class**, or **host\_locate** optional tags.

The **device\_class** tag is configured with an attribute name that identifies the router or networking device.

**Note**

In Cisco IOS Release 12.4(6)T, “Router” is the only supported attribute name for the **device\_class** tag.

The **sub\_device\_class** tag is configured with an attribute name that identifies an interface. This tag is used to associate one or more threats with one or more interfaces.

**Tip**

The **sub\_device\_class** tag maps directly to the *name* argument of the **tms-class** command. The **tms-class** command is configured in interface configuration mode to associate an interface with an ACL drop enforcement action.

The **host\_locate** tag is configured with the *ipv4\_address* attribute. This attribute is entered with a valid IP version 4 (IPv4) address to identify a specific host. This tag is used to associate a specific host with a threat.

**Tip**

The **host\_locate** tag maps directly to the **edge** keyword of the **tms-class** command. This configuration is used to associate a host with a threat. The mitigation action is enforced only if the host is reachable from the interface when the **edge** keyword is configured.

**tcdf (required)**

The **tcdf** tag defines the traffic class for which the mitigation action that is enforced. This includes the classification match rule (strict or first) and the network (IP) and the transport (TCP or UDP) layer protocols that carry the traffic.

- Only one classification is allowed for each tag.
- Information attributes of the class, such as the name, are ignored.
- Attribute *match= "all"* or *match= "any"* are supported by TCDF.
- Only one match tag can be entered. The attribute for match, is *type*, which can take values *"all"* or *"any"*.

**Note**

In Cisco IOS Release 12.4(6)T, only strict traffic class matching (*match= "all"*) is supported.

- *Eq* and *range* filters are supported.
- The attribute field can accept the following string values:  
*ip.src\_addr*  
*ip.dst\_addr*  
*ip.proocol*  
*tcp.src\_port*  
*tcp.dst\_port*  
*udp.src\_port*  
*udp.dst\_port*
- The *range* filter can be configured for only TCP and UDP port numbers.
- The *ip.protocol* attribute can be configured with only TCP and UDP values (6 and 17). When TCP is configured, *tcp.src\_port* and *tcp.dst\_port* range can be defined. When UDP is configured as the protocol, *udp.src\_port* and *udp.dst\_port* range can be defined.

**Tip**

If the *ip.protocol* attribute is not specified, the traffic class is processed without regard to the transport layer protocol. Only the source and destination IP addresses are entered for this type of traffic class definition. Port numbers are not.

## XML Threat Definition File Configuration Steps

Steps 5, 6, and 7 contain branching tasks. Each branching task shows an alternate configuration that can be applied for the given step.

- 
- Step 1** (Required) The threat file is configured with the version and encoding declaration.
- ```
<?xml version="1.0" encoding="utf-8"?>
```
- Step 2** (Required) The threat ID, owner ID, and version numbers are configured. The version must be incremented each time the threat is updated (replaced with a newer version).
- ```
<threat tid="1" owner="1000" version="10">
</threat>
```
- Step 3** (Required) Threat information is configured. In this sample step, the ASR field is set to 3 (threat priority level).
- ```
<threat_info threat_name="NAME"
             threat_text="THREATTEXT"
             mitigation_text="mitigaationtext" >
    <err ASR="3" SFR="20" ARR="30" TFR="40" PD="50"></err>
    <threat_class name="tc1"> </threat_class>
    <threat_class name="tc2"> </threat_class>
</threat_info>
```
- Step 4** (Required) The threat primitive is configured as a *block*, *redirect*, or nonstandard (user-defined) mitigation action.
- ```
<primitive name="redirect"> </primitive>
```
- Step 5** (Optional) The next-hop variable is set to a host IP address (172.16.1.1).
- ```
<parameter>
    <redirect nexthop="172.16.1.1"> </redirect>
</parameter>
```
- Or**
- (Optional) The next-hop variable is set to the null0 interface (0.0.0.0).
- ```
<parameter>
 <redirect nexthop="0.0.0.0"> </redirect>
</parameter>
```
- Or**
- (Optional) The next-hop variable is determined by the configuration of the mitigation type parameter map configured on the TMS consumer (MIT\_PAR\_2).
- ```
<parameter profile="MIT_PAR_2"> </parameter>
```

- Step 6** (Optional) A first match conditional enforcement rule is configured. In this sample step, the mitigation action is enforced when suspect traffic travels over an interface tagged with the sub_device_class name (Ingress_Ethernet) or when suspect traffic travels over an interface that is reachable from the 10.2.2.2 host.

```
<condition>
  <match type="any">
    <match type="any">
      <host_locate ipv4_addr="10.2.2.2" > </host_locate>
      <device_class name="Router" > </device_class>
    </match>
    <match type="any">
      <device_class name="Router" > </device_class>
      <sub_dev_class name="Ingress_Ethernet" > </sub_dev_class>
    </match>
  </match>
</condition>
```

Or

- (Optional) A strict match conditional enforcement rule is configured. In this sample step, the mitigation action is enforced only when suspect traffic travels over an interface that is reachable from the 10.2.2.2 host and is tagged with the sub_device_class name (Ingress_Ethernet).

```
<condition>
  <match type="all">
    <host_locate ipv4_addr="10.2.2.2" > </host_locate>
    <device_class name="Router" > </device_class>
    <sub_dev_class name="Ingress_Ethernet" > </sub_dev_class>
  </match>
</condition>
```

- Step 7** (Required) The traffic class is defined to specify suspect traffic. In this sample step, TCP is identified as the transport layer protocol. Specific source and destination IP addresses and port numbers are configured.

```
<tcdcf>
  <class name="match-criteria" type="access-control" match="all">
    <match>
      <eq field="ip.src_addr" value="192.168.7.66" mask="255.255.255.255"> </eq>
      <eq field="ip.dst_addr" value="10.3.3.3" mask="255.255.255.255"> </eq>
      <eq field="ip.protocol" value="6"> </eq>
      <range field="tcp.src_port" from="10" to="200"> </range>
      <range field="tcp.dst_port" from="50"> </range>
    </match>
  </class>
</tcdcf>
```

Or

- (Required) In this sample step, UDP is identified as the transport layer protocol.

```
<tcdcf>
  <class name="match-criteria" type="access-control" match="all">
    <match>
      <eq field="ip.src_addr" value="192.168.7.66" mask="255.255.255.255"> </eq>
      <eq field="ip.dst_addr" value="10.3.3.3" mask="255.255.255.255"> </eq>
      <eq field="ip.protocol" value="17"> </eq>
      <range field="udp.src_port" from="1000" to="2000"> </range>
      <range field="udp.dst_port" from="5000"> </range>
    </match>
  </class>
</tcdcf>
```

Or

(Required) In this sample step, no transport layer protocol is defined. Only source and destination IP addresses are configured to identify suspect traffic.

```
<tcdf>
  <class name="match-criteria" type="access-control" match="all">
    <match>
      <eq field="ip.src_addr" value="192.168.7.66" mask="255.255.255.255"> </eq>
      <eq field="ip.dst_addr" value="10.3.3.3" mask="255.255.255.255"> </eq>
    </match>
  </class>
</tcdf>
```

Tip

Source and destination port number are not configured when a transport layer protocol is not specified.

What to Do Next

The threat definition file must be loaded to the controller before threats contained in the threat definition file can be sent to consumers. Proceed to the next section to see information on loading and unloading threats.

Loading a Threat Definition File on a TMS Controller

This task shows how to load a threat definition file on a TMS controller. The **tms controller load threat** command is entered in privileged EXEC mode to load an XML threat definition file to the TMS controller from a local storage device, such as ATA or linear flash memory. The file can also be loaded from a reachable host (using FTP, HTTPS, RCP, or TFTP protocols).

Loaded and Active Databases

Two databases are maintained on the controller: the “loaded” database and the “active” database. The **tms controller load threat** command is used to upload a threat definition file on the controller. Once the threat definition file has been loaded, individual threats contained within the threat definition file are placed in the “loaded” database for distribution to consumers. Threats are removed from the loaded database by entering the **tms controller unload** command. Entering this command does not remove the threat from the active database if the threat is active on at least one consumer.

A threat is placed in the “active” database when the **tms controller send** command is used to send one or more threats to one or more consumers. A threat remains in the active database as long as it is active on at least one consumer. An active threat can be removed from consumers by entering the **tms controller reset** command on the controller. Active threats can be removed on the consumer by entering **clear tms consumer** or by reloading the consumer.

Updating or Replacing a Loaded Threat

Each threat that is contained within a threat definition file is uniquely identified by the threat ID, owner ID, and version number. The controller uses the version field to ensure that the most recent threat is sent to consumers. A higher version number indicates a more current or newer threat.

To replace or update an existing threat in the loaded database, a modified threat definition file must be loaded to the controller. The threat contained within this file must have a higher number in the version field. If the version field is the same or contains a lower number, the updated threat will not be loaded.

To distribute the updated threat to TMS consumers, the older version of the threat must be removed from the active database. The **tms controller reset** command can be entered with the **delete** keyword to remove the threat from all consumers.

Prerequisites

- TIDP and TMS is operational on the controller and all consumers.
- A threat definition file that contains one or more TIMs has been created.
- The threat definition file has been copied to flash memory on the controller or is accessible on a reachable host.

Restrictions

- There is no limit on the number of threats that can be loaded on to the controller. However, the amount of memory required is dependent on the number consumers, the number of threats, and the number of other processes that run on the router or network device.

SUMMARY STEPS

1. **enable**
2. **tms controller load threat** *{file-source}*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	tms controller load threat <i>{file-source}</i> Example: Router#_tms controller load threat disk0: THREAT_DEFINITION_FILE	(Required) Loads a threat definition file on to a TMS controller. <ul style="list-style-type: none"> • The threat definition file can be loaded from a local file system, such as flash memory, or it can be loaded from a reachable host over the network.

Examples

The following example loads a threat definition file from local flash memory:

```
Router# tms controller load threat disk0: THREAT_FILE
```

The following example loads a threat definition file from a TFTP server:

```
Router# tms controller load threat tftp://172.16.1.1/THREAT_DEFINITION_FILE
```

Troubleshooting Tips

If there is a problem loading or unloading an XML threat definition file, the **debug tms controller xml error** command can be enabled to configure the router to print related error messages.

What to Do Next

The threat message is not activated until it is sent to TMS consumers. Proceed to the next section to see more information.

Sending Threat Information Messages from the Controller to a TMS Consumer

This task shows how to send a TIM to TMS consumers. A single threat, a range of threats, or all threats can be sent. The threat can be sent to a single group or all groups. The start time when the threat is activated and the duration of the threat are configurable. The **tms controller send** command is entered in privileged EXEC mode.

Prerequisites

- TIDP and TMS is operational on the controller and all consumers.
- A threat definition file that contains one or more TIMs has been put in the loaded database on the controller.

SUMMARY STEPS

1. **enable**
2. **tms controller send {group {group-id | all} owner owner-id tid {threat-id [- number] | all} consumer {all | ipv4 ip-address} [start_time seconds] [duration seconds]}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	tms controller send {group {group-id all} owner owner-id tid {threat-id [- number] all} consumer {all ipv4 ip-address} [start_time seconds] [duration seconds]} Example: Router# tms controller send group 10 owner 1000 tid 100 consumer all duration 3600	Configures a TMS controller to send a threat definition file to TMS consumers.

Examples

The following example sends threat ID 100 to all consumers in TIDP group 10. The threat will remain active for 1 hour.

```
Router# tms controller send group 10 owner 1000 tid 100 consumer all duration 3600
```

Troubleshooting Tips

If the controller is unable to send threat messages to the consumer, perform the following steps:

1. Verify the registration status of the consumers by entering the **show tms controller** command. A registered consumer will be listed as “Registered Successfully” in the “Status” column. If the Status column displays “Configured Available”, then the controller is activated and waiting for a consumer to send a registration message.
2. If a consumer does not register successfully, use the **ping** command to send extended pings to the consumer to verify reachability.
3. If the consumer is reachable from the controller, enter the **tms consumer register** command on the consumer.
4. If the controller and consumers are properly configured and reachable via TCP/IP but the consumer is still unable to register with the controller, enable the **debug tms controller error** command to display related error messages.

What to Do Next

Proceed to the next section to see information about synchronizing the threat status on a consumer with other consumers in a TMS group.

Synchronizing the Threat Status of a Consumer with the TMS Group

This task is optional. This task shows how to synchronize the threat status on a consumer with the threat status on other consumers. This command is entered to ensure that the consumer has received all messages that have been sent to the TMS group. The **tms consumer resync** command is entered in privileged EXEC mode.

Implicit Synchronization

Implicit synchronization (resync) messages are sent between the controller and consumer when the **tms consumer register** command is entered. Implicit synchronization ensures that the consumer has received all threats that have been configured its TMS group. Threats remain active until they are removed by the controller or until the consumer is deregistered.

Prerequisites

- TIDP and TMS is operational on the controller and all consumers.
- A threat definition file that contains one or more TIMs has been put in the loaded database on the controller.

SUMMARY STEPS

1. **enable**
2. **tms consumer resync {group group-id owner {owner-id | any} tid {threat-id [- number] | all} controller ipv4 ip-address}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	tms consumer resync {group group-id owner {owner-id any} tid {threat-id [- number] all} controller ipv4 ip-address} Example: Router# tms consumer resync group 10 owner any tid all controller ipv4 10.1.1.1	(Optional) Synchronizes a TMS consumer with a TMS controller. <ul style="list-style-type: none">• The example synchronizes all threats from any owner that were sent to TIDP group 10.

Examples

The following example synchronizes all threats from any owner that were sent to TIDP group 10.

```
Router# tms consumer resync group 10 owner any tid all controller ipv4 10.1.1.1
```

Troubleshooting Tips

If you are unable to synchronize the consumer with the TMS group, perform the following steps:

1. Verify the threat status on the controller and consumers by entering the **show tms controller** and **show tms consumer** commands. Filter the output to display information about the group and threat ID numbers.
2. If the consumer is reachable from the controller, enter the **tms consumer register** command on the consumer.
3. If the controller and consumers are properly configured and reachable but the consumer is still unable to synchronize, enable the following debug commands to display related error messages:
 - **debug tms controller error** or **debug tms consumer error**
 - **debug tms controller events** or **debug tms consumer events**
 - **debug tms consumer feature-interface**

Tip

You can also process these messages through syslog by enabling the **logging tms events** command in a TMS type parameter map type.

What to Do Next

Proceed to the next section to see information about updating and removing threats on a consumer.

Managing Threat Information Messages on a Consumer from the Controller

This task is optional. This task shows how to activate, deactivate and delete threat messages on one or all consumers. The **tms controller reset** command is entered in privileged EXEC mode.

Updating or Replacing a Loaded Threat

Each threat that is contained within a threat definition file is uniquely identified by the threat ID, owner ID, and version number. The controller uses the version field to ensure that the most recent threat is sent to consumers. A higher version number indicates a more current or newer threat.

To replace or update an existing threat in the loaded database, a modified threat definition file must be loaded to the controller. The threat contained within this file must have a higher number in the version field. If the version field is the same or contains a lower number, the updated threat will not be loaded.

To distribute the updated threat to TMS consumers, the older version of the threat must be removed from the active database. The **tms controller reset** command can be entered with the **delete** keyword to remove the threat from all consumers.

Prerequisites

- TIDP and TMS is operational on the controller and all consumers.
- A threat definition file that contains one or more TIMs has been put in the loaded database on the controller.

SUMMARY STEPS

1. **enable**
2. **tms controller reset {activate | delete | inactivate} group {group-id | all} owner owner-id tid {threat-id [- number] | all} consumer {all | ipv4 ip-address}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	tms controller reset {activate delete inactivate} group {group-id all} owner owner-id tid {threat-id [- number] all} consumer {all ipv4 ip-address} Example: Router# tms consumer reset activate group 10 owner 1000 tid 1000 consumer ipv4 10.1.1.2	Manages threat definition messages on a TMS consumer from the TMS controller. <ul style="list-style-type: none"> • A single peer or range of TIDP groups can be managed. • Threat definition files can be activated, deactivated, or deleted based on the group ID, owner ID, threat ID, or host address.

Examples

Threat Activation Example

The following example activates all threats on all consumers in all groups that belong to owner number 1000:

```
Router# tms controller reset activate group all owner 1000 tid all consumer all
```

Threat Removal Example

The following example removes threats, 1 through 10, from the active database for all consumers in group 10:

```
Router# tms controller reset delete group 10 owner 1000 tid 1 - 10 consumer all
```

Threat Deactivation Example

The following example deactivates threats, 1 through 10, from the active database for all consumers in group 10:

```
Router# tms controller reset inactivate group 10 owner 1000 tid 1 - 10 consumer all
```

Troubleshooting Tips

If you are unable to manage threats on a consumer, perform the following steps:

1. Verify the threat status on the controller and consumers by entering the **show tms controller** and **show tms consumer** commands. Filter the output to display information about the group and threat ID numbers.

2. If the consumer is reachable from the controller, enter the **tms consumer register** command on the consumer.
3. If the controller and consumers are properly configured and reachable but the consumer is still unable to synchronize, enable the following debug commands to display related error messages:
 - **debug tms controller error** or **debug tms consumer error**
 - **debug tms controller events** or **debug tms consumer events**
 - **debug tms consumer feature-interface**

**Tip**

You can also process these messages through syslog by enabling the **logging tms events** command in a TMS type parameter map type.

What to Do Next

Proceed to the next section to see information about sending a status request message to a consumer.

Sending a Status Request Message to Consumers from the TMS Controller

This task is optional. This task shows how to send a status request message from a controller to a consumer or group of consumers. The consumer must be registered to receive this message. In response, the consumer sends information about one or all threats to the controller. The **tms controller status** command is entered in privileged EXEC mode.

Prerequisites

- TIDP and TMS is operational on the controller and all consumers.
- A threat definition file that contains one or more threat information messages has been loaded on the controller.

SUMMARY STEPS

1. **enable**
2. **tms controller status {group {group-id | all} owner owner-id tid {threat-id [- number] | all} consumer {all | ipv4 ip-address}}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	tms controller status {group {group-id all} owner owner-id tid {threat-id [- number] all} consumer {all ipv4 ip-address}} Example: Router# tms controller status group 10 owner 1000 tid 1 consumer ipv4 10.1.1.2	Sends a status request message to a TMS consumer from the TMS controller.

Examples

The following example sends a status request message for information about all threats from owner 1000:

```
Router# tms controller status group all owner 1000 tid all consumer all
```

The following example sends a status request message to the 10.1.1.2 consumer in group 10 for information threats, 1 through 10:

```
Router# tms controller status group 10 owner 1000 tid 1 - 10 consumer ipv4 10.1.1.2
```

Troubleshooting Tips

If you are unable to send a status request message to a consumer, perform the following steps:

1. Verify the threat status on the controller and consumers by entering the **show tms controller** and **show tms consumer** commands. Filter the output to display information about the group and threat ID numbers.
2. If the consumer is reachable from the controller, enter the **tms consumer register** command on the consumer.
3. If the controller and consumers are properly configured and reachable but the consumer is still unable to synchronize, enable the following debug commands to display related error messages:
 - **debug tms controller error** or **debug tms consumer error**
 - **debug tms controller events** or **debug tms consumer events**
 - **debug tms consumer feature-interface**

Tip

You can also process these messages through syslog by enabling the **logging tms events** command in a TMS type parameter map type.

What to Do Next

Proceed to the next section to see information about unloading threat messages from the loaded database.

Unloading a Threat Information Messages from the Loaded Database

This task is optional. This task shows how to unload a TIM from the “loaded” database. The **tms controller unload** command is entered on a TMS controller in privileged EXEC mode.

Loaded and Active Databases

Two databases are maintained on the controller: the “loaded” database and the “active” database. The **tms controller load threat** command is used to upload a threat definition file on the controller. Once the threat definition file has been loaded, individual threats contained within the threat definition file are placed in the “loaded” database for distribution to consumers. Threats are removed from the loaded database by entering the **tms controller unload** command. Entering this command does not remove the threat from the active database if the threat is active on at least one consumer.

A threat is placed in the “active” database when the **tms controller send** command is used to send one or more threats to one or more consumers. A threat remains in the active database as long as it is active on at least one consumer. An active threat can be removed from consumers by entering the **tms controller reset** command on the controller. Active threats can be removed on the consumer by entering **clear tms consumer** or by reloading the consumer.

Prerequisites

- TIDP and TMS is operational on the controller and all consumers.
- A threat definition file that contains one or more TIMs has been put in the loaded database on the controller.

SUMMARY STEPS

1. **enable**
2. **tms controller unload** {**owner** *owner-id* **tid** {*threat-id* [- *number*] | **all**}}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	tms controller unload { owner <i>owner-id</i> tid { <i>threat-id</i> [- <i>number</i>] all }} Example: Router# tms controller unload owner 10 tid 1-10	(Optional) Unloads a threat definition file from a TMS controller. <ul style="list-style-type: none"> The <i>owner-id</i> argument is entered as a number from 1 to 65535 The <i>threat-id</i> argument is entered as a number from 1 to 65535. A range of threat ID numbers can be configured by entering a hyphen and an ascending number.

Examples

The following example unloads threats, 1 through 10, from the loaded database on a TMS controller:

```
Router#_tms controller unload owner 1000 tid 1 - 10 threat
```

Troubleshooting Tips

If there is a problem loading or unloading an XML threat definition file, enabling the **debug tms controller xml error** command will configure the router to print related error messages.

What to Do Next

At completion of this procedure, all configuration tasks that are performed on a controller are complete. The remaining configuration tasks are performed on a consumer. Proceed to the next section for information about configuring the TMS Rules Engine on a consumer.

Configuring the TMS Rules Engine on a Consumer

This task is optional. The steps in this task show how to configure the TMS Rules Engine. The TMS Rules Engine is configured using a mitigation type service policy.

The TMS Rules Engine is used to configure a mitigation enforcement action directly on a consumer to override an enforcement action sent from the controller. The following tasks are performed in this section:

- The mitigation traffic class is defined in a class map
- The next hop variable is defined in parameter map
- A mitigation type policy map is configured to bind the class and parameter maps
- The mitigation type service policy is associated with the TMS type policy map

Mitigation Type Service Policy

The mitigation type service policy is configured only on the consumer. It is used to customize or override mitigation enforcement actions sent by the controller. The TMS Rules Engine is used to configure an ACL drop, an ignore, or a redirect enforcement action. Only one action can be configured for each mitigation type traffic class.

This type of service policy is created by configuring and linking mitigation type parameter and class maps to a mitigation type policy map. The class map is configured to define threat primitive and priority traffic matching conditions (as a class of traffic). The parameter map is configured to apply a next-hop variable to the class of traffic. The class and parameter maps are attached to a mitigation type policy map. The mitigation type service policy is activated by attaching the mitigation type policy map to a TMS type policy map, which is attached to the global TMS consumer process.

ACL Drop Rule

The ACL drop rule is configured to drop packets that are permitted by a predefined extended access-list. The **ip access-group** command is configured to attach the access list to the interface. The **tms-class** command is configured to associate the interface with the ACL drop enforcement action.

Ignore Rule

The ignore rule configures the TMS Rules Engine to ignore (not carry out any action for) a mitigation enforcement action defined for the matching traffic class. The traffic class is defined by the primitive and/or priority configured in a mitigation type class map.

Redirect Rule

The redirect rule is configured to redirect traffic to an explicitly defined IPv4 host, to a null interface or to an IPv4 host defined in a variable. The variable is initialized under the mitigation parameter-map using the **variable** command. If no destination is configured, the TMS Rules Engine will first check the threat information message (associated with the mitigation class map). If a destination cannot be derived from the threat information message, then the mitigation type parameter map is checked (if one is configured and attached to the mitigation type service policy).

If a next-hop IP address, null interface, or user-defined variable is not configured, the next hop variable must be defined in a mitigation type parameter map and then associated under the policy map with the **source parameter** command, or the parameter-map name must be specified in the *profile* attribute entered under the **parameter** tag in the threat definition file.

Prerequisites

- TIDP and TMS is operational on the controller and all consumers.
- A TMS type service policy has been configured and attached to the global TMS consumer process.

Restrictions

- Only one mitigation enforcement action can be configured for each mitigation type traffic class.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type mitigation** {[**match-all** | **match-any**] *name*}
4. **match priority** {*number*}
5. **match primitive** {**any** | **block** | **redirect** | *any-string*}
6. **exit**
7. **parameter-map type mitigation** {*name*}
8. **variable** *name* {**ipv4** *ip-address* | **null0**}
9. **exit**
10. **policy-map type control mitigation** {*name*}
11. **class** {*class-name* | **class-default**}
12. **acl drop**
13. **ignore**
14. **redirect route** {*next-hop-ip-address* | **null** | *\$-variable*}
15. **source parameter**{*parameter-map*}
16. **exit**
17. **exit**
18. **policy-map type control mitigation** {*name*}
19. **service-policy** {*policy-map*}
20. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	class-map type mitigation {[match-all match-any] name} Example: Router(config)# class-map type mitigation MIT_CLASS_1	Configures a mitigation class map. Note Match all is default behavior if no optional keywords are configured.
Step 4	match priority {number} Example: Router(config-cmap)# match priority 4	Configures the traffic class to match the priority level of a mitigation enforcement action.
Step 5	match primitive {any block redirect any-string} Example: Router(config-cmap)# match primitive block	Configures the traffic class to match the primitive (mitigation enforcement action.)
Step 6	exit Example: Router(config-cmap)# exit	Exits class map configuration mode, and enters global configuration mode.
Step 7	parameter-map type {mitigation name tms name} Example: Router(config)# parameter-map type mitigation MIT_PAR_1	Configures a mitigation type parameter map.
Step 8	variable name {ipv4 ip-address null0} Example: Router(config-profile)# variable nexthop ipv4 192.168.1.1	Defines the next-hop variable in the mitigation type parameter map.
Step 9	exit Example: Router(config-profile)# exit	Exits parameter-map configuration mode, and enters global configuration mode.

	Command or Action	Purpose
Step 10	policy-map type control mitigation {name} Example: Router(config)# policy-map type control mitigation MIT_POL_1	Configures a mitigation type policy map.
Step 11	class {class-name class-default} Example: Router(config-pmap)# class MIT_CLASS_1	Attaches the mitigation traffic class to the policy map. <ul style="list-style-type: none"> The <i>class-name</i> argument must be configured in this step.
Step 12	redirect route {next-hop-ip-address null \$-variable} Example: Router(config-pmap-c)# redirect route	(Optional) Configures a redirect enforcement action in a mitigation type policy map. <ul style="list-style-type: none"> The next hop is configured as specific IP address, the null 0 interface, or a user-defined variable. If a user-defined variable is entered, the variable string must start with the \$ character.
Step 13	acl drop Example: Router(config-pmap-c)# acl drop	(Optional) Configures an access list drop enforcement action. <ul style="list-style-type: none"> The drop action is based on a predefined named access list.
Step 14	ignore Example: Router(config-pmap-c)# ignore	(Optional) Configures TMS to ignore the enforcement action.
Step 15	source parameter {parameter-map} Example: Router(config-pmap-c)# source parameter MIT_PAR_1	Attaches a mitigation type parameter map in a policy-map class configuration.
Step 16	exit Example: Router(config-pmap-c)# exit	Exits policy-map class configuration mode, and enters policy-map configuration mode.
Step 17	exit Example: Router(config-pmap)# exit	Exits policy-map configuration mode, and enters global configuration mode.
Step 18	policy-map type control {mitigation name tms name} Example: Router(config)# policy-map type control tms TMS_POL_1	Configures the TMS type policy map.

	Command or Action	Purpose
Step 19	class { <i>name</i> } Example: Router(config-pmap)# class MIT_CLASS_1	Configures the TMS type class under the policy map. Note The TMS type class-map configuration is not shown in this task table.
Step 20	service-policy { <i>policy-map</i> } Example: Router(config-pmap-c)# service policy MIT_POL_1	Attaches the mitigation type policy map to the TMS type policy map. Note A TMS type policy map that has a mitigation type policy map attached cannot be attached to a global TMS controller process.
Step 21	end Example: Router	Exits policy-map class configuration mode, and enters privileged EXEC mode.

Examples

ACL Drop Rule Example

The following example, starting in global configuration mode, configures an ACL drop enforcement action. Traffic that matches the extended access list (172.16.1/24) is dropped.

```
Router(config)# ip access-list extended 100
Router(config-ipacl)# permit ip 172.16.1.0 0.0.0.255 any
Router(config-ipacl)# exit
Router(config)# interface Ethernet 0/0
Router(config-if)# ip access-group 100 in
Router(config-if)# tms-class
Router(config-if)# exit
Router(config)# class-map type mitigation match-all MIT_CLASS_1
Router(config-cmap)# match priority 3
Router(config-cmap)# match primitive block
Router(config-cmap)# exit
Router(config)# policy-map type control mitigation MIT_POL_1
Router(config-pmap)# class MIT_CLASS_1
Router(config-pmap-c)# acl drop
Router(config-pmap-c)# end
```

Blackhole (Redirect) Rule Example

The following example, starting in global configuration mode, configures the TMS Rules Engine to send priority 5 redirect threat mitigation traffic to a null interface (black hole):

```
Router(config)# parameter-map type mitigation MIT_PAR_2
Router(config-profile)# variable RTBH NULL0
Router(config-profile)# exit
Router(config)# class-map type mitigation match-all MIT_CLASS_2
Router(config-cmap)# match priority 5
Router(config-cmap)# match primitive redirect
Router(config-cmap)# exit
Router(config)# policy-map type control mitigation MIT_POL_2
Router(config-pmap)# class MIT_CLASS_2
Router(config-pmap-c)# source parameter MIT_PAR_2
Router(config-pmap-c)# redirect route $RTBH
Router(config-pmap-c)# end
```

Collection (Redirect) Rule Example

The following example, starting in global configuration mode, configures the TMS Rules Engine to set the next hop variable to 192.168.1.1 for traffic that matches the mitigation class (priority 1 traffic and any primitive):

```
Router(config)# class-map type mitigation MIT_CLASS_3
Router(config-cmap)# match primitive any
Router(config-cmap)# match priority 1
Router(config-cmap)# exit
Router(config)# parameter-map type mitigation MIT_PAR_3
Router(config-profile)# variable COLLECTION ipv4 192.168.1.1
Router(config-profile)# exit
Router(config)# policy-map type control mitigation MIT_POL_3
Router(config-pmap)# class MIT_CLASS_3
Router(config-pmap-c)# source parameter MIT_PAR_3
Router(config-pmap-c)# end
```

Ignore Example

The following example, starting in global configuration mode, configures a TMS consumer to ignore a priority 5 redirect primitive:

```
Router(config)# parameter-map type mitigation MIT_PAR_4
Router(config-profile)# variable RTBH NULL0
Router(config-profile)# exit
Router(config)# class-map type mitigation match-all MIT_CLASS_4
Router(config-cmap)# match priority 5
Router(config-cmap)# match primitive redirect
Router(config-cmap)# exit
Router(config)# policy-map type control mitigation MIT_POL_4
Router(config-pmap)# class MIT_CLASS_4
Router(config-pmap-c)# source parameter MIT_PAR_4
Router(config-pmap-c)# ignore
Router(config-pmap-c)# end
```

Activating the TMS Rules Engine Example (Complete Configuration)

The following example, starting in global configuration mode, creates a Rules Engine configuration and activates it under the global TMS consumer process:

```
Router(config)# class-map type mitigation MIT_CLASS_3
Router(config-cmap)# match primitive block
Router(config-cmap)# match priority 1
Router(config-cmap)# exit
Router(config)# parameter-map type mitigation MIT_PAR_3
Router(config-profile)# variable COLLECTION ipv4 192.168.1.1
Router(config-profile)# exit
Router(config)# policy-map type control mitigation MIT_POL_3
Router(config-pmap)# class MIT_CLASS_3
Router(config-pmap-c)# redirect route
Router(config-pmap-c)# source parameter MIT_PAR_3
Router(config-pmap-c)# exit
Router(config-pmap)# exit
Router(config)# policy-map type control tms TMS_POL_1
Router(config-pmap)# class TMS_CLASS_1
Router(config-pmap-c)# mitigation TMS_PAR_1
Router(config-pmap-c)# service-policy MIT_POL_3
Router(config-pmap-c)# exit
Router(config-pmap)# exit
Router(config)# tms consumer
Router(config-cons)# service-policy type tms TMS_POL_1
Router(config-cons)# end
```

Troubleshooting Tips

Troubleshooting Strict Match Mitigation Policies

The TMS Rules Engine provides a flexible mechanism to match TIMs on the TMS consumer. A match policy can be configured to match any (first) threat priority or primitive or to match all (strict).

Match all is the default when a mitigation type class map is configured without entering either optional keyword. This, as the name implies, is a strict match that requires all elements to match in order for the rule to be processed. Therefore, it is possible to configure a strict match that cannot function because it is impossible to match all elements. The following example illustrates this point:

```
class-map type mitigation MIT_CLASS
  match primitive block
  match primitive redirect
  match priority 2
  match priority 3
```

The above configuration uses a default match-all rule because no keyword is entered. The match-all rule invalidates the above configuration because no threat can satisfy all match criteria (block and redirect).

This configuration can be corrected by configuring the class map with the **match-any** keyword, as shown in the following configuration:

```
class-map type mitigation match-any MIT_CLASS
  match primitive block
  match primitive redirect
  match priority 2
  match priority 3
```

The above configuration could be configured with a match-all rule if either the block or redirect primitive is removed.

General TMS Rules Engine Troubleshooting

The Rules Engine configuration can be verified by entering the **show tms consumer** and **show tms controller** commands. If the enforcement action is not applied, you can enable the **debug tms consumer feature-interface** command to print error messages to help determine if the correct feature interface is called (ACL or OER).

What to Do Next

In this task, the TMS Rules Engine was configured to override a threat enforcement action on the consumer. Proceed to the next section to see information on excluding a device from TMS control.

Configuring Local Device Exceptions on a Consumer

This task is optional. The steps in this task show how to configure local device exceptions. Local device exceptions are configured on TMS consumers only. A local device exception is an override configured for a specific host IP address or network. The TMS consumer negates a mitigation enforcement action sent from the controller or from a mitigation type service policy configured on the consumer.

For example, traffic from the 192.168.1.0/24 network is considered to be suspect. So, an ACL drop enforcement action is configured for all traffic sourced from this network. However, a device with a host address in this range (192.168.1.55) needs to transit over a specific consumer. A local device exception is configured on the consumer to override ACL drop enforcement action.

A host IP address (or any other subset of the network) is defined in an extended access list and then referenced by the **exception access-group** command. The **tms-class** command is configured to associate an interface with the device exception. The enforcement action configured on the controller is not applied to traffic that is permitted by the access list.

Prerequisites

- TIDP and TMS is operational on the controller and all consumers.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list** {**standard** | **extended**} [*access-list-name* | *access-list-number*]
4. [*sequence-number*] **permit** | **deny protocol** *source source-wildcard destination destination-wildcard* [**option** *option-value*] [**precedence** *precedence*] [**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
5. **exit**
6. **interface** {*type* | *number*}
7. **ip access-group** {*access-list-number* | *access-list-name*} {**in** | **out**}
8. **tms-class**
9. **exit**
10. **tms consumer**
11. **exception access-group** {*extended-acl*}
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip access-list { standard extended } [<i>access-list-name</i> <i>access-list-number</i>] Example: Router(config)# ip access-list extended NAMEDACL	Specifies the IP access list type, and enters the corresponding access list configuration mode. <ul style="list-style-type: none"> A named or numbered extended access list must be configured in this step.
Step 4	[<i>sequence-number</i>] permit deny protocol source <i>source-wildcard destination</i> <i>destination-wildcard</i> [option <i>option-value</i>] [precedence <i>precedence</i>] [tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] Example: Router(config-ext-nacl)# permit tcp host 192.168.1.55 any	Defines the criteria for which the access list will permit or deny packets. <ul style="list-style-type: none"> A host IP address or any subset of the network can be configured.
Step 5	exit Example: Router(config-ext-nacl)# exit	Exits named access list configuration mode, and enters global configuration mode.
Step 6	interface { <i>type</i> <i>number</i> } Example: Router(config)# interface Ethernet 0/0	Enters interface configuration mode to configure an interface.
Step 7	ip access-group { <i>access-list-number</i> <i>access-list-name</i> } { in out } Example: Router(config-if)# ip access-group NAMED_ACL in	Applies an access list to the interface.
Step 8	tms-class Example: Router(config-if)# tms-class	Associates the interface with the device exception.
Step 9	exit Example: Router(config-if)# exit	Exits interface configuration mode, and enters global configuration mode.

	Command or Action	Purpose
Step 10	tms consumer Example: Router(config)# tms consumer	Enters TMS consumer configuration mode to configure a consumer.
Step 11	exception access-group {named-acl} Example: Router(cfg-tms-cons)# exception access-group NAMED_ACL	Defines the extended access list as the source criteria for the device exception under the global TMS consumer process.
Step 12	end Example: Router(cfg-tms-cons)# end	Exits TMS consumer configuration mode, and enters privileged EXEC mode.

Examples

The following example, starting in global configuration mode, configures an device exception for the 192.168.1.55 host address:

```
Router(config)# ip access-list extended NAMED_ACL
Router(config-ext-nacl)# permit tcp host 192.168.1.55 any
Router(config-ext-nacl)# exit
Router(config)# interface Ethernet 0/0
Router(config-if)# ip access-group NAMED_ACL in
Router(config-if)# tms-class
Router(config-if)# exit
Router(config)# tms consumer
Router(cfg-tms-cons)# exception access-group NAMED_ACL
Router(cfg-tms-cons)# service-policy type tms TMS_POL_1
Router(cfg-tms-cons)# end
```

Troubleshooting Tips

If the interface is operational and the device exception is properly configured, you can enable the **debug tms consumer feature-interface** command to print error messages to help determine if the correct feature interface is called (ACL or OER).

What to Do Next

At completion of this task, all procedures related to TMS configuration and management have been completed. Proceed to the following sections to see information about using TMS **clear**, **show**, and **debug** commands.

Clearing Threat Information Messages on a Consumer

This task is optional. This task shows how to clear threat information messages on a TMS consumer. The **clear tms consumer group** command is entered in privileged EXEC mode. Entering this command on a consumer has an effect similar to entering the **tms controller reset** command from the TMS controller.

SUMMARY STEPS

1. **enable**
2. **clear tms consumer group** {*group-id* | **all**} **owner** {*owner-id* | **any**} **tid** {*threat-id* [- *number*] | **all**}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	clear tms consumer group { <i>group-id</i> all } owner { <i>owner-id</i> any } tid { <i>threat-id</i> [- <i>number</i>] all } Example: Router# clear tms consumer group all owner any tid all	Clears threat information messages on a TMS consumer.

Examples

The following example clears all threat information messages:

```
Router# clear tms consumer group all owner any tid all
```

Troubleshooting Tips

The **show tms controller** and **show tms consumer** commands can be entered to verify that the clear command was successful.

What to Do Next

Proceed to the next section to see information on verifying TMS configuration.

Verifying TMS Configuration and Threat Status on a Controller or Consumer

This task is optional. This task shows how to verify TMS configuration on a controller or consumer using TMS show commands. All commands described in this section are entered in privileged EXEC mode.

SUMMARY STEPS

1. **enable**
2. **show tms consumer**
3. **show tms consumer group** {*group-id* [**owner** {*owner-id* | **any**}] **tid** {*threat-id* | **all**} [**controller** *ipv4 ip-address*] [**verbose**] | **threats**] | **all** **owner** {*owner-id* | **any**} **tid** {*threat-id* | **all**} [**controller** *ipv4 ip-address*] [**verbose**]}

4. **show tms controller**
5. **show tms controller group** {group-id [owner {owner-id | any}] tid {threat-id | all} [controller ipv4 ip-address] [verbose] | threats] | all owner {owner-id | any} tid {threat-id | all} [controller ipv4 ip-address] [verbose]}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show tms consumer Example: Router# show tms consumer	Displays information about TMS consumer registration, TIDP membership, and TMS controllers.
Step 3	show tms consumer group {group-id [owner {owner-id any}] tid {threat-id all} [consumer ipv4 ip-address] [verbose] threats] all owner {owner-id any} tid {threat-id all} [controller ipv4 ip-address] [verbose]} Example: Router# show tms consumer group all owner any tid all verbose	Displays information about threats sent to the specified consumer groups.
Step 4	show tms controller Example: Router# show tms controller	Displays information about TMS consumer registration and TIDP membership.
Step 5	show tms controller group {group-id [owner {owner-id any}] tid {threat-id all} [controller ipv4 ip-address] [verbose] threats] all owner {owner-id any} tid {threat-id all} [controller ipv4 ip-address] [verbose]} Example: Router# show tms controller group 10	Displays information about TMS controller groups.

Examples

show tms consumer example

The following example is sample output from the **show tms consumer** command:

```
Router# show tms consumer

TMS Interface details
Interface      Edge      SubDeviceClass
-----      -

```

```

Fa0/0
Fa0/1    Edge

TIDP-Group    TMS-Controller-IP    Status
-----
10            10.11.11.55                Registered Successfully
20            10.11.11.55                Registered Successfully

```

show tms consumer group examples

The following is sample output from the **show tms consumer group** command.

```
Router# show tms consumer group all owner any tid all verbose
```

OwnerID	TID	Ver	Group	Controller	Status	ActionTaken
1	1	1	10	10.1.1.1	Active	Redirect 172.16.1.1
1	2	1	10	10.1.1.1	Active	Redirect NULL
1	3	1	10	10.1.1.1	Inactive	Threat Inactive
2	10	1	10	10.1.1.1	Active	ACL-Drop
2	20	1	10	10.1.1.1	Active	ACL-Drop

The following example is sample output from the **show tms consumer group** command entered with the **threats** keyword:

```
Router# show tms consumer group 10 threats
```

```
TIDP Group 10
Number of Threats : 13
```

```

#sh tms controller group 10 threats
TIDP Group 10 ptr 656C4848
Number of Threats : 1
OwnerID    TID    Ver    State
-----
1          10     1      Active

```

show tms controller example

The following is sample output from the **show tms controller** command:

```
Router# show tms controller
```

TIDP-Group	TMS-Consumer-IP	Status
10	10.3.3.2	Registered Successfully
10	10.1.1.2	Registered Successfully
20	10.3.3.2	Registered Successfully
20	10.1.1.2	Registered Successfully

show tms controller group example

The following is sample output from the **show tms controller group** command:

```
Router# show tms controller group 10
```

```

TMS-Controller# show tms controller group all owner any tid all verbose
OwnerID    TID    Ver    Group    Consumer    Status    ActionTaken
-----

```

1	1	1			Load	Active	
1	1	1	10	10.1.1.2		Active	Redirect 172.16.1.1
1	2	1			Load	Active	
1	2	1	10	10.1.1.2		Active	Redirect NULL
1	3	1			Load	Active	
1	3	1	10	10.1.1.2		Inactive	Threat Inactive
2	10	1			Load	Active	
2	10	1	10	10.1.1.2		Active	ACL-Drop
2	20	1			Load	Active	
2	20	1	10	10.1.1.2		Active	ACL-Drop

What to Do Next

Proceed to the next section to see information on enabling TMS debug messages.

Enabling TMS Debug Messages on a Controller or Consumer

This task shows how to enable TMS debugging on a controller or consumer. All commands described in this section are entered in privileged EXEC mode.

Restrictions

These commands should be used with caution on a production router or networking device. We recommend that debugging is enabled for only individual components as necessary. This restriction is intended to prevent the console session from be overwhelmed by large numbers of messages.

SUMMARY STEPS

1. **enable**
2. **debug tms consumer { all | errors [details] | events [details] | feature-interface | packet | protocol | xml [detail | error] }**
3. **debug tms controller { all | errors [details] | events [details] | feature-interface | packet | protocol | xml [detail | error] }**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	debug tms consumer {all errors [details] events [details] feature-interface packet protocol xml [detail error]} Example: Router# debug tms consumer all	Enables the generation of debugging messages on a TMS consumer.
Step 3	debug tms controller {all errors [details] events [details] feature-interface packet protocol xml [detail error]} Example: Router# debug tms controller xml detail	Enables the generation of debugging messages on a TMS controller.

Examples

Consumer Event Debugging Example

The following is sample output from the **debug tms consumer** command entered with the **events** keyword:

```
Router# debug tms consumer events
```

```
TMS consumer event debugging is on
*Feb 27 21:27:18: TMS_EVE_CO:start timer Controller=10.1.1.1 period=180
*Feb 27 21:27:18: TMS_EVE:Posting a message for the service layer
*Feb 27 21:27:18: TMS_EVE_CO:Processing Reg message from ctrl=10.1.1.1 group=10
*Feb 27 21:27:18: TMS_EVE_CO:Processing Reg response from ctrl=10.1.1.1 group=10
*Feb 27 21:27:18: TMS_EVE_CO:start timer Controller=10.1.1.1 period=120
```

Consumer Feature-Interface Debugging Example

The following is sample output from the **debug tms consumer** command entered with the **feature-interface** keyword:

```
Router# debug tms consumer feature-interface
```

```
TMS consumer feature-interface debugging is on
*Feb 27 21:28:12: TMS_FI_CO:OER:Policy Add client 2 pol id 12 tag 5000 nxthop 172.16.1.1
*Feb 27 21:28:12: TMS_FI_CO:OERCB:ctx C type 2 values 0
*Feb 27 21:28:12: TMS_FI_CO:OERCB:return code rcvd rc 1
*Feb 27 21:28:12: TMS_FI_CO:OERCB:Threat (1, 1, 1) grpId 10 ctrlIp 10.1.1.1 statflags 0
pol state 1
*Feb 27 21:28:12: TMS_FI_CO:OERCB:Prefix create client 2 id 12 src 0.0.0.0 0.0.0.0 dst
192.168.8.0 255.255.255.0 proto 6 0 - 0, 10 - 2000 grant TRUE exact TRUE
*Feb 27 21:28:12: TMS_FI_CO:OERCB:ctx C type 2 values 0
*Feb 27 21:28:12: TMS_FI_CO:OERCB:return code rcvd rc 1
```

```
*Feb 27 21:28:12: TMS_FI_CO:OERCB:Threat (1, 1, 1) grpId 10 ctrlIp 10.1.1.1 statFlags 0
pol state 3
*Feb 27 21:28:12: TMS_FI_CO:OERCB:Prefix create success with rc = 1
*Feb 27 21:28:13: TMS_FI_CO:ACL:CB3: acl 66886028 item 669C9F98 type 3 ADD
*Feb 27 21:28:13: TMS_FI_CO:ACL:CB1: acl 66886028 modified.
*Feb 27 21:28:13: TMS_FI_CO:ACL:CB3: acl 66886098 item 669CA0E0 type 3 ADD
*Feb 27 21:28:13: TMS_FI_CO:ACL:CB1: acl 66886098 modified.
```

Consumer Packet Debugging Example

The following is sample output from the **debug tms consumer** command entered with the **packet** keyword:

```
Router# debug tms consumer packet
```

```
TMS consumer packets debugging is on
*Feb 27 00:00:38: TMSCONS:out:Type(6)HeartBeat Req trans-id 15698 len 16
*Feb 27 00:00:38:   tms_flags 8 msg_flags 0 reason 0
*Feb 27 00:00:38:   TLVs:
*Feb 27 00:00:38: TMSCONS:in:Type(6)HeartBeat Req trans-id 158 len 16
*Feb 27 00:00:38:   tms_flags 0 msg_flags 0 reason 0
*Feb 27 00:00:38:   TLVs:
```

Consumer Protocol Debugging Example

The following is sample output from the **debug tms consumer** command entered with the **protocol** keyword:

```
Router# debug tms consumer protocol
```

```
TMS consumer protocol debugging is on
*Feb 27 21:27:18: TMS_PRO_CO:Sending RegReq ctrl=10.1.1.1 group=10
*Feb 27 21:27:18: TMS_PRO_CO:RegResp recvd controller 10.1.1.1 group 10
*Feb 27 21:27:18: TMS_PRO_CO:Sending Resync request for ctrl=10.1.1.1 group=10
*Feb 27 21:27:18: TMS_PRO_CO:Resync response recvd controller 10.1.1.1, group 10
*Feb 27 21:27:18: TMS_PRO_CO:Processing Resync response from Controller=10.1.1.1on
Group=10
*Feb 27 21:28:12: TMS_PRO_CO:Threat msg recvd controller 10.1.1.1, Group 10
*Feb 27 21:28:12: TMS_PRO_CO:Processing Threat request from Controller=10.1.1.1on Group=10
*Feb 27 21:28:12: TMS_PRO_CO:msg:NewThreat (1,1,1) in grp 10 ctrl 10.1.1.1
*Feb 27 21:28:58: TMS_PRO_CO:Heartbeat msg recvd controller 10.1.1.1, Group 10
```

Controller Event Debugging Example

The following is sample output from the **debug tms controller** command entered with the **events** keyword:

```
Router# debug tms controller events
```

```
TMS controller events debugging is on
*Feb 27 10:12:42: TMS_EVE_CN:Timer expired group=10
*Feb 27 10:12:42: TMS_EVE_CN:Start timer: Group=10, period=120
*Feb 27 10:12:42: TMS_EVE_CN:Posting a message for the service layer
*Feb 27 10:12:42: TMS_EVE_CN:Data packet recvd from DL layer
*Feb 27 10:13:34: TMS_EVE_CN:Posting a message for the service layer
*Feb 27 10:13:34: TMS_EVE_CN:Data packet recvd from DL layer
*Feb 27 10:13:34: TMS_EVE_CN:Start timer: Group=10, period=120
*Feb 27 10:13:34: TMS_EVE_CN:Posting a message for the service layer
*Feb 27 10:13:34: TMS_EVE_CN:Data packet recvd from DL layer
```

Controller Packet Debugging Example

The following is sample output from the **debug tms controller** command entered with the **packet** keyword:

```
Router# debug tms controller packet

TMS controller packets debugging is on
TMS controller packets debugging is on
*Feb 27 10:13:34: TMSCTRL:in:Type(1)Registration Req trans-id 15685 len 16
*Feb 27 10:13:34:   tms_flags 8 msg_flags 1 reason 0
*Feb 27 10:13:34:   TLVs:
*Feb 27 10:13:34: TMSCTRL:out:Type(1)Registration Resp trans-id 15685 len 16
*Feb 27 10:13:34:   tms_flags 1 msg_flags 1 reason 1
*Feb 27 10:13:34:   TLVs:
*Feb 27 10:13:34: TMSCTRL:in:Type(4)Resync/Audit Req trans-id 15686 len 16
*Feb 27 10:13:34:   tms_flags 8 msg_flags 1 reason 0
*Feb 27 10:13:34:   TLVs:
*Feb 27 10:13:34: TMSCTRL:out:Type(4)Resync/Audit Resp trans-id 15686 len 24
*Feb 27 10:13:34:   tms_flags 1 msg_flags 0 reason 0
*Feb 27 10:13:34:   TLVs: Summary(514,8)
```

Controller Protocol Debugging Example

The following is sample output from the **debug tms controller** command entered with the **protocol** keyword:

```
Router# debug tms controller protocol

TMS controller protocol debugging is on
*Feb 27 10:13:34: TMS_PRO_CN:Registration request recvd consumer 10.1.1.2, group 10
*Feb 27 10:13:34: TMS_PRO_CN:Sending Reg resp to cons=10.1.1.2 group=10
*Feb 27 10:13:34: TMS_PRO_CN:Resync request recvd consumer 10.1.1.2, group 10
*Feb 27 10:13:34: TMS_PRO_CN:Received Resync Req Group=10
*Feb 27 10:13:34: TMS_PRO_CN:Sending Resync resp for cons=10.1.1.2 group=10 ntids=0
```

XML Debugging Example

The following is sample output from the **debug tms controller** command entered with the **xml** keyword:

```
Router# debug tms controller xml

TMS controller xml debugs debugging is on
*Feb 27 10:13:45: TMS_XML_CN:Found tag threat in threat file
*Feb 27 10:13:45: TMS_XML_CN:Found tag threat_info in threat file
*Feb 27 10:13:45: TMS_XML_CN:Found tag primitive in threat file
*Feb 27 10:13:45: TMS_XML_CN:Found tag parameter in threat file
*Feb 27 10:13:45: TMS_XML_CN:Found tag tcdf in threat file
*Feb 27 10:13:45: TMS_XML_CN:Found tag threat in threat file

```

What to Do Next

Proceed to the next section to see complete TMS configuration examples.

Configuration Examples for TMS

This section provides the following configuration examples:

- [Controller: TMS Configuration Example, page 59](#)
- [Consumer: TMS Configuration Example, page 60](#)
- [Consumer: TMS Rules Engine Configuration Example, page 61](#)

Controller: TMS Configuration Example

The following example, starting in global configuration mode, configures a TMS type parameter map:

```
Router(config)# parameter-map type tms TMS_PAR_1
Router(config-profile)# logging tms events
Router(config-profile)# heartbeat retry interval 60
Router(config-profile)# heartbeat retry count 3
Router(config-profile)# message retry interval 15
Router(config-profile)# message retry count 5
Router(config-profile)# exit
```

TMS groups 10 through 20 and group 30 are configured as a TMS traffic class:

```
Router(config)# class-map type tms TMS_CLASS_1
Router(config-cmap)# match tidp group 10 - 20
Router(config-cmap)# match tidp group 30
Router(config-cmap)# exit
```

TMS type class and parameter maps are attached to a TMS type policy map:

```
Router(config)# policy-map type control tms TMS_POL_1
Router(config-pmap)# class TMS_CLASS_1
Router(config-pmap-c)# mitigation TMS_PAR_1
Router(config-pmap-c)# end
```

A global TMS controller process is created and a policy map (TMS type service policy) is attached:

```
Router(config)# tms controller
Router(cfg-tms-ctrl)# service-policy type tms TMS_POL_1
Router(cfg-tms-ctrl)# end
```

Consumer: TMS Configuration Example

The following example, starting in global configuration mode, configures a TMS type parameter map:

```
Router(config)# parameter-map type tms TMS_PAR_2
Router(config-profile)# controller ipv4 10.1.1.1
Router(config-profile)# logging tms events
Router(config-profile)# registration retry count 5
Router(config-profile)# registration retry interval 60
Router(config-profile)# exit
```

TMS groups 10 through 20 and group 30 are configured as a TMS traffic class:

```
Router(config)# class-map type tms TMS_CLASS_2
Router(config-cmap)# match tidp group 10 - 20
Router(config-cmap)# match tidp group 30
Router(config-cmap)# exit
```

TMS type class and parameter maps are attached to a TMS type policy map:

```
Router(config)# policy-map type control tms TMS_POL_2
Router(config-pmap)# class TMS_CLASS_2
Router(config-pmap-c)# mitigation TMS_PAR_2
Router(config-pmap-c)# end
```

A global TMS consumer process is created and a policy map (TMS type service policy) is attached. A local device exception is configured for the 192.168.1.55 host.

```
Router(config)# ip access-list extended NAMED_ACL
Router(config-ext-nacl)# permit tcp host 192.168.1.55 any
Router(config-ext-nacl)# exit
Router(config)# interface Ethernet 0/0
Router(config-if)# ip access-group NAMED_ACL in
Router(config-if)# tms-class
```

```
Router(config-if)# exit
Router(config)# tms consumer
Router(cfg-tms-cons)# exception access-group NAMED_ACL
Router(cfg-tms-cons)# service-policy type tms TMS_POL_2
Router(cfg-tms-cons)# end
```

Consumer: TMS Rules Engine Configuration Example

The following example, starting in global configuration mode, creates a TMS Rules Engine configuration and activates it under the global TMS consumer process.

The priority 1 block traffic is defined as a traffic class:

```
Router(config)# class-map type mitigation MIT_CLASS_3
Router(config-cmap)# match primitive block
Router(config-cmap)# match priority 1
Router(config-cmap)# exit
```

The next-hop variable is defined in a mitigation type parameter map:

```
Router(config)# parameter-map type mitigation MIT_PAR_3
Router(config-profile)# variable COLLECTION ipv4 192.168.1.1
Router(config-profile)# exit
```

The mitigation type policy map is configured to bind the class and parameter maps. A redirect mitigation action is also configured in this policy map:

```
Router(config)# policy-map type control mitigation MIT_POL_3
Router(config-pmap)# class MIT_CLASS_3
Router(config-pmap-c)# redirect route
Router(config-pmap-c)# source parameter MIT_PAR_3
Router(config-pmap-c)# exit
Router(config-pmap)# exit
```

The mitigation service policy (TMS Rules Engine configuration) is attached to a TMS type policy map:

```
Router(config)# policy-map type control tms TMS_POL_2
Router(config-pmap)# class TMS_CLASS_1
Router(config-pmap-c)# mitigation TMS_PAR_2
Router(config-pmap-c)# service-policy MIT_POL_3
Router(config-pmap-c)# exit
Router(config-pmap)# exit
```

The TMS type policy map is attached to a global consumer process, activating the mitigation type service policy:

```
Router(config)# tms consumer
Router(config-cons)# service-policy type tms TMS_POL_2
Router(config-cons)# end
```

Command Reference

The following commands are introduced or modified in the feature or features

- **acl drop**
- **class-map type mitigation**
- **class-map type tms**
- **clear tms consumer group**
- **controller (TMS)**
- **debug tms consumer**
- **debug tms controller**
- **exception access-group**
- **heartbeat retry count**
- **heartbeat retry interval**
- **identifier**
- **ignore (TMS)**
- **logging tms events**
- **match primitive**
- **match priority**
- **match tidp-group**
- **message retry count**
- **message retry interval**
- **mitigation**
- **parameter-map type mitigation**
- **parameter-map type tms**
- **policy-map type control mitigation**
- **policy-map type control tms**
- **redirect route**
- **registration retry count**
- **registration retry interval**
- **show tms consumer**
- **show tms consumer group**
- **show tms controller**
- **show tms controller group**
- **service-policy type tms**
- **source parameter**
- **tms consumer**
- **tms consumer deregister**
- **tms consumer register**

- **tms consumer resync**
- **tms controller**
- **tms controller deregister**
- **tms controller load threat**
- **tms controller reset**
- **tms controller send**
- **tms controller status**
- **tms controller unload**
- **tms-class**
- **variable**

For information about these commands, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html.

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

Feature Information for TMS

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 1 Feature Information for TMS

TIDP Based Mitigation Services	12.4(6)T	TMS was introduced. TMS provides the framework to rapidly and efficiently distribute threat information to devices across the network. The TMS framework transports messages that contain specific threat information about suspect traffic and associated mitigation enforcement actions to all devices in the network.

Tag and Template

First Published: February 27, 2006

Last Updated: February 27, 2006

The Tag and Template feature allows network administrators to define enforcement policies on a local device and have a RADIUS server specify the policy selector to be enforced. This feature can be applied to a Network Admission Control (NAC) architecture.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Tag and Template](#)” section on page 11.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Prerequisites for Tag and Template

- You must have a Cisco IOS image that supports the Modular Quality of Service (QoS) command-line interface (CLI).

Requirements for Tag and Template

- To apply the enforcement policies, the identity policy and access groups that are associated with the identity policy have to be configured for Tag and Template.

Information About Tag and Template

Before configuring Tag and Template, you should understand the following concepts:

- [Tag and Template Overview, page 2](#)

Tag and Template Overview

In a typical Network Admission Control deployment, an access control server (ACS) or a RADIUS server is used for validating the user posture information and for applying the policies on the network access device (NAD). A centralized ACS can be used to support multiple NADs. This solution has inherent problems associated with it, namely:

- Version control of policies. Typically, a specific NAD that is running a Cisco IOS image may support some ACLs, and another NAD may support a different version. Managing different versions can be a problem.
- Users connect on different interfaces to the NAD, and on the basis of the interface type, the policies that can be applied to the user can change, and the NAD can determine the policies to be applied. In the current architecture, the ACS sends the same set of policies to all the NADs when a profile is matched, which does not give enough control to the administrator to configure the policies on the basis of the NAD configuration.

To overcome the above problems, the Tag and Template concept has been introduced. The concept is that the ACS maps users to specific groups and associates a tag with them. For example, the Usergroup1 user group may have a tag with the name “usergroup1.” When the NAD queries the ACS for the policies, the ACS can return the tag that is associated with the user group. When this tag is received at the NAD, the NAD can map the tag to a specific template that can have a set of policies that are associated with the user group. This mapping provides administrators with the flexibility to configure the template on a NAD basis, and the policies can change from NAD to NAD even though the tag is the same.

In summary, a template must be configured on the NAD, and the template must be associated with a tag. When the ACS sends the policies back to the NAD, the template that matches the tag that was received from the ACS is used.

How to Configure Tag and Template

This section includes the following procedures:

- [Defining a Class Map for a Specific Type and Associating Match Conditions with It, page 3](#)

- [Associating the Class Map with the Policy Map and Applying Actions for Classes That Match, page 4](#)
- [Associating the Service Policy with a Specific IP Admission Rule, page 5](#)
- [Monitoring the Template Configuration, page 6](#)
- [Verifying the Template Configuration, page 7](#)

Defining a Class Map for a Specific Type and Associating Match Conditions with It

To define a class map and associate match conditions with it, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type tag [match-all | match-any] *class-map-name***
4. **match port-type {routed | switched}**
5. **match tag *tag-name***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	class-map type tag [match-all match-any] <i>class-map-name</i> Example: Router (config)# class-map tag match-all group1_class	Creates a class map to be used for matching packets to a specified class and enters class-map configuration mode.
Step 4	match port-type {routed switched} Example: Router (config-cmap)# match port-type routed	Matches the access policy on the basis of the port for a class map.
Step 5	match tag tag-name Example: Router (config-cmap)# match tag group1_class	Specifies the tag to be matched for a tag type of class map.

What to Do Next

Associate the class map with the policy map and apply actions for classes that match.

Associating the Class Map with the Policy Map and Applying Actions for Classes That Match

To associate the class map with the policy map and apply actions for classes that match, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type control tag policy-map-name**
4. **class type tag {class-name} [insert-before {class-name}]**
5. **identity policy policy-name**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	policy-map type control tag <i>policy-map-name</i> Example: Router (config)# policy-map type control tag usergroup1_pmap	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy and enters policy-map configuration mode.
Step 4	class type tag { <i>class-name</i> } [insert-before { <i>class-name</i> }] Example: Router (config-pmap)# class type tag usergroup1_class	Associates a class map with a policy map.
Step 5	identity policy <i>policy-name</i> Example: Router (config-pmap)# identity policy usergroup1_iden_policy	Associates an identity policy with the class map.

What to Do Next

Associate the service policy with a specific IP admission table.

Associating the Service Policy with a Specific IP Admission Rule

The policy map defined above can be associated with an IP authentication proxy or IP admission rule. To associate the map with the IP authentication proxy or IP admission rule, perform the following steps.

Note

There can be multiple policy maps, and each one can be associated with a different IP admission rule even though an IP admission rule can have only one instance of the policy map.

SUMMARY STEPS

- enable**
- configure terminal**
- ip admission name** *admission-name* [**eapoudp** | **proxy** {**ftp** | **http** | **telnet**} | **service-policy type tag** {*service-policy-name*}] [**list** {*acl* | *acl-name*}]

or

```
ip auth-proxy name auth-proxy-name {ftp | http | telnet} [inactivity-timer min] [absolute-timer min] [list {acl | acl-name}] [service-policy type tag {service-policy-name} ]
```

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	<pre>ip admission name <i>admission-name</i> [eapoudp proxy {ftp http telnet} service-policy type tag {<i>service-policy-name</i>}] [list {<i>acl</i> <i>acl-name</i>}]</pre> <p>or</p> <pre>ip auth-proxy name <i>auth-proxy-name</i> {ftp http telnet} [inactivity-timer <i>min</i>] [absolute-timer <i>min</i>] [list {<i>acl</i> <i>acl-name</i>}] [service-policy type tag {<i>service-policy-name</i>}]</pre> Example: Router (config)# ip admission name nac eapoudp service-policy type tag usergroup1_iden_policy or Router (config)# ip auth-proxy name nac eapoudp service-policy type tag usergroup1_iden_policy	Associates the policy map with an IP network admission control rule. <ul style="list-style-type: none"> The service policy name must be the same as the policy map name. <p>or</p> Associates the policy map with an authentication proxy rule.

Monitoring the Template Configuration

To monitor the template configuration, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **debug tag-template event**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
	Example: Router> enable	
Step 2	debug tag-template event	Displays the tag application on a session (an Authentication Proxy or Extensible Authentication Protocol over UDP [EAPoUDP] session).
	Example: Router# debug tag-template event	

Verifying the Template Configuration

To verify the template configuration, perform the following steps. The **show** commands can be used individually or together.

SUMMARY STEPS

1. **enable**
2. **show class-map type tag** *class-map-name*
3. **show epm session ip** { *ip-address* | **summary** }
4. **show policy-map type control tag** *type-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show class-map type tag class-map-name Example: Router# show class-map type tag map1	Displays all class maps and their matching criteria.
Step 3	show epm session ip {ip-address summary} Example: Router# show epm session ip 10.1.1.1	Displays whether tag policies or authentication, authorization, and accounting (AAA) policies are actually applied to a service policy application.
Step 4	show policy-map type control tag type-name Example: Router# show policy-map type control tag type1	Displays a template configuration when applying access policies on Layer 2 and Layer 3 interfaces.

Configuration Examples for Tag and Template

This section provides the following configuration example.

- [Typical Tag and Template Configuration: Example, page 8](#)

Typical Tag and Template Configuration: Example

In the following service policy (Tag and Template) example, tags named “healthy” and “non_healthy” can be received from an AAA server, the policy map is defined on the NAD, and the tag policy type is associated with the IP admission name “greentree.”

Class Map Definition for the “healthy class” Type Tag

```
Router (config)# class-map type tag healthy_class
Router(config-cmap)# match tag healthy
Router(config-cmap)# end
```

Class Map Definition for the “non_healthy_class” Type Tag

```
Router (config)# class-map type tag non_healthy_class
Router (config-cmap)# match tag non_healthy
Router (config-cmap)# end
```

Policy Map Is Defined

```
! The following line will be associated with the IP admission name.
Router (config)# policy-map type control tag global_class
! The following line refers to the class map that was defined above.
Router (config-pmap)# class healthy_class
Router (config-pmap-c)# identity policy healthy_policy
Router(config-pmap-c)# exit
```

The following line refers to the `non_healthy` class that was defined above.

```
Router (config-pmap)# class non_healthy_class
Router (config-pmap-c)# identity policy non_healthy_policy
Router (config-pmap-c)# end
```

Identity Policy Can Be Defined As Follows

```
Router (config)# identity policy healthy_policy
! The following line is the IP access list for healthy users.
Router (config-identity-policy)# access-group healthy
Router (config-identity-policy)# end
Router (config)# identity policy non_healthy_policy
Router (config-identity-policy)# access-group non_healthy
Router (config-identity-policy)# end
```

Access Lists Can Be Defined As Follows

```
Router (config)# ip access-list extended healthy_class
! The following line can be anything, but as an example, traffic is being allowed.
Router (config-ext-nacl)# permit ip any any
Router (config-ext-nacl)# end
Router (config)# ip access-list extended non_healthy_class
! The following line is only an example. In practical cases, you could prevent a user from
accessing specific networks.
Router (config-ext-nacl)# deny ip any any
Router (config-ext-nacl)# end
```

Policy Map That Was Defined Above Is Associated with the IP Admission Name

```
Router (config)# ip admission name greentree service-policy type tag global_class
! In the next line, the admission name can be associated with the interface.
Router (config)# interface fastethernet 1/0
Router (config-if)# ip admission greentree
```

In the above configuration, if the AAA server sends a tag named "healthy" or "non_healthy" for any host, the policies that are associated with the appropriate identity policy will be applied on the host.

Where to Go Next

The tag attribute must be configured in the RADIUS profile using the following Cisco attribute-value (AV) pair: `tag-name={tag string}`.

For information about configuring RADIUS AV pairs, see the subsection "Configuring Cisco AV Pairs" in the section "[Related Documents](#)."

Secure Infrastructure

AutoSecure

By using a single command-line interface (CLI), the AutoSecure feature allows a user to perform the following functions:

- Disable common IP services that can be exploited for network attacks
- Enable IP services and features that can aid in the defense of a network when under attack.

This feature also simplifies the security configuration of a router and hardens the router configuration.

Feature History for AutoSecure

Release	Modification
12.3(1)	This feature was introduced.
12.2(18)S	This feature was integrated into Cisco IOS Release 12.2(18)S.
12.3(8)T	Support for the roll-back functionality and system logging messages were added to Cisco IOS Release 12.3(8)T.
12.2(27)SBC	This feature was integrated into Cisco IOS Release 12.(27)SBC.

Finding Support Information for Platforms and Cisco IOS Software Images

Information About AutoSecure

To configure the AutoSecure feature, you should understand the following concepts:

- [Benefits of AutoSecure, page 2](#)
- [Secure Management Plane, page 3](#)
- [Secure Forwarding Plane, page 5](#)

Benefits of AutoSecure

Simplified Router Security Configuration

AutoSecure is valuable to customers without special Security Operations Applications because it allows them to quickly secure their network without thorough knowledge of all the Cisco IOS features.

This feature eliminates the complexity of securing a router by creating a new CLI that automates the configuration of security features and disables certain features enabled by default that could be exploited for security holes.

Enhanced Password Security

AutoSecure provides the following mechanisms to enhance security access to the router:

- The ability to configure a required minimum password length, which can eliminate common passwords that are prevalent on most networks, such as “lab” and “cisco.”

To configure a minimum password length, use the [security passwords min-length](#) command.

- Syslog messages are generated after the number of unsuccessful attempts exceeds the configured threshold.

To configure the number of allowable unsuccessful login attempts (the threshold rate), use the [security passwords min-length](#) command.

Roll-Back and System Logging Message Support

In Cisco IOS Release 12.3(8)T, support for roll-back of the AutoSecure configuration is introduced. Roll-back enables a router to revert back to its preautosecure configuration state if the AutoSecure configuration fails.

Note

Prior to Cisco IOS Release 12.3(8)T, roll-back of the AutoSecure configuration is unavailable; thus, you should always save the running configuration before configuring AutoSecure.

System Logging Messages capture any changes or tampering of the AutoSecure configuration that were applied on the running configuration. That is, more detailed audit trail information is provided when autosecure is executed.

Secure Management Plane

Securing the management plane is one of two focus areas for the AutoSecure feature. (The other focus area is described in the following section, “[Secure Forwarding Plane](#).”) Securing the management plane is done by turning off certain global and interface services that can be potentially exploited for security attacks and turning on global services that help mitigate the threat of attacks. Secure access and secure logging are also configured for the router.

**Caution**

If your device is managed by a network management (NM) application, securing the management plane could turn off some services like HTTP server and disrupt the NM application support.

The following subsections define how AutoSecure helps to secure the management plane:

- [Disable Global Services](#)
- [Disable Per Interface Services](#)
- [Enable Global Services](#)
- [Secure Access to the Router](#)
- [Log for Security](#)

Disable Global Services

After enabling this feature (via the [auto secure](#) command), the following global services will be disabled on the router without prompting the user:

- Finger—Collects information about the system (reconnaissance) before an attack. If enabled, the information can leave your device vulnerable to attacks.
- PAD—Enables all packet assembler and disassembler (PAD) commands and connections between PAD devices and access servers. If enabled, it can leave your device vulnerable to attacks.
- Small Servers—Causes TCP and User Datagram Protocol (UDP) diagnostic port attacks: a sender transmits a volume of fake requests for UDP diagnostic services on the router, consuming all CPU resources.
- Bootp Server—Bootp is an insecure protocol that can be exploited for an attack.
- HTTP Server—Without secure-http or authentication embedded in the HTTP server with an associated ACL, the HTTP server is insecure and can be exploited for an attack. (If you must enable the HTTP server, you will be prompted for the proper authentication or access list.)

**Note**

If you are using Security Device Manager (SDM), you must manually enable the HTTP server via the **ip http server** command.

- Identification Service—An unsecure protocol, defined in RFC 1413, that allows one to query a TCP port for identification. An attacker can access private information about the user from the ID server.
- CDP—If a large number of Cisco Discovery Protocol (CDP) packets are sent to the router, the available memory of the router can be consumed, causing the router to crash.

**Caution**

NM applications that use CDP to discover network topology will not be able to perform discovery.

- **NTP**—Without authentication or access-control, Network Time Protocol (NTP) is insecure and can be used by an attacker to send NTP packets to crash or overload the router. (If you want to turn on NTP, you must configure NTP authentication using Message Digest 5 (MD5) and the **ntp access-group** command. If NTP is enabled globally, disable it on all interfaces on which it is not needed.)
- **Source Routing**—Provided only for debugging purposes, so source routing should be disabled in all other cases. Otherwise, packets may slip away from some of the access control mechanisms that they should have gone through.

Disable Per Interface Services

After enabling this feature, the following per interface services will be disabled on the router without prompting the user:

- **ICMP redirects**—Disabled on all interfaces. Does not add a useful functionality to a correctly configured to network, but it could be used by attackers to exploit security holes.
- **ICMP unreachable**s—Disabled on all interfaces. Internet Control Management Protocol (ICMP) unreachable are a known cause for some ICMP-based denial of service (DoS) attacks.
- **ICMP mask reply** messages—Disabled on all interfaces. ICMP mask reply messages can give an attacker the subnet mask for a particular subnetwork in the internetwork.
- **Proxy-Arp**—Disabled on all interfaces. Proxy-Arp requests are a known cause for DoS attacks because the available bandwidth and resources of the router can be consumed in an attempt to respond to the repeated requests that are sent by an attacker.
- **Directed Broadcast**—Disabled on all interfaces. Potential cause of SMURF attacks for DoS.
- **Maintenance Operations Protocol (MOP) service**—Disabled on all interfaces.

Enable Global Services

After enabling this feature, the following global services will be enabled on the router without prompting the user:

- The **service password-encryption** command—Prevents passwords from being visible in the configuration.
- The **service tcp-keepalives-in** and **service tcp-keepalives-out** commands—Ensures that abnormally terminated TCP sessions are removed.

Secure Access to the Router

Caution

If your device is managed by an NM application, securing access to the router could turn off vital services and may disrupt the NM application support.

After enabling this feature, the following options in which to secure access to the router are available to the user:

- If a text banner does not exist, users will be prompted to add a banner. This feature provides the following sample banner:

Authorized access only

```
This system is the property of ABC Enterprise
Disconnect IMMEDIATELY if you are not an authorized user!
Contact abc@xyz.com +99 876 543210 for help.
```

- The login and password (preferably a secret password, if supported) are configured on the console, AUX, vty, and tty lines. The **transport input** and **transport output** commands are also configured on all of these lines. (Telnet and secure shell (SSH) are the only valid transport methods.) The **exec-timeout** command is configured on the console and AUX as 10.
- When the image on the device is a crypto image, AutoSecure enables SSH and secure copy (SCP) for access and file transfer to and from the router. The **timeout seconds** and **authentication-retries integer** options for the **ip ssh** command are configured to a minimum number. (Telnet and FTP are not affected by this operation and remain operational.)
- If the AutoSecure user specifies that their device does not use Simple Network Management Protocol (SNMP), one of the following functionalities will occur:
 - In interactive mode, the user is asked whether to disable SNMP regardless of the values of the community strings, which act like passwords to regulate access to the agent on the router.
 - In non-interact mode, SNMP will be disabled if the community string is “public” or “private.”

**Note**

After AutoSecure has been enabled, tools that use SNMP to monitor or configure a device will be unable to communicate with the device via SNMP.

- If authentication, authorization, and accounting (AAA) is not configured, configure local AAA. AutoSecure will prompt users to configure a local username and password on the router.

Log for Security

After this feature is enabled, the following logging options, which allow you to identify and respond to security incidents, are available:

- Sequence numbers and time stamps for all debug and log messages. This option is useful when auditing logging messages.
- Logging messages can be generated for login-related events; for example, the message “Blocking Period when Login Attack Detected” will be displayed when a login attack is detected and the router enters “quiet mode.” (Quiet mode means that the router will not allow any login attempts via Telnet, HTTP, or SSH.)

For more information on login system messages, see the Cisco IOS Release 12.3(4)T feature module *Cisco IOS Login Enhancements*.

- The **logging console critical** command, which sends system logging (syslog) messages to all available TTY lines and limits messages based on severity.
- The **logging buffered** command, which copies logging messages to an internal buffer and limits messages logged to the buffer based on severity.
- The **logging trap debugging** command, which allows all commands with a severity higher than debugging to be sent to the logging server.

Secure Forwarding Plane

To minimize the risk of attacks on the router forward plane, AutoSecure provides the following functions:

- Cisco Express Forwarding (CEF)—AutoSecure enables CEF or distributed CEF (dCEF) on the router whenever possible. Because there is no need to build cache entries when traffic starts arriving for new destinations, CEF behaves more predictably than other modes when presented with large volumes of traffic addressed to many destinations. Thus, routers configured for CEF perform better under SYN attacks than routers using the traditional cache.

Note CEF consumes more memory than a traditional cache.

- If the TCP intercept feature is available, it can be configured on the router for connection timeout.
- If strict Unicast Reverse Path Forwarding (uRPF) is available, it can be configured on the router to help mitigate problems that are caused by the introduction of forged (spoofed) IP source addresses. uRPF discards IP packets that lack a verifiable IP source address.
- If the router is being used as a firewall, it can be configured for context-based access control (CBAC) on public interfaces that are facing the Internet.

Note At the beginning of the AutoSecure dialogue, you will be prompted for a list of public interfaces.

How to Configure AutoSecure

This section contains the following procedures:

- [Configuring AutoSecure, page 6](#) (required)
- [Configuring Additional Security, page 7](#) (required)
- [Verifying AutoSecure, page 8](#) (optional)

Configuring AutoSecure

To configure AutoSecure, you must perform the following tasks.

The auto secure Command

The **auto secure** command takes you through a semi-interactive session (also known as the AutoSecure dialogue) to secure the management and forwarding planes. This command gives you the option to secure just the management or the forwarding plane; if neither option is selected, the dialogue will ask you to configure both planes.

This command also allows you to go through all noninteractive configuration portions of the dialogue before the interactive portions. The noninteractive portions of the dialogue can be enabled by selecting the optional **no-interact** keyword.

Caution

Although the **auto secure** command helps to secure a router, it does not guarantee the complete security of the router.

Restrictions

The AutoSecure configuration can be configured at run time or setup time. If any related configuration is modified after AutoSecure has been enabled, the AutoSecure configuration may not be fully effective.

SUMMARY STEPS

1. **enable**
2. **auto secure** [**management** | **forwarding**] [**no-interact** | **full**] [**ntp** | **login** | **ssh** | **firewall** | **tcp-intercept**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	auto secure [management forwarding] [no-interact full] [ntp login ssh firewall tcp-intercept] Example: Router# auto secure	Secures the management and forwarding planes of the router. <ul style="list-style-type: none"> • management—Only the management plane will be secured. • forwarding—Only the forwarding plane will be secured. • no-interact—The user will not be prompted for any interactive configurations. • full—The user will be prompted for all interactive questions. This is the default.

Configuring Additional Security

To enable enhanced security access to your router, perform the following steps:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **security passwords min-length** *length*
4. **enable password** {*password* | [*encryption-type*] *encrypted-password*}
5. **security authentication failure rate** *threshold-rate* **log**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	security passwords min-length length Example: Router(config)# security passwords min-length 6	Ensures that all configured passwords are at least a specified length. <ul style="list-style-type: none"> <i>length</i>—Minimum length of a configured password.
Step 4	enable password {password [encryption-type] encrypted-password} Example: Router(config)# enable password elephant	Sets a local password to control access to various privilege levels.
Step 5	security authentication failure rate threshold-rate log Example: Router(config)# security authentication failure rate 10 log	Configures the number of allowable unsuccessful login attempts. <ul style="list-style-type: none"> <i>threshold-rate</i>—Number of allowable unsuccessful login attempts. log—Syslog authentication failures if the rate exceeds the threshold.

Verifying AutoSecure

To verify that the AutoSecure feature is working successfully, perform the following optional steps:

SUMMARY STEPS

1. **enable**
2. **show auto secure config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables higher privilege levels, such as privileged EXEC mode.
	Example: Router> enable	Enter your password if prompted.
Step 2	show auto secure config	(Optional) Displays all configuration commands that have been added as part of the AutoSecure configuration.
	Example: Router# show auto secure config	

Configuration Examples for AutoSecure

This section provides the following configuration example:

- [AutoSecure Configuration Dialogue: Example, page 9](#)

AutoSecure Configuration Dialogue: Example

The following example is a sample AutoSecure dialogue. After you enable the **auto secure** command, the feature will automatically prompt you with a similar dialogue unless you enable the **no-interact** keyword. (For information on which features are disabled and which features are enabled, see the sections, “[Secure Management Plane](#)” and “[Secure Forwarding Plane](#)” earlier in this document.)

```
Router# auto secure
--- AutoSecure Configuration ---

*** AutoSecure configuration enhances the security of the router but it will not make
router absolutely secure from all security attacks ***

All the configuration done as part of AutoSecure will be shown here. For more details of
why and how this configuration is useful, and any possible side effects, please refer to
Cisco documentation of AutoSecure.
At any prompt you may enter '?' for help.
Use ctrl-c to abort this session at any prompt.

Gathering information about the router for AutoSecure

Is this router connected to internet? [no]:y
Enter the number of interfaces facing internet [1]:
Interface                IP-Address OK? Method Status
Protocol
FastEthernet0/1          10.1.1.1   YES NVRAM   up down

FastEthernet1/0          10.2.2.2   YES NVRAM   up down

FastEthernet1/1          10.0.0.1   YES NVRAM   up up

Loopback0                unassigned YES NVRAM   up up

FastEthernet0/0          10.0.0.2   YES NVRAM   up down

Enter the interface name that is facing internet:FastEthernet0/0
```

```

Securing Management plane services..

Disabling service finger
Disabling service pad
Disabling udp & tcp small servers
Enabling service password encryption
Enabling service tcp-keepalives-in
Enabling service tcp-keepalives-out
Disabling the cdp protocol

Disabling the bootp server
Disabling the http server
Disabling the finger service
Disabling source routing
Disabling gratuitous arp
Enable secret is either not configured or is same as enable password
Enter the new enable secret:abc123
Configuring aaa local authentication
Configuring console, Aux and vty lines for
local authentication, exec-timeout, transport

Configure SSH server? [yes]:
Enter the domain-name:cisco.com

Configuring interface specific AutoSecure services
Disabling the following ip services on all interfaces:

no ip redirects
no ip proxy-arp
no ip unreachable
no ip directed-broadcast
no ip mask-reply
Disabling mop on Ethernet interfaces

Securing Forwarding plane services..

Enabling CEF (it might have more memory requirements on some low end
platforms)

Enabling unicast rpf on all interfaces connected to internet

Configure CBAC Firewall feature? [yes/no]:yes

This is the configuration generated:

no service finger
no service pad
no service udp-small-servers
no service tcp-small-servers
service password-encryption
service tcp-keepalives-in
service tcp-keepalives-out
no cdp run
no ip bootp server
no ip http server
no ip finger
no ip source-route
no ip gratuitous-arps
no ip identd

Cisco IOS Login Enhancements (Login Block)

Document First Published: August 2005

Last Updated: October 2007

The Cisco IOS Login Enhancements (Login Block) feature allows users to enhance the security of a router by configuring options to automatically block further login attempts when a possible denial-of-service (DoS) attack is detected.

The login block and login delay options introduced by this feature can be configured for Telnet or SSH virtual connections. By enabling this feature, you can slow down “dictionary attacks” by enforcing a “quiet period” if multiple failed connection attempts are detected, thereby protecting the routing device from a type of denial-of-service attack.

Feature History for Cisco IOS Login Enhancements

Release	Modification
12.3(4)T	This feature was introduced.
12.2(25)S	This feature was integrated into Cisco IOS Release 12.2 S.
12.2(33)SRA	This feature was integrated into Cisco IOS Release 12.2 SR.
12.2(33)SRB, 12.2(33)SXH, 12.4(15)T1	Support for HTTP login blocking was added.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Information About Cisco IOS Login Enhancements

To use login enhancements, you should understand the following concepts:

- [Protecting Against Denial of Service and Dictionary Login Attacks](#)
- [Login Enhancements Functionality Overview, page 3](#)

Protecting Against Denial of Service and Dictionary Login Attacks

Connecting to a routing device for the purposes of administering (managing) the device, at either the User or Executive level, is most frequently performed using Telnet or SSH (secure shell) from a remote console (such as a PC). SSH provides a more secure connection option because communication traffic between the user's device and the managed device are encrypted. The Login Block capability, when enabled, applies to both Telnet connections and SSH connections. Beginning in Release versions 12.3(33)SRB2, 12.2(33)SXH2, and 12.4(15)T1, the Login Block capability also applies to HTTP connections."

The automated activation and logging of the Login Block and Quiet Period capabilities introduced by this feature are designed to further enhance the security of your devices by specifically addressing two well known methods that individuals use to attempt to disrupt or compromise networked devices.

If the connection address of a device is discovered and is reachable, a malicious user may attempt to interfere with the normal operations of the device by flooding it with connection requests. This type of attack is referred to as an attempted Denial-of-Service, because it is possible that the device may become too busy trying to process the repeated login connection attempts to properly handle normal routing services or will not be able to provide the normal login service to legitimate system administrators.

The primary intention of a dictionary attack, unlike a typical DoS attack, is to actually gain administrative access to the device. A dictionary attack is an automated process to attempt to login by attempting thousands, or even millions, of username/password combinations. (This type of attack is called a "dictionary attack" because it typically uses, as a start, every word found in a typical dictionary as a possible password.) As scripts or programs are used to attempt this access, the profile for such attempts is typically the same as for DoS attempts; multiple login attempts in a short period of time.

By enabling a detection profile, the routing device can be configured to react to repeated failed login attempts by refusing further connection request (login blocking). This block can be configured for a period of time, called a "quiet period". Legitimate connection attempts can still be permitted during a quiet period by configuring an access-list (ACL) with the addresses that you know to be associated with system administrators.

Login Enhancements Functionality Overview

To better configure security for virtual login connections, the following requirements have been added to the login process:

- [Delays Between Successive Login Attempts](#)
- [Login Shutdown If DoS Attacks Are Suspected](#)
- [Generation of System Logging Messages for Login Detection](#)

Delays Between Successive Login Attempts

A Cisco IOS device can accept virtual connections as fast as they can be processed. Introducing a delay between login attempts helps to protect the Cisco IOS software-based device against malicious login connections such as dictionary attacks and DoS attacks. Delays can be enabled in one of the following ways:

- Via the **auto secure** command. If you enable the AutoSecure feature, the default login delay time of one second is automatically enforced.
- Via the **login block-for** command. You must enter this command before issuing the **login delay** command. If you enter only the **login block-for** command, the default login delay time of one second is automatically enforced.
- Via the new global configuration mode command, **login delay**, which allows you to specify a the login delay time to be enforced, in seconds.

Login Shutdown If DoS Attacks Are Suspected

If the configured number of connection attempts fail within a specified time period, the Cisco IOS device will not accept any additional connections for a “quiet period.” (Hosts that are permitted by a predefined access-control list [ACL] are excluded from the quiet period.)

The number of failed connection attempts that trigger the quiet period can be specified via the new global configuration mode command **login block-for**. The predefined ACL that is excluded from the quiet period can be specified via the new global configuration mode command **login quiet-mode access-class**.

This functionality is disabled by default, and it is not enabled if autosecure is enabled.

Generation of System Logging Messages for Login Detection

After the router switches to and from quiet mode, logging messages are generated. Also, if configured, logging messages are generated upon every successful or failed login request.

Logging messages can be generated for successful login requests via the new global configuration command **login on-success**; the **login on-failure** command generates logs for failed login requests.

Logging messages for failed login attempts are automatically enabled when the **auto secure** command is issued; they are not automatically enabled for successful login attempts via autosecure.

Note

Currently, only system logging (syslog) messages can be generated for login-related events. Support for SNMP notifications (traps) will be added in a later release.

System Logging Messages for a Quiet Period

The following logging message is generated after the router switches to quiet-mode:

```
00:04:07:%SEC_LOGIN-1-QUIET_MODE_ON:Still timeleft for watching failures is 158 seconds,
[user:sfd] [Source:10.4.2.11] [localport:23] [Reason:Invalid login], [ACL:22] at 16:17:23
UTC Wed Feb 26 2003
```

The following logging message is generated after the router switches from quiet mode back to normal mode:

```
00:09:07:%SEC_LOGIN-5-QUIET_MODE_OFF:Quiet Mode is OFF, because block period timed out at
16:22:23 UTC Wed Feb 26 2003
```

System Logging Messages for Successful and Failed Login Requests

The following logging message is generated upon a successful login request:

```
00:04:32:%SEC_LOGIN-5-LOGIN_SUCCESS>Login Success [user:test] [Source:10.4.2.11]
[localport:23] at 20:55:40 UTC Fri Feb 28 2003
```

The following logging message is generated upon a failed login request:

```
00:03:34:%SEC_LOGIN-4-LOGIN_FAILED>Login failed [user:sdfs] [Source:10.4.2.11]
[localport:23] [Reason:Invalid login] at 20:54:42 UTC Fri Feb 28 2003
```

How to Configure Cisco IOS Login Enhancements

This section contains the following procedures:

- [Configuring Login Parameters, page 4](#) (Required)
- [Verifying Login Parameters, page 6](#) (Optional)

Configuring Login Parameters

Use this task to configure your Cisco IOS device for login parameters that help detect suspected DoS attacks and slow down dictionary attacks.

Login Parameter Defaults

All login parameters are disabled by default. You must issue the **login block-for** command, which enables default login functionality, before using any other login commands. After the **login block-for** command is enabled, the following defaults are enforced:

- A default login delay of one second
- All login attempts made via Telnet or SSH are denied during the quiet period; that is, no ACLs are exempt from the login period until the **login quiet-mode access-class** command is issued.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **login block-for** *seconds* **attempts** *tries* **within** *seconds*
4. **login quiet-mode access-class** {*acl-name* | *acl-number*}

5. **login delay** *seconds*
6. **login on-failure log** [**every** *login*]
7. **login on-success log** [**every** *login*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	login block-for <i>seconds</i> attempts <i>tries</i> within <i>seconds</i> Example: Router(config)# login block-for 100 attempts 2 within 100	Configures your Cisco IOS device for login parameters that help provide DoS detection. Note This command must be issued before any other login command can be used.
Step 4	login quiet-mode access-class { <i>acl-name</i> <i>acl-number</i> } Example: Router(config)# login quiet-mode access-class myacl	(Optional) Specifies an ACL that is to be applied to the router when it switches to quiet mode. If this command is not enabled, all login requests will be denied during quiet mode.
Step 5	login delay <i>seconds</i> Example: Router(config)# login delay 10	(Optional) Configures a delay between successive login attempts.
Step 6	login on-failure log [every <i>login</i>] Example: Router(config)# login on-failure log	(Optional) Generates logging messages for failed login attempts.
Step 7	login on-success log [every <i>login</i>] Example: Router(config)# login on-success log every 5	(Optional) Generates logging messages for successful login attempts.

What to Do Next

After you have configured login parameters on your router, you may wish to verify the settings. To complete this task, see the following section “[Verifying Login Parameters](#).”

Verifying Login Parameters

Use this task to verify the applied login configuration and present login status on your router.

SUMMARY STEPS

- 1. enable
- 2. show login [failures]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	show login [failures] Example: Router# show login	Displays login parameters. <ul style="list-style-type: none">• failures—Displays information related only to failed login attempts.

Examples

The following sample output from the **show login** command verifies that no login parameters have been specified:

```
Router# show login

No login delay has been applied.
No Quiet-Mode access list has been configured.
All successful login is logged and generate SNMP traps.
All failed login is logged and generate SNMP traps

Router NOT enabled to watch for login Attacks
```

The following sample output from the **show login** command verifies that the **login block-for** command is issued. In this example, the command is configured to block login hosts for 100 seconds if 16 or more login requests fail within 100 seconds; five login requests have already failed.

```
Router# show login

A default login delay of 1 seconds is applied.
No Quiet-Mode access list has been configured.
All successful login is logged and generate SNMP traps.
All failed login is logged and generate SNMP traps.

Router enabled to watch for login Attacks.
If more than 15 login failures occur in 100 seconds or less, logins will be disabled for
100 seconds.

Router presently in Watch-Mode, will remain in Watch-Mode for 95 seconds.
Present login failure count 5.
```

The following sample output from the **show login** command verifies that the router is in quiet mode. In this example, the **login block-for** command was configured to block login hosts for 100 seconds if 3 or more login requests fail within 100 seconds.

```
Router# show login
```

```
A default login delay of 1 seconds is applied.
No Quiet-Mode access list has been configured.
All successful login is logged and generate SNMP traps.
All failed login is logged and generate SNMP traps.
```

```
Router enabled to watch for login Attacks.
If more than 2 login failures occur in 100 seconds or less, logins will be disabled for
100 seconds.
```

```
Router presently in Quiet-Mode, will remain in Quiet-Mode for 93 seconds.
Denying logins from all sources.
```

The following sample output from **show login failures** command shows all failed login attempts on the router:

```
Router# show login failures
```

```
Information about login failure's with the device
```

Username	Source IPAddr	lPort	Count	TimeStamp
try1	10.1.1.1	23	1	21:52:49 UTC Sun Mar 9 2003
try2	10.1.1.2	23	1	21:52:52 UTC Sun Mar 9 2003

The following sample output from **show login failures** command verifies that no information is presently logged:

```
Router# show login failures
```

```
*** No logged failed login attempts with the device.***
```

Configuration Examples for Login Parameters

This section includes the following example:

- [Setting Login Parameters: Example, page 7](#)

Setting Login Parameters: Example

The following example shows how to configure your router to enter a 100 second quiet period if 15 failed login attempts is exceeded within 100 seconds; all login requests will be denied during the quiet period except hosts from the ACL "myacl." Also, logging messages will be generated for every 10th failed login and every 15th successful login.

```
Router(config)# login block-for 100 attempts 15 within 100
Router(config)# login quiet-mode access-class myacl
Router(config)# login on-failure log every 10
Router(config)# login on-success log every 15
```

Cisco IOS Resilient Configuration

The Cisco IOS Resilient Configuration feature enables a router to secure and maintain a working copy of the running image and configuration so that those files can withstand malicious attempts to erase the contents of persistent storage (NVRAM and flash).

Feature History for Cisco IOS Resilient Configuration

Release	Modification
12.3(8)T	This feature was introduced.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Restrictions for Cisco IOS Resilient Configuration

- This feature is available only on platforms that support a Personal Computer Memory Card International Association (PCMCIA) Advanced Technology Attachment (ATA) disk. There must be enough space on the storage device to accommodate at least one Cisco IOS image (two for upgrades) and a copy of the running configuration. IOS File System (IFS) support for secure file systems is also needed by the software.
- It may be possible to force removal of secured files using an older version of Cisco IOS software that does not contain file system support for hidden files.
- This feature can be disabled only by using a console connection to the router. With the exception of the upgrade scenario, feature activation does not require console access.
- You cannot secure a bootset with an image loaded from the network. The running image must be loaded from persistent storage to be secured as primary.
- Secured files will not appear on the output of a **dir** command issued from an executive shell because the IFS prevents secure files in a directory from being listed. ROM monitor (ROMMON) mode does not have any such restriction and can be used to list and boot secured files. The running image and running configuration archives will not be visible in the Cisco IOS **dir** command output. Instead, use the **show secure bootset** command to verify archive existence.

Information About Cisco IOS Resilient Configuration

Before using Cisco IOS Resilient Configuration, you should understand the following concept:

- [Feature Design of Cisco IOS Resilient Configuration, page 2](#)

Feature Design of Cisco IOS Resilient Configuration

A great challenge of network operators is the total downtime experienced after a router has been compromised and its operating software and configuration data erased from its persistent storage. The operator must retrieve an archived copy (if any) of the configuration and a working image to restore the router. Recovery must then be performed for each affected router, adding to the total network downtime.

The Cisco IOS Resilient Configuration feature is intended to speed up the recovery process. The feature maintains a secure working copy of the router image and the startup configuration at all times. These secure files cannot be removed by the user. This set of image and router running configuration is referred to as the primary bootset.

The following factors were considered in the design of Cisco IOS Resilient Configuration:

- The configuration file in the primary bootset is a copy of the running configuration that was in the router when the feature was first enabled.
- The feature secures the smallest working set of files to preserve persistent storage space. No extra space is required to secure the primary Cisco IOS image file.
- The feature automatically detects image or configuration version mismatch.
- Only local storage is used for securing files, eliminating scalability maintenance challenges from storing multiple images and configurations on TFTP servers.
- The feature can be disabled only through a console session.

How to Use Cisco IOS Resilient Configuration

This section contains the following procedures:

- [Archiving a Router Configuration, page 3](#)
- [Restoring an Archived Router Configuration, page 4](#)

Archiving a Router Configuration

This task describes how to save a primary bootset to a secure archive in persistent storage.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **secure boot-image**
4. **secure boot-config**
5. **end**
6. **show secure bootset**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	secure boot-image Example: Router(config)# secure boot-image	Enables Cisco IOS image resilience.
Step 4	secure boot-config Example: Router(config)# secure boot-config	Stores a secure copy of the primary bootset in persistent storage.

	Command or Action	Purpose
Step 5	end Example: Router(config)# end	Exits to privileged EXEC mode.
Step 6	show secure bootset Example: Router# show secure bootset	(Optional) Displays the status of configuration resilience and the primary bootset filename.

Examples

This section provides the following output example:

- [Sample Output for the show secure bootset Command, page 4](#)

Sample Output for the show secure bootset Command

The following example displays sample output from the **show secure bootset** command:

```
Router# show secure bootset
```

```
IOS resilience router id JMX0704L5GH
```

```
IOS image resilience version 12.3 activated at 08:16:51 UTC Sun Jun 16 2002
```

```
Secure archive slot0:c3745-js2-mz type is image (elf) []
  file size is 25469248 bytes, run size is 25634900 bytes
  Runnable image, entry point 0x80008000, run from ram
```

```
IOS configuration resilience version 12.3 activated at 08:17:02 UTC Sun Jun 16 2002
```

```
Secure archive slot0:.runcfg-20020616-081702.ar type is config
configuration archive size 1059 bytes
```

Restoring an Archived Router Configuration

This task describes how to restore a primary bootset from a secure archive after the router has been tampered with (by an NVRAM erase or a disk format).

Note

To restore an archived primary bootset, Cisco IOS image resilience must have been enabled and a primary bootset previously archived in persistent storage.

SUMMARY STEPS

1. **reload**
2. **dir** [*filesystem*:]
3. **boot** [*partition-number*:] [*filename*]
4. **no**
5. **enable**
6. **configure terminal**

7. **secure boot-config** [restore *filename*]
8. **end**
9. **copy** *filename* **running-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	reload Example: Router# reload	(Optional) Enters ROM monitor mode, if necessary.
Step 2	dir [<i>filesystem</i> :] Example: rommon 1 > dir slot0:	Lists the contents of the device that contains the secure bootset file. <ul style="list-style-type: none">The device name can be found in the output of the show secure bootset command.
Step 3	boot [<i>partition-number</i> :][<i>filename</i>] Example: rommon 2 > boot slot0:c3745-js2-mz	Boots up the router using the secure bootset image.
Step 4	no Example: --- System Configuration Dialog --- Would you like to enter the initial configuration dialog? [yes/no]: no	(Optional) Declines to enter an interactive configuration session in setup mode. <ul style="list-style-type: none">If the NVRAM was erased, the router enters setup mode and prompts the user to initiate an interactive configuration session.
Step 5	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 6	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 7	secure boot-config [restore <i>filename</i>] Example: Router(config)# secure boot-config restore slot0:rescue-cfg	Restores the secure configuration to the supplied filename.

	Command or Action	Purpose
Step 8	end Example: Router(config)# end	Exits to privileged EXEC mode.
Step 9	copy filename running-config Example: Router# copy slot0:rescue-cfg running-config	Copies the restored configuration to the running configuration.

Image Verification

The Image Verification feature allows users to automatically verify the integrity of Cisco IOS images. Thus, users can be sure that the image is protected from accidental corruption, which can occur at any time during transit, starting from the moment the files are generated by Cisco until they reach the user.

Feature History for Image Verification

Release	Modification
12.2(18)S	This feature was introduced.
12.0(26)S	This feature was integrated into Cisco IOS Release 12.0(26)S.
12.3(4)T	This feature was integrated in Cisco IOS Release 12.3(4)T.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

Restrictions for Image Verification

Cisco IOS Release 12.2(18)S and 12.0(26)S Only

Image Verification is applied to and attempted on any file; however, if the file is not an image file, image verification will not occur and you will see the following error, “SIGNATURE-NOT-FOUND.”

Cisco IOS Release 12.3(4)T Only

Image Verification is applied only to image files. If any other file type is copied or verified, you will not receive a warning that image verification did occur, and the command (copy or verify) will silently succeed.

Information About Image Verification

To use image authentication for your Cisco IOS images, you should understand the following concepts:

- [Benefit of Image Verification, page 2](#)
- [How Image Verification Works, page 2](#)

Benefit of Image Verification

The efficiency of Cisco IOS routers is improved because the routers can now automatically detect when the integrity of an image is accidentally corrupted as a result of transmission errors or disk corruption.

How Image Verification Works

Because a production image undergoes a sequence of transfers before it is copied into the memory of a router, the integrity of the image is at risk of accidental corruption every time a transfer occurs. When downloading an image from Cisco.com, a user can run a message-digest5 (MD5) hash on the downloaded image and verify that the MD5 digest posted on Cisco.com is the same as the MD5 digest that is computed on the user's server. However, many users choose not to run an MD5 digest because it is 128-bits long and the verification is manual. Image verification allows the user to automatically validate the integrity of all downloaded images, thereby, significantly reducing user interaction.

How to Use Image Verification

This section contains the following procedures:

- [Globally Verifying the Integrity of an Image, page 3](#)
- [Verifying the Integrity of an Image That Is About to Be Copied, page 4](#)
- [Verifying the Integrity of an Image That Is About to Be Reloaded, page 4](#)

Globally Verifying the Integrity of an Image

The **file verify auto** command enables image verification globally; that is, all images that are to be copied (via the **copy** command) or reloaded (via the **reload** command) are automatically verified. Although both the **copy** and **reload** commands have a **/verify** keyword that enables image verification, you must issue the keyword each time you want to copy or reload an image. The **file verify auto** command enables image verification by default, so you no longer have to specify image verification multiple times.

If you have enabled image verification by default but prefer to disable verification for a specific image copy or reload, the **/noverify** keyword, along with either the **copy** or the **reload** command, will override the **file verify auto** command.

Use this task to enable automatic image verification.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **file verify auto**
4. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	file verify auto Example: Router(config)# file verify auto	Enables automatic image verification.
Step 4	exit Example: Router(config)# exit	Exits global configuration mode. You must exit global configuration mode if you are going to copy or reload an image.

What to Do Next

After issuing the **file verify auto** command, you do not have to issue the **/verify** keyword with the **copy** or the **reload** command because each image that is copied or reloaded will be automatically verified.

Verifying the Integrity of an Image That Is About to Be Copied

When issuing the **copy** command, you can verify the integrity of the copied file by entering the **/verify** keyword. If the integrity check fails, the copied file will be deleted. If the file that is about to be copied does not have an embedded hash (an old image), you will be prompted whether or not to continue with the copying process. If you choose to continue, the file will be successfully copied; if you choose not to continue, the copied file will be deleted.

Without the **/verify** keyword, the **copy** command could copy a file that is not valid. Thus, after the **copy** command has been successfully executed, you can issue the **verify** command at any time to check the integrity of the files that are in the storage of the router.

Use this task to verify the integrity of an image before it is copied onto a router.

SUMMARY STEPS

1. **enable**
2. **copy** [/erase] [/verify | /noverify] *source-url destination-url*
3. **verify** [/md5 [md5-value]] *filesystem:[file-url]*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	copy [/erase] [/verify /noverify] <i>source-url destination-url</i> Example: Router# copy /verify tftp://10.1.1.1/jdoe/c7200-js-mz disk0:	Copies any file from a source to a destination. <ul style="list-style-type: none"> • /verify—Verifies the signature of the destination file. If verification fails, the file will be deleted. • /noverify—Does not verify the signature of the destination file before the image is copied. <p>Note /noverify is often issued if the file verify auto command is enabled, which automatically verifies the signature of all images that are copied.</p>
Step 3	verify [/md5 [md5-value]] <i>filesystem:[file-url]</i> Example: Router# verify bootflash://c7200-kboot-mz.121-8a.E	(Optional) Verifies the integrity of the images in the router's storage.

Verifying the Integrity of an Image That Is About to Be Reloaded

By issuing the **reload** command with the **/verify** keyword, the image that is about to be loaded onto your system will be checked for integrity. If the **/verify** keyword is specified, image verification will occur before the system initiates the reboot. Thus, if verification fails, the image will not be loaded.

**Note**

Because different platforms obtain the file that is to be loaded in various ways, the file specified in BOOTVAR will be verified. If a file is not specified, the first file on each subsystem will be verified.

On certain platforms, because of variables such as the configuration register, the file that is verified may not be the file that is loaded.

Use this task to verify the integrity of an image before it is reloaded onto a router.

SUMMARY STEPS

1. **enable**
2. **reload** [
 - [warm] [/verify | /noverify] *text* |
 - [warm] [/verify | /noverify] in [*hh:*]*mm* [*text*] |
 - [warm] [/verify | /noverify] at *hh:mm* [*month day* | *day month*] [*text*] |
 - [warm] [/verify | /noverify] **cancel**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	reload [[warm] [/verify /noverify] <i>text</i> [warm] [/verify /noverify] in [<i>hh:</i>] <i>mm</i> [<i>text</i>] [warm] [/verify /noverify] at <i>hh:mm</i> [<i>month day</i> <i>day month</i>] [<i>text</i>] [warm] [/verify /noverify] cancel] Example: Router# reload /verify	Reloads the operating system. <ul style="list-style-type: none"> /verify—Verifies the signature of the destination file. If verification fails, the file will be deleted. /noverify—Does not verify the signature of the destination file before the image is reloaded. Note /noverify is often issued if the file verify auto command is enabled, which automatically verifies the signature of all images that are copied.

Configuration Examples for Image Verification

This section contains the following configuration examples:

- [Global Image Verification: Example, page 6](#)
- [Image Verification via the copy Command: Example, page 6](#)
- [Image Verification via the reload Command: Example, page 6](#)
- [verify Command Sample Output: Example, page 7](#)

Global Image Verification: Example

The following example shows how to enable automatic image verification. After enabling this command, image verification will automatically occur for all images that are either copied (via the **copy** command) or reloaded (via the **reload** command).

```
Router(config)# file verify auto
```

Image Verification via the copy Command: Example

The following example shows how to specify image verification before copying an image:

```
Router# copy /verify tftp://10.1.1.1/jdoe/c7200-js-mz disk0:

Destination filename [c7200-js-mz]?
Accessing tftp://10.1.1.1/jdoe/c7200-js-mz...
Loading jdoe/c7200-js-mz from 10.1.1.1 (via FastEthernet0/0):!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
[OK - 19879944 bytes]

19879944 bytes copied in 108.632 secs (183003 bytes/sec)
Verifying file integrity of disk0:/c7200-js-mz
.....
.....
.....Done!
Embedded Hash MD5 :CFA258948C4ECE52085DCF428A426DCD
Computed Hash MD5 :CFA258948C4ECE52085DCF428A426DCD
CCO Hash MD5 :44A7B9BDDD9638128C35528466318183

Signature Verified
```

Image Verification via the reload Command: Example

The following example shows how to specify image verification before reloading an image onto the router:

```
Router# reload /verify

Verifying file integrity of bootflash:c7200-kboot-mz.121-8a.E
%ERROR:Signature not found in file bootflash:c7200-kboot-mz.121-8a.E.
Signature not present. Proceed with verify? [confirm]
Verifying file disk0:c7200-js-mz
.....
.....Done!
Embedded Hash MD5 :CFA258948C4ECE52085DCF428A426DCD
Computed Hash MD5 :CFA258948C4ECE52085DCF428A426DCD
CCO Hash MD5 :44A7B9BDDD9638128C35528466318183
Signature Verified

Proceed with reload? [confirm]n
```

verify Command Sample Output: Example

The following example shows how to specify image verification via the **verify** command:

```
Router# verify disk0:c7200-js-mz
```

```
%Filesystem does not support verify operations
Verifying file integrity of disk0:c7200-js-mz.....
.....Done!
Embedded Hash   MD5 :CFA258948C4ECE52085DCF428A426DCD
Computed Hash   MD5 :CFA258948C4ECE52085DCF428A426DCD
CCO Hash        MD5 :44A7B9BDDD9638128C35528466318183

Signature Verified
```

IP Source Tracker

The IP Source Tracker feature allows you to gather information about the traffic that is flowing to a host that is suspected of being under attack. This feature also allows you to easily trace an attack to its entry point into the network.

Feature History for IP Source Tracker

Release	Modification
12.0(21)S	This feature was introduced on the Cisco 12000 series.
12.0(22)S	This feature was implemented on the Cisco 7500 series.
12.0(26)S	This feature was implemented on Cisco 12000 series IP Service Engine (ISE) line cards.
12.3(7)T	This feature was integrated into Cisco IOS Release 12.3(7)T.
12.2(25)S	This feature was integrated into Cisco IOS Release 12.2(25)S.

Finding Support Information for Platforms and Cisco IOS Software Images

Restrictions for IP Source Tracker

Packets Can Be Dropped for Routers

IP source tracking is designed to track attacks against hosts. Packets can be dropped if the line card or port adapter CPU is overwhelmed. Therefore, when used to track an attack against a router, IP source tracking can drop control packets, such as Border Gateway Protocol (BGP) updates.

Engine 0 and 1 Performances Affected on Cisco 12000 Series

There is no performance impact for packets destined to nontracked IP addresses on Engine 2 and Engine 4 line cards because the IP source tracker affects only tracked destinations. Engine 0 and Engine 1 performances are affected because on these engines all packets are switched by the CPU.

Note

On Cisco 7500 series routers, there is no performance impact on destinations that are not tracked.

Information About IP Source Tracker

To configure source tracking, you should understand the following concepts:

- [Identifying and Tracking Denial of Service Attacks, page 2](#)
- [Using IP Source Tracker, page 3](#)
- [Benefits of IP Source Tracker, page 4](#)

Identifying and Tracking Denial of Service Attacks

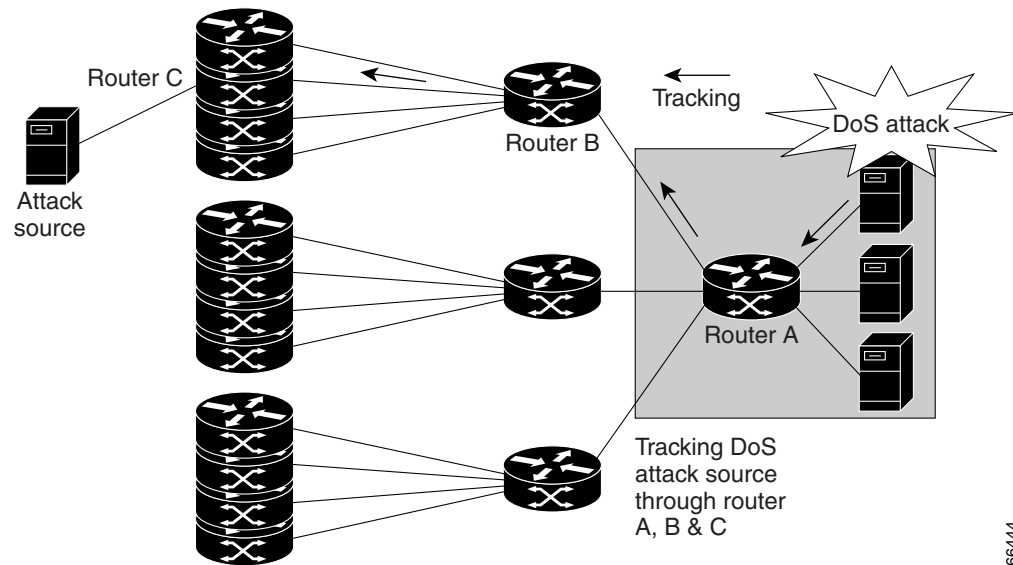

One of the many challenges faced by customers today is the tracking and blocking denial-of-service (DoS) attacks. Counteracting a DoS attack involves intrusion detection, source tracking, and blocking. This functionality addresses the need for source tracking.

To trace attacks, NetFlow and access control lists (ACLs) have been used. To block attacks, committed access rate (CAR) and ACLs have been used. Support for these features on the Cisco 12000 series Internet router has depended on the type of line card used. Support for these features on the Cisco 7500 series routers depends upon the type of port adapter used. There is, therefore, a need to develop a way to receive information that both traces the source of an attack and is supported on all line cards and port adapters.

Normally, when you identify the host that is subject to a DoS attack, you must determine the network ingress point to effectively block the attack. This process starts at the router closest to the host.

For example, in [Figure 124](#), you would start at Router A and try to determine the next upstream router to examine. Traditionally, you would apply an output ACL to the interface connecting to the host to log packets that match the ACL. The logging information is dumped to the router console or system log. You then have to analyze this information, and possibly go through several ACLs in succession to identify the input interface for the attack. In this case the information points back to Router B.

You then repeat this process on Router B, which leads back to Router C, an ingress point into the network. At this point you can use ACLs or CAR to block the attack. This procedure can require applying several ACLs that generate an excessive amount of output to analyze, making this procedure cumbersome and error prone.

Figure 124 Source Tracking in a DoS Attack

66444

Using IP Source Tracker

IP source tracker provides an easier, more scalable alternative to output ACLs for tracking DoS attacks, and it works as follows:

- After you identify the destination being attacked, enable tracking for the destination address on the whole router by entering the **ip source-track** command.
- Each line card creates a special Cisco Express Forwarding (CEF) entry for the destination address being tracked. For line cards or port adapters that use specialized Application-Specific Integrated Circuit (ASICs) for packet switching, the CEF entry is used to punt packets to the line card's or port adapter's CPU.
- Each line card CPU collects information about the traffic flow to the tracked destination.
- The data generated is periodically exported to the router. To display a summary of the flow information, enter the **show ip source-track summary** command. To display more detailed information for each input interface, enter the **show ip source-track** command.
- Statistics provide a breakdown of the traffic to each tracked IP address. This breakdown allows you to determine which upstream router to analyze next. You can shut down the IP source tracker on the current router by entering the **no ip source-track** command, and reopen it on the upstream router.
- Repeat Step 1 to Step 5 until you identify the source of the attack.
- Apply CAR or ACLs to limit or stop the attack.

IP Source Tracker: Hardware Support

IP source tracking is supported on all Engine 0, 1, 2, and 4 line cards in the Cisco 12000 series Internet router. It is also supported on all port adapters and RSPs that have CEF switching enabled on Cisco 7500 series routers.

Benefits of IP Source Tracker

Complete Tracking Information Provided

IP source tracking generates all the necessary information in an easy-to-use format to track the network entry point of a DoS attack.

Tracking an Unlimited Number of IPs Simultaneously

IP source tracking allows you to track multiple IPs at the same time. By default there is no limit. To limit the number of IPs that are simultaneously tracked, use the **ip source-track address-limit** command.

Complete Network Coverage for Cisco 12000 Series and Cisco 7500 Series Routers as of 12.0(26)S

Because IP source tracking is supported on all line cards on the Cisco 12000 series routers and on all port adapters on Cisco 7500 series routers, it allows you to track DoS attacks across your entire network.

Note

For Cisco IOS Release 12.0(21)S and 12.0(22)S, IP source tracking is supported only on Engine 0, 1, 2, and 4 line cards on Cisco 12000 series routers; that is, Engine 3 is not supported.

How to Configure IP Source Tracker

This section contains the following procedures:

- [Configuring IP Source Tracking, page 4](#) (required)
- [Verifying IP Source Tracking, page 5](#) (optional)

Configuring IP Source Tracking

To configure IP source tracking for a host under attack, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip source-track *ip-address***
4. **ip source-track address-limit *number***
5. **ip source-track syslog-interval *number***
6. **ip source-track export-interval *number***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip source-track ip-address Example: Router(config)# ip source-track 100.10.0.1	Enables IP source tracking for a specified host.
Step 4	ip source-track address-limit number Example: Router(config)# ip source-track address-limit 10	(Optional) Limits the number of hosts that can be simultaneously tracked at any given time. Note If this command is not enabled, there is no limit to the number of hosts that be can tracked.
Step 5	ip source-track syslog-interval number Example: Router(config)# ip source-track syslog-interval 2	(Optional) Sets the time interval, in minutes, used to generate syslog messages that indicate IP source tracking is enabled. Note If this command is not enabled, system log messages are not generated.
Step 6	ip source-track export-interval number Example: Router(config)# ip source-track export-interval 30	(Optional) Sets the time interval, in seconds, used to export IP tracking statistics that are collected in the line cards to the gigabit route processor (GRP) and the port adapters to the route switch processor (RSP). Note If this command is not enabled, traffic flow information is exported to the GRP and RSP every 30 seconds.

What to Do Next

After you have configured source tracking on your network device, you can verify your configuration and source tracking statistics, such as traffic flow. To complete this task, see the following section [“Verifying IP Source Tracking.”](#)

Verifying IP Source Tracking

To verify the status of source tracking, such as packet processing and traffic flow information, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **show ip source-track** [*ip-address*] [**summary** | **cache**]
3. **show ip source-track export flows**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ip source-track [<i>ip-address</i>] [summary cache] Example: Router# show ip source-track summary	Displays traffic flow statistics for tracked IP host addresses
Step 3	show ip source-track export flows Example: Router# show ip source-track export flows	Displays the last 10 packet flows that were exported from the line card to the route processor. Note This command can be issued only on distributed platforms, such as the GRP and the RSP.

Examples

The following example, which is sample output from the **show ip source-track summary** command, shows how to verify that IP source tracking is enabled for one or more hosts:

```
Router# show ip source-track summary
```

Address	Bytes	Pkts	Bytes/s	Pkts/s
10.0.0.1	119G	1194M	443535	4432
192.168.1.1	119G	1194M	443535	4432
192.168.42.42	119G	1194M	443535	4432

The following example, which is sample output from the **show ip source-track summary** command, shows how to verify that no traffic has yet to be received for the destination hosts that are being tracked:

```
Router# show ip source-track summary
```

Address	Bytes	Pkts	Bytes/s	Pkts/s
10.0.0.1	0	0	0	0
192.168.1.1	0	0	0	0
192.168.42.42	0	0	0	0

The following example, which is sample output from the **show ip source-track** command, shows how to verify that IP source tracking is processing packets to the hosts and exporting statistics from the line card or port adapter to the GRP and RSP:

```
Router# show ip source-track
```

Address	SrcIF	Bytes	Pkts	Bytes/s	Pkts/s
10.0.0.1	PO0/0	119G	1194M	513009	5127

```

192.168.1.1      PO0/0      119G      1194M      513009      5127
192.168.42.42   PO0/0      119G      1194M      513009      5127

```

Configuration Examples for IP Source Tracker

This section includes the following examples:

- [Configuring IP Source Tracking: Example, page 7](#)
- [Verifying Source Interface Statistics for All Tracked IP Addresses: Example, page 7](#)
- [Verifying a Flow Statistic Summary for All Tracked IP Addresses: Example, page 7](#)
- [Verifying Detailed Flow Statistics Collected by a Line Card: Example, page 8](#)
- [Verifying Flow Statistics Exported from Line Cards and Port Adapters: Example, page 8](#)

Configuring IP Source Tracking: Example

The following example shows how to configure IP source tracking on all line cards and port adapters in the router. In this example, each line card or port adapter collects traffic flow data to host address 100.10.0.1 for 2 minutes before creating an internal system log entry; packet and flow information recorded in the system log is exported for viewing to the route processor or switch processor every 60 seconds.

```

Router# configure interface
Router(config)# ip source-track 100.10.0.1
Router(config)# ip source-track syslog-interval 2
Router(config)# ip source-track export-interval 60

```

Verifying Source Interface Statistics for All Tracked IP Addresses: Example

The following example displays a summary of the traffic flow statistics that are collected on each source interface for tracked host addresses.

```
Router# show ip source-track
```

Address	SrcIF	Bytes	Pkts	Bytes/s	Pkts/s
10.0.0.1	PO2/0	0	0	0	0
192.168.9.9	PO1/2	131M	511M	1538	6
192.168.9.9	PO2/0	144G	3134M	6619923	143909

Verifying a Flow Statistic Summary for All Tracked IP Addresses: Example

The following example displays a summary of traffic flow statistics for all hosts that are being tracked; it shows that no traffic has yet been received.

```
Router# show ip source-track summary
```

Address	Bytes	Pkts	Bytes/s	Pkts/s
10.0.0.1	0	0	0	0
100.10.1.1	131M	511M	1538	6
192.168.9.9	146G	3178M	6711866	145908

Verifying Detailed Flow Statistics Collected by a Line Card: Example

The following example displays traffic flow information that is collected on line card 0 for all tracked hosts.

```
Router# exec slot 0 show ip source-track cache
```

```
===== Line Card (Slot 0) =====
```

```
IP packet size distribution (7169M total packets):
```

```
1-32  64  96 128 160 192 224 256 288 320 352 384 416 448 480
.000 .000 .000 0.00 .000 .000 .000 .000 .000 .000 .000 .000 .000 .000 .000
```

```
512 544 576 1024 1536 2048 2560 3072 3584 4096 4608
.000 .000 .000 .000 .000 .000 .000 .000 .000 .000 .000 .000
```

```
IP Flow Switching Cache, 278544 bytes
```

```
1 active, 4095 inactive, 13291 added
```

```
198735 aged polls, 0 flow alloc failures
```

```
Active flows timeout in 0 minutes
```

```
Inactive flows timeout in 15 seconds
```

```
last clearing of statistics never
```

Protocol	Total	Flows	Packets	Bytes	Packets	Active(Sec)	Idle(Sec)
-----	Flows	/Sec	/Flow	/Pkt	/Sec	/Flow	/Flow
SrcIf	SrcIPAddress		DstIf		DstIPAddress	Pr	TOS Flgs Pkts
Port Msk AS			Port Msk AS		NextHop		B/Pk Active
PO0/0	101.1.1.0		Null		100.1.1.1	06 00 00	55K
0000 /0 0			0000 /0 0		0.0.0.0	100	10.1

Verifying Flow Statistics Exported from Line Cards and Port Adapters: Example

The following example displays packet flow information that is exported from line cards and port adapters to the GRP and the RSP:

```
Router# show ip source-track export flows
```

SrcIf	SrcIPAddress	DstIf	DstIPAddress	Pr	SrcP	DstP	Pkts
PO0/0	101.1.1.0	Null	100.1.1.1	06	0000	0000	88K
PO0/0	101.1.1.0	Null	100.1.1.3	06	0000	0000	88K
PO0/0	101.1.1.0	Null	100.1.1.2	06	0000	0000	88K

Command Reference

The following new commands are pertinent to this feature.

- **ip source-track**
- **ip source-track address-limit**
- **ip source-track export-interval**
- **ip source-track syslog-interval**
- **show ip source-track**
- **show ip source-track export flows**

For information about these commands, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html.

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

IP Traffic Export

The IP Traffic Export feature allows users to configure their router to export IP packets that are received on multiple, simultaneous WAN or LAN interfaces. The unaltered IP packets are exported on a single LAN or VLAN interface, thereby, easing deployment of protocol analyzers and monitoring devices.

Feature History for IP Traffic Export

Release	Modification
12.3(4)T	This feature was introduced.
12.2(25)S	This feature was integrated into Cisco IOS Release 12.2(25)S.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Restrictions for IP Traffic Export

Platform Restriction

IP traffic export is intended only for software switching platforms; distributed architectures are not supported.

IP Packet Forwarding Performance Impact

When IP traffic export is enabled, a delay is incurred on the outbound interface when packets are captured and transmitted across the interface. Performance delays increase with the increased number of interfaces that are monitored and the increased number of destination hosts.

Exported Traffic Limitation

- The MAC address of the device that is receiving the exported traffic must be on the same VLAN or directly connected to one of the router interfaces. (Use the **show arp** command to determine the MAC address of device that is directly connected to an interface.)
- The outgoing interface for exported traffic must be Ethernet (10/100/1000). (Incoming (monitored) traffic can traverse any interface.)

Information About IP Traffic Export

To use the IP traffic export, you should understand the following concept:

- [Benefits of IP Traffic Export, page 2](#)

Benefits of IP Traffic Export

Simplified IDS Deployment

Without the ability to export IP traffic, the Intrusion Detection System (IDS) probe must be inline with the network device to monitor traffic flow. IP traffic export eliminates the probe placement limitation, allowing users to place an IDS probe in any location within their network or direct all exported traffic to a VLAN that is dedicated for network monitoring. Allowing users to choose the optimal location of their IDS probe reduces processing burdens.

Also, because packet processing that was once performed on the network device can now be performed away from the network device, the need to enable IDS with the Cisco IOS software can be eliminated.

IP Traffic Export Functionality Benefits

Users can configure their router to perform the following tasks:

- Filter copied packets via an access control list (ACL)
- Filter copied packets via sampling, which allows you to export one in every few packets in which you are interested. Use this option when it is not necessary to export all incoming traffic. Also, sampling is useful when a monitored ingress interface can send traffic faster than the egress interface can transmit it.
- Configure bidirectional traffic on an interface. (By default, only incoming traffic is exported.)

How to Use IP Traffic Export

This section contains the following procedures:

- [Configuring IP Traffic Export, page 3](#)
- [Displaying IP Traffic Export Configuration Data, page 5](#)

Configuring IP Traffic Export

Use this task to configure IP traffic export profiles, which enable IP traffic to be exported on an ingress interface and allow you to specify profile attributes, such as the outgoing interface for exporting traffic.

Note

Packet exporting is performed before packet switching or filtering.

IP Traffic Export Profiles Overview

All packet export configurations are specified via IP traffic export profiles, which consist of IP-traffic-export-related command-line interfaces (CLIs) that control various attributes for both incoming and outgoing exported IP traffic. You can configure a router with multiple IP traffic export profiles. (Each profile must have a different name.) You can apply different profiles on different interfaces.

The two different IP traffic export profiles are as follows:

- The global configuration profile, which is configured via the **ip traffic-export profile** command.
- The IP traffic export submode configuration profile, which is configured via any of the following router IP Traffic Export (RITE) commands—**bidirectional**, **incoming**, **interface**, **mac-address**, and **outgoing**.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip traffic-export profile** *profile-name*
4. **interface** *interface-name*
5. **bidirectional**
6. **mac-address** *H.H.H*
7. **incoming** {**access-list** {*standard* | *extended* | *named*} | **sample one-in-every** *packet-number*}
8. **outgoing** {**access-list** {*standard* | *extended* | *named*} | **sample one-in-every** *packet-number*}
9. **exit**
10. **interface** *type number*
11. **ip traffic-export apply** *profile-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip traffic-export profile <i>profile-name</i> Example: Router(config)# ip traffic-export profile my_rite	Creates or edits an IP traffic export profile, enables the profile on an ingress interface, and enters RITE configuration mode.
Step 4	interface <i>interface-name</i> Example: Router(config-rite)# interface FastEthernet 0/1	Specifies the outgoing (monitored) interface for exported traffic. Note If you do not issue this command, the profile will not recognize an interface in which to send the captured IP traffic.
Step 5	bidirectional Example: Router(config-rite)# bidirectional	(Optional) Exports incoming and outgoing IP traffic on the monitored interface. Note If this command is not enabled, only incoming traffic is exported.
Step 6	mac-address <i>H.H.H</i> Example: Router(config-rite)# mac-address 00a.8aab.90a0	Specifies the 48-bit address of the destination host that is receiving the exported traffic. Note If you do not issue this command, the profile will not recognize a destination host in which to send the exported packets.
Step 7	incoming { access-list { <i>standard</i> <i>extended</i> <i>named</i> } sample one-in-every <i>packet-number</i> } Example: Router(config-rite)# incoming access-list my_acl	(Optional) Configures filtering for incoming traffic. After you have created a profile via the ip traffic-export profile , this functionality is enabled by default.
Step 8	outgoing { access-list { <i>standard</i> <i>extended</i> <i>named</i> } sample one-in-every <i>packet-number</i> } Example: Router(config-rite)# outgoing sample one-in-every 50	(Optional) Configures filtering for outgoing export traffic. Note If you issue this command, you must also issue the bidirectional command, which enables outgoing traffic to be exported. However, only routed traffic (such as passthrough traffic) is exported; that is, traffic that originates from the network device is not exported.
Step 9	exit	Exits RITE configuration mode.

	Command or Action	Purpose
Step 10	interface <i>type number</i> Example: Router(config)# interface FastEthernet0/0	Configures an interface type and enters interface configuration mode.
Step 11	ip traffic-export apply <i>profile-name</i> Example: Router(config-if)# ip traffic-export apply my_rite	Enables IP traffic export on an ingress interface.

Troubleshooting Tips

Creating an IP Traffic Export Profile

The **interface** and **mac-address** commands are required to successfully create a profile. If these commands are not issued, you will receive the following profile incomplete message if the **show running config** command is issued:

```
ip traffic-export profile newone
! No outgoing interface configured
! No destination mac-address configured
```

Applying an IP Traffic Export Profile to an interface

The following system logging messages should appear immediately after you activate and deactivate a profile from an interface (via the **ip traffic-export apply profile** command):

- Activated profile:

```
%RITE-5-ACTIVATE: Activated IP traffic export on interface FastEthernet 0/0.
```

- Deactivated profile:

```
%RITE-5-DEACTIVATE: Deactivated IP traffic export on interface FastEthernet 0/0.
```

If you attempt to apply an incomplete profile to an interface, you will receive the following message:

```
Router(config-if)# ip traffic-export apply newone
RITE: profile newone has missing outgoing interface
```

What to Do Next

After you have configured a profile and enabled the profile on an ingress interface, you can monitor IP traffic exporting events and verify your profile configurations. To complete these steps, refer to the following task “[Displaying IP Traffic Export Configuration Data](#).”

Displaying IP Traffic Export Configuration Data

This task allows you to verify IP traffic export parameters such as the monitored ingress interface, which is where the IP traffic is exported, and outgoing and incoming IP packet information, such as configured ACLs. You can also use this task to monitor packets that are captured and then transmitted across an interface to a destination host. Use this optional task to help you troubleshoot any problems with your exported IP traffic configurations.

SUMMARY STEPS

1. **enable**
2. **debug ip traffic-export events**
3. **show ip traffic-export [interface *interface-name* | profile *profile-name*]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	debug ip traffic-export events Example: Router# debug ip traffic-export events	Enables debugging messages for exported IP traffic packets events.
Step 3	show ip traffic-export [interface <i>interface-name</i> profile <i>profile-name</i>] Example: Router# show ip traffic-export	Displays information related to exported IP traffic events. <ul style="list-style-type: none"> • interface <i>interface-name</i>—Only data associated with the monitored ingress interface is shown. • profile <i>profile-name</i>—Only flow statistics, such as exported packets and the number of bytes, are shown.

Examples

The following sample output from the **show ip traffic-export** command is for the profile “one.” This example is for a single, configured interface. If multiple interfaces are configured, the information shown below is displayed for each interface.

```
Router# show ip traffic-export

Router IP Traffic Export Parameters
Monitored Interface      FastEthernet0/0
Export Interface         FastEthernet0/1
Destination MAC address  0030.7131.abfc
bi-directional traffic export is off
Input IP Traffic Export Information   Packets/Bytes Exported   0/0
Packets Dropped          0
Sampling Rate             one-in-every 1 packets
No Access List configured
Profile one is Active
```

Configuration Examples for IP Traffic Export

This section includes the following configuration example:

- [Exporting IP Traffic Configuration: Example, page 7](#)

Exporting IP Traffic Configuration: Example

Figure 1 and the following sample output from the **show running-config** command illustrate how to configure Router 2 to export the incoming traffic from Router 1 to IDS:

Router2# **show running-config**

Command Reference

The following commands are introduced or modified in the feature or features

- **bidirectional**
- **debug ip traffic-export events**
- **incoming**
- **interface (RITE)**
- **ip traffic-export apply**
- **ip traffic-export profile**
- **mac-address (RITE)**
- **outgoing**
- **show ip traffic-export**

For information about these commands, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html.

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

Role-Based CLI Access

The Role-Based CLI Access feature allows the network administrator to define “views,” which are a set of operational commands and configuration capabilities that provide selective or partial access to Cisco IOS EXEC and configuration (Config) mode commands. Views restrict user access to Cisco IOS command-line interface (CLI) and configuration information; that is, a view can define what commands are accepted and what configuration information is visible. Thus, network administrators can exercise better control over access to Cisco networking devices.

Feature History for Role-Based CLI Access

Release	Modification
12.3(7)T	This feature was introduced.
12.3(11)T	The CLI view capability was extended to restrict user access on a per-interface level, and additional CLI views were introduced to support the extended view capability. Also, support to group configured CLI views into a superview was introduced.
12.2(33)SRB	This feature was integrated into Cisco IOS Release 12.2(33)SRB.
12.2(33)SB	All feature functionality was integrated into Cisco IOS Release 12.2(33)SB.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Configuration Examples for Role-Based CLI Access, page 9](#)
- [Additional References, page 12](#)
- [Command Reference, page 13](#)

Prerequisites for Role-Based CLI Access

Your image must support CLI views.

Restrictions for Role-Based CLI Access

Lawful Intercept Images Limitation

Because CLI views are a part of the Cisco IOS parser, CLI views are a part of all platforms and Cisco IOS images. However, the lawful intercept view is available only in images that contain the lawful intercept subsystem.

Maximum Number of Allowed Views

The maximum number of CLI views and superviews, including one lawful intercept view, that can be configured is 15. (This does not include the root view.)

Information About Role-Based CLI Access

To create and use views, you should understand the following concepts:

- [Benefits of Using CLI Views, page 2](#)
- [Root View, page 3](#)
- [View Authentication via a New AAA Attribute, page 3](#)

Benefits of Using CLI Views

Views: Detailed Access Control

Although users can control CLI access via both privilege levels and enable mode passwords, these functions do not provide network administrators with the necessary level of detail needed when working with Cisco IOS routers and switches. CLI views provide a more detailed access control capability for network administrators, thereby, improving the overall security and accountability of Cisco IOS software.

As of Cisco IOS Release 12.3(11)T, network administrators can also specify an interface or a group of interfaces to a view; thereby, allowing access on the basis of specified interfaces.

Root View

When a system is in “root view,” it has all of the access privileges as a user who has level 15 privileges. If the administrator wishes to configure any view to the system (such as a CLI view, a superview, or a lawful intercept view), the system must be in root view.

The difference between a user who has level 15 privileges and a root view user is that a root view user can configure a new view and add or remove commands from the view. Also, when you are in a CLI view, you have access only to the commands that have been added to that view by the root view user.

View Authentication via a New AAA Attribute

View authentication is performed by an external authentication, authorization, and accounting (AAA) server via the new attribute “cli-view-name.”

AAA authentication associates only one view name to a particular user; that is, only one view name can be configured for a user in an authentication server.

How to Use Role-Based CLI Access

This section contains the following procedures:

- [Configuring a CLI View, page 3](#) (required)
- [Configuring a Lawful Intercept View, page 5](#) (optional)
- [Configuring a Superview, page 7](#) (optional)
- [Monitoring Views and View Users, page 9](#) (optional)

Configuring a CLI View

Use this task to create a CLI view and add commands or interfaces to the view, as appropriate.

Prerequisites

Before you create a view, you must perform the following tasks:

- Enable AAA via the **aaa new-model** command. (For more information on enabling AAA, see the chapter “Configuring Authentication” in the *Cisco IOS Security Configuration Guide*, Release 12.3.)
- Ensure that your system is in root view—not privilege level 15.

SUMMARY STEPS

1. **enable view**
2. **configure terminal**
3. **parser view** *view-name*
4. **secret 5** *encrypted-password*
5. **commands** *parser-mode* {**include** | **include-exclusive** | **exclude**} [**all**] [**interface** *interface-name* | *command*]

6. **exit**
7. **exit**
8. **enable** [*privilege-level*] [**view** *view-name*]
9. **show parser view** [**all**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable view Example: Router> enable view	Enables root view. <ul style="list-style-type: none"> Enter your privilege level 15 password (for example, root password) if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	parser view <i>view-name</i> Example: Router(config)# parser view first	Creates a view and enters view configuration mode.
Step 4	secret 5 <i>encrypted-password</i> Example: Router(config-view)# secret 5 secret	Associates a command-line interface (CLI) view or superview with a password. Note You must issue this command before you can configure additional attributes for the view.
Step 5	commands <i>parser-mode</i> { include include-exclusive exclude } [all] [interface <i>interface-name</i> <i>command</i>] Example: Router(config-view)# commands exec include show version	Adds commands or interfaces to a view. <ul style="list-style-type: none"> <i>parser-mode</i>—The mode in which the specified command exists. include—Adds a command or an interface to the view and allows the same command or interface to be added to an additional view. include-exclusive—Adds a command or an interface to the view and excludes the same command or interface from being added to all other views. exclude—Excludes a command or an interface from the view; that is, customers cannot access a command or an interface. all—A “wildcard” that allows every command in a specified configuration mode that begins with the same keyword or every subinterface for a specified interface to be part of the view. interface <i>interface-name</i>—Interface that is added to the view. <i>command</i>—Command that is added to the view.

	Command or Action	Purpose
Step 6	exit Example: Router(config-view)# exit	Exits view configuration mode.
Step 7	exit Example: Router(config)# exit	Exits global configuration mode.
Step 8	enable [<i>privilege-level</i>] [view <i>view-name</i>] Example: Router# enable view first	Prompts the user for a password, which allows the user to access a configured CLI view, and is used to switch from one view to another view. After the correct password is given, the user can access the view.
Step 9	show parser view [all] Example: Router# show parser view	(Optional) Displays information about the view that the user is currently in. <ul style="list-style-type: none"> all—Displays information for all views that are configured on the router. Note Although this command is available for both root and lawful intercept users, the all keyword is available only to root users. However, the all keyword can be configured by a user in root view to be available for users in lawful intercept view and CLI view.

Troubleshooting Tips

After you have successfully created a view, a system message such as the following will be displayed:

```
%PARSER-6-VIEW_CREATED: view 'first' successfully created.
```

After you have successfully deleted a view, a system message such as the following will be displayed:

```
%PARSER-6-VIEW_DELETED: view 'first' successfully deleted.
```

You must associate a password with a view. If you do not associate a password, and you attempt to add commands to the view via the **commands** command, a system message such as the following will be displayed:

```
%Password not set for view <viewname>.
```

Configuring a Lawful Intercept View

Use this task to initialize and configure a view for lawful-intercept-specific commands and configuration information. (Only an administrator or a user who has level 15 privileges can initialize a lawful intercept view.)

About Lawful Intercept Views

Like a CLI view, a lawful intercept view restricts access to specified commands and configuration information. Specifically, a lawful intercept view allows a user to secure access to lawful intercept commands that are held within the TAP-MIB, which is a special set of simple network management protocol (SNMP) commands that store information about calls and users.

Commands available in lawful intercept view belong to one of the following categories:

- Lawful intercept commands that should not be made available to any other view or privilege level
- CLI views that are useful for lawful intercept users but do not have to be excluded from other views or privilege levels

Prerequisites

Before you initialize a lawful intercept view, ensure that the privilege level is set to 15 via the **privilege** command.

SUMMARY STEPS

1. **enable view**
2. **configure terminal**
3. **li-view** *li-password* **user** *username* **password** *password*
4. **username** [**lawful-intercept**] *name* [**privilege** *privilege-level* | **view** *view-name*] **password** *password*
5. **parser view** *view-name*
6. **secret** **5** *encrypted-password*
7. **name** *new-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable view Example: Router> enable view	Enables root view. • Enter your privilege level 15 password (for example, root password) if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	li-view <i>li-password</i> user <i>username</i> password <i>password</i> Example: Router(config)# li-view lipass user li_admin password li_adminpass	Initializes a lawful intercept view. After the li-view is initialized, you must specify at least one user via user <i>username</i> password <i>password</i> options.

	Command or Action	Purpose
Step 4	username [lawful-intercept [<i>name</i>] [privilege <i>privilege-level</i> view <i>view-name</i>] password <i>password</i> Example: Router(config)# username lawful-intercept li-user1 password li-user1pass	Configures lawful intercept users on a Cisco device.
Step 5	parser view <i>view-name</i> Example: Router(config)# parser view li view name	(Optional) Enters view configuration mode, which allows you to change the lawful intercept view password or the lawful intercept view name.
Step 6	secret 5 <i>encrypted-password</i> Example: Router(config-view)# secret 5 secret	(Optional) Changes an existing password for a lawful intercept view.
Step 7	name <i>new-name</i> Example: Router(config-view)# name second	(Optional) Changes the name of a lawful intercept view. If this command is not issued, the default name of the lawful intercept view is “li-view.”

Troubleshooting Tips

To display information for all users who have access to a lawful intercept view, issue the **show users lawful-intercept** command. (This command is available only to authorized lawful intercept view users.)

Configuring a Superview

Use this task to create a superview and add at least one CLI view to the superview.

About Superviews

A superview consists of one or more CLI views, which allow users to define what commands are accepted and what configuration information is visible. Superviews allow a network administrator to easily assign all users within configured CLI views to a superview instead of having to assign multiple CLI views to a group of users.

Superviews contain the following characteristics:

- A CLI view can be shared among multiple superviews.
- Commands cannot be configured for a superview; that is, you must add commands to the CLI view and add that CLI view to the superview.
- Users who are logged into a superview can access all of the commands that are configured for any of the CLI views that are part of the superview.
- Each superview has a password that is used to switch between superviews or from a CLI view to a superview.
- If a superview is deleted, all CLI views associated with that superview will not be deleted too.

Adding CLI Views to a Superview

You can add a view to a superview only after a password has been configured for the superview (via the **secret 5** command). Thereafter, issue the **view** command in view configuration mode to add at least one CLI view to the superview.

Note

Before adding a CLI view to a superview, ensure that the CLI views that are added to the superview are valid views in the system; that is, the views have been successfully created via the **parser view** command.

SUMMARY STEPS

1. **enable view**
2. **configure terminal**
3. **parser view** *superview-name* **superview**
4. **secret 5** *encrypted-password*
5. **view** *view-name*
6. **exit**
7. **exit**
8. **show parser view** [**all**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable view Example: Router> enable view	Enables root view. <ul style="list-style-type: none">Enter your privilege level 15 password (for example, root password) if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	parser view <i>superview-name</i> superview Example: Router(config)# parser view su_view1 superview	Creates a superview and enters view configuration mode.
Step 4	secret 5 <i>encrypted-password</i> Example: Router(config-view)# secret 5 secret	Associates a CLI view or superview with a password. Note You must issue this command before you can configure additional attributes for the view.
Step 5	view <i>view-name</i> Example: Router(config-view)# view view_three	Adds a normal CLI view to a superview. Issue this command for each CLI view that is to be added to a given superview.

	Command or Action	Purpose
Step 6	exit Example: Router(config-view)# exit	Exits view configuration mode.
Step 7	exit Example: Router(config)# exit	Exits global configuration mode.
Step 8	show parser view [all] Example: Router# show parser view	<p>(Optional) Displays information about the view that the user is currently in.</p> <ul style="list-style-type: none"> all—Displays information for all views that are configured on the router. <p>Note Although this command is available for both root and lawful intercept users, the all keyword is available only to root users. However, the all keyword can be configured by a user in root view to be available for users in lawful intercept view and CLI view.</p>

Monitoring Views and View Users

To display debug messages for all views—root, CLI, lawful intercept, and super, use the **debug parser view** command in privileged EXEC mode.

Configuration Examples for Role-Based CLI Access

This section contains the following configuration examples:

- [Configuring a CLI View: Example, page 9](#)
- [Verifying a CLI View: Example, page 10](#)
- [Configuring a Lawful Intercept View: Example, page 11](#)
- [Configuring a Superview: Example, page 12](#)

Configuring a CLI View: Example

The following example shows how to configure two CLI views, “first” and “second.” Thereafter, you can verify the CLI view in the running configuration.

```
Router(config)# parser view first
00:11:40:%PARSER-6-VIEW_CREATED:view 'first' successfully created.
Router(config-view)# secret 5 firstpass
Router(config-view)# command exec include show version
Router(config-view)# command exec include configure terminal
Router(config-view)# command exec include all show ip
Router(config-view)# exit
Router(config)# parser view second
```

```

00:13:42:%PARSER-6-VIEW_CREATED:view 'second' successfully created.
Router(config-view)# secret 5 secondpass
Router(config-view)# command exec include-exclusive show ip interface
Router(config-view)# command exec include logout
Router(config-view)# exit
!
!
Router(config-view)# do show run | beg view
parser view first
secret 5 $1$MCmh$QuZaU8PIMPlff9sFCZvgW/
commands exec include configure terminal
commands exec include configure
commands exec include all show ip
commands exec include show version
commands exec include show
!
parser view second
secret 5 $1$iP2M$R16BXKecMEiQesxLyqygW.
commands exec include-exclusive show ip interface
commands exec include show ip
commands exec include show
commands exec include logout
!

```

Verifying a CLI View: Example

After you have configured the CLI views “first” and “second,” you can issue the **enable view** command to verify which commands are available in each view. The following example shows which commands are available inside the CLI view “first” after the user has logged into this view. (Because the **show ip interface** command is configured with the all option, a complete set of suboptions is shown, except the **show ip interface** command, which is using the include-exclusive keyword in the second view.)

```

Router# enable view first
Password:

00:28:23:%PARSER-6-VIEW_SWITCH:successfully set to view 'first'.
Router# ?
Exec commands:
  configure  Enter configuration mode
  enable     Turn on privileged commands
  exit       Exit from the EXEC
  show       Show running system information

Router# show ?

  ip          IP information
  parser      Display parser information
  version     System hardware and software status

Router# show ip ?

  access-lists      List IP access lists
  accounting         The active IP accounting database
  aliases           IP alias table
  arp               IP ARP table
  as-path-access-list List AS path access lists
  bgp               BGP information
  cache             IP fast-switching route cache
  casa              display casa information
  cef               Cisco Express Forwarding
  community-list    List community-list

```

dfp	DFP information
dhcp	Show items in the DHCP database
drp	Director response protocol
dvmrp	DVMRP information
eigrp	IP-EIGRP show commands
extcommunity-list	List extended-community list
flow	NetFlow switching
helper-address	helper-address table
http	HTTP information
igmp	IGMP information
irdp	ICMP Router Discovery Protocol
.	
.	
.	

Configuring a Lawful Intercept View: Example

The following example shows how to configure a lawful intercept view, add users to the view, and verify the users that were added:

```
!Initialize the LI-View.
Router(config-view)# li-view lipass user li_admin password li_adminpass
00:19:25:%PARSER-6-LI_VIEW_INIT:LI-View initialized.
Router(config-view)# end

! Enter the LI-View; that is, check to see what commands are available within the view.
Router# enable view li-view
Password:

Router#
00:22:57:%PARSER-6-VIEW_SWITCH:successfully set to view 'li-view'.
Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# parser view li-view
Router(config-view)# ?
View commands:
  commands  Configure commands for a view
  default   Set a command to its defaults
  exit      Exit from view configuration mode
  name      New LI-View name      ===This option only resides in LI View.
  no        Negate a command or set its defaults
  password  Set a password associated with CLI views

Router(config-view)#

! NOTE:LI View configurations are never shown as part of 'running-configuration'.

! Configure LI Users.
Router(config)# username lawful-intercept li-user1 password li-user1pass
Router(config)# username lawful-intercept li-user2 password li-user2pass

! Displaying LI User information.
Router# show users lawful-intercept

li_admin
li-user1
li-user2
Router#
```

Configuring a Superview: Example

The following sample output from the **show running-config** command shows that “view_one” and “view_two” have been added to superview “su_view1,” and “view_three” and “view_four” have been added to superview “su_view2”:

```
!
parser view su_view1 superview
 secret 5 <encoded password>
 view view_one
 view view_two
!
parser view su_view2 superview
 secret 5 <encoded password>
 view view_three
 view view_four
!
```

Security with Passwords, Privilege Levels, and Login Usernames for CLI Sessions on Networking Devices

Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

Cisco IOS based networking devices provide several features that can be used to implement basic security for CLI sessions using only the operating system running on the device. These features include the following:

- Different levels of authorization for CLI sessions to control access to commands that can modify the status of the networking device versus commands that are used to monitor the device
- Assigning passwords to CLI sessions
- Requiring users log in to a networking device with a username
- Changing the privilege levels of commands to create new authorization levels for CLI sessions.

This module is a guide to implementing a baseline level of security for your networking devices. It focuses on the least complex options available for implementing a baseline level of security. If you have networking devices installed in your network with no security options configured, or you are about to install a networking device and you need help understanding the how to implement a baseline of security, this document will help you.

Module History

This module was first published on May 2nd, 2005, and last updated on May 2nd, 2005.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all features. To find information about feature support and configuration, use the [“Feature Information for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices”](#) section on page 42.

Restrictions for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

Your networking device must not be configured to use any local or remote authentication, authorization, and accounting (AAA) security features. This document describes only the non-AAA security features that can be configured locally on the networking device.

For information how to configure AAA security features that can be run locally on a networking device, or for information on how to configure remote AAA security using TACACS+ or RADIUS servers, see the [Cisco IOS Security Configuration Guide](#), Release 12.4.

Information About Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

To configure router security with passwords, CLI privilege levels and usernames, you should understand the following concepts:

- [Benefits of Creating a Security Scheme for Your Networking Device, page 3](#)
- [Cisco IOS CLI Modes, page 3](#)
- [Cisco IOS CLI Sessions, page 10](#)
- [Protect Access to Cisco IOS EXEC Modes, page 11](#)
- [Cisco IOS Password Encryption Levels, page 11](#)
- [Cisco IOS CLI Session Usernames, page 13](#)
- [Cisco IOS Privilege Levels, page 13](#)
- [Cisco IOS Password Configuration, page 14](#)

Benefits of Creating a Security Scheme for Your Networking Device

The foundation of a good security scheme in the network is the protection of the user interfaces of the networking devices from unauthorized access. Protecting access to the user interfaces on your networking devices prevents unauthorized users from making configuration changes that can disrupt the stability of your network or compromise your network security.

The Cisco IOS features described in this document can be combined in many different ways to create a unique security scheme for each of your networking devices. Here are some possible examples that you can configure:

- You can enable non administrative users to run a subset of the administrative commands available on the networking device by lowering the entitlement level for the commands to the non administrative privilege level. This can be useful for the following scenarios:
 - ISPs that want their first-line technical support staff to perform tasks such as enabling new interfaces for new customers or resetting the connection for a customer whose connection has stopped passing traffic. See the [“Configuring and Verifying a Networking Device to Allow Non Administrative Users to Shutdown and Enable Interfaces: Example”](#) section on page 38 section for an example of how to do this.
 - When you want your first-line technical support staff to have the ability to clear console port sessions that were disconnected improperly from a terminal server. See the [“Configuring and Verifying a Networking Device to Allow Non Administrative Users to Clear Remote CLI Sessions: Example”](#) section on page 37 section for an example of how to do this.
 - When you want your first-line technical support staff to have the ability to view, but not change, the configuration of a networking device to facilitate troubleshooting a networking problem. See the [“Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example”](#) section on page 38 section for an example of how to do this.

Cisco IOS CLI Modes

To aid in the configuration of Cisco devices, the Cisco IOS command-line interface is divided into different command modes. Each command mode has its own set of commands available for the configuration, maintenance, and monitoring of router and network operations. The commands available to you at any given time depend on the mode you are in. Entering a question mark (?) at the system prompt (router prompt) allows you to obtain a list of commands available for each command mode.

The use of specific commands allows you to navigate from one command mode to another. The standard order in which a user would access the modes is as follows: user EXEC mode; privileged EXEC mode; global configuration mode; specific configuration modes; configuration submodes; and configuration subsubmodes.

Note

The default configuration of a Cisco IOS software based networking device only allows you to configure passwords to protect access to user EXEC mode (for local, and remote CLI sessions) and privileged EXEC mode. This document describes how you can provide additional levels of security by protecting access to other modes, and commands, using a combination of usernames, passwords and the **privilege** command.

Most EXEC mode commands are one-time commands, such as **show** or **more** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. EXEC mode commands are not saved across reboots of the router.

From privileged EXEC mode, you can enter *global configuration mode*. In this mode, you can enter commands that configure general system characteristics. You also can use global configuration mode to enter specific configuration modes. Configuration modes, including global configuration mode, allow you to make changes to the running configuration. If you later save the configuration, these commands are stored across router reboots.

From global configuration mode you can enter a variety of protocol-specific or feature-specific configuration modes. The CLI hierarchy requires that you enter these specific configuration modes only through global configuration mode. For example, *interface configuration mode*, is a commonly used configuration mode.

From configuration modes, you can enter configuration submodes. Configuration submodes are used for the configuration of specific features within the scope of a given configuration mode. As an example, this chapter describes the *subinterface configuration mode*, a submode of the interface configuration mode.

ROM monitor mode is a separate mode used when the router cannot boot properly. If your system (router, switch, or access server) does not find a valid system image to load when it is booting, the system will enter ROM monitor mode. ROM monitor (ROMMON) mode can also be accessed by interrupting the boot sequence during startup. ROMMON is not covered in this document because it does not have any security features available in it.

The following sections contain detailed information on these command modes:

- [User EXEC Mode](#)
- [Privileged EXEC Mode](#)
- [Global Configuration Mode](#)
- [Interface Configuration Mode](#)
- [Subinterface Configuration Mode](#)

User EXEC Mode

When you start a session on a router, you generally begin in *user EXEC mode*, which is one of two access levels of the EXEC mode. For security purposes, only a limited subset of EXEC commands are available in user EXEC mode. This level of access is reserved for tasks that do not change the configuration of the router, such as determining the router status.

If your device is configured to require users to log-in the log-in process will require a username and a password. You may try three times to enter a password before the connection attempt is refused.

User EXEC mode is set by default to privilege level 1. Privileged EXEC mode is set by default to privilege level 15. For more information see the [“Privileged EXEC Mode” section on page 6](#). When you are logged into a networking device in user EXEC mode your session is running at privilege level 1. By default the EXEC commands at privilege level 1 are a subset of those available at privilege level 15. When you are logged into a networking device in privileged EXEC mode your session is running at privilege level 15. You can move commands to any privilege level between 1 and 15 using the **privilege** command. See the [“Cisco IOS Privilege Levels” section on page 13](#) for more information on privilege levels and the **privilege** command.

In general, the user EXEC commands allow you to connect to remote devices, change terminal line settings on a temporary basis, perform basic tests, and list system information.

To list the available user EXEC commands, use the following command:

Command	Purpose
Router(config)# ?	Lists the user EXEC mode commands

The user EXEC mode prompt consists of the host name of the device followed by an angle bracket (>), as shown in the following example:

```
Router>
```

The default host name is generally `Router`, unless it has been changed during initial configuration using the **setup** EXEC command. You also change the host name using the **hostname** global configuration command.

Note

Examples in Cisco IOS documentation assume the use of the default name of “Router.” Different devices (for example, access servers) may use a different default name. If the routing device (router, access server, or switch) has been named with the **hostname** command, that name will appear as the prompt instead of the default name.

To list the commands available in user EXEC mode, enter a question mark (?) as shown in the following example:

```
Router> ?
Exec commands:
<1-99>          Session number to resume
connect         Open a terminal connection
disconnect      Disconnect an existing telnet session
enable         Turn on privileged commands
exit           Exit from Exec mode
help           Description of the interactive help system
lat            Open a lat connection
lock           Lock the terminal
login          Log in as a particular user
logout         Exit from Exec mode and log out
menu          Start a menu-based user interface
mbranch       Trace multicast route for branch of tree
mrbranch      Trace reverse multicast route to branch of tree
mtrace        Trace multicast route to group
name-connection Name an existing telnet connection
pad           Open a X.29 PAD connection
ping          Send echo messages
resume        Resume an active telnet connection
show          Show running system information
sysstat       Display information about terminal lines
telnet        Open a telnet connection
terminal      Set terminal line parameters
tn3270        Open a tn3270 connection
trace         Trace route to destination
where         List active telnet connections
x3            Set X.3 parameters on PAD
```

The list of commands will vary depending on the software feature set and router platform you are using.

Note

You can enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive. However, Cisco IOS documentation convention is to always present commands in lowercase.

Privileged EXEC Mode

In order to have access to all commands, you must enter *privileged EXEC mode*, which is the second level of access for the EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. In privileged EXEC mode, you can enter any EXEC command, because privileged EXEC mode is a superset of the user EXEC mode commands.

Because many privileged EXEC mode commands set operating parameters, privileged EXEC level access should be password protected to prevent unauthorized use. The privileged EXEC command set includes those commands contained in user EXEC mode. Privileged EXEC mode also provides access to configuration modes through the **configure** command, and includes advanced testing commands, such as **debug**.

Privileged EXEC mode is set by default to privilege level 15. User EXEC mode is set by default to privilege level 1. For more information see the [“User EXEC Mode” section on page 4](#). When you are logged into a networking device in privileged EXEC mode your session is running at privilege level 15. When you are logged into a networking device in user EXEC mode your session is running at privilege level 1. By default the EXEC commands at privilege level 15 are a superset of those available at privilege level 1. You can move commands to any privilege level between 1 and 15 using the **privilege** command. See the [“Cisco IOS Privilege Levels” section on page 13](#) for more information on privilege levels and the **privilege** command.

The privileged EXEC mode prompt consists of the host name of the device followed by a pound sign(#), as shown in the following example:

```
Router#
```

To access privileged EXEC mode, use the following command:

Command	Purpose
Router> enable Password Router# exit Router>	Enables privileged EXEC mode. <ul style="list-style-type: none"> If a privileged EXEC mode password has been configured the system will prompt you for a password after you issue the enable command. Use the exit command to leave privileged EXEC mode.

Note

Privileged EXEC mode is sometimes referred to as “enable mode,” because the **enable** command is used to enter the mode.

If a password has been configured on the system, you will be prompted to enter it before being allowed access to privileged EXEC mode. The password is not displayed on the screen and is case sensitive. If an enable password has not been set, privileged EXEC mode can be accessed only by a local CLI session (terminal connected to the console port).

If you attempt to access privileged EXEC mode on a router over a remote connection, such as a telnet connection, and you have not configured a password for privileged EXEC mode you will see the **% No password set** error message. For more information on remote connections see the [“Remote CLI Sessions” section on page 10](#). The system administrator uses the **enable secret** or **enable password** global configuration commands to set the password that restricts access to privileged EXEC mode. For information on configuring a password for privileged EXEC mode, see the [“Protecting Access to Privileged Exec Mode” section on page 20](#).

To return to user EXEC mode, use the following command:

Command	Purpose
Router# disable	Exits from privileged EXEC mode to user EXEC mode.

The following example shows the process of accessing privileged EXEC mode:

```
Router> enable
Password:<letmein>
Router#
```

Note that the password will not be displayed as you type, but is shown here for illustrational purposes. To list the commands available in privileged EXEC mode, issue the **?** command at the prompt. From privileged EXEC mode you can access global configuration mode, which is described in the following section.

**Note**

Because the privileged EXEC command set contains all of the commands available in user EXEC mode, some commands can be entered in either mode. In Cisco IOS documentation, commands that can be entered in either user EXEC mode or privileged EXEC mode are referred to as EXEC mode commands. If user or privileged is not specified in the documentation, assume that you can enter the referenced commands in either mode.

Global Configuration Mode

The term “global” is used to indicate characteristics or features that affect the system as a whole. Global configuration mode is used to configure your system globally, or to enter specific configuration modes to configure specific elements such as interfaces or protocols. Use the **configure terminal** privileged EXEC command to enter global configuration mode.

To access global configuration mode, use the following command in privileged EXEC mode:

Command	Purpose
Router# configure terminal	From privileged EXEC mode, enters global configuration mode.

The following example shows the process of entering global configuration mode from privileged EXEC mode:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#
```

Note that the system prompt changes to indicate that you are now in global configuration mode. The prompt for global configuration mode consists of the host-name of the device followed by (config) and the pound sign (#). To list the commands available in privileged EXEC mode, issue the **?** command at the prompt.

Commands entered in global configuration mode update the running configuration file as soon as they are entered. In other words, changes to the configuration take effect each time you press the Enter or Return key at the end of a valid command. However, these changes are not saved into the startup configuration file until you issue the **copy running-config startup-config** EXEC mode command. This behavior is explained in more detail later in this document.

As shown in the example above, the system dialogue prompts you to end your configuration session (exit configuration mode) by pressing the Control (Ctrl) and “z” keys simultaneously; when you press these keys, ^Z is printed to the screen. You can actually end your configuration session by entering the Ctrl-Z key combination, using the **end** command, using the Ctrl-C key combination. The **end** command is the recommended way to indicate to the system that you are done with the current configuration session.

Caution

If you use Ctrl-Z at the end of a command line in which a valid command has been typed, that command will be added to the running configuration file. In other words, using Ctrl-Z is equivalent to hitting the Enter (Carriage Return) key before exiting. For this reason, it is safer to end your configuration session using the **end** command. Alternatively, you can use the Ctrl-C key combination to end your configuration session without sending a Carriage Return signal.

You can also use the **exit** command to return from global configuration mode to EXEC mode, but this only works in global configuration mode. Pressing Ctrl-Z or entering the **end** command will always take you back to EXEC mode regardless of which configuration mode or configuration submode you are in.

To exit global configuration command mode and return to privileged EXEC mode, use one of the following commands:

Command	Purpose
Router(config)# end or Router(config)# ^Z	Ends the current configuration session and returns to privileged EXEC mode.
Router(config)# exit	Exits the current command mode and returns to the preceding mode. For example, exits from global configuration mode to privileged EXEC mode.

From global configuration mode, you can enter a number of protocol-specific, platform-specific, and feature-specific configuration modes.

Interface configuration mode, described in the following section, is an example of a configuration mode you can enter from global configuration mode.

Interface Configuration Mode

One example of a specific configuration mode you enter from global configuration mode is interface configuration mode.

Many features are enabled on a per-interface basis. Interface configuration commands modify the operation of an interface such as an Ethernet, FDDI, or serial port. Interface configuration commands always follow an **interface** global configuration command, which defines the interface type.

For details on interface configuration commands that affect general interface parameters, such as bandwidth or clock rate, refer to the Release 12.2 *Cisco IOS Interface Configuration Guide*. For protocol-specific commands, refer to the appropriate Cisco IOS software command reference.

To access and list the interface configuration commands, use the following command:

Command	Purpose
Router(config)# interface <i>type number</i>	Specifies the interface to be configured, and enters interface configuration mode.

In the following example, the user enters interface configuration mode for serial interface 0. The new prompt, `hostname(config-if)#`, indicates interface configuration mode.

```
Router(config)# interface serial 0
Router(config-if)#
```

To exit interface configuration mode and return to global configuration mode, enter the **exit** command. Configuration submodes are configuration modes entered from other configuration modes (besides global configuration mode). Configuration submodes are for the configuration of specific elements within the configuration mode. One example of a configuration submode is subinterface configuration mode, described in the following section.

Subinterface Configuration Mode

From interface configuration mode, you can enter subinterface configuration mode. Subinterface configuration mode is a submode of interface configuration mode. In subinterface configuration mode you can configure multiple virtual interfaces (called subinterfaces) on a single physical interface. Subinterfaces appear to be distinct physical interfaces to the various protocols.

For detailed information on how to configure subinterfaces, refer to the appropriate documentation module for a specific protocol in the Cisco IOS software documentation set.

To access subinterface configuration mode, use the following command in interface configuration mode:

Command	Purpose
Router(config-if)# interface <i>type number</i>	Specifies the virtual interface to be configured and enters subinterface configuration mode.

In the following example, a subinterface is configured for serial line 2, which is configured for Frame Relay encapsulation. The subinterface is identified as “2.1” to indicate that it is subinterface 1 of serial interface 2. The new prompt `hostname(config-subif)#` indicates subinterface configuration mode. The subinterface can be configured to support one or more Frame Relay PVCs.

```
Router(config)# interface serial 2
Router(config-if)# encapsulation frame-relay
Router(config-if)# interface serial 2.1
Router(config-subif)#
```

To exit subinterface configuration mode and return to interface configuration mode, use the **exit** command. To end your configuration session and return to privileged EXEC mode, press Ctrl-Z or enter the **end** command.

Cisco IOS CLI Sessions

This section describes the following concepts:

- [Local CLI Sessions, page 10](#)
- [Remote CLI Sessions, page 10](#)
- [Terminal Lines are Used for Local and Remote CLI Sessions, page 10](#)

Local CLI Sessions

Local CLI sessions require direct access to the console port of the networking device. Local CLI sessions start in user EXEC mode. See the “[Cisco IOS CLI Modes](#)” section on page 3 for more information on the different modes that are supported on your networking device. All of the tasks required to configure and manage a networking device can be done using a local CLI session. The most common method for establishing a local CLI session is to connect the serial port on a PC to the console port of the networking device and then to launch a terminal emulation application on the PC. The type of cable and connectors required and the settings for the terminal emulation application on the PC are dependant on the type of networking device that you are configuring. See to the documentation for your networking device for more information on setting it up for a local CLI session.

Remote CLI Sessions

Remote CLI sessions are created between a host such as a PC and a networking device such as a router over a network using a remote terminal access application such as Telnet and Secure Shell (SSH). Local CLI sessions start in user EXEC mode. See the “[Cisco IOS CLI Modes](#)” section on page 3 for more information on the different modes that are supported on your networking device. Most of the tasks required to configure and manage a networking device can be done using a remote CLI session. The exceptions are tasks that interact directly with the console port (such as recovering from a corrupted operating system (OS) by uploading a new OS image over the console port) and interacting with the networking device when it is in ROM Monitor Mode.

This document explains how to configure security for remote Telnet sessions. Telnet is the most common method for accessing a remote CLI session on a networking device.

Note

SSH is a more secure alternative to Telnet. SSH provides encryption for the session traffic between your local management device such as a PC and the networking device that you are managing. Encrypting the session traffic with SSH prevents hackers that might intercept the traffic from being able to decode it. See [Secure Shell Version 2 Support](#) (http://www.cisco.com/en/US/products/sw/iosswrel/ps5207/products_feature_guide09186a00802045dc.html) for more information on using SSH.

Terminal Lines are Used for Local and Remote CLI Sessions

Cisco networking devices use the word lines to refer to the software components that manage local and remote CLI sessions. You use the **line console 0** global configuration command to enter line configuration mode to configure options, such as a password, for the console port.

```
Router# configure terminal
Router(config)# line console 0
Router(config-line)# password password-string
```

Remote CLI sessions use lines that are referred to virtual teletypewriter (VTY) lines. You use the **line vty line-number [ending-line-number]** global configuration command to enter line configuration mode to configure options, such as a password, for remote CLI sessions.

```
Router# configure terminal
Router(config)# line vty 0 4
Router(config-line)# password password-string
```

Protect Access to Cisco IOS EXEC Modes

Cisco IOS provides the ability to configure passwords that protect access to the following:

- [Protecting Access to User EXEC Mode, page 11](#)
- [Protecting Access to Privileged EXEC mode, page 11](#)

Protecting Access to User EXEC Mode

The first step in creating a secure environment for your networking device is protecting access to user EXEC mode by configuring passwords for local and remote CLI sessions.

You protect access to user EXEC mode for local CLI sessions by configuring a password on the console port. See the [“Configuring and Verifying a Password for Local CLI Sessions” section on page 18](#).

You protect access to user EXEC mode for remote CLI sessions by configuring a password on the virtual terminal lines (VTYs). See the [“Configuring and Verifying a Password for Remote CLI Sessions” section on page 15](#) for instructions on how to configure passwords for remote CLI sessions.

Protecting Access to Privileged EXEC mode

The second step in creating a secure environment for your networking device is protecting access to privileged EXEC mode with a password. The method for protecting access to privileged EXEC mode is the same for local and remote CLI sessions.

You protect access to privileged EXEC mode by configuring a password for it. This is sometimes referred to as the enable password because the command to enter privileged EXEC mode is **enable**.

Command	Purpose
enable	Enables privileged EXEC mode.
Example: Router> enable Password Router#	<ul style="list-style-type: none">• Enter your password if prompted. The password will not be shown in the terminal window.• The “>” at the end of the prompt string is changed to a “#” to indicate that you are in privileged EXEC mode.

Cisco IOS Password Encryption Levels

Some of the passwords that you configure on your networking device are saved in the configuration in plain text. This means that if you store a copy of the configuration file on a disk, anybody with access to the disk can discover the passwords by reading the configuration file. The following password types are stored as plain text in the configuration by default:

- Console passwords for local CLI sessions
- Virtual terminal line passwords for remote CLI sessions
- Username passwords using the default method for configuring the password
- Privileged EXEC mode password when it is configured with the **enable password** *password* command
- Authentication key chain passwords used by RIPv2 and EIGRP
- BGP passwords for authenticating BGP neighbors
- OSPF authentication keys for authenticating OSPF neighbors
- ISIS passwords for authenticating ISIS neighbors

This excerpt from a router configuration file shows examples of passwords and authentication keys that are stored as clear text.

```
!
enable password 09Jb6D
!
username gjones password 0 kv9sIj3
!
key chain trees
  key 1
    key-string willow
!
interface Ethernet1/0.1
 ip address 172.16.6.1 255.255.255.0
 ip router isis
 ip rip authentication key-chain trees
 ip authentication key-chain eigrp 1 trees
 ip ospf authentication-key j7876
 no snmp trap link-status
 isis password u7865k
!
line vty 0 4
 password v9jA5M
!
```

You can encrypt these clear text passwords in the configuration file by using the **service password-encryption** command. This should be considered only a minimal level of security because the encryption algorithm used by the **service password-encryption** command to encrypt passwords creates text strings that be decrypted using tools that are publicly available. You should still protect access to any electronic or paper copies of your configuration files after you use the **service password-encryption** command.

The **service password-encryption** command does not encrypt the passwords when they are sent to the remote device. Anybody with a network traffic analyzer who has access to you network can capture these passwords from the packets as they are transmitted between the devices. See the [“Configuring Password Encryption for Clear Text Passwords”](#) section on page 22 for more information on encrypting clear text passwords in configuration files.

Many of the Cisco IOS features that use clear text passwords can also be configured to use the more secure MD5 algorithm. The MD5 algorithm creates a text string in the configuration file that is much more difficult to decrypt. The MD5 algorithm does not send the password to the remote device. This prevents people using a traffic analyzer to capture traffic on your network from being able to discover your passwords.

You can determine the type of password encryption that has been used by the number that is stored with the password string in the configuration file of the networking device. The number 5 in the configuration excerpt below indicates that the enable secret password has been encrypted using the MD5 algorithm.

```
!  
enable secret 5 $1$fGCS$rkYbR6.Z8xo4qCl3vghWQ0  
!
```

The number 5 in the excerpt below indicates that the enable password has been encrypted using the less secure algorithm used by the **service password-encryption** command.

```
!  
enable password 7 00081204  
!
```

Cisco IOS CLI Session Usernames

After you have protected access to user EXEC mode and privileged EXEC mode by configuring passwords for them you can further increase the level of security on your networking device by configuring usernames to limit access to CLI sessions to your networking device to specific users.

Usernames that are intended to be used for managing a networking device can be modified with additional options such as:

- Automatically starting a CLI session at a specific privilege level. See [“Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff” section on page 30](#).
- Running a CLI command automatically. See [“Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example” section on page 38](#).

See the [Cisco IOS Security Command Reference](#), Release, 12.4

(http://www.cisco.com/univercd/cc/td/doc/product/software/ios124/124cr/hsec_r/index.htm) for more information on how to configure the **username** command.

Cisco IOS Privilege Levels

The default configuration for Cisco IOS based networking devices uses privilege level 1 for user EXEC mode and privilege level 15 for privileged EXEC. The commands that can be run in user EXEC mode at privilege level 1 are a subset of the commands that can be run in privileged EXEC mode at privilege 15.

The **privilege** command is used to move commands from one privilege level to another. For example, some ISPs allow their first level technical support staff to enable and disable interfaces to activate new customer connections or to restart a connection that has stopped transmitting traffic. See the [“Configuring and Verifying a Networking Device to Allow Non Administrative Users to Shutdown and Enable Interfaces: Example” section on page 38](#) for an example of how to configure this option.

The **privilege** command can also be used to assign a privilege level to a username so that when a user logs in with the username, the session will run at the privilege level specified by the **privilege** command. For example if you want your technical support staff to view the configuration on a networking device to help them troubleshoot network problems without being able to modify the configuration, you can create a username, configure it with privilege level 15, and configure it to run the **show running-config** command automatically. When a user logs in with the username the running configuration will be displayed automatically. The user’s session will be logged out automatically after the user has viewed the last line of the configuration. See the [“Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example” section on page 38](#) for an example of how to configure this option.

These command privileges can also be implemented when using AAA with TACACS+ and RADIUS. For example, TACACS+ provides two ways to control the authorization of router commands on a per-user or per-group basis. The first way is to assign privilege levels to commands and have the router verify with the TACACS+ server whether or not the user is authorized at the specified privilege level. The second way is to explicitly specify in the TACACS+ server, on a per-user or per-group basis, the commands that are allowed. For more information about implementing AAA with TACACS+ and RADIUS, see the technical note [How to Assign Privilege Levels with TACACS+ and RADIUS](#).

Cisco IOS Password Configuration

Cisco IOS software does not prompt you to repeat any passwords that you configure to verify that you have entered the passwords exactly as you intended. New passwords, and changes to existing passwords, go into effect immediately after you press the Enter key at the end of a password configuration command string. If you make a mistake when you enter a new password and have saved the configuration on the networking device to its startup configuration file and exited privileged EXEC mode before you realize that you made a mistake, you may find that you are no longer able to manage the device.

The following are common situations that can happen:

- You make a mistake configuring a password for local CLI sessions on the console port.
 - If you have properly configured access to your networking device for remote CLI sessions, you can Telnet to it and reconfigure the password on the console port.
- You make a mistake configuring a password for remote Telnet or SSH sessions.
 - If you have properly configured access to your networking device for local CLI sessions, you can connect a terminal to it and reconfigure the password for the remote CLI sessions.
- You make a mistake configuring a password for privileged EXEC mode (enable password or enable secret password).
 - You will have to perform a lost password recovery procedure.
- You make a mistake configuring your username password, and the networking device requires that you log into it with your username.
 - If you do not have access to another account name, you will have to perform a lost password recovery procedure.

To protect yourself from having to perform a lost password recovery procedure open two CLI sessions to the networking device and keep one of them in privilege EXEC mode while you reset the passwords using the other session. You can use the same device (PC or terminal) to run the two CLI sessions or two different devices. You can use a local CLI session and a remote CLI session or two remote CLI sessions for this procedure. The CLI session that you use to configure the password can also be used to verify that the password was changed properly. The other CLI session that you keep in privileged EXEC mode can be used to change the password again if you made a mistake the first time you configured it.

You should not save password changes that you have made in the running configuration to the startup configuration until you have verified that your password was changed successfully. If you discover that you made a mistake configuring a password, and you were not able to correct the problem using the second CLI session technique described above, you can power cycle the networking device so that it returns to the previous passwords that are stored in the startup configuration.

How To Configure Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

This section contains the following procedures:

- [Protecting Access to User Exec Mode, page 15](#)
- [Protecting Access to Privileged Exec Mode, page 20](#)
- [Configuring Security Options with Passwords, Privilege Levels and usernames to Manage Access to CLI Sessions and CLI Commands, page 25](#)
- [Recovering from a Lost or Misconfigured Password for Local CLI Sessions, page 33](#)
- [Recovering from a Lost or Misconfigured Password for Remote CLI Sessions, page 34](#)
- [Recovering from a Lost or Misconfigured Passwords for Privileged EXEC Mode, page 35](#)

Protecting Access to User Exec Mode

This section contains the following procedures:

- [Configuring and Verifying a Password for Remote CLI Sessions, page 15](#)
- [Configuring and Verifying a Password for Local CLI Sessions, page 18](#)

Configuring and Verifying a Password for Remote CLI Sessions

This task will assign a password for remote CLI sessions. After you have completed this task the networking device will prompt you for a password the next time that you start a remote CLI session with it.

Cisco IOS based networking devices require that you have a password configured for remote CLI sessions. If you attempt to start a remote CLI session with a device that doesn't have a password configured for remote CLI sessions you will see a message that a password is required and has not been set. The remote CLI session will be terminated by the remote host.

Prerequisites

If you have not previously configured a password for remote CLI sessions, you must perform this task over a local CLI session using a terminal or a PC running a terminal emulation application, attached to the console port.

Your terminal, or terminal emulation application, must be configured with the settings that are used by the console port on the networking device. The console ports on most Cisco networking devices require the following settings: 9600 baud, 8 data bits, 1 stop bit, no parity, and flow control is set to "none." See the documentation for your networking device if these settings do not work for your terminal.

To perform the verification step (Step 6) for this task, your networking device must have an interface that is in an operational state. The interface must have a valid IP address.

Restrictions

If you have not previously configured a password for remote CLI sessions, you must perform this task over a local CLI session using a terminal attached to the console port.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line vty** *line-number* [*ending-line-number*]
4. **password** *password*
5. **end**
6. telnet ip-address
7. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	line vty <i>line-number</i> [<i>ending-line-number</i>] Example: Router(config)# line vty 0 4	Enters line configuration mode.
Step 4	password <i>password</i> Example: Router(config-line)# password H7x3U8	The argument <i>password</i> is a character string that specifies the line password. The following rules apply to the <i>password</i> argument: <ul style="list-style-type: none"> The first character cannot be a number. The string can contain any alphanumeric characters, including spaces, up to 80 characters. You cannot specify the password in the format number-space-anything. Passwords are case sensitive.
Step 5	end Example: Router(config-line)# end	Exits the current configuration mode and returns to privileged EXEC mode.
Step 6	telnet <i>ip-address</i> Example: Router# telnet 172.16.1.1	Start a remote CLI session with the networking device from your current CLI session using the IP address of an interface in the networking device that is in an operational state (interface up, line protocol up). <ul style="list-style-type: none"> Enter the password that you configured in step 4 when prompted. <p>Note This procedure is often referred to as starting a recursive Telnet session because you are initiating a remote Telnet session with the networking device from the networking device itself.</p>
Step 7	exit	Terminates the remote CLI session (recursive Telnet session) with the networking device.

Troubleshooting Tips

Repeat this task if you made a mistake configuring the remote CLI session password.

What to Do Next

Proceed to the [“Configuring and Verifying a Password for Local CLI Sessions”](#) section on page 18 .

Configuring and Verifying a Password for Local CLI Sessions

This task will assign a password for local CLI sessions over the console port. After you have completed this task, the networking device will prompt you for a password the next time that you start a local CLI session on the console port.

This task can be performed over a local CLI session using the console port or a remote CLI session. If you want to perform the optional step of verifying that you configured the password correctly you should perform this task using a local CLI session using the console port.

Prerequisites

If you want to perform the optional step of verifying the local CLI session password, you must perform this task using a local CLI session. You must have a terminal or a PC running a terminal emulation program, connected to the console port of the networking device. Your terminal must be configured with the settings that are used by the console port on the networking device. The console ports on most Cisco networking devices require the following settings: 9600 baud, 8 data bits, 1 stop bit, no parity, and flow control is set to "none." See the documentation for your networking device if these settings do not work for your terminal.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line console 0**
4. **password *password***
5. **end**
6. **exit**
7. Press the Enter key, and enter the password from Step 4 when prompted.

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	line console 0 Example: Router(config)# line console 0	Enters line configuration mode and selects the console port as the line that you are configuring.
Step 4	password password Example: Router(config-line)# password Ji8F5Z	The argument <i>password</i> is a character string that specifies the line password. The following rules apply to the <i>password</i> argument: <ul style="list-style-type: none"> The first character cannot be a number. The string can contain any alphanumeric characters, including spaces, up to 80 characters. You cannot specify the password in the format number-space-anything. Passwords are case sensitive.
Step 5	end Example: Router(config-line)# end	Exits the current configuration mode and returns to privileged EXEC mode.
Step 6	exit Example: Router# exit	Exits privileged EXEC mode.
Step 7	Press the Enter key.	(Optional) Initiates the local CLI session on the console port. <ul style="list-style-type: none"> Enter the password that you configured in step 4 when prompted to verify that it was configured correctly. Note This step can be performed only if you are using a local CLI session to perform this task.

Troubleshooting Tips

If your new password is not accepted proceed to the [“Recovering from a Lost or Misconfigured Password for Local CLI Sessions”](#) section on page 33 for instructions on what to do next.

What to Do Next

Proceed to the [“Protecting Access to Privileged Exec Mode”](#) section on page 20.

Protecting Access to Privileged Exec Mode

This section contains the following procedures:

- [Configuring and Verifying the Enable Password, page 20](#) (optional)
- [Configuring Password Encryption for Clear Text Passwords, page 22](#) (optional)
- [Configuring and Verifying the Enable Secret Password, page 23](#) (recommended)

Configuring and Verifying the Enable Password

Cisco no longer recommends that you use the **enable password** command to configure a password for privileged EXEC mode. The password that you enter with the **enable password** command is stored as plain text in the configuration file of the networking device. You can encrypt the password for the **enable password** command in the configuration file of the networking device using the **service password-encryption** command. However the encryption level used by the **service password-encryption** command can be decrypted using tools available on the Internet.

Instead of using the **enable password** command, Cisco recommends using the **enable secret** command because it encrypts the password that you configure with it with strong encryption . For more information on password encryption issues see the [“Cisco IOS Password Encryption Levels” section on page 11](#). For information on configuring the **enable secret** command see the [“Configuring and Verifying the Enable Secret Password” section on page 23](#).

Restrictions

The networking device must not have a password configured by the **enable secret** command in order to perform this task successfully. If you have already configured a password for privileged EXEC mode using the **enable secret** command, the password configured takes precedences over the password that you configure in this task using the **enable password** command.

You cannot use the same password for the **enable secret** command and the **enable password** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **enable password** *password*
4. **end**
5. **exit**
6. **enable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	enable password password Example: Router(config)# enable password t6D77CdKq	The argument <i>password</i> is a character string that specifies the enable password. The following rules apply to the <i>password</i> argument: <ul style="list-style-type: none"> Must contain from 1 to 25 uppercase and lowercase alphanumeric characters. Must not have a number as the first character. Can have leading spaces, but they are ignored. However, intermediate and trailing spaces are recognized. Can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do the following: <ul style="list-style-type: none"> Enter abc Type Ctrl-v Enter ?123
Step 4	end Example: Router(config)# end	Exits the current configuration mode and returns to privileged EXEC mode.
Step 5	exit Example: Router# exit	Exits privileged EXEC mode.
Step 6	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter the password you configured in step 3.

Troubleshooting Tips

If your new password is not accepted, proceed to the [“Recovering from a Lost or Misconfigured Passwords for Privileged EXEC Mode”](#) section on page 35 for instructions on what to do next.

What to Do Next

Encrypt the clear text enable password in the configuration file of the networking device using the procedure described in [“Configuring Password Encryption for Clear Text Passwords” section on page 22](#).

Configuring Password Encryption for Clear Text Passwords

Cisco IOS stores passwords in clear text in network device configuration files for several features such as passwords for local and remote CLI sessions, and passwords for neighbor authentication for routing protocols. Clear text passwords are a security risk because anybody with access to archived copies of the configuration files can discover the passwords that are stored as clear text. The **service password-encryption** command can be used to encrypt clear text commands in the configuration files of networking devices. See the [“Cisco IOS Password Encryption Levels” section on page 11](#) for more information.

Perform the following steps to configure password encryption for passwords that are stored as clear text in the configuration files of your networking device.

Prerequisites

You must have at least one feature that uses clear text passwords configured on your networking device for this command to have any immediate effect.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service password-encryption**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	service password-encryption Example: Router(config)# service password-encryption	Enables Password encryption for all passwords clear text passwords, including username passwords, authentication key passwords, the privileged command password, console and virtual terminal line access passwords, and Border Gateway Protocol neighbor passwords.
Step 4	end Example: Router(config)# end	Exits the current configuration mode and returns to privileged EXEC mode.

Configuring and Verifying the Enable Secret Password

Cisco recommends that you use the **enable secret** command, instead of the **enable password** command to configure a password for privileged EXEC mode. The password created by the **enable secret** command is encrypted with the more secure MD5 algorithm.

Restrictions

You cannot use the same password for the **enable secret** command and the **enable password** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **enable secret** *password*
or
enable secret *5 previously-encrypted-password*
4. **end**
5. **exit**
6. **enable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	enable secret password or enable secret 5 previously-encrypted-password Example: Router(config)# enable secret t6D77CdKq or Example: Router(config)# enable secret 5 \$1\$/x6H\$RhndI3yLC4GA01aJnHLQ4/	<p>The argument <i>password</i> is a character string that specifies the enable secret password. The following rules apply to the <i>password</i> argument:</p> <ul style="list-style-type: none"> Must contain from 1 to 25 uppercase and lowercase alphanumeric characters. Must not have a number as the first character. Can have leading spaces, but they are ignored. However, intermediate and trailing spaces are recognized. Can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do the following: <ul style="list-style-type: none"> Enter abc Type Ctrl-v Enter ?123 <p>or</p> <p>Sets a previously encrypted password for privileged EXEC mode by entering the number 5 before the previously encrypted string. You must enter an exact copy of a password from a configuration file that was previously encrypted by the enable secret command to use this method.</p>
Step 4	end Example: Router(config)# end	Exits the current configuration mode and returns to privileged EXEC mode.

	Command or Action	Purpose
Step 5	exit Example: Router# exit	Exits privileged EXEC mode.
Step 6	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter the password that you configured in Step 3.

Troubleshooting Tips

If your new password is not accepted proceed to the [“Recovering from a Lost or Misconfigured Passwords for Privileged EXEC Mode”](#) section on page 35 for instructions on what to do next.

What to Do Next

If you have finished configuring passwords for local and remote CLI sessions and you want to configure additional security features, such as usernames, and privilege levels proceed to the [“Configuring Security Options with Passwords, Privilege Levels and usernames to Manage Access to CLI Sessions and CLI Commands”](#) section on page 25.

Configuring Security Options with Passwords, Privilege Levels and usernames to Manage Access to CLI Sessions and CLI Commands

The tasks in this section describe how to configure your networking device to permit the use of a subset of privileged EXEC mode commands by users who should not have access to all of the commands available in privileged EXEC mode.

These tasks are beneficial for companies that have multiple levels of network support staff and the company wants the staff at each level to have access to a different subset of the privileged EXEC mode commands.

In this task the users who should not have access to all of the commands available in privileged EXEC mode are referred to as the first-line technical support staff.

This section contains the following procedures:

- [Configuring the Networking Device for the First-Line Technical Support Staff, page 25](#)
- [Verifying the Configuration for the First-Line Technical Support Staff, page 28](#)
- [Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff, page 30](#)

Configuring the Networking Device for the First-Line Technical Support Staff

This task describes how to configure the networking device for first-line technical support users. First-line technical support staff are usually not allowed to run all of the commands available in privileged EXEC mode (privilege level 15) on a networking device. They are prevented from running commands that they are not authorized for by not being granted access to the password assigned to privileged EXEC mode or to other roles that have been configured on the networking device.

The **privilege** command is used to move commands from one privilege level to another in order to create the additional levels of administration of a networking device that is required by companies that have different levels of network support staff with different skill levels.

The default configuration of a Cisco IOS device permits two types of users to access the CLI. The first type of user is a person who is only allowed to access user EXEC mode. The second type of user is a person who is allowed access to privileged EXEC mode. A user who is only allowed to access user EXEC mode is not allowed to view or change the configuration of the networking device, or to make any changes to the operational status of the networking device. On the other hand, a user who is allowed access to privileged EXEC mode can make any change to a networking device that is allowed by the CLI.

In this task the two commands that normally run at privilege level 15 are reset to privilege level 7 using the **privilege** command in order that first-line technical support users will be allowed to run the two commands. The two commands for which the privilege levels will be reset are the **clear counters** command and **reload** command.

- The **clear counters** command is used to reset the counter fields on interfaces for statistics such as packets received, packets transmitted, and errors. When a first-line technical support user is troubleshooting an interface related connectivity issue between networking devices, or with remote users connecting to the network, it is useful to reset the interface statistics to zero and then monitor the interfaces for a period of time to see if the values in the interface statistics counters change.
- The **reload** command is used to initiate a reboot sequence for the networking device. One common use of the reload command by first-line technical support staff is to cause the networking device to reboot during a maintenance window so that it loads a new operating system that was previously copied onto the networking device's file system by a user with a higher level of authority.

Any user that is permitted to know the **enable secret** password that is assigned to the first-line technical support user role privilege level can access the networking device as a first-line technical support user. You can add an additional level of security by configuring a username on the networking device and requiring that the users know the username and the password. Configuring a username as an additional level of security is described in the [“Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff”](#) section on page 30.

Privilege Command Enhancement

Before Cisco IOS Releases 12.0(22)S and 12.2(13)T, each command in a privilege level had to be specified with a separate **privilege** command. In Cisco IOS Releases 12.0(22)S, 12.2(13)T, and later releases, a “wildcard” option specified by the new keyword **all** was introduced that allows you to configure access to multiple commands with only one **privilege** command. By using the new **all** keyword, you can specify a privilege level for all commands which begin with the string you enter. In other words, the **all** keyword allows you to grant access to all command-line options and suboptions for a specified command.

For example, if you wanted to create a privilege level to allow users to configure all commands which begin with **service-module t1** (such as **service-module t1 linecode** or **service-module t1 clock source**) you can use the **privilege interface all level 2 service-module t1** command instead of having to specify each **service-module t1** command separately.

If the command specified in the privilege command (used with the **all** keyword) enables a configuration submode, all commands in the submode of that command will also be set to the specified privilege level.

Restrictions

The **all** “wildcard” keyword option for the **privilege** command is not supported in versions of Cisco IOS software prior to Cisco IOS Releases 12.0(22)S and, 12.2(13)T.

You must not have the **aaa new-model** command enabled on the networking device. You must not have the **login local** command configured for the local CLI sessions over the console port or the remote CLI sessions.

**Note**

For clarity, only the arguments and keywords that are relevant for each step are shown in the syntax for the steps in this task. See the Cisco IOS command reference book for your Cisco IOS release for further information on the additional arguments and keywords that can be used with these commands.

**Caution**

Do not use the **no** form of the **privilege** command to reset the privilege level of a command to its default because it might not return the configuration to the correct default state. Use the **reset** keyword for the **privilege** command instead to return a command to its default privilege level. For example, to remove the **privilege exec level reload** command from the configuration and return the **reload** command to its default privilege of 15, use the **privilege exec reset reload** command.

SUMMARY STEPS

1. **enable** *password*
2. **configure terminal**
3. **enable secret level** *level password*
4. **privilege exec level** *level command-string*
5. **privilege exec all level** *level command-string*
6. **end**

DETAILED STEPS

- | | |
|---------------|---|
| Step 1 | enable <i>password</i>
Enters privileged EXEC mode. Enter the password when prompted.
Router> enable |
| Step 2 | configure terminal
Enters global configuration mode.
Router# configure terminal |
| Step 3 | enable secret level <i>level password</i>
Configures a new enable secret password for privilege level 7.
Router(config)# enable secret level 7 Zy72sKj |
| Step 4 | privilege exec level <i>level command-string</i>
Changes the privilege level of the clear counters command from privilege level 15 to privilege level 7.
Router(config)# privilege exec level 7 clear counters |
| Step 5 | privilege exec all level <i>level command-string</i>
Changes the privilege level of the reload command from privilege level 15 to privilege level 7.
Router(config)# privilege exec all level 7 reload |

Step 6 **end**

Exits global configuration mode.

```
Router(config)# end
```

Verifying the Configuration for the First-Line Technical Support Staff

This task describes how to verify that the network device is configured correctly for the first-line technical support staff.

Prerequisites

The following commands must have been modified to run at privilege level 7 for this task:

- **clear counters**
- **reload**

SUMMARY STEPS

1. **enable level password**
2. **show privilege**
3. **clear counters**
4. **clear ip route ***
5. **reload in time**
6. **reload cancel**
7. **disable**
8. **show privilege**

DETAILED STEPS

Step 1 **enable level password**

Logs the user into the networking device at the privilege level specified for the level argument.

```
Router> enable 7 Zy72sKj
```

Step 2 **show privilege**

Displays the privilege level of the current CLI session

```
Router# show privilege
Current privilege level is 7
```

Step 3 **clear counters**

The clear counters command clears the interface counters. This command has been changed from privilege level 15 to privilege level 7.

```
Router# clear counters
Clear "show interface" counters on all interfaces [confirm]
Router#
02:41:37: %CLEAR-5-COUNTERS: Clear counter on all interfaces by console
```

Step 4 **clear ip route ***

The *ip route* argument string for the **clear** command should not be allowed because it was not changed from privilege level 15 to privilege level 7.

```
Router# clear ip route *
      ^
% Invalid input detected at '^' marker.

Router#
```

Step 5 **reload in time**

The **reload** command causes the networking device to reboot.

```
Router# reload in 10
Reload scheduled in 10 minutes by console
Proceed with reload? [confirm]
Router#

***
*** --- SHUTDOWN in 0:10:00 ---
***

02:59:50: %SYS-5-SCHEDULED_RELOAD: Reload requested for 23:08:30 PST Sun Mar 20
```

Step 6 **reload cancel**

The **reload cancel** terminates a reload that was previously setup with the the **reload in time** command.

```
Router# reload cancel

***
*** --- SHUTDOWN ABORTED ---
***

04:34:08: %SYS-5-SCHEDULED_RELOAD_CANCELLED: Scheduled reload cancelled at 15:38:46 PST
Sun Mar 27 2005
```

Step 7 **disable**

Exits the current privilege level and returns to privilege level 1.

```
Router# disable
```

Step 8 **show privilege**

Displays the privilege level of the current CLI session

```
Router> show privilege
Current privilege level is 1
```

Troubleshooting Tips

If your configuration does not work the way that you want it to and you want to remove the privilege commands from the configuration, use the **reset** keyword for the **privilege** command to return the commands to their default privilege level. For example, to remove the command **privilege exec level reload** command from the configuration and return the **reload** command to its default privilege of 15 use the **privilege exec reset reload** command.

What to Do Next

If you want to add an additional level of security by requiring that the first level technical staff use a login name, proceed to the [“Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff”](#) section on page 30.

Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff

This task configures the networking device to require that the first-line technical support staff login to the networking device with a login name of admin. The admin username configured in this task is assigned the privilege level 0f 7 which will allow users who log in with this name to run the commands that were reassigned to privilege level 7 in the previous task. When a user successfully logs in with the admin username, the CLI session will automatically enter privilege level 7.

Enhanced Username Password Security

Before Cisco IOS Releases 12.0(18)S and 12.2(8)T, two types of passwords were associated with usernames: Type 0, which is a clear text password visible to any user who has access to privileged mode on the router, and type 7, which has a password encrypted by the **service password encryption** command.

In Cisco IOS Releases 12.0(18)S, 12.2(8)T, and later releases, the new **secret** keyword for the **username** command allows you to configure Message Digest 5 (MD5) encryption for username passwords.

Prerequisites

The following commands must have been modified to run at privilege level 7 for this task:

- **clear counters**
- **reload**

See the [“Configuring the Networking Device for the First-Line Technical Support Staff”](#) section on page 25 for instructions on how to change the privilege level for a command.

Restrictions

MD5 encryption for the **username** command is not supported in versions of Cisco IOS software prior to Cisco IOS Releases 12.0(18)S and 12.2(8)T.

You must not have the **aaa-new model** command enabled on the networking device. You must not have the **login local** command configured for the local CLI sessions over the console port or the remote CLI sessions.

Note

For clarity, only the arguments and keywords that are relevant for each step are shown in the syntax for the steps in this task. Refer to the Cisco IOS command reference book for your Cisco IOS release for further information on the additional arguments and keywords that can be used with these commands.

SUMMARY STEPS

1. **enable password**
2. **configure terminal**

3. **username** *username* **privilege** *level* **secret** *password*
4. **end**
5. **disable**
6. **login** *username* *password*
7. **show privilege**
8. **clear counters**
9. **clear ip route ***
10. **reload in 10**
11. **reload cancel**
12. **disable**
13. **show privilege**

DETAILED STEPS

Step 1 **enable** *t6D77CdKq*

Enters privileged EXEC mode. Enter the password when prompted.

Router> **enable**

Step 2 **configure terminal**

Enters global configuration mode.

Router# **configure terminal**

Step 3 **username** *username* **privilege** *level* **secret** *password*

Creates a username and applies MD5 encryption to the *password* text string.

Router(config)# **username** *admin* **privilege** 7 **secret** *Kd65xZa*

Step 4 **end**

Exits global configuration mode.

Router(config)# **end**

Step 5 **disable**

Exits the current privilege level and returns to user EXEC mode.

Router# **disable**

Step 6 **login** *username*

Logs in the user. Enter the username and password you configured in step 3 when prompted.

Router> **login** *admin*

Step 7 **show privilege**

The **show privilege** command displays the privilege level of the CLI session.

Router# **show privilege**

Current privilege level is 7

Step 8 **clear counters**

The **clear counters** command clears the interface counters. This command has been changed from privilege level 15 to privilege level 7.

```
Router# clear counters
Clear "show interface" counters on all interfaces [confirm]
Router#
02:41:37: %CLEAR-5-COUNTERS: Clear counter on all interfaces by console
```

Step 9 **clear ip route ***

The *ip route* argument string for the **clear** command is not allowed because it was not changed from privilege level 15 to privilege level 7.

```
Router# clear ip route *
          ^
% Invalid input detected at '^' marker.

Router#
```

Step 10 **reload in time**

The reload command causes the networking device to reboot.

```
Router# reload in 10
Reload scheduled in 10 minutes by console
Proceed with reload? [confirm]
Router#

***
*** --- SHUTDOWN in 0:10:00 ---
***

02:59:50: %SYS-5-SCHEDULED_RELOAD: Reload requested for 23:08:30 PST Sun Mar 20
```

Step 11 **reload cancel**

The **reload cancel** command terminates a reload that was previously setup with the the **reload in time** command.

```
Router# reload cancel

***
*** --- SHUTDOWN ABORTED ---
***

04:34:08: %SYS-5-SCHEDULED_RELOAD_CANCELLED: Scheduled reload cancelled at 15:38:46 PST
Sun Mar 27 2005
```

Step 12 **disable**

Exits the current privilege level and returns to user EXEC mode.

```
Router# disable
```

Step 13 **show privilege**

Displays the privilege level of the current CLI session

```
Router> show privilege
Current privilege level is 1
```

Recovering from a Lost or Misconfigured Password for Local CLI Sessions

There are three methods that can be used to recover from a lost or misconfigured password for local CLI sessions over console port. The method that you will use depends on the current configuration of your networking device.

- [Networking Device Is Configured to Allow Remote CLI Sessions, page 33](#)
- [Networking Device Is Not Configured to Allow Remote CLI Sessions and the Local CLI Session Password Has Not Been Saved to the Startup Configuration File, page 33](#)
- [Networking Device is not Configured to Allow Remote CLI Sessions and the Local CLI Session Password Has Been Saved to the Startup Configuration File, page 33](#)

Networking Device Is Configured to Allow Remote CLI Sessions

The fastest method to recover from a lost, or misconfigured password for local CLI sessions is to establish a remote CLI session with the networking device and repeat the “[Configuring and Verifying a Password for Local CLI Sessions](#)” section on [page 18](#). Your networking device must be configured to allow remote CLI sessions and you must know the remote CLI session password to perform this procedure.

Networking Device Is Not Configured to Allow Remote CLI Sessions and the Local CLI Session Password Has Not Been Saved to the Startup Configuration File

If you cannot establish a remote session to your networking device, and you have not saved the misconfigured local CLI session password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous local CLI session password is restored.

**Caution**

Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.

Networking Device is not Configured to Allow Remote CLI Sessions and the Local CLI Session Password Has Been Saved to the Startup Configuration File

If you can not establish a remote CLI session with the networking device, and you have saved the misconfigured local CLI session password to the startup configuration, or you have lost the local CLI session password, you must perform a password recovery procedure. Password recovery procedures are device specific. You must locate the document that describes the procedure for your type of networking device.

There are three methods for locating a password recovery procedure document for your networking device:

- Many networking devices have a Password Recovery subsection in the Troubleshoot and Alerts section of their product support page on Cisco’s Technical Support website (<http://www.cisco.com/tac>). Navigate to the Troubleshoot and Alerts section of the product support page for your networking device and look for the Password Recovery subsection.

- If you do not find the password recovery document for your networking device on its product support page try searching for the text string **“password recovery”** on Cisco’s Technical Support website (<http://www.cisco.com/tac>). Enclose the text string in double quotes. You can improve the search results by adding an additional text string that matches the model number, series number or platform name for your networking device, For example searching on the string **“password recovery” 12000** will provide search results that give documents with the words **password**, **recovery** and **12000** in the title a higher ranking.
- If the product support page for your networking device does not have a password recovery document, and you can not find the correct document by searching for it, you can try the Cisco’s Network Professionals Connection (<http://www.cisco.com/go/netpro>).

Recovering from a Lost or Misconfigured Password for Remote CLI Sessions

There are three methods that can be used to recover from a lost, or misconfigured remote CLI session password. The method that you will use depends on the current configuration of your networking device.

- [Networking Device Is Configured to Allow Local CLI Sessions, page 34](#)
- [Networking Device Is Not Configured to Allow Local CLI Sessions and the Remote CLI Session Password Has Not Been Saved to the Startup Configuration File, page 34](#)
- [Networking Device Is Not Configured to Allow Local CLI Sessions and the Remote CLI Session Password Has Been Saved to the Startup Configuration File, page 35](#)

Networking Device Is Configured to Allow Local CLI Sessions

The fastest method to recover from a lost, or misconfigured password for remote CLI sessions is to establish a local CLI session with the networking device and repeat the [“Configuring and Verifying a Password for Remote CLI Sessions” section on page 15](#). Your networking device must be configured to allow local CLI sessions and you must know the local CLI session password to perform this procedure.

Networking Device Is Not Configured to Allow Local CLI Sessions and the Remote CLI Session Password Has Not Been Saved to the Startup Configuration File

If you cannot establish a local CLI session to your networking device, and you have not saved the misconfigured remote CLI session password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous remote CLI session password is restored.

Caution

Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.

Networking Device Is Not Configured to Allow Local CLI Sessions and the Remote CLI Session Password Has Been Saved to the Startup Configuration File

If you can not establish a local CLI session with the networking device, and you have saved the misconfigured remote CLI session password to the startup configuration, or you have lost the remote CLI session password, you must perform a password recovery procedure. Password recovery procedures are device specific. You must locate the document that describes the procedure for your type of networking device.

There are three methods for locating a password recovery procedure document for your networking device:

- Many networking devices have a Password Recovery subsection in the Troubleshoot and Alerts section of their product support page on Cisco's Technical Support website (<http://www.cisco.com/tac>). Navigate to the Troubleshoot and Alerts section of the product support page for your networking device and look for the Password Recovery subsection.
- If you do not find the password recovery document for your networking device on its product support page try searching for the text string **"password recovery"** on Cisco's Technical Support website (<http://www.cisco.com/tac>). Enclose the text string in double quotes. You can improve the search results by adding an additional text string that matches the model number, series number or platform name for your networking device. For example searching on the string **"password recovery" 12000** will provide search results that give documents with the words **password**, **recovery** and **12000** in the title a higher ranking.
- If the product support page for your networking device does not have a password recovery document, and you can not find the correct document by searching for it, you can try the Cisco's Network Professionals Connection (<http://www.cisco.com/go/netpro>).

Recovering from a Lost or Misconfigured Passwords for Privileged EXEC Mode

There are two methods that can be used to recover from a lost, or misconfigured Privileged EXEC Mode password. The method that you will use depends on the current configuration of your networking device.

- [A Misconfigured Privileged EXEC Mode Password Has Not Been Saved to the Startup Configuration File, page 35](#)
- [A Misconfigured Privileged EXEC Mode Password Has Been Saved to the Startup Configuration File, or the Privileged EXEC Mode Password Has Been Lost, page 36](#)

A Misconfigured Privileged EXEC Mode Password Has Not Been Saved to the Startup Configuration File

If you have not saved the misconfigured privileged EXEC mode password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous privileged EXEC mode password is restored.

Caution

Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.

A Misconfigured Privileged EXEC Mode Password Has Been Saved to the Startup Configuration File, or the Privileged EXEC Mode Password Has Been Lost

If you have saved the misconfigured privileged EXEC mode password to the startup configuration, or you have lost the privileged EXEC mode password, you must perform a password recovery procedure. Password recovery procedures are device specific. You must locate the document that describes the procedure for your type of networking device.

There are three methods for locating a password recovery procedure document for your networking device:

- Many networking devices have a Password Recovery subsection in the Troubleshoot and Alerts section of their product support page on Cisco's Technical Support website (<http://www.cisco.com/tac>). Navigate to the Troubleshoot and Alerts section of the product support page for your networking device and look for the Password Recovery subsection.
- If you do not find the password recovery document for your networking device on its product support page try searching for the text string **"password recovery"** on Cisco's Technical Support website (<http://www.cisco.com/tac>). Enclose the text string in double quotes. You can improve the search results by adding an additional text string that matches the model number, series number or platform name for your networking device. For example searching on the string **"password recovery" 12000** will provide search results that give documents with the words **password, recovery** and **12000** in the title a higher ranking.
- If the product support page for your networking device does not have a password recovery document, and you can not find the correct document by searching for it, you can try the Cisco's Network Professionals Connection (<http://www.cisco.com/go/netpro>).

Configuration Examples for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

This section contains the following configuration examples:

- [Configuring and Verifying a Networking Device to Allow Non Administrative Users to Clear Remote CLI Sessions: Example, page 37](#)
- [Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example, page 38](#)
- [Configuring and Verifying a Networking Device to Allow Non Administrative Users to Shutdown and Enable Interfaces: Example, page 38](#)

Configuring and Verifying a Networking Device to Allow Non Administrative Users to Clear Remote CLI Sessions: Example

The following example shows how to configure a networking device to allow a non administrative user to clear remote CLI session virtual terminal (VTY) lines.

The first section is an excerpt of the running configuration for this example. The following sections show you how this example is used.

The following section is an excerpt of the running-configuration:

```
!
privilege exec level 7 clear line
!
no aaa new-model
!
!
username admin privilege 7 secret 5 $1$tmIw$1aM7sadKhWMpkVTzxNw1J.
!
privilege exec level 7 clear line
!
! the privilege exec level 7 clear command below is entered automatically
! when you enter the privilege exec level 7 clear line command above, do
! not enter it again
!
privilege exec level 7 clear
!
```

The following section using the **login** command shows the user logging in to the networking device with the username of admin:

```
R1> login
Username: admin
Password:
```

The following section using the **show privilege** command shows that the current privilege level is 7:

```
R1# show privilege
Current privilege level is 7
R1#
```

The following section using the **show user** command shows that two users (admin and root) are currently logged in to the networking device:

```
R1# show user
```

	Line	User	Host(s)	Idle	Location
*	0 con 0	admin	idle	00:00:00	
	2 vty 0	root	idle	00:00:17	172.16.6.2

Interface	User	Mode	Idle	Peer Address
-----------	------	------	------	--------------

The following section using the **clear line 2** command terminates the remote CLI session in use by the username root:

```
R1# clear line 2
[confirm]
[OK]
```

The following section using the **show user** command shows that admin is the only user currently logged in to the networking device:

```

R1# show user
      Line      User      Host(s)      Idle      Location
*   0 con 0      admin      idle        00:00:00

      Interface      User      Mode      Idle      Peer Address

```

Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example

The following example shows how to configure the networking device to allow a non administrative users (no access to privileged EXEC mode) to view the running configuration automatically. This example requires that the username is configured for privilege level 15 because many of the commands in the configuration file can be viewed only by users who have access to privilege level 15.

The solution is to temporarily allow the user access to privilege level 15 while running the **show running-config** command and then terminating the CLI session when the end of the configuration file has been viewed. In this example the networking device will automatically terminate the CLI session when the end of the configuration file has been viewed. No further configuration steps are required.

Caution

You must include the **noescape** keyword for the **username** command to prevent the user from entering an escape character that will terminate viewing the configuration file and leave the session running at privilege level 15.

```

!
!
username viewconf privilege 15 noescape secret 5 $1$zA9C$TDWD/Q0zwp/5xRwRqdgc/.
username viewconf autocommand show running-config
!

```

Configuring and Verifying a Networking Device to Allow Non Administrative Users to Shutdown and Enable Interfaces: Example

The following example shows how to configure a networking device to allow non administrative users to shutdown and enable interfaces.

The first section is an excerpt of the running configuration for this example. The following sections show you how this example is used.

The following section is an excerpt of the running-configuration:

```

!
no aaa new-model
!
username admin privilege 7 secret 5 $1$tmIw$1aM7sadKhWmpkVTzxNw1J.
!
privilege interface all level 7 shutdown
privilege interface all level 7 no shutdown
privilege configure level 7 interface
privilege exec level 7 configure terminal
!
! the privilege exec level 7 configure command below is entered automatically
! when you enter the privilege exec level 7 configure terminal command above, do
! not enter it again
!

```

```
privilege exec level 7 configure
!
```

The following section using the **login** command shows the user logging in to the networking device with the username of admin:

```
R1> login
Username: admin
Password:
```

The following section using the **show privilege** command shows that the current privilege level is 7:

```
R1# show privilege
Current privilege level is 7
R1#
```

The following section using the **show user** command shows that admin is the only user currently logged in to the networking device:

```
R1# show user
```

Line	User	Host(s)	Idle	Location
* 0 con 0	admin	idle	00:00:00	

Interface	User	Mode	Idle	Peer Address
-----------	------	------	------	--------------

The following section shows that the admin user is permitted to shutdown and enable an interface:

```
R1# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
R1(config)# interface ethernet 1/0
R1(config-if)# shutdown
R1(config-if)# no shutdown
R1(config-if)# exit
R1#
```

Where to Go Next

Once you have established a baseline of security for your networking devices you can consider more advanced options such as:

- **Role-Based CLI Access**—The role-based CLI access feature offers a more comprehensive set of options than the **privilege** command (described in this document) for network managers who want to allow different levels of technical support staff to have different levels of access to CLI commands.
- **AAA Security**—Many Cisco networking devices offer an advanced level of security using authentication, authorization and accounting (AAA) features. All of the tasks described in this document, and other - more advanced security features - can be implemented using AAA on the networking device in conjunction with a remote TACACS+ or RADIUS server. For information how to configure AAA security features that can be run locally on a networking device, or for information on how to configure remote AAA security using TACACS+ or RADIUS servers, see the [Cisco IOS Security Configuration Guide](#), Release 12.4.

Feature Information for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

Table 70 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Releases 12.2(1) or 12.0(3)S or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For details on when support for specific command was introduced, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Note

Table 70 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 70 *Feature Information for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices*

Feature Name	Releases	Feature Configuration Information
Enhanced Password Security	12.0(18)S 12.2(8)T	<p>Using the Enhanced Password Security feature, you can configure MD5 encryption for username passwords. MD5 encryption is a one-way hash function that makes reversal of an encrypted password impossible, providing strong encryption protection. Using MD5 encryption, you cannot retrieve clear text passwords. MD5 encrypted passwords cannot be used with protocols that require that the clear text password be retrievable, such as Challenge Handshake Authentication Protocol (CHAP).</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> • Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff, page 30
Privilege Command Enhancement	12.0(22)S 12.2(13)T	<p>The keyword all was added to the privilege command as a wild card to reduce the number of times you need to enter the privilege command when you are changing the privilege level of several keywords for the same command.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> • Privilege Command Enhancement, page 26

No Service Password-Recovery

The No Service Password-Recovery feature is a security enhancement that prevents anyone with console access from accessing the router configuration and clearing the password. It also prevents anyone from changing the configuration register values and accessing NVRAM.

Feature History for the No Service Password-Recovery Feature

Release	Modification
12.3(8)YA	This feature was introduced.
12.3(14)T	This feature was integrated into Cisco IOS Release 12.3(14)T.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Prerequisites for No Service Password-Recovery

You are required to download and install ROM monitor (ROMMON) version 12.2(11)YV1 before you can use this feature.

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

Information About No Service Password-Recovery

To configure the No Service Password-Recovery feature, you should understand the following concepts:

- [Cisco Password Recovery Procedure, page 2](#)
- [Configuration Registers and System Boot Configuration, page 2](#)

Cisco Password Recovery Procedure

The Cisco IOS software provides a password recovery procedure that relies upon gaining access to ROMMON mode using the Break key during system startup. In ROMMON mode, the router software can be reloaded at which time prompting a new system configuration that includes a new password.

The current password recovery procedure enables anyone with console access, the ability to access the router and its network. The No Service Password-Recovery feature prevents the completion of the Break key sequence and the entering of ROMMON mode during system startups and reloads.

Configuration Registers and System Boot Configuration

The lowest four bits of the configuration register (bits 3, 2, 1, and 0) form the boot field. The boot field determines if the router boots manually from ROM or automatically from Flash or the network. For example, when the configuration register boot field value is set to any value from 0x2 to 0xF, the router uses the boot field value to form a default boot filename for autobooting from a network server.

Bit 6, when set, ignores the startup configuration, while bit 8 enables a break. To use this feature, the configuration register must be set to autoboot before it can be enabled. Any other configuration register setting will prevent the feature from being enabled.

**Note**

By default, the no confirm prompt and message are not displayed after reloads.

How to Enable No Service Password-Recovery

This section contains the following procedures:

- [Upgrading the ROMMON Version, page 3](#) (required)
- [Verifying the Upgraded ROMMON Version, page 5](#) (optional)
- [Enabling No Service Password-Recovery, page 5](#) (required)
- [Recovering a Device, page 6](#) (required)

Upgrading the ROMMON Version

If your router or access server does not find a valid system image to load, the system will enter ROMMON mode. ROMMON mode can also be accessed by interrupting the boot sequence during startup.

Another method for entering ROMMON mode is to set the configuration register so that the router automatically enters ROMMON mode when it boots. For information about setting the configuration register value, refer to the [Cisco IOS Configuration Fundamentals and Network Management Configuration Guide](#), Release 12.3.

Perform this task to upgrade your version of ROMMON.

SUMMARY STEPS

1. reload
2. set *tftp-file ip-address ip-subnet-mask default-gateway tftp-server*
3. sync
4. tftpdnld -u
5. boot

DETAILED STEPS

	Command or Action	Purpose
Step 1	reload Example: Router> reload	Reloads a Cisco IOS image. After issuing this command and responding to the system prompts as necessary, the system will begin reloading the system software image. While the system is reloading, press the Break key or a Break key-combination during the first 60 seconds of system startup. Pressing the Break key interrupts the boot sequence and puts the router into ROMMON mode. Note The default Break key combination is Ctrl-C, but this may be configured differently on your system.
Step 2	set tftp-file ip-address ip-subnet-mask default-gateway tftp-server Example: ROMMON> set tftpabc 10.10.0.0 255.0.0.0 10.1.1.0 10.29.32.0	Displays all the created variables. The arguments are as follows: <ul style="list-style-type: none"> <i>tftp-file</i>—Location of the new ROMMON image on the TFTP server. The length of the filename is a maximum of 45 characters. <i>ip-address</i>—IP address on the router to connect to the TFTP server. <i>ip-subnet-mask</i>—IP subnet mask of the router. <i>default-gateway</i>—IP address of the gateway of the TFTP server. <i>tftp-server</i>—IP address of the TFTP server from which the image will be downloaded. Note This command is not supported on the Cisco 800 series routers.
Step 3	sync Example: ROMMON> sync	Saves the changes to the image.
Step 4	tftpdnld -u Example: ROMMON> tftpdnld -u	Downloads the new ROMMON image from the TFTP server. Reset if prompted.
Step 5	boot Example: ROMMON> boot	Boots the router with the Cisco IOS image in flash memory.

Verifying the Upgraded ROMMON Version

To verify that you have downloaded a new version of ROMMON, use the **show version** command:

```
Router# show version
```

```
Cisco IOS Software, C828 Software (C828-K9OS&6-M), Version 12.3 (20040702:094716)  
[userid 168]
```

```
Copyright (c) 1986-2004 by Cisco Systems, Inc.
```

```
ROM: System Bootstrap, Version 12.2(11)YV1, Release Software (fc1)
```

```
Router uptime is 22 minutes  
System returned to ROM by reload  
.  
.  
.
```

Enabling No Service Password-Recovery

Perform this task to enable the No Service Password-Recovery feature.

Note

As a precaution, a valid Cisco IOS image should reside in flash memory before this feature is enabled.

If you plan to enter the **no service password-recovery** command, we recommend that you save a copy of the system configuration file in a location away from the switch or router. If you are using a switch that is operating in VTP transparent mode, we recommend that you also save a copy of the vlan.dat file in a location away from the switch.

Prerequisites

Always disable the feature before downgrading to an image that does not support this feature, because you cannot reset after the downgrade.

The configuration register boot bit must be enabled so that there is no way to break into ROMMON when this command is configured. Cisco IOS software should prevent the user from configuring the boot field in the config register.

Bit 6, which ignores the startup configuration and bit 8, which enables a break, should be set.

The Break key should be disabled while the router is booting up and disabled in Cisco IOS software when this feature is enabled.

SUMMARY STEPS

1. **enable**
2. **show version**
3. **configure terminal**

4. **config-register** *value*
5. **no service password-recovery**
6. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	show version Example: Router# show version	Displays information about the system software, including configuration register settings. The configuration register must be set to autoboot before entering the no service password-recovery command.
Step 3	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 4	config-register <i>value</i> Example: Router(config)# config-register 0x2012	(Optional) Changes the configuration register setting. <ul style="list-style-type: none">• If necessary, change the configuration register setting so the router is set to autoboot.
Step 5	no service password-recovery Example: Router(config)# no service password-recovery	Disables password-recovery capability at the system console.
Step 6	exit Example: Router(config)# exit	Exits global configuration mode and returns to EXEC mode.

Recovering a Device

To recover a device once the No Service Password-Recovery feature has been enabled, press the Break key within 5 seconds after the image decompresses during the boot. You are prompted to confirm the Break key action. When you confirm the action, the startup configuration is erased, the password-recovery procedure is enabled, and the router boots with the factory default configuration.

If you do not confirm the Break key action, the router boots normally with the No Service Password-Recovery feature enabled.

Examples

This section provides the following examples of the process:

- [Confirmed Break, page 7](#)
- [Unconfirmed Break, page 8](#)

Confirmed Break

```
PASSWORD RECOVERY FUNCTIONALITY IS DISABLED
program load complete, entry point: 0x80013000, size: 0x8396a8
Self decompressing the image :
#####
##### [OK]
!The 5 second window starts now.
```

```
telnet> send break
telnet> send break
telnet> send break
```

Restricted Rights Legend

Use, duplication, or disclosure by the Government is subject to restrictions as set forth in subparagraph (c) of the Commercial Computer Software - Restricted Rights clause at FAR sec. 52.227-19 and subparagraph (c) (1) (ii) of the Rights in Technical Data and Computer Software clause at DFARS sec. 252.227-7013.

Appendixes

RADIUS Attributes

RADIUS Attributes Overview and RADIUS IETF Attributes

Feature History

Release	Modification
Cisco IOS	For information about feature support in Cisco IOS software, use Cisco Feature Navigator.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

Remote Authentication Dial-In User Service (RADIUS) attributes are used to define specific authentication, authorization, and accounting (AAA) elements in a user profile, which is stored on the RADIUS daemon. This appendix lists the RADIUS attributes currently supported.

In This Appendix

This appendix contains the following sections:

- [RADIUS Attributes Overview](#)
- [RADIUS IETF Attributes](#)
- [RADIUS Vendor-Proprietary Attributes](#)
- [RADIUS Vendor-Specific Attributes \(VSA\) and RADIUS Disconnect-Cause Attribute Values](#)
- [RADIUS Disconnect-Cause Attribute Values](#)

RADIUS Attributes Overview

This section contains information important to understanding how RADIUS attributes exchange AAA information between a client and server and includes the following sections:

- [IETF Attributes Versus VSAs](#)
- [RADIUS Packet Format](#)

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2007 Cisco Systems, Inc. All rights reserved.

- [RADIUS Files](#)
- [Supporting Documentation](#)

IETF Attributes Versus VSAs

RADIUS Internet Engineering Task Force (IETF) attributes are the original set of 255 standard attributes that are used to communicate AAA information between a client and a server. Because IETF attributes are standard, the attribute data is predefined and well known; thus all clients and servers who exchange AAA information via IETF attributes must agree on attribute data such as the exact meaning of the attributes and the general bounds of the values for each attribute.

RADIUS vendor-specific attributes (VSAs) derived from one IETF attribute—vendor-specific (attribute 26). Attribute 26 allows a vendor to create an additional 255 attributes however they wish. That is, a vendor can create an attribute that does not match the data of any IETF attribute and encapsulate it behind attribute 26; thus, the newly created attribute is accepted if the user accepts attribute 26.

For more information on VSAs, refer to the section “[RADIUS Vendor-Specific Attributes \(VSA\) and RADIUS Disconnect-Cause Attribute Values](#)” later in this appendix.

RADIUS Packet Format

The data between a RADIUS server and a RADIUS client is exchanged in RADIUS packets. The data fields are transmitted from left to right.

[Figure 125](#) shows the fields within a RADIUS packet.

Note

For a diagram of VSAs, which is an extension of [Figure 125](#), refer to [Figure 1](#).

Figure 125 **RADIUS Packet Diagram**

Each RADIUS packet contains the following information:

- Code—The code field is one octet; it identifies one of the following types of RADIUS packets:
 - Access-Request (1)
 - Access-Accept (2)
 - Access-Reject (3)
 - Accounting-Request (4)
 - Accounting-Response (5)

- Identifier—The identifier field is one octet; it helps the RADIUS server match requests and responses and detect duplicate requests.
- Length—The length field is two octets; it specifies the length of the entire packet.
- Authenticator—The authenticator field is 16 octets. The most significant octet is transmitted first; it is used to authenticate the reply from the RADIUS server. Two types of authenticators are as follows:
 - Request-Authentication: Available in Access-Request and Accounting-Request packets
 - Response-Authenticator: Available in Access-Accept, Access-Reject, Access-Challenge, and Accounting-Response packets

RADIUS Packet Types

The following list defines the various types of RADIUS packet types that can contain attribute information:

Access-Request—Sent from a client to a RADIUS server. The packet contains information that allows the RADIUS server to determine whether to allow access to a specific network access server (NAS), which will allow access to the user. Any user performing authentication *must* submit an Access-Request packet. Once an Access-Request packet is received, the RADIUS server *must* forward a reply.

Access-Accept—Once a RADIUS server receives an Access-Request packet, it must send an Access-Accept packet if all attribute values in the Access-Request packet are acceptable. Access-Accept packets provide the configuration information necessary for the client to provide service to the user.

Access-Reject—Once a RADIUS server receives an Access-Request packet, it must send an Access-Reject packet if any of the attribute values are not acceptable.

Access-Challenge—Once the RADIUS server receives an Access-Accept packet, it can send the client an Access-Challenge packet, which requires a response. If the client does not know how to respond or if the packets are invalid, the RADIUS server discards the packets. If the client responds to the packet, a new Access-Request packet should be sent with the original Access-Request packet.

Accounting-Request—Sent from a client to a RADIUS accounting server, which provides accounting information. If the RADIUS server successfully records the Accounting-Request packet, it must submit an Accounting Response packet.

Accounting-Response—Sent by the RADIUS accounting server to the client to acknowledge that the Accounting-Request has been received and recorded successfully.

RADIUS Files

Understanding the types of files used by RADIUS is important for communicating AAA information from a client to a server. Each file defines a level of authentication or authorization for the user: The dictionary file defines which attributes the user's NAS can implement; the clients file defines which users are allowed to make requests to the RADIUS server; the users file defines which user requests the RADIUS server will authenticate based on security and configuration data.

- [Dictionary File](#)
- [Clients File](#)
- [Users File](#)

Dictionary File

A dictionary file provides a list of attributes that are dependent upon which attributes your NAS supports. However, you can add your own set of attributes to your dictionary for custom solutions. It defines attribute values, thereby allowing you to interpret attribute output such as parsing requests. A dictionary file contains the following information:

- Name—The ASCII string “name” of the attribute, such as User-Name.
- ID—The numerical “name” of the attribute; for example, User-Name attribute is attribute 1.
- Value type—Each attribute can be specified as one of the following five value types:
 - binary—0 to 254 octets.
 - date—32-bit value in big endian order. For example, seconds since 00:00:00 GMT, JAN. 1, 1970.
 - ipaddr—4 octets in network byte order.
 - integer—32-bit value in big endian order (high byte first).
 - string—0 to 253 octets.

When the data type for a particular attribute is an integer, you can optionally expand the integer to equate to some string. The follow sample dictionary includes an integer-based attribute and its corresponding values:

```
# dictionary sample of integer entry
#
ATTRIBUTE      Service-Type      6          integer
VALUE          Service-Type      Login       1
VALUE          Service-Type      Framed      2
VALUE          Service-Type      Callback-Login  3
VALUE          Service-Type      Callback-Framed  4
VALUE          Service-Type      Outbound    5
VALUE          Service-Type      Administrative  6
VALUE          Service-Type      NAS-Prompt  7
VALUE          Service-Type      Authenticate-Only  8
VALUE          Service-Type      Callback-NAS-Prompt  9
VALUE          Service-Type      Call-Check  10
VALUE          Service-Type      Callback-Administrative 11
```

Clients File

A clients file is important because it contains a list of RADIUS clients that are allowed to send authentication and accounting requests to the RADIUS server. To receive authentication, the name and authentication key the client sends the server must be an exact match with the data contained in clients file.

The following is an example of a clients file. The key, as shown in this example, must be the same as the **radius-server key** *SomeSecret* command.

```
#Client Name      Key
#-----
10.1.2.3:256      test
nas01             bananas
nas02             MoNkEys
nas07.foo.com     SomeSecret
```

Users File

A RADIUS users file contains an entry for each user that the RADIUS server will authenticate; each entry, which is also referred to as a user profile, establishes an attribute the user can access.

The first line in any user profile is always a “user access” line; that is, the server must check the attributes on the first line before it can grant access to the user. The first line contains the name of the user, which can be up to 252 characters, followed by authentication information such as the password of the user.

Additional lines, which are associated with the user access line, indicate the attribute reply that is sent to the requesting client or server. The attributes sent in the reply must be defined in the dictionary file.

When looking at a user file, please note the the data to the left of the equal (=) character is an attribute defined in the dictionary file, and the data to the right of the equal character is the configuration data.

**Note**

A blank line cannot appear anywhere within a user profile.

The following is an example of a RADIUS user profile (Merit Daemon format). In this example, the user name is cisco.com, the password is cisco, and the user can access five tunnel attributes.

```
# This user profile includes RADIUS tunneling attributes
cisco.com Password="cisco" Service-Type=Outbound
    Tunnel-Type = :1:L2TP
    Tunnel-Medium-Type = :1:IP
    Tunnel-Server-Endpoint = :1:10.0.0.1
    Tunnel-Password = :1:"welcome"
    Tunnel-Assignment-ID = :1:"nas"
```

Supporting Documentation

For more information on RADIUS IETF and Vendor-Proprietary Attributes, refer to the following documents:

- Cisco AAA Implementation Case Study
- “[Configuring RADIUS](#)” “[Configuring Authentication](#),” “[Configuring Authorization](#)” and “[Configuring Accounting](#)” chapters in this book.

Refer to these chapters for information on how RADIUS is used with AAA.

- IETF RADIUS RFCs
 - RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*
 - RFC 2866, *RADIUS Accounting*
 - RFC 2867, *RADIUS Accounting Modifications for Tunnel Protocol Support*
 - RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*
 - RFC 2869, *RADIUS Extensions*
- RADIUS Vendor-Specific Attributes Voice Implementation Guide

RADIUS IETF Attributes

Note

In the Cisco IOS Release 12.2 for RADIUS tunnel attributes, 32 tagged tunnel sets are supported for L2TP.

This section contains the following sections:

- [Supported RADIUS IETF Attributes](#)
- [Comprehensive List of RADIUS Attribute Descriptions](#)

Supported RADIUS IETF Attributes

[Table 71](#) lists Cisco-supported IETF RADIUS attributes and the Cisco IOS release in which they are implemented. In cases where the attribute has a security server-specific format, the format is specified.

Refer to [Table 72](#) for a description of each listed attribute.

Note

Attributes implemented in special (AA) or early development (T) releases will be added to the next mainline image.

Table 71 *Supported RADIUS IETF Attributes*

1. This RADIUS attribute complies with the following two draft IETF documents: RFC 2868 *RADIUS Attributes for Tunnel Protocol Support* and RFC 2867 *RADIUS Accounting Modifications for Tunnel Protocol Support*.
2. This RADIUS attribute complies with RFC 2865 and RFC 2868.

Comprehensive List of RADIUS Attribute Descriptions

Table 72 lists and describes IETF RADIUS attributes. In cases where the attribute has a security server-specific format, the format is specified.

Table 72 **RADIUS IETF Attributes**

Number	IETF Attribute	Description
1	User-Name	Indicates the name of the user being authenticated by the RADIUS server.
2	User-Password	Indicates the user's password or the user's input following an Access-Challenge. Passwords longer than 16 characters are encrypted using RFC 2865 specifications.
3	CHAP-Password	Indicates the response value provided by a PPP Challenge-Handshake Authentication Protocol (CHAP) user in response to an Access-Challenge.
4	NAS-IP Address	Specifies the IP address of the network access server that is requesting authentication. The default value is 0.0.0.0/0.
5	NAS-Port	<p>Indicates the physical port number of the network access server that is authenticating the user. The NAS-Port value (32 bits) consists of one or two 16-bit values (depending on the setting of the radius-server extended-portnames command). Each 16-bit number should be viewed as a 5-digit decimal integer for interpretation as follows:</p> <p>For asynchronous terminal lines, async network interfaces, and virtual async interfaces, the value is 00ttt, where ttt is the line number or async interface unit number.</p> <p>For ordinary synchronous network interface, the value is 10xxx.</p> <p>For channels on a primary rate ISDN interface, the value is 2ppcc.</p> <p>For channels on a basic rate ISDN interface, the value is 3bb0c.</p> <p>For other types of interfaces, the value is 6nnss.</p>

Table 72 RADIUS IETF Attributes (continued)

Number	IETF Attribute	Description
6	Service-Type	<p>Indicates the type of service requested or the type of service to be provided.</p> <ul style="list-style-type: none"> In a request: <ul style="list-style-type: none"> Framed for known PPP or SLIP connection. Administrative-user for enable command. In response: <ul style="list-style-type: none"> Login—Make a connection. Framed—Start SLIP or PPP. Administrative User—Start an EXEC or enable ok. <p>Exec User—Start an EXEC session.</p> <p>Service type is indicated by a particular numeric value as follows:</p> <ul style="list-style-type: none"> 1: Login 2: Framed 3: Callback-Login 4: Callback-Framed 5: Outbound 6: Administrative 7: NAS-Prompt 8: Authenticate Only 9: Callback-NAS-Prompt
7	Framed-Protocol	<p>Indicates the framing to be used for framed access. No other framing is allowed.</p> <p>Framing is indicated by a numeric value as follows:</p> <ul style="list-style-type: none"> 1: PPP 2: SLIP 3: ARA 4: Gandalf-proprietary single-link/multilink protocol 5: Xylogics-proprietary IPX/SLIP
8	Framed-IP-Address	<p>Indicates the IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the access-request. To enable this command, use the radius-server attribute 8 include-in-access-req command in global configuration mode.</p>
9	Framed-IP-Netmask	<p>Indicates the IP netmask to be configured for the user when the user is a router to a network. This attribute value results in a static route being added for Framed-IP-Address with the mask specified.</p>

Table 72 **RADIUS IETF Attributes (continued)**

Number	IETF Attribute	Description
10	Framed-Routing	<p>Indicates the routing method for the user when the user is a router to a network. Only “None” and “Send and Listen” values are supported for this attribute.</p> <p>Routing method is indicated by a numeric value as follows:</p> <ul style="list-style-type: none"> • 0: None • 1: Send routing packets • 2: Listen for routing packets • 3: Send routing packets and listen for routing packets
11	Filter-Id	<p>Indicates the name of the filter list for the user and is formatted as follows: %d, %d.in, or %d.out. This attribute is associated with the most recent service-type command. For login and EXEC, use %d or %d.out as the line access list value from 0 to 199. For Framed service, use %d or %d.out as interface output access list, and %d.in for input access list. The numbers are self-encoding to the protocol to which they refer.</p>
12	Framed-MTU	<p>Indicates the maximum transmission unit (MTU) that can be configured for the user when the MTU is not negotiated by PPP or some other means.</p>
13	Framed-Compression	<p>Indicates a compression protocol used for the link. This attribute results in a “/compress” being added to the PPP or SLIP autocommand generated during EXEC authorization. Not currently implemented for non-EXEC authorization.</p> <p>Compression protocol is indicated by a numeric value as follows:</p> <ul style="list-style-type: none"> • 0: None • 1: VJ-TCP/IP header compression • 2: IPX header compression
14	Login-IP-Host	<p>Indicates the host to which the user will connect when the Login-Service attribute is included. (This begins immediately after login.)</p>
15	Login-Service	<p>Indicates the service that should be used to connect the user to the login host.</p> <p>Service is indicated by a numeric value as follows:</p> <ul style="list-style-type: none"> • 0: Telnet • 1: Rlogin • 2: TCP-Clear • 3: PortMaster • 4: LAT
16	Login-TCP-Port	<p>Defines the TCP port with which the user is to be connected when the Login-Service attribute is also present.</p>
18	Reply-Message	<p>Indicates text that might be displayed to the user via the RADIUS server. You can include this attribute in user files; however, you cannot exceed a maximum of 16 Reply-Message entries per profile.</p>
19	Callback-Number	<p>Defines a dialing string to be used for callback.</p>
20	Callback-ID	<p>Defines the name (consisting of one or more octets) of a place to be called, to be interpreted by the network access server.</p>

Table 72 **RADIUS IETF Attributes (continued)**

Number	IETF Attribute	Description
22	Framed-Route	Provides routing information to be configured for the user on this network access server. The RADIUS RFC format (net/bits [router [metric]]) and the old style dotted mask (net mask [router [metric]]) are supported. If the router field is omitted or 0, the peer IP address is used. Metrics are currently ignored. This attribute is access-request packets.
23	Framed-IPX-Network	Defines the IPX network number configured for the user.
24	State	Allows state information to be maintained between the network access server and the RADIUS server. This attribute is applicable only to CHAP challenges.
25	Class	(Accounting) Arbitrary value that the network access server includes in all accounting packets for this user if supplied by the RADIUS server.
26	Vendor-Specific	<p>Allows vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option using the format recommended in the specification. Cisco's vendor-ID is 9, and the supported option has vendor-type 1, which is named "cisco-avpair." The value is a string of the format:</p> <pre>protocol : attribute sep value</pre> <p>"Protocol" is a value of the Cisco "protocol" attribute for a particular type of authorization. "Attribute" and "value" are an appropriate AV pair defined in the Cisco TACACS+ specification, and "sep" is "=" for mandatory attributes and "*" for optional attributes. This allows the full set of features available for TACACS+ authorization to also be used for RADIUS. For example:</p> <pre>cisco-avpair= "ip:addr-pool=first" cisco-avpair= "shell:priv-lvl=15"</pre> <p>The first example causes Cisco's "multiple named ip address pools" feature to be activated during IP authorization (during PPP's IPCP address assignment). The second example causes a user logging in from a network access server to have immediate access to EXEC commands.</p> <p>Table 71 lists supported vendor-specific RADIUS attributes (IETF attribute 26). The "TACACS+ Attribute-Value Pairs" appendix provides a complete list of supported TACACS+ attribute-value (AV) pairs that can be used with IETF attribute 26. (RFC 2865)</p>
27	Session-Timeout	Sets the maximum number of seconds of service to be provided to the user before the session terminates. This attribute value becomes the per-user "absolute timeout."
28	Idle-Timeout	Sets the maximum number of consecutive seconds of idle connection allowed to the user before the session terminates. This attribute value becomes the per-user "session-timeout."
29	Termination-Action	<p>Termination is indicated by a numeric value as follows:</p> <ul style="list-style-type: none"> 0: Default 1: RADIUS request
30	Called-Station-Id	(Accounting) Allows the network access server to send the telephone number the user called as part of the Access-Request packet (using Dialed Number Identification Service [DNIS] or similar technology). This attribute is only supported on ISDN, and modem calls on the Cisco AS5200 if used with PRI.

Table 72 RADIUS IETF Attributes (continued)

Number	IETF Attribute	Description
31	Calling-Station-Id	(Accounting) Allows the network access server to send the telephone number the call came from as part of the Access-Request packet (using Automatic Number Identification or similar technology). This attribute has the same value as “remote-addr” from TACACS+. This attribute is only supported on ISDN, and modem calls on the Cisco AS5200 if used with PRI.
32	NAS-Identifier	String identifying the network access server originating the Access-Request. Use the radius-server attribute 32 include-in-access-req global configuration command to send RADIUS attribute 32 in an Access-Request or Accounting-Request. By default, the FQDN is sent in the attribute when the format is not specified.
33	Proxy-State	Attribute that can be sent by a proxy server to another server when forwarding Access-Requests; this must be returned unmodified in the Access-Accept, Access-Reject or Access-Challenge and removed by the proxy server before sending the response to the network access server.
34	Login-LAT-Service	Indicates the system with which the user is to be connected by LAT. This attribute is only available in the EXEC mode.
35	Login-LAT-Node	Indicates the node with which the user is to be automatically connected by LAT.
36	Login-LAT-Group	Identifies the LAT group codes that this user is authorized to use.
37	Framed-AppleTalk-Link	Indicates the AppleTalk network number that should be used for serial links to the user, which is another AppleTalk router.
38	Framed-AppleTalk-Network	Indicates the AppleTalk network number that the network access server uses to allocate an AppleTalk node for the user.
39	Framed-AppleTalk-Zone	Indicates the AppleTalk Default Zone to be used for this user.
40	Acct-Status-Type	(Accounting) Indicates whether this Accounting-Request marks the beginning of the user service (start) or the end (stop).
41	Acct-Delay-Time	(Accounting) Indicates how many seconds the client has been trying to send a particular record.
42	Acct-Input-Octets	(Accounting) Indicates how many octets have been received from the port over the course of this service being provided.
43	Acct-Output-Octets	(Accounting) Indicates how many octets have been sent to the port in the course of delivering this service.
44	Acct-Session-Id	(Accounting) A unique accounting identifier that makes it easy to match start and stop records in a log file. Acct-Session ID numbers restart at 1 each time the router is power cycled or the software is reloaded. To send this attribute in access-request packets, use the radius-server attribute 44 include-in-access-req command in global configuration mode.
45	Acct-Authentic	(Accounting) Indicates how the user was authenticated, whether by RADIUS, the network access server itself, or another remote authentication protocol. This attribute is set to “radius” for users authenticated by RADIUS; “remote” for TACACS+ and Kerberos; or “local” for local, enable, line, and if-needed methods. For all other methods, the attribute is omitted.
46	Acct-Session-Time	(Accounting) Indicates how long (in seconds) the user has received service.
47	Acct-Input-Packets	(Accounting) Indicates how many packets have been received from the port over the course of this service being provided to a framed user.

Table 72 **RADIUS IETF Attributes (continued)**

Number	IETF Attribute	Description
48	Acct-Output-Packets	(Accounting) Indicates how many packets have been sent to the port in the course of delivering this service to a framed user.
49	Acct-Terminate-Cause	<p>(Accounting) Reports details on why the connection was terminated. Termination causes are indicated by a numeric value as follows:</p> <ol style="list-style-type: none"> 1. User request 2. Lost carrier 3. Lost service 4. Idle timeout 5. Session timeout 6. Admin reset 7. Admin reboot 8. Port error 9. NAS error 10. NAS request 11. NAS reboot 12. Port unneeded 13. Port pre-empted 14. Port suspended 15. Service unavailable 16. Callback 17. User error 18. Host request <p>Note For attribute 49, Cisco IOS supports values 1 to 6, 9, 12, and 15 to 18.</p>
50	Acct-Multi-Session-Id	<p>(Accounting) A unique accounting identifier used to link multiple related sessions in a log file.</p> <p>Each linked session in a multilink session has a unique Acct-Session-Id value, but shares the same Acct-Multi-Session-Id.</p>
51	Acct-Link-Count	(Accounting) Indicates the number of links known in a given multilink session at the time an accounting record is generated. The network access server can include this attribute in any accounting request that might have multiple links.
52	Acct-Input-Gigawords	Indicates how many times the Acct-Input-Octets counter has wrapped around 2 ³² over the course of the provided service.
53	Acct-Output-Gigawords	Indicates how many times the Acct-Output-Octets counter has wrapped around 2 ³² while delivering service.

Table 72 RADIUS IETF Attributes (continued)

Number	IETF Attribute	Description
55	Event-Timestamp	<p>Records the time that the event occurred on the NAS; the timestamp sent in attribute 55 is in seconds since January 1, 1970 00:00 UTC. To send RADIUS attribute 55 in accounting packets, use the radius-server attribute 55 include-in-acct-req command.</p> <p>Note Before the Event-Timestamp attribute can be sent in accounting packets, you <i>must</i> configure the clock on the router. (For information on setting the clock on your router, refer to section “Performing Basic System Management” in the chapter “System Management” of the <i>Cisco IOS Configuration Fundamentals Configuration Guide</i>.)</p> <p>To avoid configuring the clock on the router every time the router is reloaded, you can enable the clock calendar-valid command. (For information on this command, refer to the chapter “Basic System Management Commands” in the <i>Cisco IOS Configuration Fundamentals Command Reference</i>.)</p>
60	CHAP-Challenge	Contains the Challenge Handshake Authentication Protocol challenge sent by the network access server to a PPP CHAP user.
61	NAS-Port-Type	<p>Indicates the type of physical port the network access server is using to authenticate the user. Physical ports are indicated by a numeric value as follows:</p> <ul style="list-style-type: none"> • 0: Asynchronous • 1: Synchronous • 2: ISDN-Synchronous • 3: ISDN-Asynchronous (V.120) • 4: ISDN-Asynchronous (V.110) • 5: Virtual
62	Port-Limit	Sets the maximum number of ports provided to the user by the NAS.
63	Login-LAT-Port	Defines the port with which the user is to be connected by LAT.
64	Tunnel-Type ¹	Indicates the tunneling protocol(s) used. Cisco IOS software supports two possible values for this attribute: L2TP and L2F. If this attribute is not set, L2F is used as a default.
65	Tunnel-Medium-Type ¹	Indicates the transport medium type to use to create a tunnel. This attribute has only one available value for this release: IP. If no value is set for this attribute, IP is used as the default.

Table 72 RADIUS IETF Attributes (continued)

Number	IETF Attribute	Description
66	Tunnel-Client-Endpoint	<p>Contains the address of the initiator end of the tunnel. It <i>may</i> be included in both Access-Request and Access-Accept packets to indicate the address from which a new tunnel is to be initiated. If the Tunnel-Client-Endpoint attribute is included in an Access-Request packet, the RADIUS server should take the value as a hint; the server is not obligated to honor the hint, however. This attribute <i>should</i> be included in Accounting-Request packets that contain Acct-Status-Type attributes with values of either Start or Stop, in which case it indicates the address from which the tunnel was initiated. This attribute, along with the Tunnel-Server-Endpoint and Acct-Tunnel-Connection-ID attributes, may be used to provide a globally unique means to identify a tunnel for accounting and auditing purposes.</p> <p>An enhancement has been added for the network access server to accept a value of 127.0.0.X for this attribute such that:</p> <ul style="list-style-type: none"> 127.0.0.0 would indicate that loopback0 IP address is to be used 127.0.0.1 would indicate that loopback1 IP address is to be used ... 127.0.0.X would indicate that loopbackX IP address is to be used <p>for the actual tunnel client endpoint IP address. This enhancement adds scalability across multiple network access servers.</p>
67	Tunnel-Server-Endpoint ¹	Indicates the address of the server end of the tunnel. The format of this attribute varies depending on the value of Tunnel-Medium-Type. Because this release only supports IP as a tunnel medium type, the IP address or the host name of LNS is valid for this attribute.
68	Acct-Tunnel-Connection-ID	Indicates the identifier assigned to the tunnel session. This attribute <i>should</i> be included in Accounting-Request packets that contain an Acct-Status-Type attribute having the value Start, Stop, or any of the values described above. This attribute, along with the Tunnel-Client-Endpoint and Tunnel-Server-Endpoint attributes, may be used to provide a means to uniquely identify a tunnel session for auditing purposes.
69	Tunnel-Password ¹	<p>Defines the password to be used to authenticate to a remote server. This attribute is converted into different AAA attributes based on the value of Tunnel-Type: AAA_ATTR_l2tp_tunnel_pw (L2TP), AAA_ATTR_nas_password (L2F), and AAA_ATTR_gw_password (L2F).</p> <p>By default, all passwords received are encrypted, which can cause authorization failures when a NAS attempts to decrypt a non-encrypted password. To enable attribute 69 to receive non-encrypted passwords, use the radius-server attribute 69 clear global configuration command.</p>
70	ARAP-Password	Identifies an Access-Request packet containing a Framed-Protocol of ARAP.
71	ARAP-Features	Includes password information that the NAS should send to the user in an ARAP "feature flags" packet.
72	ARAP-Zone-Access	Indicates how the ARAP zone list for the user should be used.
73	ARAP-Security	Identifies the ARAP Security Module to be used in an Access-Challenge packet.
74	ARAP-Security-Data	Contains the actual security module challenge or response. It can be found in Access-Challenge and Access-Request packets.
75	Password-Retry	Indicates how many times a user may attempt authentication before being disconnected.

Table 72 **RADIUS IETF Attributes (continued)**

Number	IETF Attribute	Description
76	Prompt	Indicates to the NAS whether it should echo the user's response as it is entered or not echo it. (0=no echo, 1=echo)
77	Connect-Info	Provides additional call information for modem calls. This attribute is generated in start and stop accounting records.
78	Configuration-Token	Indicates a type of user profile to be used. This attribute should be used in large distributed authentication networks based on proxy. It is sent from a RADIUS Proxy Server to a RADIUS Proxy Client in an Access-Accept; it should not be sent to a NAS.
79	EAP-Message	Encapsulates Extended Access Protocol (EAP) packets that allow the NAS to authenticate dial-in users via EAP without having to understand the EAP protocol.
80	Message-Authenticator	Prevents spoofing Access-Requests using CHAP, ARAP, or EAP authentication methods.
81	Tunnel-Private-Group-ID	Indicates the group ID for a particular tunneled session.
82	Tunnel-Assignment-ID ¹	Indicates to the tunnel initiator the particular tunnel to which a session is assigned.
83	Tunnel-Preference	Indicates the relative preference assigned to each tunnel. This attribute should be included if more than one set of tunneling attributes is returned by the RADIUS server to the tunnel initiator.
84	ARAP-Challenge-Response	Contains the response to the challenge of the dial-in client.
85	Acct-Interim-Interval	Indicates the number of seconds between each interim update in seconds for this specific session. This value can only appear in the Access-Accept message.
86	Acct-Tunnel-Packets-Lost	Indicates the number of packets lost on a given link. This attribute should be included in Accounting-Request packets that contain an Acct-Status-Type attribute having the value Tunnel-Link-Stop.
87	NAS-Port-ID	Contains a text string which identifies the port of the NAS that is authenticating the user.
88	Framed-Pool	Contains the name of an assigned address pool that should be used to assign an address for the user. If a NAS does not support multiple address pools, the NAS should ignore this attribute.
90	Tunnel-Client-Auth-ID	Specifies the name used by the tunnel initiator (also known as the NAS) when authenticating tunnel setup with the tunnel terminator. Supports L2F and L2TP protocols.
91	Tunnel-Server-Auth-ID	Specifies the name used by the tunnel terminator (also known as the Home Gateway) when authenticating tunnel setup with the tunnel initiator. Supports L2F and L2TP protocols.
200	IETF-Token-Immediate	<p>Determines how RADIUS treats passwords received from login-users when their file entry specifies a hand-held security card server.</p> <p>The value for this attribute is indicated by a numeric value as follows:</p> <ul style="list-style-type: none"> • 0: No, meaning that the password is ignored. • 1: Yes, meaning that the password is used for authentication.

1. This RADIUS attribute complies with the following two IETF documents: RFC 2868, *RADIUS Attributes for Tunnel Protocol Support* and RFC 2867, *RADIUS Accounting Modifications for Tunnel Protocol Support*.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

RADIUS Vendor-Proprietary Attributes

Feature History

Release	Modification
Cisco IOS	For information about feature support in Cisco IOS software, use Cisco Feature Navigator.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the network access server and the RADIUS server, some vendors have extended the RADIUS attribute set for specific applications.

This section contains the following sections:

- [Supported Vendor-Proprietary RADIUS Attributes](#)
- [Comprehensive List of Vendor-Proprietary RADIUS Attribute Descriptions](#)

Supported Vendor-Proprietary RADIUS Attributes

Table 73 lists Cisco-supported vendor-proprietary RADIUS attributes and the Cisco IOS release in which they are implemented. In cases where the attribute has a security server-specific format, the format is specified. Refer to Table 74 for a list of descriptions.

Note

Attributes implemented in special (AA) or early development (T) releases will be added to the next mainline image.

Table 73 Supported Vendor-Proprietary RADIUS Attributes

Comprehensive List of Vendor-Proprietary RADIUS Attribute Descriptions

Table 74 lists and describes the known vendor-proprietary RADIUS attributes:

Table 74 **Vendor-Proprietary RADIUS Attributes**

Number	Vendor-Proprietary Attribute	Description
17	Change-Password	Specifies a request to change the password of a user.
21	Password-Expiration	Specifies an expiration date for a user's password in the user's file entry.
68	Tunnel-ID	(Ascend 5) Specifies the string assigned by RADIUS for each session using CLID or DNIS tunneling. When accounting is implemented, this value is used for accounting.
108	My-Endpoint-Disc-Alias	(Ascend 5) No description available.
109	My-Name-Alias	(Ascend 5) No description available.
110	Remote-FW	(Ascend 5) No description available.
111	Multicast-GLeave-Delay	(Ascend 5) No description available.
112	CBCP-Enable	(Ascend 5) No description available.
113	CBCP-Mode	(Ascend 5) No description available.
114	CBCP-Delay	(Ascend 5) No description available.
115	CBCP-Trunk-Group	(Ascend 5) No description available.
116	Appletalk-Route	(Ascend 5) No description available.
117	Appletalk-Peer-Mode	(Ascend 5) No description available.
118	Route-Appletalk	(Ascend 5) No description available.
119	FCP-Parameter	(Ascend 5) No description available.
120	Modem-PortNo	(Ascend 5) No description available.
121	Modem-SlotNo	(Ascend 5) No description available.
122	Modem-ShelfNo	(Ascend 5) No description available.
123	Call-Attempt-Limit	(Ascend 5) No description available.
124	Call-Block-Duration	(Ascend 5) No description available.
125	Maximum-Call-Duration	(Ascend 5) No description available.

Table 74 **Vendor-Proprietary RADIUS Attributes (continued)**

Number	Vendor-Proprietary Attribute	Description
126	Router-Preference	(Ascend 5) No description available.
127	Tunneling-Protocol	(Ascend 5) No description available.
128	Shared-Profile-Enable	(Ascend 5) No description available.
129	Primary-Home-Agent	(Ascend 5) No description available.
130	Secondary-Home-Agent	(Ascend 5) No description available.
131	Dialout-Allowed	(Ascend 5) No description available.
133	BACP-Enable	(Ascend 5) No description available.
134	DHCP-Maximum-Leases	(Ascend 5) No description available.
135	Primary-DNS-Server	Identifies a primary DNS server that can be requested by Microsoft PPP clients from the network access server during IPCP negotiation.
136	Secondary-DNS-Server	Identifies a secondary DNS server that can be requested by Microsoft PPP clients from the network access server during IPCP negotiation.
137	Client-Assign-DNS	No description available.
138	User-Acct-Type	No description available.
139	User-Acct-Host	No description available.
140	User-Acct-Port	No description available.
141	User-Acct-Key	No description available.
142	User-Acct-Base	No description available.
143	User-Acct-Time	No description available.
144	Assign-IP-Client	No description available.
145	Assign-IP-Server	No description available.
146	Assign-IP-Global-Pool	No description available.
147	DHCP-Reply	No description available.
148	DHCP-Pool-Number	No description available.
149	Expect-Callback	No description available.
150	Event-Type	No description available.
151	Session-Svr-Key	No description available.
152	Multicast-Rate-Limit	No description available.
153	IF-Netmask	No description available.
154	Remote-Addr	No description available.

156	FR-Circuit-Name	No description available.
157	FR-LinkUp	No description available.
158	FR-Nailed-Grp	No description available.
159	FR-Type	No description available.

Table 74 **Vendor-Proprietary RADIUS Attributes (continued)**

Number	Vendor-Proprietary Attribute	Description
160	FR-Link-Mgt	No description available.
161	FR-N391	No description available.
162	FR-DCE-N392	No description available.
163	FR-DTE-N392	No description available.
164	FR-DCE-N393	No description available.
165	FR-DTE-N393	No description available.
166	FR-T391	No description available.
167	FR-T392	No description available.
168	Bridge-Address	No description available.
169	TS-Idle-Limit	No description available.
170	TS-Idle-Mode	No description available.
171	DBA-Monitor	No description available.
172	Base-Channel-Count	No description available.
173	Minimum-Channels	No description available.
174	IPX-Route	No description available.
175	FT1-Caller	No description available.
176	Backup	No description available.
177	Call-Type	No description available.
178	Group	No description available.
179	FR-DLCI	No description available.
180	FR-Profile-Name	No description available.
181	Ara-PW	No description available.
182	IPX-Node-Addr	No description available.
183	Home-Agent-IP-Addr	Indicates the home agent's IP address (in dotted decimal format) when using Ascend Tunnel Management Protocol (ATMP).
184	Home-Agent-Password	With ATMP, specifies the password that the foreign agent uses to authenticate itself.
185	Home-Network-Name	With ATMP, indicates the name of the connection profile to which the home agent sends all packets.
186	Home-Agent-UDP-Port	Indicates the UDP port number the foreign agent uses to send ATMP messages to the home agent.
187	Multilink-ID	Reports the identification number of the multilink bundle when the session closes. This attribute applies to sessions that are part of a multilink bundle. The Multilink-ID attribute is sent in authentication-response packets.

Table 74 **Vendor-Proprietary RADIUS Attributes (continued)**

Number	Vendor-Proprietary Attribute	Description
188	Num-In-Multilink	Reports the number of sessions remaining in a multilink bundle when the session reported in an accounting-stop packet closes. This attribute applies to sessions that are part of a multilink bundle. The Num-In-Multilink attribute is sent in authentication-response packets and in some accounting-request packets.
189	First-Dest	Records the destination IP address of the first packet received after authentication.
190	Pre-Input-Octets	Records the number of input octets before authentication. The Pre-Input-Octets attribute is sent in accounting-stop records.
191	Pre-Output-Octets	Records the number of output octets before authentication. The Pre-Output-Octets attribute is sent in accounting-stop records.
192	Pre-Input-Packets	Records the number of input packets before authentication. The Pre-Input-Packets attribute is sent in accounting-stop records.
193	Pre-Output-Packets	Records the number of output packets before authentication. The Pre-Output-Packets attribute is sent in accounting-stop records.
194	Maximum-Time	Specifies the maximum length of time (in seconds) allowed for any session. After the session reaches the time limit, its connection is dropped.
195	Disconnect-Cause	Specifies the reason a connection was taken offline. The Disconnect-Cause attribute is sent in accounting-stop records. This attribute also causes stop records to be generated without first generating start records if disconnection occurs before authentication is performed. For more information, refer to the table of Disconnect-Cause Attribute Values and their meanings.
196	Connect-Progress	Indicates the connection state before the connection is disconnected.
197	Data-Rate	Specifies the average number of bits per second over the course of the connection's lifetime. The Data-Rate attribute is sent in accounting-stop records.
198	PreSession-Time	Specifies the length of time, in seconds, from when a call first connects to when it completes authentication. The PreSession-Time attribute is sent in accounting-stop records.
199	Token-Idle	Indicates the maximum amount of time (in minutes) a cached token can remain alive between authentications.
201	Require-Auth	Defines whether additional authentication is required for class that has been CLID authenticated.
202	Number-Sessions	Specifies the number of active sessions (per class) reported to the RADIUS accounting server.

Table 74 **Vendor-Proprietary RADIUS Attributes (continued)**

Number	Vendor-Proprietary Attribute	Description
203	Authen-Alias	Defines the RADIUS server's login name during PPP authentication.
204	Token-Expiry	Defines the lifetime of a cached token.
205	Menu-Selector	Defines a string to be used to cue a user to input data.
206	Menu-Item	Specifies a single menu-item for a user-profile. Up to 20 menu items can be assigned per profile.
207	PW-Warntime	(Ascend 5) No description available.
208	PW-Lifetime	Enables you to specify on a per-user basis the number of days that a password is valid.
209	IP-Direct	<p>When you include this attribute in a user's file entry, a framed route is installed to the routing and bridging tables.</p> <p>Note Packet routing is dependent upon the entire table, not just this newly installed entry. The inclusion of this attribute does not guarantee that all packets should be sent to the specified IP address; thus, this attribute is not fully supported.</p> <p>These attribute limitations occur because the Cisco router cannot bypass all internal routing and bridging tables and send packets to a specified IP address.</p>
210	PPP-VJ-Slot-Comp	Instructs the Cisco router not to use slot compression when sending VJ-compressed packets over a PPP link.
211	PPP-VJ-1172	Instructs PPP to use the 0x0037 value for VJ compression.
212	PPP-Async-Map	Gives the Cisco router the asynchronous control character map for the PPP session. The specified control characters are passed through the PPP link as data and used by applications running over the link.
213	Third-Prompt	Defines a third prompt (after username and password) for additional user input.
214	Send-Secret	Enables an encrypted password to be used in place of a regular password in outdial profiles.
215	Receive-Secret	Enables an encrypted password to be verified by the RADIUS server.
216	IPX-Peer-Mode	(Ascend 5) No description available.
217	IP-Pool-Definition	Defines a pool of addresses using the following format: X a.b.c Z; where X is the pool index number, a.b.c is the pool's starting IP address, and Z is the number of IP addresses in the pool. For example, 3 10.0.0.1 5 allocates 10.0.0.1 through 10.0.0.5 for dynamic assignment.
218	Assign-IP-Pool	Tells the router to assign the user and IP address from the IP pool.
219	FR-Direct	Defines whether the connection profile operates in Frame Relay redirect mode.

Table 74 **Vendor-Proprietary RADIUS Attributes (continued)**

Number	Vendor-Proprietary Attribute	Description
220	FR-Direct-Profile	Defines the name of the Frame Relay profile carrying this connection to the Frame Relay switch.
221	FR-Direct-DLCI	Indicates the DLCI carrying this connection to the Frame Relay switch.
222	Handle-IPX	Indicates how NCP watchdog requests will be handled.
223	Netware-Timeout	Defines, in minutes, how long the RADIUS server responds to NCP watchdog packets.
224	IPX-Alias	Allows you to define an alias for IPX routers requiring numbered interfaces.
225	Metric	No description available.
226	PRI-Number-Type	No description available.
227	Dial-Number	Defines the number to dial.
228	Route-IP	Indicates whether IP routing is allowed for the user's file entry.
229	Route-IPX	Allows you to enable IPX routing.
230	Bridge	No description available.
231	Send-Auth	Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.
232	Send-Passwd	Enables the RADIUS server to specify the password that is sent to the remote end of a connection on outgoing calls.
233	Link-Compression	<p>Defines whether to turn on or turn off "stac" compression over a PPP link.</p> <p>Link compression is defined as a numeric value as follows:</p> <ul style="list-style-type: none"> • 0: None • 1: Stac • 2: Stac-Draft-9 • 3: MS-Stac
234	Target-Util	Specifies the load-threshold percentage value for bringing up an additional channel when PPP multilink is defined.
235	Maximum-Channels	Specifies allowed/allocatable maximum number of channels.
236	Inc-Channel-Count	No description available.
237	Dec-Channel-Count	No description available.
238	Seconds-of-History	No description available.
239	History-Weigh-Type	No description available.
240	Add-Seconds	No description available.
241	Remove-Seconds	No description available.

Table 74 **Vendor-Proprietary RADIUS Attributes (continued)**

Number	Vendor-Proprietary Attribute	Description
242	Data-Filter	Defines per-user IP data filters. These filters are retrieved only when a call is placed using a RADIUS outgoing profile or answered using a RADIUS incoming profile. Filter entries are applied on a first-match basis; therefore, the order in which filter entries are entered is important.
243	Call-Filter	Defines per-user IP data filters. On a Cisco router, this attribute is identical to the Data-Filter attribute.
244	Idle-Limit	Specifies the maximum time (in seconds) that any session can be idle. When the session reaches the idle time limit, its connection is dropped.
245	Preempt-Limit	No description available.
246	Callback	Allows you to enable or disable callback.
247	Data-Svc	No description available.
248	Force-56	Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available.
249	Billing Number	No description available.
250	Call-By-Call	No description available.
251	Transit-Number	No description available.
252	Host-Info	No description available.
253	PPP-Address	Indicates the IP address reported to the calling unit during PPP IPCP negotiations.
254	MPP-Idle-Percent	No description available.
255	Xmit-Rate	(Ascend 5) No description available.

For more information on vendor-proprietary RADIUS attributes, refer to the section “[Configuring Router for Vendor-Proprietary RADIUS Server Communication](#)” in the chapter “[Configuring RADIUS](#).”

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and

RADIUS Vendor-Specific Attributes (VSA) and RADIUS Disconnect-Cause Attribute Values

First Published: September 23, 2005
Last Updated: December 17, 2007

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the network access server and the RADIUS server by using the vendor-specific attribute (attribute 26). Attribute 26 encapsulates vendor specific attributes, thereby, allowing vendors to support their own extended attributes otherwise not suitable for general use.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for RADIUS Vendor-Specific Attributes \(VSA\) and RADIUS Disconnect-Cause Attribute Values”](#) section on page 14.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About RADIUS Vendor-Specific Attributes (VSA) and RADIUS Disconnect-Cause Attribute Values

The Cisco RADIUS implementation supports one vendor-specific option using the format recommended in the specification. Cisco's vendor-ID is 9, and the supported option has vendor-type 1, which is named "cisco-avpair." The value is a string of the following format:

```
protocol : attribute sep value *
```

"Protocol" is a value of the Cisco "protocol" attribute for a particular type of authorization; protocols that can be used include IP, IPX, VPDN, VOIP, SHELL, RSVP, SIP, AIRNET, OUTBOUND. "Attribute" and "value" are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and "sep" is "=" for mandatory attributes and "*" for optional attributes. This allows the full set of features available for TACACS+ authorization to also be used for RADIUS.

For example, the following AV pair causes Cisco's "multiple named ip address pools" feature to be activated during IP authorization (during PPP's IPCP address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

If you insert an "*", the AV pair "ip:addr-pool=first" becomes optional. Note that any AV pair can be made optional.

```
cisco-avpair= "ip:addr-pool*first"
```

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

Attribute 26 contains the following three elements:

- Type
- Length
- String (also known as data)
 - Vendor-Id
 - Vendor-Type
 - Vendor-Length
 - Vendor-Data

Figure 1 shows the packet format for a VSA encapsulated "behind" attribute 26.

Figure 1 VSA Encapsulated Behind Attribute 26

Note

It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor's definition of that attribute.

[Table 2](#) lists supported vendor-specific RADIUS attributes (IETF attribute 26). [Table 1](#) describes significant fields listed in the [Table 2](#).

Table 1 Vendor-Specific Attributes Table Field Descriptions

Field	Description
Number	All attributes listed in the following table are extensions of IETF attribute 26.
Vendor-Specific Command Codes	A defined code used to identify a particular vendor. Code 9 defines Cisco VSAs, 311 defines Microsoft VSAs, and 529 defines Ascend VSAs.
Sub-Type Number	The attribute ID number. This number is much like the ID numbers of IETF attributes, except it is a “second layer” ID number encapsulated behind attribute 26.
Attribute	The ASCII string name of the attribute.
Description	Description of the attribute.

Table 2 Vendor-Specific RADIUS IETF Attributes

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
MS-CHAP Attributes				
26	311	1	MSCHAP-Response	Contains the response value provided by a PPP MS-CHAP user in response to the challenge. It is only used in Access-Request packets. This attribute is identical to the PPP CHAP Identifier. (RFC 2548)
26	311	11	MSCHAP-Challenge	Contains the challenge sent by a network access server to an MS-CHAP user. It can be used in both Access-Request and Access-Challenge packets. (RFC 2548)
VPDN Attributes				
26	9	1	l2tp-cm-local-window-size	Specifies the maximum receive window size for L2TP control messages. This value is advertised to the peer during tunnel establishment.

Table 2 **Vendor-Specific RADIUS IETF Attributes (continued)**

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	l2tp-drop-out-of-order	Respects sequence numbers on data packets by dropping those that are received out of order. This does not ensure that sequence numbers will be sent on data packets, just how to handle them if they are received.
26	9	1	l2tp-hello-interval	Specifies the number of seconds for the hello keepalive interval. Hello packets are sent when no data has been sent on a tunnel for the number of seconds configured here.
26	9	1	l2tp-hidden-avp	When enabled, sensitive AVPs in L2TP control messages are scrambled or hidden.
26	9	1	l2tp-nosession-timeout	Specifies the number of seconds that a tunnel will stay active with no sessions before timing out and shutting down.
26	9	1	l2tp-tos-reflect	Copies the IP ToS field from the IP header of each payload packet to the IP header of the tunnel packet for packets entering the tunnel at the LNS.
26	9	1	l2tp-tunnel-authen	If this attribute is set, it performs L2TP tunnel authentication.
26	9	1	l2tp-tunnel-password	Shared secret used for L2TP tunnel authentication and AVP hiding.
26	9	1	l2tp-udp-checksum	This is an authorization attribute and defines whether L2TP should perform UDP checksums for data packets. Valid values are “yes” and “no.” The default is no.

Store and Forward Fax Attributes

26	9	3	Fax-Account-Id-Origin	Indicates the account ID origin as defined by system administrator for the mmoip aaa receive-id or the mmoip aaa send-id commands.
26	9	4	Fax-Msg-Id=	Indicates a unique fax message identification number assigned by Store and Forward Fax.
26	9	5	Fax-Pages	Indicates the number of pages transmitted or received during this fax session. This page count includes cover pages.
26	9	6	Fax-Coverpage-Flag	Indicates whether or not a cover page was generated by the off-ramp gateway for this fax session. True indicates that a cover page was generated; false means that a cover page was not generated.
26	9	7	Fax-Modem-Time	Indicates the amount of time in seconds the modem sent fax data (x) and the amount of time in seconds of the total fax session (y), which includes both fax-mail and PSTN time, in the form x/y. For example, 10/15 means that the transfer time took 10 seconds, and the total fax session took 15 seconds.

Table 2 Vendor-Specific RADIUS IETF Attributes (continued)

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	8	Fax-Connect-Speed	Indicates the modem speed at which this fax-mail was initially transmitted or received. Possible values are 1200, 4800, 9600, and 14400.
26	9	9	Fax-Recipient-Count	Indicates the number of recipients for this fax transmission. Until e-mail servers support Session mode, the number should be 1.
26	9	10	Fax-Process-Abort-Flag	Indicates that the fax session was aborted or successful. True means that the session was aborted; false means that the session was successful.
26	9	11	Fax-Dsn-Address	Indicates the address to which DSNs will be sent.
26	9	12	Fax-Dsn-Flag	Indicates whether or not DSN has been enabled. True indicates that DSN has been enabled; false means that DSN has not been enabled.
26	9	13	Fax-Mdn-Address	Indicates the address to which MDNs will be sent.
26	9	14	Fax-Mdn-Flag	Indicates whether or not message delivery notification (MDN) has been enabled. True indicates that MDN had been enabled; false means that MDN had not been enabled.
26	9	15	Fax-Auth-Status	Indicates whether or not authentication for this fax session was successful. Possible values for this field are success, failed, bypassed, or unknown.
26	9	16	Email-Server-Address	Indicates the IP address of the e-mail server handling the on-ramp fax-mail message.
26	9	17	Email-Server-Ack-Flag	Indicates that the on-ramp gateway has received a positive acknowledgment from the e-mail server accepting the fax-mail message.
26	9	18	Gateway-Id	Indicates the name of the gateway that processed the fax session. The name appears in the following format: hostname.domain-name.
26	9	19	Call-Type	Describes the type of fax activity: fax receive or fax send.
26	9	20	Port-Used	Indicates the slot/port number of the Cisco AS5300 used to either transmit or receive this fax-mail.
26	9	21	Abort-Cause	If the fax session aborts, indicates the system component that signaled the abort. Examples of system components that could trigger an abort are FAP (Fax Application Process), TIFF (the TIFF reader or the TIFF writer), fax-mail client, fax-mail server, ESMTP client, or ESMTP server.
H323 Attributes				
26	9	23	Remote-Gateway-ID (h323-remote-address)	Indicates the IP address of the remote gateway.

Table 2 *Vendor-Specific RADIUS IETF Attributes (continued)*

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	24	Connection-ID (h323-conf-id)	Identifies the conference ID.
26	9	25	Setup-Time (h323-setup-time)	Indicates the setup time for this connection in Coordinated Universal Time (UTC) formerly known as Greenwich Mean Time (GMT) and Zulu time.
26	9	26	Call-Origin (h323-call-origin)	Indicates the origin of the call relative to the gateway. Possible values are originating and terminating (answer).
26	9	27	Call-Type (h323-call-type)	Indicates call leg type. Possible values are telephony and VoIP .
26	9	28	Connect-Time (h323-connect-time)	Indicates the connection time for this call leg in UTC.
26	9	29	Disconnect-Time (h323-disconnect-time)	Indicates the time this call leg was disconnected in UTC.
26	9	30	Disconnect-Cause (h323-disconnect-cause)	Specifies the reason a connection was taken offline per Q.931 specification.
26	9	31	Voice-Quality (h323-voice-quality)	Specifies the impairment factor (ICPIF) affecting voice quality for a call.
26	9	33	Gateway-ID (h323-gw-id)	Indicates the name of the underlying gateway.

Large Scale Dialout Attributes

26	9	1	callback-dialstring	Defines a dialing string to be used for callback.
26	9	1	data-service	No description available.
26	9	1	dial-number	Defines the number to dial.
26	9	1	force-56	Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available.
26	9	1	map-class	Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out.
26	9	1	send-auth	Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.

Table 2 Vendor-Specific RADIUS IETF Attributes (continued)

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	send-name	<p>PPP name authentication. To apply for PAP, do not configure the ppp pap sent-name password command on the interface. For PAP, “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For CHAP, “preauth:send-name” will be used not only for outbound authentication, but also for inbound authentication. For a CHAP inbound case, the NAS will use the name defined in “preauth:send-name” in the challenge packet to the caller box.</p> <p>Note The send-name attribute has changed over time: Initially, it performed the functions now provided by both the send-name and remote-name attributes. Because the remote-name attribute has been added, the send-name attribute is restricted to its current behavior.</p>
26	9	1	send-secret	<p>PPP password authentication. The vendor-specific attributes (VSAs) “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For a CHAP outbound case, both “preauth:send-name” and “preauth:send-secret” will be used in the response packet.</p>
26	9	1	remote-name	<p>Provides the name of the remote host for use in large-scale dial-out. Dialer checks that the large-scale dial-out remote name matches the authenticated name, to protect against accidental user RADIUS misconfiguration. (For example, dialing a valid phone number but connecting to the wrong router.)</p>
Miscellaneous Attributes				
26	9	2	Cisco-NAS-Port	<p>Specifies additional vendor specific attribute (VSA) information for NAS-Port accounting. To specify additional NAS-Port information in the form an Attribute-Value Pair (AVPair) string, use the radius-server vsa send global configuration command.</p> <p>Note This VSA is typically used in Accounting, but may also be used in Authentication (Access-Request) packets.</p>
26	9	1	min-links	<p>Sets the minimum number of links for MLP.</p>

Table 2 Vendor-Specific RADIUS IETF Attributes (continued)

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	proxyacl#<n>	Allows users to configure the downloadable user profiles (dynamic ACLs) by using the authentication proxy feature so that users can have the configured authorization to permit traffic going through the configured interfaces.
26	9	1	spi	Carries the authentication information needed by the home agent to authenticate a mobile node during registration. The information is in the same syntax as the ip mobile secure host <addr> configuration command. Basically it contains the rest of the configuration command that follows that string, verbatim. It provides the Security Parameter Index (SPI), key, authentication algorithm, authentication mode, and replay protection timestamp range.

For more information on configuring your NAS to recognize and use VSAs, refer to the section [“Configuring Router to Use Vendor-Specific RADIUS Attributes”](#) of the chapter [“Configuring RADIUS.”](#)

RADIUS Disconnect-Cause Attribute Values

Disconnect-cause attribute values specify the reason a connection was taken offline. The attribute values are sent in Accounting request packets. These values are sent at the end of a session, even if the session fails to be authenticated. If the session is not authenticated, the attribute can cause stop records to be generated without first generating start records.

[Table 3](#) lists the cause codes, values, and descriptions for the Disconnect-Cause (195) attribute.

Note

The Disconnect-Cause is incremented by 1000 when it is used in RADIUS AVPairs; for example, disc-cause 4 becomes 1004.

Table 3 Disconnect-Cause Attribute Values

Cause Code	Value	Description
0	No-Reason	No reason is given for the disconnect.
1	No-Disconnect	The event was not disconnected.
2	Unknown	Reason unknown.
3	Call-Disconnect	The call has been disconnected.
4	CLID-Authentication-Failure	Failure to authenticate number of the calling-party.
9	No-Modem-Available	A modem is not available to connect the call.

Table 3 *Disconnect-Cause Attribute Values (continued)*

Cause Code	Value	Description
10	No-Carrier	No carrier detected. Note Codes 10, 11, and 12 can be sent if there is a disconnection during initial modem connection.
11	Lost-Carrier	Loss of carrier.
12	No-Detected-Result-Codes	Failure to detect modem result codes.
20	User-Ends-Session	User terminates a session. Note Codes 20, 22, 23, 24, 25, 26, 27, and 28 apply to EXEC sessions.
21	Idle-Timeout	Timeout waiting for user input. Codes 21, 100, 101, 102, and 120 apply to all session types.
22	Exit-Telnet-Session	Disconnect due to exiting Telnet session.
23	No-Remote-IP-Addr	Could not switch to SLIP/PPP; the remote end has no IP address.
24	Exit-Raw-TCP	Disconnect due to exiting raw TCP.
25	Password-Fail	Bad passwords.
26	Raw-TCP-Disabled	Raw TCP disabled.
27	Control-C-Detected	Control-C detected.
28	EXEC-Process-Destroyed	EXEC process destroyed.
29	Close-Virtual-Connection	User closes a virtual connection.
30	End-Virtual-Connection	Virtual connected has ended.
31	Exit-Rlogin	User exists Rlogin.
32	Invalid-Rlogin-Option	Invalid Rlogin option selected.
33	Insufficient-Resources	Insufficient resources.
40	Timeout-PPP-LCP	PPP LCP negotiation timed out. Note Codes 40 through 49 apply to PPP sessions.
41	Failed-PPP-LCP-Negotiation	PPP LCP negotiation failed.
42	Failed-PPP-PAP-Auth-Fail	PPP PAP authentication failed.
43	Failed-PPP-CHAP-Auth	PPP CHAP authentication failed.
44	Failed-PPP-Remote-Auth	PPP remote authentication failed.
45	PPP-Remote-Terminate	PPP received a Terminate Request from remote end.
46	PPP-Closed-Event	Upper layer requested that the session be closed.
47	NCP-Closed-PPP	PPP session closed because there were no NCPs open.
48	MP-Error-PPP	PPP session closed because of an MP error.
49	PPP-Maximum-Channels	PPP session closed because maximum channels were reached.
50	Tables-Full	Disconnect due to full terminal server tables.
51	Resources-Full	Disconnect due to full internal resources.
52	Invalid-IP-Address	IP address is not valid for Telnet host.
53	Bad-Hostname	Hostname cannot be validated.

Table 3 *Disconnect-Cause Attribute Values (continued)*

Cause Code	Value	Description
54	Bad-Port	Port number is invalid or missing.
60	Reset-TCP	TCP connection has been reset. Note Codes 60 through 67 apply to Telnet or raw TCP sessions.
61	TCP-Connection-Refused	TCP connection has been refused by the host.
62	Timeout-TCP	TCP connection has timed out.
63	Foreign-Host-Close-TCP	TCP connection has been closed.
64	TCP-Network-Unreachable	TCP network is unreachable.
65	TCP-Host-Unreachable	TCP host is unreachable.
66	TCP-Network-Admin Unreachable	TCP network is unreachable for administrative reasons.
67	TCP-Port-Unreachable	TCP port is unreachable.
100	Session-Timeout	Session timed out.
101	Session-Failed-Security	Session failed for security reasons.
102	Session-End-Callback	Session terminated due to callback.
120	Invalid-Protocol	Call refused because the detected protocol is disabled.
150	RADIUS-Disconnect	Disconnected by RADIUS request.
151	Local-Admin-Disconnect	Administrative disconnect.
152	SNMP-Disconnect	Disconnected by SNMP request.
160	V110-Retries	Allowed V.110 retries have been exceeded.
170	PPP-Authentication-Timeout	PPP authentication timed out.
180	Local-Hangup	Disconnected by local hangup.
185	Remote-Hangup	Disconnected by remote end hangup.
190	T1-Quiesced	Disconnected because T1 line was quiesced.
195	Call-Duration	Disconnected because the maximum duration of the call was exceeded.
600	VPN-User-Disconnect	Call disconnected by client (through PPP). Code is sent if the LNS receives a PPP terminate request from the client.
601	VPN-Carrier-Loss	Loss of carrier. This can be the result of a physical line going dead. Code is sent when a client is unable to dial out using a dialer.
602	VPN-No-Resources	No resources available to handle the call. Code is sent when the client is unable to allocate memory (running low on memory).
603	VPN-Bad-Control-Packet	Bad L2TP or L2F control packets. This code is sent when an invalid control packet, such as missing mandatory Attribute-Value pairs (AVP), from the peer is received. When using L2TP, the code will be sent after six retransmits; when using L2F, the number of retransmits is user configurable. Note VPN-Tunnel-Shut will be sent if there are active sessions in the tunnel.

Table 3 **Disconnect-Cause Attribute Values (continued)**

Cause Code	Value	Description
604	VPN-Admin-Disconnect	Administrative disconnect. This can be the result of a VPN soft shutdown, which is when a client reaches maximum session limit or exceeds maximum hopcount. Code is sent when a tunnel is brought down by issuing the clear vpdn tunnel command.
605	VPN-Tunnel-Shut	Tunnel teardown or tunnel setup has failed. Code is sent when there are active sessions in a tunnel and the tunnel goes down. Note This code is <i>not</i> sent when tunnel authentication fails.
606	VPN-Local-Disconnect	Call is disconnected by LNS PPP module. Code is sent when the LNS sends a PPP terminate request to the client. It indicates a normal PPP disconnection initiated by the LNS.
607	VPN-Session-Limit	VPN soft shutdown is enabled. Code is sent when a call has been refused due to any of the soft shutdown restrictions previously mentioned.
608	VPN-Call-Redirect	VPN call redirect is enabled.

For Q.850 cause codes and descriptions, see the section “Internal Cause Codes for SIP and H.323” in the chapter “Cause Codes and Debug Values” of the *Cisco IOS Voice Troubleshooting and Monitoring*.

Connect-Info RADIUS Attribute 77

First Published: September 22, 2002

Last Published: December 17, 2007

The Connect-Info RADIUS Attribute 77 feature enables the Network Access Server (NAS) to report Connect-Info (attribute 77) in RADIUS accounting “start” and “stop” records that are sent to the RADIUS client (dial-in modem). These records allow the transmit and receive connection speeds, modulation, and compression to be compared in order to analyze a user session over a dial-in modem where speeds are often different at the end of the connection (after negotiation).

When the network access server (NAS) sends attribute 77 in accounting “start” and “stop” records, the connect rates can be measured across the platform. The “transmit” speed (the speed at which the NAS modem sends information) and “receive” speed (the speed at which the NAS receives information) can be recorded to determine whether user modem connections renegotiate to lower speeds shortly into a session. If the transmit and receive speeds are different from each other, attribute 77 reports both speeds, which allows the modem connection speeds that each customer gets from their session.

Attribute 77 is also used to send the Class string for broadband connections such as PPPoX, physical connection speeds for dial access, and the VRF string for any sessions on router interfaces defined with **ip vrf forwarding** command.

Note

This feature requires no configuration.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for Connect-Info RADIUS Attribute 77” section on page 5](#).

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [How to Verify the Connect-Info RADIUS Attribute 77, page 2](#)
- [Configuration Example for Connect-Info RADIUS Attribute 77, page 3](#)
- [Additional References, page 3](#)
- [Command Reference, page 4](#)
- [Feature Information for Connect-Info RADIUS Attribute 77, page 5](#)

Prerequisites for Connect-Info RADIUS Attribute 77

Before the NAS can send attribute 77 in accounting “start” and “stop” records, you must perform the following tasks:

- Configure your NAS for authentication, authorization, and accounting (AAA) and to accept incoming modem calls.
- Enable AAA accounting by using the **aaa accounting network default start-stop group radius** command in global configuration mode.
- Change the modem poll timer by using the **modem link-info poll time** command in global configuration mode. (Changing the modem poll timer is required on all supported platforms *except* the Cisco AS5400).

How to Verify the Connect-Info RADIUS Attribute 77

To verify attribute 77 in your accounting “start” and “stop” records, use the **debug radius** privileged EXEC command. The following example shows that Connect-Info appears in the first and last accounting attributes:

Router# **debug radius**

```
RADIUS: code=Acct-Request id=04 len=0134
      authenticator=BE A2 F3 BD EE CE 89 C7 - 48 19 32 F5 79 84 94 D5
      T=Connect-Info[77]                      L=17 V="31200/33600 V34+/LAPM"
      T=Acct-Status-Type[40]                  L=06 V=Start                      [1]
      ...

RADIUS: code=Acct-Request id=07 len=0226
      authenticator=06 AC 03 10 4A 84 44 A4 - 6F D9 68 AA B3 90 44 CB
      ...
      T=Connect-Info[77]                      L=1F V="33600 V34+/LAPM (31200/336"
      T=Acct-Status-Type[40]                  L=06 V=Stop                          [2]
      ...
```

Note

If the modem negotiation speeds are different, the speeds are shown in a bracket format at the end of the call.

Configuration Example for Connect-Info RADIUS Attribute 77

This section provides the following configuration example:

- [Configure NAS for AAA and Incoming Modem Calls Example](#)

Configure NAS for AAA and Incoming Modem Calls Example

The following example is a sample NAS configuration for AAA and incoming modem calls:

```
interface Serial0:15
  no ip address
  isdn switch-type primary-net5
  isdn incoming-voice modem
!
interface Async1
  ip address 10.0.0.10 255.0.0.0
  encapsulation ppp
  async default routing
  async mode interactive
  no peer default ip address
  ppp authentication chap
!
line 1
  modem InOu
  transport preferred none
  transport input all
  autoselect ppp
!
```

Command Reference

No commands are introduced or modified in the feature documented in this module. For information about commands, see the *Cisco IOS Security Command Reference* at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html. For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*.

Feature Information for Connect-Info RADIUS Attribute 77

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 1 Feature Information for Connect-Info RADIUS Attribute 77

Feature Name	Releases	Feature Information
Connect-Info RADIUS Attribute 77	12.2(11)T 12.2(33)SRC Cisco IOS XE Release 2.1	<p>The Connect-Info RADIUS Attribute 77 feature enables the network access server (NAS) to report Connect-Info (attribute 77) in RADIUS accounting “start” and “stop” records that are sent to the RADIUS client (dial-in modem). These “start” and “stop” records allow the transmit and receive connection speeds, modulation, and compression to be compared in order to analyze a user session over a dial-in modem where speeds are often different at the end of the connection (after negotiation).</p> <p>This feature was introduced on Cisco IOS Release 12.2(11)T.</p> <p>This feature was integrated into Cisco IOS Release 12.2(33)SRC.</p> <p>In Cisco IOS XE Release 2.1, this feature was introduced on Cisco ASR 1000 Series Routers</p> <p>This feature supports the following platforms:</p> <ul style="list-style-type: none"> • Cisco AS5300 series • Cisco AS5400 series • Cisco AS5800 series • Cisco AS5850 series

Encrypted Vendor-Specific Attributes

First Published: February 25, 2002

Last Updated: December 3, 2007

The Encrypted Vendor-Specific Attributes feature provides users with a way to centrally manage filters at a RADIUS server and supports the following types of string vendor-specific attributes (VSAs):

- **Tagged String VSA** (similar to Cisco VSA type 1 (Cisco:AVPair (1)) except that this new VSA is tagged)
- **Encrypted String VSA** (similar to Cisco VSA type 1 except that this new VSA is encrypted)
- **Tagged and Encrypted String VSA** (similar to Cisco VSA type 1 except that this new VSA is tagged and encrypted)

Cisco:AVPairs specify additional authentication and authorization information in the form an Attribute-Value Pair (AVPair) string. When Internet Engineering Task Force (IETF) RADIUS attribute 26 (Vendor-Specific) is transmitted with a vendor-Id number of “9” and a vendor-type value of “1” (which means that it is a Cisco AVPair), the RADIUS user profile format for a Cisco AVPair looks as follows: Cisco:AVPair = “protocol:attribute=value”.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for Encrypted Vendor-Specific Attributes” section on page 7](#).

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Contents

- [Prerequisites for Encrypted Vendor-Specific Attributes, page 2](#)
- [Information About Encrypted Vendor-Specific Attributes, page 2](#)
- [How to Verify Encrypted Vendor-Specific Attributes, page 4](#)
- [Configuration Examples for Encrypted Vendor-Specific Attributes, page 4](#)
- [Additional References, page 5](#)
- [Command Reference, page 6](#)
- [Feature Information for Encrypted Vendor-Specific Attributes, page 7](#)

Prerequisites for Encrypted Vendor-Specific Attributes

Before the RADIUS server can accept tagged and encrypted VSAs, you must configure your server for AAA authentication and authorization and to accept PPP calls.

For information on performing these tasks, refer to the chapter “PPP Configuration” in the *Cisco IOS Dial Technologies Configuration Guide*, Release 12.4 and the chapters “Configuring Authentication” and “Configuring Authorization” in the *Cisco IOS Security Configuration Guide*, Release 12.4.

Information About Encrypted Vendor-Specific Attributes

The following sections describe packet encryption formats for the different VSAs:

- [Tagged String VSA](#)
- [Encrypted String VSA](#)
- [Tagged and Encrypted String VSA](#)

Tagged String VSA

Figure 1 displays the packet format for the Tagged String VSA:

Figure 1 Tagged String VSA Format

Tagged String VSA

Type (26)	Length	Vendor-ID (9)	
Vendor-ID (cont.)		Vendor-type (1)	Vendor-length
Tag	Attribute string		

62354

To retrieve the correct value, the Tag field must be parsed correctly. The value for this field can range only from 0x01 through 0x1F. If the value is not within the specified range, the RADIUS server ignores the value and considers the Tag field to be a part of the Attribute String field.

Encrypted String VSA

Figure 2 displays the packet format for the Encrypted String VSA:

Figure 2 *Encrypted String VSA Format*

Encrypted String VSA

Type (26)	Length	Vendor-ID (9)	
Vendor-ID (cont.)		Vendor-type (36)	Vendor-length
Salt	Salt (cont.)	Attribute string	

62355

The Salt field ensures the uniqueness of the encryption key that is used to encrypt each instance of the VSA. The first and most significant bit of the Salt field must be set to 1.

Note

Vendor-type (36) indicates that the attribute is an encrypted string VSA.

Tagged and Encrypted String VSA

Figure 3 displays the packet formats for each of the newly supported VSAs:

Figure 3 *Tagged and Encrypted String VSA Format*

Tagged and Encrypted String VSA

Type (26)	Length	Vendor-ID (9)	
Vendor-ID (cont.)		Vendor-type (36)	Vendor-length
*Tag	Salt	Salt (cont.)	Attribute string

62356

This VSA is similar to encrypted string VSAs *except* this VSA has an additional Tag field. If the Tag field is not within the valid range (0x01 through 0x1F), it is considered to be part of the Salt field.

How to Verify Encrypted Vendor-Specific Attributes

The Encrypted Vendor-Specific Attributes feature requires no configuration. To verify that RADIUS-tagged and encrypted VSAs are being sent from the RADIUS server, use the following command in privileged EXEC mode:

Command	Purpose
Router# debug radius	Displays information associated with RADIUS. The output of this command shows whether tagged and encrypted VSAs are being sent from the RADIUS server.

Configuration Examples for Encrypted Vendor-Specific Attributes

This section provides the following configuration examples:

- [NAS Configuration Example, page 4](#)
- [RADIUS User Profile with a Tagged and Encrypted VSA Example, page 4](#)

NAS Configuration Example

The following example shows how to configure a network access server (NAS) with a basic configuration using tagged and encrypted VSAs. (This example assumes that the configuration required to make PPP calls is already enabled.)

```
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius
!
radius-server host 10.2.2.2 auth-port 1645 acct-port 1646
radius-server key cisco
```

RADIUS User Profile with a Tagged and Encrypted VSA Example

The following is an example of user profile on a RADIUS server that supports tagged and encrypted string VSAs:

```
mascot Password = "cisco"
Service-Type = NAS-Prompt,
Framed-Protocol = PPP,
Cisco:Cisco-Enc = "ip:route=10.0.0.0 255.0.0.0"
Cisco.attr Cisco-Enc 36 tag-encstr(*,*)
```

Local AAA Server

First Published: March 28, 2005

Last Updated: January 2 2008

The Local AAA Server feature allows you to configure your router so that user authentication and authorization attributes currently available on AAA servers are available locally on the router. The attributes can be added to existing framework, such as the local user database or subscriber profile. The local AAA server provides access to the complete dictionary of Cisco IOS supported attributes.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for Local AAA Server” section on page 14](#).

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Local AAA Server

- Before using this feature, you must have the **aaa new-model** command enabled.

Information About Local AAA Server

To configure the Local AAA Server feature, you should understand the following concepts:

- [Local Authorization Attributes: Overview, page 2](#)
- [Local AAA Attribute Support, page 2](#)
- [AAA Attribute Lists, page 3](#)
- [Validation of Attributes, page 3](#)

Local Authorization Attributes: Overview

The AAA subsystem (authentication, authorization, and accounting) is responsible for managing all supported attributes that are available to the various services within the Cisco IOS software. As such, it maintains its own local dictionary of all supported attributes. However, prior to Cisco IOS Release 12.3(14)T, most of these authorization options were not available for local (on-box) authorizations.

Local AAA Attribute Support

Effective with Cisco IOS Release 12.3(14)T, you can configure your router so that AAA authentication and authorization attributes currently available on AAA servers are made available on existing Cisco IOS devices. The attributes can be added to existing framework, such as the local user database or subscriber profile. For example, an attribute list can now be added to an existing username, providing the ability for the local user database to act as a local AAA server. For situations in which the local username list is relatively small, this flexibility allows you to provide complete user authentication or authorization locally within the Cisco IOS software without having a AAA server. This ability can allow you to maintain your user database locally or provide a failover local mechanism without having to sacrifice policy options when defining local users.

A subscriber profile allows domain-based clients to have policy applied at the end-user service level. This flexibility allows common policy to be set for all users under a domain in one place and applied there whether or not user authorization is done locally. Effective with Cisco IOS Release 12.3(14)T, an attribute list can be added to the subscriber profile, allowing the profile to apply all attributes that can be applied to services using AAA servers. Attributes that are configured under the AAA attribute list are merged with the existing attributes that are generated with the existing subscriber profile and passed to the Subscriber Server Switch (SSS) framework for application.

**Note**

Accounting is still done on a AAA server and is not supported by this feature.

AAA Attribute Lists

AAA attribute lists define user profiles that are local to the router. Every attribute that is known to the AAA subsystem is made available for configuration.

The AAA attributes that are defined in the AAA attribute list are standard RADIUS or TACACS+ attributes. However, they are in the Cisco IOS internal format for that attribute. The attributes must be converted from the RADIUS format (for a RADIUS case) to the Cisco IOS AAA interface format. TACACS+ attributes are generally identical to the Cisco IOS AAA interface format.

Converting from RADIUS Format to Cisco IOS AAA Format

You can use the **show aaa attributes protocol radius** command to get the Cisco IOS AAA format of the Internet Engineering Task Force (IETF) RADIUS attribute. The **show** command output provides a complete list of all the AAA attributes that are supported.

**Note**

The conversion from RADIUS to internal AAA is done internally within the AAA framework. RADIUS vendor-specific attributes (VSAs) are usually accurately reflected during conversion. TACACS+ attributes are also usually identical to the local attributes and do not require the conversion process. However, IETF numbered attributes and some special VSAs often require the conversion process.

Validation of Attributes

Attributes are not validated at configuration. The AAA subsystem “knows” only the format that is expected by the services when the service defines a given attribute inside a definition file. However, it cannot validate the attribute information itself. This validation is done by a service when it first uses the attribute. This validation applies whether the AAA server is RADIUS or TACACS+. Thus, if you are not familiar with configuring a AAA server, it is advisable that you test your attribute list on a test device with the service that will be using the list before configuring and using it in a production environment.

How to Configure Local AAA Server

This section contains the following procedures:

- [Defining a AAA Attribute List, page 3](#) (required)
- [Defining a Subscriber Profile, page 6](#) (required)
- [Monitoring and Troubleshooting a Local AAA Server, page 7](#) (optional)

Defining a AAA Attribute List

To define an AAA attribute list, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **aaa attribute list** *list-name*
4. **attribute type** {*name*} {*value*} [**service** *service*] [**protocol** *protocol*]
5. **attribute type** {*name*} {*value*} [**service** *service*] [**protocol** *protocol*]
6. **attribute type** {*name*} {*value*} [**service** *service*] [**protocol** *protocol*]
7. **attribute type** {*name*} {*value*}
8. **attribute type** {*name*} {*value*}
9. **attribute type** {*name*} {*value*}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	aaa attribute list list-name Example: Router (config)# aaa attribute list TEST	Defines a AAA attribute list.
Step 4	attribute type {name} {value} [service service] [protocol protocol] Example: Router (config)# attribute type addr-pool "pool name" service ppp protocol ip	Defines an IP address pool to use.
Step 5	attribute type {name} {value} [service service] [protocol protocol] Example: Router (config)# attribute type ip-unnumbered "loopback number" service ppp protocol ip	Defines the loopback interface to use.
Step 6	attribute type {name} {value} [service service] [protocol protocol] Example: Router (config)# attribute type vrf-id "vrf name" service ppp protocol ip	Defines the virtual route forwarding (VRF) to use.
Step 7	attribute type {name} {value} Example: Router (config)# attribute type ppp-authen-list "aaa list name"	Defines the AAA authentication list to use.
Step 8	attribute type {name} {value} Example: Router (config)# attribute type ppp-author-list "aaa list name"	Defines the AAA authorization list to use.
Step 9	attribute type {name} {value} Example: Router (config)# attribute type ppp-acct-list "aaa list name"	Defines the AAA accounting list to use.

Defining a Subscriber Profile

To define a subscriber profile, perform the following steps.

**Note**

RADIUS users should use the **show aaa attributes** command to map the RADIUS version of the particular attribute to the Cisco IOS AAA version of the string attribute. See the example “[Mapping from the RADIUS Version of a Particular Attribute to the Cisco IOS AAA Version: Example, page 11.](#)”

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **subscriber authorization enable**
4. **subscriber profile** *domain-name*
5. **service local**
6. **exit**
7. **aaa attribute list** *list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	subscriber authorization enable Example: Router (config)# subscriber authorization enable	Enables subscriber authorization.
Step 4	subscriber profile domain-name Example: Router (config)# subscriber profile cisco1.com	Specifies the username domain that has to be matched and enters subscriber profile configuration mode.
Step 5	service local Example: Router (subscriber-profile)# service local	Specifies that local subscriber authorization should be performed.
Step 6	exit Example: Router (subscriber-profile)# exit	Exits subscriber profile configuration mode.
Step 7	aaa attribute list list-name Example: Router (config)# aaa attribute list TEST	Defines the AAA attribute list from which RADIUS attributes are retrieved.

Monitoring and Troubleshooting a Local AAA Server

The following debug commands may be helpful in monitoring and troubleshooting, especially to ensure that domain-based service authorization is being triggered and that location authorization is being called on the local AAA server, which triggers the service.

SUMMARY STEPS

1. enable
2. debug aaa authentication
3. debug aaa authorization
4. debug aaa per-user

5. **debug ppp authentication**
6. **debug ppp error**
7. **debug ppp forward**
8. **debug ppp negotiation**
9. **debug radius**
10. **debug sss error**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	debug aaa authentication Example: Router# debug aaa authentication	Displays the methods of authentication being used and the results of these methods.
Step 3	debug aaa authorization Example: Router# debug aaa authorization	Displays the methods of authorization being used and the results of these methods.
Step 4	debug aaa per-user Example: Router# debug aaa per-user	Displays information about PPP session per-user activities.
Step 5	debug ppp authentication Example: Router# debug ppp authentication	Indicates whether a client is passing authentication.
Step 6	debug ppp error Example: Router (config)# debug ppp error	Displays protocol errors and error statistics that are associated with PPP connection negotiation and operation.
Step 7	debug ppp forward Example: Router# debug ppp forward	Displays who is taking control of a session.
Step 8	debug ppp negotiation Example: Router# debug ppp negotiation	Displays PPP packets sent during PPP startup, where PPP options are negotiated.
Step 9	debug radius Example: Router# debug radius	Displays information about the RADIUS server.
Step 10	debug sss error Example: Router# debug sss error	Displays diagnostic information about errors that may occur during SSS call setup.

Configuration Examples for Local AAA Server

This section contains the following configuration examples:

- [Local AAA Server: Example, page 10](#)
- [Mapping from the RADIUS Version of a Particular Attribute to the Cisco IOS AAA Version: Example, page 11](#)

Local AAA Server: Example

The following example shows a Point to Point over Ethernet (PPPoE) group named “bba-group” that is configured for subscriber profile cisco.com (thus, any user with the domain name cisco.com will execute the subscriber profile cisco.com authorization policy). The cisco.com subscriber profile is configured to attach the AAA attribute list “TEST,” which has both “ip vrf forwarding” and “ip unnumbered” configured for PPP service under Link Control Protocol (LCP) negotiation. This configuration will essentially cause the named attributes to be applied on the session with the cisco.com domain under the bba-group “pppoe grp1.”

```
aaa authentication ppp template1 local
aaa authorization network template1 local
!
aaa attribute list TEST
  attribute type interface-config "ip unnumbered FastEthernet0" service ppp protocol lcp
  attribute type interface-config "ip vrf forwarding blue" service ppp protocol lcp
!
ip vrf blue
  description vrf blue template1
  rd 1:1
  route-target export 1:1
  route-target import 1:1
!
subscriber authorization enable
!
subscriber profile cisco.com
  service local
  aaa attribute list TEST
!
bba-group pppoe grp1
  virtual-template 1
  service profile cisco.com
!
interface Virtual-Template1
  no ip address
  no snmp trap link-status
  no peer default ip address
  no keepalive
  ppp authentication pap template1
  ppp authorization template1
!
```

Note

In some versions of Cisco IOS software, it is better to use the explicit attribute instead of interface-config because it provides better scalability (full VAccess interfaces are not required, and sub interfaces could be used to provide the service). In such a case, you might configure “attribute type ip-unnumbered ‘FastEthernet0’ service ppp protocol ip” instead of “attribute type interface-config ‘ip unnumbered FastEthernet0’ service ppp protocol lcp.”

Mapping from the RADIUS Version of a Particular Attribute to the Cisco IOS AAA Version: Example

The following output example of the **show aaa attributes** command lists RADIUS attributes, which can be used when configuring this feature.

```
Router# show aaa attributes protocol radius
```

IETF defined attributes:

Type=4	Name=acl	Format=Ulong
Protocol:RADIUS		
Unknown	Type=11	Name=Filter-Id
		Format=Binary

Converts attribute 11 (Filter-Id) of type Binary into an internal attribute named "acl" of type Ulong. As such, one can configure this attributes locally by using the attribute type "acl."

Cisco VSA attributes:

Type=157	Name=interface-config	Format=String
----------	-----------------------	---------------

Simply expects a string for the attribute of type "interface-config."

**Note**

The **aaa attribute list** command requires the Cisco IOS AAA version of an attribute, which is defined in the "Name" field above.

Feature Information for Local AAA Server

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

[Table 1](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 1 Feature Information for Local AAA Server

Feature Name	Releases	Feature Information
Local AAA Server	12.3(14)T 12.2(28)SB 12.2(33)SRC Cisco IOS XE Release 2.1	The Local AAA Server feature allows you to configure your router so that user authentication and authorization attributes currently available on AAA servers are available locally on the router. The attributes can be added to existing framework, such as the local user database or subscriber profile. The local AAA server provides access to the complete dictionary of Cisco IOS supported attributes. In Cisco IOS XE Release 2.1, this feature was introduced on Cisco ASR 1000 Series Routers.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

Per-User QoS via AAA Policy Name

First Published: March 31, 2000

Last Updated: January 2, 2008

The Per-User QoS via AAA Policy Name feature provides the ability to download a policy name that describes quality of service (QoS) parameters for a user session from a RADIUS server and apply them for the particular session.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Command Reference](#)” section on page 6.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Per-User QoS via AAA Policy Name

Before you configure the Per-User QoS via AAA Policy Name feature, you must locally define on your router the policy whose name is received from the RADIUS server.

Information About Per-User QoS via AAA Policy Name

Effective with Cisco IOS Release 12.2(15)T, separate Cisco vendor-specific attributes (VSAs) are added for the service map.

To configure the Per-User QoS via AAA Policy Name feature, you must understand the following concept:

VSAs Added for Per-User QoS via AAA Policy Name

Two new VSAs have been added for the service map, and the VSAs will bypass the parser while applying the policy for a particular user or session. The new VSAs are as follows:

- vendor-id=9 (Cisco) Vendor type 37 for upstream traffic to input policy name
- vendor-id+9 (Cisco) Vendor type 38 for downstream traffic to output policy name

How to Configure Per-User QoS via AAA Policy Name

This section contains the following procedure:

- [Monitoring and Maintaining Per-User QoS via AAA Policy Name, page 2](#)

To configure per-user QoS, use the authentication, authorization, and accounting (AAA) policy name that you have received from the RADIUS server. To configure QoS policy, refer to the documents listed in the section [Related Documents](#).

Monitoring and Maintaining Per-User QoS via AAA Policy Name

To monitor and maintain per-user QoS using the AAA policy name, use the following **debug** commands:

SUMMARY STEPS

1. **enable**
2. **debug aaa authorization**
3. **debug aaa per-user**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	debug aaa authorization Example: Router# debug aaa authorization	Displays information about AAA/TACACS+ authorization.
Step 3	debug aaa per-user Example: Router# debug aaa per-user	Displays information about per-user QoS parameters.

Configuration Examples for Per-User QoS via AAA Policy Name

This section provides the following configuration example:

- [Per-User QoS Using the AAA Policy Name, page 3](#)

Per-User QoS Using the AAA Policy Name

The following example shows that per-user QoS is being configured using the AAA policy name “policy_class_1_2”:

```
class-map match-all class1
  match access-group 101
class-map match-all class2
  match qos-group 4
  match access-group 101

policy-map policy_class_1_2
  class class1
    bandwidth 3000
    queue-limit 30
  class class2
    bandwidth 2000
  class class-default
    bandwidth 500

peruser_qos_1    Password = "lab"
  Service-Type = Framed,
  Framed-Protocol = PPP,
  Cisco:Cisco-avpair = "ip:sub-policy-In=ssspolicy"
!ssspolicy in the above line is the name of the policy.

peruser_qos_2    Password = "lab"
  Service-Type = Framed,
```

```
Framed-Protocol = PPP,  
Cisco:Cisco-avpair = "ip:sub-policy-Out=ssspolicy"
```

Command Reference

This feature uses no new or modified commands. To see the command pages for the commands used with this feature, see the *Cisco IOS Security Command Reference* at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html. For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or a Cisco IOS master commands list.

Feature Information for Per-User QoS via AAA Policy Name

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 1 Feature Information for Per-User QoS via AAA Policy Name

Feature Name	Releases	Feature Information
Per-User QoS via AAA Policy Name	12.2(15)B 12.2(15)T 12.2(33)SRC	You can use the Per-User QoS via AAA Policy Name feature to download a policy name that describes QoS parameters for a user session from a RADIUS server and apply them for a particular session.

Glossary

RADIUS—Remote Authentication Dial-In User Service. RADIUS is a database for authenticating modem and ISDN connections and for tracking connection time.

VSA—vendor-specific attribute. A VSA is an attribute that has been implemented by a particular vendor. It uses the attribute Vendor-Specific to encapsulate the resulting AV pair: essentially, Vendor-Specific = protocol:attribute = value.

**Note**

Refer to the [Internetworking Terms and Acronyms](#) for terms not included in this glossary.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

Prerequisites for RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

- You must be running a Cisco IOS image that contains the authentication, authorization, and accounting (AAA) component.

Information About RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

To configure the RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level feature, you should understand the following concept:

- [RADIUS Attribute 5 Format Customization, page 2](#)

RADIUS Attribute 5 Format Customization

Prior to Cisco IOS Release 12.3(14)T, Cisco IOS software allowed RADIUS attributes that were sent in access requests or accounting requests to be customized on a global basis. You could customize how each configurable attribute should function when communicating with a RADIUS server. Since the implementation of server groups, global attribute configurations were not flexible enough to address the different customizations that were required to support the various RADIUS servers with which a router might be interacting. For example, if you configured the **global radius-server attribute nas-port format command** option, every service on the router that interacted with a RADIUS server was used in the same way.

Effective with Cisco IOS Release 12.3(14)T, you can configure your router to support override flexibility for per-server groups. You can configure services to use specific named methods for different service types on a RADIUS server. The service types can be set to use their own respective service groups. This flexibility allows customized NAS-port formats to be used instead of the global formats.

How to Configure RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

This section contains the following procedures:

- [Configuring the RADIUS Attribute 5 Format on a Per-Server Group Level, page 2](#)
- [Monitoring and Maintaining RADIUS Attribute 5 Format on a Per-Server Group Level, page 4](#)

Configuring the RADIUS Attribute 5 Format on a Per-Server Group Level

To configure your router to support the RADIUS Attribute 5 format on a per-server group level, perform the following steps.

**Note**

To use this per-server group capability, you must actively use a named method list within your services. You can configure one client to use a specific named method while other clients use the default format.

Prerequisites

Before performing these steps, you should first configure method lists for AAA as is applicable for your situation.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa group server radius** *group-name*
4. **server** *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*]
5. **attribute nas-port format** *format-type* [*string*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	aaa group server radius group-name Example: Router (config)# aaa group server radius radius1	Groups different RADIUS server hosts into distinct lists and distinct methods and enters server-group configuration mode.
Step 4	server ip-address [auth-port port-number] [acct-port port-number] Example: Router (server-group)# server 172.101.159.172 auth-port 1645 acct-port 1646	Configures the IP address of the RADIUS server for the group server.
Step 5	attribute nas-port format format-type [string] Example: Router (server-group)# attribute nas-port format d	Configures a service to use specific named methods for different service types. <ul style="list-style-type: none"> The service types can be set to use their own respective server groups.

Monitoring and Maintaining RADIUS Attribute 5 Format on a Per-Server Group Level

To monitor and maintain RADIUS Attribute 5 Format on a Per-Server Group Level, perform the following steps (the **debug** commands may be used separately):

SUMMARY STEPS

1. **enable**
2. **debug aaa sg-server selection**
3. **debug radius**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	debug aaa sg-server selection Example: Router# debug aaa sg-server selection	Displays information about why the RADIUS and TACACS+ server group system in a router is choosing a particular server.
Step 3	debug radius Example: Router# debug radius	Displays information showing that a server group has been selected for a particular request.

Configuration Examples for RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

- This section provides the following configuration example:
- [RADIUS Attribute 5 Format Specified on a Per-Server Level: Example, page 5](#)

RADIUS Attribute 5 Format Specified on a Per-Server Level: Example

The following configuration example shows a leased-line PPP client that has chosen to send no RADIUS Attribute 5 while the default is to use format d:

```
interface Serial2/0
no ip address
encapsulation ppp
ppp accounting SerialAccounting
ppp authentication pap

aaa accounting network default start-stop group radius
aaa accounting network SerialAccounting start-stop group group1

aaa group server radius group1
server 10.101.159.172 auth-port 1645 acct-port 1646
attribute nas-port none

radius-server host 10.101.159.172 auth-port 1645 acct-port 1646
radius-server attribute nas-port format d
```

Additional References

The following sections provide references related to RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level.

RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

First Published: August 12, 2002

Last Updated: January 10, 2008

The RADIUS Attribute 8 (Framed-IP-Address) in Access Requests feature makes it possible for a network access server (NAS) to provide the RADIUS server with a hint of the user IP address in advance of user authentication. An application can be run on the RADIUS server to use this hint and build a table (map) of user names and addresses. Using the mapping information, service applications can begin preparing user login information to have available upon successful user authentication.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for RADIUS Attribute 8 \(Framed-IP-Address\) in Access Requests”](#) section on page 7.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Command Reference, page 6](#)
- [Feature Information for RADIUS Attribute 8 \(Framed-IP-Address\) in Access Requests, page 7](#)

Prerequisites for RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

Sending RADIUS attribute 8 in the RADIUS access requests assumes that the login host has been configured to request its IP address from the NAS server. It also assumes that the login host has been configured to accept an IP address from the NAS.

The NAS must be configured with a pool of network addresses on the interface supporting the login hosts.

Information About RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

How This Feature Works

When a network device dials in to a NAS that is configured for RADIUS authentication, the NAS begins the process of contacting the RADIUS server in preparation for user authentication. Typically, the IP address of the dial-in host is not communicated to the RADIUS server until after successful user authentication. Communicating the device IP address to the server in the RADIUS access request allows other applications to begin to take advantage of that information.

As the NAS is setting up communication with the RADIUS server, the NAS assigns an IP address to the dial-in host from a pool of IP addresses configured at the specific interface. The NAS sends the IP address of the dial-in host to the RADIUS server as attribute 8. At that time, the NAS sends other user information, such as the user name, to the RADIUS server.

After the RADIUS server receives the user information from the NAS, it has two options:

- If the user profile on the RADIUS server already includes attribute 8, the RADIUS server can override the IP address sent by the NAS with the IP address defined as attribute 8 in the user profile. The address defined in the user profile is returned to the NAS.
- If the user profile does not include attribute 8, the RADIUS server can accept attribute 8 from the NAS, and the same address is returned to the NAS.

The address returned by the RADIUS server is saved in memory on the NAS for the life of the session. If the NAS is configured for RADIUS accounting, the accounting start packet sent to the RADIUS server includes the same IP address as in attribute 8. All subsequent accounting packets, updates (if configured), and stop packets will also include the same IP address provided in attribute 8.

Benefits

The RADIUS Attribute 8 (Framed-IP-Address) in Access Requests feature makes it possible to run applications on the RADIUS server that builds mapping tables of users and IP addresses. The server can then use the mapping table information in other applications, such as preparing customized user login pages in advance of a successful user authentication with the RADIUS server.

How to Configure RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

This section contains the following procedures:

- [Configuring RADIUS Attribute 8 in Access Requests, page 3](#) (required)
- [Verifying RADIUS Attribute 8 in Access Requests, page 4](#)

Configuring RADIUS Attribute 8 in Access Requests

To send RADIUS attribute 8 in the access request, perform the following steps:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server attribute 8 include-in-access-req**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	radius-server attribute 8 include-in-access-req Example: Router(config)# radius-server attribute 8 include-in-access-req	Sends RADIUS attribute 8 in access-request packets.

Verifying RADIUS Attribute 8 in Access Requests

To verify that RADIUS attribute 8 is being sent in access requests, perform the following steps. Attribute 8 should be present in all PPP access requests.

SUMMARY STEPS

- 1. `enable`
- 2. `more system:running-config`
- 3. `debug radius`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>enable</code> Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	<code>more system:running-config</code> Example: Router# more system:running-config	Displays the contents of the current running configuration file. (Note that the <code>more system:running-config</code> command has replaced the <code>show running-config</code> command.)
Step 3	<code>debug radius</code> Example: Router# debug radius	Displays information associated with RADIUS. The output of this command shows whether attribute 8 is being sent in access requests.

Configuration Examples for RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

This section provides the following configuration example:

- [NAS Configuration That Sends the IP Address of the Dial-in Host to the RADIUS Server in the RADIUS Access Request](#)

NAS Configuration That Sends the IP Address of the Dial-in Host to the RADIUS Server in the RADIUS Access Request

The following example shows a NAS configuration that sends the IP address of the dial-in host to the RADIUS server in the RADIUS access request. The NAS is configured for RADIUS authentication, authorization, and accounting (AAA). A pool of IP addresses (async1-pool) has been configured and applied at interface Async1.

```
aaa new-model
aaa authentication login default group radius
aaa authentication ppp default group radius
aaa authorization network default group radius
```

```

aaa accounting network default start-stop group radius
!
ip address-pool local
!
interface Async1
 peer default ip address pool async1-pool
!
ip local pool async1-pool 209.165.200.225 209.165.200.229
!
radius-server host 172.31.71.146 auth-port 1645 acct-port 1646
radius-server retransmit 3
radius-server attribute 8 include-in-access-req
radius-server key radhost<xxx>: Example

```

RADIUS Attribute 82: Tunnel Assignment ID

Feature History

Release	Modification
12.2(4)T	This feature was introduced.
12.2(4)T3	Support for the Cisco 7500 series routers was added.
12.2(11)T	This feature was integrated into Cisco IOS Release 12.2(11)T and support was added for the Cisco 1760, Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800 and Cisco AS5850 platforms.
12.2(27)SB	This feature was integrated into Cisco IOS Release 12.2(27)SB.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Feature Overview

The RADIUS Attribute 82: Tunnel Assignment ID feature allows the Layer 2 Transport Protocol access concentrator (LAC) to group users from different per-user or domain RADIUS profiles into the same active tunnel. Previously, Cisco IOS software assigned a separate virtual private dialup network (VPDN) tunnel for each per-user or domain RADIUS profile, even if tunnels with identical endpoints already existed. The RADIUS Attribute 82: Tunnel Assignment ID feature defines a new avpair, Tunnel-Assignment-ID, which allows the LAC to group users from different RADIUS profiles into the same tunnel if the chosen endpoint, tunnel type, and Tunnel-Assignment-ID are identical. This feature introduces new software functionality. No new commands are introduced with this feature.

Benefits

The RADIUS Attribute 82: Tunnel Assignment ID feature improves LAC and L2TP network server (LNS) performance by reducing memory usage, because fewer tunnel data structures must be maintained. This feature allows the LAC and LNS to handle a higher volume of users without negatively impacting router performance.

Restrictions

This feature is designed only for VPDN dial-in applications. It does not support VPDN dial-out.

Supported Platforms

- Catalyst 4000 Gateway
- Cisco 806
- Cisco 1400 series
- Cisco 1600 series
- Cisco 1700 series
- Cisco 2600 series
- Cisco 3600 series
- Cisco 3700 series
- Cisco 7100 series
- Cisco 7200 series
- Cisco 7500 series

- Cisco AS5300
- Cisco AS5400
- Cisco AS5800
- Cisco IGX 8400 URM
- Cisco MGX 8850
- Cisco ubr7200

Supported Standards, MIBs, and RFCs

Standards

No new or modified standards are supported by this feature.

MIBs

No new or modified MIBs are supported by this feature.

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

<http://tools.cisco.com/ITDIT/MIBS/servlet/index>

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

RFCs

No new or modified RFCs are supported by this feature.

Prerequisites

You must be using a Cisco platform that supports VPDN to use this feature.

Configuration Tasks

None

Verifying RADIUS Attribute 82

To verify that RADIUS attribute 82 is being used by the LAC during tunnel authorization, use the following privileged EXEC command:

Command	Purpose
Router# debug radius	Displays information associated with RADIUS. The output of this command shows whether attribute 82 is being sent in access requests.

Configuration Examples

This section provides the following configuration examples:

- [LAC Configuration Example](#)
- [LNS Configuration Example](#)
- [RADIUS Configuration Example](#)

LAC Configuration Example

The following example configures VPDN on the LAC:

```
hostname lac
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius

vpdn enable
vpdn authen-before-forward

interface Serial2/0:23
no ip address
encapsulation ppp
dialer-group 1
isdn switch-type primary-5ess
no fair-queue

dialer-list 1 protocol ip permit

radius-server host lac-radiusd auth-port 1645 acct-port 1646
radius-server retransmit 3
radius-server key rad123
```

LNS Configuration Example

The following example configures VPDN on the LNS:

```
hostname lns
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius

vpdn enable

vpdn-group 1
accept-dialin
protocol any
virtual-template 1

interface Loopback0
ip address 10.1.1.3 255.255.255.0

interface Virtual-Template1
ip unnumbered Loopback0
no keepalive
peer default ip address pool mypool
ppp authentication chap
```

```
ip local pool mypool 10.1.1.10 10.1.1.50

radius-server host lns-radiusd auth-port 1645 acct-port 1646
radius-server retransmit 3
radius-server key cisco
```

RADIUS Configuration Example

The following examples configure the RADIUS server to group sessions in a tunnel:

Per-User Configuration

```
user@router.com Password = "cisco" Service-Type = Outbound,
    Tunnel-Type = :1:L2TP,
    Tunnel-Server-Endpoint = :1:"10.14.10.54",
    Tunnel-Assignment-Id = :1:"router"

client@router.com Password = "cisco" Service-Type = Outbound,
    Tunnel-Type = :1:L2TP,
    Tunnel-Server-Endpoint = :1:"10.14.10.54",
    Tunnel-Assignment-Id = :1:"router"
```

Domain Configuration

```
eng.router.com Password = "cisco" Service-Type = Outbound,
    Tunnel-Type = :1:L2TP,
    Tunnel-Server-Endpoint = :1:"10.14.10.54",
    Tunnel-Assignment-Id = :1:"router"

sales.router.com Password = "cisco" Service-Type = Outbound,
    Tunnel-Type = :1:L2TP,
    Tunnel-Server-Endpoint = :1:"10.14.10.54",
    Tunnel-Assignment-Id = :1:"router"
```

Command Reference

This feature uses no new or modified commands. To see the command pages for the commands used with this feature, see the Cisco IOS Security Command Reference at

http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html.

For information about all Cisco IOS commands, see the Command Lookup Tool at

<http://tools.cisco.com/Support/CLILookup> or the Master Command List. .

RADIUS Attribute 104

First Published: March 1, 2004

Last Updated: February 28, 2006

The RADIUS Attribute 104 feature allows you to specify private routes (attribute 104) in your RADIUS authorization profile. The private routes affect only packets that are received on an individual interface. The routes are stored apart from the global routing table and are not injected into any routing protocols for redistribution.

History for the RADIUS Attribute 104 Feature

Release	Modification
12.3(7)T	This feature was introduced.
12.3(14)T	This feature was integrated into Cisco IOS release 12.3(14)T.
12.2(28)SB	This feature was integrated into Cisco IOS Release 12.2(28)SB.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Prerequisites for RADIUS Attribute 104

- You must be using a Cisco RADIUS server.
- You should be familiar with configuring RADIUS.
- You should be familiar with policy-based routing (PBR) and private routes.
- You should be familiar with configuring access control lists (ACLs).
- Before using the RADIUS Attribute 104 feature, you must configure RADIUS AAA authorization and RADIUS route download.
- The following memory bytes are required:
 - One route map—50 bytes.
 - One match-set clause—600 bytes.
 - One extended ACL—366 bytes.
 - For N number of attribute 104s, the memory requirement is $(600+366)*N+50=1000*N$ (approximate) per user.

Restrictions for RADIUS Attribute 104

- If you already have PBR locally (statically) configured under the interface, and you specify attribute 104, the locally configured PBR will be disabled.
- If a pseudo next-hop address is involved, there must be a route available in the routing table for the next-hop address. If a route is not available, the packet will not be policy routed.
- Policy routing does not order the match-set clauses and relies on the first match, so you should specify the attributes in the order in which you want them to be matched.
- Metric numbers cannot be used in the attribute.

Information About RADIUS Attribute 104

Before using the RADIUS Attribute 104 feature, you should understand the following concepts:

- [Policy-Based Routing: Background, page 2](#)
- [Attribute 104 and the Policy-Based Route Map, page 3](#)

Policy-Based Routing: Background

PBR provides a mechanism for the forwarding, or routing of, data packets on the basis of defined policies. The policies are not wholly dependent on the destination address but rather on other factors, such as type of service, source address, precedence, port numbers, or protocol type.

Policy-based routing is applied to incoming packets. All packets that are received on an interface that has policy-based routing enabled are considered for policy-based routing. The router passes the packets through enhanced packet filters called route maps. On the basis of the criteria that are defined in the route maps, the packets are forwarded to the appropriate next hop.

Each entry in a route map statement contains a combination of match clauses and set clauses or commands. The match clauses define the criteria for whether appropriate packets meet the particular policy (that is, whether the conditions are met). The set clauses provide instruction for how the packets should be routed after they have met the match criteria. The match clause specifies which set of filters a packet must match for the corresponding set clause to be applied.

Attribute 104 and the Policy-Based Route Map

This section discusses the attribute 104 feature and how it works with policy-based route maps.

RADIUS Attribute 104 Overview

Using the RADIUS Attribute 104 feature, you can specify private routes in your RADIUS authorization profile. The private routes you specify will affect only packets that are received on an individual interface. The routes are stored apart from the global routing table and are not injected into any routing protocols for redistribution.

Permit Route Map

Route map statements can be marked as “permit” or “deny.” If the statement is marked “permit,” the set clause is applied to the packets that match the match criteria. For attribute 104, when you are configuring the route map, you need to mark the route map as “permit,” as follows. (To configure a route map, see the chapter “[Configuring Policy-Based Routing](#)” in the *Cisco IOS Quality of Service Solutions Configuration Guide*.)

```
route-map map-tag permit sequence-number
```

Default Private Route

The policy routing process proceeds through the route map until a match is found. If no match is found in the route map, the global routing table is consulted. If you have specified a default route in your user profile, any further routes beyond the default route are effectively ignored.

Route Map Order

You need to specify route maps on the server in the order that you want them to be applied.

How to Apply RADIUS Attribute 104

This section contains the following procedures:

- [Applying RADIUS Attribute 104 to Your User Profile, page 4](#)
- [Verifying Route Maps, page 4](#)
- [Troubleshooting the RADIUS Profile, page 5](#)

Applying RADIUS Attribute 104 to Your User Profile

You can apply RADIUS attribute 104 to your user profile by adding the following to the RADIUS server database.

SUMMARY STEPS

1. Apply RADIUS attribute 104 to your user profile.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Apply RADIUS attribute 104 to your user profile.	<p>Ascend-Private-Route="dest_addr/netmask next_hop"</p> <p>The destination network address of the router is "dest_addr/netmask", and the address of the next-hop router is "next_hop."</p>

Examples

The following is a sample user profile that creates three private routes that are associated with the caller:

```
username Password="ascend"; User-Service=Framed-User
```

```
Framed-Protocol=PPP,
Framed-Address=10.1.1.1,
Framed-Netmask=255.0.0.0,
Ascend-Private-Route="172.16.1.1/16 10.10.10.1"
Ascend-Private-Route="192.168.1.1/32 10.10.10.2"
Ascend-Private-Route="10.20.0.0/1 10.10.10.3"
Ascend-Private-Route="10.0.0.0/0 10.10.10.4"
```

Using the above profile, the private routing table for the connection contains the following routes, including a default route:

Destination/Mask	Gateway
172.16.1.1/16	10.10.10.1
192.168.1.1/32	10.10.10.2
10.20.20.20/1	10.10.10.3
10.0.0.0/0	10.10.10.4

Verifying Route Maps

You can use the following **show** commands to verify the route maps that have been configured.

SUMMARY STEPS

1. **enable**
2. **show ip policy**
3. **show route-map** [*map-name* | **dynamic** [*dynamic-map-name* | **application** [*application-name*]] | **all**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show ip policy Example: Router# show ip policy	Displays the route map that is used for policy routing.
Step 3	show route-map [<i>map-name</i> dynamic [<i>dynamic-map-name</i> application [<i>application-name</i>]] all] Example: Router# show route-map	Displays all route maps that are configured or only the one that is specified.

Troubleshooting the RADIUS Profile

If your private route configuration is not working properly, you may want to reread the section “[Policy-Based Routing: Background](#).” This section may help you determine what is happening to the packets. In addition, the following **debug** commands can be used to troubleshoot your RADIUS profile.

SUMMARY STEPS

1. **enable**
2. **debug radius**
3. **debug aaa per-user**
4. **debug ip policy**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	debug radius Example: Router# debug radius	Displays information associated with RADIUS.
Step 3	debug aaa per-user Example: Router# debug aaa per-user	Displays the attributes that are applied to each user as the user authenticates.
Step 4	debug ip policy Example: Router# debug ip policy	Displays IP routing packet activity.

Configuration Examples for RADIUS Attribute 104

This section includes the following configuration example:

- [Route-Map Configuration in Which Attribute 104 Has Been Applied: Example, page 6](#)

Route-Map Configuration in Which Attribute 104 Has Been Applied: Example

The following output is a typical route-map configuration to which attribute 104 has been applied:

```
Router# show route-map dynamic
```

```
route-map AAA-01/08/04-14:13:59.542-1-AppSpec, permit, sequence 0, identifier 1639994476
  Match clauses:
    ip address (access-lists): PBR#1 PBR#2
  Set clauses:
    Policy routing matches: 0 packets, 0 bytes
route-map AAA-01/08/04-14:13:59.542-1-AppSpec, permit, sequence 1, identifier 1640264784
  Match clauses:
    ip address (access-lists): PBR#3 PBR#4
  Set clauses:
    Policy routing matches: 0 packets, 0 bytes
route-map AAA-01/08/04-14:13:59.542-1-AppSpec, permit, sequence 2, identifier 1645563704
  Match clauses:
    ip address (access-lists): PBR#5 PBR#6
    length 10 100
  Set clauses:
    ip next-hop 10.1.1.1
    ip gateway 10.1.1.1
  Policy routing matches: 0 packets, 0 bytes
Current active dynamic routemaps = 1
```

RADIUS Progress Codes

First Published: August 12, 2002

Last Updated: December 17, 2007

The RADIUS Progress Codes feature adds additional progress codes that are defined in [Table 1](#) to RADIUS attribute 196 (Ascend-Connect-Progress), which indicates a connection state before a call is disconnected through progress codes.

Attribute 196 is sent in network, exec, and resource accounting “start” and “stop” records. This attribute can facilitate call failure debugging because each progress code identifies accounting information relevant to the connection state of a call. The attribute is activated by default; when an accounting “start” or “stop” accounting record is requested, authentication, authorization, and accounting (AAA) adds attribute 196 into the record as part of the standard attribute list. Attribute 196 is valuable because the progress codes, which are sent in accounting “start” and “stop” records, facilitate the debugging of call failures.

Note

In accounting “start” records, attribute 196 does not have a value.

Table 1 *Newly Supported Progress Codes for Attribute 196*

Code	Description
10	Modem allocation and negotiation is complete; the call is up.
30	The modem is up.
33	The modem is waiting for result codes.
41	The max TNT is establishing the TCP connection by setting up a TCP clear call.
60	Link control protocol (LCP) is the open state with PPP and IP Control Protocol (IPCP) negotiation; the LAN session is up.
65	PPP negotiation occurs and, initially, the LCP negotiation occurs; LCP is in the open state.
67	After PPP negotiation with LCP in the open state occurs, IPCP negotiation begins.

Americas Headquarters:

Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2002, 2006, 2007 Cisco Systems, Inc. All rights reserved.

**Note**

Progress codes 33, 30, and 67 are generated and seen through debugs on the NAS; all other codes are generated and seen through debugs and the accounting record on the RADIUS server.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for RADIUS Progress Codes](#)” section on page 6.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Contents

- [Prerequisites for RADIUS Progress Codes, page 2](#)
- [How to Configure RADIUS Progress Codes, page 2](#)
- [How to Verify Attribute 196, page 3](#)
- [Debug Output Example for RADIUS Progress Codes, page 3](#)
- [Additional References, page 4](#)
- [Command Reference, page 5](#)
- [Feature Information for RADIUS Progress Codes, page 6](#)
- [Glossary, page 7](#)

Prerequisites for RADIUS Progress Codes

Before attribute 196 (Ascend-Connect-Progress) can be sent in accounting “start” and “stop” records, you must perform the following tasks:

- Enable AAA.
- Enable exec, network, or resource accounting.

For information on completing these tasks, refer to the AAA sections of the *Cisco IOS Security Configuration Guide*, Release 12.4.

When these tasks are completed, attribute 196 is active by default.

How to Configure RADIUS Progress Codes

No configuration is required to configure RADIUS Progress Codes.

How to Verify Attribute 196

To verify attribute 196 in accounting “start” and “stop” records, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **debug aaa accounting**
3. **show radius statistics**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	debug aaa accounting Example: Router# debug aaa accounting	Displays information on accountable events as they occur.
Step 3	show radius statistics Example: Router# debug aaa authorization	Displays the RADIUS statistics for accounting and authentication packets.

Debug Output Example for RADIUS Progress Codes

The following example is a sample debug output from the **debug ppp negotiation** command. This debug output is used to verify that accounting “stop” records have been generated and that attribute 196 (Ascend-Connect-Progress) has a value of 65.

```
Tue Aug 7 06:21:03 2001
  NAS-IP-Address = 10.0.58.62
  NAS-Port = 20018
  Vendor-Specific = ""
  NAS-Port-Type = ISDN
  User-Name = "peer_16a"
  Called-Station-Id = "5213124"
  Calling-Station-Id = "5212175"
  Acct-Status-Type = Stop
  Acct-Authentic = RADIUS
  Service-Type = Framed-User
  Acct-Session-Id = "00000014"
  Framed-Protocol = PPP
  Framed-IP-Address = 172.16.0.2
  Acct-Input-Octets = 3180
  Acct-Output-Octets = 3186
  Acct-Input-Packets = 40
  Acct-Output-Packets = 40
```

```

Ascend-Connect-Pr = 65
Acct-Session-Time = 49
Acct-Delay-Time = 0
Timestamp = 997190463
Request-Authenticator = Unverified

```

Glossary

AAA—authentication, authorization, and accounting. Suite of network security services that provide the primary framework through which access control can be set up on your Cisco router or access server.

attribute—RADIUS Internet Engineering Task Force (IETF) attributes are the original set of 255 standard attributes that are used to communicate AAA information between a client and a server. Because IETF attributes are standard, the attribute data is predefined and well known; thus all clients and servers who exchange AAA information through IETF attributes must agree on attribute data such as the exact meaning of the attributes and the general bounds of the values for each attribute.

EXEC accounting—Provides information about user EXEC terminal sessions of the network access server.

IPCP—IP Control Protocol. A protocol that establishes and configures IP over PPP.

LCP—link control protocol. A protocol that establishes, configures, and tests data-link connections for use by PPP.

network accounting—Provides information for all PPP, Serial Line Internet Protocol (SLIP), or AppleTalk Remote Access Protocol (ARAP) sessions, including packet and byte counts.

PPP—Point-to-Point Protocol. Successor to SLIP that provides router-to-router and host-to-network connections over synchronous and asynchronous circuits. Whereas SLIP was designed to work with IP, PPP was designed to work with several network layer protocols, such as IP, IPX, and ARA. PPP also has built-in security mechanisms, such as CHAP and PAP. PPP relies on two protocols: LCP and NCP.

RADIUS—Remote Authentication Dial-In User Service. RADIUS is a distributed client/server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco routers and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

resource accounting—Provides “start” and “stop” records for calls that have passed user authentication, and provides “stop” records for calls that fail to authenticate.

RADIUS Timeout Set During Pre-Authentication

First Published: March 17, 2003
Last Updated: December 17, 2007

Some call sessions for Internet Service Provider (ISP) subscribers are billed through authentication, authorization, and accounting (AAA) messages in a prepaid time model. When these subscribers are preauthenticated, a RADIUS server checks for any remaining credit in the prepaid time model and sets a session timeout based on the credit available. The RADIUS Timeout Set During Pre-Authentication feature is useful in situations where the PPP authentication that follows the preauthentication phase of these call sessions does not return the Session-Timeout value (RADIUS attribute 27), and therefore allows the ISP to add call setup time to the subscriber's bill.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for RADIUS Timeout Set During Pre-Authentication” section on page 5](#).

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for the RADIUS Timeout Set During Pre-Authentication Feature

- This feature is specific to RADIUS. Basic AAA authentication and preauthentication must be configured.
- Preauthentication and normal PPP authentication are required for legacy functionality.

Information About the RADIUS Timeout Set During Pre-Authentication Feature

You need to understand the following concept about the RADIUS Timeout Set During Pre-Authentication feature:

- [RADIUS Attribute 27 and the PPP Authentication Phase, page 2](#)

RADIUS Attribute 27 and the PPP Authentication Phase

The RADIUS Timeout Set During Pre-Authentication feature was developed for ISPs that want to bill dial-in subscribers for call setup time and the entire duration of the call session. These subscribers are billed through AAA messages in a prepaid time model. When the subscribers are preauthenticated, a RADIUS server checks for any remaining credit in the prepaid time model and sets a session timeout (in minutes or seconds) based on the credit available. This time can range from a few seconds for ISDN users, to much longer for asynchronous dial-up subscribers.

Until the RADIUS Timeout Set During Pre-Authentication feature was developed, the value of RADIUS attribute 27, which is returned during the preauthentication phase of a call, was either ignored or overwritten during the PPP authentication phase. Even when the PPP authentication phase did not return a value for attribute 27, the old value obtained during the preauthentication phase was being ignored.

With the RADIUS Timeout Set During Pre-Authentication feature introduced for Cisco IOS Release 12.2(15)T, if the PPP authentication phase does not return a value for attribute 27, the old value that was returned during the preauthentication phase is saved and used to time out the session; attribute 27 is saved in a preauthentication database for future use. However, if the PPP authentication user profile has a session timeout configured and PPP authentication succeeds, the new value downloaded during PPP authentication overwrites the old attribute 27 value. By setting the session timeout value in the preauthentication phase itself, the service provider can bill the subscriber for the call setup time and the call duration.

How to Configure the RADIUS Timeout Set During Pre-Authentication Feature

No new configuration is required. The RADIUS Timeout Set During Pre-Authentication feature is included in all Cisco platforms that support preauthentication, and that have RADIUS attribute 27, Session-Timeout, specified in a preauthentication user profile.

Additional References

RADIUS Tunnel Attribute Extensions

Feature History

Release	Modification
12.1(5)T	This feature was introduced.
12.2(4)B3	This feature was integrated into Cisco IOS Release 12.2(4)B3.
12.2(13)T	This feature was integrated into Cisco IOS Release 12.2(13)T.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

This feature module describes the RADIUS Tunnel Attribute Extensions feature. It includes the following sections:

- [Feature Overview, page 1](#)
- [Supported Platforms, page 3](#)
- [Supported Standards, MIBs, and RFCs, page 4](#)
- [Prerequisites, page 4](#)
- [Configuration Tasks, page 4](#)
- [Configuration Examples, page 5](#)
- [Command Reference, page 6](#)
- [Glossary, page 7](#)

Feature Overview

The RADIUS Tunnel Attribute Extensions feature introduces RADIUS attribute 90 (Tunnel-Client-Auth-ID) and RADIUS attribute 91 (Tunnel-Server-Auth-ID). Both attributes help support the provision of compulsory tunneling in virtual private networks (VPNs) by allowing the user to specify authentication names for the network access server (NAS) and the RADIUS server.

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2007 Cisco Systems, Inc. All rights reserved.

How It Works

Once a NAS has set up communication with a RADIUS server, you can enable a tunneling protocol. Some applications of tunneling protocols are voluntary, but others involve compulsory tunneling; that is, a tunnel is created without any action from the user and without allowing the user any choice in the matter. In those cases, new RADIUS attributes are needed to carry the tunneling information from the NAS to the RADIUS server to establish authentication. These new RADIUS attributes are listed in [Table 79](#).

Note

In compulsory tunneling, any security measures in place apply only to traffic between the tunnel endpoints. Encryption or integrity protection of tunneled traffic must not be considered as a replacement for end-to-end security.

Table 79 **RADIUS Tunnel Attributes**

Number	IETF RADIUS Tunnel Attribute	Equivalent TACACS+ Attribute	Supported Protocols	Description
90	Tunnel-Client-Auth-ID	tunnel-id	<ul style="list-style-type: none"> Layer 2 Forwarding (L2F) Layer 2 Tunneling Protocol (L2TP) 	Specifies the name used by the tunnel initiator (also known as the NAS ¹) when authenticating tunnel setup with the tunnel terminator.
91	Tunnel-Server-Auth-ID	gw-name	<ul style="list-style-type: none"> Layer 2 Forwarding (L2F) Layer 2 Tunneling Protocol (L2TP) 	Specifies the name used by the tunnel terminator (also known as the Home Gateway ²) when authenticating tunnel setup with the tunnel initiator.

1. When L2TP is used, the NAS is referred to as an L2TP access concentrator (LAC).
2. When L2TP is used, the Home Gateway is referred to as an L2TP network server (LNS).

RADIUS attribute 90 and RADIUS attribute 91 are included in the following situations:

- If the RADIUS server accepts the request and the desired authentication name is different from the default, they must be included it.
- If an accounting request contains Acct-Status-Type attributes with values of either start or stop and pertains to a tunneled session, they should be included in.

Benefits

The RADIUS Tunnel Attribute Extensions feature allows you to specify a name (other than the default) of the tunnel initiator and the tunnel terminator. Thus, you can establish a higher level of security when setting up VPN tunneling.

Restrictions

Your RADIUS server must support tagged attributes to use RADIUS tunnel attributes 90 and 91.

Related Documents

The following documents provide information related to the RADIUS Tunnel Attribute Extensions feature:

- The chapters “Configuring Authentication” and “Configuring RADIUS” in the *Cisco IOS Security Configuration Guide*, Release 12.2
- The appendix “RADIUS Attributes” in the *Cisco IOS Security Configuration Guide*, Release 12.2
- The chapter “Configuring Virtual Private Networks” in the *Cisco IOS Dial Technologies Configuration Guide*, Release 12.2
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*

Supported Platforms

Cisco IOS Release 12.1(5)T Only

- AS5300
- AS5800

Cisco IOS Releases 12.2(4)B3 and 12.2(13)T Only

Cisco 6400-NRP-1

Cisco 6400-NRP-2

Cisco 6400-NRP-2SV

Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

<http://www.cisco.com/go/fn>

Availability of Cisco IOS Software Images

Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

Supported Standards, MIBs, and RFCs

Standards

None

MIBs

None

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

<http://tools.cisco.com/ITDIT/MIBS/servlet/index>

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

RFCs

- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*

Prerequisites

To use RADIUS attributes 90 and 91, you must complete the following tasks:

- Configure your NAS to support AAA.
- Configure your NAS to support RADIUS.
- Configure your NAS to support VPN.

Configuration Tasks

None

Verifying RADIUS Attribute 90 and RADIUS Attribute 91

To verify that RADIUS attribute 90 and RADIUS attribute 91 are being sent in access accepts and accounting requests, use the following command in privileged EXEC mode:

Command	Purpose
Router# debug radius	Displays information associated with RADIUS. The output of this command shows whether attribute 90 and attribute 91 are being sent in access accepts and accounting requests.

Configuration Examples

This section provides the following configuration examples:

- [L2TP Network Server \(LNS\) Configuration Example](#)
- [RADIUS User Profile with RADIUS Tunneling Attributes 90 and 91 Example](#)

L2TP Network Server (LNS) Configuration Example

The following example shows how to configure the LNS with a basic L2F and L2TP configuration using RADIUS tunneling attributes 90 and 91:

```
aaa new-model
aaa authentication login default none
aaa authentication login console none
aaa authentication ppp default local group radius
aaa authorization network default group radius if-authenticated
!

```

RADIUS User Profile with RADIUS Tunneling Attributes 90 and 91 Example

The following is an example of a RADIUS user profile that includes RADIUS tunneling attributes 90 and 91. This entry supports two tunnels, one for L2F and the other for L2TP. The tag entries with :1 support L2F tunnels, and the tag entries with :2 support L2TP tunnels.

```

cisco.com Password = "cisco", Service-Type = Outbound
  Service-Type = Outbound,
  Tunnel-Type = :1:L2F,
  Tunnel-Medium-Type = :1:IP,
  Tunnel-Client-Endpoint = :1:"10.0.0.2",
  Tunnel-Server-Endpoint = :1:"10.0.0.3",
  Tunnel-Client-Auth-Id = :1:"l2f-cli-auth-id",
  Tunnel-Server-Auth-Id = :1:"l2f-svr-auth-id",
  Tunnel-Assignment-Id = :1:"l2f-assignment-id",
  Cisco-Avpair = "vpdn:nas-password=l2f-cli-pass",
  Cisco-Avpair = "vpdn:gw-password=l2f-svr-pass",
  Tunnel-Preference = :1:1,
  Tunnel-Type = :2:L2TP,
  Tunnel-Medium-Type = :2:IP,
  Tunnel-Client-Endpoint = :2:"10.0.0.2",
  Tunnel-Server-Endpoint = :2:"10.0.0.3",
  Tunnel-Client-Auth-Id = :2:"l2tp-cli-auth-id",
  Tunnel-Server-Auth-Id = :2:"l2tp-svr-auth-id",
  Tunnel-Assignment-Id = :2:"l2tp-assignment-id",
  Cisco-Avpair = "vpdn:l2tp-tunnel-password=l2tp-tnl-pass",
  Tunnel-Preference = :2:2

```

Command Reference

This feature uses no new or modified commands. To see the command pages for the commands used with this feature, see the Cisco IOS Security Command Reference at

http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html.

For information about all Cisco IOS commands, see the Command Lookup Tool at

<http://tools.cisco.com/Support/CLILookup> or the Master Command List.

Glossary

Layer 2 Forwarding (L2F)—A Layer 2 tunneling protocol that enables an ISP or other access service to create a virtual tunnel to link customer remote sites or remote users with corporate home networks. In particular, a network access server (NAS) at the ISP point of presence (POP) exchanges PPP messages with the remote users and communicates by L2F or L2TP requests and responses with the customer tunnel server to set up tunnels.

Layer 2 Tunnel Protocol (L2TP)—A Layer 2 tunneling protocol that enables an ISP or other access service to create a virtual tunnel to link customer remote sites or remote users with corporate home networks. In particular, a network access server (NAS) at the ISP point of presence (POP) exchanges PPP messages with the remote users and communicates by L2F or L2TP requests and responses with the customer tunnel server to set up tunnels.

L2TP access concentrator (LAC)—A network access server (NAS) to which the client directly connects and through which PPP frames are tunneled to the L2TP network server (LNS). The LAC need only implement the media over which L2TP is to operate to pass traffic to one or more LNSs. The LAC may tunnel any protocol carried within PPP. The LAC initiates incoming calls and receives outgoing calls. A LAC is analogous to an L2F network access server.

L2TP network server (LNS)—A termination point for L2TP tunnels, and an access point where PPP frames are processed and passed to higher-layer protocols. An LNS can operate on any platform that terminates PPP. The LNS handles the server side of the L2TP protocol. L2TP relies only on the single medium over which L2TP tunnels arrive. The LNS initiates outgoing calls and receives incoming calls. An LNS is analogous to a home gateway in L2F technology.

network access server (NAS)—A Cisco platform, or collection of platforms, such as an AccessPath system, that interfaces between the packet world (such as the Internet) and the circuit-switched world (such as the PSTN).

tunnel—A virtual pipe between the L2TP access concentrator (LAC) and L2TP network server (LNS) that can carry multiple PPP sessions.

virtual private network (VPN)—A system that permits dial-in networks to exist remotely to home networks, while giving the appearance of being directly connected. VPNs use L2TP and L2F to terminate the Layer 2 and higher parts of the network connection at the L2TP network server (LNS) instead of the L2TP access concentrator (LAC).

V.92 Reporting Using RADIUS Attribute v.92-info

The V.92 Reporting Using RADIUS Attribute v.92-info feature provides the ability to track V.92 call information, such as V.92 features that are supported, the Quick Connect feature set that was attempted, the duration for which the original call was put on hold, and how many times Modem On Hold was initiated. The vendor-specific attribute (VSA) v.92-info is included in accounting “start” and “stop” records when modems negotiate a V.92 connection.

Feature Specifications for the V.92 Reporting Using RADIUS Attribute v.92-info Feature

Feature History

Release	Modification
12.3(1)	This feature was introduced.

Supported Platforms

Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, Cisco AS5850

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Prerequisites for V.92 Reporting Using RADIUS Attribute v.92-info

Before the network access server (NAS) can send attribute v.92-info information in accounting “start” and “stop” records, you must perform the following tasks:

- Configure your NAS for authentication, authorization, and accounting (AAA) and to accept incoming modem calls.
- Enable AAA accounting by using the **aaa accounting network default start-stop group radius** command in global configuration mode.
- Familiarize yourself with the V.92 Quick Connect feature. Refer to the following document:
 - *V.92 Quick Connect for Cisco AS5300 and Cisco AS5800 Universal Access Servers*
- Familiarize yourself with the V.92 Modem on Hold feature. Refer to the following document:
 - *V.92 Modem on Hold for Cisco AS5300 and Cisco AS5800 Universal Access Servers*

Restrictions for V.92 Reporting Using RADIUS Attribute v.92-info

- If V.92 is not negotiated on your server, V.92 information will not be included in the accounting record.
- Because the attribute v.92-info information is sent as a Cisco VSA, if you configure your RADIUS server as nonstandard (using a non-Cisco server), the V.92 call information will not be sent by default. However, you can still get the V.92 call information by first configuring the **radius-server vsa send** command with the **accounting** keyword (that is, **radius-server vsa send accounting**).

Information About V.92 Reporting Using RADIUS Attribute v.92-info

Before you use the V.92 Reporting Using RADIUS Attribute v.92-info feature, you must understand the following concepts:

- [V.92 Standard Overview, page 2](#)
- [VSA v.92-info, page 3](#)

V.92 Standard Overview

The International Telecommunication Union Telecommunication Standardization Sector (ITU-T) V.92 standard encompasses a number of specifications, including Quick Connect (QC), which dramatically improves how quickly users can connect with their Internet service provider (ISP), and Modem on Hold (MoH), which enables users to suspend and reactivate their dial-up connection to either receive or initiate a telephone call. V.92 also includes pulse code modulation (PCM) upstream, which boosts the upstream data rates from the user to the ISP to reduce transfer times for large files and e-mail attachments sent by the user.

VSA v.92-info

The VSA v.92-info information in RADIUS accounting “start” and “stop” records can help you track V.92 feature set information. The VSA is enabled by default for all sessions that reside over a modem call that is connected using V.92 model modulation.

The VSA information is displayed in the “start” and “stop” records as follows:

```
v92-info=<V.92 features supported>/<QC Exchange>/<Total MOH time>/<MOH count>
```

The VSA v92-info has the following four subfields:

- V.92 features supported—All features that are available for the V.92 modem user who is dialing in. These features include QC, MoH, and PCM Upstream.
- QC Exchange—If QC was initiated, this subfield states what feature set (within QC) was attempted.
- Total MOH time—If MoH was initiated, this subfield indicates the duration for which the original call was put on hold.
- MOH count—If MOH was initiated, this field indicates how many times the MOH was initiated.

The following is an example of VSA v92-info information displayed in an accounting record:

```
v92-info=V.92 QC MOH/QC Requested/60/1
```

How to Monitor and Verify V.92 Call Information

The following sections include tasks to help you monitor and verify V.92 call information:

- [Monitoring V.92 Call Information, page 3](#)
- [Verifying V.92 Call Information, page 11](#)

Monitoring V.92 Call Information

To monitor the V.92 information in the accounting “start” and “stop” records, you can perform the following task using some or all of the debug commands that are listed:

SUMMARY

1. **enable**
2. **debug aaa accounting**
3. **debug aaa authentication**
4. **debug aaa authorization**
5. **debug isdn event**
6. **debug modem csm** [*slot/port* | **group** *group-number*]
7. **debug ppp** {*negotiation* | *authentication*}
8. **debug radius**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	debug aaa accounting Example: Router# debug aaa accounting	Displays information about accountable events as they occur.
Step 3	debug aaa authentication Example: Router# debug aaa authentication	Displays information about AAA authentication.
Step 4	debug aaa authorization Example: Router# debug aaa authorization	Displays information about AAA and TACACS+ authorization.
Step 5	debug isdn event Example: Router# debug isdn event	Displays ISDN events occurring on the user side (on the router) of the ISDN interface.
Step 6	debug modem csm [<i>slot/port</i> group <i>group-number</i>] Example: Router# debug modem csm 1/0 group 1	Displays call switching module (CSM) modem call information.
Step 7	debug ppp { negotiation authentication } Example: Router# debug ppp authentication	Displays information on traffic and exchanges in an internetwork that is implementing the PPP.
Step 8	debug radius Example: Router# debug radius	Displays information associated with RADIUS.

Examples

The following sample debug outputs display information about a V.92 reporting situation:

Debug Output 1

Verifying V.92 Call Information

To verify that the V.92 call was correctly established, use the following **show** commands:

SUMMARY

- **show modem** [*slot/port* | *group number*]
- **show port modem log** [*reverse slot/port*] [*slot* | *slot/port*]
- **show users** [*all*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	show modem [<i>slot/port</i> <i>group number</i>] Example: Router# show modem 1/0 group 1	Displays a high-level performance report for all the modems or a single modem inside Cisco access servers.
Step 2	show port modem log [<i>reverse slot/port</i>] [<i>slot</i> <i>slot/port</i>] Example: Router# show port modem log	Displays the events generated by the modem sessions.
Step 3	show users [<i>all</i>] Example: Router# show users	Displays information about the active lines on the router.

Examples

The following V.92 reporting outputs are from the **show port modem log** and **show users** commands:

Show Output 1

```
Router# show port modem log 1/05

Troubleshooting Tips

If you see that V.92 call information is not being reported by AAA, ensure that the call is a V.92 call by using the **show modem** command or by looking at the modem logs by using the **show modem log** command.

Technical Assistance

Description	Link
Technical Assistance Center (TAC) home page, containing 30,000 pages of searchable technical content, including links to products, technologies, solutions, technical tips, and tools. Registered Cisco.com users can log in from this page to access even more content.	http://www.cisco.com/public/support/tac/home.shtml

Command Reference

This feature uses no new or modified commands. To see the command pages for the commands used with this feature, see the Cisco IOS Security Command Reference at

http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html.

For information about all Cisco IOS commands, see the Command Lookup Tool at

<http://tools.cisco.com/Support/CLILookup> or the Master Command List.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

TACACS+ Attribute-Value Pairs

Terminal Access Controller Access Control System Plus (TACACS+) attribute-value (AV) pairs are used to define specific authentication, authorization, and accounting elements in a user profile that is stored on the TACACS+ daemon. This appendix lists the TACACS+ AV pairs currently supported.

How to Use This Appendix

This appendix is divided into two sections:

-
-

and it specifies the Cisco IOS release in which they are implemented. The second section lists and describes the supported TACACS+ accounting AV pairs, and it specifies the Cisco IOS release in which they are implemented.

TACACS+ Authentication and Authorization AV Pairs

Table 80 lists and describes the supported TACACS+ authentication and authorization AV pairs and specifies the Cisco IOS release in which they are implemented.

Table 80 Supported TACACS+ Authentication and Authorization AV Pairs

Attribute	Description	11.0	11.1	11.2	11.3	12.0	12.1	12.2
acl=x	ASCII number representing a connection access list. Used only when service=shell.	yes	yes	yes	yes	yes	yes	yes
addr=x	A network address. Used with service=slip, service=ppp, and protocol=ip. Contains the IP address that the remote host should use when connecting via SLIP or PPP/IP. For example, addr=10.2.3.4.	yes	yes	yes	yes	yes	yes	yes

Americas Headquarters:

Supported TACACS+ Authentication and Authorization AV Pairs (continued)

		yes	yes	yes	yes	yes	yes	yes
	<p>Note that addr-pool works in conjunction with local pooling. It specifies the name of a local pool (which must be preconfigured on the network access server). Use the ip-local pool</p> <pre>ip address-pool local ip local pool boo 10.0.0.1 10.0.0.10 ip local pool moo 10.0.0.1 10.0.0.20</pre> <p>You can then use TACACS+ to return <code>addr-pool=boo</code> or <code>addr-pool=moo</code> to indicate the address pool from which you want to get this remote node's address.</p>							
autocmd=x	Specifies an autocommand to be executed at EXEC startup (for example, <code>autocmd=telnet example.com</code>). Used only with <code>service=shell</code> .	yes	yes	yes	yes	yes	yes	yes
callback-dialstring	Sets the telephone number for a callback (for example: <code>callback-dialstring=408-555-1212</code>). Value is NULL, or a dial-string. A NULL value indicates that the service might choose to get the dial string through other means. Used with <code>service=arap</code> , <code>service=slip</code> , <code>service=ppp</code> , <code>service=shell</code> . Not valid for ISDN.	no	yes	yes	yes	yes	yes	yes
callback-line	The number of a TTY line to use for callback (for example: <code>callback-line=4</code>). Used with <code>service=arap</code> , <code>service=slip</code> , <code>service=ppp</code> , <code>service=shell</code> . Not valid for ISDN.	no	yes	yes	yes	yes	yes	yes
callback-rotary	The number of a rotary group (between 0 and 100 inclusive) to use for callback (for example: <code>callback-rotary=34</code>). Used with <code>service=arap</code> , <code>service=slip</code> , <code>service=ppp</code> , <code>service=shell</code> . Not valid for ISDN.	no	yes	yes	yes	yes	yes	yes
cmd-arg=x	<p>An argument to a shell (EXEC) command. This indicates an argument for the shell command that is to be run. Multiple <code>cmd-arg</code> attributes can be specified, and they are order dependent.</p> <p>Note</p> <p>with RADIUS attribute 26.</p>	yes	yes	yes	yes	yes	yes	yes

		yes	yes	yes	yes	yes	yes	yes
	<p>equals “shell.” A NULL value indicates that the shell itself is being referred to.</p> <p>This TACACS+ AV pair cannot be used with RADIUS attribute 26.</p>							
data-service	Used with the service=outbound and protocol=ip.	no	no	no	no	no	yes	yes
dial-number	Defines the number to dial. Used with the service=outbound and protocol=ip.	no	no	no	no	no	yes	yes
dns-servers=	Identifies a DNS server (primary or secondary) that can be requested by Microsoft PPP clients from the network access server during IPCP negotiation. To be used with service=ppp and protocol=ip. The IP address identifying each DNS server is entered in dotted decimal format.	no	no	no	yes	yes	yes	yes
force-56	Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available. To turn on this attribute, use the “true” value (force-56=true). Any other value is treated as false. Used with the service=outbound and protocol=ip.	no	no	no	no	no	yes	yes
gw-password	Specifies the password for the home gateway during the L2F tunnel authentication. Used with service=ppp and protocol=vpdn.	no	no	yes	yes	yes	yes	yes
idletime=x	Sets a value, in minutes, after which an idle session is terminated. A value of zero indicates no timeout.	no	yes	yes	yes	yes	yes	yes
inac1#<n>	ASCII access list identifier for an input access list to be installed and applied to an interface for the duration of the current connection. Used with service=ppp and protocol=ip, and service service=ppp and protocol=ipx. Per-user access lists do not currently work with ISDN interfaces.	no	no	no	yes	yes	yes	yes
inac1=x	ASCII identifier for an interface input access list. Used with service=ppp and protocol=ip. Per-user access lists do not currently work with ISDN interfaces.	yes	yes	yes	yes	yes	yes	yes

interface-config# <n>	Specifies user-specific AAA interface configuration information with Virtual Profiles. The information that follows the equal sign (=) can be any Cisco IOS interface configuration command. Multiple instances of the attributes are allowed, but each instance must have a unique number. Used with service=ppp and protocol=lcp. This attribute replaces the “interface-config=” attribute.	no	no	no	yes	yes	yes	yes
ip-addresses	Space-separated list of possible IP addresses that can be used for the end-point of a tunnel. Used with service=ppp and protocol=vpdn.	no	no	yes	yes	yes	yes	yes
l2tp-busy-disconnect	If a vpdn-group on an LNS uses a virtual-template that is configured to be pre-cloned, this attribute will control the disposition of a new L2TP session that finds no pre-cloned interface to which to connect. If the attribute is true (the default), the session will be disconnected by the LNS. Otherwise, a new interface will be cloned from the virtual-template. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
l2tp-cm-local-window-size	Specifies the maximum receive window size for L2TP control messages. This value is advertised to the peer during tunnel establishment. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
l2tp-drop-out-of-order	Respects sequence numbers on data packets by dropping those that are received out of order. This does not ensure that sequence numbers will be sent on data packets, just how to handle them if they are received. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
l2tp-hello-interval	Specifies the number of seconds for the hello keepalive interval. Hello packets are sent when no data has been sent on a tunnel for the number of seconds configured here. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
l2tp-hidden-avp	When enabled, sensitive AVPs in L2TP control messages are scrambled or hidden. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
l2tp-nosession-timeout	Specifies the number of seconds that a tunnel will stay active with no sessions before timing out and shutting down. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes

l2tp-tos-reflect	Copies the IP ToS field from the IP header of each payload packet to the IP header of the tunnel packet for packets entering the tunnel at the LNS. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
l2tp-tunnel-authen	If this attribute is set, it performs L2TP tunnel authentication. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
l2tp-tunnel-password	Shared secret used for L2TP tunnel authentication and AVP hiding. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
l2tp-udp-checksum	This is an authorization attribute and defines whether L2TP should perform UDP checksums for data packets. Valid values are “yes” and “no.” The default is no. Used with service=ppp and protocol=vpdn.	no	no	no	no	no	yes	yes
link-compression=	Defines whether to turn on or turn off “stac” compression over a PPP link. Used with service=ppp. Link compression is defined as a numeric value as follows: 0: None 1: Stac 2: Stac-Draft-9 3: MS-Stac	no	no	no	yes	yes	yes	yes
load-threshold=<n>	Sets the load threshold for the caller at which additional links are either added to or deleted from the multilink bundle. If the load goes above the specified value, additional links are added. If the load goes below the specified value, links are deleted. Used with service=ppp and protocol=multilink. The range for <n> is from 1 to 255.	no	no	no	yes	yes	yes	yes
map-class	Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out. Used with the service=outbound and protocol=ip.	no	no	no	no	no	yes	yes
max-links=<n>	Restricts the number of links that a user can have in a multilink bundle. Used with service=ppp and protocol=multilink. The range for <n> is from 1 to 255.	no	no	no	yes	yes	yes	yes
min-links	Sets the minimum number of links for MLP. Used with service=ppp and protocol=multilink, protocol=vpdn.	no	no	no	no	no	yes	yes

	compression when sending VJ-compressed packets over a PPP link.	no	no	no	yes	yes	yes	yes
priv-lvl=x	Privilege level to be assigned for the EXEC. Used with service=shell. Privilege levels range from 0 to 15, with 15 being the highest.	yes	yes	yes	yes	yes	yes	yes
protocol=x	A protocol that is a subset of a service. An example would be any PPP NCP. Currently known values are ipx atalk vines lat xremote tn3270 telnet rlogin pad vpdn osicp deccp ccp cdp bridging xns nbf bap multilink unknown							

	<div>route="<i>dst_address mask</i> [<i>gateway</i>]"</div> <div><i>dst_address mask</i> <i>gateway</i></div> <div><i>gateway</i></div>							

	system							
	vpdn outgoing							
		no	no	no	no	no	yes	yes
	ip mobile secure host <addr> configuration command. Basically it contains the rest of the configuration command that follows that string, verbatim. It provides the Security Parameter Index (SPI), key, authentication algorithm, authentication mode, and replay protection timestamp range. Used with the service=mobileip and protocol=ip.							
timeout=x	The number of minutes before an EXEC or ARA session disconnects (for example, timeout=60). A value of zero indicates no timeout. Used with service=arap.	yes	yes	yes	yes	yes	yes	yes
tunnel-id	Specifies the username that will be used to authenticate the tunnel over which the individual user MID will be projected. This is analogous to the <i>remote name</i>							

Attribute	Description	11.0	11.1	11.2	11.3	12.0	12.1	12.2

TACACS+ Accounting AV Pairs

Table 81 *Supported TACACS+ Accounting AV Pairs*

			11.1	11.2	11.3	12.0	12.1	12.2
bytes_in	The number of input bytes transferred during this connection.	yes	yes	yes	yes	yes	yes	yes
bytes_out	The number of output bytes transferred during this connection.	yes	yes	yes	yes	yes	yes	yes
Call-Type	Describes the type of fax activity: fax receive or fax send.	no	no	no	no	no	yes	yes
cmd	The command the user executed.	yes	yes	yes	yes	yes	yes	yes
data-rate	This AV pair has been renamed. See nas-rx-speed.							
disc-cause	Specifies the reason a connection was taken off-line. The Disconnect-Cause attribute is sent in accounting-stop records. This attribute also causes stop records to be generated without first generating start records if disconnection occurs before authentication is performed. Refer to Table 82 for a list of Disconnect-Cause values and their meanings.	no	no	no	yes	yes	yes	yes

disc-cause-ext	Extends the disc-cause attribute to support vendor-specific reasons why a connection was taken off-line.	no	no	no	yes	yes	yes	yes
elapsed_time	The elapsed time in seconds for the action. Useful when the device does not keep real time.	yes	yes	yes	yes	yes	yes	yes
Email-Server-Address	Indicates the IP address of the e-mail server handling the on-ramp fax-mail message.	no	no	no	no	no	yes	yes
Email-Server-Ack-Flag	Indicates that the on-ramp gateway has received a positive acknowledgment from the e-mail server accepting the fax-mail message.	no	no	no	no	no	yes	yes
event	Information included in the accounting packet that describes a state change in the router. Events described are accounting starting and accounting stopping.	yes	yes	yes	yes	yes	yes	yes
Fax-Account-Id-Origin	Indicates the account ID origin as defined by system administrator for the command.	no	no	no	no	no	yes	yes
Fax-Auth-Status	Indicates whether or not authentication for this fax session was successful. Possible values for this field are success, failed, bypassed, or unknown.	no	no	no	no	no	yes	yes
Fax-Connect-Speed	Indicates the modem speed at which this fax-mail was initially transmitted or received. Possible values are 1200, 4800, 9600, and 14400.	no	no	no	no	no	yes	yes
Fax-Coverpage-Flag	Indicates whether or not a cover page was generated by the off-ramp gateway for this fax session. True indicates that a cover page was generated; false means that a cover page was not generated.	no	no	no	no	no	yes	yes
Fax-Dsn-Address	Indicates the address to which DSNs will be sent.	no	no	no	no	no	yes	yes
Fax-Dsn-Flag	Indicates whether or not DSN has been enabled. True indicates that DSN has been enabled; false means that DSN has not been enabled.	no	no	no	no	no	yes	yes
Fax-Mdn-Address	Indicates the address to which MDNs will be sent.	no	no	no	no	no	yes	yes
Fax-Mdn-Flag	Indicates whether or not message delivery notification (MDN) has been enabled. True indicates that MDN had been enabled; false means that MDN had not been enabled.	no	no	no	no	no	yes	yes
Fax-Modem-Time	Indicates the amount of time in seconds the modem sent fax data (x) and the amount of time in seconds of the total fax session (y), which includes both fax-mail and PSTN time, in the form x/y. For example, 10/15 means that the transfer time took 10 seconds, and the total fax session took 15 seconds.	no	no	no	no	no	yes	yes

Fax-Msg-Id=	Indicates a unique fax message identification number assigned by Store and Forward Fax.	no	no	no	no	no	yes	yes
Fax-Pages	Indicates the number of pages transmitted or received during this fax session. This page count includes cover pages.	no	no	no	no	no	yes	yes
Fax-Process-Abort-Flag	Indicates that the fax session was aborted or successful. True means that the session was aborted; false means that the session was successful.	no	no	no	no	no	yes	yes
Fax-Recipient-Count	Indicates the number of recipients for this fax transmission. Until e-mail servers support Session mode, the number should be 1.	no	no	no	no	no	yes	yes
Gateway-Id	Indicates the name of the gateway that processed the fax session. The name appears in the following format: hostname.domain-name	no	no	no	no	no	yes	yes
mlp-links-max	Gives the count of links which are known to have been in a given multilink session at the time the accounting record is generated.	no	no	no	yes	yes	yes	yes
mlp-sess-id	Reports the identification number of the multilink bundle when the session closes. This attribute applies to sessions that are part of a multilink bundle. This attribute is sent in authentication-response packets.	no	no	no	yes	yes	yes	yes
nas-rx-speed	Specifies the average number of bits per second over the course of the connection's lifetime. This attribute is sent in accounting-stop records.	no	no	no	yes	yes	yes	yes
nas-tx-speed	Reports the transmit speed negotiated by the two modems.	no	no	no	yes	yes	yes	yes
paks_in	The number of input packets transferred during this connection.	yes	yes	yes	yes	yes	yes	yes
paks_out	The number of output packets transferred during this connection.	yes	yes	yes	yes	yes	yes	yes
port	The port the user was logged in to.	yes	yes	yes	yes	yes	yes	yes
Port-Used	Indicates the slot/port number of the Cisco AS5300 used to either transmit or receive this fax-mail.	no	no	no	no	no	yes	yes
pre-bytes-in	Records the number of input bytes before authentication. This attribute is sent in accounting-stop records.	no	no	no	yes	yes	yes	yes
pre-bytes-out	Records the number of output bytes before authentication. This attribute is sent in accounting-stop records.	no	no	no	yes	yes	yes	yes
pre-paks-in	Records the number of input packets before authentication. This attribute is sent in accounting-stop records.	no	no	no	yes	yes	yes	yes

Table 81 **Supported TACACS+ Accounting AV Pairs (continued)**

	epoch, 12:00 a.m. Jan 1 1970). The clock must be configured to receive this information.	yes	yes	yes	yes	yes	yes	yes
stop_time	The time the action stopped (in seconds since the epoch.) The clock must be configured to receive this information.	yes	yes	yes	yes	yes	yes	yes
task_id	Start and stop records for the same event must have matching (unique) task_id numbers.	yes	yes	yes	yes	yes	yes	yes
timezone	The time zone abbreviation for all timestamps included in this packet.	yes	yes	yes	yes	yes	yes	yes
xmit-rate	This AV pair has been renamed. See nas-tx-speed.							

Table 82 lists the cause codes and descriptions for the Disconnect Cause Extended (disc-cause-ext) attribute.

Table 82 **Disconnect Cause Extensions**

Cause Codes	Description	11.0	11.1	11.2	11.3	12.0	12.1	12.2	12.3
1000 – No Reason	No reason for the disconnect.	no	no	no	no	yes	yes	yes	yes
1001 – No Disconnect	The event was not a disconnect.	no	no	no	no	yes	yes	yes	yes
1002 – Unknown	The reason for the disconnect is unknown. This code can appear when the remote connection goes down.	no	no	no	no	yes	yes	yes	yes
1003 – Call Disconnect	The call has disconnected.	no	no	no	no	yes	yes	yes	yes
1004 – CLID Auth Fail	Calling line ID (CLID) authentication has failed.	no	no	no	no	yes	yes	yes	yes

Cause Codes	Description	11.0	11.1	11.2	11.3	12.0	12.1	12.2	12.3
1009 – No Modem Available	The modem is not available.	no	no	no	no	yes	yes	yes	yes
1010 – No Carrier	The modem never detected data carrier detect (DCD). This code can appear if a disconnect occurs during the initial modem connection.	no	no	no	no	yes	yes	yes	yes
1011 – Lost Carrier	The modem detected DCD but became inactive. This code can appear if a disconnect occurs during the initial modem connection.	no	no	no	no	yes	yes	yes	yes
1012 – No Modem Results	The result codes could not be parsed. This code can appear if a disconnect occurs during the initial modem connection.	no	no	no	no	yes	yes	yes	yes
1020 – TS User Exit	The user exited normally from the terminal server. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1021 – Idle Timeout	The user exited from the terminal server because the idle timer expired. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1022 – TS Exit Telnet	The user exited normally from a Telnet session. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1023 – TS No IP Addr	The user could not switch to Serial Line Internet Protocol (SLIP) or PPP because the remote host had no IP address or because the dynamic pool could not assign one. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1024 – TS TCP Raw Exit	The user exited normally from a raw TCP session. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1025 – TS Bad Password	The login process ended because the user failed to enter a correct password after three attempts. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1026 – TS No TCP Raw	The raw TCP option is not enabled. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1027 – TS CNTL-C	The login process ended because the user typed Ctrl-C. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1028 – TS Session End	The terminal server session has ended. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes

Cause Codes	Description	11.0	11.1	11.2	11.3	12.0	12.1	12.2	12.3
1029 – TS Close Vconn	The user closed the virtual connection. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1030 – TS End Vconn	The virtual connection has ended. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1031 – TS Rlogin Exit	The user exited normally from an Rlogin session. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1032 – TS Rlogin Opt Invalid	The user selected an invalid Rlogin option. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1033 – TS Insuff Resources	The access server has insufficient resources for the terminal server session. This code is related to immediate Telnet and raw TCP disconnects during a terminal server session.	no	no	no	no	yes	yes	yes	yes
1040 – PPP LCP Timeout	PPP link control protocol (LCP) negotiation timed out while waiting for a response from a peer. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes
1041 – PPP LCP Fail	There was a failure to converge on PPP LCP negotiations. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes
1042 – PPP Pap Fail	PPP Password Authentication Protocol (PAP) authentication failed. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes
1043 – PPP CHAP Fail	PPP Challenge Handshake Authentication Protocol (CHAP) authentication failed. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes
1044 – PPP Remote Fail	Authentication failed from the remote server. This code concerns PPP sessions.	no	no	no	no	yes	yes	yes	yes
1045 – PPP Receive Term	The peer sent a PPP termination request. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes
PPP LCP Close (1046)	LCP got a close request from the upper layer while LCP was in an open state. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes
1047 – PPP No NCP	LCP closed because no NCPs were open. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes
1048 – PPP MP Error	LCP closed because it could not determine to which Multilink PPP bundle that it should add the user. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes
1049 – PPP Max Channels	LCP closed because the access server could not add any more channels to an MP session. This code concerns PPP connections.	no	no	no	no	yes	yes	yes	yes

Cause Codes	Description	11.0	11.1	11.2	11.3	12.0	12.1	12.2	12.3
1050 – TS Tables Full	The raw TCP or Telnet internal session tables are full. This code relates to immediate Telnet and raw TCP disconnects and contains more specific information than the Telnet and TCP codes listed earlier in this table.	no	no	no	no	yes	yes	yes	yes
1051 – TS Resource Full	Internal resources are full. This code relates to immediate Telnet and raw TCP disconnects and contains more specific information than the Telnet and TCP codes listed earlier in this table.	no	no	no	no	yes	yes	yes	yes
1052 – TS Invalid IP Addr	The IP address for the Telnet host is invalid. This code relates to immediate Telnet and raw TCP disconnects and contains more specific information than the Telnet and TCP codes listed earlier in this table.	no	no	no	no	yes	yes	yes	yes
1053 – TS Bad Hostname	The access server could not resolve the host name. This code relates to immediate Telnet and raw TCP disconnects and contains more specific information than the Telnet and TCP codes listed earlier in this table.	no	no	no	no	yes	yes	yes	yes
1054 – TS Bad Port	The access server detected a bad or missing port number. This code relates to immediate Telnet and raw TCP disconnects and contains more specific information than the Telnet and TCP codes listed earlier in this table.	no	no	no	no	yes	yes	yes	yes
1060 – TCP Reset	The host reset the TCP connection. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes
1061 – TCP Connection Refused	The host refused the TCP connection. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes
1062 – TCP Timeout	The TCP connection timed out. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes
1063 – TCP Foreign Host Close	A foreign host closed the TCP connection. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes
1064 – TCP Net Unreachable	The TCP network was unreachable. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes
1065 – TCP Host Unreachable	The TCP host was unreachable. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes
1066 – TCP Net Admin Unreachable	The TCP network was administratively unreachable. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes

1067 – TCP Host Admin Unreachable	The TCP host was administratively unreachable. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes
1068 – TCP Port Unreachable	The TCP port was unreachable. The TCP stack can return this disconnect code during an immediate Telnet or raw TCP session.	no	no	no	no	yes	yes	yes	yes
1100 – Session Timeout	The session timed out because there was no activity on a PPP link. This code applies to all session types.	no	no	no	no	yes	yes	yes	yes
1101 – Security Fail	The session failed for security reasons. This code applies to all session types.	no	no	no	no	yes	yes	yes	yes
1102 – Callback	The session ended for callback. This code applies to all session types.	no	no	no	no	yes	yes	yes	yes
1120 – Unsupported	One end refused the call because the protocol was disabled or unsupported. This code applies to all session types.	no	no	no	no	yes	yes	yes	yes
1150 – Radius Disc	The RADIUS server requested the disconnect.	no	no	no	no	yes	yes	yes	yes
1151 – Local Admin Disc	The local administrator has disconnected.	no	no	no	no	yes	yes	yes	yes
1152 – SNMP Disc	Simple Network Management Protocol (SNMP) has disconnected.	no	no	no	no	yes	yes	yes	yes
1160 – V110 Retries	The allowed retries for V110 synchronization have been exceeded.	no	no	no	no	yes	yes	yes	yes
1170 – PPP Auth Timeout	Authentication timeout. This code applies to PPP sessions.	no	no	no	no	yes	yes	yes	yes
1180 – Local Hangup	The call disconnected as the result of a local hangup.	no	no	no	no	yes	yes	yes	yes
1185 – Remote Hangup	The call disconnected because the remote end hung up.	no	no	no	no	yes	yes	yes	yes
1190 – T1 Quiesced	The call disconnected because the T1 line that carried it was quiesced.	no	no	no	no	yes	yes	yes	yes
1195 – Call Duration	The call disconnected because the call duration exceeded the maximum amount of time allowed by the Max Call Mins or Max DS0 Mins parameter on the access server.	no	no	no	no	yes	yes	yes	yes
1600 – VPDN User Disconnect	The user disconnected. This value applies to virtual private dial-up network (VPDN) sessions.	no	no	no	no	no	no	yes	yes
1601 – VPDN Carrier Loss	Carrier loss has occurred. This code applies to VPDN sessions.	no	no	no	no	no	no	yes	yes
1602 – VPDN No Resources	There are no resources. This code applies to VPDN sessions.	no	no	no	no	no	no	yes	yes
1603 – VPDN Bad Control Packet	The control packet is invalid. This code applies to VPDN sessions.	no	no	no	no	no	no	yes	yes

1604 – VPDN Admin Disconnect	The administrator disconnected. This code applies to VPDN sessions.	no	no	no	no	no	no	yes	yes
1605 – VPDN Tunnel Down/Setup Fail	The tunnel is down or the setup failed. This code applies to VPDN sessions.	no	no	no	no	no	no	yes	yes
1606 – VPDN Local PPP Disconnect	There was a local PPP disconnect. This code applies to VPDN sessions.	no	no	no	no	no	no	yes	yes
1607 – VPDN Softshut/Session Limit	New sessions cannot be established on the VPN tunnel. This code applies to VPDN sessions.	no	no	no	no	no	no	yes	yes
1608 – VPDN Call Redirected	The call was redirected. This code applies to VPDN sessions.	no	no	no	no	no	no	yes	yes
1801 – Q850 Unassigned Number	The number has not been assigned. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1802 – Q850 No Route	The equipment that is sending this code has received a request to route the call through a particular transit network that it does not recognize. The equipment that is sending this code does not recognize the transit network because either the transit network does not exist or because that particular transit network, while it does exist, does not serve the equipment that is sending this code. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1803 – Q850 No Route To Destination	The called party cannot be reached because the network through which the call has been routed does not serve the destination that is desired. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1806 – Q850 Channel Unacceptable	The channel that has been most recently identified is not acceptable to the sending entity for use in this call. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1816 – Q850 Normal Clearing	The call is being cleared because one of the users who is involved in the call has requested that the call be cleared. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1817 – Q850 User Busy	The called party is unable to accept another call because the user-busy condition has been encountered. This code may be generated by the called user or by the network. In the case of the user, the user equipment is compatible with the call. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes

1818 – Q850 No User Responding	Used when a called party does not respond to a call-establishment message with either an alerting or connect indication within the prescribed period of time that was allocated. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1819 – Q850 No User Answer	The called party has been alerted but does not respond with a connect indication within a prescribed period of time. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1821 – Q850 Call Rejected	The equipment that is sending this code does not wish to accept this call although it could have accepted the call because the equipment that is sending this code is neither busy nor incompatible. This code may also be generated by the network, indicating that the call was cleared due to a supplementary service constraint. The diagnostic field may contain additional information about the supplementary service and reason for rejection. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1822 – Q850 Number Changed	The number that is indicated for the called party is no longer assigned. The new called party number may optionally be included in the diagnostic field. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1827 – Q850 Destination Out of Order	The destination that was indicated by the user cannot be reached because the interface to the destination is not functioning correctly. The term “not functioning correctly” indicates that a signaling message was unable to be delivered to the remote party. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1828 – Q850 Invalid Number Format	The called party cannot be reached because the called party number is not in a valid format or is not complete. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1829 – Q850 Facility Rejected	This code is returned when a supplementary service that was requested by the user cannot be provided by the network. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1830 – Q850 Responding to Status Enquiry	This code is included in the STATUS message when the reason for generating the STATUS message was the prior receipt of a STATUS ENQUIRY message. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1831 – Q850 Unspecified Cause	No other code applies. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes

1834 – Q850 No Circuit Available	No circuit or channel is available to handle the call. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1838 – Q850 Network Out of Order	The network is not functioning correctly and the condition is likely to last a relatively long period of time. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1841 – Q850 Temporary Failure	The network is not functioning correctly and the condition is not likely to last a long period of time. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1842 – Q850 Network Congestion	The network is congested. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1843 – Q850 Access Info Discarded	This code indicates that the network could not deliver access information to the remote user as requested. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1844 – Q850 Requested Channel Not Available	This code is returned when the circuit or channel that is indicated by the requesting entity cannot be provided by the other side of the interface. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1845 – Q850 Call Pre-empted	The call was preempted. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1847 – Q850 Resource Unavailable	This code is used to report a resource-unavailable event only when no other code in the resource-unavailable class applies. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1850 – Q850 Facility Not Subscribed	Not a subscribed facility. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
1852 – Q850 Outgoing Call Barred	Although the calling party is a member of the closed user group for the outgoing closed user group call, outgoing calls are not allowed for this member. This code applies to ISDN or modem calls that came in over ISDN.	no	no	no	no	no	no	no	yes
Q850 Incoming Call Barred (1854)	Although the called party is a member of the closed user group for the incoming closed user group call, incoming calls are not allowed to this member. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1858 – Q850 Bearer Capability Not Available	The user has requested a bearer capability that is implemented by the equipment that generated this code but that is not available at this time. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes

1863 – Q850 Service Not Available	The code is used to report a service- or option-not-available event only when no other code in the service- or option-not-available class applies. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1865 – Q850 Bearer Capability Not Implemented	The equipment that is sending this code does not support the bearer capability that was requested. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1866 – Q850 Channel Not Implemented	The equipment that is sending this code does not support the channel type that was requested. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1869 – Q850 Facility Not Implemented	The supplementary service requested by the user cannot be provided by the network. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1881 – Q850 Invalid Call Reference	The equipment that is sending this code has received a message having a call reference that is not currently in use on the user-network interface. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1882 – Q850 Channel Does Not Exist	The channel most recently identified is not acceptable to the sending entity for use in this call. This code applies to ISDN or modem calls that have come in over ISDN. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1888 – Q850 Incompatible Destination	The equipment that is sending this code has received a request to establish a call that has low-layer compatibility or other compatibility attributes that cannot be accommodated. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1896 – Q850 Mandatory Info Element Is Missing	The equipment that is sending this code has received a message that is missing an information element that must be present in the message before that message can be processed. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes
1897 – Q850 Non Existent Message Type	The equipment that is sending this code has received a message with a message type that it does not recognize either because this is a message that is not defined or that is defined but not implemented by the equipment that is sending this code. This code applies to ISDN or modem calls that have come in over ISDN.	no	no	no	no	no	no	no	yes

Flexible Packet Matching

First Published: October 31, 2006

Last Updated: August 7, 2008

Flexible Packet Matching (FPM) is the next generation access control list (ACL) pattern matching tool, providing more thorough and customized packet filters. FPM enables users to match on arbitrary bits of a packet at an arbitrary depth in the packet header and payload. FPM removes constraints to specific fields that had limited packet inspection.

FPM is useful because it enables users to create their own stateless packet classification criteria and to define policies with multiple actions (such as drop, log, or send Internet Control Message Protocol [ICMP] unreachable¹) to immediately block new viruses, worms, and attacks.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for Flexible Packet Matching” section on page 15](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required

- [Command Reference, page 14](#)
- [Feature Information for Flexible Packet Matching, page 15](#)

Prerequisites for Flexible Packet Matching

- In Cisco IOS Release 12.4(4)T, FPM is available only in advanced security images.
- In Cisco IOS Release 12.2(18)ZY, FPM is also available in ipbase and ipservices images for the Supervisor Engine 32 Programmable Intelligent Services Accelerator (PISA) platform.
- Although access to an XML editor is not required, XML will ease the creation of protocol header description files (PHDFs).

Restrictions for Flexible Packet Matching

- FPM cannot be used to mitigate an attack that requires stateful classification.
- Because FPM is stateless, it cannot keep track of port numbers being used by protocols that dynamically negotiate ports. Thus, when using FPM, port numbers must be explicitly specified.
- FPM cannot perform IP fragmentation or TCP flow reassembly.
- FPM inspects only IPv4 unicast packets.
- FPM cannot classify packets with IP options.
- FPM does not support multicast packet inspection.
- FPM is not supported on tunnel and MPLS interfaces.
- FPM cannot be configured on FlexWAN cards.
- Noninitial fragments will not be matched by the FPM engine.
- Offset can be only a constant in a match start construct.
- FPM cannot match across packets.
- Mapping of FPM policies to control-plane is not supported.

Information About Flexible Packet Matching

Before configuring FPM, you should understand the following concept:

- [Flexible Packet Matching Functional Overview, page 3](#)
- [Traffic Classification Definition Files \(TCDFs\) for the Flexible Packet Matching XML Configuration, page 4](#)
- [FPM on PISA Overview, page 4](#)

Flexible Packet Matching Functional Overview

FPM allows customers to create their own filtering policies that can immediately detect and block new viruses and attacks.

A filtering policy is defined via the following tasks:

- Load a PHDF (for protocol header field matching)
- Define a class map and define the protocol stack chain (traffic class)
- Define a service policy (traffic policy)
- Apply the service policy to an interface

Protocol Header Description File

Protocol headers are defined in separate files called PHDFs; the field names that are defined within the PHDFs are used for defining the packet filters. A PHDF is a file that allows the user to leverage the flexibility of XML to describe almost any protocol header. The important components of the PHDF are the version, the XML file schema location, and the protocol field definitions. The protocol field definitions name the appropriate field in the protocol header, allow for a comment describing the field, provide the location of the protocol header field in the header (the offset is relative to the start of the protocol header), and provide the length of the field. Users can choose to specify the measurement in bytes or in bits.

**Note**

The total length of the header must be specified at the end of each PHDF.

Users can write their own custom PHDFs via XML for existing or proprietary protocols. However, the following standard PHDFs can also be loaded onto the router via the **load protocol** command: ip.phdf, ether.phdf, tcp.phdf, and udp.phdf.

**Note**

Because PHDFs are defined via XML, they are not shown in a running configuration. However, you can use the **show protocol phdf** command to verify the loaded PHDF.

Standard PHDFs are available on Cisco.com at the following URL:
<http://www.cisco.com/cgi-bin/tablebuild.pl/fpm>

Filter Description

A filter description is a definition of a traffic class that can contain the header fields defined in a PHDF (using the **match field** command). If a PHDF is not loaded, the traffic class can be defined via the datagram header start (Layer 2) or the network header start (Layer 3) (using the **match start** command). If a PHDF has been loaded onto the router, the class specification begins with a list of the protocol headers in the packet.

A filter definition also includes the policy map; that is, after a class map has been defined, a policy map is needed to bind the match to an action. A policy map is an ordered set of classes and associated actions, such as drop, log, or send ICMP unreachable.

For information on how to configure a class map and a policy map for FPM, see the following section “[How to Configure a Flexible Packet Matching Traffic Class and Traffic Policy](#).”

Traffic Classification Definition Files (TCDFs) for the Flexible Packet Matching XML Configuration

FPM uses a traffic classification definition file (TCDF) to define policies that can block attacks on the network. Before Cisco IOS Release 12.4(6)T, FPM defined traffic classes (class maps), policies (policy maps), and service policies (attach policy maps to class maps) through the use of CLI commands. With TCDFs, FPM can use XML as an alternative to the CLI to define classes of traffic and specify actions to apply to the traffic classes. Traffic classification behavior is the same whether you create the behavior using a TCDF or configure it using CLI commands. Once a TCDF is created, it can be loaded on any FPM-enabled device in the network.

For more information on configuring FPM using TCDFs, see [Flexible Packet Matching XML Configuration](#).

FPM on PISA Overview

The PISA functions as a network-processor based daughter card that is mounted on the Catalyst 6500 Supervisor. PISA provides a superset of the multilayer switch feature card 2a (MSFC2a) capabilities. In addition to performing all of the same functions as the MSFC2a, PISA also provides a dedicated hardware to accelerate certain features, such as FPM.

FPM occurs before Network-Based Application Recognition (NBAR); thus, packets that are dropped by FPM are not processed by NBAR.

Logging FPM Activity

In software-based FPM logging, every flow is logged and aggregated statistics are provided for each flow. Logging every flow for FPM on PISA would overwhelm the CPU; thus, only selective packets are logged. That is, when a packet matches a policy that is to be logged or the first time, the packet is logged, time-stamped, and stored. For every subsequent packet that matches any policy with a log action, the packet is checked for the difference between the current time (which is clocked by the global timer) and the last time stamp. If the current time is greater than the last time stamp, the packet is logged and the “stamp time” is updated with the current time.

Memory Requirements

Note

Because memory requirements vary among system configurations, the requirements listed in this document are estimates.

- PISA will support a maximum of 1024 interfaces; however, it is expected that no more than 256 interfaces will be configured with FPM.
- A maximum of 32 classes per policy map, and a total of 1024 classes globally, are supported.
- A maximum of 32 filters (such as match entries) per class map are supported. (However, some optimizations for better performance are possible with match-any type of class maps that have filters starting at same the same offset and the same size.)

How to Configure a Flexible Packet Matching Traffic Class and Traffic Policy

This section contains the following procedures that should be followed when configuring a FPM traffic class and traffic policy within your network:

- [Creating a Traffic Class for Flexible Packet Matching, page 5](#)
- [Creating a Traffic Policy for Flexible Packet Matching, page 7](#)

Creating a Traffic Class for Flexible Packet Matching

Perform this task to create an FPM traffic class; that is, create a stateless packet classification criteria that, when used in conjunction with an appropriately defined policy, can mitigate network attacks.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **load protocol** *location:filename*
4. **class-map** [**type** {**stack** | **access-control**}] *class-map-name* [**match-all** | **match-any**]
5. **description** *character-string*
6. **match field** *protocol protocol-field* {**eq** [*mask*] | **neq** [*mask*] | **gt** | **lt** | **range** *range* | **regex** *string*} *value* [**next** *next-protocol*]
7. **match start** {**l2-start** | **l3-start**} **offset** *number* **size** *number* {**eq** | **neq** | **gt** | **lt** | **range** *range* | **regex** *string*} *value* [*value2*]
8. **exit**
9. **show class-map** [**type** {**stack** | **access-control**}] [*class-map-name*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	load protocol <i>location:filename</i> Example: Router(config)# load protocol disk2:udp.phdf	(Optional) Loads a PHDF onto a router. <ul style="list-style-type: none">• The specified location must be local to the router. Note If a PHDF is not loaded, only the match start command can be used; that is, you cannot issue the match field command.

	Command or Action	Purpose
Step 4	class-map [type { stack access-control }] <i>class-map-name</i> [match-all match-any] Example: Router(config)# class-map type access-control slammer match-all	Creates a class map to be used for matching packets to a specified class and enters class-map configuration mode. <ul style="list-style-type: none"> • type stack —Enables FPM to determine the correct protocol stack in which to examine. • type access-control—Determines the exact pattern to look for in the protocol stack of interest. • <i>class-map-name</i>—Can be a maximum of 40 alphanumeric characters. • If match-all or match-any are not specified, traffic must match all the match criterion to be classified as part of the traffic class.
Step 5	description <i>character-string</i> Example: Router(config-cmap)# description "match on slammer packets"	(Optional) Adds a description to the class map.
Step 6	match field <i>protocol protocol-field</i> { eq [<i>mask</i>] neq [<i>mask</i>] gt lt range <i>range</i> regex <i>string</i> } <i>value</i> [next <i>next-protocol</i>] Example: Router(config-cmap)# match field udp dest-port eq 0x59A	(Optional) Configures the match criteria for a class map on the basis of the fields defined in the PHDFs.
Step 7	match start { l2-start l3-start } offset <i>number</i> size <i>number</i> { eq neq gt lt range <i>range</i> regex <i>string</i> } <i>value</i> [<i>value2</i>] Example: Router(config-cmap)# match start l3-start offset 224 size 4 eq 0x4011010	(Optional) Configures the match criteria for a class map on the basis of the datagram header (Layer 2) or the network header (Layer 3).
Step 8	exit Example: Router(config-cmap)# exit Example: Router(config)# exit	Exits class-map configuration mode and global configuration mode.
Step 9	show class-map [type { stack access-control }] [<i>class-map-name</i>] Example: Router# show class-map type access-control slammer	(Optional) Displays all configured FPM class maps.

Troubleshooting Tips

To track all FPM events, issue the **debug fpm event** command.

The following sample output is from the **debug fpm event** command:

```
*Jun 21 09:22:21.607: policy-classification-inline(): matches class: class-default *Jun 21
09:22:21.607: packet-access-control(): policy-map: fpm-policy, dir: input, match. retval:
0x0, ip-flags: 0x80000000
```

What to Do Next

After you have defined at least one class map for your network, you must create a traffic policy and apply that policy to an interface as shown in the following task “[Creating a Traffic Policy for Flexible Packet Matching](#).”

Creating a Traffic Policy for Flexible Packet Matching

Perform this task to create an FPM traffic policy and apply the policy to a given interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** [type access-control] *policy-map-name*
4. **description** *character-string*
5. **class** *class-name* [insert-before *class-name*]
6. **drop**
7. **service-policy** *policy-map-name*
8. **exit**
9. **interface** *type name*
10. **service-policy** [type access-control] { **input** | **output** } *policy-map-name*
11. **exit**
12. **show policy-map interface** [type access-control] *interface-name* [**input** | **output**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
	Example: Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example: Router# configure terminal	

	Command or Action	Purpose
Step 3	policy-map [type access-control] <i>policy-map-name</i> Example: Router(config)# policy-map type access-control fpm-udp-policy	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy and enters policy-map configuration mode.
Step 4	description <i>character-string</i> Example: Router(config-pmap)# description "policy for UDP based attacks"	(Optional) Adds a description to the policy map.
Step 5	class <i>class-name</i> [insert-before <i>class-name</i>] Example: Router(config-pmap)# class slammer	Specifies the name of a predefined traffic class, which was configured with the class-map command, used to classify traffic to the traffic policy. <ul style="list-style-type: none"> insert-before class-name—Adds a class map to any location within the policy map. If this option is not issued, the class map is appended to the end of the policy map.
Step 6	drop Example: Router(config-pmap)# drop	(Optional) Configures a traffic class to discard packets belonging to a specific class. If this command is issued, note the following restrictions: <ul style="list-style-type: none"> Discarding packets is the only action that can be configured in a traffic class. When a traffic class is configured with the drop command, a “child” (nested) policy cannot be configured for this specific traffic class through the service policy command. Discarding packets cannot be configured for the default class specified via the class class-default command.
Step 7	service-policy <i>policy-map-name</i> Example: Router(config-pmap-c)# service policy fpm-udp-policy	Creates hierarchical service policies.
Step 8	exit Example: Router(config-pmap-c)# exit Example: Router(config-pmap)# exit	Exits policy-map class configuration mode and policy-map configuration mode.
Step 9	interface <i>type number</i> Example: Router(config)# interface gigabitEthernet 0/1	Configures an interface type and enters interface configuration mode.

	Command or Action	Purpose
Step 10	service-policy [type access-control] { input output } <i>policy-map-name</i> Example: Router(config-if)# service-policy type access-control input fpm-policy	Specifies the type and the name of the traffic policy to be attached to the input or output direction of an interface.
Step 11	exit Example: Router(config-if)# exit Example: Router(config)# exit	Exits interface configuration and global configuration modes.
Step 12	show policy-map interface [type access-control] <i>interface-name</i> [input output] Example: Router# show policy-map interface type access-control interface gigabit 0/1	(Optional) Verifies the FPM configuration.

Configuration Examples for FPM Configuration

This section contains the following configuration examples:

- [Configuring FPM for Slammer Packets: Example, page 9](#)
- [Configuring FPM for Blaster Packets: Example, page 11](#)
- [Configuring FPM for MyDoom Packets: Example, page 12](#)

Configuring FPM for Slammer Packets: Example

The following example shows how to define FPM traffic classes for slammer packets (UDP port 1434). The match criteria defined within the class maps is for slammer packets with an IP length not to exceed 404 bytes, UDP port 1434, and pattern 0x4011010 at 224 bytes from start of IP header. This example also shows how to define the service policy “fpm-policy” and apply it to the Gigabit Ethernet interface. Show commands have been issued to verify the FPM configuration. (Note that PHDFs are not displayed in show output because they are in XML format.)

```
Router(config)# load protocol disk2:ip.phdf
Router(config)# load protocol disk2:udp.phdf

Router(config)# class-map type stack match-all ip-udp
Router(config-cmap)# description "match UDP over IP packets"
Router(config-cmap)# match field ip protocol eq 0x11 next udp

Router(config)# class-map type access-control match-all slammer
Router(config-cmap)# description "match on slammer packets"
Router(config-cmap)# match field udp dest-port eq 0x59A
Router(config-cmap)# match field ip length eq 0x194
Router(config-cmap)# match start 13-start offset 224 size 4 eq 0x4011010
```

```

Router(config)# policy-map type access-control fpm-udp-policy
Router(config-pmap)# description "policy for UDP based attacks"
Router(config-pmap)# class slammer
Router(config-pmap-c)# drop

Router(config)# policy-map type access-control fpm-policy
Router(config-pmap)# description "drop worms and malicious attacks"
Router(config-pmap)# class ip-udp
Router(config-pmap-c)# service-policy fpm-udp-policy

Router(config)# interface gigabitEthernet 0/1
Router(config-if)# service-policy type access-control input fpm-policy

Router# show policy-map type access-control interface gigabit 0/1

GigabitEthernet0/1
Service-policy access-control input: fpm-policy
Class-map: ip-udp (match-all)
0 packets, 0 bytes
3 minute offered rate 0 bps
Match: field IP protocol eq 0x11 next UDP
Service-policy access-control : fpm-udp-policy
Class-map: slammer (match-all)
0 packets, 0 bytes
3 minute offered rate 0 bps, drop rate 0 bps
Match: field UDP dest-port eq 0x59A
Match: field IP length eq 0x194
Match: start 13-start offset 224 size 4 eq 0x4011010
drop
Class-map: class-default (match-any)

```

Configuring FPM for Blaster Packets: Example

The following example shows how to configure FPM for blaster packets. The class map contains the following match criteria: TCP port 135, 4444 or UDP port 69; and pattern 0x0030 at 3 bytes from start of IP header.

```

Router(config)# load protocol disk2:ip.phdf
Router(config)# load protocol disk2:tcp.phdf
Router(config)# load protocol disk2:udp.phdf

Router(config)# class-map type stack match-all ip-tcp
Router(config-cmap)# match field ip protocol eq 0x6 next tcp

Router(config)# class-map type stack match-all ip-udp
Router(config-cmap)# match field ip protocol eq 0x11 next udp

```

```

Router(config)# class-map type access-control match-all blaster1
Router(config-cmap)# match field tcp dest-port eq 135
Router(config-cmap)# match start 13-start offset 3 size 2 eq 0x0030

Router(config)# class-map type access-control match-all blaster2
Router(config-cmap)# match field tcp dest-port eq 4444
Router(config-cmap)# match start 13-start offset 3 size 2 eq 0x0030

Router(config)# class-map type access-control match-all blaster3
Router(config-cmap)# match field udp dest-port eq 69
Router(config-cmap)# match start 13-start offset 3 size 2 eq 0x0030

Router(config)# policy-map type access-control fpm-tcp-policy
Router(config-pmap)# class blaster1
Router(config-pmap-c)# drop
Router(config-pmap-c)# class blaster2
Router(config-pmap-c)# drop

Router(config)# policy-map type access-control fpm-udp-policy
Router(config-pmap)# class blaster3
Router(config-pmap-c)# drop

Router(config)# policy-map type access-control fpm-policy
Router(config-pmap)# class ip-tcp
Router(config-pmap-c)# service-policy fpm-tcp-policy
Router(config-pmap)# class ip-udp
Router(config-pmap-c)# service-policy fpm-udp-policy

Router(config)# interface gigabitEthernet 0/1
Router(config-if)# service-policy type access-control input fpm-policy

```

Configuring FPM for MyDoom Packets: Example

The following example shows how to configure FPM for MyDoom packets. The match criteria is as follows:

- 90 > IP length > 44
- pattern 0x47455420 at 40 bytes from start of IP header
- or
- IP length > 44
- pattern 0x6d3a3830 at 48 bytes from start of IP header
- pattern 0x47455420 at 40 bytes from start of IP header

```

Router(config)# load protocol disk2:ip.phdf
Router(config)# load protocol disk2:tcp.phdf

Router(config)# class-map type stack match-all ip-tcp
Router(config-cmap)# match field ip protocol eq 0x6 next tcp

Router(config)# class-map type access-control match-all mydoom1
Router(config-cmap)# match field ip length gt 44
Router(config-cmap)# match field ip length lt 90
Router(config-cmap)# match start 13-start offset 40 size 4 eq 0x47455420

```

```

Router(config)# class-map type access-control match-all mydoom2
Router(config-cmap)# match field ip length gt 44
Router(config-cmap)# match start 13-start offset 40 size 4 eq 0x47455420
Router(config-cmap)# match start 13-start offset 78 size 4 eq 0x6d3a3830

Router(config)# policy-map type access-control fpm-tcp-policy
Router(config-pmap)# class mydoom1
Router(config-pmap-c)# drop
Router(config-pmap-c)# class mydoom2
Router(config-pmap-c)# drop

Router(config)# policy-map type access-control fpm-policy
Router(config-pmap)# class ip-tcp
Router(config-pmap-c)# service-policy fpm-tcp-policy

Router(config)# interface gigabitEthernet 0/1
Router(config-if)# service-policy type access-control input fpm-policy

```

Feature Information for Flexible Packet Matching

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 1 Feature Information for Flexible Packet Matching

Feature Name	Releases	Feature Information
Flexible Packet Matching	12.4(4)T 12.2(18)ZY	FPM is a packet classification feature that allows users to define one or more classes of network traffic by pairing a rich set of standard matching operators with user-defined protocol header fields. In Cisco IOS Release 12.2(18)ZY, FPM was implemented on the Catalyst 6500 series of switches equipped with the PISA.
FPM Full Packet Filtering	12.4(15)T	In Cisco IOS Release 12.4(15)T, FPM now supports searching for patterns up to 56 bytes long anywhere within the entire packet. Prior to 12.4(15)T, FPM only supported searching for patterns up to 32 bytes long within the first 256 bytes of the packet.
Enhance FPM Search Window Size To 128 bytes	12.2(18)ZYA	FPM now supports searching for patterns up to 128 bytes long anywhere within the entire packet. Also, the number of filters that can be configured per class map has increased from 8 to 32. The additional filters can help offset adverse CPU performance that may occur if the “window” for pattern searching is increased. (However, some optimizations for better performance are possible with match-any type of class maps that have filters starting at same the same offset and the same size.)

Flexible Packet Matching XML Configuration

First Published: March 3, 2006

Last Updated: March 3, 2006

The Flexible Packet Matching XML Configuration feature allows the use of eXtensible Markup Language (XML) to define traffic classes and actions (policies) to assist in blocking network attacks. The XML file used by Flexible Packet Matching (FPM) is called the traffic classification definition file (TCDF).

The TCDF gives you an alternative to the command-line interface (CLI) as a method to define traffic classification behavior. Traffic classification behavior is identical regardless of the method you use.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for Flexible Packet Matching XML Configuration”](#) section on [page 18](#).

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

- [Feature Information for Flexible Packet Matching XML Configuration, page 18](#)

Prerequisites for the Flexible Packet Matching XML Configuration

The Flexible Packet Matching XML Configuration feature has the following prerequisites:

- A protocol header definition file (PHDF) relevant to the TCDF must be loaded on the router.
- Although access to an XML editor is not required, using one might make the creation of the TCDF easier.
- You must be familiar with XML file syntax.

Restrictions for the Flexible Packet Matching XML Configuration

The Flexible Packet Matching XML Configuration has the following restrictions:

- The FPM TCDF cannot be used to mitigate an attack that requires stateful classification.
- Because FPM is stateless, it cannot keep track of port numbers being used by protocols that dynamically negotiate ports. Thus, when using the FPM TCDF, port numbers must be explicitly specified.
- FPM cannot perform IP fragmentation or TCP flow reassembly.

Information About the Flexible Packet Matching XML Configuration

Before you create and load the TCDF XML configuration files for use with FPM, you should understand the following concepts.

- [Traffic Classification Definition Files for the Flexible Packet Matching XML Configuration, page 3](#)
- [Protocol Header Definition Files for Traffic Classification Definitions, page 3](#)
- [Traffic Classification Description File Format and Use, page 3](#)
- [Traffic Class Definitions for a Traffic Classification Definition File, page 4](#)
- [Policy Definitions for a Traffic Classification Definition File, page 6](#)

Traffic Classification Definition Files for the Flexible Packet Matching XML Configuration

FPM uses a TCDF to define policies that can block attacks on the network. FPM is a packet classification feature that allows users to define one or more classes of network traffic by pairing a rich set of standard matching operators with user-defined protocol header fields. FPM users can create their own stateless packet classification criteria and define policies with multiple actions (such as drop, log, or send Internet Control Message Protocol [ICMP] unreachable) to immediately block new viruses, worms, and attacks on the network.

Before the release of the Flexible Packet Matching XML Configuration feature, FPM defined traffic classes (class maps), policies (policy maps), and service policies (attach policy maps to a class maps) through the use of CLI commands. With TCDFs, FPM can use XML as an alternative to the CLI to define classes of traffic and specify actions to apply to the traffic classes. Traffic classification behavior is the same whether you create the behavior using a TCDF or configure it using CLI commands. Once a TCDF is created, it can be loaded on any FPM-enabled device in the network.

For more information on FPM, see the [Flexible Packet Matching](#) feature module.

Protocol Header Definition Files for Traffic Classification Definitions

TCDFs require that a relevant PHDF is already loaded on the device. A PHDF defines each field contained in the header of a particular protocol. Each field is described with a name, optional comment, an offset (the location of the protocol header field in relation to the start of the protocol header), and the length of the field. The total length is specified at the end of each PHDF.

The description of a traffic class in a TCDF file can contain header fields defined in a PHDF. If the PHDF is loaded on the router, the class specification to match begins with a list of the protocol headers in the packet. In the TCDF, the traffic class is associated with a policy that binds the match to an action, such as drop, log, or send ICMP unreachable.

FPM provides ready-made definitions for these standard protocols, which can be loaded onto the router with the **load protocol** command: ether.phdf, ip.phdf, tcp.phdf, and udp.phdf. You can also write your own custom PHDFs using XML if one is required for the TCDF.

Note

Because PHDFs are defined via XML, they are not shown in a running configuration.

For more information about PHDFs, see the [Flexible Packet Matching](#) feature module.

Traffic Classification Description File Format and Use

In the TCDF, you can define one or more classes of traffic and policies that describe specified actions for each class of traffic. The TCDF is an XML file that you create in a text file or with an XML editor. The file that you create must have a filename that has the .tcd extension.

The TCDF has the following basic format. XML tags are shown in bold text for example purposes only.

```
<tdcf>
  <class ...> ... </class>
  ...
  <policy> ... </policy>
  ...
</tdcf>
```

For a traffic class, you can identify a match for any field or fields against any part of the packet.

Note

FPM is stateless and cannot be used to mitigate an attack that requires stateful classification, that is classify across IP fragments, across packets in a TCP stream, or peer-to-peer protocol elements.

Policies can be anything from access control, quality of service (QoS), or even routing decisions. For FPM, the associated actions (policies) might include permit, drop, log, or send ICMP unreachable.

Once loaded, the TCDF-defined classes and policies can be applied to any interface or subinterface and behave in an identical manner as the CLI-defined classes and policies. You can define policies in the TCDF and apply them to any entry point to the network to block new attacks.

Traffic Class Definitions for a Traffic Classification Definition File

A class can be any traffic stream of interest. You define a traffic stream of interest by matching a particular interface or port, a source address or destination IP address, a protocol or an application. The following sections contain information you should understand before you define the traffic class in the TCDF for FPM configuration:

- [Class Element Attributes for a Traffic Classification Definition File, page 4](#)
- [Match Element for a Traffic Classification Definition File, page 5](#)
- [Operator Element Attributes for a Traffic Classification Definition File, page 5](#)

Class Element Attributes for a Traffic Classification Definition File

[Table 1](#) lists and describes the attributes that you can associate with the **class** element in a TCDF for the FPM XML configuration. The **class** element contains attributes you can use to specify the traffic class name, its description and type, where to look in the packet, what kind of match, and when the actions should apply to the traffic.

Table 1 *Attributes for Use with the Class Element in a TCDF for the FPM XML Configuration*

Attribute Name	Use	Type
name (required)	Specifies the name of the class. Note When you use the class element inside policy elements, you need specify the name attribute only.	String
type (required)	Specifies the type of class.	Keywords: stack or access-control
stack start	Specifies where to look in the packet. By default, the match starts at Layer 3.	Keyword: l2-start

Table 1 *Attributes for Use with the Class Element in a TCDF for the FPM XML Configuration (continued)*

Attribute Name	Use	Type
match	Specifies the type of match to be performed on the class.	Keywords: all or any <ul style="list-style-type: none"> all—All class matches must be met to perform the policy actions. any—One or more matches within the class must be met to perform the policy actions.
undo	Directs the device to remove the class-map when set to true.	Keywords: true or false

For example, XML syntax for a stack class describing an IP, User Datagram Protocol (UDP), Simple Management Protocol (SNMP) stack might look like this:

```
<class name="snmp-stack" type="stack">
  <match>
    <eq field="ip.protocol" value="x"></eq>
    <eq field="udp.dport" value="161"></eq>
  </match>
</class>
```

Match Element for a Traffic Classification Definition File

The **match** element in the TCDF for FPM XML configuration contains **operator** elements. **Operator** elements are the following: **eq** (equal to), **neq** (not equal to), **lt** (less than), **gt** (greater than), **range** (a value in a specific range, for example, **range 1 – 25**), and **regex** (regular expression string with a maximum length of 32 characters).

In following sections, these various operators are collectively called the operator element.

Operator Element Attributes for a Traffic Classification Definition File

[Table 2](#) lists and describes direct matching attributes that you can associate with the **operator** element in a TCDF for the FPM XML configuration.

Table 2 *Direct Matching Attributes to Use with a Match Element in a TCDF for the FPM XML Configuration*

Attribute Name	Use	Type
start	Begin the match on a predefined keyword or Protocol.Field , if given.	Keyword: l2-start or l3-start Otherwise, a field of a protocol as defined in the PHDF, for example, the source field in the IP protocol.
offset	Used with start attribute. Offset from the start point.	Hexadecimal or decimal number, or string constants, Protocol.Field , or combination of a constant and Protocol.Field with +, -, *, /, &, or l.

Table 2 *Direct Matching Attributes to Use with a Match Element in a TCDF for the FPM XML Configuration (continued)*

Attribute Name	Use	Type
size	Used together with start and offset attributes. How much to match.	Specifies the size of the match in bytes.
mask	Number specifying bits to be matched in protocol or field attributes. Used exclusively with field type of bitset to specify the bits of interest in a bit map.	Decimal or hexadecimal number
value	Value on which to match.	String, number, or regular expression
field	Specifies the name of the field to be compared.	Name of field as defined in the PHDF
next	Identifies the next layer of the protocol. This attribute can be used only in stack type classes.	Keyword that is the name of a protocol defined in the PHDF.
undo	Directs the device to remove the particular match operator when set to true.	Keywords: true or false

Policy Definitions for a Traffic Classification Definition File

A policy is any action that you apply to a class. You should understand the following information before defining the policy in a TCDF for the FPM XML configuration:

- [Policy Element Attributes for a Traffic Classification Definition File, page 6](#)
- [Action Element for a Traffic Classification Definition File, page 7](#)

Policy Element Attributes for a Traffic Classification Definition File

Policies can be anything from access control, QoS, or even routing decisions. For FPM, the associated actions or policies might include drop, log, or send ICMP unreachable. Policies describe the action to take to mitigate attacks on the network.

[Table 3](#) lists and describes the attributes that you can use with the **policy** element in the TDCF for FPM XML configuration.

Table 3 *Attributes for Use with the Policy Element in a TCDF for the FPM XML Configuration*

Attribute Name	Use	Type
name	Name of the policy.	String
type	Specifies the type of policy map.	Keyword: access-control
undo	Directs the device to remove the policy map when set to true.	Keywords: true or false

The policy name in this example is sql-slammer, and the action defined for the policy is to drop the packet. This action is to be applied to the class that has the same name as the policy (class name=“sql-slammer”).

```
<policy name="sql-slammer">
  <class name="sql-slammer"></class>
  <action>drop</action>
</policy>
```

Action Element for a Traffic Classification Definition File

The **action** element is used to specify actions to associate with a policy. The policy with the **action** element is applied to a defined class. The **action** element can contain any of the following: permit, drop, Log, SendBackIcmp, set, RateLimit, alarm, ResetTcpConnection, and DropFlow. For example:

```
<action>
  log
</action>
```

How to Create and Load Traffic Classification Definition Files for the FPM XML Configuration

Perform the following tasks to create and load TCDFs for the FPM XML configuration. You can define traffic classes and policies with multiple actions (such as drop, log, or send Internet Control Message Protocol [ICMP] unreachable) in a TCDF to assist in the blocking of new viruses, worms, and attacks on the network.

- [Creating a Traffic Classification Definition File for the FPM XML Configuration, page 7](#) (required)
- [Loading a Traffic Classification Definition File for the FPM XML Configuration, page 9](#) (required)
- [Associating a Traffic Classification Definition File with an Interface or Subinterface, page 11](#) (required)
- [Displaying TCDF-Defined Traffic Classes and Policies, page 12](#) (optional)

Creating a Traffic Classification Definition File for the FPM XML Configuration

Perform the following task to create a TCDF for FPM XML configuration. The TCDF is used to define traffic classes and the associated policies with specified actions for the purpose of blocking new viruses, worms, and attacks on the network.

The TCDF is configured in a text or XML editor. The syntax of the TCDF must comply with the XML Version 1.0 syntax and the TCDF schema. For information about Version 1.0 XML syntax, see the document at the following url:

<http://www.w3.org/TR/REC-xml/>

Traffic Classification Definition File Syntax Guidelines

The following list describes required and optional syntax for the TCDF:

- The TCDF filename must end in the .tcd extension, for example, sql_slammer.tcd.
- The TCDF contains descriptions for one or more traffic classes and one or more policy actions.

- The file is encoded in the XML notation.
- The TCDF file should begin with the following version encoding:
`<?xml version="1.0" encoding="UTF-8"?>`

SUMMARY STEPS

1. Open a text file or an XML editor and begin the file with the XML version and encoding declaration.
2. Identify the file as a TCDF.
3. Define the traffic class of interest.
4. Identify matching criteria for the defined class of traffic.
5. Define the action to apply to the defined class.
6. End the traffic classification definition.
7. Save the TCDF file with a filename that has a .tcd extension.

DETAILED STEPS

- Step 1** Open a text file or an XML editor and begin the file with the XML version and encoding declaration.

```
<?xml version="1.0" encoding="UTF-8"?>
```

- Step 2** Identify the file as a TCDF. For example:

```
<tcd>
```

- Step 3** Define the traffic class of interest.

For example, a stack class describing an IP and UDP stack might be described as follows. In this example, the name of the traffic class is “ip-udp,” and the class type is “stack.”

```
<class name="ip-udp" type="stack"></class>
```

In the following example, the name of the traffic class is slammer, the class type is access control, and the match criteria is all:

```
<class name="slammer" type="access-control" match="all"></class>
```

- Step 4** Identify matching criteria for the defined classes of traffic. For example:

```
<class name="ip-udp" type="stack">
  <match>
    <eq field="ip.protocol" value="0x11" next="udp"></eq>
  </match>
</class>

<class name="slammer" type="access-control" match="all">
  <match>
    <eq field="udp.dest-port" value="0x59A"></eq>
    <eq field="ip.length" value="0x194"></eq>
    <eq start="13-start" offset="224" size="4" value="0x00401010"></eq>
  </match>
</class>
```

The traffic of interest in this TCDF matches fields defined in the PHDF files, ip.phdf and udp.phdf. The matching criteria for slammer packets is a UDP destination port number 1434 (0x59A), an IP length not to exceed 404 (0x194) bytes, and a Layer 3 position with a pattern 0x00401010 at 224 bytes from start (offset) of the IP header.

Step 5 Define the action to apply to the defined class. For example:

```
<policy name="fpm-udp-policy">
  <class name="slammer"></class>
  <action>Drop</action>
</policy>
```

The policy name in this example is fpm-udp-policy, and the action defined for the policy is to drop the packet. This action is to be applied to the class that has the name slammer.

Step 6 End the traffic classification definition. For example:

```
</tcdf>
```

Step 7 Save the TCDF file with a filename that has a .tcd file extension, for example: slammer.tcd.

Loading a Traffic Classification Definition File for the FPM XML Configuration

Perform this task to load a TCDF for the FPM XML configuration. After the TCDF is successfully loaded, you can use service-policy CLI to attach TCDF policies to a specific interface or interfaces (see the [“Associating a Traffic Classification Definition File with an Interface or Subinterface”](#) section on page 11).

SUMMARY STEPS

1. **enable**
2. **show protocol phdf** *protocol-name*
3. **configure terminal**
4. **load protocol** *location:filename*
5. **load classification** *location:filename*
6. **end**
7. **show class-map** [**type** {**stack** | **access-control**}] [*class-map-name*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Router> enable	<ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show protocol phdf <i>protocol-name</i>	Displays protocol information from a specific PHDF.
	Example: Router# show protocol phdf ip	<ul style="list-style-type: none"> • Use this command to verify that a PHDF file relevant to the TCDF is loaded on the device.
Step 3	configure terminal	Enters global configuration mode.
	Example: Router# configure terminal	

	Command or Action	Purpose
Step 4	load protocol <i>location:filename</i> Example: Router(config)# load protocol localdisk1:ip.phdf	(Optional) Loads a PHDF onto a router. <ul style="list-style-type: none"> The specified location must be local to the router. Note If the required PHDF is already loaded on the router (see Step 2), skip this step and proceed to Step 5).
Step 5	load classification <i>location:filename</i> Example: Router(config)# load classification localdisk1:slammer.tcdf	Loads a TCDF onto a router. <ul style="list-style-type: none"> The specified location must be local to the router.
Step 6	end Example: Router(config)# end	Exits to privileged EXEC mode.
Step 7	show class-map [type { stack access-control }] [<i>class-map-name</i>] Example: Router# show class-map sql-slammer	(Optional) Displays a class map and its matching criteria. <ul style="list-style-type: none"> Use this command to verify that a class defined in the TCDF file is available on the device. The <i>class-map-name</i> argument is the name of a class in the TCDF.

Examples

The following is sample output from a **show class-map** command that displays the traffic classes defined in the TCDF after it is loaded on the router:

```
Router# show class-map
.
.
.
class-map type stack match-all ip-udp
  match field IP protocol eq 0x11 next UDP

class-map type access-control match-all slammer
  match field UDP dest-port eq 0x59A
  match field IP length eq 0x194
  match start 13-start offset 224 size 4 eq 0x4011010
.
.
.
```

What to Do Next

After you have defined the TCDF, you must apply that policy to an interface as shown in the following task “[Associating a Traffic Classification Definition File with an Interface or Subinterface](#).”

Associating a Traffic Classification Definition File with an Interface or Subinterface

Perform the following task to associate a TCDF with an interface or subinterface.

After the TCDF is loaded, traffic classification behavior defined using the TCDF is identical to the same behavior defined using the CLI.

Prerequisites

The TCDP and FPM must be configured on the device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **service-policy** [**type access-control**] {**input** | **output**} *policy-map-name*
5. **end**
6. **show policy-map interface** [**type access-control**] *interface-name slot/port* [**input** | **output**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>type slot/port</i> Example: Router(config)# interface gigabitEthernet 0/1	Configures an interface type and enters interface configuration mode.
Step 4	service-policy [type access-control] { input output } <i>policy-map-name</i> Example: Router(config-if)# service-policy type access-control input sql-slammer	Specifies the type and the name of the traffic policy to be attached to the input or output direction of an interface. <ul style="list-style-type: none">• The <i>policy-map-name</i> argument is the name of a policy in the TCDF.

	Command or Action	Purpose
Step 5	end Example: Router(config-if)# end	Exits to privileged EXEC mode.
Step 6	show policy-map interface [type access-control] interface-name slot/port [input output] Example: Router# show policy-map interface gigabitEthernet 0/1	(Optional) Displays the packet statistics of all classes that are configured for all service policies either on the specified interface or subinterface. <ul style="list-style-type: none">Use this command to verify that policy defined in TCDF is associated with the named interface.

Displaying TCDF-Defined Traffic Classes and Policies

Perform this task to display TCDF-defined traffic classes and policies.

SUMMARY STEPS

1. **enable**
2. **show class-map** [type {stack | access-control}] [class-map-name]
3. **show class-map type stack** [class-map-name]
4. **show class-map type access-control** [class-map-name]
5. **show policy-map** [policy-map]
6. **exit**

DETAILED STEPS

Step 1	enable Use this command to enable privileged EXEC mode. Enter your password if prompted. For example: <pre>Router> enable Router#</pre>
Step 2	show class-map [type {stack access-control}] [class-map-name] Use this command to verify that a class defined in the TCDF file is available on the device. For example: <pre>Router# show class-map . . . class-map type stack match-all ip-udp match field IP protocol eq 0x11 next UDP class-map type access-control match-all slammer match field UDP dest-port eq 0x59A match field IP length eq 0x194 match start 13-start offset 224 size 4 eq 0x4011010 . . .</pre>

Step 3 **show class-map type stack** [*class-map name*]

Use this command to display the stack type defined for the class of traffic in the TCDF file. For example:

```
Router# show class-map type stack ip-udp

class-map type stack match-all ip-udp
  match field IP protocol eq 0x11 next UDP
```

Step 4 **show class-map type access-control** [*class-map-name*]

Use this command to display the access type defined for the class in the TCDF file. For example:

```
Router# show class-map type access-control slammer

class-map type access-control match-all slammer
  match field UDP dest-port eq 0x59A
  match field IP length eq 0x194
  match start 13-start offset 224 size 4 eq 0x4011010
```

Step 5 **show policy-map** [*policy-map*]

Use this command to display the contents of a policy map defined in the TCDF. For example:

```
Router# show policy-map fpm-udp-policy

policy-map type access-control fpm-udp-policy
  class slammer
    drop
```

Step 6 **exit**

Use this command to exit to user EXEC mode. For example:

```
Router# exit
Router>
```

Configuration Examples for Creating and Loading Traffic Classification Definition Files for the FPM XML Configuration

This section contains the following configuration examples:

- [Creating and Loading a Traffic Classification Definition File for Slammer Packets for the FPM XML Configuration: Example, page 14](#)
- [Creating and Loading a Traffic Classification Definition File for MyDoom Packets for the FPM XML Configuration: Example, page 14](#)

**Note**

The TCDF files are created in a text file or with an XML editor. In the following examples, XML tags are shown in bold text and field names in italic text. The values for the attributes are entered in quotation marks ("value").

Creating and Loading a Traffic Classification Definition File for Slammer Packets for the FPM XML Configuration: Example

The following example shows how to create and load a TCDF for slammer packets (UDP 1434) for the FPM configuration. The match criteria defined within the **class** element is for slammer packets with an IP length not to exceed 404 (0x194) bytes, UDP destination port 1434 (0x59A), and pattern 0x00401010 at 224 bytes from start of IP header. This example also shows how to define the policy “sql-slammer” with the action to drop slammer packets.

```
<?xml version="1.0" encoding="UTF-8"?>
<tcdf>
  <class name="ip-udp" type="stack">
    <match>
      <eq field="ip.protocol" value="0x11" next="udp"></eq>
    </match>
  </class>

  <class name="slammer" type="access-control" match="all">
    <match>
      <eq field="udp.dest-port" value="0x59A"></eq>
      <eq field="ip.length" value="0x194"></eq>
      <eq start="13-start" offset="224" size="4" value="0x00401010"></eq>
    </match>
  </class>

  <policy type="access-control" name="fpm-udp-policy">
    <class name="slammer"></class>
    <action>Drop</action>
  </policy>
</tcdf>
```

The following example shows how to load the TCDF file onto the device and apply the policy defined in the file to the interface Gigabit Ethernet 0/1:

```
configure terminal
load classification localdisk1:sql-slammer.tcdf
policy-map type access-control my-policy-1
class ip-udp
service-policy fpm-udp-policy
interface gigabitEthernet 0/1
service-policy type access-control input my-policy-1
end
```

Creating and Loading a Traffic Classification Definition File for MyDoom Packets for the FPM XML Configuration: Example

The following example shows how to create and load a TCDF for MyDoom packets in a text file or XML editor for the FPM XML configuration. The match criteria for the MyDoom packets are as follows:

- 90 > IP length > 44
- pattern 0x47455420 at 40 bytes from start of IP header
- or
- IP length > 44
- pattern 0x47455420 at 40 bytes from start of IP header

```

<tcdcf>
  <class name="md-stack" type="stack">
    <match>
      <eq field="ip.protocol" value="6" next="tcp"></eq>
    </match>
  </class>
  <class type="access-control" name="mydoom1">
    <match>
      <gt field="ip.length" value="44"/>
      <lt field="ip.length" value="90"/>
      <eq start="ip.version" offset="tcp.headerlength*4+20" size="4"
        value="0x47455420"/>
    </match>
  </class>
  <class type="access-control" name="mydoom2">
    <match>
      <gt field="ip.length" value="44"/>
      <eq start="ip.version" offset="tcp.headerlength*4+58" size="4"
        value="0x6d3a3830"/>
      <eq start="ip.version" offset="tcp.headerlength*4+20" size="4"
        value="0x47455420"/>
    </match>
  </class>

  <policy name="fpm-md-stack-policy">
    <class name="mydoom1"></class>
    <action>drop</action>
  </policy>

  <policy name="fpm-md-stack-policy">
    <class name="mydoom2"></class>
    <action>drop</action>
  </policy>
</tcdcf>

```

The following example shows how to load the TCDF file onto the device and apply the policy defined in the file to the interface Ethernet 0/1:

```

configure terminal
load classification localdisk1:sql-slammer.tcdf
policy-map type access-control my-policy-2
class md-stack
service-policy fpm-md-stack-policy
interface Ethernet 0/1
  service-policy type access-control input my-policy-2
end

```

Command Reference

The following commands are introduced or modified in the feature or features

- **load classification**

For information about these commands, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html.

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

Glossary

FPM—Flexible Packet Matching. Packet classification feature that allows users to define one or more classes of network traffic by pairing a rich set of standard matching operators with user-defined protocol header fields.

packet—Logical grouping of information that includes a header containing control information and (usually) user data. Packets most often are used to refer to network layer units of data. The terms datagram, frame, message, and segment also are used to describe logical information groupings at various layers of the OSI reference model and in various technology circles.

stateful classification—Classification that requires state maintenance to identify classes of packets, for example, classifying across IP fragments, classifying across packets in a TCP stream, or classifying peer-to-peer protocols.

stateless classification—Classification that supports a match on any field or fields anywhere in Layer 2 to Layer 7 within the packet. Stateless classification can identify a packet as belonging to a class while utilizing no information other than what is in the packet itself and the class specification.

TCDF—traffic classification definition file. Extensible Markup Language (XML) file created for the purpose of defining traffic classes and policies for Flexible Packet Matching (FPM) that can assist in the blocking of attacks on the network.

XML—eXtensible Markup Language. Standard maintained by the World Wide Web Consortium (W3C). It defines a syntax that lets you create markup languages to specify information structures, which define the type of information, for example, subscriber name or address, not how the information looks (bold, italic, and so on). External processes can manipulate these information structures and publish them in a variety of formats. Text markup language designed to enable the use of SGML on the World Wide Web. XML allows you to define your own customized markup language.

**Note**

See the Cisco [Dictionary of Internetworking Terms and Acronyms](#) for terms not included in this glossary.

Feature Information for Flexible Packet Matching XML Configuration

[Table 4](#) lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

**Note**

[Table 4](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 4 **Feature Information for Flexible Packet Matching XML Configuration**

Feature Name	Releases	Feature Information
Flexible Packet Matching XML Configuration	12.4(6)T	<p>The Flexible Packet Matching XML Configuration feature provides an Extensible Markup Language (XML)-based configuration file for Flexible Packet Matching (FPM) that can be used to define traffic classes and actions (policies) to assist in the blocking of attacks on a network. The XML file used by FPM is called the traffic classification definition file (TCDF).</p> <p>The TCDF gives you an alternative to the command-line interface (CLI) as a method to define traffic classification behavior. Traffic classification behavior is identical regardless of the method you use.</p> <p>This feature was introduced in Cisco IOS Release 12.4(6)T.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> • Traffic Classification Definition Files for the Flexible Packet Matching XML Configuration, page 3 • Traffic Classification Description File Format and Use, page 3 • Creating a Traffic Classification Definition File for the FPM XML Configuration, page 7 • Loading a Traffic Classification Definition File for the FPM XML Configuration, page 9 • Associating a Traffic Classification Definition File with an Interface or Subinterface, page 11 • Displaying TCDF-Defined Traffic Classes and Policies, page 12 <p>The following command was introduced by this feature: load classification.</p>
