	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	class-map type inspect pop3 [match-any] <i>class-map-name</i> Example: Router(config)# class-map type inspect pop3 pop3-class	Creates a class map for the POP3 protocol so that you can enter match criteria. Enters class-map configuration mode.
Step 4	match invalid-command Example: Router(config-cmap)# match invalid-command	(Optional) Locates invalid commands on a POP3 server.
Step 5	match login clear-text Example: Router(config-cmap)# match login clear-text	(Optional) Finds a non-secure login when using a POP3 server.

Configuring a POP3 Firewall Policy Map

Use this task to configure a POP3 firewall policy map.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type inspect pop3** *policy-map-name*
4. **class-type inspect pop3** *pop3-class-name*
5. **log**
6. **reset**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	policy-map type inspect pop3 <i>policy-map-name</i> Example: Router(config)# policy-map type inspect pop3 mypop3-policy	Creates a Layer 7 POP3 policy map. Enters policy-map configuration mode.
Step 4	class-type inspect pop3 <i>pop3-class-name</i> Example: Router(config-pmap)# class-type inspect pop3 pcl	Creates a class map for the POP3 protocol.
Step 5	log Example: Router(config-pmap)# log	Generates a log (messages).
Step 6	reset Example: Router(config-pmap)# reset	(Optional) Resets a TCP connection if the data length of the SMTP body exceeds the value that you configured in the class-map type inspect smtp command.

Configuring an SMTP Firewall Policy

Use these tasks to configure an SMTP firewall policy—a class map and a policy map, respectively.

Configuring an SMTP Firewall Class Map

Use this task to configure an SMTP firewall class map.

**Note**

To enable inspection for extended SMTP (ESMTP), the match filter for the traffic class must contain the extended keyword. For example, **match protocol smtp extended**.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect smtp [match-all | match-any] *class-map-name***
4. **match data-length gt *max-data-value***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	class-map type inspect smtp [match-all match-any] <i>class-map-name</i> Example: Router(config)# class-map type inspect smtp smtp-class	Creates a class map for the SMTP protocol so that you can enter match criteria. Enters class-map configuration mode.
Step 4	match data-length gt <i>max-data-value</i> Example: Router(config-cmap)# match data-length gt 200000	Determines if the amount of data transferred in a Simple Mail Transfer Protocol (SMTP) connection is above the configured limit.

Configuring an SMTP Firewall Policy Map

Use this task to configure an SMTP firewall policy map.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type inspect smtp *policy-map-name***
4. **class-type inspect smtp *smtp-class-name***
5. **reset**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	policy-map type inspect smtp <i>policy-map-name</i> Example: Router(config)# policy-map type inspect smtp mysmtp-policy	Creates a Layer 7 SMTP policy map. Enters policy-map configuration mode.
Step 4	class-type inspect smtp <i>smtp-class-name</i> Example: Router(config-pmap)# class-type inspect smtp sc	Configures inspection parameters for the SMTP protocol.
Step 5	reset Example: Router(config-pmap)# reset	(Optional) Resets the TCP connection if the data length of the SMTP body exceeds the value that you configured in the class-map type inspect smtp command.

Configuring a SUNRPC Firewall Policy

Use these tasks to configure a SUNRPC firewall policy—a class map and a policy map, respectively.

**Note**

If you are inspecting an RPC protocol (that is, you specified the **match protocol sunrpc** command in the Layer 4 class map) the Layer 7 SUNRPC policy map is required.

Configuring a SUNRPC Firewall Class Map

Use this task to configure a SUNRPC firewall class map.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect sunrpc** [**match-any**] *class-map-name*
4. **match program-number** *program-number*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	class-map type inspect sunrpc [match-any] <i>class-map-name</i> Example: Router(config)# class-map type inspect sunrpc long-urls	Creates a class map for the SUNRPC protocol so that you can enter match criteria. Enters class-map configuration mode.
Step 4	match program-number <i>program-number</i> Example: Router(config-cmap)# match program-number 2345	(Optional) Specifies the allowed Remote Procedure Call (RPC) protocol program number as a match criteria.

Configuring a SUNRPC Firewall Policy Map

Use this task to configure an SUNRPC firewall policy map.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type inspect sunrpc** *policy-map-name*
4. **class-type inspect sunrpc** *sunrpc-class-name*
5. **allow** [wait-time *minutes*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	policy-map type inspect sunrpc <i>policy-map-name</i> Example: Router(config)# policy-map type inspect sunrpc my-rpc-policy	Creates a Layer 7 SUNRPC policy map. Enters policy-map configuration mode.
Step 4	class-type inspect sunrpc <i>sunrpc-class-name</i> Example: Router(config-pmap)# class-type inspect sunrpc cs1	Configures inspection parameters for the SUNRPC protocol.
Step 5	allow [wait-time <i>minutes</i>] Example: Router(config-pmap)# allow wait-time 10	(Optional) Allows the configured program number. Specifies the number of minutes to keep a small hole in the firewall to allow subsequent connections from the same source address and to the same destination address and port. The default wait time is zero minutes. This keyword is available only for the RPC protocol.

Creating Security Zones, Zone-Pairs, and Attaching a Policy Map to a Zone-Pair

You need two security zones to create a zone-pair. However, you can create only one security zone and use a system-defined security zone called “self.” Note that if you select a self zone, you cannot configure inspect policing.

Use this process to complete the following tasks:

- Create at least one security zone
- Define zone-pairs
- Assign interfaces to security zones
- Attach a policy map to a zone-pair.

**Tip**

Before you create zones, think about what should constitute the zones. The general guideline is that you should group together interfaces that are similar when they are viewed from a security perspective.

Security Zone Restrictions

- An interface cannot be part of a zone and legacy inspect policy at the same time.

- An interface can be a member of only one security zone.
- When an interface is a member of a security zone, all traffic to and from that interface is blocked unless you configure an explicit interzone policy on a zone-pair involving that zone.
- Traffic cannot flow between an interface that is a member of a security zone and an interface that is not a member of a security zone because a policy can be applied only between two zones.
- For traffic to flow among all the interfaces in a router, all the interfaces must be members of one security zone or another. This is particularly important because after you make an interface a member of a security zone, a policy action (such as **inspect** or **pass**) must explicitly allow packets. Otherwise, packets are dropped.
- If an interface on a router cannot be part of a security zone or firewall policy, you may have to put that interface in a security zone and configure a “pass all” policy (that is, a “dummy” policy) between that zone and other zones to which a traffic flow is desired.
- You cannot apply an access control list (ACL) between security zones or on a zone-pair.
- An ACL cannot be applied between security zones and zone-pairs. Include the ACL configuration in a class map, and use policy maps to drop traffic.
- An ACL on an interface that is a zone member should not be restrictive (strict).
- All interfaces in a security zone must belong to the same virtual routing and forwarding (VRF).
- You can configure policies between security zones whose member interfaces are in separate VRFs. However, traffic may not flow between these VRFs if the configuration does not allow it.
- If traffic does not flow between VRFs (because route-leaking between VRFs is not configured), the policy across the VRFs is not executed. This is a misconfiguration on the routing side, not on the policy side.
- Traffic between interfaces in the same security zone is not subjected to any policy; the traffic passes freely.
- The source and the destination zones in a zone pair must be the type security.
- The same zone cannot be defined as both the source and the destination.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *zone-name*
4. **description** *line-of-description*
5. **exit**
6. **zone-pair security** *zone-pair-name* { **source** *source-zone-name* | **self** } **destination** [**self** | *destination-zone-name*]
7. **description** *line-of-description*
8. **exit**
9. **interface** *type number*
10. **zone-member security** *zone-name*
11. **exit**
12. **zone-pair security** *zone-pair-name* { **source** *source-zone-name* | **self** } **destination** [**self** | *destination-zone-name*]

13. **service-policy type inspect** *policy-map-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	zone security zone-name Example: Router(config)# zone security zone1	Creates a security zone to which interfaces can be assigned. Enters security zone configuration mode.
Step 4	description line-of-description Example: Router(config-sec-zone)# description Internet Traffic	(Optional) Describes the zone.
Step 5	exit Example: Router(config-sec-zone)# exit	Returns to global configuration mode.
Step 6	zone-pair security zone-pair name {source source-zone-name self} destination [self destination-zone-name] Example: Router(config)# zone-pair security zp source z1 destination z2	Creates a zone-pair. Note To apply a policy, you must configure a zone-pair Enters security zone configuration mode.
Step 7	description line-of-description Example: Router(config-sec-zone)# description accounting network	(Optional) Describes the zone-pair.
Step 8	exit Example: Router(config-sec-zone)# exit	Returns to global configuration mode.
Step 9	interface type number Example: Router(config)# interface ethernet 0	Specifies an interface for configuration. Enters interface configuration mode.

	Command or Action	Purpose
Step 10	zone-member security zone-name Example: Router(config-if)# zone-member security zone1	Assigns an interface to a specified security zone. Note When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the router or initiated by the router) is dropped by default. To let traffic through the interface, you must make the zone part of a zone-pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 11	exit Example: Router(config-if)# exit	Returns to interface configuration mode.
Step 12	zone-pair security zone-pair-name {source source-zone-name self} destination [self destination-zone-name] Example: Router(config)# zone-pair security zp source z1 destination z2	Creates a zone-pair. Enters security zone-pair configuration mode.
Step 13	service-policy type inspect policy-map-name Example: Router(config-sec-zone-pair)# service-policy type inspect p2	Attaches a firewall policy map to the destination zone-pair. Note If a policy is not configured between a pair of zones, traffic is dropped by default.

Configuration Examples for Zone-Based Policy Firewall

- [Configuring Layer 3 and Layer 4 Firewall Policies: Example, page 41](#)
- [Configuring Layer 7 Firewall Policies: Example, page 42](#)
- [Configuring a Security Zone: Example, page 42](#)
- [Configuring a Zone-Pair: Example, page 42](#)
- [Assigning an Interface to a Security Zone: Example, page 42](#)
- [Attaching a Policy Map to a Zone-Pair: Example, page 43](#)

Configuring Layer 3 and Layer 4 Firewall Policies: Example

The following example shows a Layer 3 / Layer 4 top-level policy. Traffic is matched to access control list 199. There is deep-packet HTTP inspection.

```
class-map type inspect match-all http-traffic
 match protocol http
 match access-group 199
policy-map type inspect mypolicy
 class type inspect http-traffic
 inspect
```

```
service-policy http http-policy
```

Configuring Layer 7 Firewall Policies: Example

The following example matches HTTP sessions that have a URL length greater than 500. The Layer 7 policy action is **reset**.

```
class-map type inspect http long-urls
  match request uri length gt 500
policy-map type inspect http http-policy
  class type inspect http long-urls
    reset
```

The following example enables inspection for ESMTP by including the **extended** keyword:

```
class-map type inspect c1
  match protocol smtp extended

policy-map type inspect p1
  class type inspect c1
    inspect
```

Now the **service-policy type inspect smtp** command is optional and can be entered after the **inspect** command.

Configuring a Security Zone: Example

The following example creates security zone z1 which is called Internet Traffic.

```
zone security z1
  description Internet Traffic
```

Configuring a Zone-Pair: Example

The following example creates zones z1 and z2, describes the zones, and specifies that the firewall policy map will be applied in zone z2 for traffic flowing between the zones:

```
zone security z1
  description finance department networks

zone security z2
  description engineering services network

zone-pair security zp source z1 destination z2
```

Assigning an Interface to a Security Zone: Example

The following example attaches interface ethernet0 to zone z1:

```
interface ethernet0
  zone-member security z1
```

Attaching a Policy Map to a Zone-Pair: Example

The following example attaches a firewall policy map to the target zone-pair p1:

```
zone-pair security zp source z1 destination z2
service-policy type inspect p1
```

Feature Information for Zone-Based Policy Firewall

Table 1 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 1 Feature Information for Zone-Based Policy Firewall

Feature Name	Releases	Feature Configuration Information
Zone-Based Policy Firewall	12.4(6)T	This feature provides a Cisco IOS unidirectional firewall policy between groups of interfaces known as zones.
Application Inspection And Control for HTTP—Phase 2	12.4(9)T	<p>This feature extends support for HTTP application firewall policies.</p> <p>The following section provides information about this feature: Configuring an HTTP Firewall Policy, page 21</p> <p>The following commands were introduced or modified by this feature: match body regex, match header count, match header length, match header regex, match request length, match request regex, match response status-line regex</p>

Cisco IOS Intrusion Prevention System (IPS)

Configuring Cisco IOS Intrusion Prevention System (IPS)

First Published: May 2, 2005

Last Updated: August 7, 2007

This module describes how to configure the Cisco IOS Intrusion Prevention System (IPS), which helps to protect a network from internal and external attacks and threats. Cisco IOS IPS restructures and replaces the existing Cisco IOS Intrusion Detection System (IDS).

Cisco IOS IPS allows customers to choose between any of the following options when loading IPS signatures onto a device:

- Loading the default, built-in signatures.

Download the SDF on the router by using the Cisco Router and Security Device Manager (SDM) to have the latest available detection of security threats. Go to the following link to download the SDF:

<http://www.cisco.com/cgi-bin/tablebuild.pl/ios-sigup>

Note

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module.

[“Feature Information for Configuring Cisco IOS IPS” section on page 36.](#)

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Configuring Cisco IOS IPS

Compatibility with VMS IDS MC 2.3 and Cisco Router SDM

VMS IDS MC provides a web-based interface for configuring, managing, and monitoring multiple IDS sensors. SDM is a web-based device-management tool that allows users to import and edit SDFs from Cisco.com to the router. VMS IDS MC is for network-wide management while SDM is for single-device management. It is strongly recommended that customers download the SDF to an IDS MC 2.3 network management device or an SDM.

Customers can choose to download the SDF to a device other than VMS IDS MC or SDM (such as a router) via command-line interface (CLI); however, this approach is not recommended because it requires that the customer know which signatures come from which signature engines.

Restrictions for Configuring Cisco IOS IPS

Signature Support Deprecation

Effective Cisco IOS Release 12.(8)T, the following signatures are no longer supported by Cisco IOS IPS:

1100 IP Fragment Attack (Attack, Atomic)

Triggers when any IP datagram is received with the “more fragments” flag set to 1 or if there is an offset indicated in the offset field. (To scan for application layer signatures across fragments, you can enable virtual fragment reassembly.)

1105 Broadcast Source Address (Compound/Attack)

Triggers when an IP packet with a source address of 255.255.255.255 is detected. This signature may be an indicator of an IP spoof attack or an attempt to subvert a firewall, proxy, or gateway.

1106 Multicast IP Source Address (Compound/Attack)

Triggers when an IP packet with a source address of 224.x.x.x is detected. This signature may be an indicator of an IP spoof attack or an attempt to subvert a firewall, proxy, or gateway.

8000 FTP Retrieve Password File (Attack, Atomic) SubSig ID: 2101

Triggers on string “passwd” issued during an FTP session. May indicate that someone is attempting to retrieve the password file from a machine to try and gain unauthorized access to system resources.

Memory Impact on Low-End to Midrange Routers

Action Configuration via CLI No Longer Supported

Restrictions for Transparent Cisco IOS IPS

-

Cisco IOS IPS Overview

flow through the router and scanning each packet to match any of the Cisco IOS IPS signatures. When Cisco IOS IPS detects suspicious activity, it responds before network security can be compromised and logs the event through Cisco IOS syslog messages or Security Device Event Exchange (SDEE). The network administrator can configure Cisco IOS IPS to choose the appropriate response to various threats. When packets in a session match a signature, Cisco IOS IPS can take any of the following actions, as appropriate:

- Send an alarm to a syslog server or a centralized management interface
- Drop the packet
- Reset the connection
- Deny traffic from the source IP address of the attacker for a specified amount of time
- Deny traffic on the connection for which the signature was seen for a specified amount of time

Transparent Cisco IOS IPS Overview

Transparent Bridging Overview

Transparent and Non-Transparent IPS Devices Configured on the Same Router

Benefits of Cisco IOS IPS

Dynamic IPS Signatures

Parallel Signature Scanning

Named and Numbered Extended ACL Support

one of the following commands—**ip ips *ips-name* list** **ip ips signature *signature-id* list *acl-list***

The Signature Definition File

- **attack-drop.sdf**

128MB.sdf

256MB.sdf

attack-drop.sdf 128MB.sdf 256MB.sdf

SDF files can be used only with 12.4(9)Tx or earlier IOS Images and mainline images.

To help detect the latest vulnerabilities, Cisco provides signature updates on Cisco.com on a regular basis. Users can use VMS or SDM to download these signature updates, tune the signature parameters as necessary, and deploy the new SDF to a Cisco IOS IPS router.

Signature Microengines: Overview and Lists of Supported Engines

Lists of Supported Signature Engines

Note

Table 1 *Supported Signature Engines for Cisco IOS IPS*

Signature Engine	Initial Supported Cisco IOS Release	Parameter Exceptions ¹
ATOMIC.L3.IP	12.3(8)T	—
ATOMIC.ICMP	12.3(8)T	—
ATOMIC.IPOPTIONS	12.3(8)T	—
ATOMIC.TCP	12.3(8)T	—
ATOMIC.UDP	12.3(8)T	—
SERVICE.DNS	12.3(8)T	—
SERVICE.HTTP	12.3(8)T	ServicePorts (applicable only in Cisco IOS Release 12.3(8)T)
SERVICE.FTP	12.3(8)T	ServicePorts
SERVICE.SMTP	12.3(8)T	ServicePorts
SERVICE.RPC	12.3(8)T	ServicePorts, Unique, and isSweep
STRING.ICMP	12.3(14)T	—
STRING.TCP	12.3(14)T	—
STRING.UDP	12.3(14)T	—

1. The following parameters, which are defined in all signature engines, are currently not supported: AlarmThrottle=Summarize (all other values are supported), MaxInspectLength, MaxTTL, Protocol, ResetAfterIdle, StorageKey, and SummaryKey.

[Table 2](#) lists support for the 100 signatures that are available in Cisco IOS IDS prior to Cisco IOS Release 12.3(8)T. As of Cisco IOS Release 12.3(8)T, these 100 signatures are a part of the Cisco IOS IPS built-in SDF. By default, signatures are loaded from this built-in SDF. [Table 2](#) lists support for these 100 signatures under Cisco IOS IPS.

Because Cisco IOS IPS counts signatures on the basis of signature-id and subsignature-id, the 100 signatures under Cisco IOS IDS are counted as 132 signatures under Cisco IOS IPS.

Table 2 *Support for Signatures Available in Cisco IOS IDS (prior to 12.3(8)T)*

Signature ID	Count	Signature Engine
1000–1006	7	ATOMIC.IPOPTIONS
1101, 1102	2	ATOMIC.L3.IP
1004, 1007	2	ATOMIC.L3.IP

2000–2012, 2150	14	ATOMIC.ICMP
2151, 2154	2	ATOMIC.L3.IP
3038–3043	6	ATOMIC.TCP
3100–3107	8	SERVICE.SMTP
3153, 3154	2	SERVICE.FTP
4050–4052, 4600	4	ATOMIC.UDP
6100–6103	4	SERVICE.RPC
6150–6155	6	SERVICE.RPC
6175, 6180, 6190	3	SERVICE.RPC
6050–6057	8	SERVICE.DNS
6062–6063	2	SERVICE.DNS
3215, 3229, 3223	3	SERVICE.HTTP
5034–5035	2	SERVICE.HTTP
5041, 5043–5045	4	SERVICE.HTTP
5050, 5055, 5071	3	SERVICE.HTTP
5081, 5090, 5123	3	SERVICE.HTTP
5114, 5116–5118	4	SERVICE.HTTP
1100	1	Not applicable. Signature is replaced by 12xx series.
1105–1106	2	Cisco IOS IPS deprecates these signatures, which do not appear in the SDF.
1201–1208	10	OTHER ¹ (fragment attack signatures)
3050	2	OTHER ¹ (SYN attack signatures)
3150–3152	3	STRING.TCP
4100	1	STRING.UDP
8000	1	Cisco IOS IPS deprecates these signatures, which do not appear in the SDF.

1. The OTHER engine contains existing, hard-coded signatures. Although the standard SDF contains an entry for these signatures, the engine is not dynamically updated. If the SDF that is loaded onto the engine does not contain the signature, the signature will be treated as though it has been disabled.

Supported Cisco IOS IPS Signatures in the attack-drop.sdf File

- [Cisco IOS IPS Signatures in the attack-drop.sdf File](#). (You must have a valid Cisco.com account to access this web page.)
- Download the attack-drop.sdf file, which contains the signatures that are identified in [Table 3](#).

Cisco IOS IPS Signatures Supported in Cisco IOS Release 12.3(8)T

Signature ID: SubSig ID	Signature Name	Action ¹	SME	Signature Description
				Control Message Protocol [ICMP]), the Last Fragment bit is set. The IP offset (which represents the starting position of this fragment in the original packet and which is in 8-byte units) plus the rest of the packet is greater than the maximum size for an IP packet.
3038:0	Fragmented NULL TCP Packet	A, D	ATOMIC.TCP	Triggers when a single, fragmented TCP packet with none of the SYN, FIN, ACK, or RST flags set has been sent to a specific host. A reconnaissance sweep of your network may be in progress.
3039:0	Fragmented Orphaned FIN packet	A, D	ATOMIC.TCP	Triggers when a single, fragmented, orphan TCP FIN packet is sent to a privileged port (having a port number less than 1024) on a specific host. A reconnaissance sweep of your network may be in progress.
3040:0	NULL TCP Packet	A, D	ATOMIC.TCP	Triggers when a single TCP packet with none of the SYN, FIN, ACK, or RST flags set has been sent to a specific host. A reconnaissance sweep of your network may be in progress.
3041:0	SYN/FIN Packet	A, D	ATOMIC.TCP	Triggers when a single TCP packet with the SYN and FIN flags set is sent to a specific host. A reconnaissance sweep of your network may be in progress. The use of this type of packet indicates an attempt to conceal the sweep.
3043:0	Fragmented SYN/FIN Packet	A, D	ATOMIC.TCP	Triggers when a single, fragmented TCP packet with the SYN and FIN flags set is sent to a specific host. A reconnaissance sweep of your network may be in progress. The use of this type of packet indicates an attempt to conceal the sweep.

3129:0	Mimail Virus C Variant File Attachment	A, D, R	SERVICE.SMTP	Fires when an e-mail attachment matching the C Variant of the Mimail virus is detected. The virus sends itself to recipients as the e-mail attachment “photos.zip” that contains the file “photos.jpg.exe” and has “our private photos” in the e-mail subject line. If launched, the virus harvests e-mail addresses and possible mail servers from the infected system.
3140:3	Bagle Virus Activity²	A, D, R	SERVICE.HTTP	Fires when HTTP propagation using .jpeg associated with the .Q variant is detected.
3140:4	Bagle Virus Activity³	A, D, R	SERVICE.HTTP	Fires when HTTP propagation using .php associated with the .Q variant is detected.
3300:0	NetBIOS OOB Data	A, D	ATOMIC.TCP	Triggers when an attempt to send Out Of Band data to port 139 is detected.
5045:0	WWW xterm display attack	A, D, R	SERVICE.HTTP	Triggers when any cgi-bin script attempts to execute the command xterm -display. An attempt to illegally log into your system may be in progress.
5047:0	WWW Server Side Include POST attack	A, D, R	SERVICE.HTTP	Triggers when an attempt is made to embed a server side include (SSI) in an http POST command. An attempt to illegally access system resources may be in progress.
5055:0	HTTP Basic Authentication Overflow	A, D	SERVICE.HTTP	A buffer overflow can occur on vulnerable web servers if a very large username and password combination is used with basic authentication.
5071:0	WWW msacds.dll Attack	A, D, R	SERVICE.HTTP	An attempt has been made to execute commands or view secured files, with privileged access. Administrators are highly recommended to check the affected systems to ensure that they have not been illicitly modified.
5081:0	WWW WinNT cmd.exe Access	A, D, R	SERVICE.HTTP	Triggers when the use of the Windows NT cmd.exe is detected in a URL. This signature can detect the NIMDA attack.
5114: 0 5114:1 5114:2	WWW IIS Unicode Attack	A, D, R	SERVICE.HTTP	Triggers when an attempt to exploit the Unicode ../ directory traversal vulnerability is detected. Looks for the commonly exploited combinations that are included in publicly available exploit scripts. SubSig 2 is know to detect the NIMDA attack.
5126:0	WWW IIS .ida Indexing Service Overflow	A, D, R	SERVICE.HTTP	Alarms if web traffic is detected with the ISAPI extension .ida? and a data size of greater 200 characters.
5159:0	phpMyAdmin Cmd Exec	A, D, R	SERVICE.HTTP	Triggers when access to sql.php with the arguments goto and btnDrop=No is detected.

	⁴ SubSig 0: GotomyPC	A, D, R	SERVICE.HTTP	Triggers when a computer connects to gotomyPC site.
5188:1	HTTP Tunneling SubSig 1: FireThru	A, D, R	SERVICE.HTTP	Triggers when an attempt to use /cgi-bin/proxy is detected. The /cgi-bin/proxy is used to tunnel connections to other ports using web ports.
5188:2	HTTP Tunneling SubSig 2: HTTP Port	A, D, R	SERVICE.HTTP	Triggers when a connection is made to exectech-va.com. The site runs a server, which connects to the requested resource and passes the information back to the client on web ports.
5188:3	HTTP Tunneling SubSig 3: httptunnel	A, D, R	SERVICE.HTTP	Triggers when /index/html? is detected on POST request.
5245:0	HTTP 1.1 Chunked Encoding Transfer	A, D, R	SERVICE.HTTP	Fires when HTTP 1.1 chunked encoding transfer activity is detected. This signature is known to detect the Scalper Worm.
5326:0	Root.exe access	A, D, R	SERVICE.HTTP	Alarms upon detecting an HTTP request for root.exe. This signature is known to detect the NIMDA attack.
5329:0	Apache/mod_ssl Worm Probe	A, D, R	SERVICE.HTTP	Fires when a probe by the Apache/mod_ssl worm is detected. If the worm detects a vulnerable web server, a buffer overflow attack is sent to HTTPS port (TCP 443) of the web server. The worm then attempts to propagate itself to the newly infected web server and begins scanning for new hosts to attack.
5364:0	IIS WebDAV Overflow	A, D, R	SERVICE.HTTP	Fires when a long HTTP request (65000+ characters) is detected with an HTTP header option "Translate:". An attack to exploit a weakness in the WebDAV component of the IIS web server may be in progress.
5390:0	Sven Worm HTTP Counter Update Attempt	A, D, R	SERVICE.HTTP	Triggers when an attempt to access the URL "/bin/counter.gif/link=bacillus" is detected. A system may be infected by the Sven worm trying the update a counter on a web page located on the server "ww2.fce.vutbr.cz."
5400:0	Beagle.B (Bagle.B) Web Beacon	A, D, R	SERVICE.HTTP	Fires when a request is made for the script 1.php or 2.php residing on the hosts "www.47df.de" or "www.strato.de," followed by the argument indicating the trojan's listening port number, p=8866.

6055:0 6055:1 6055:2	DNS Inverse Query Buffer Overflow	A, D R for subsig 1, 2	SERVICE.DNS	Triggers when an IQUERY request arrives with a data section that is greater than 255 characters.
6056:0 6056:1 6056:2	DNS NXT Buffer Overflow	A, D R for subsig 1, 2	SERVICE.DNS	Triggers when a Domain Name System (DNS) server response arrives with a long NXT resource where the length of the resource data is greater than 2069 bytes or the length of the TCP stream containing the NXT resource is greater than 3000 bytes.
6057:0 6057:1 6057:2	DNS SIG Buffer Overflow	A, D R for subsig 1, 2	SERVICE.DNS	Triggers when a DNS server response arrives with a long SIG resource where the length of the resource data is greater than 2069 bytes or the length of the TCP stream that contains the SIG resource is greater than 3000 bytes.
6058:0 6058:1	DNS SRV DoS	A, D R for subsig 1	SERVICE.DNS	Alarms when a DNS query type SRV and DNS query class IN is detected with more than ten pointer jumps in the SRV resource record.
6059:0 6059:1 6059:2	DNS TSIG Overflow	A, D R for subsig 2	SERVICE.DNS	Alarms when a DNS query type TSIG is detected and the domain name is greater than 255 characters. This signature is known to detect the Lion work.
6060:0 6060:1 6060:2 6060:3	DNS Complan Overflow	A, D R for subsig 2, 3	SERVICE.DNS	Alarms when a Name Server (NS) record is detected with a domain name greater than 255 characters and the IP address is 0.0.0.0, 255.255.255.255 or a multicast address of the form 224.x.x.x.
6100:0 6100:1	RPC Port Registration	A, D R for subsig 1	SERVICE.RPC	Triggers when attempts are made to register new RPC services on a target host. Port registration is the method used by new services to report their presence to the portmapper and to gain access to a port. Their presence is then advertised by the portmapper.
6101:0 6101:1	RPC Port Unregistration	A, D R for subsig 1	SERVICE.RPC	Triggers when attempts are made to unregister existing Remote Procedure Call (RPC) services on a target host. Port unregistration is the method used by services to report their absence to the portmapper and to remove themselves from the active port map.
6104:0 6104:1	RPC Set Spoof	A, D R for subsig 1	SERVICE.RPC	Triggers when an RPC set request with a source address of 127.x.x.x is detected.

6105:0 6105:1	RPC Unset Spoof	A, D R for subsig 1	SERVICE.RPC	Triggers when an RPC unset request with a source address of 127.x.x.x is detected.
6188:0	statd dot dot	A, D	SERVICE.RPC	Alarms upon detecting a dot dot slash (../) sequence sent to the statd RPC service.
6189:0 6189:1	statd automount attack	A, D R for subsig 1	SERVICE.RPC	Alarms upon detecting a statd bounce attack on the automount process. This attack targets a vulnerability in the automount process that could be exploited only via localhost.
6190:0 6190:1	statd Buffer Overflow	A, D R for subsig 1	SERVICE.RPC	Triggers when a large statd request is sent. This attack could be an attempt to overflow a buffer and gain access to system resources.
6191:0 6191:1	RPC.tooltalk buffer overflow	A, D R for subsig 1	SERVICE.RPC	Fires when an attempt is made to overflow an internal buffer in the tooltalk rpc program.
6192:0 6192:1	RPC mountd Buffer Overflow	A, D R for subsig 1	SERVICE.RPC	Triggers on an attempt to overflow a buffer in the RPC mountd application. This attack may result in unauthorized access to system resources.
6193:0 6193:1	RPC CMSD Buffer Overflow	A, D R for subsig 1	SERVICE.RPC	Fires when an attempt is made to overflow an internal buffer in the Calendar Manager Service Daemon, rpc.cmsd.
6194:0 6194:1	sadmind RPC Buffer Overflow	A, D R for subsig 1	SERVICE.RPC	Fires when a call to RPC program number 100232 procedure 1 with a UDP packet length greater than 1024 bytes is detected.
6195:0 6195:1	RPC amd Buffer Overflow	A, D R for subsig 1	SERVICE.RPC	Detects the exploitation of the RPC AMD Buffer Overflow vulnerability. The trigger for this signature is an RPC call to the berkeley automounter daemons rpc program (300019) procedure 7 that has a UDP length greater than 1024 bytes or a TCP stream length greater than 1024 bytes. The TCP stream length is defined by the contents of the two bytes preceding the RPC header in a TCP packet.
6196:0 6196:1	snmpXdmid Buffer Overflow	A, D R for subsig 1	SERVICE.RPC	Fires when an abnormally long call to the RPC program 100249 (snmpXdmid) and procedure 257 is detected.
6197:0 6197:1	rpc yppaswdd overflow	A, D R for subsig 0	SERVICE.RPC	Fires when an overflow attempt is detected. This alarm looks for an abnormally large argument in the attempt to access yppaswdd.

[illegible]

				the Bagle.H-J virus.
9240:0	Back Door Response (TCP 2556)	A, D	ATOMIC.TCP	Fires upon detecting a TCP SYN/ACK packet from port 2556, which is a known trojan port for the Bagle (.M.N.O.P) virus.
9241:0	Back Door Response (TCP 4751)	A, D	ATOMIC.TCP	Fires upon detecting a TCP SYN/ACK packet from port 4751, which is a known trojan port for the Bagle.U virus.

1. A = alarm, D = drop, R = reset
2. This signature requires port to application mapping (PAM) configuration via the command **ip port-map http port 81**
3. This signature requires PAM configuration via the command **ip port-map http port 81.**
4. This signature requires PAM configuration via the command **8200**

How to Configure Cisco IOS IPS on a Device

-

SDM Intrusion Prevention System (IPS)

Configuring a Bridge Group for Transparent Cisco IOS IPS

Note

BVI Configuration Requirements

-
-
-
-

Restrictions

-
-

SUMMARY STEPS

- enable
- configure terminal
- bridge-group { | | vlan-bridge}
-
-
- exit
-
-
-
- ip-address mask
-

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	
	Example: Router> enable	
	configure terminal	
	Router# configure terminal	
	bridge bridge-group protocol { vlan-bridge}	
	Router(config)# bridge 1 protocol ieee type number	
	Router(config)# interface Ethernet0	

bridge-group	
exit	
Router(config-if)# exit	
bridge irb	
Router(config)# bridge irb	
bridge route protocol	
<i>type number</i>	
ip address <i>ip-address mask</i>	
Router(config-if) ip address 10.1.1.1 255.255.255.0	
no shutdown	
Router(config-if)# no shutdown	

Examples

```

                bridge 1 protocol ieee
                interface ethernet0
Router(config-if)# bridge-group 1
Router(config-if)# interface ethernet1
Router(config-if)# bridge-group 1
Router(config-if)# exit
! Configure the BVI.
Router(config)#
Router(config)#
Router(config)# interface BVI1

```

```
Router(config-if)# ip address 10.1.1.1 255.255.255.0
no shutdown
```

Troubleshooting Tips

```
show bridge
show bridge-group
```

What to Do Next

Installing Cisco IOS IPS on a New Router

Note

SUMMARY STEPS

- 1.
- 2.
- 3.
- 4.
- 5. : delete disable list
- 6. ip ips deny-action ips-interface
interface
ip ips in out
exit
show ip ips configuration

Interpreting Cisco IOS IPS System Messages

Table 4 *Cisco IOS IPS System Messages*

System Message	Description
Alarm Messages	
%IPS-4-SIGNATURE:Sig:1107 Subsig:0 Sev:2 RFC1918 address [192.168.121.1:137 -> 192.168.121.255:137]	
%IPS-5-SIGNATURE:Sig:1107 Subsig:0 Global Summary:50 alarms in this interval	
%IPS-6-ENGINE_READY:SERVICE.HTTP - 183136 ms - packets for this engine will be scanned	
%IPS-6-ENGINE_BUILD_SKIPPED:STRING.UDP - there are no new signature definitions for this engine	
%IPS-5-PACKET_DROP:SERVICE.DNS - packets dropped while engine is building	
%IPS-5-PACKET_UNSCANNED:SERVICE.DNS - packets passed unscanned while engine is building	
%IPS-6-SDF_LOAD_SUCCESS:SDF loaded successfully from flash:sdf_8http.xml	
Error Messages	
%IPS-3-BUILTIN_SIGS:Configured to load builtin signatures	
%IPS-3-BUILTIN_SIGS:Not Configured to load builtin signatures	
%IPS-3-BUILTIN_SIGS:Failed to load builtin signatures	

<pre>%IPS-5-ENGINE_UNKNOWN: SERVICE.GENERIC - unknown engine encountered while parsing SDF</pre>	
<pre>%IPS-5-UNSUPPORTED_PARAM: SERVICE.RPC 6275:1 isSweep=False - bad parameter - removing parameter</pre>	
<pre>%IPS-3-ENGINE_BUILD_FAILED: SERVICE.HTTP - 158560 ms - engine build</pre>	
<pre>%IPS-4-SDF_PARSE_FAILED: not well-formed (invalid token) at Line 1 Col 0 Byte 0 Len 1006</pre>	
<pre>%IPS-4-SDF_LOAD_FAILED: failed to parse SDF from tftp://tftp-server/sdf.xml</pre>	
<pre>%IPS-2-DISABLED: IPS removed from all interfaces - IPS disabled</pre>	

Conditions of an SME Build Failure

-

-

-

Note

Configuration Examples

-

-

-

Loading the Default Signatures: Example

```
media-type rj45
no negotiation auto
!
```

Loading the attack-drop.sdf: Example

```
!
ip ips sdf location disk2:attack-drop.sdf
ip ips name MYIPS
!
```

Merging the attack-drop.sdf File with the Default, Built-in Signatures: Example

```
copy disk2:attack-drop.sdf ips-sdf

copy ips-sdf disk2:my-signatures.sdf

! Configure the router to use the new file, my-signatures.sdf
Router#
Router(config)#
! Reinitialize the IPS by removing the IPS rule set and reapplying the rule set.
Router(config-if)# interface gig 0/1
Router(config-if)# no ip ips MYIPS in

*Apr 8 14:05:38.243:%IPS-2-DISABLED:IPS removed from all interfaces - IPS disabled
!
Router(config-if)# ip ips MYIPS in
!
Router(config-if)# exit
```

Cisco IOS IPS 5.x Signature Format Support and Usability Enhancements

First Published: November 17, 2006

Last Updated: November 17, 2006

This feature introduces support for Cisco IOS Intrusion Prevention System (IPS) version 5.0, which is a version-based signature definition XML format. In Cisco IOS Release 12.4(11)T, Cisco IOS IPS 4.x format signatures are replaced by the 5.x format signatures that are used by all other Cisco IPS devices.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Cisco IOS 5.x Format Signatures with Cisco IOS IPS](#)” section on page 31.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Cisco IOS 5.x Format Signatures with Cisco IOS IPS

System and Image Requirements for Cisco IOS IPS 5.x

- Cisco IOS IPS signature categories are available in two formats—Basic and Advanced.
- Cisco IOS IPS system requirements depend on the type of deployment, the bandwidth requirements, and security requirements. The larger the number of signatures, the larger the amount of memory consumed.
- You must generate a RSA crypto key and load the public signature on your router for signature decryption.

This following cisco public key configuration can be cut and pasted directly into your router configuration:

```
crypto key pubkey-chain rsa
named-key realm-cisco.pub signature
key-string
30820122 300D0609 2A864886 F70D0101 01050003 82010F00 3082010A 02820101

quit
```

Note You can also access the public key configuration at the following URL:
<http://www.cisco.com/cgi-bin/tablebuild.pl/ios-v5sigup>

- You must load one of the following images on your router to install Cisco IOS IPS 5.x: `adventerprisek9`, `advsecurityk9`, and `advipservicesk9`.

Note To check the current system version, use the **show subsys name ips** command.

IPS 4.x uses a version format of 2.xxx.xxx; IPS 5.x uses a version format of 3.xxx.xxx.

Upgrading from Cisco IOS IPS 4.x to Cisco IOS IPS 5.x Signatures

Cisco IOS IPS 5.x format signatures are not backward compatible with Cisco IOS IPS 4.x. You must reconfigure your Cisco IOS IPS features for use with the IPS 5.x signature format command-line interface (CLI) and features.

When reconfiguring Cisco IOS IPS on a router to convert to the 5.x signature format, you must have the following Cisco IOS IPS 4.x information:

- Cisco IOS IPS rule name (which was specified via the **ip ips name ips-name** command)
- Interfaces for which the Cisco IOS IPS rule has been applied
- User-created and customized signature definition files (SDFs)

To gather this information, issue the **show ip ips configuration** command, which displays a copy of the existing output.

```
Router# show ip ips configuration
Configured SDF Locations:
disk2:my-signatures.sdf
Builtin signatures are enabled but not loaded
Last successful SDF load time: 05:31:54 MST Sep 20 2003
IPS fail closed is disabled
Fastpath ips is enabled
Quick run mode is enabled
Event notification through syslog is enabled
Event notification through SDEE is enabled
Total Active Signatures: 13
Total Inactive Signatures: 0
Signature 50000:0 disable
Signature 50000:1 disable
Signature 50000:2 disable
IPS Rule Configuration
IPS name MYIPS
Interface Configuration
Interface GigabitEthernet0/1
Inbound IPS rule is MYIPS
Outgoing IPS rule is not set
```

**Note**

Detailed or customized changes to specific signatures may be lost. IPS 4.x SDF files will not load under the Cisco IOS IPS 5.x version.

Restrictions for Cisco IOS 5.x Format Signatures with Cisco IOS IPS

Backward Compatibility

Cisco IOS IPS 5.x format signatures are not backward compatible with Cisco IOS IPS 4.x SDFs.

Cisco 870 Series Platform Support

The 870 series platform with Cisco IOS IPS in Cisco IOS Release 12.4(11)T may experience lower performance relative to previous releases (CSCsg57228). The Cisco IOS IPS performance on the 870 series platform will be enhanced in a later 12.4(11)T image rebuild.

On the 870 series platform, Cisco IOS IPS is supported only on the adv-ipservices and the adv-enterprise images. Cisco IOS IPS is the same on both images.

Information About Cisco IOS 5.x Format Signatures with Cisco IOS IPS

Before using Cisco IOS 5.x format signatures with Cisco IOS IPS, you should understand the following concepts:

- [Cisco IOS IPS Overview, page 4](#)
- [Signature Categories, page 4](#)

- [Benefits of Cisco IOS 5.x Format Signatures with Cisco IOS IPS, page 5](#)
- [Signature Update Accessibility, page 5](#)

Cisco IOS IPS Overview

The Cisco IOS IPS acts as an in-line intrusion prevention sensor, watching packets and sessions as they flow through the router and scanning each packet to match any of the Cisco IOS IPS signatures. When it detects suspicious activity, it responds before network security can be compromised and logs the event through Cisco IOS syslog messages or Security Device Event Exchange (SDEE). The network administrator can configure Cisco IOS IPS to choose the appropriate response to various threats. The Signature Event Action Processor (SEAP) can dynamically control actions that are to be taken by a signature event on the basis of parameters such as fidelity, severity, or target value rating. These parameters have default values but can also be configured via CLI. When packets in a session match a signature, Cisco IOS IPS can take any of the following actions, as appropriate:

- Send an alarm to a syslog server or a centralized management interface
- Drop the packet
- Reset the connection
- Deny traffic from the source IP address of the attacker for a specified amount of time
- Deny traffic on the connection for which the signature was seen for a specified amount of time

Cisco developed its Cisco IOS software-based intrusion-prevention capabilities and Cisco IOS Firewall with flexibility in mind, so that individual signatures could be disabled in case of false positives. Generally, it is preferable to enable both the firewall and Cisco IOS IPS to support network security policies. However, each of these features may be enabled independently and on different router interfaces.

Signature Categories

Cisco IPS appliances and Cisco IOS IPS with Cisco 5.x format signatures operate with signature categories. All signatures are pregrouped into categories; the categories are hierarchical. An individual signature can belong to more than one category. Top-level categories help to define general types of signatures. Subcategories exist beneath each top-level signature category. (For a list of supported top-level categories, use your router CLI help (?).)

Router Configuration Files and Signature Event Action Processor (SEAP)

As of Cisco IOS Release 12.4(11)T, SDFs are no longer used by Cisco IOS IPS. Instead, routers access signature definition information via a directory that contains three configuration files—the default configuration, the delta configuration, and the SEAP configuration. Cisco IOS accesses this directory via the **ip ips config location** command.

Note

You must issue the **ip ips config location** command; otherwise, the configuration files are not saved to any location.

SEAP is the control unit responsible for coordinating the data flow of a signature event. It allows for advanced filtering and signature overrides on the basis of the Event Risk Rating (ERR) feedback. ERR is used to control the level in which a user chooses to take actions in an effort to minimize false positives.

Signatures once stored in NVRAM, will now be stored in the delta configuration file; thus, support for access control lists (ACLs) is no longer necessary.

Additional Risk Rating Algorithms

The ERR characterizes the risk of an attack and allows users to make decisions on the basis of the risk control signature event actions. To help further control signature event actions, the following additional rating categories are now supported:

- **Attack Severity Rating (ASR)**—Determines the severity of an attack. The attack-severity rating values are hard-coded in Cisco IOS IPS as follows: high, medium, low, and informational. The ASR can be changed via the **alert-rating** command. To change the ASF, see the section “[Tuning Signature Parameters](#).”
- **Signature Fidelity Rating (SFR)**—Determines the confidence level of detecting a true positive. The SFR can be changed via the **fidelity-rating** command. To change the SFR, see the section “[Tuning Signature Parameters](#).”
- **Target Value Rating (TVR)**—Allows users to develop security policies that can be more strict for some resources than others. The security policy is applied to a table of hosts that are protected by Cisco IOS IPS. A host can be a single IP address or a range of IP addresses with an associated target value rating. To configure the TVR, see the task “[Setting the Target Value Rating](#).”

Benefits of Cisco IOS 5.x Format Signatures with Cisco IOS IPS

Automatic Signature Update

With Cisco IOS IPS 5.0, customers can now configure automatic signature updates from local servers.

Network administrators can either preserve the user's current configuration of signature actions or override the user's current configuration of signature actions with the current IPS configuration.

Auto update can also update the CLI signature package.

If this feature is enabled, signatures are delivered in either a Basic signature file or an Advanced signature file.

Signature Category-Based Configuration

Top-level signature categories help to classify signatures for easy grouping and tuning; that is, group-wide parameters, such as signature event action, can be applied to a group via CLI, so the user does not have to modify each individual signature.

Encrypted Signature Support

Cisco IOS IPS introduces support for encrypted (NDA) signatures.

Signature Update Accessibility

To help detect the latest vulnerabilities, Cisco provides the following signature update options:

- Download the latest signature file package from Cisco.com at the following URL:
<http://www.cisco.com/cgi-bin/tablebuild.pl/ios-v5sigup>
- Configure automatic signature updates via the **ip ips autoupdate** command. Updates can be configured to run on the basis of a preset time. For more information, see the task “[Enabling Automatic Signature Updates](#).”

- Issue the **copy url idconf** command to instruct the router where to load a signature file. (The file can be saved in a location specified via the **ip ips config location** command.)

How to Use Cisco IOS 5.x Format Signatures with Cisco IOS IPS

This section contains the following procedures:

- [Retiring All Signatures and Selecting a Category of Signatures, page 6](#)
- [Configuring Cisco IOS IPS on Your Router, page 8](#)
- [Loading a Signature File into Cisco IOS IPS, page 11](#)
- [Tuning Signature Parameters, page 12](#)
- [Setting the Target Value Rating, page 18](#)
- [Enabling Automatic Signature Updates, page 19](#)
- [Monitoring Cisco IOS IPS Signatures via Syslog Messages or SDEE, page 22](#)

Retiring All Signatures and Selecting a Category of Signatures

Router memory and resource constraints prevent a router from loading all Cisco IOS IPS signatures. Thus, it is recommended that you load only a selected set of signatures that are defined by the categories. Because the categories are applied in a “top-down” order, you should first retire all signatures, followed by “unretiring” specific categories. Retiring signatures enables the router to load information for all signatures, but the router will not build the parallel scanning data structure.

Retired signatures are not scanned by Cisco IOS IPS, so they will not fire alarms. If a signature is irrelevant to your network or if you want to save router memory, you should retire signatures, as appropriate.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ips signature-category**
4. **category category [sub-category]**
5. **retired {true | false}**
6. **exit**
7. **category category [sub-category]**
8. **retired {true | false}**
9. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip ips signature-category Example: Router(config)# ip ips signature-category	Enters enters IPS category configuration mode.
Step 4	category category [sub-category] Example: Router(config-ips-category)# category all	Specifies that all categories (and all signatures) will be retired in the following step and enters IPS category action configuration mode.
Step 5	retired {true false} Example: Router(config-ips-category-action)# retired true	Specifies that the router should retire all categories (and all signatures). <ul style="list-style-type: none"> true—Retires all signatures within a given category. false —“Unretires” all signatures within a given category.
Step 6	exit Example: Router(config-ips-category-action)# exit	Exits IPS category action configuration mode.
Step 7	category category [sub-category] Example: Router(config-ips-category)# category ios_ips basic	Specifies the basic category (and a set of signatures) that are to be “unretired” in the following step.
Step 8	retired {true false} Example: Router(config-ips-category-action)# retired false	Specifies that all signatures within the basic category are to be unretired; that is, signatures will be enabled for the basic category.
Step 9	exit Example: Router(config-ips-category-action)# exit Router(config-ips-category)# exit	Exits IPS category action and IPS category configuration modes.

What to Do Next

After you have configured the basic category, you should enable Cisco IOS IPS on your router as shown in the section “[Configuring Cisco IOS IPS on Your Router](#).”

You can customize (or tune) the entire category or individual signatures within a category to addresses the needs of your network. For information on tuning signatures, see the section “[Tuning Signature Parameters](#).”

Configuring Cisco IOS IPS on Your Router

After you have set up a “load definition” for the signature package file to be copied to the idconf, you must configure an IPS rule name. Use this task to configure an IPS rule name and start the IPS configuration.

You can also use this task to configure a Cisco IOS IPS signature location, which tells Cisco IOS IPS where to save signature information.

The configuration location is used to restore the IPS configuration in case the router reboots or IPS is disabled or reenabled. Files, such as signature definition, signature-type definitions, and signature category information, are written in XML format, compressed, and saved to the specified IPS signature location.

SUMMARY STEPS

1. **enable**
2. **mkdir flash:/ips5**
3. **configure terminal**
4. **ip ips name *ips-name***
5. **ip ips config location *url***
6. **interface *type name***
7. **ip ips *ips-name* {in | out}**
8. **exit**
9. **show ip ips configuration**
10. **show ip ips signature *count***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	mkdir flash:/ips5 Example: Router# mkdir flash:/ips5	Create a directory for which Cisco IOS IPS will save signature information. <p>Note The directory location will be specified via the ip ips config location command.</p>
Step 3	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 4	ip ips name ips-name Example: Router(config)# ip ips name myips	Creates an IPS rule.
Step 5	ip ips config location url Example: Router(config)# ip ips config location flash:/ips5	Specifies the location where Cisco IOS IPS will save the signature information, and, if necessary, access the signature configuration information. <p>Note You must specify a location; otherwise, the signature package will not be saved.</p> <p>Note If the specified location is a URL, such as an FTP server, the user must have writer privileges.</p>
Step 6	interface type name Example: Router(config)# interface gigbitEthernet 0/0	Identifies the interface in which to enable Cisco IOS IPS and enters interface configuration mode.
Step 7	ip ips ips-name {in out} Example: Router(config-if)# ip ips MYIPS in	Applies an IPS rule at an interface and automatically loads the signatures and builds the signature engines. <p>Note Whenever signatures are replaced or merged, the router prompt is suspended while the signature engines for the newly added or merged signatures are being built. The router prompt will be available again after the engines are built.</p> <p>Depending on your platform and how many signatures are being loaded, building the engine can take up to several minutes. It is recommended that you enable logging messages to monitor the engine building status.</p>

	Command or Action	Purpose
Step 8	<pre>exit</pre> <p>Example: <pre>Router(config-if)# exit Router(config)# exit</pre></p>	Exits interface and global configuration modes.
Step 9	<pre>show ip ips configuration</pre> <p>Example: <pre>Router# show ip ips configuration</pre></p>	(Optional) Verifies that Cisco IOS IPS is properly configured.
Step 10	<pre>show ip ips signature count</pre> <p>Example: <pre>Router# show ip ips signature</pre></p>	(Optional) Verifies the number of signatures that are loaded into each signature micro engine (SME).

Examples

The following sample output displays the number of signatures that have been loaded into each SME:

```
Router# show ip ips signature count

Cisco SDF release version S247.0
Trend SDF release version V1.2
Signature Micro-Engine: multi-string
Total Signatures: 7
Enabled: 7
Retired: 2
Compiled: 5
Signature Micro-Engine: service-http
Total Signatures: 541

Total Signatures: 1266
Total Enabled Signatures: 741
Total Retired Signatures: 831
Total Compiled Signatures: 434
Total Signatures with invalid parameters: 1
```

Loading a Signature File into Cisco IOS IPS

Use this task to load a signature package into Cisco IOS IPS. You may wish to load a new signature package into Cisco IOS IPS if a signature (or signatures) with the current signature package is not providing your network with adequate protection from security threats.

Prerequisites

You must enable Cisco IOS IPS (as shown in the task “[Configuring Cisco IOS IPS on Your Router](#)”) before loading a new signature package.

Flexible Signatures: Ordered and Incremental

Each signature is compiled incrementally into the scanning tables at the same time. Thus, Cisco IOS IPS can deactivate signatures that fail to compile. (Prior to Cisco IOS Release 12.4(11)T, Cisco IOS IPS deactivated the entire signature microengine (SME) if a single signature failed to compile.)

Signatures are loaded into the scanning table on the basis of importance. Parameters such as signature severity, signature fidelity rating, and time lapsed since signatures were last released allow Cisco IOS IPS to compile the most important signatures first, followed by less important signatures, thereby, creating a load order and prioritizing which signatures are loaded first.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ips config location *url***
4. **interface *type name***
5. **ip ips *ips-name* {in | out}**
6. **exit**
7. **copy *url idconf***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip ips config location url Example: Router(config)# ip ips config location flash:/ips5	Specifies the location where Cisco IOS IPS will save the signature information, and, if necessary, access the signature configuration information.
Step 4	interface type name Example: Router(config)# interface gigbitEthernet 0/0	Identifies the interface in which to enable Cisco IOS IPS.
Step 5	ip ips ips-name {in out} Example: Router(config-if)# ip ips MYIPS in	Applies an IPS rule at an interface and automatically loads the signatures and builds the signature engines.
Step 6	exit Example: Router(config-if)# exit Router(config)# exit	Exits interface and global configuration modes.
Step 7	copy url idconf Example: Router# copy tftp://tftp_server/sig.xml idconf	Loads a signature package into Cisco IOS IPS. After the package is loaded, all signature information is saved to the location specified via the ip ips config location command.

Tuning Signature Parameters

You can tune signature parameters on the basis of a signature ID (for an individual signature), or you can tune signature parameters on the basis of a category (that is, all signatures that are within a specified category). To tune signature parameters, use the following tasks, as appropriate:

- [Tuning Signatures Per Signature ID, page 13](#)
- [Tuning Signatures Per Category, page 15](#)

**Note**

Some changes to the signature definitions are not shown in the run time config because the changes are recorded in the sigdef-delta.xml file, which can be located via the **ip ips config location** command.

Tuning Signatures Per Signature ID

Use this task to change default signature parameters for a specified signature ID.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ips signature-definition**
4. **signature** *signature-id* [*subsignature-id*]
5. **engine**
6. **event-action** *action*
7. **exit**
8. **alert-severity** {**high** | **medium** | **low** | **informational**}
9. **fidelity-rating** *rating*
10. **status**
11. **enabled** {**true** | **false**}
12. **exit**
13. **show ip ips signature**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip ips signature-definition Example: Router(config)# ip ips signature-definition	Enters signature-definition-signature configuration mode.
Step 4	signature <i>signature-id</i> [<i>subsignature-id</i>] Example: Router(config-sigdef-sig)# signature 9000:0	Specifies a signature for which the CLI user tunings will be changed and enters signature-definition-action configuration mode.
Step 5	engine Example: Router(config-sigdef-action)# engine	(Optional) Enters signature-definition-action-engine configuration mode, which allows you to change router actions for a specified signature.
Step 6	event-action <i>action</i> Example: Router(config-sigdef-action-engine)# event-action deny-attacker-inline	Changes router actions for a specified signature. The <i>action</i> argument can be any of the following options: <ul style="list-style-type: none">• deny-attacker-inline• deny-connection-inline• deny-packet-inline• produce-alert• reset-tcp-connection Note Signature event actions must be entered on a single line. Note You must enter the engine command before issuing this command.
Step 7	exit Example: Router(config-sigdef-action-engine)# exit	Exits the signature-definition-action-engine configuration mode. This step is required only if the engine and event-action commands are issued.
Step 8	alert-severity { high medium low informational } Example: Router(config-sigdef-action)# alert-severity medium	(Optional) Changes the alert severity rating for a given signature.

	Command or Action	Purpose
Step 9	fidelity-rating <i>rating</i> Example: Router(config-sigdef-action)# fidelity-rating	(Optional) Changes the signature fidelity rating for a given signature.
Step 10	status Example: Router(config-sigdef-action)# status	(Optional) Enters the signature-definition-status configuration mode, which allows you to change the enabled status of a signature.
Step 11	enabled { true false } Example: Router(config-sigdef-status)# enabled true	(Optional) Changes the enabled status of a given signature or signature category.
Step 12	exit Example: Router(config-sigdef-sta)# exit Router(config-sigdef-action)# exit Router(config-sigdef-sig)# exit Router(config)# exit	Returns to EXEC mode, which allows you to later verify the configuration.
Step 13	show ip ips signature Example: Router# show ip ips signature	(Optional) Verifies the signature changes that have been made.

Tuning Signatures Per Category

Use this task to change default signature parameters for a category of signatures. Categories such as operating systems; Layer 2, Layer 3, or Layer 4 protocols; or service-based categories can be configured to provide wider changes to a group of signatures.

Tip

Category configuration information is processed in the order that it is entered. Thus, it is recommended that the process of retiring all signatures (as shown in the task “[Retiring All Signatures and Selecting a Category of Signatures](#)”) occur before all other category tuning.

If a category is configured more than once, the parameters entered in the second configuration will be added to or will replace the previous configuration.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ips signature-category**
4. **category** *category* [*sub-category*]
5. **event-action** *action*
6. **alert-severity** {**high** | **medium** | **low** | **informational**}

7. **fidelity-rating** *rating*
8. **enabled** {true | false}
9. **retired** {true | false}
10. **exit**
11. **show ip ips signature**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip ips signature-category Example: Router(config)# ip ips signature-category	Enters IPS category (config-ips-category) configuration mode.
Step 4	category category [sub-category] Example: Router(config-ips-category)# category attack adware/spyware	Specifies a category that is to be used for multiple signature actions or conditions and enters IPS category action configuration mode.
Step 5	event-action action Example: Router(config-ips-category-action)# event-action produce-alert	Changes router actions for a specified signature category. The <i>action</i> argument can be any of the following options: <ul style="list-style-type: none"> deny-attacker-inline deny-connection-inline deny-packet-inline produce-alert reset-tcp-connection Note Event actions associated with a category can be entered separately or on a single line.
Step 6	alert-severity {high medium low informational} Example: Router(config-ips-category-action)# alert-severity medium	(Optional) Changes the alert severity rating for a given signature category.
Step 7	fidelity-rating rating Example: Router(config-ips-category-action)# fidelity-rating	(Optional) Changes the signature fidelity rating for a signature given category.
Step 8	enabled {true false} Example: Router(config-ips-category-action)# enabled true	(Optional) Changes the enabled status of a given signature or signature category.

	Command or Action	Purpose
Step 9	retired { true false }	(Optional) Specifies whether or not the router should retire a signature category.
	Example: Router(config-ips-category-action)# retired true	
Step 10	exit	Returns to EXEC mode, which allows you to later verify the configuration.
	Example: Router(config-ips-category-action)# exit Router(config-ips-category)# exit Router(config)# exit	
Step 11	show ip ips signature	(Optional) Verifies the signature category changes that have been made.
	Example: Router# show ip ips signature	

Setting the Target Value Rating

Use this task to set the target value rating, which allows users to develop security policies that can be more strict for some resources than others. The security policy is applied to a table of hosts that are protected by Cisco IOS IPS. A host can be a single IP address or a range of IP addresses with an associated target value rating.

Note

Changes to the target value rating is not shown in the run time config because the changes are recorded in the seap-delta.xml file, which can be located via the **ip ips config location** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ips event-action-rules**
4. **target-value** {**mission-critical** | **high** | **medium** | **low**} **target-address** *ip-address* [*/nn* | *to ip-address*]
5. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip ips event-action-rules Example: Router(config)# ip ips event-action-rules	Enters the config-rule configuration mode, which allows users to change the target value rating.
Step 4	target-value {mission-critical high medium low} target-address ip-address [/nn to ip-address] Example: Router(config-rul)# target-value medium target-address 10.12.100.53	Sets the target value rating for a host.
Step 5	exit Example: Router(config-rul)# exit	Exits config-rule configuration mode.

Enabling Automatic Signature Updates

Automatic signature updates allow users to override the existing configuration and automatically keep signatures up to date on the basis of a preset time, which can be configured to a preferred setting.

Time can be updated via the hardware clock or the configurable software clock (which ever option is available on your system). Although Network Time Protocol (NTP) is typically used for automated time synchronization, Cisco IOS IPS updates use the local clock resources as a reference for update intervals. Thus, NTP should be configured to update the local time server of the router, as appropriate.

Use this task to enable Cisco IOS IPS to automatically update the signature file on the system.

Automatic Signature Update Guidelines

When enabling automatic signature updates, it is recommended that you ensure the following configuration guidelines have been met:

- The router's clock is set up with the proper relative time.
- The frequency for Cisco IOS IPS to obtain updated signature information has been defined.
- The URL in which to retrieve the Cisco IOS IPS signature configuration files has been specified.
- Optionally, the username and password for which to access the files from the server have been specified.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ips auto-update**
4. **occur-at** *min:hour date day*
5. **username** *name* **password** *password*
6. **url** *url*
7. **exit**
8. **show ip ips auto-update**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip ips auto-update Example: Router(config)# ip ips auto-update	Enables automatic signature updates for Cisco IOS IPS and enters IPS auto-update configuration mode.
Step 4	occur-at min:hour date day Example: Router(config-ips-auto-update)# occur-at 0 0-23 1-31 1-5	(Optional) Defines a preset time for which the Cisco IOS IPS signature files are automatically updated.
Step 5	username name password password Example: Router(config-ips-auto-update)# username myips password secret	(Optional) Defines a username and password for the automatic signature update function.
Step 6	url url Example: Router(config-ips-auto-update)# url tftp://192.168.0.2/jdoe/ips-auto-update/IOS_req Seq-dw.xml	(Optional) URL in which the router retrieves the Cisco IOS IPS signature configuration files.
Step 7	exit Example: Router(config-ips-auto-update)# exit Router(config)# exit	Exits IPS auto-update and global configuration modes.
Step 8	show ip ips auto-update Example: Router# show ip ips auto-update	Verifies the automatic signature update configuration.

Examples

The following example shows how to configure automatic signature updates and issue the **show ip ips auto-update** command to verify the configuration. In this example, the signature package file is pulled from the TFTP server at the start of every hour or every day, Sunday through Thursday. (Note that adjustments are made for months without 31 days and daylight savings time.)

Monitoring Cisco IOS IPS Signatures via Syslog Messages or SDEE

Cisco IOS IPS provides two methods to report IPS intrusion alerts—Cisco IOS logging (syslog) and SDEE. Perform this task to enable SDEE to report IPS intrusion alerts.

To configure syslog messages, see the chapter “[Troubleshooting and Fault Management](#)” in the *Cisco IOS Network Management Configuration Guide*, Release 12.4.

SDEE Overview

SDEE is an application-level communication protocol that is used to exchange IPS messages between IPS clients and IPS servers. SDEE is always running, but it does not receive and process events from IPS unless SDEE notification is enabled. If SDEE notification is not enabled and a client sends a request, SDEE will respond with a fault response message, indicating that notification is not enabled.

Storing SDEE Events in the Buffer

When SDEE notification is enabled (via the **ip ips notify sdee** command), 200 events can automatically be stored in the buffer. When SDEE notification is disabled, all stored events are lost. A new buffer is allocated when the notifications are reenabled.

When specifying the size of an events buffer, note the following functionality:

- It is circular. When the end of the buffer is reached, the buffer will start overwriting the earliest stored events. (If overwritten events have not yet been reported, you will receive a buffer overflow notice.)
- If a new, smaller buffer is requested, all events that are stored in the previous buffer will be lost.
- If a new, larger buffer is requested, all existing events will be saved.

Prerequisites

To use SDEE, the HTTP server must be enabled (via the **ip http server** command). If the HTTP server is not enabled, the router cannot respond to the SDEE clients because it cannot not “see” the requests.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ips notify sdee**
4. **ip sdee events** *events*
5. **ip sdee subscriptions** *subscriptions*
6. **ip sdee messages** *messages*
7. **ip sdee alerts** *alerts*
8. **exit**
9. **show ip sdee** {[alerts] [all] [errors] [events] [configuration] [status] [subscriptions]}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip ips notify sdee Example: Router(config)# ip ips notify sdee	Enables SDEE event notification on a router.
Step 4	ip sdee events events Example: Router(config)# ip sdee events 500	(Optional) Sets the maximum number of SDEE events that can be stored in the event buffer. <ul style="list-style-type: none">• Maximum value: 1000 events. Note By default, 200 events can be stored in the buffer when SDEE is enabled. When SDEE is disabled, all stored events are lost; a new buffer is allocated when the notifications are reenabled.
Step 5	ip sdee subscriptions subscriptions Example: Router(config)# ip sdee subscriptions 1	(Optional) Sets the maximum number of SDEE subscriptions that can be open simultaneously. <ul style="list-style-type: none">• Valid value ranges from 1 to 3.
Step 6	ip sdee messages messages Example: Router(config)# ip sdee messages 500	(Optional) Sets the maximum number of SDEE messages that can be stored in the buffer at one time.
Step 7	ip sdee alerts alerts Example: Router(config)# ip sdee alerts 2000	(Optional) Sets the maximum number of SDEE alerts that can be stored in the buffer at one time.
Step 8	exit Example: Router(config)# exit	Exits global configuration mode.
Step 9	show ip sdee {[alerts] [all] [errors] [events] [configuration] [status] [subscriptions]} Example: Router# show ip sdee configuration	(Optional) Verifies SDEE configuration information and notification functionality.

Examples

The following example shows how to configure and verify SDEE on your router:

```
Router(config)# ip ips notify SDEE
Router(config)# ip sdee event 500
Router(config)# ip sdee subscriptions 1
Router(config)# ip sdee messages 500
Router(config)# ip sdee alerts 2000
router(config)# exit
*Nov 9 21:41:33.171: %SYS-5-CONFIG_I: Configured from console by cisco on console
Router# show ip sdee all
Configured concurrent subscriptions: 1
No currently open subscriptions.
Alert storage: 2000 alerts using 560000 bytes of memory
Message storage: 500 messages using 212000 bytes of memory
SDEE Events
Time Type Description
Router#
```

Troubleshooting Tips

To print out new SDEE alerts on the router console, issue the **debug ip sdee** command.

To clear the event buffer or SDEE subscriptions from the router (which helps with error recovery), issue the **clear ip sdee** command.

Configuration Examples

This section contains the following configuration example:

- [Cisco IOS IPS Configuration: Example, page 25](#)

Cisco IOS IPS Configuration: Example

The following example shows how to enable and verify Cisco IOS IPS on your router:

```
Router# mkdir flash:/ips5
Create directory filename [ips5]?
Created dir flash:/ips5
Router#
Router#
Router#
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip ips name MYIPS
Router(config)# ip ips config location flash:/ips5
Router(config)# ip ips signature-category
Router(config-ips-category)# category all
Router(config-ips-category-action)# retired true
Router(config-ips-category-action)# exit
Router(config-ips-category)# category ios_ips advanced
Router(config-ips-category-action)# retired false
Router(config-ips-category-action)# exit
Router(config-ips-category)# exit
Do you want to accept these changes? [confirm]
Router(config)# d
*Nov 14 2006 17:16:42 MST: Applying Category configuration to signatures ..
Router(config)#
Router(config)# do show ip interface brief
```

```

Interface          IP-Address      OK?    Method  Status        Protocol

Feature Information for Cisco IOS 5.x Format Signatures with Cisco IOS IPS

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 1 Feature Information for Cisco IOS 5.x Format Signatures with Cisco IOS IPS

Feature Name	Releases	Feature Information
Cisco IOS IPS 5.x Signature Format and Usability Enhancements	12.4(11)T	This feature introduces support for Cisco IOS Intrusion Prevention System (IPS) version 5.0, which is a version-based signature definition XML format. Cisco IOS IPS 4.x format signatures are replaced by the 5.x format signatures that are used by all other Cisco IPS devices.

Cisco IOS IPS Support for Microsoft Engines

First Published: June 28, 2007

Last Updated: June 28, 2007

The Cisco IOS IPS Support for Microsoft Engines feature extends Cisco IOS Intrusion Prevention Systems (IPS) to support Microsoft RPC (Remote Procedure Call) and Microsoft SMB (Server Message Block) protocols. IPS signatures can now scan for, detect, and take proper action against vulnerabilities in MSRPC and SMB protocols.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Cisco IOS IPS Support for Microsoft Engines](#)” section on page 7.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Cisco IOS IPS Support for Microsoft Engines

Before using IPS, you should understand the following concept:

- [Cisco IOS IPS Overview, page 2](#)

Cisco IOS IPS Overview

The Cisco IOS IPS acts as an in-line intrusion prevention sensor, watching packets and sessions as they flow through the router and scanning each packet to match any of the Cisco IOS IPS signatures. When it detects suspicious activity, it responds before network security can be compromised and logs the event through Cisco IOS syslog messages or Security Device Event Exchange (SDEE). The network administrator can configure Cisco IOS IPS to choose the appropriate response to various threats. The Signature Event Action Processor (SEAP) can dynamically control actions that are to be taken by a signature event on the basis of parameters such as fidelity, severity, or target value rating. These parameters have default values but can also be configured via CLI. When packets in a session match a signature, Cisco IOS IPS can take any of the following actions, as appropriate:

- Send an alarm to a syslog server or a centralized management interface
- Drop the packet
- Reset the connection
- Deny traffic from the source IP address of the attacker for a specified amount of time
- Deny traffic on the connection for which the signature was seen for a specified amount of time

Cisco developed its Cisco IOS software-based intrusion-prevention capabilities and Cisco IOS Firewall with flexibility in mind, so that individual signatures could be disabled in case of false positives. Generally, it is preferable to enable both the firewall and Cisco IOS IPS to support network security policies. However, each of these features may be enabled independently and on different router interfaces.

How to Use Cisco IOS IPS

The addition of the MSRPC and MSB protocol support does not change the way in which Cisco IOS IPS is defined and enabled in your network. For information on how to enable IPS on your network via command-line interface (CLI), see the section “[How to Use Cisco IOS 5.x Format Signatures with Cisco IOS IPS](#)” within the document *Cisco IOS IPS 5.x Signature Format Support and Usability Enhancements*.

Network Admission Control

Network Admission Control

First Published: May 27, 2004

Last Updated: July 19, 2007

The Network Admission Control feature addresses the increased threat and impact of worms and viruses to networked businesses. This feature is part of the Cisco Self-Defending Network Initiative that helps customers identify, prevent, and adapt to security threats.

In its initial phase, the Cisco Network Admission Control (NAC) functionality enables Cisco routers to enforce access privileges when an endpoint attempts to connect to a network. This access decision can be on the basis of information about the endpoint device, such as its current antivirus state. The antivirus state includes information such as version of antivirus software, virus definitions, and version of scan engine.

Network admission control systems allow noncompliant devices to be denied access, placed in a quarantined area, or given restricted access to computing resources, thus keeping insecure nodes from infecting the network.

The key component of the Cisco Network Admission Control program is the Cisco Trust Agent, which resides on an endpoint system and communicates with Cisco routers on the network. The Cisco Trust Agent collects security state information, such as what antivirus software is being used, and communicates this information to Cisco routers. The information is then relayed to a Cisco Secure Access Control Server (ACS) where access control decisions are made. The ACS directs the Cisco router to perform enforcement against the endpoint.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Network Admission Control](#)” section on page 76.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Network Admission Control

- You must have a Cisco IOS router that is running Cisco IOS software, Release 12.3(8)T or later.
- You must have Cisco Trust Agent installed on the endpoint devices (for example, on PCs and laptops).
- You must have a Cisco Secure ACS for authentication, authorization, and accounting (AAA).
- You must be familiar with configuring access control lists (ACLs).
- You should be familiar with configuring AAA.

Restrictions for Network Admission Control

- This feature is available only on Cisco IOS firewall feature sets.

Information About Network Admission Control

Before configuring the Network Admission Control feature, you should understand the following concepts:

- [Virus Infections and Their Effect on Networks, page 3](#)
- [How Network Admission Control Works, page 3](#)
- [Network Access Device, page 3](#)
- [Cisco Trust Agent, page 4](#)
- [Cisco Secure ACS, page 4](#)
- [Remediation, page 5](#)
- [Network Admission Control and Authentication Proxy, page 5](#)
- [NAC MIB, page 5](#)

Virus Infections and Their Effect on Networks

Virus infections are the single largest cause of serious security breaches for networks and often result in huge financial losses. Sources of virus infections are insecure endpoints (for example, PCs, laptops, and servers). Although the endpoints may have antivirus software installed, the software is often disabled. Even if the software is enabled, the endpoints may not have the latest virus definitions and scan engines. A larger security risk is from devices that do not have any antivirus software installed. Although antivirus vendors today are making it more difficult to disable the antivirus software, they are not addressing the risk of outdated virus definitions and scan engines.

How Network Admission Control Works

Endpoint systems, or clients, are normally hosts on the network, such as PCs, laptops, workstations, and servers. The endpoint systems are a potential source of virus infections, and their antivirus states have to be validated before they are granted network access. When an endpoint attempts an IP connection to a network through an upstream Cisco network access device (typically a Cisco IOS router), the router challenges the endpoint for its antivirus state. The endpoint systems run a client called Cisco Trust Agent, which collects antivirus state information from the end device and transports the information to the Cisco network access device. This information is then communicated to a Cisco Secure ACS where the antivirus state of the endpoint is validated and access control decisions are made and returned to Cisco network access devices. The network devices either permit, deny, or quarantine the end device. The Cisco Secure ACS may in turn use back-end antivirus vendor-specific servers for evaluating the antivirus state of the endpoint.

Figure 1 illustrates how Cisco Network Admission Control works.

Figure 1 Cisco IOS Network Admission Control System

Network Access Device

A network access device (NAD) is typically a Cisco IOS router (a Layer 3 Extensible Authentication Protocol over User Datagram Protocol [EAPoUDP] access point) that provides connectivity to external networks, such as the Internet or remote enterprise networks. Cisco Network Admission Control

functionality may have an Intercept ACL, which determines connections that are intercepted for network admission. Connections from endpoints that match the access list are intercepted by Network Admission Control and are challenged for their antivirus states over a Layer 3 association before they are granted network access.

Cisco Trust Agent

Cisco Trust Agent is a specialized software that runs on endpoint systems. Cisco Trust Agent responds to challenges from the router about the antivirus state of an endpoint system. If an endpoint system is not running the Cisco Trust Agent, the network access device (router) classifies the endpoint system as “clientless.” The network access device uses the EOU clientless username and EOU clientless password that are configured on the network access device as the credentials of the endpoint system for validation with Cisco Secure ACS. The policy attributes that are associated with this username are enforced against the endpoint system.

Cisco Secure ACS

Cisco Secure ACS provides authentication, authorization, and accounting services for network admission control using industry-standard RADIUS authentication protocol. Cisco Secure ACS returns access control decisions to the network access device on the basis of the antivirus credentials of the endpoint system.

Using RADIUS cisco_av_pair vendor-specific attributes (VSAs), you can set the following attribute-value pairs (AV pairs) on the Cisco Secure ACS. These AV pairs will be sent to the network access device along with other access-control attributes.

- **url-redirect**—Enables the AAA client to intercept an HTTP request and redirect it to a new URL. This redirection is especially useful if the result of posture validation indicates that the network access control endpoint requires an update or patch that you have made available on a remediation web server. For example, a user can be redirected to a remediation web server to download and apply a new virus Directory Administration Tool (DAT) file or an operating system patch. (See the following example.)

```
url-redirect=http://10.1.1.1
```

- **posture-token**—Enables Cisco Secure ACS to send a text version of a system posture token (SPT) that is derived by posture validation. The SPT is always sent in numeric format, and using the posture-token AV pair makes it easier to view the result of a posture validation request on the AAA client. (See the following example.)

```
posture-token=Healthy
```

Valid SPTs, in order of best to worst, are as follows:

- Healthy
 - Checkup
 - Quarantine
 - Infected
 - Unknown
- **status-query-timeout**—Overrides the status-query default value of the AAA client with the value you specify, in seconds. (See the following example.)

```
status-query-timeout=150
```

For more information about AV pairs that are supported by Cisco IOS software, see the documentation for the releases of Cisco IOS software that are implemented on your AAA clients.

Remediation

Network Admission Control supports HTTP redirection that redirects any HTTP request from the endpoint device to a specified redirect address. This support mechanism redirects all HTTP requests from a source to a specified web page (URL) to which the latest antivirus files can be downloaded. For the HTTP redirection to work, you have to set the value of the “url-redirect” VSA on the ACS and, correspondingly, associate an access control entry in the downloadable ACL that permits the access of the endpoint system to the redirect URL address. After the value of the url-redirect VSA has been set and the access control entry has been associated, any HTTP request that matches the IP admission Intercept ACL will be redirected to the specified redirect URL address.

Network Admission Control and Authentication Proxy

It is possible that network admission control and authentication proxy can be configured for the same set of hosts on a given interface. In each case, the Intercept ACL should be the same for IP admission EAPoUDP and authentication proxy. IP admission proxy with proxy authentication should be configured first, followed by IP admission control.

NAC MIB

The NAC MIB feature adds Simple Network Management Protocol (SNMP) support for the NAC subsystem. Using SNMP commands (get and set operations), an administrator can monitor and control NAC sessions on the network access device (NAD).

For more information about SNMP get and set operations, see the subsection “[Related Documents](#)” in the section “[Additional References](#).”

Correlation Between SNMP Get and Set Operations and the Cisco CLI

Most of the objects in the object tables in the NAC MIB (CISCO-NAC-NAD-MIB.my) describe various EAPoUDP and session parameters that are applicable to the setup of a NAD. These properties can be viewed and modified by performing various SNMP get and set operations. Many of the values of the table objects can also be viewed or modified by configuring corresponding command-line interface (CLI) commands on a router. For example, you can perform an SNMP get operation on the `cnnEOUGlobalObjectsGroup` table or you can configure the **show eou** command on a router. The parameter information obtained from the SNMP get operation is the same as the output from the **show eou** command. Similarly, performing an SNMP get operation on the table `cnnEouIfConfigTable` provides interface-specific parameters that can also be viewed in output from the **show eou** command.

SNMP set operations are allowed for table objects that have corresponding CLI commands, which can be used to modify table object values. For example, to change the value range for the `cnnEouHostValidateAction` object in the `cnnEouHostValidateAction` MIB table to 2, you can either perform the SNMP set operation or configure the **eou initialize all** command on a router.

For examples of NAC MIB output, see the subsection “[NAC MIB Output: Examples](#)” in the section “[Configuration Examples for Network Admission Control](#).”

Initializing and Revalidating Sessions

NAC allows administrators to initialize and revalidate sessions using the following CLI commands:

- **euo initialize all**
- **euo initialize authentication clientless**
- **euo initialize authentication eap**
- **euo initialize authentication static**
- **euo initialize ip** {*ip-address*}
- **euo initialize mac** {*mac-address*}
- **euo initialize posturetoken** {*string*}
- **euo revalidate all**
- **euo revalidate authentication clientless**
- **euo revalidate authentication eap**
- **euo revalidate authentication static**
- **euo revalidate ip** {*ip-address*}
- **euo revalidate mac** {*mac-address*}
- **euo revalidate posturetoken** {*string*}

The initialization and revalidation actions can also be accomplished by performing SNMP set operations on the objects of the `cnnEuoHostValidateAction` table. For more information about initializing and revalidating sessions, see the section [“CLI Commands That Correlate to `cnnEuoHostValidateAction` Table Objects.”](#)

For examples of CLI commands that correlate to changes that can be made to `cnnEuoHostValidateAction` table objects, see the subsection [“NAC MIB Output: Examples”](#) in the section [“Configuration Examples for Network Admission Control.”](#)

Session-Specific Information

The NAC MIB provides a way to view session-specific details using the `cnnEuoHostQueryTable` and `cnnEuoHostResultTable`. The `cnnEuoHostQueryTable` is used to build the query. The query is the same format as the **show euo ip** {*ip-address*} command (that is, the IP address would be shown as in the **show euo ip** command—for example, 10.1.1.1). Administrators must use the SNMP set operation on the objects of the `cnnEuoHostQueryTable` to create the query. The results of the query are stored as a row in the `cnnEuoHostResultTable`. For more information about viewing session-specific details, see the section [“Viewing MIB Query Results.”](#)

Using show Commands to View MIB Object Information

The CLI commands **show euo**, **show euo all**, **show euo authentication**, **show euo initialize**, **show euo ip**, **show euo mac**, **show euo posturetoken**, **show euo revalidate**, and **show ip device tracking all** provide the same output information as that in the CISCO-NAC-NAD-MIB tables using SNMP get operations.

For examples of **show** command output information that can also be viewed in MIB object tables, see the subsection [“NAC MIB Output: Examples”](#) in the section [“Configuration Examples for Network Admission Control.”](#)

How to Configure Network Admission Control

This section contains the following procedures:

- [Configuring the ACL and Admission Control, page 7](#) (required)
- [Configuring Global EAPoUDP Values, page 10](#) (optional)
- [Configuring an Interface-Specific EAPoUDP Association, page 11](#) (optional)
- [Configuring AAA for EAPoUDP, page 12](#) (optional)
- [Configuring the Identity Profile and Policy, page 13](#) (required)
- [Clearing EAPoUDP Sessions That Are Associated with an Interface, page 16](#) (optional)
- [Verifying Network Admission Control, page 16](#) (optional)
- [Troubleshooting Network Admission Control, page 17](#) (optional)
- [Monitoring and Controlling NAC with the CISCO-NAC-NAD-MIB, page 18](#) (optional)

Configuring the ACL and Admission Control

Network admission control is applied in the inbound direction at any interface. Applying network admission control inbound at an interface causes network admission control to intercept the initial IP connections of the intercept end system through the router.

[Figure 1](#) shows that IP admission control is applied at the LAN interface. All network devices must be validated for their antivirus states upon their initial IP connections through the router. Until then, all traffic from endpoint systems (except for EAPoUDP and Cisco Secure ACS traffic) is blocked at the interface.

The endpoint system is then challenged for its antivirus state over an EAPoUDP association. The endpoint system gains access to the network if it complies with the network admission control policy as evaluated by the Cisco Secure ACS. If the endpoint system does not comply, the device is either denied access or quarantined.

To configure an intercept ACL, perform the DETAILED STEPS below.

In this configuration, an intercept ACL is defined as “101,” and the Intercept ACL is associated with the IP admission control rule “greentree.” Any IP traffic that is destined to the 192.50.0.0 network will be subjected to validation. In addition, beginning with Step 5, an intercept ACL is applied inbound to the interface that is associated with network admission control. This ACL typically blocks access to endpoint systems until they are validated. This ACL is referred to as the default access list.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* {**permit** | **deny**} *protocol source destination*
4. **ip admission name** *admission-name* [**capouudp** | **proxy** {**ftp** | **http** | **telnet**}] [**list** {*acl* | *acl-name*}]
5. **interface** *type slot/port*
6. **ip address** *ip-address mask*
7. **ip admission** *admission-name*
8. **exit**

9. **access-list** *access-list-number* {**permit** | **deny**} *protocol source destination*
10. **ip access-group** {*access-list-number* | *access-list-name*} **in**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	access-list <i>access-list-number</i> { permit deny } <i>protocol source destination</i> Example: Router (config)# access-list 101 permit ip any 192.50.0.0 0.0.0.255	Defines a numbered access list.
Step 4	ip admission name <i>admission-name</i> [eapoudp proxy {ftp http telnet}] [list { <i>acl</i> <i>acl-name</i> }] Example: Router (config)# ip admission name greentree eapoudp list 101	Creates IP network admission control rules. The rules define how you apply admission control. The rules are as follows: <ul style="list-style-type: none"> eapoudp—Specifies IP network admission control using EAPoUDP. proxy ftp—Specifies FTP to trigger authentication proxy. proxy http—Specifies HTTP to trigger authentication proxy. proxy telnet—Specifies Telnet to trigger authentication proxy. <p>You can associate the named rule with an ACL, providing control over which hosts use the admission control feature. If no standard access list is defined, the named admission rule intercepts IP traffic from all hosts whose connection-initiating packets are received at the configured interface.</p> <p>The list option allows you to apply a standard, extended (1 through 199) or named access list to a named admission control rule. IP connections that are initiated by hosts in the access list are intercepted by the admission control feature.</p>
Step 5	interface <i>type slot/port</i> Example: Router (config)# interface ethernet 2/1	Defines an interface and enters interface configuration mode.
Step 6	ip address <i>ip-address mask</i> Example: Router (config-if)# ip address 192.0.0.1 255.255.255.0	Sets a primary or secondary IP address for an interface.

	Command or Action	Purpose
Step 7	ip admission <i>admission-name</i> Example: Router (config-if)# ip admission greentree	Applies the named admission control rule at the interface.
Step 8	exit Example: Router (config-if)# exit	Exits interface configuration mode.
Step 9	access-list <i>access-list-number</i> { permit deny } <i>protocol source destination</i> Example: Router (config)# access-list 105 permit udp any any or Router (config)# access-list 105 permit ip host 192.168.0.2 any or Router (config)# access-list 105 deny ip any any	Defines a numbered access list. Note In the first two examples (under “Command or Action”), ACL “105” denies all IP traffic except UDP and access to 192.168.0.2 (Cisco Secure ACS). Note In the third example (under “Command or Action,” ACL “105” will be applied on the interface that is configured for network admission control, and access to endpoint systems (except for EAPoUDP traffic and access to Cisco Secure ACS [192.168.0.2 in the example] is blocked until their antivirus states are validated. This ACL (“105”) is referred to as “Interface ACL.”
Step 10	ip access-group { <i>access-list-number</i> <i>access-list-name</i> } in Example: Router (config)# ip access-group 105 in	Controls access to an interface.

Configuring Global EAPoUDP Values

To configure global EAPoUDP values, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **eou {allow | clientless | default | initialize | logging | max-retry | port | rate-limit | revalidate | timeout}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	eou {allow clientless default initialize logging max-retry port rate-limit revalidate timeout} Example: Router (config)# eou initialize	Specifies EAPoUDP values. <ul style="list-style-type: none"> For a breakout of available keywords and arguments for the eou command, see the following commands: <ul style="list-style-type: none"> eou allow eou clientless eou default eou initialize eou logging eou max-retry eou port eou rate-limit eou revalidate eou timeout

Configuring an Interface-Specific EAPoUDP Association

To configure an EAPoUDP association that can be changed or customized for a specific interface that is associated with network admission control, perform the following steps.

SUMMARY STEPS

- enable**
- configure terminal**
- interface** *type slot/port*
- eou** [**default** | **max-retry** | **revalidate** | **timeout**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>type slot/port</i> Example: Router (config)# interface ethernet 2/1	Defines an interface and enters interface configuration mode.
Step 4	eou [default max-retry revalidate timeout] Example: Router (config-if)# eou revalidate	Enables an EAPoUDP association for a specific interface. <ul style="list-style-type: none"> For a breakout of available keywords and arguments for the eou command, see the following commands: <ul style="list-style-type: none"> eou default eou max-retry eou revalidate eou timeout

Configuring AAA for EAPoUDP

To set up AAA for EAPoUDP, perform the following steps.

SUMMARY STEPS

- enable**
- configure terminal**
- aaa new-model**
- aaa authentication eou default enable group radius**
- aaa authorization network default group radius**
- radius-server host** {*hostname* | *ip-address*}
- radius-server key** {**0** *string* | **7** *string* | *string*}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Router (config)# aaa new-model	Enables the AAA access control model.
Step 4	aaa authentication eou default enable group radius Example: Router (config)# aaa authentication eou default enable group radius	Sets authentication lists for an EAPoUDP association.
Step 5	aaa authorization network default group radius Example: Router (config)# aaa authorization network default group radius	Uses the list of all RADIUS servers for authentication.
Step 6	radius-server host {hostname ip-address} Example: Router (config)# radius-server host 192.0.0.40	Specifies a RADIUS server host.
Step 7	radius-server key {0 string 7 string string} Example: Router (config)# radius-server key cisco	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon.

Configuring the Identity Profile and Policy

Identity is a common infrastructure that is used to specify local profile and policy configurations. The identity profile allows you to statically authorize or validate individual devices on the basis of IP address, MAC address, or device type. Each statically authenticated device can be associated with a local policy that specifies the network access control attributes. Hosts are added to this “exception list” using the **identity profile** command, and corresponding policies are associated with these hosts using the **identity policy** command.

If the client is part of the identity (that is, the client is on the exception list), the status of the client is set on the basis of the identity configuration. The client does not have to go through the posture validation process, and the associated identity policy is applied for the client.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **identity profile eapoudp**
4. **device {authorize {ip address *ip-address* {policy *policy-name*} | mac-address *mac-address* | type {cisco | ip | phone}} | not-authorize}**
5. **exit**
6. **identity policy *policy-name* [access-group *group-name* | description *line-of-description* | redirect *url* | template [virtual-template *interface-name*]]**
7. **access-group *group-name***
8. **exit**
9. **exit**
10. **ip access-list extended *access-list-name***
11. **{permit | deny} *source source-wildcard destination destination-wildcard***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	identity profile eapoudp Example: Router (config)# identity profile eapoudp	Creates an identity profile and enters identity profile configuration mode.
Step 4	device {authorize {ip address ip-address {policy policy-name} mac-address mac-address type {cisco ip phone}} not-authorize} Example: Router (config-identity-prof)# device authorize ip address 10.10.142.25 policy bluemoon	Statically authorizes an IP device and applies an associated policy to the device.
Step 5	exit Example: Router (config-identity-prof)# exit	Exits identity profile configuration mode.
Step 6	identity policy policy-name [access-group group-name description line-of-description redirect url template [virtual-template interface-name]] Example: Router (config-identity-prof)# identity policy bluemoon	Creates an identity policy and enters identity policy configuration mode.
Step 7	access-group group-name Example: Router (config-identity-policy)# access-group exempt-acl	Defines network access attributes for the identity policy.
Step 8	exit Example: Router (config-identity-policy)# exit	Exits identity policy configuration mode.
Step 9	exit Example: Router (config-identity-prof)# exit	Exits identity profile configuration mode.

	Command or Action	Purpose
Step 10	ip access-list extended <i>access-list-name</i> Example: Router (config)# ip access-list extended exempt-acl	Defines access control for statically authenticated devices (and enters network access control configuration mode).
Step 11	{permit deny} <i>source source-wildcard destination destination-wildcard</i> Example: Router (config-ext-nacl)# permit ip any 192.50.0.0. 0.0.0.255	Set conditions to allow a packet to pass a named IP access list.

Clearing EAPoUDP Sessions That Are Associated with an Interface

To clear EAPoUDP sessions that are associated with a particular interface or that are on the NAD, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **clear eou all**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	clear eou all Example: Router# clear eou all	Clears all EAPoUDP sessions on the NAD.

Verifying Network Admission Control

To verify EAP and EAPoUDP messages or sessions, perform the following steps. The **show** commands may be used in any order or independent of the other **show** command.

SUMMARY STEPS

1. **enable**
2. **show eou all**
3. **show ip admission eapoudp**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	show eou all Example: Router# show eou all	Displays information about EAPoUDP sessions on the network access device.
Step 3	show ip admission eapoudp Example: Router# show ip admission eapoudp	Displays the network admission control configuration or network admission cache entries.

Troubleshooting Network Admission Control

The following commands may be used to display information about EAP and EAPoUDP messages or sessions. The **debug** commands may be used in any order or independent of the other **debug** commands.

SUMMARY STEPS

1. **enable**
2. **debug eap {all | errors | packets | sm}**
3. **debug eou {all | eap | errors | packets | sm}**
4. **debug ip admission eapoudp**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	debug eap {all errors packets sm} Example: Router# debug eap all	Displays information about EAP messages.
Step 3	debug eou {all eap errors packets sm} Example: Router# debug eou all	Displays information about EAPoUDP messages.
Step 4	debug ip admission eapoudp Example: Router# debug ip admission eapoudp	Displays information about IP admission events.

Monitoring and Controlling NAC with the CISCO-NAC-NAD-MIB

This section includes the following tasks:

- [CLI Commands That Correlate to cnnEouHostValidateAction Table Objects, page 19](#)
- [CLI Commands That Correlate to cnnEouIfConfigTable Objects, page 19](#)
- [CLI Commands That Correlate to cnnEouHostValidateAction Table Objects, page 19](#)
- [Creating MIB Query Tables, page 20](#)
- [Viewing MIB Query Results, page 23](#)

CLI Commands That Correlate to cnnEouGlobalObjectsGroup Table Objects

An SNMP get or set operation can be performed to obtain or change information about value ranges for objects in the cnnEouGlobalObjectsGroup table. The same information can be viewed in output from the **show eou** command. [Table 1](#) displays examples of some global configuration objects and the SNMP get and set operations required to obtain or change their values.

For an example of **show eou** command output, see the section “[show eou](#)” section on [page 26](#).

Table 1 *Obtaining and Changing Global Configuration Values Using SNMP Get and Set Operations*

Global Configuration Objects	SNMP Operation
EAPoUDP version	Performs a get operation on the cnnEouVersion object. (The object value will be “1.”)

Table 1 *Obtaining and Changing Global Configuration Values Using SNMP Get and Set Operations*

Global Configuration Objects	SNMP Operation
EAPoUDP port	Performs a get operation on the <code>cnnEouPort</code> object.
Enabling logging (enable EOU logging)	Sets the <code>cnnEouLoggingEnable</code> object. (The object value will be “true.”)

CLI Commands That Correlate to `cnnEouIfConfigTable` Objects

An SNMP get operation is performed to obtain information about value ranges for objects in the `cnnEouIfConfigTable`. The same information can be viewed in output from the **show eou** command. [Table 2](#) displays examples of some interface-specific configuration objects and the SNMP get operations required to obtain their values.

Table 2 *Obtaining Interface-Specific Configuration Values Using SNMP Get Operations*

Interface-Specific Object	SNMP Operation
AAA timeout	Performs a get operation on the <code>cnnEouIfTimeoutAAA</code> object. <ul style="list-style-type: none"> Format: GET <code>cnnEouIfTimeoutAAA.IfIndex</code> You must specify the corresponding index number of the specific interface.
Maximum retries	Performs a get operation on the <code>cnnEouIfMaxRetry</code> object. <ul style="list-style-type: none"> Format: GET <code>cnnEouIfMaxRetry.IfIndex</code>

CLI Commands That Correlate to `cnnEouHostValidateAction` Table Objects

EOU sessions can be initialized or revalidated by the CLI or by using the SNMP set operation on the table `cnnEouHostValidateAction`.

Following are some examples (listed by CLI command) that correlate to MIB objects.

eou initialize all

EOU initialization can be accomplished for all sessions by using the **eou initialize all** command or by using an SNMP set operation on the object `cnnEouHostValidateAction`. This object must be set to the numeric value 2.

eou initialize authentication clientless

EOU initialization can be accomplished for sessions having an authentication type “clientless” using the **eou initialize authentication clientless** command or an SNMP set operation on the object `cnnEouHostValidateAction`. This object must be set to the numeric value 3.

eou initialize ip

EOU initialization can be accomplished for a particular session using the **eou initialize ip** *{ip-address}* command.

To achieve the same result using an SNMP operation, three objects have to be set in the `cnnEouHostValidateAction` MIB table:

- `cnnEouHostValidateAction`—The value range must be set.
- `cnnEouHostValidateIpAddressType`—The IP address type must be set. This value must be set to IPv4 because IPv4 is currently the only address type supported by NAC. (This value is the type of address being set for the `cnnEouHostValidateIPAddr` object.)
- `cnnEouHostValidateIPAddr`—The IP address must be set.

Note The three MIB objects should be set in a single SNMP set operation.

euo initialize posturetoken

All sessions having a particular posturetoken can be initialized using the **euo initialize posturetoken** {*string*} command. The default value range for this command is 8.

To achieve the same result using an SNMP set operation, you must set the following objects:

- `cnnEouHostValidateAction`—Set this value to 8.
- `cnnEouHostValidatePostureTokenStr`—Set the string value.

Note The two MIB objects should be set in a single SNMP set operation.

Creating MIB Query Tables

The MIB table `cnnEouHostQueryTable` is used to create, or build, MIB queries.

MIB Query Correlating to the CLI **show euo all** Command

To build a query that provides the same results as using the **show euo all** command, perform the following SNMP get operation.

The object `cnnEouHostQueryMask` in the table `cnnEouHostQueryTable` indicates the kind of query. The corresponding value of the `cnnEouHostQueryMask` object in output from the **show euo all** command is 8 (the integer value).

SUMMARY STEPS

1. Set the `cnnEouHostQueryStatus` object to `createandgo`.
2. Set the `cnnEouHostQueryMask` object to 8.
3. Set the `cnnEouHostQueryStatus` object to `active` to indicate that query creation is complete.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Set the <code>cnnEouHostQueryStatus</code> object to <code>createandgo</code> .	Creates a query row.
Step 2	Set the <code>cnnEouHostQueryMask</code> object to 8.	Corresponds in value to the show euo all command.
Step 3	Set the <code>cnnEouHostQueryStatus</code> object to <code>active</code> .	Indicates that you have finished building the query.

**Note**

Examples are not shown in the previous table because the format differs depending on the software you are using.

What to Do Next

View the results. See the section “[Viewing MIB Query Results Correlating to the show eou all Command](#).”

Viewing MIB Query Results Correlating to the show eou all Command

After the MIB query has been built and you have indicated that you are finished (with the “active” status), the results can be viewed. A query in the `cnnEouHostQueryTable` is represented by a row. The row number is the Query Index. Similarly, the `cnnEouHostResultTable` is composed of result rows. Each row in the `cnnEouHostResultTable` is uniquely identified by a combination of Query Index and Result Index. The results of the `cnnEouHostQueryTable` index and the `cnnEouHostResultTable` have to be matched. Match one row in the Query table to one of the rows in the Result table. For example, if a query that corresponds to a **show** command results in ten sessions, the Result table has ten rows, each row corresponding to a particular session. The first row in the Result table is R1.1. The second row is R1.2, and so on to R1.10. If another query is created in the Query table, and it results in five sessions, five rows are created in the Result table (R2.1, R2.2, R2.3, R2.4, and R2.5).

[Table 3](#) illustrates how the above Query table sessions are mapped to Result table rows.

Table 3 Query Table-to-Result Table Mapping

Query Table	Result Table Rows
Q1 (10 sessions)	R1.1, R1.2, R1.3, R1.4, R1.5, R1.6, R1.7, R1.8, R1.9, R1.10
Q2 (5 sessions)	R2.1, R2.2, R2.3, R2.4, R2.5

Creating the SNMP Query

To create an SNMP query that provides the same information as output from the **show eou ip {ip-address}** command, perform the following steps.

SUMMARY STEPS

1. Set `cnnEouHostQueryStatus` to `createandgo`.
2. Set `cnnEouHostQueryIpAddrType` to `IPv4` and the IP address (for example, 10.2.3.4).
3. Set `cnnEouHostQueryStatus` to `active`.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Set <code>cnnEouHostQueryStatus</code> to <code>createandgo</code> .	Creates a query row.
Step 2	Set <code>cnnEouHostQueryIpAddrType</code> to <code>IPv4</code> and the IP address (for example, 10.2.3.4).	Sets the address type. <ul style="list-style-type: none"> The only address type currently supported by NAC is IPv4.
Step 3	Set <code>cnnEouHostQueryStatus</code> to <code>active</code> .	Indicates you have finished building the query.

Note

Examples are not shown in the previous table because the format differs depending on the software you are using.

Viewing the Results

To view the results in the `cnnEouHostResultTable`, perform the following steps.

SUMMARY STEPS

1. Perform a get operation on `cnnEouHostQueryRows`.
2. Perform a get operation on the `cnnEouHostResultTable` objects in the format `resultTableObjectName.QueryIndex.ResultIndex`.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Perform a get operation on <code>cnnEouHostQueryRows</code> .	Finds how many rows will be created in a Result table for a particular query. <ul style="list-style-type: none"> If a query row is a negative number, the query is still being processed.
Step 2	Perform a get operation on the <code>cnnEouHostResultTable</code> objects in the format <code>resultTableObjectName.QueryIndex.ResultIndex</code> .	Finds the value of a particular object in a Result table that matches a particular query. <ul style="list-style-type: none"> For multiple rows in the Result table for a single query, the <code>ResultIndex</code> ranges from 1 to the value of <code>cnnEouHostQueryRows</code>.

Note

Examples are not shown in the above table because the format differs depending on the software you are using.

MIB Query Correlating to the `show eou ip` Command

To build a MIB query that provides the same results as the `show eou ip {ip-address}` command, perform the following SNMP get operation.

SUMMARY STEPS

1. Set the `cnnEouHostQueryStatus` object to `createandgo`.
2. Set the `cnnEouHostQueryIpAddrType` object to “IPv4”.
3. Set the `cnnEouHostQueryIpAddr` object to IP address (for example, 10.2.3.4).
4. Set the `cnnEouHostQueryStatus` object to `active`.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Set the <code>cnnEouHostQueryStatus</code> object to <code>createandgo</code> .	Sets the query status.
Step 2	Set the <code>cnnEouHostQueryIpAddrType</code> object to “IPv4”.	Sets the address type. Note The only address type currently supported by NAC is IPv4.
Step 3	Set the <code>cnnEouHostQueryIpAddr</code> object to IP address (for example, 10.2.3.4).	Sets the IP address.
Step 4	Set the <code>cnnEouHostQueryStatus</code> object to <code>active</code> .	Indicates that you have finished building the query.

Note

Examples are not shown in the previous table because the format differs depending on the software you are using.

Viewing MIB Query Results

After the MIB query has been built, the results can be viewed in `cnnEouHostResultTable`. For information about how to review the results, see the subsection “[Viewing MIB Query Results Correlating to the show eou all Command](#)” in the previous section “[Creating MIB Query Tables](#).”

Splitting a Query into Subqueries

If you are doing a MIB query that correlates to the **show eou all** command, there could possibly be as many as 2,000 rows of output. To ensure that you can view all the information in a MIB query, you can split the query into subqueries. For example, for a query having 2,000 rows of output, you could split the query into four subqueries to view the results in a page-by-page format. The first subquery would include rows 1 through 500 (the first 500 sessions); the second subquery would include rows 501 through 1,000; the third subquery would include rows 1,001 through 1,500; and the fourth subquery would include rows 1,501 through 2,000.

Note

The `cnnEouHostQueryTotalHosts` object provides the total number of hosts (number of rows) that match a query criterion. By looking at this number, you can determine how many subqueries are necessary. However, you cannot get the `cnnEouHostQueryTotalHosts` object number until you have built your first query.

Build your query by performing the following steps.

SUMMARY STEPS

1. Set the `cnnEouHostQueryStatus` object to `createandgo`.
2. Set the `cnnEouHostQueryMask` object to 8.
3. Set `cnnEouHostQueryRows` to 500.
4. Set `cnnEouHostQuerySkipNHosts` to 0.
5. Set the `cnnEouHostQueryStatus` object to active.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Set the <code>cnnEouHostQueryStatus</code> object to <code>createandgo</code> .	Sets the query status.
Step 2	Set the <code>cnnEouHostQueryMask</code> object to 8.	Correlates to the default of the show eou all command.
Step 3	Set <code>cnnEouHostQueryRows</code> to 500.	Identifies the maximum number of rows to be built in the result table for this query.
Step 4	Set <code>cnnEouHostQuerySkipNHosts</code> to 0.	Corresponds to the result rows to be created.
Step 5	Set the <code>cnnEouHostQueryStatus</code> object to active.	Indicates that you have finished building the query.

Note

Examples are not shown in the previous table because the format differs depending on the software you are using. The table is on the basis of a query having 2,000 sessions (rows).

What to Do Next

After you have performed the above task, you will have query information for the first 500 hosts (rows). To view query information for the next 500 hosts (rows), you have to perform the same five steps, but you must change the Step 4 (`cnnEouHostQuerySkipNHosts` object) value to 500. This task will result in query information for rows 501 through 1000. In the same way, to obtain query information for the remaining hosts (through 2000), you have to perform the same five steps again but with `cnnEouHostQuerySkipNHosts` object values of 1000 and 1500, respectively.

Configuration Examples for Network Admission Control

This section includes the following example.

- [Network Admission Control: Example, page 24](#)
- [NAC MIB Output: Examples, page 26](#)

Network Admission Control: Example

The following output example shows that IP admission control has been configured on a Cisco IOS router:

```
Router# show running-config
```

Building configuration...

Current configuration: 1240 bytes

```
!  
version 12.3  
service timestamps debug datetime msec  
service timestamps log datetime msec

NAC MIB Output: Examples

The following are examples of **show** command output displaying MIB object information.

show eou

The **show eou** command provides output for information that can also be viewed in various CISCO-NAC-NAD-MIB tables. The information that follows the **show eou** command can also be found in the `cnnEouGlobalObjectsGroup` table and the information that follows the **show eou all** command can be found in the `cnnEouIfConfigTable`.

```
Router# show eou
```

```

Global EAPoUDP Configuration
-----
EAPoUDP Version      = 1
EAPoUDP Port         = 0x5566
Clientless Hosts     = Enabled
IP Station ID        = Disabled
Revalidation         = Enabled
Revalidation Period  = 36000 Seconds
ReTransmit Period    = 3 Seconds
StatusQuery Period   = 300 Seconds
Hold Period          = 30 Seconds
AAA Timeout          = 60 Seconds
Max Retries          = 3
EAP Rate Limit       = 20
EAPoUDP Logging      = Enabled
Clientless Host Username = clientless
Clientless Host Password = clientless

```

```
Router# show eou all
```

```

Interface Specific EAPoUDP Configurations
-----
Interface Vlan333
AAA Timeout          = 60 Seconds
Max Retries          = 3
eou initialize interface {interface-name}
eou revalidate interface {interface-name}

```

show ip device tracking all

The **show ip device tracking all** command provides output for information that can also be found in the `cnnIpDeviceTrackingObjectsGroup` MIB table. The following is an example of such **show** command output:

```
Router# show ip device tracking all
```

```

IP Device Tracking = Enabled
Probe Count: 2
Probe Interval: 10

```

Feature Information for Network Admission Control

Table 4 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

Table 4 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 4 Feature Information for Network Admission Control

Glossary

default access policy—Set of ACLs that are applied to a client device until its credentials are validated by the AAA server.

EAPoUDP—Extensible Authentication Protocol over User Datagram Protocol. EAP is a framework that supports multiple, optional authentication mechanisms for PPP, including clear-text passwords, challenge-response, and arbitrary dialogue sequences. UDP is a connectionless transport layer protocol in the TCP/IP protocol stack. UDP is a simple protocol that exchanges datagrams without acknowledgments or guaranteed delivery, and it requires that error processing and retransmission be handled by other protocols. UDP is defined in RFC 768.

ip admission rule—Named rule that defines how IP admission control is applied. The IP admission rule is associated with an Intercept ACL and provides control over which hosts can use the IP admission feature. To create an IP admission control rule, use the **ip admission name** command.

posture token—Status that is used to convey the result of the evaluation of posture credentials. The AAA server maps the posture token (its status can be Healthy, Checkup, Quarantine, Infected, or Unknown) to a network access policy (ACL, URL, redirect, or status query timer) for the peer that the client wants to reach.

NAC—Auth Fail Open

First Published: November 17, 2006

Last Updated: November 17, 2006

In network admission control (NAC) deployments, authentication, authorization, and accounting (AAA) servers validate the antivirus status of clients before granting network access. This process is called posture validation. If the AAA server is unreachable, clients will not have access to the network. The NAC—Auth Fail Open feature enables the administrator to apply a policy that allows users to have network access when the AAA server is unreachable. The administrator can configure a global policy that applies to a device, or a rule-based policy that applies to a specific interface.

When the AAA server returns to a reachable status, the posture validation process resumes for clients that are using the NAC—Auth Fail Open policy.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for NAC—Auth Fail Open](#)” section on page 29.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Feature Information for NAC—Auth Fail Open, page 29](#)

Prerequisites for NAC—Auth Fail Open

You can configure this feature in networks using NAC and an AAA server for security. NAC is implemented on Cisco IOS routers running Cisco IOS Release 12.3(8)T or a later release.

Restrictions for NAC—Auth Fail Open

To apply local policies to a device or an interface when the AAA server is unreachable, you must configure the **aaa authorization network default local** command.

Information About Network Admission Control

You should understand the following concepts:

- [Controlling Admission to a Network, page 2](#)
- [Network Admission Control When the AAA Server Is Unreachable, page 2](#)

Controlling Admission to a Network

NAC protects networks from endpoint devices or clients (such as PCs or servers) that are infected with viruses by enforcing access control policies that prevent infected devices from adversely affecting the network. It checks the antivirus condition (called *posture*) of endpoint systems or clients before granting the devices network access. NAC keeps insecure nodes from infecting the network by denying access to noncompliant devices, placing them in a quarantined network segment or giving them restricted access to computing resources.

NAC enables network access devices (NADs) to permit or deny network hosts access to the network based on the state of the antivirus software on the host. This process is called posture validation.

Posture validation consists of the following actions:

- Checking the antivirus condition or credentials of the client.
- Evaluating the security posture credentials from the network client.
- Providing the appropriate network access policy to the NAD based on the system posture.

Network Admission Control When the AAA Server Is Unreachable

Typical deployments of NAC use a AAA server to validate the client posture and to pass policies to the NAD. If the AAA server is not reachable when the posture validation occurs, the typical response is to deny network access. Using NAC—Auth Fail Open, an administrator can configure a default policy that allows the host at least limited network access while the AAA server is unreachable.

This policy offers these two advantages:

- While AAA is unavailable, the host will still have connectivity to the network, although it may be restricted.

- When the AAA server is once again reachable, users can be revalidated, and their policies can be downloaded from the access control server (ACS).

**Note**

When the AAA server is unreachable, the NAC—Auth Fail Open policy is applied only when there is no existing policy associated with the host. Typically, when the AAA server becomes unreachable during revalidation, the policies already in effect for the host are retained.

How to Configure NAC—Auth Fail Open

You can configure NAC—Auth Fail Open policies per interface, or globally for a device. Configuring NAC—Auth Fail Open is optional, and includes the following tasks:

- [Configuring a NAC Rule-Associated Policy Globally for a Device, page 3](#)
- [Applying a NAC Policy to a Specific Interface, page 4](#)
- [Configuring Authentication and Authorization Methods, page 5](#)
- [Configuring RADIUS Server Parameters, page 6](#)
- [Displaying the Status of the Configured AAA Servers, page 10](#)
- [Enabling EOU Logging, page 11](#)

Configuring a NAC Rule-Associated Policy Globally for a Device

This task creates a NAC rule and associates a policy to be applied while the AAA server is unreachable. You can apply a policy globally to all interfaces on a network access device, if you want to provide the same level of network access to all users who access that device.

Prerequisites

An AAA server must be configured and NAC must be implemented on the NAD.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission name** *admission-name* [**eapoudp** [**bypass**] | **proxy** {**ftp** | **http** | **telnet**} | **service-policy type tag** {*service-policy-name*}] [**list** {*acl* | *acl-name*}] [**event**] [**timeout aaa**] [**policy identity** {*identity-policy-name*}]
4. **ip admission** *admission-name* [**event timeout aaa policy identity** *identity-policy-name*]
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip admission name <i>admission-name</i> [eapoudp [bypass] proxy { ftp http telnet } service-policy type tag { <i>service-policy-name</i> }] [list { <i>acl</i> <i>acl-name</i> }] [event] [timeout aaa] [policy identity { <i>identity-policy-name</i> }] Example: Router (config)# ip admission name greentree event timeout aaa policy identity aaa-down	(Optional) Configures a rule-specific policy globally for the device. If a rule is configured, it will be applied instead of any other global event timeout policy configured on the device. To remove a rule that was applied globally to the device, use the no form of the command.
Step 4	ip admission <i>admission-name</i> [event timeout aaa policy identity <i>identity-policy-name</i>] Example: Router (config)# ip admission event timeout aaa policy identity AAA_DOWN	(Optional) Configures the specified IP NAC policy globally for the device. To remove IP NAC policy that was applied to the device, use the no form of the command. Note This policy will apply only if no rule-specific policy is configured.
Step 5	end Example: Router (config)# end	Exits the global configuration mode.

Applying a NAC Policy to a Specific Interface

An IP admission rule with NAC—Auth Fail Open policies can be attached to an interface. This task attaches a NAC—Auth Fail Open policy to a rule, and applies the rule to a specified interface on a device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip access-group** {*access-list-number* | *name*} **in**
5. **ip admission** *admission-name*
6. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Router (config)# interface fastEthernet 2/1	Enters interface configuration mode.
Step 4	ip access-group { <i>access-list-number</i> <i>name</i> } in Example: Router (config-if)# ip access-group ACL15 in	Controls access to the specified interface.
Step 5	ip admission <i>admission-name</i> Example: Router (config-if)# ip admission AAA_DOWN	Attaches the globally configured IP admission rule to the specified interface(s). To remove the rule on the interface, use the no form of the command.
Step 6	exit Example: Router (config)# exit	Returns to global configuration mode.

Configuring Authentication and Authorization Methods

This task configures the authentication and authorization methods for the device. The access granted using these methods will remain in effect for users who attempt reauthorization while the AAA server is unavailable. These methods must be configured before you configure any policy to be applied to users who try to access the network when the AAA server is unreachable.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication eou default group radius**
5. **aaa authorization network default local**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Router (config)# aaa new-model	Enables AAA.
Step 4	aaa authentication eou default group radius Example: Router (config)# aaa authentication eou default group radius	Sets authentication methods for Extensible Authorization Protocol over User Datagram Protocol (EAPoUDP). To remove the EAPoUDP authentication methods, use the no form of the command.
Step 5	aaa authorization network default local Example: Router (config)# aaa authorization network default local	Sets the authorization method to local. To remove the authorization method, use the no form of the command.

Configuring RADIUS Server Parameters

This task configures the identity and parameters of the RADIUS server that provides AAA services to the network access device. To configure RADIUS server parameters, you should understand the following concepts:

- [Identifying the RADIUS Server, page 6](#)
- [Determining When the RADIUS Server Is Unavailable, page 7](#)

Identifying the RADIUS Server

A RADIUS server can be identified by:

- hostname
- IP address
- hostname and a specific UDP port number
- IP address and a specific UDP port number

The combination of the RADIUS server IP address and a specific UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the backup to the first one. The RADIUS host entries are tried in the order that they were configured.

Determining When the RADIUS Server Is Unavailable

Because the NAC—Auth Fail Open feature applies a local policy when the RADIUS server is unavailable, you should configure “dead criteria” that identify when the RADIUS server is unavailable. There are two configurable dead criteria:

- **time**—the interval (in seconds) without a response to a request for AAA service
- **tries**—the number of consecutive AAA service requests without a response

If you do not configure the dead criteria, they will be calculated dynamically, based on the server configuration and the number of requests being sent to the server.

You can also configure the number of minutes to wait before attempting to resume communication with a RADIUS server after it has been defined as unavailable.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server dead-criteria** [**time** *seconds*] [**tries** *number-of-tries*]
4. **radius-server deadtime** *minutes*
5. **radius-server host** {*hostname* | *ip-address*} [**test username** *user-name*] [**auth-port** *port-number*] [**ignore-auth-port**] [**acct-port** *port-number*] [**ignore-acct-port**] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*] [**alias** {*hostname* | *ip-address*}] [**idle-time** *seconds*]
6. **radius-server attribute 8 include-in-access-req**
7. **radius-server vsa send** [**accounting** | **authentication**]
8. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	radius-server dead-criteria [<i>time seconds</i>] [<i>tries number-of-tries</i>] Example: Router (config)# radius-server dead-criteria time 30 tries 20	(Optional) Sets the conditions that are used to decide when a RADIUS server is considered unavailable or <i>dead</i> . <ul style="list-style-type: none"> The range for <i>seconds</i> is from 1 to 120 seconds. The default is that the NAD dynamically determines the <i>seconds</i> value within a range from 10 to 60 seconds. The range for <i>number-of-tries</i> is from 1 to 100. The default is that the NAD dynamically determines the <i>number-of-tries</i> parameter within a range from 10 to 100.
Step 4	radius-server deadtime <i>minutes</i> Example: Router (config)# radius-server deadtime 60	(Optional) Sets the number of minutes that a RADIUS server is not sent requests after it is found to be dead. The range is from 0 to 1440 minutes (24 hours). The default is 0 minutes.

	Command or Action	Purpose
<p>Step 5</p>	<pre>radius-server host ip-address [acct-port udp-port] [auth-port udp-port] [key string] [test username name [idle-time time]</pre> <p>Example:</p> <pre>Router (config)# radius-server host 10.0.0.2 acct-port 1550 auth-port 1560 test username user1 idle-time 30 key abc1234</pre>	<p>(Optional) Configures the RADIUS server parameters by using these keywords:</p> <ul style="list-style-type: none"> • acct-port <i>udp-port</i>—Specifies the UDP port for the RADIUS accounting server. The range for the UDP port number is from 0 to 65536. The default is 1646. If the port number is set to 0, the host is not used for accounting. • auth-port <i>udp-port</i>—Specifies the UDP port for the RADIUS authentication server. The range for the UDP port number is from 0 to 65536. The default is 1645. If the port number is set to 0, the host is not used for authentication. <p>Note You should configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.</p> <ul style="list-style-type: none"> • key <i>string</i>—Specifies the authentication and encryption key for all RADIUS communication between the NAD and the RADIUS daemon. <p>Note Always configure the key as the last item in the radius-server host command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.</p> <ul style="list-style-type: none"> • test username <i>name</i>—Enables automated testing of the RADIUS server status, and specify the username to be used. • idle-time <i>time</i>—Sets the interval of time in minutes after which the NAD sends test packets to the server. The range is from 1 to 35791 minutes. The default is 60 minutes (1 hour). <p>To configure multiple RADIUS servers, reenter this command.</p>
<p>Step 6</p>	<pre>radius-server attribute 8 include-in-access-req</pre> <p>Example:</p> <pre>Router (config)# radius-server attribute 8 include-in-access-req</pre>	<p>If the device is connected to nonresponsive hosts, configures the device to send the Framed-IP-Address RADIUS attribute (attribute[8]) in access-request or accounting-request packets.</p> <p>To configure the device to not send the Framed-IP-Address attribute, use the no radius-server attribute 8 include-in-access-req global configuration command.</p>

	Command or Action	Purpose
Step 7	radius-server vsa send authentication Example: Router (config)# radius-server vsa send authentication	Configures the network access server to recognize and use vendor-specific attributes (VSAs).
Step 8	end Example: Router (config)# end	Returns to privileged EXEC mode.

Displaying the Status of the Configured AAA Servers

This task displays the status of the AAA servers you have configured for the device.

SUMMARY STEPS

1. **enable**
2. **show aaa servers**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	show aaa servers Example: Router# show aaa servers	Displays the status of the AAA servers configured for the device.

Displaying the NAC Configuration

This task displays the current NAC configuration for the device.

SUMMARY STEPS

1. **enable**
2. **show ip admission {[cacke] [configuration] [eapoudp]}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Router> enable	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show ip admission configuration	Displays all the IP admission control rules configured for the device.
	Example: Router# show ip admission configuration	

Displaying the EAPoUDP Configuration

This task displays information about the current EAPoUDP configuration for the device, including any NAC—Auth Fail Open policies in effect.

SUMMARY STEPS

1. **enable**
2. **show eou {all | authentication {clientless | eap | static} | interface {interface-type} | ip {ip-address} | mac {mac-address} | posturetoken {name}} [{begin | exclude | include} expression]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Router> enable	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show eou ip 10.0.0.1	Displays information about the EAPoUDP configuration for the specified interface.
	Example: Router# show eou ip 10.0.0.1	

Enabling EOU Logging

A set of new system logs is included in Cisco IOS Release 12.4(11)T. These new logs track the status of the servers defined by the methodlist, and the NAC Auth Fail policy configuration. You should enable EOU logging to generate syslog messages that notify you when the AAA servers defined by the methodlist are unavailable, and display the configuration of the NAC—Auth Fail Open policy. The display shows whether a global or rule-specific policy is configured for the NAD or interface. If no policy is configured, the existing policy is retained.

This task enables EOU logging.

SUMMARY STEPS

1. **configure terminal**
2. **eou logging**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 2	eou logging Example: Router (config) # eou logging	Enables EOU logging.

Configuration Examples for NAC—Auth Fail Open

This section contains the following examples:

- [Sample NAC—Auth Fail Open Configuration: Example, page 12](#)
- [Sample RADIUS Server Configuration: Example, page 13](#)
- [show ip admission configuration Output: Example, page 13](#)
- [show eou Output: Example, page 13](#)
- [show aaa servers Output: Example, page 14](#)
- [EOU Logging Output: Example, page 14](#)

Sample NAC—Auth Fail Open Configuration: Example

The example below shows how to configure the NAC—Auth Fail Open feature:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip admission name AAA_DOWN eapoudp event timeout aaa policy identity
global_policy
Switch(config)# aaa new-model
Switch(config)# aaa authorization network default local
Switch(config)# aaa authentication eou default group radius
Switch(config)# identity policy global_policy
Switch(config-identity-policy)# ac
Switch(config-identity-policy)# access-group global_acl
Switch(config)# ip access-list extended global_acl
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
```

Sample RADIUS Server Configuration: Example

The example below shows that the RADIUS server will be considered unreachable after 3 unsuccessful tries:

```
Switch(config)# radius-server host 10.0.0.4 test username administrator idle-time 1 key
sample
Switch(config)# radius-server dead-criteria tries 3
Switch(config)# radius-server deadtime 30
Switch(config)# radius-server vsa send authentication
Switch(config)# radius-server attribute 8 include-in-access-req
Switch(config)# int fastEthernet 2/13
Switch(config-if)# ip admission AAA_DOWN
Switch(config-if)# exit
```

show ip admission configuration Output: Example

The following example shows that a policy called “global policy” has been configured for use when the AAA server is unreachable:

```
Switch# show ip admission configuration
```

```
Authentication global cache time is 60 minutes Authentication global absolute time is 0
minutes Authentication global init state time is 2 minutes Authentication Proxy Watch-list
is disabled
```

```
Authentication Proxy Rule Configuration
```

```
Auth-proxy name AAA_DOWN
```

```
    eapoudp list not specified auth-cache-time 60 minutes
```

```
    Identity policy name global_policy for AAA fail policy
```

show eou Output: Example

The example below shows the configuration of the AAA servers defined for a NAC—Auth Fail policy configuration:

```
Router# show eou ip 10.0.0.1
```

```
Address : 10.0.0.1
MAC Address : 0001.027c.f364
Interface : Vlan333
! Authtype is show as AAA DOWN when in AAA is not reachable.
AuthType : AAA DOWN
! AAA Down policy name:
AAA Down policy : rule_policy
Audit Session ID : 00000000011C11830000000311000001
PostureToken : -----
Age(min) : 0
URL Redirect : NO URL REDIRECT
URL Redirect ACL : NO URL REDIRECT ACL
ACL Name : rule_acl
Tag Name : NO TAG NAME
User Name : UNKNOWN USER
```

```
Revalidation Period : 500 Seconds
Status Query Period : 300 Seconds
Current State : AAA DOWN
```

show aaa servers Output: Example

The example below shows sample status information for a configured AAA server:

```
Switch# show aaa servers

RADIUS: id 1, priority 1, host 10.0.0.4, auth-port 1645, acct-port 1646

    State: current UP, duration 5122s, previous duration 9s

    Dead: total time 79s, count 3

    Authen: request 158, timeouts 14

        Response: unexpected 1, server error 0, incorrect 0, time 180ms

        Transaction: success 144, failure 1

    Author: request 0, timeouts 0

        Response: unexpected 0, server error 0, incorrect 0, time 0ms

        Transaction: success 0, failure 0

    Account: request 0, timeouts 0

        Response: unexpected 0, server error 0, incorrect 0, time 0ms

        Transaction: success 0, failure 0

    Elapsed time since counters last cleared: 2h13mS
```

EOU Logging Output: Example

The example below shows the display when EOU logging is enabled:

```
Router (config)# eou logging
EOU-5-AAA_DOWN: AAA unreachable.
METHODLIST=Default| HOST=17.0.0.1| POLICY=Existing policy retained.
EOU-5-AAA_DOWN: AAA unreachable.
METHODLIST=Default| HOST=17.0.0.1| POLICY=aaa_unreachable_policy
```

Network Admission Control: Agentless Host Support

First Published: February 27, 2006

Last Updated: February 27, 2006

The Network Admission Control: Agentless Host Support feature allows for an exhaustive examination of agentless hosts (hosts that are not running the Cisco Trust Agent software). This examination allows customers to build a robust host or examination functionality by integrating any third-party audit mechanisms into the Network Admission Control architecture.

This feature also allows for Extensible Authentication Protocol over UDP (EAPoUDP) bypass, which speeds up the posture validation of hosts that are not using Cisco Trust Agent.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Network Admission Control: Agentless Host Support](#)” section on page 18.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Prerequisites for Network Admission Control: Agentless Host Support

- You must be running Cisco IOS Release 12.4(6)T or a later release.
- You must be using a Cisco access control server (ACS) version 4.0 or a later version.
- You must have a Cisco or third-party audit server setup.

Information About Network Admission Control: Agentless Host Support

To configure the Network Admission Control: Agentless Host Support feature, you should understand the following concepts:

- [Network Admission Control, page 2](#)
- [Agentless Hosts, page 2](#)
- [EAPoUDP Bypass, page 3](#)
- [Vendor-Specific Attributes for This Feature, page 3](#)

Network Admission Control

The Cisco Network Admission Control functionality enables the credentials of the endpoint device to be checked for compliance with the security policy before the device is granted access to network resources. This checking requires a security application called Cisco Trust Agent (CTA) to be installed on end devices that gather security state information and communicate it to access servers where policy decisions are made and eventually enforced on Cisco network access devices (such as routers and switches).

Agentless Hosts

End devices that do not run CTA cannot provide credentials when challenged by network access devices (NADs). Such hosts are termed “agentless” or “nonresponsive.” In the Phase 1 release of Network Admission Control, agentless hosts were supported by either a static configuration using exception lists (an identity profile) or by using “clientless” username and password authentication on an ACS. These methods are restrictive and do not convey any specific information about the host while making policy decisions.

EAPoUDP Bypass

You can use the EAPoUDP Bypass feature to reduce latency of the validation of hosts that are not using CTA. If EAPoUDP bypass is enabled, the NAD does not contact the host to request the antivirus condition (the NAD does not try to establish an EAPoUDP association with the host if the EAPoUDP Bypass option is configured). Instead, the NAD sends a request to the Cisco Secure ACS that includes the IP address, MAC address, service type, and EAPoUDP session ID of the host. The Cisco Secure ACS makes the access control decision and sends the policy to the NAD.

If EAPoUDP bypass is enabled, the NAD sends an agentless host request to the Cisco Secure ACS and applies the access policy from the server to the host.

If EAPoUDP bypass is enabled and the host uses the Cisco Trust Agent, the NAD also sends a nonresponsive-host request to the Cisco Secure ACS and applies the access policy from the server to the host.

Vendor-Specific Attributes for This Feature

The following new attributes are supported for various RADIUS message exchanges:

- [audit-session-id](#), page 3
- [url-redirect-acl](#), page 3

audit-session-id

The audit-session-id vendor-specific attribute (VSA) is a 32-byte string that uniquely identifies a host session. This identifier is generated by a NAD when the host is detected, and it remains the same until the session is deleted. Session revalidation or reinitialization does not change this identifier. Every time a session is detected, a new identifier is generated. This attribute is included in access requests to the authentication, authorization, and accounting (AAA) server and in web requests to the audit server. The value of this attribute is displayed in **show eou** command output (using the **ip** keyword).

url-redirect-acl

The url-redirect-acl VSA string specifies the name of the access control list (ACL) for URL redirection. Any ingress HTTP from the host that matches the access list that is specified by this attribute is subjected to redirection to the URL address specified by the url-redirect VSA. The access list specified in this attribute has to be locally configured on the NAD as an “ip access-list extended” named ACL. This attribute is specified only in RADIUS access-accept messages. The value of the url-redirect-acl attribute is displayed using the **show eou** command (with the **ip** keyword).

Note

Phase 1 of the Network Admission Control feature introduced the url-redirect VSA that allowed the HTTP sessions of users to be redirected to the address specified by the url-redirect VSA. This redirection is useful if you want to remediate hosts that do not comply to network security policy. However, to determine to which users HTTP requests are to be redirected, Phase 1 of Network Admission Control assumed that any HTTP traffic that was intercepted and denied by the host policy ACL (the access control server ACL) was subjected to redirection. The url-redirect-acl VSA provides an option so that users can customize the redirect criteria. The url-redirect-acl VSA supports backward compatibility. If the url-redirect-acl is specified in the access-accept message for the host, any user HTTP sessions that

match the ACL are subjected to redirection. However, if the url-redirect-acl attribute is not received, the Phase 1 logic to perform redirection is used. The Phase 1 logic to perform redirection applies only to Cisco IOS routers. The url-redirect-acl attribute is mandatory for Cisco IOS switches.

How to Configure Network Admission Control: Agentless Host Support

This section includes the following required and optional tasks.

- [Configuring a NAD to Bypass EAPoUDP Communication, page 4](#) (required)
- [Verifying Agentless Host and EAPoUDP Bypass, page 5](#) (optional)

Configuring a NAD to Bypass EAPoUDP Communication

To configure a NAD to bypass EAPoUDP, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission name** *admission-name* **eapoudp bypass**
4. **eou allow clientless**
5. **interface type** *slot/port*
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip admission name <i>admission-name</i> eapoudp bypass Example: Router (config)# ip admission name greentree eapoudp bypass	The IP network admission control rule bypasses EAPoUDP communication.
Step 4	eou allow clientless Example: Router (config)# eou allow clientless	Allows authentication of clientless hosts (systems that do not run Cisco Trust Agent).
Step 5	interface type <i>slot/port</i> Example: Router (config)# interface ethernet 2/4	Configures an interface type and enters interface configuration mode.
Step 6	end Example: Router (config-if)# end	Exits configuration modes.

Verifying Agentless Host and EAPoUDP Bypass

To verify your configuration for Agentless Host and EOUoUDP Bypass, perform the following steps. The **debug** and **show** commands can be used independently of each other.

SUMMARY STEPS

1. **enable**
2. **debug eou**
3. **show eou ip** *ip-address*
4. **show ip admission configuration**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	debug eou Example: Router# debug eou	Displays information about EAUoUDP.
Step 3	show eou ip ip-address Example: Router# show eou ip 10.0.0.0	Displays information about EAPoUDP global values or EAPoUDP session cache entries.
Step 4	show ip admission configuration Example: Router# show ip admission configuration	Displays information about the agentless and EAPoUDP Bypass configuration.

Configuration Examples for Network Admission Control: Agentless Host Support

This section provides the following configuration examples.

- [RADIUS Message Exchange url-redirect-acl VSA: Example, page 6](#)
- [Show Output Displaying the Value of a Newly Defined VSA, page 6](#)

RADIUS Message Exchange url-redirect-acl VSA: Example

ACS Configuration

```
url-redirect=http://audit-server.com/host_session_id=$host_session_id
url-redirect-acl=RedirectACL
```

NAD Configuration

```
Router(config)# ip access-list extended RedirectACL
Router (config-ext-nacl)# permit tcp any 10.0.0.0 0.0.0.255 eq www
Router (config-ext-nacl)# end
```

Show Output Displaying the Value of a Newly Defined VSA

The following **show eou** command output displays EAPoUDP session cache information for a given IP address. The value of the newly defined VSA is also shown.

```
Router# show eou ip 10.0.0.1
```

```
Address           : 10.0.0.1
MAC Address       : 0001.027c.f364
Interface         : FastEthernet1/0/3
AuthType          : EAP
Audit Session ID  : 000000001C8A6A330000001812000001
PostureToken      : Infected
Age(min)          : 444
URL Redirect      : http://wwwin.cisco.com
URL Redirect ACL  : RedirectACL
ACL Name          : #ACSACL#-IP-Infected-42835ff7
User Name         : NAC-DEV-PC-3:Administrator
Revalidation Period : 30000 Seconds
Status Query Period : 300 Seconds
Current State     : AUTHENTICATED
```

Authentication Proxy

Configuring Authentication Proxy

This chapter describes the Cisco IOS Firewall Authentication Proxy feature. Authentication proxy provides dynamic, per-user authentication and authorization, authenticating users against industry standard TACACS+ and RADIUS authentication protocols. Authenticating and authorizing connections by users provides more robust protection against network attacks.

For a complete description of the authentication proxy commands in this chapter, refer to the “Authentication Proxy Commands” chapter of the *Cisco IOS Security Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

In This Chapter

This chapter contains the following sections:

- [About Authentication Proxy](#)
- [Authentication Proxy Configuration Task List](#)
- [Monitoring and Maintaining the Authentication Proxy](#)
- [Authentication Proxy Configuration Examples](#)

About Authentication Proxy

The Cisco IOS Firewall authentication proxy feature allows network administrators to apply specific security policies on a per-user basis. Previously, user identity and related authorized access were associated with a user IP address, or a single security policy had to be applied to an entire user group or subnetwork. Now, users can be identified and authorized on the basis of their per-user policy. Tailoring of access privileges on an individual basis is possible, as opposed to applying a general policy across multiple users.

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2007 Cisco Systems, Inc. All rights reserved.

With the authentication proxy feature, users can log in to the network or access the Internet via HTTP, and their specific access profiles are automatically retrieved and applied from a CiscoSecure ACS, or other RADIUS, or TACACS+ authentication server. The user profiles are active only when there is active traffic from the authenticated users.

The authentication proxy is compatible with other Cisco IOS security features such as Network Address Translation (NAT), Context-based Access Control (CBAC), IP Security (IPSec) encryption, and Cisco Secure VPN Client (VPN client) software.

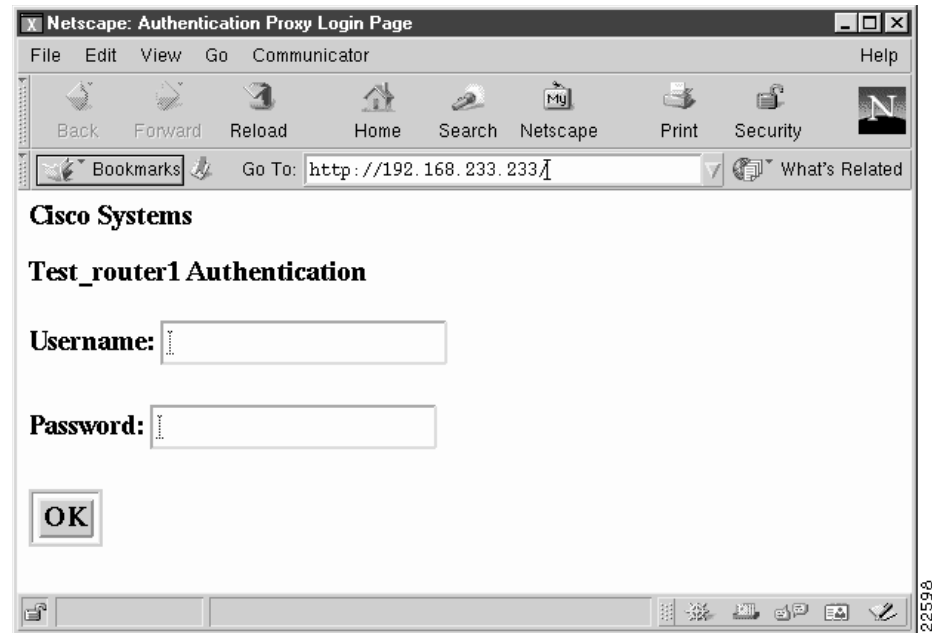

This section contains the following sections:

- [Restrictions](#)
- [Prerequisites to Configuring Authentication Proxy](#)

How the Authentication Proxy Works

When a user initiates an HTTP session through the firewall, the authentication proxy is triggered. The authentication proxy first checks to see if the user has been authenticated. If a valid authentication entry exists for the user, the connection is completed with no further intervention by the authentication proxy. If no entry exists, the authentication proxy responds to the HTTP connection request by prompting the user for a username and password.

[Figure 42](#) illustrates the authentication proxy HTML login page.

Figure 42 Authentication Proxy Login Page

Users must successfully authenticate themselves with the authentication server by entering a valid username and password.

If the authentication succeeds, the user's authorization profile is retrieved from the AAA server. The authentication proxy uses the information in this profile to create dynamic access control entries (ACEs) and add them to the inbound (input) access control list (ACL) of an input interface and to the outbound (output) ACL of an output interface, if an output ACL exists at the interface. This process enables the firewall to allow authenticated users access to the network as permitted by the authorization profile. For example, a user can initiate a Telnet connection through the firewall if Telnet is permitted in the user's profile.

If the authentication fails, the authentication proxy reports the failure to the user and prompts the user with multiple retries. If the user fails to authenticate after five attempts, the user must wait two minutes and initiate another HTTP session to trigger authentication proxy.

The login page is refreshed each time the user makes requests to access information from a web server.

The authentication proxy customizes each of the access list entries in the user profile by replacing the source IP addresses in the downloaded access list with the source IP address of the authenticated host.

At the same time that dynamic ACEs are added to the interface configuration, the authentication proxy sends a message to the user confirming that the login was successful. [Figure 43](#) illustrates the login status in the HTML page.

Figure 43 **Authentication Proxy Login Status Message**

The authentication proxy sets up an inactivity (idle) timer for each user profile. As long as there is activity through the firewall, new traffic initiated from the user's host does not trigger the authentication proxy, and authorized user traffic is permitted access through the firewall.

If the idle timer expires, the authentication proxy removes the user's profile information and dynamic access lists entries. When this happens, traffic from the client host is blocked. The user must initiate another HTTP connection to trigger the authentication proxy.

Secure Authentication

The authentication proxy uses JavaScript to help achieve secure authentication using the client browser. Secure authentication prevents a client from mistakenly submitting a username and password to a network web server other than the authentication proxy router.

This section contains the following sections:

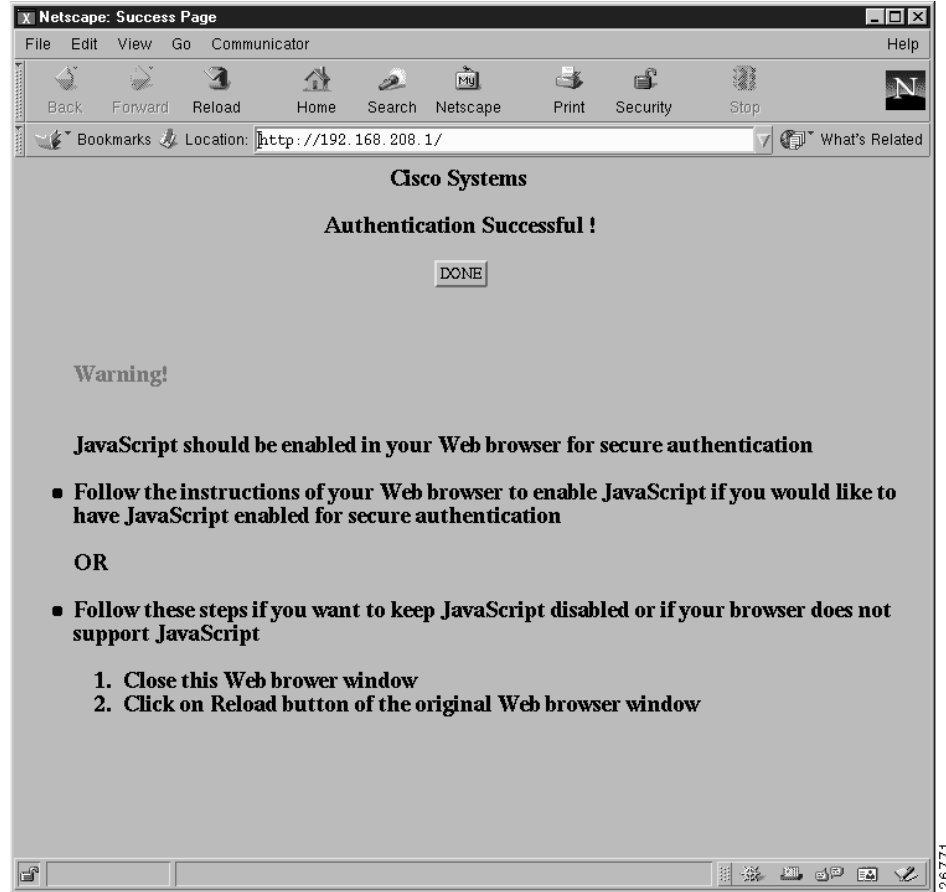

- [Operation with JavaScript](#)
- [Operation Without JavaScript](#)

Operation with JavaScript

Users should enable JavaScript on the browser prior to initiating an HTTP connection. With JavaScript enabled on the browser, secure authentication is done automatically, and the user sees the authentication message shown in [Figure 43](#). The HTTP connection is completed automatically for the user.

Operation Without JavaScript

If the client browser does not support JavaScript, or if site security policy prevents users from enabling JavaScript, any login attempt generates a popup window with instructions for manually completing the connection. [Figure 44](#) illustrates the authentication proxy login status message with JavaScript disabled on the browser.

Figure 44 Authentication Proxy Login Status Message with JavaScript Disabled

To close this window, click Close on the browser File menu.

After closing the popup window, the user should click Reload (Refresh for Internet Explorer) in the browser window in which the authentication login page is displayed. If the user's last authentication attempt succeeds, clicking Reload brings up the web page the user is trying to retrieve. If the user's last attempt fails, clicking Reload causes the authentication proxy to intercept the client HTTP traffic again, prompting the user with another login page that solicits the username and password.

If JavaScript is not enabled, it is strongly recommended that site administrators advise users of the correct procedure for closing the popup window as described in the section "[Establishing User Connections Without JavaScript](#)."

Using the Authentication Proxy

Unlike some Cisco IOS Firewall features that operate transparently to the user, the authentication proxy feature requires some user interaction on the client host. [Table 40](#) describes the interaction of the authentication proxy with the client host.

Table 40 **Authentication Proxy Interaction with the Client Host**

Authentication Proxy Action with Client	Description
Triggering on HTTP connections	If a user is not currently authenticated at the firewall router, any HTTP connection initiated by the user triggers the authentication proxy. If the user is already authenticated, the authentication proxy is transparent to the user.
Logging in using the login page	Triggering the authentication proxy generates an HTML-based login page. The user must enter a username and password to be authenticated with the AAA server. Figure 42 illustrates the authentication proxy login page.
Authenticating the user at the client	<p>Following the login attempt, the authentication proxy action can vary depending on whether JavaScript is enabled in the browser. If JavaScript is enabled, and authentication is successful, the authentication proxy displays a message indicating the status of the authentication as shown in Figure 43. After the authentication status is displayed, the proxy automatically completes the HTTP connection.</p> <p>If JavaScript is disabled, and authentication is successful, the authentication proxy generates a popup window with additional instructions for completing the connection. See Figure 44.</p> <p>If authentication is unsuccessful in any case, the user must log in again from the login page.</p>

When to Use the Authentication Proxy

Here are examples of situations in which you might use the authentication proxy:

- You want to manage access privileges on an individual (per-user) basis using the services provided by the authentication servers instead of configuring access control based on host IP address or global access policies. Authenticating and authorizing users from any host IP address also allows network administrators to configure host IP addresses using DHCP.
- You want to authenticate and authorize local users before permitting access to intranet or Internet services or hosts through the firewall.
- You want to authenticate and authorize remote users before permitting access to local services or hosts through the firewall.
- You want to control access for specific extranet users. For example, you might want to authenticate and authorize the financial officer of a corporate partner with one set of access privileges while authorizing the technology officer for that same partner to use another set of access privileges.
- You want to use the authentication proxy in conjunction with VPN client software to validate users and to assign specific access privileges.
- You want to use the authentication proxy in conjunction with AAA accounting to generate “start” and “stop” accounting records that can be used for billing, security, or resource allocation purposes, thereby allowing users to track traffic from the authenticated hosts.

Applying the Authentication Proxy

Apply the authentication proxy in the inbound direction at any interface on the router where you want per-user authentication and authorization. Applying the authentication proxy inbound at an interface causes it to intercept a user's initial connection request before that request is subjected to any other processing by the firewall. If the user fails to gain authentication with the AAA server, the connection request is dropped.

How you apply the authentication proxy depends on your security policy. For example, you can block all traffic through an interface and enable the authentication proxy feature to require authentication and authorization for all user initiated HTTP connections. Users are authorized for services only after successful authentication with the AAA server.

The authentication proxy feature also allows you to use standard access lists to specify a host or group of hosts whose initial HTTP traffic triggers the proxy.

Figure 45 shows the authentication proxy applied at the LAN interface with all network users required to be authenticated upon the initial connection (all traffic is blocked at each interface).

Figure 45 **Applying the Authentication Proxy at the Local Interface**

Figure 46 shows the authentication proxy applied at the dial-in interface with all network traffic blocked at each interface.

Figure 46 *Applying the Authentication Proxy at an Outside Interface*

Operation with One-Time Passwords

Given a one-time password, the user enters the username and one-time password in the HTML login page as usual.

The user must enter the correct token password within the first three attempts. After three incorrect entries, the user must enter two valid token passwords in succession before authentication is granted by the AAA server.

Compatibility with Other Security Features

The authentication proxy is compatible with Cisco IOS software and with Cisco IOS security features:

- Cisco IOS Firewall Intrusion Detection System (IDS)
- NAT
- CBAC
- IPSec encryption
- VPN client software

The authentication proxy works transparently with the Cisco IOS Firewall IDS and IPSec encryption features. The following sections describe the relationship of the NAT, CBAC, and VPN client software features with the authentication proxy:

- [NAT Compatibility](#)
- [CBAC Compatibility](#)
- [VPN Client Compatibility](#)

NAT Compatibility

The authentication proxy feature is compatible with NAT only if the ACL and authentication are completed prior to the NAT translation. Although NAT is compatible with the authentication proxy feature, NAT is not a requirement of the feature.

CBAC Compatibility

Although authentication proxy is compatible with CBAC security functions, CBAC is not required to use the authentication proxy feature.

Authentication proxy's authorization returns Access Control Entries (ACEs) that are dynamically prepended into a manually created ACL. Thereafter, apply the ACL to the "protected side" inbound interface, allowing or disallowing an authorized user's source IP address access to the remote networks.

VPN Client Compatibility

Using the authentication proxy, network administrators can apply an extra layer of security and access control for VPN client traffic. If a VPN client initiates an HTTP connection, the authentication proxy first checks for prior client authentication. If the client is authenticated, authorized traffic is permitted. If the client is not authenticated, the HTTP request triggers the authentication proxy, and the user is prompted for a username and password.

If the user authentication is successful, the authentication proxy retrieves the user profile from the AAA server. The source address in the user profile entries is replaced with the IP address of the authenticated VPN client from the decrypted packet.

Compatibility with AAA Accounting

Using the authentication proxy, you can generate "start" and "stop" accounting records with enough information to be used for billing and security auditing purposes. Thus, you can monitor the actions of authenticated hosts that use the authentication proxy service.

When an authentication proxy cache and associated dynamic access control lists are created, the authentication proxy will start to track the traffic from the authenticated host. Accounting saves data about this event in a data structure stored with the data of other users. If the accounting start option is enabled, you can generate an accounting record (a "start" record) at this time. Subsequent traffic from the authenticated host will be recorded when the dynamic ACL created by the authentication proxy receives the packets.

When an authentication proxy cache expires and is deleted, additional data, such as elapsed time, is added to the accounting information and a "stop" record is sent to the server. At this point, the information is deleted from the data structure.

The accounting records for the authentication proxy user session are related to the cache and the dynamic ACL usage.

**Note**

The accounting records must include RADIUS attributes 42, 46, and 47 for both RADIUS and TACACS+.

For more information on RADIUS attributes, refer to the appendix "RADIUS Attributes."

Protection Against Denial-of-Service Attacks

The authentication proxy monitors the level of incoming HTTP requests. For each request, the authentication proxy prompts the user's for login credentials. A high number of open requests could indicate that the router is the subject of a denial-of-service (DoS) attack. The authentication proxy limits the level of open requests and drops additional requests until the number of open requests has fallen below 40.

If the firewall is experiencing a high level of connection requests requiring authentication, legitimate network users may experience delays when making connections, or the connection may be rejected and the user must try the connection again.

Risk of Spoofing with Authentication Proxy

When the authentication proxy is triggered, it creates a dynamic opening in the firewall by temporarily reconfiguring an interface with user access privileges. While this opening exists, another host might spoof the authenticated users address to gain access behind the firewall. The authentication proxy does not cause the address spoofing problem; the problem is only identified here as a matter of concern to the user. Spoofing is a problem inherent to all access lists, and the authentication proxy does not specifically address this problem.

Comparison with the Lock-and-Key Feature

Lock-and-key is another Cisco IOS Firewall feature that uses authentication and dynamic access list to provide user access through the firewall. [Table 41](#) compares the authentication proxy and lock-and-key features.

Table 41 Comparison of the Authentication Proxy and Lock-and-Key Features

Lock-and-Key	Authentication Proxy
Triggers on Telnet connection requests.	Triggers on HTTP connection requests.
TACACS+, RADIUS, or local authentication.	TACACS+ or RADIUS authentication and authorization.
Access lists are configured on the router only.	Access lists are retrieved from the AAA server only.
Access privileges are granted on the basis of the user's host IP address.	Access privileges are granted on a per-user and host IP address basis.
Access lists are limited to one entry for each host IP address.	Access lists can have multiple entries as defined by the user profiles on the AAA server.
Associates a fixed IP addresses with a specific user. Users must log in from the host with that IP address.	Allows DHCP-based host IP addresses, meaning that users can log in from any host location and obtain authentication and authorization.

Use the authentication proxy in any network environment that provides a per-user security policy. Use lock-and-key in network environments that might benefit from local authentication and a limited number of router-based access control policies based on host addresses. Use lock-and-key in environments not using the Cisco Secure Integrated Software.

Restrictions

- The authentication proxy triggers only on HTTP connections.
- HTTP services must be running on the standard (well-known) port, which is port 80 for HTTP.
- Client browsers must enable JavaScript for secure authentication.
- The authentication proxy access lists apply to traffic passing through the router. Traffic destined to the router is authenticated by the existing authentication methods provided by Cisco IOS software.
- The authentication proxy does not support concurrent usage; that is, if two users try to log in from the same host at the same time, authentication and authorization applies only to the user who first submits a valid username and password.
- Load balancing using multiple or different AAA servers is not supported.

Prerequisites to Configuring Authentication Proxy

Prior to configuring authentication proxy, review the following:

- For the authentication proxy to work properly, the client host must be running the following browser software:
 - Microsoft Internet Explorer 3.0 or later
 - Netscape Navigator 3.0 or later
- The authentication proxy has an option to use standard access lists. You must have a solid understanding of how access lists are used to filter traffic before you attempt to configure the authentication proxy. For an overview of how to use access lists with the Cisco IOS Firewall, refer to the chapter “Access Control Lists: Overview and Guidelines.”
- The authentication proxy employs user authentication and authorization as implemented in the Cisco authentication, authorization, and accounting (AAA) paradigm. You must understand how to configure AAA user authentication, authorization, and accounting before you configure the authentication proxy. User authentication, authorization, and accounting are explained in the chapter “Authentication, Authorization, and Accounting (AAA).”
- To run the authentication proxy successfully with Cisco IOS Firewall, configure CBAC on the firewall. For complete information on the CBAC feature, refer to the chapter “Configuring Context-Based Access Control.”

Authentication Proxy Configuration Task List

To configure the authentication proxy feature, perform the following tasks:

- [Configuring AAA](#) (Required)
- [Configuring the HTTP Server](#) (Required)
- [Configuring the Authentication Proxy](#) (Required)
- [Verifying the Authentication Proxy](#) (Optional)

For authentication proxy configuration examples using the commands in this chapter, refer to the section “[Authentication Proxy Configuration Examples](#)” at the end of this chapter.

Configuring AAA

You must configure the authentication proxy for AAA services. Use the following commands in global configuration mode to enable authorization and to define the authorization methods:

	Command	Purpose
Step 1	<code>router(config)# aaa new-model</code>	Enables the AAA functionality on the router.
Step 2	<code>router(config)# aaa authentication login default TACACS+ RADIUS</code>	Defines the list of authentication methods at login.
Step 3	<code>router(config)# aaa authorization auth-proxy default [method1 [method2...]]</code>	Uses the auth-proxy keyword to enable authentication proxy for AAA methods.
Step 4	<code>router(config)# aaa accounting auth-proxy default start-stop group tacacs+</code>	Uses the auth-proxy keyword to set up the authorization policy as dynamic ACLs that can be downloaded. This command activates authentication proxy accounting.
Step 5	<code>router(config)# tacacs-server host hostname</code>	Specifies an AAA server. For RADIUS servers, use the radius server host command.
Step 6	<code>router(config)# tacacs-server key key</code>	Sets the authentication and encryption key for communications between the router and the AAA server. For RADIUS servers use the radius server key command.
Step 7	<code>router(config)# access-list access-list-number permit tcp host source eq tacacs host destination</code>	Creates an ACL entry to allow the AAA server to return traffic to the firewall. The source address is the IP address of the AAA server, and the destination is the IP address of the router interface where the AAA server resides.

In addition to configuring AAA on the firewall router, the authentication proxy requires a per-user access profile configuration on the AAA server. To support the authentication proxy, configure the AAA authorization service **auth-proxy** on the AAA server as outlined here:

- Define a separate section of authorization for the **auth-proxy** keyword to specify the downloadable user profiles. This keyword does not interfere with other type of services, such as EXEC. The following example shows a user profile on a TACACS server:

```
default authorization = permit
key = cisco
user = newuser1 {
  login = cleartext cisco
  service = auth-proxy
  {
    priv-lvl=15
    proxyacl#1="permit tcp any any eq 26"
    proxyacl#2="permit icmp any host 60.0.0.2"
    proxyacl#3="permit tcp any any eq ftp"
    proxyacl#4="permit tcp any any eq ftp-data"
    proxyacl#5="permit tcp any any eq smtp"
    proxyacl#6="permit tcp any any eq telnet"
  }
}
```

- The only supported attribute in the AAA server user configuration is proxyacl#n. Use the proxyacl#n attribute when configuring the access lists in the profile. The attribute proxyacl#n is for both RADIUS and TACACS+ attribute-value (AV) pairs.
- The privilege level must be set to 15 for all users.

- The access lists in the user profile on the AAA server must have access commands that contain only the **permit** keyword.
- Set the source address to the **any** keyword in each of the user profile access list entries. The source address in the access lists is replaced with the source address of the host making the authentication proxy request when the user profile is downloaded to the firewall.
- The supported AAA servers are:
 - CiscoSecure ACS 2.1.x for Windows NT
 - CiscoSecure ACS 2.3 for Windows NT
 - CiscoSecure ACS 2.2.4 for UNIX
 - CiscoSecure ACS 2.3 for UNIX
 - TACACS+ server (vF4.02.alpha)
 - Ascend RADIUS server radius-980618 (required attribute-value pair patch)
 - Livingston RADIUS server (v1.16)

Refer to the section [“AAA Server User Profile Example”](#) for sample AAA server configurations.

Configuring the HTTP Server

To use authentication proxy, you must also enable the HTTP server on the firewall and set the HTTP server authentication method to use AAA. Enter the following commands in global configuration mode:

	Command	Purpose
Step 1	<code>router(config)# ip http server</code>	Enables the HTTP server on the router. The authentication proxy uses the HTTP server to communicate with the client for user authentication.
Step 2	<code>router(config)# ip http access-class access-list-number</code>	Specifies the access list for the HTTP server. Use the standard access list number configured in the section “Interface Configuration Example.”

Configuring the Authentication Proxy

Note

Set the **auth-cache-time** option for any authentication proxy rule to a higher value than the idle timeout value for any CBAC inspection rule. When the authentication proxy removes an authentication cache along with its associated dynamic user ACL, there may be some idle connections monitored by CBAC, and removal of user-specific ACLs could cause those idle connections to hang. If CBAC has a shorter idle timeout, CBAC resets these connections when the idle timeout expires; that is, before the authentication proxy removes the user profile.

To configure the authentication proxy, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	<code>router(config)# ip auth-proxy auth-cache-time min</code>	Sets the global authentication proxy idle timeout value in minutes. If the timeout expires, user authentication entries are removed, along with any associated dynamic access lists. The default value is 60 minutes.
Step 2	<code>router(config)# ip auth-proxy auth-proxy-banner</code>	(Optional) Displays the name of the firewall router in the authentication proxy login page. The banner is disabled by default.
Step 3	<code>router(config)# ip auth-proxy name auth-proxy-name http [auth-cache-time min] [list {acl acl-name}]</code>	<p>Creates authentication proxy rules. The rules define how you apply authentication proxy. This command associates connections initiating HTTP protocol traffic with an authentication proxy name. You can associate the named rule with an access control list (ACL), providing control over which hosts use the authentication proxy feature. If no standard access list is defined, the named authentication proxy rule intercepts HTTP traffic from all hosts whose connection initiating packets are received at the configured interface.</p> <p>(Optional) The auth-cache-time option overrides the global authentication proxy cache timer. This option provides more control over timeout values for a specific authentication proxy rule. If no value is specified, the proxy rule assumes the value set with the ip auth-proxy auth-cache-time command.</p> <p>(Optional) The list option allows you to apply a standard, extended (1-199), or named access list to a named authentication proxy rule. HTTP connections initiated by hosts in the access list are intercepted by the authentication proxy.</p>
Step 4	<code>router(config)# interface type</code>	Enters interface configuration mode by specifying the interface type on which to apply the authentication proxy.
Step 5	<code>router(config-if)# ip auth-proxy auth-proxy-name</code>	In interface configuration mode, applies the named authentication proxy rule at the interface. This command enables the authentication proxy rule with that name.

Verifying the Authentication Proxy

Verifying the authentication proxy configuration can have several components:

- [Checking the Authentication Proxy Configuration](#) (Optional)
- [Establishing User Connections with JavaScript](#) (Optional)
- [Establishing User Connections Without JavaScript](#) (Optional)

Checking the Authentication Proxy Configuration

To check the current authentication proxy configuration, use the **show ip auth-proxy configuration** command in privileged EXEC mode:

Command	Purpose
router# show ip auth-proxy configuration	Displays the authentication proxy configuration.

In the following example, the global authentication proxy idle timeout value is set to 60 minutes, the named authentication proxy rule is “pxy”, and the idle timeout value for this named rule is one minute. The display shows that no host list is specified, meaning that all connections initiating HTTP traffic at the interface are subject to the authentication proxy rule.

```
router# show ip auth-proxy configuration
Authentication cache time is 60 minutes
Authentication Proxy Rule Configuration
Auth-proxy name pxy
http list not specified auth-cache-time 1 minutes
```

To verify that the authentication proxy is successfully configured on the router, ask a user to initiate an HTTP connection through the router. The user must have authentication and authorization configured at the AAA server. If the user authentication is successful, the firewall completes the HTTP connection for the user. If the authentication is unsuccessful, check the access list and the AAA server configurations.

Display the user authentication entries using the **show ip auth-proxy cache** command in privileged EXEC mode:

Command	Purpose
router# show ip auth-proxy cache	Displays the list of user authentication entries.

The authentication proxy cache lists the host IP address, the source port number, the timeout value for the authentication proxy, and the state of the connection. If the authentication proxy state is HTTP_ESTAB, the user authentication was successful.

```
router# show ip auth-proxy cache
Authentication Proxy Cache
Client IP 192.168.25.215 Port 57882, timeout 1, state HTTP_ESTAB
```

Wait for one minute, which is the timeout value for this named rule, and ask the user to try the connection again. After one minute, the user connection is denied because the authentication proxy has removed the user's authentication entry and any associated dynamic ACLs. The user is presented with a new authentication login page and must log in again to gain access through the firewall.

Establishing User Connections with JavaScript

To verify client connections using the authentication proxy with JavaScript enabled on the client browser, follow this procedure:

- Step 1** From a client host, initiate an HTTP connection through the firewall. This generates the authentication proxy login page.
- Step 2** At the authentication proxy login page, enter a username and password.

Step 3 Click **OK** to submit the username and password to the AAA server.

A popup window appears indicating whether the login attempt succeeded or failed. If the authentication is successful, the connection is completed automatically. If the authentication fails, the authentication proxy reports the failure to the user and prompts the user with multiple retries.

**Note**

If the authentication attempt is unsuccessful after five attempts, the user must wait two minutes and initiate another HTTP session to trigger authentication proxy.

Establishing User Connections Without JavaScript

To ensure secure authentication, the authentication proxy design requires JavaScript. You can use the authentication proxy without enabling JavaScript on the browser, but this poses a potential security risk if users do not properly establish network connections. The following procedure provides the steps to properly establish a connection with JavaScript disabled. Network administrators are strongly advised to instruct users on how to properly establish connections using the procedure in this section.

**Note**

Failure to follow this procedure can cause user credentials to be passed to a network web server other than the authentication proxy or can cause the authentication proxy to reject the login attempt.

To verify client connections using the authentication proxy when JavaScript is not enabled on the client browser, follow this procedure:

Step 1 Initiate an HTTP connection through the firewall.

This generates the authentication proxy login page.

Step 2 From the authentication proxy login page at the client, enter the username and password.

Step 3 Click **OK** to submit the username and password to the AAA server.

A popup window appears indicating whether the login attempt succeeded or failed. If the popup window indicates successful authentication, go to [Step 7](#).

Step 4 If the popup window displays a failed authentication message, click **Close** on the browser **File** menu.

**Note**

Do not click **Reload** (**Refresh** for Internet Explorer) to close the popup window.

Step 5 From the original authentication login page, click **Reload** (**Refresh** for Internet Explorer) on the browser toolbar. The user login credentials are cleared from the form.

**Note**

Do not click **OK**. You must click **Reload** or **Refresh** to clear the username and password and to reload the form before attempting to log in again.

Step 6 Enter the username and password again.

If the authentication is successful, a window appears displaying a successful authentication message. If the window displays a failed authentication message, go to [Step 4](#).

Step 7 Click **Close** on the browser **File** menu.

Step 8 From the original authentication proxy login page, click **Reload** (**Refresh** for Internet Explorer) on the browser toolbar.

The authentication proxy completes the authenticated connection with the web server.

Monitoring and Maintaining the Authentication Proxy

This section describes how to view dynamic access list entries and how to manually remove authentication entries. This section contains the following sections:

- [Displaying Dynamic ACL Entries](#)
- [Deleting Authentication Proxy Cache Entries](#)

Displaying Dynamic ACL Entries

You can display dynamic access list entries when they are in use. After an authentication proxy entry is cleared by you or by the idle timeout parameter, you can no longer display it. The number of matches displayed indicates the number of times the access list entry was hit.

To view dynamic access lists and any temporary access list entries that are currently established by the authentication proxy, use the **show ip access-lists** command in privileged EXEC mode:

Command	Purpose
router# show ip access-lists	Displays the standard and extended access lists configured on the firewall, including dynamic ACL entries.

Consider the following example where ACL 105 is applied inbound at the input interface where you configure authentication proxy. The initial display shows the contents of the ACLs prior to authentication. The second display shows the same displays after user authentication with the AAA server.

Note

If NAT is configured, the **show ip access list** command might display the translated host IP address for the dynamic ACL entry or the IP address of the host initiating the connection. If the ACL is applied on the NAT outside interface, the translated address is displayed. If the ACL is applied on the NAT inside interface, the IP address of the host initiating the connection is displayed. The **show ip auth-proxy cache** command always displays the IP address of the host initiating the connection.

For example, the following is a list of ACL entries prior to the authentication proxy:

```
Router# show ip access-lists
.
.
.
Extended IP access list 105
deny tcp any any eq telnet
deny udp any any
permit tcp any any (28 matches)
permit ip any any
```

The following sample output shows a list of ACL entries following user authentication:

```
Router# show ip access-lists
.
.
.
Extended IP access list 105
! The ACL entries following user authentication are shown below.
permit tcp host 192.168.25.215 any eq 26
permit icmp host 192.168.25.215 host 60.0.0.2
permit tcp host 192.168.25.215 any eq telnet
permit tcp host 192.168.25.215 any eq ftp
permit tcp host 192.168.25.215 any eq ftp-data
permit tcp host 192.168.25.215 any eq smtp
deny tcp any any eq telnet
deny udp any any
permit tcp any any (76 matches)
permit ip any any
```

Deleting Authentication Proxy Cache Entries

When the authentication proxy is in use, dynamic access lists dynamically grow and shrink as authentication entries are added and deleted. To display the list of authentication entries, use the **show ip auth-proxy cache** command. To manually delete an authentication entry, use the **clear ip auth-proxy cache** command in privileged EXEC mode:

Command	Purpose
router# clear ip auth-proxy cache { * host ip address }	Deletes authentication proxy entries from the firewall before they time out. Use an asterisk to delete all authentication cache entries. Enter a specific IP address to delete an entry for a single host.

Authentication Proxy Configuration Examples

Configuring the authentication proxy feature requires configuration changes on both the router and the AAA server. The following sections provide authentication proxy configuration examples:

- [Authentication Proxy Configuration Example](#)
- [Authentication Proxy, IPSec, and CBAC Configuration Example](#)
- [Authentication Proxy, IPSec, NAT, and CBAC Configuration Example](#)
- [AAA Server User Profile Example](#)

Throughout these examples, the exclamation point (!) indicates a comment line. Comment lines precede the configuration entries being described.

Authentication Proxy Configuration Example

The following examples highlight the specific authentication proxy configuration entries. These examples do not represent a complete router configuration. Complete router configurations using the authentication proxy are included later in this chapter.

This section contains the following examples:

- [AAA Configuration Example](#)
- [HTTP Server Configuration Example](#)
- [Authentication Proxy Configuration Example](#)
- [Interface Configuration Example](#)

AAA Configuration Example

```
aaa new-model
aaa authentication login default group tacacs group radius
! Set up the aaa new model to use the authentication proxy.
aaa authorization auth-proxy default group tacacs group radius
! Define the AAA servers used by the router.
aaa accounting auth-proxy default start-stop group tacacs+
! Set up authentication proxy with accounting.
tacacs-server host 172.31.54.143
tacacs-server key cisco
radius-server host 172.31.54.143
radius-server key cisco
```

HTTP Server Configuration Example

```
! Enable the HTTP server on the router.
ip http server
! Set the HTTP server authentication method to AAA.
ip http authentication aaa
! Define standard access list 61 to deny any host.
access-list 61 deny any
! Use ACL 61 to deny connections from any host to the HTTP server.
ip http access-class 61
```

Authentication Proxy Configuration Example

```
! Set the global authentication proxy timeout value.
ip auth-proxy auth-cache-time 60
! Apply a name to the authentication proxy configuration rule.
ip auth-proxy name HQ_users http
```

Interface Configuration Example

```
! Apply the authentication proxy rule at an interface.
interface e0
 ip address 10.1.1.210 255.255.255.0
 ip auth-proxy HQ_users
```

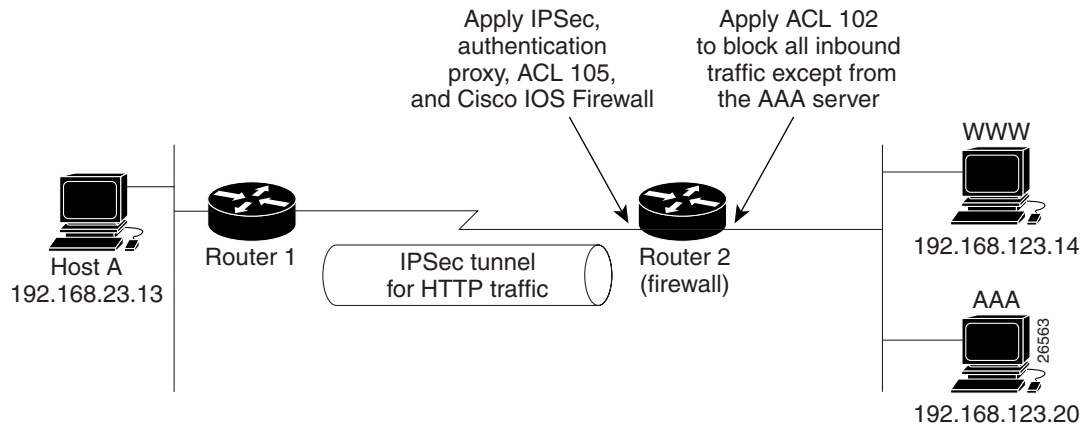

Authentication Proxy, IPSec, and CBAC Configuration Example

The following example shows a router configuration with the authentication proxy, IPSec, and CBAC features. [Figure 47](#) illustrates the configuration.

**Note**

If you are using this feature with Cisco IOS software release 12.3(8)T or later, see the document [Crypto Access Check on Clear-Text Packets](#) (feature module, release 12.3(8)T).

Figure 47 Authentication Proxy, IPSec, and CBAC Configuration Example

In this example, Host A initiates an HTTP connection with the web server (WWW). The HTTP traffic between Router 1 and Router 2 is encrypted using IPSec. The authentication proxy, IPSec, and CBAC are configured at interface Serial0 on Router 2, which is acting as the firewall. ACL 105 blocks all traffic at interface Serial0. ACL 102 is applied at interface Ethernet0 on Router 2 to block all traffic on that interface except traffic from the AAA server.

When Host A initiates an HTTP connection with the web server, the authentication proxy prompts the user at Host A for a username and password. These credentials are verified with the AAA server for authentication and authorization. If authentication is successful, the per-user ACLs are downloaded to the firewall to permit services.

The following examples provide both the Router 1 and Router 2 configurations for completeness:

- [Router 1 Configuration Example](#)
- [Router 2 Configuration Example](#)

Authentication Proxy, IPSec, NAT, and CBAC Configuration Example

The following example provides a router configuration with the authentication proxy, IPSec, NAT, and CBAC features. [Figure 48](#) illustrates the configuration.

Figure 48 Authentication Proxy, IPSec, and CBAC Configuration Example

In this example, Host A initiates an HTTP connection with the web server (WWW). The HTTP traffic between router 1 (interface BRI0) and router 2 (interface Serial2) is encrypted using IPSec. The authentication proxy is configured on router 2, which is acting as the firewall. The authentication proxy, NAT, and CBAC are configured at interface Serial2, which is acting as the firewall. ACL 105 blocks all traffic at interface Serial2. ACL 102 is applied at interface Ethernet0 on router 2 to block all traffic on that interface except traffic from the AAA server. In this example, the authentication proxy uses standard ACL 10 to specify the hosts using the authentication proxy feature.

When any host in ACL 10 initiates an HTTP connection with the web server, the authentication proxy prompts the user at that host for a username and password. These credentials are verified with AAA server for authentication and authorization. If authentication is successful, the per-user ACLs are downloaded to the firewall to permit services.

The following examples provide both the router 1 and router 2 configurations for completeness:

AAA Server User Profile Example

This section includes examples of the authentication proxy user profile entries on the AAA servers. The “proxyacl” entries define the user access privileges. After the user has successfully used the authentication proxy to log in, these entries are transferred to the firewall router. Each entry in the profile must specify “permit” access for the service or application. The source address in each entry is set to “any”, which is replaced with the IP address of the authenticating host when the profile is downloaded to the firewall. The privilege level must be set to 15 for all AAA users.

This section contains the following sections:

- [CiscoSecure ACS 2.3 for Windows NT](#)
- [CiscoSecure ACS 2.3 for UNIX](#)
- [TACACS+ Server](#)
- [Livingston Radius Server](#)
- [Ascend Radius Server](#)

CiscoSecure ACS 2.3 for Windows NT

This section describes how to configure authentication proxy on CiscoSecure ACS 2.3 for Windows NT. For detailed information about CiscoSecure ACS, refer to the documentation for that product.

The following sample configuration is for the TACACS+ service of CiscoSecure ACS for Windows NT.

-
- Step 1** Click the Interface Configuration icon and click **TACACS+ (Cisco)**.
- a. Scroll down to New Services.
 - b. Add a new service, “auth-proxy”, in the Service field. Leave the Protocol field empty.
 - c. Select both the User and Group check boxes for the new service.
 - d. Scroll down to Advance Configuration Options and check the Per-user Advance TACACS+ features.
 - e. Click **Submit**.
- Step 2** Click the Network Configuration icon.
- a. Click the Add Entry icon for Network Access Servers and fill in the Network Access Server Hostname, IP address, and key (the key configured on the router) fields.
 - b. Select TACACS+ (Cisco) for the Authenticate Using option.
 - c. Click the Submit + Restart icon.
- Step 3** Click the Group Setup icon.
- a. Select a user group from the drop-down menu.
 - b. Select the Users in Group check box.
 - c. Select a user from the user list.
 - d. In the User Setup list, scroll down to TACACS+ Settings and select the “auth-proxy” check box.
 - e. Select the Custom Attributes check box.
 - f. Add the profile entries (do not use single or double quotes around the entries) and set the privilege level to 15.

```
priv-lvl=15
proxyacl#1=permit tcp any any eq 26
```

```

proxyacl#2=permit icmp any host 60.0.0.2
proxyacl#3=permit tcp any any eq ftp
proxyacl#4=permit tcp any any eq ftp-data
proxyacl#5=permit tcp any any eq smtp
proxyacl#6=permit tcp any any eq telnet

```

g. Click **Submit**.

Step 4 Click the User Setup icon.

a. Click **List All Users**.

b. Add a username.

c. Scroll down to User Setup Password Authentication.

d. Select SDI SecurID Token Card from the Password Authentication drop-down menu.

e. Select the previous configured user group 1.

f. Click **Submit**.

Step 5 Click Group Setup icon again.

a. Select the user group 1.

b. Click **Users in Group**.

c. Click **Edit Settings**.

d. Click the Submit + Restart icon to make sure the latest configuration is updated and sent to the AAA server.

CiscoSecure ACS 2.3 for UNIX

This section describes how to configure authentication proxy on CiscoSecure ACS 2.3 for UNIX. For detailed information regarding CiscoSecure ACS, refer to the documentation for that product.

To manage the CiscoSecure ACS using the Administrator program, you need a web browser that supports Java and JavaScript. You must enable Java in the browser application. You can start the Java-based CiscoSecure Administrator advanced configuration program from any of the CiscoSecure ACS Administrator web pages.

The following sample configuration procedure is for the TACACS+ service of CiscoSecure ACS 2.3 for UNIX.

Step 1 On the CiscoSecure ACS web menu bar of the CiscoSecure ACS web interface, click **Advanced** and then click **Advanced** again.

The Java-based CiscoSecure Administrator advanced configuration program appears. It might require a few minutes to load.

Step 2 In the CiscoSecure Administrator advanced configuration program, locate and deselect Browse in the Navigator pane of the tabbed Members page.

This displays the Create New Profile icon.

Step 3 In the Navigator pane, do one of the following:

- Locate and click the group to which the user will belong.
- If you do not want the user to belong to a group, click the [Root] folder icon.

- Step 4** Click **Create Profile** to display the New Profile dialog box.
- Step 5** Make sure the Group check box is cleared.
- Step 6** Enter the name of the user you want to create and click **OK**. The new user appears in the tree.
- Step 7** Click the icon for the group or user profile in the tree that is displayed in the Navigator pane of the tabbed Members page.
- Step 8** If necessary, in the Profile pane, click the Profile icon to expand it.
A list or dialog box that contains attributes applicable to the selected profile or service appears in the window at the bottom right of the screen. The information in this window changes depending on what you have selected in the Profile pane.
- Step 9** Click **Service-String**.
- Step 10** Click **string**, enter **auth-proxy** in the text field, and click **Apply**.
- Step 11** Select the **Option** menu.
- Step 12** On the **Option** menu, click **Default Attributes**.
- Step 13** Change the attribute from Deny to **Permit**.
- Step 14** Click **Apply**.
- Step 15** On the **Option** menu, click **Attribute** and enter the privilege level in the text field:
`priv-lvl=15`
- Step 16** On the **Option** menu, click **Attribute** and enter the **proxyacl** entries in the text field:
`proxyacl#1="permit tcp any any eq 26"`

Repeat this step for each additional service or protocol to add:
`proxyacl#2="permit icmp any host 60.0.0.2"`
`proxyacl#3="permit tcp any any eq ftp"`
`proxyacl#4="permit tcp any any eq ftp-data"`
`proxyacl#5="permit tcp any any eq smtp"`
`proxyacl#6="permit tcp any any eq telnet"`
- Step 17** When you have finished making all your changes, click **Submit**.

TACACS+ Server

```
default authorization = permit
key = cisco
user = Brian {
login = cleartext cisco
service = auth-proxy
{
priv-lvl=15
proxyacl#1="permit tcp any any eq 26"
proxyacl#2="permit icmp any host 60.0.0.2"
proxyacl#3="permit tcp any any eq ftp"
proxyacl#4="permit tcp any any eq ftp-data"
proxyacl#5="permit tcp any any eq smtp"
proxyacl#6="permit tcp any any eq telnet"
}
}
```

Livingston Radius Server

```
Bob Password = "cisco" User-Service-Type=Outbound-User
cisco-avpair = "auth-proxy:priv-lvl=15",
cisco-avpair = "auth-proxy:proxyacl#1=permit tcp any any eq 26",
cisco-avpair = "auth-proxy:proxyacl#2=permit icmp any host 60.0.0.2",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq ftp",
cisco-avpair = "auth-proxy:proxyacl#4=permit tcp any any eq ftp-data",
cisco-avpair = "auth-proxy:proxyacl#5=permit tcp any any eq smtp",
cisco-avpair = "auth-proxy:proxyacl#6=permit tcp any any eq telnet"
```

Ascend Radius Server

```
Alice Password = "cisco" User-Service = Dialout-Framed-User
cisco-avpair = "auth-proxy:priv-lvl=15",
cisco-avpair = "auth-proxy:proxyacl#1=permit tcp any any eq 26",
cisco-avpair = "auth-proxy:proxyacl#2=permit icmp any host 60.0.0.2",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq ftp",
cisco-avpair = "auth-proxy:proxyacl#4=permit tcp any any eq ftp-data",
cisco-avpair = "auth-proxy:proxyacl#5=permit tcp any any eq smtp",
cisco-avpair = "auth-proxy:proxyacl#6=permit tcp any any eq telnet"
```

Consent Feature for Cisco IOS Routers

First Published: July 19, 2007

Last Updated: July 19, 2007

The Consent Feature for Cisco IOS Routers enables organizations to provide temporary Internet and corporate access to end users through their wired and wireless networks by presenting a consent webpage. This webpage lists the terms and conditions in which the organization is willing to grant requested access to an end user. Users can connect to the network only after they accept the terms of use on the consent webpage.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Authentication Proxy with Consent Support](#)” section on page 32.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Consent Feature for Cisco IOS Routers

To enable a consent webpage, you must be running an Advanced Enterprise image.

Information About Consent Feature for Cisco IOS Routers

Before enabling the consent feature for Cisco IOS routers, you should understand the following concepts:

- [Authentication Proxy Overview, page 2](#)
- [An Integrated Consent–Authentication Proxy Webpage, page 2](#)

Authentication Proxy Overview

Authentication proxy is an ingress authentication feature that grants access to an end user (out an interface) only if the user submits valid username and password credentials for an ingress traffic that is destined for HTTP, Telnet, or FTP protocols. After the submitted authentication credentials have been checked against the credentials that are configured on an Authentication, Authorization, Accounting (AAA) server, access is granted to the requester (source IP address).

When an end user posts an HTTP(S), FTP, or Telnet request on a router's authentication-proxy-enabled ingress interface, the Network Authenticating Device (NAD) verifies whether or not the same host has already been authenticated. If a session is already present, the ingress request is not authenticated again, and it is subjected to the dynamic (Auth-Proxy) ACEs and the ingress interface ACEs. If an entry is not present, the authentication proxy responds to the ingress connection request by prompting the user for a valid username and password. When authenticated, the Network Access Profiles (NAPs) that are to be applied are either downloaded from the AAA server or taken from the locally configured profiles.

An Integrated Consent–Authentication Proxy Webpage

The HTTP authentication proxy webpage has been extended to support radio buttons—"Accept" and "Don't Accept"—for the consent webpage feature. The consent webpage radio buttons are followed by the authentication proxy input fields for a username and a password. (See [Figure 1](#).)

The following consent scenarios are possible:

- If consent is declined (that is, the "Don't Accept" radio button is selected), the authentication proxy radio buttons are disabled. The ingress client session's access will be governed by the default ingress interface ACL.
- If consent is accepted (that is, the "Accept" radio button is selected), the authentication proxy radio buttons are enabled. If the wrong username and password credentials are entered, HTTP-Auth-Proxy authentication will fail. The ingress client session's access will again be governed only by the default ingress interface ACL.
- If consent is accepted (that is, the "Accept" radio button is selected) and valid username and password credentials are entered, HTTP-Auth-Proxy authentication is successful. Thus, one of the following possibilities can occur:
 - If the ingress client session's access request is HTTP_GET, the destination webpage will open and the ingress client session's access will be governed by the default ingress interface ACL and the dynamic (Auth-Proxy) ACEs.

- If the ingress client session's access request is HTTPS_GET, a "Security Dialogue Box" will be displayed on the client's browser. If the user selects YES on the Security Dialogue Box window, the destination webpage will open and the ingress client session's access will be governed by the default ingress interface ACL and the dynamic (Auth-Proxy) ACEs. If the user selects NO on the Security Dialogue Box window, the destination page will not open and the user will see the message "Page cannot be displayed." However the ingress client session's access will still be governed by the default ingress interface ACL and the dynamic (Auth-Proxy) ACEs.

Figure 1 **Consent WebPage: Example**

How to Configure Authentication Proxy Consent

Use the following tasks to configure a consent webpage and enable a consent webpage that is to be displayed to end users:

- [Configuring an IP Admission Rule for Authentication Proxy Consent, page 4](#)
- [Defining a Parameter Map for Authentication Proxy Consent, page 6](#)

Configuring an IP Admission Rule for Authentication Proxy Consent

Use this task to define the IP admission rule for authentication proxy consent and to associate the rule with an interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission name** *admission-name* **consent** [[**absolute-timer** *minutes*] [**event**] [**inactivity-time** *minutes*] [**list** {*acl* | *acl-name*}] [**parameter-map** *consent-parameter-map-name*]]
4. **ip admission consent banner** [**file** *file-name* | **text** *banner-text*]
5. **interface** *type number*
6. **ip admission** *admission-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip admission name <i>admission-name</i> consent [[absolute-timer <i>minutes</i>] [event] [inactivity-time <i>minutes</i>] [list { <i>acl</i> <i>acl-name</i> }] [parameter-map <i>consent-parameter-map-name</i>] Example: Router(config)# ip admission name consent_rule consent absolute-timer 304 list 103 inactivity-time 204 parameter-map consent_parameter_map	Defines the IP admission rule for authentication proxy consent.
Step 4	ip admission consent banner [file <i>file-name</i> text <i>banner-text</i>] Example: Router(config)# ip admission consent banner file flash:consent_page.html	(Optional) Displays a banner in the authentication proxy consent webpage.
Step 5	interface <i>type number</i> Example: Router(config)# interface FastEthernet 0/0	Specifies the interface in which the consent IP admission rule will be applied and enters interface configuration mode.
Step 6	ip admission <i>admission-name</i> Example: Router(config-if)# ip admission consent_rule	Applies the IP admission rule created in Step 3 to an interface.

Troubleshooting Tips

To display authentication proxy consent page information on the router, you can use the **debug ip admission consent** command.

```
Router# debug ip admission consent errors
IP Admission Consent Errors debugging is on
```

```
Router# debug ip admission consent events
IP Admission Consent Events debugging is on
```

```
Router# debug ip admission consent messages
IP Admission Consent Messages debugging is on
Router#
Router# show debugging
```

```
IP Admission Consent:  
IP Admission Consent Errors debugging is on  
IP Admission Consent Events debugging is on  
IP Admission Consent Messages debugging is on
```

Defining a Parameter Map for Authentication Proxy Consent

Use this task to define a parameter map that is to be used for authentication proxy consent.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type consent** *parameter-map-name*
4. **copy** *src-file-name* *dst-file-name*
5. **file** *file-name*
6. **authorize accept identity** *identity-policy-name*
7. **timeout file download** *minutes*
8. **logging enabled**
9. **exit**
10. **show parameter-map type consent** [*parameter-map-name*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	parameter-map type consent <i>parameter-map-name</i> Example: Router(config)# parameter-map type consent consent_parameter_map	Defines an authentication proxy consent-specific parameter map and enters parameter-map type consent configuration mode. To use a default policy-map, enter default for the parameter-map-name.
Step 4	copy <i>src-file-name</i> <i>dst-file-name</i> Example: Router(config-profile)# copy tftp://192.168.104.136/consent_page.html flash:consent_page.html	Transfers a file (consent webpage) from an external server to a local file system on your device.
Step 5	file <i>file-name</i> Example: Router(config-profile)# file flash:consent_page.html	(Optional) Specifies a local filename that is to be used as the consent webpage.
Step 6	authorize accept identity <i>identity-policy-name</i> Example: Router(config-profile)# authorize accept identity consent_identity_policy	(Optional) Configures an accept policy. Note Currently, only an accept policy can be configured.
Step 7	timeout file download <i>minutes</i> Example: Router(config-profile)# timeout file download 35791	(Optional) Specifies how often the consent page file should be downloaded from the external TFTP server.
Step 8	logging enabled Example: Router(config-profile)# logging enabled	(Optional) Enables syslog messages.

	Command or Action	Purpose
Step 9	exit Example: Router(config-profile) # exit Router(config) # exit	Returns to global configuration and privileged EXEC modes.
Step 10	show parameter-map type consent [parameter-map-name] Example: Router# show parameter-map type consent	(Optional) Displays all or a specified configured consent profiles.

Configuration Examples for Authentication Proxy Consent

This section contains the following configuration examples:

- [Ingress Interface ACL and Intercept ACL Configuration: Example, page 8](#)
- [Consent Page Policy Configuration: Example, page 9](#)
- [Parameter Map Configuration: Example, page 9](#)
- [IP Admission Consent Rule Configuration: Example, page 9](#)

Ingress Interface ACL and Intercept ACL Configuration: Example

The following example shows how to define the ingress interface ACL (via the **ip access-list extended 102** command) to which the consent page policy ACEs will be dynamically appended. This example also shows how to define an intercept ACL (via the **ip access-list extended 103** command) to intercept the ingress interesting traffic by the IP admission consent rule.

```
ip access-list extended 102
 permit ip any 192.168.100.0 0.0.0.255
 permit ip any host 192.168.104.136
 permit udp any any eq bootps
 permit udp any any eq domain
 permit tcp any any eq www
 permit tcp any any eq 443
 permit udp any any eq 443
 exit
!
ip access-list extended 103
 permit ip any host 192.168.104.136
 permit udp any host 192.168.104.132 eq domain
 permit tcp any host 192.168.104.136 eq www
 permit udp any host 192.168.104.136 eq 443
 permit tcp any host 192.168.104.136 eq 443
 exit
!
```

Consent Page Policy Configuration: Example

The following example shows how to configure the consent page policy ACL, the consent page identity policy, and the URL redirect ACL:

```
ip access-list extended consent-pg-ip-acc-group
 permit ip any host 192.168.104.128
 permit ip any host 192.168.104.136
 exit
!
identity policy consent_identity_policy
 description ### Consent Page Identity Policy ###
 access-group consent-pg-ip-acc-group
 exit
!
ip access-list extended url-redirect-acl
 permit tcp any host 192.168.104.136 eq www
 permit tcp any host 192.168.104.136 eq 443
 exit
```

Parameter Map Configuration: Example

The following example shows how to define the consent-specific parameter map “consent_parameter_map” and a default consent parameter map:

```
parameter-map type consent consent_parameter_map
 copy tftp://192.168.104.136/consent_page.html flash:consent_page.html
 authorize accept identity consent_identity_policy
 timeout file download 35791
 file flash:consent_page.html
 logging enabled
 exit
!
parameter-map type consent default
 copy tftp://192.168.104.136/consent_page.html flash:consent_page.html
 authorize accept identity test_identity_policy
 timeout file download 35791
 file flash:consent_page.html
 logging enabled
 exit
!
```

IP Admission Consent Rule Configuration: Example

The following example shows how to configure an IP admission consent rule, which includes the consent page parameter map as defined the in the [“Parameter Map Configuration: Example”](#) section:

```
ip admission name consent-rule consent inactivity-time 204 absolute-timer 304 param-map
 consent_parameter_map list 103
ip admission consent-banner file flash:consent_page.html
ip admission consent-banner text ^C Consen-Page-Banner-Text ^C
ip admission max-login-attempts 5
ip admission init-state-timer 15
ip admission auth-proxy-audit
ip admission inactivity-timer 205
ip admission absolute-timer 305
ip admission ratelimit 100
ip http server
ip http secure-server
```

```
!  
interface FastEthernet 0/0  
  description ### CLIENT-N/W ###  
  ip address 192.168.100.170 255.255.255.0  
  ip access-group 102 in  
  ip admission consent-rule  
  no shut  
  exit  
!  
interface FastEthernet 0/1  
  description ### AAA-DHCP-AUDIT-SERVER-N/W ###  
  ip address 192.168.104.170 255.255.255.0  
  no shut  
  exit  
!  
line con 0  
  exec-timeout 0 0  
  login authentication noAAA  
  exit  
!  
line vty 0 15  
  exec-timeout 0 0  
  login authentication noAAA  
  exit  
!
```

Firewall Support of HTTPS Authentication Proxy

The Firewall Support of HTTPS Authentication Proxy feature allows a user to encrypt the change of the username and password between the HTTP client and the Cisco IOS router via Secure Socket Layer (SSL) when authentication proxy is enabled on the Cisco IOS firewall, thereby ensuring confidentiality of the data passing between the HTTP client and the Cisco IOS router.

Feature Specifications for the Firewall Support of HTTPS Authentication Proxy feature

Feature History

Release	Modification
12.2(11)YU	This feature was introduced.
12.2(15)T	This feature was integrated into Cisco IOS Release 12.2(15)T.

Supported Platforms

For platforms supported in Cisco IOS Releases 12.2(11)YU and 12.2(15)T, consult Cisco Feature Navigator.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

- [Glossary, page 15](#)

Prerequisites for Firewall Support of HTTPS Authentication Proxy

Before enabling this feature, ensure that your router is running a crypto image with k8 and k9 designations and that your Cisco IOS image supports SSL.

Restrictions for Firewall Support of HTTPS Authentication Proxy

- Although Port to Application Mapping (PAM) configuration is allowed in Cisco IOS Firewall processing, authentication proxy is limited to the server ports that are configured by the HTTP subsystem of the router.
- To conform to a proper TCP connection handshake, the authentication proxy login page will be returned from the same port and address as the original request. Only the postrequest, which contains the username and password of the HTTP client, will be forced to use HTTP over SSL (HTTPS).

Information About Firewall Support of HTTPS Authentication Proxy

To configure the Firewall Support of HTTPS Authentication Proxy feature, you must understand the following concepts:

- [Authentication Proxy, page 2](#)
- [Feature Design for HTTPS Authentication Proxy, page 3](#)

Authentication Proxy

Authentication proxy grants Internet access to an authorized user through the Cisco Secure Integrated Software (also known as a Cisco IOS firewall). Access is granted on a per-user basis after the proper identification process is completed and the user policies are retrieved from a configured authentication, authorization, and accounting (AAA) server.

When authentication proxy is enabled on a Cisco router, users can log into the network or access the Internet via HTTP(S). When a user initiates an HTTP(S) session through the firewall, the authentication proxy is triggered. Authentication proxy first checks to see if the user has been authenticated. If a valid authentication entry exists for the user, the connection is completed with no further intervention by authentication proxy. If no entry exists, the authentication proxy responds to the HTTP(S) connection request by prompting the user for a username and password. When authenticated, the specific access profiles are automatically retrieved and applied from a CiscoSecure Access Control Server (ACS), or other RADIUS or TACACS+ authentication server. The user profiles are active only when there is active traffic from the authenticated users.

Feature Design for HTTPS Authentication Proxy

Authentication proxy support using HTTPS provides encryption between the HTTPS client and the Cisco IOS router during the username and password exchange, ensuring secure communication between trusted entities.

Figure 49 and the corresponding steps explain how the data flows from the time the client issues a HTTP request to the time the client receives a response from the Cisco IOS router.

Figure 49 *HTTPS Authentication Proxy Data Flow*

1. The HTTP or HTTPS client requests a web page.
2. The HTTP or HTTPS request is intercepted by the Cisco IOS router with authentication proxy.
3. The router marks the TCP/IP connection and forwards the request (with the client address) to the web server, if authentication is required.
4. The web server builds the authentication request form and sends it to the HTTP or HTTPS client via the original request protocol—HTTP or HTTPS.
5. The HTTP or HTTPS client receives the authentication request form.
6. The user enters his or her username and password in the HTTPS POST form and returns the form to the router. At this point, the authentication username and password form is sent via HTTPS. The web server will negotiate a new SSL connection with the HTTPS client.

Note Your Cisco IOS image must support HTTPS, and HTTPS must be configured; otherwise, an HTTP request form will be generated.

7. The router receives the HTTPS POST form from the HTTPS client and retrieves the username and password.
8. The router sends the username and password to the AAA server for client authentication.
9. If the AAA server validates the username and password, it sends the configured user profile to the router. (If it cannot validate the username and password, an error is generated and sent to the router.)
10. If the router receives a user profile from the AAA server, it updates the access list with the user profile and returns a successful web page to the HTTPS client. (If the router receives an error from the AAA server, it returns an error web page to the HTTPS client.)

11. After the HTTPS client receives the successful web page, it retries the original request. Thereafter, HTTPS traffic will depend on HTTPS client requests; no router intervention will occur.

How to Use HTTPS Authentication Proxy

To enable HTTPS authentication proxy, you must enable AAA service, configure the HTTPS server, and enable authentication proxy. This section contains the following procedures:

- [Configuring the HTTPS Server, page 4](#)
- [Verifying HTTPS Authentication Proxy, page 5](#)

Configuring the HTTPS Server

To use HTTPS authentication proxy, you must enable the HTTPS server on the firewall and set the HTTPS server authentication method to use AAA.

Prerequisites

Before configuring the HTTPS server, you must perform the following procedures:

- Configure the authentication proxy for AAA services by enabling AAA and configuring a RADIUS or TACACS+ server. For information on completing these tasks, refer to the section “Configuring AAA” in the chapter “Configuring Authentication Proxy” of the *Cisco IOS Security Configuration Guide*, Release 12.2.
- Obtain a certification authority (CA) certificate. For information on completing this task, refer to the section “Configuring a Trustpoint CA” in the *Trustpoint CLI*, Cisco IOS Release 12.2(8)T feature module.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **ip http authentication aaa**
5. **ip http secure-server**
6. **ip http secure-trustpoint *name***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip http server Example: Router (config)# ip http server	Enables the HTTP server on the router. <ul style="list-style-type: none"> The authentication proxy uses the HTTP server to communicate with the client for user authentication.
Step 4	ip http authentication aaa Router (config)# ip http authentication aaa	Sets the HTTP server authentication method to AAA.
Step 5	ip http secure-server Example: Router (config)# ip http secure-server	Enables HTTPS.
Step 6	ip http secure-trustpoint name Example: Router (config)# ip http secure-trustpoint netCA	Enables HTTP secure server certificate trustpoint.

What to Do Next

After you have finished configuring the HTTPS server, you must configure the authentication proxy (globally and per interface). For information on completing this task, refer to the section “Configuring the Authentication Proxy” in the chapter “Configuring Authentication Proxy” of the *Cisco IOS Security Configuration Guide*, Release 12.2.

Verifying HTTPS Authentication Proxy

To verify your HTTPS authentication proxy configuration, perform the following optional steps:

SUMMARY STEPS

1. enable
2. show ip auth-proxy configuration
3. show ip auth-proxy cache
4. show ip http server secure status

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show ip auth-proxy configuration Example: Router# show ip auth-proxy configuration	Displays the current authentication proxy configuration.
Step 3	show ip auth-proxy cache Example: Router# show ip auth-proxy cache	Displays the list of user authentication entries. The authentication proxy cache lists the host IP address, the source port number, the timeout value for the authentication proxy, and the state of the connection. If the authentication proxy state is HTTP_ESTAB, the user authentication was successful.
Step 4	show ip http server secure status Example: Router# show ip http server secure status	Displays HTTPS status.

Monitoring Firewall Support of HTTPS Authentication Proxy

Perform the following task to troubleshoot your HTTPS authentication proxy configuration:

SUMMARY STEPS

1. enable
2. debug ip auth-proxy detailed

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	Example: debug ip auth-proxy detailed Example: Router# debug ip auth-proxy detailed	Displays the authentication proxy configuration information on the router.

Configuration Examples for HTTPS Authentication Proxy

This section provides the following comprehensive configuration examples:

- [HTTPS Authentication Proxy Support Example, page 7](#)
- [RADIUS User Profile Example, page 10](#)
- [TACACS User Profile Example, page 10](#)
- [HTTPS Authentication Proxy Debug Example, page 11](#)

HTTPS Authentication Proxy Support Example

The following example is output from the **show running-config** command. This example shows how to enable HTTPS authentication proxy on a Cisco IOS router.

```
Router# show running-config

RADIUS User Profile Example

The following example is a sample RADIUS user profile for Livingston RADIUS:

```
#----- Proxy user -----

http          Password = "test" User-Service-Type=Outbound-User
              cisco-avpair = "auth-proxy:priv-lvl=15",
              cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

http_1        Password = "test"
              User-Service-Type = Shell-User,
              User-Service-Type=Dialout-Framed-User,
              cisco-avpair = "shell:priv-lvl=15",
              cisco-avpair = "shell:inacl#4=permit tcp any host 192.168.134.216
eq 23          cisco-avpair = "auth-proxy:priv-lvl=15",
              cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

http_fail     Password = "test" User-Service-Type=Outbound-User
              cisco-avpair = "auth-proxy:priv-lvl=14",
              cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

proxy        Password = "cisco" User-Service-Type=Outbound-User      cisco-avpair =
"auth-proxy:proxyacl#4=permit tcp any any eq 20"
```

TACACS User Profile Example

The following examples are sample TACACS user profiles:

```
default authorization = permit
key = cisco
user = http_1 {
    default service = permit
    login = cleartext test
    service = exec
    {
        priv-lvl = 15
        inacl#4="permit tcp any host 192.168.134.216 eq 23"
        inacl#5="permit tcp any host 192.168.134.216 eq 20"
        inacl#6="permit tcp any host 192.168.134.216 eq 21"
        inacl#3="deny -1"
    }
    service = auth-proxy
    {
        priv-lvl=15
        proxyacl#4="permit tcp any host 192.168.105.216 eq 23"
        proxyacl#5="permit tcp any host 192.168.105.216 eq 20"
        proxyacl#6="permit tcp any host 192.168.105.216 eq 21"
        proxyacl#7="permit tcp any host 192.168.105.216 eq 25"
    }
}
user = http {
    login = cleartext test
```

```

        service = auth-proxy
        {
            priv-lvl=15
            proxyacl#4="permit tcp any host 192.168.105.216 eq 23"
            proxyacl#5="permit tcp any host 192.168.105.216 eq 20"
            proxyacl#6="permit tcp any host 192.168.105.216 eq 21"
        }
    }
    user = proxy_1 {
        login = cleartext test
        service = auth-proxy
        {
            priv-lvl=14
        }
    }

    user = proxy_3 {
        login = cleartext test
        service = auth-proxy
        {
            priv-lvl=15
        }
    }

```

HTTPS Authentication Proxy Debug Example

The following is a sample of **debug ip auth-proxy** detailed command output:

```

*Mar  1 21:18:18.534: AUTH-PROXY:proto_flag=7, dstport_index=4
*Mar  1 21:18:18.534:  SYN SEQ 462612879 LEN 0

Command Reference

This feature uses no new or modified commands. For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*..

Glossary

ACL—access control list. An ACL is a list kept by routers to control access to or from the router for a number of services (for example, to prevent packets with a certain IP address from leaving a particular interface on the router).

Cisco IOS Firewall—The Cisco IOS Firewall is a protocol that provides advanced traffic filtering functionality and can be used as an integral part of your network's firewall.

The Cisco IOS Firewall creates temporary openings in access lists at firewall interfaces. These openings are created when specified traffic exits your internal network through the firewall. The openings allow returning traffic (that would normally be blocked) and additional data channels to enter your internal network back through the firewall. The traffic is allowed back through the firewall only if it is part of the same session as the original traffic that triggered the Cisco IOS Firewall when exiting through the firewall.

firewall—A firewall is a networking device that controls access to the network assets of your organization. Firewalls are positioned at the entrance points into your network. If your network has multiple entrance points, you must position a firewall at each point to provide effective network access control.

The most basic function of a firewall is to monitor and filter traffic. Firewalls can be simple or elaborate, depending on your network requirements. Simple firewalls are usually easier to configure and manage. However, you might require the flexibility of a more elaborate firewall.

HTTPS—HTTP over SSL. HTTPS is client communication with a server by first negotiating an SSL connection and then transmitting the HTTP protocol data over the SSL application data channel.

SSL—Secure Socket Layer. SSL is encryption technology for the web used to provide secure transactions, such as the transmission of credit card numbers for e-commerce.

Firewall Authentication Proxy for FTP and Telnet Sessions

Before the introduction of the Firewall Authentication Proxy for FTP and Telnet Sessions feature, users could enable only HTTP when configuring authentication proxy. This feature introduces support for FTP and Telnet, providing users with three protocol options when configuring authentication proxy.

Feature Specifications for the Firewall Authentication Proxy for FTP and Telnet Sessions Feature

Feature History

Release	Modification
12.3(1)	This feature was introduced.

Supported Platforms

For platforms supported in Cisco IOS Release 12.3(1), consult Cisco Feature Navigator.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Restrictions for Firewall Authentication Proxy for FTP and Telnet Sessions

- Authentication proxy is an IP-only feature; thus, it comes with only -o3 images.
- “proxyacl#<n>” is the only supported attribute in the authentication, authorization, and accounting (AAA) server’s user configuration.
- Authentication proxy is subjected only to the traffic that passes through the router; traffic that is destined for the router continues to be authenticated by the existing authentication methods that are provided by Cisco IOS.

Information About Firewall Authentication Proxy for FTP and Telnet Sessions

To configure the Authentication Proxy for FTP and Telnet Sessions feature, you must understand the following concepts:

- [Feature Design for FTP and Telnet Authentication Proxy, page 2](#)
- [Absolute Timeout, page 7](#)

Feature Design for FTP and Telnet Authentication Proxy

Authentication proxy for FTP and Telnet Sessions functions like authentication proxy for HTTP; that is, FTP and Telnet are independent components in the Cisco IOS software and can be enabled or disabled on the interface of an unauthenticated host.

Many of the authentication proxy for FTP or Telnet functions are similar to those used with HTTP, such as the interaction between the authentication proxy router and the AAA server during authentication. However, because of protocol differences, FTP and Telnet login methods are different from HTTP.

FTP and Telnet Login Methods

[Figure 1](#) displays a typical authentication proxy topology.

Figure 1 *Typical Authentication Proxy Topology*

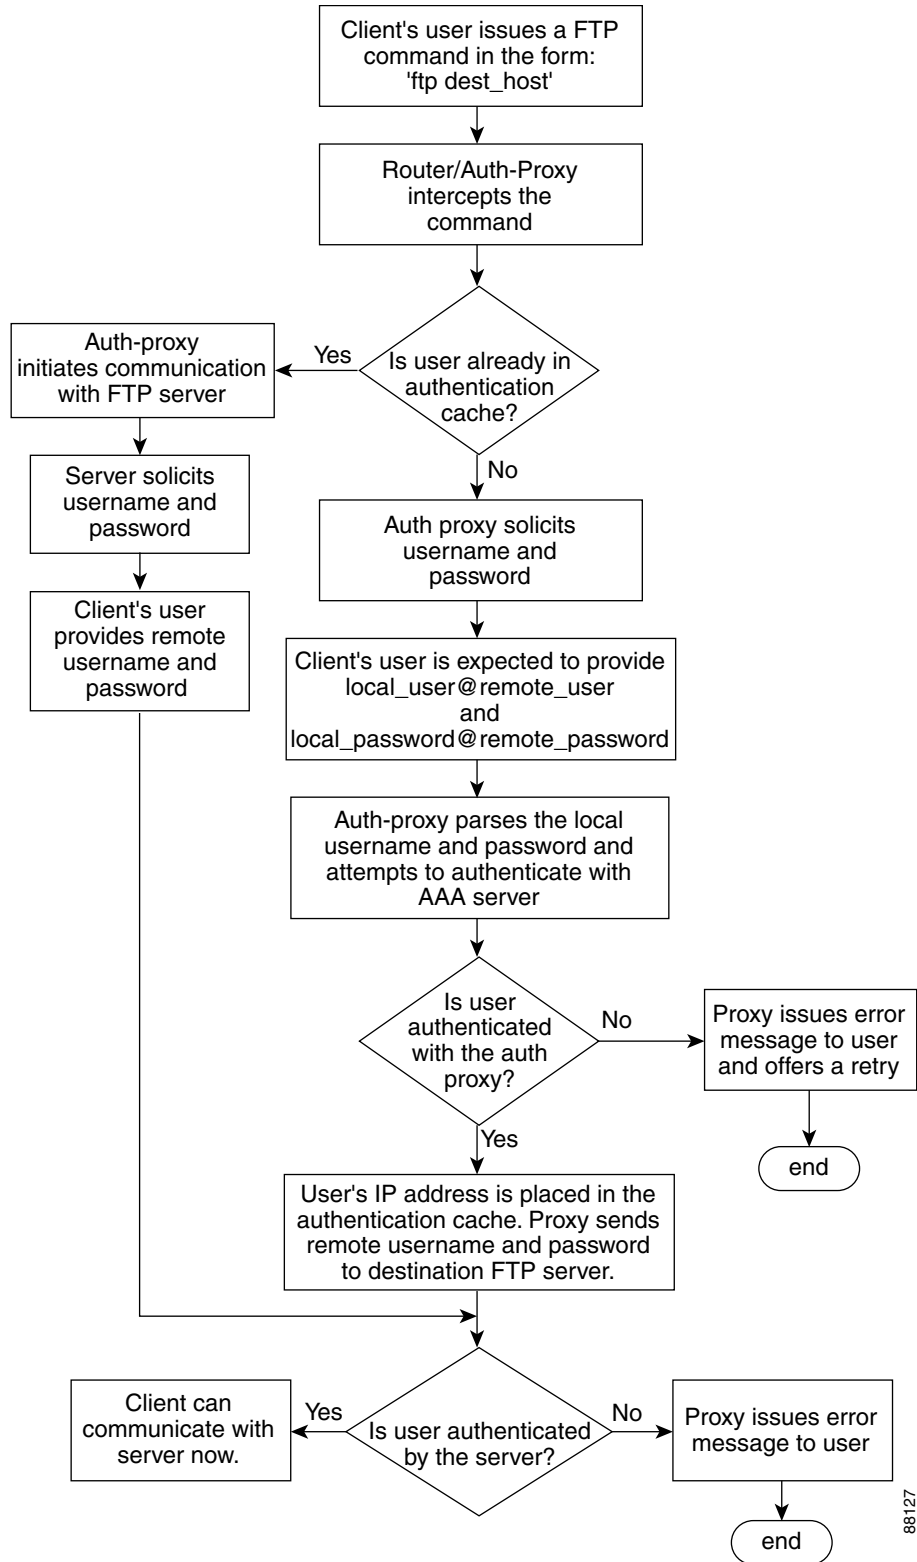

Just as with HTTP, the authentication proxy router intercepts traffic that is sent from the client host. Upon receiving a FTP or Telnet packet, the router will look into its authentication cache to check whether the client host has already been authenticated. If it has been authenticated, the router will forward the client host's traffic to the FTP or Telnet server for additional authentication. If the IP address of the client host is not in the cache of the router, the router will try to authenticate the client host with the AAA server using the username and password of the router.

FTP Login

For FTP login, the client host will be prompted (by the authentication proxy router) for the username and password of the router; the client must respond with the username and password in the following format: "login: proxy_username@ftp_username" and "password: proxy_passwd@ftp_passwd:". The authentication proxy will use the proxy username and password to verify the client's profile against the AAA server's user database. After the client is successfully authenticated with the AAA server, the authentication proxy will pass the FTP (remote) username and password to the FTP server (destination server) for the application server authentication.

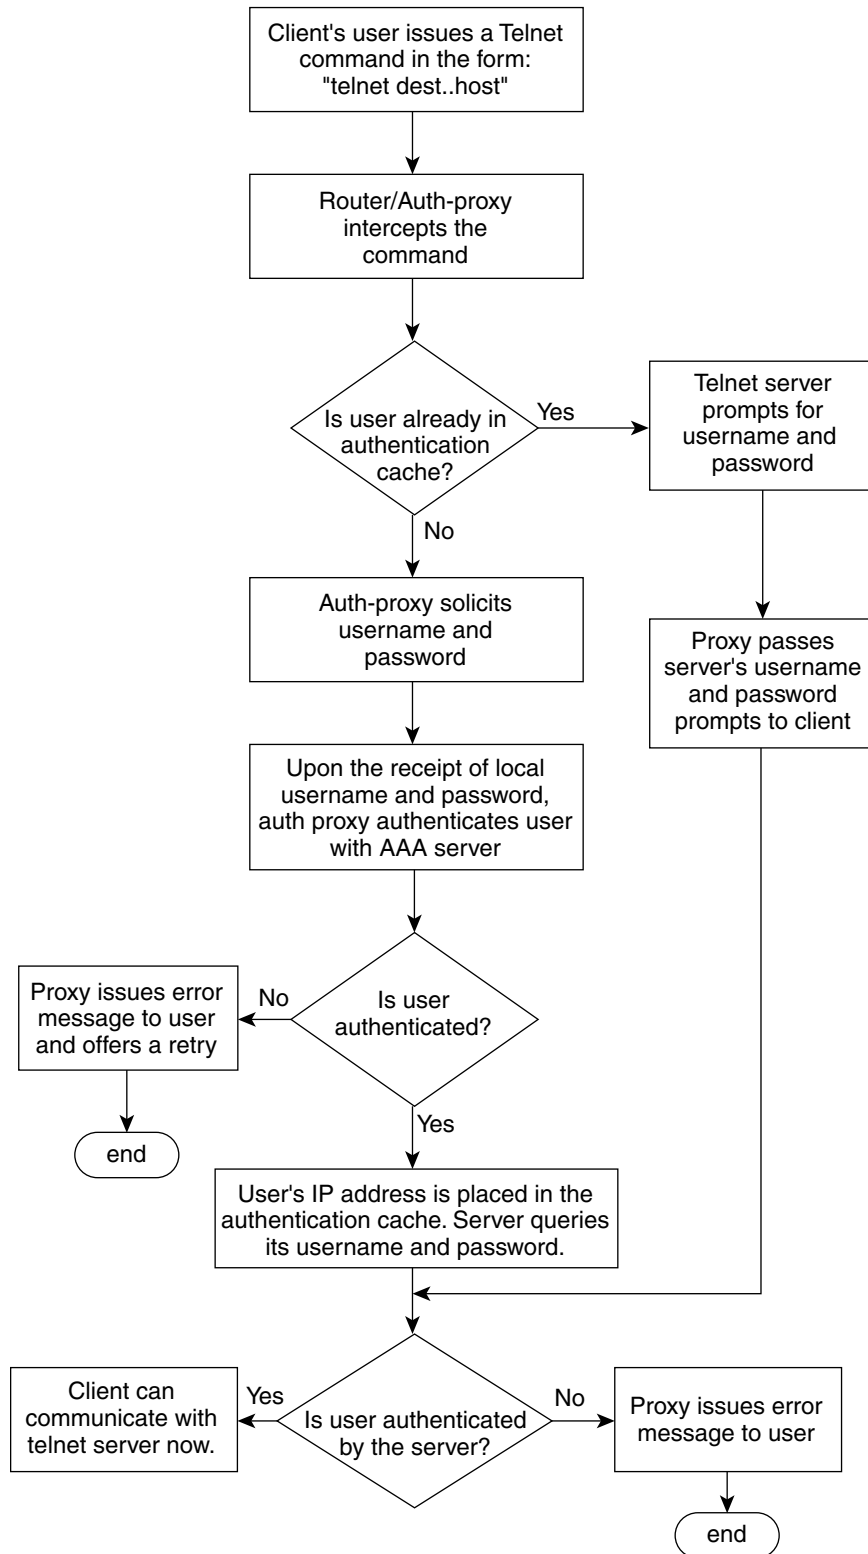

A flow chart that depicts an overview of the FTP authentication proxy process is shown in [Figure 2](#).

Figure 2 *FTP Authentication Proxy Overview*

Telnet Login

For Telnet login, the client host will be prompted (by the authentication proxy router) for the username, followed by the password; the client must respond with the username and password in the following format: “login: proxy_username:” and “password: proxy_passwd:”. The username and password will be verified against the AAA server’s user database. After the client is successfully authenticated with the AAA server, the Telnet server (destination server) will prompt the client for the username and password of the Telnet server.

A flow chart that depicts an overview of the Telnet authentication proxy process is shown in [Figure 3](#).

Figure 3 *Telnet Authentication Proxy Overview*

88126

If authentication with the AAA server fails, the proxy will inform the client accordingly. With Telnet, the proxy does not have any interest in the Telnet server's username and password. If the client is authenticated with the AAA server but fails with the Telnet server, the client will not have to authenticate with the AAA server the next time he or she logs into the network; the client's IP address will be stored in the authentication cache. The client will have to authenticate only with the Telnet server.

**Note**

With FTP, the client must always reenter the local and remote username and password combination every time he or she tries to log into the network—regardless of a successful AAA server authentication.

Absolute Timeout

An absolute timeout value has been added to allow users to configure a window during which the authentication proxy on the enabled interface is active. After the absolute timer expires, the authentication proxy will be disabled regardless of any activity. The absolute timeout value can be configured per protocol (via the **ip auth-proxy name** command) or globally (via the **ip auth-proxy** command). The default value of the absolute timeout is zero; that is, the absolute timer is turned off by default, and the authentication proxy is enabled indefinitely and is subject only to the timeout specified by the **inactivity-timer** keyword.

**Note**

The **inactivity-timer** keyword deprecates the **auth-cache-time** keyword in the **ip auth-proxy name** and the **ip auth-proxy** commands.

How to Configure FTP or Telnet Authentication Proxy

To enable FTP or Telnet authentication proxy, you must enable AAA services, configure the FTP or Telnet server, and enable authentication proxy. This section contains the following procedures:

- [Configuring AAA, page 7](#)
- [Configuring the Authentication Proxy, page 9](#)
- [Verifying FTP or Telnet Authentication Proxy, page 11](#)
- [Monitoring and Maintaining FTP or Telnet Authentication Proxy Sessions, page 11](#)

Configuring AAA

To use authentication proxy, you must configure a AAA server for authentication. The authentication proxy service of the AAA server must also be configured for authorization. To configure these tasks, perform the following steps:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login default group tacacs+ group radius**

5. **aaa authorization auth-proxy default** [[group tacacs+] [group radius]]
6. **aaa authorization exec default** [group tacacs+] [group radius]
7. **aaa accounting auth-proxy default stop-only** [group tacacs+] [group radius]
8. **access-list** *access-list-number* {permit | deny} {tcp | ip | icmp} host *source* eq *tacacs* host *destination*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Router (config)# aaa new-model	Enables the AAA functionality on the router.
Step 4	aaa authentication login default group tacacs+ group radius Example: Router (config)# aaa authentication login default group tacacs+ group radius	Defines the list of authentication methods at login.
Step 5	aaa authorization auth-proxy default [[group tacacs+] [group radius]] Example: Router (config)# aaa authorization auth-proxy default group tacacs+ group radius	Uses the auth-proxy keyword to enable authorization proxy for AAA methods.
Step 6	aaa authorization exec default [group tacacs+] [group radius] Example: Router (config)# aaa authorization exec default group tacacs+ group radius	Enables authorization for TACACS+ and RADIUS.

	Command or Action	Purpose
Step 7	<pre>aaa accounting auth-proxy default stop-only [group tacacs+] [group radius]</pre> <p>Example:</p> <pre>Router (config)# aaa accounting auth-proxy default stop-only group tacacs+ group radius</pre>	Activates authentication proxy accounting and uses the auth-proxy keyword to set up the authorization policy as dynamic access control lists (ACLs) that can be downloaded.
Step 8	<pre>access-list access-list-number {permit deny} {tcp ip icmp} host source eq tacacs host destination</pre> <p>Example:</p> <pre>Router (config)# access-list 111 permit tcp host 209.165.200.225 eq tacacs host 209.165.200.254</pre> <p>or</p> <pre>Router (config)# access-list 111 deny ip any any</pre> <p>or</p> <pre>Router (config)# access-list 111 permit icmp any any</pre>	<p>Creates an ACL entry to allow the AAA server to return traffic to the firewall.</p> <p>The source address is the IP address of the AAA server, and the destination is the IP address of the router interface where the AAA server resides.</p>

What to Do Next

Ensure that your FTP or Telnet server is enabled and that the user credentials of the client (the username and password) are stored in the server's database.

Configuring the Authentication Proxy

To configure the authentication proxy, perform the following steps:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip auth-proxy {inactivity-timer *min* | absolute-timer *min*}**
4. **ip auth-proxy auth-proxy-banner {ftp | http | telnet} [*banner-text*]**
5. **ip auth-proxy name *auth-proxy-name* {ftp | http | telnet} [*inactivity-timer min* | *absolute-timer min*] [*list {acl | acl-name}*]**
6. **interface *type***
7. **ip auth-proxy *auth-proxy-name***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip auth-proxy {inactivity-timer min absolute-timer min} Example: Router (config)# ip auth-proxy inactivity-timer 30	Sets the global authentication proxy idle timeout values in minutes. <ul style="list-style-type: none"> inactivity-timer min—Specifies the length of time in minutes that an authentication cache entry is managed after a period of inactivity. Enter a value in the range 1 to 2,147,483,647. The default value is 60 minutes. absolute-timer min—Specifies a window in which the authentication proxy on the enabled interface is active. Enter a value in the range 1 to 65,535 minutes (45 and a half days). The default value is 0 minutes.
Step 4	ip auth-proxy auth-proxy-banner {ftp http telnet} [banner-text] Example: Router (config)# ip auth-proxy auth-proxy-banner ftp hello	Optional) Displays the name of the firewall router in the authentication proxy login page. Disabled by default. <ul style="list-style-type: none"> ftp—Specifies the FTP protocol. http—Specifies the HTTP protocol. telnet—Specifies the Telnet protocol. banner-text—(Optional) A text string that replaces the default banner.
Step 5	ip auth-proxy name auth-proxy-name {ftp http telnet} [inactivity-timer min] [absolute-timer min] [list {acl acl-name}] Example: Router (config)# ip auth-proxy name ftp_list1 ftp absolute-timer 60 ftp list 102	Configures authentication proxy on an interface. <ul style="list-style-type: none"> ftp—Specifies FTP to trigger that authentication proxy. http—Specifies HTTP to trigger that authentication proxy. telnet—Specifies Telnet to trigger that authentication proxy. inactivity-timer min—Overrides global authentication proxy cache timer for a specific authentication proxy name. absolute-timer min— Overrides the global value specified via the ip auth-proxy command. list {acl acl-name}—Specifies a standard (1–99), extended (1–199), or named access list to use with the authentication proxy.

	Command or Action	Purpose
Step 6	interface <i>type</i> Example: Router (config)# interface e0	Enters interface configuration mode by specifying the interface type on which to apply the authentication proxy.
Step 7	ip auth-proxy <i>auth-proxy-name</i> Example: Router(config-if)# ip auth-proxy authproxyrule	In interface configuration mode, applies the named authentication proxy rule at the interface. This command enables the authentication proxy rule with that name.

Verifying FTP or Telnet Authentication Proxy

To verify your FTP or Telnet authentication proxy configuration, perform the following optional steps:

SUMMARY STEPS

1. **enable**
2. **show ip auth-proxy configuration**
3. **show ip auth-proxy cache**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	show ip auth-proxy configuration Example: Router# show ip auth-proxy configuration	Displays the current authentication proxy configuration.
Step 3	show ip auth-proxy cache Example: Router# show ip auth-proxy cache	Displays the list of user authentication entries. The authentication proxy cache lists the host IP address, the source port number, the timeout value for the authentication proxy, and the state of the connection. If the authentication proxy state is ESTAB or INTERCEPT, the user authentication was successful.

Monitoring and Maintaining FTP or Telnet Authentication Proxy Sessions

To monitor FTP or Telnet authentication proxy sessions, perform the following optional steps:

SUMMARY STEPS

1. **enable**
2. **debug ip auth-proxy {detailed | ftp | function-trace | object-creation | object-deletion | telnet | timers}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	debug ip auth-proxy {detailed ftp function-trace object-creation object-deletion telnet timers} Example: Router# debug ip auth-proxy ftp	Displays the authentication proxy configuration information on the router.

Configuration Examples for FTP and Telnet Authentication Proxy

This section provides the following configuration examples:

- [Authentication Proxy Configuration Example, page 12](#)
- [AAA Server User Profile Examples, page 13](#)

Authentication Proxy Configuration Example

The following example shows how to configure your router for authentication proxy:

```

aaa new-model
aaa authentication login default group tacacs+
aaa authorization exec default group tacacs+
aaa authorization auth-proxy default group tacacs+
enable password lab
!
ip inspect name pxy_test ftp
ip auth-proxy name pxy auth-cache-time 1
!
interface Ethernet0/0
 ip address 209.165.200.225 255.255.255.224
 ip access-group 105 in
 no ip directed-broadcast
 ip inspect pxy_test in
 ip auth-proxy pxy
 no shut
!
interface Ethernet0/1
 ip address 209.165.200.225 255.255.255.224
 ip access-group 102 in
 no ip directed-broadcast

```

```

no shut
!

  transport input none
  login authentication special
line aux 0
line vty 0 4
  password lab

```

AAA Server User Profile Examples

This section includes examples of the authentication proxy user profile entries on the AAA servers. The “proxyacl” entries define the user access privileges. After the user has successfully used the authentication proxy to log in, these entries are transferred to the firewall router. Each entry in the profile must specify “permit” access for the service or application. The source address in each entry is set to “any”, which is replaced with the IP address of the authenticating host when the profile is downloaded to the firewall. The privilege level must be set to 15 for all AAA users.

This section contains the following examples:

- [TACACS+ User Profiles Example](#)
- [Livingston RADIUS User Profiles Example](#)
- [Ascend RADIUS User Profiles Example](#)

TACACS+ User Profiles Example

The following example are sample TACACS+ user profiles:

```

default authorization = permit
key = cisco
user = http_1 {
  default service = permit
  login = cleartext test
  service = exec
  {
    priv-lvl = 15
    inacl#4="permit tcp any host 209.165.200.234 eq 23"
    inacl#5="permit tcp any host 209.165.200.234 eq 20"
    inacl#6="permit tcp any host 209.165.200.234 eq 21"
    inacl#3="deny -1"
  }
}

```

```

service = auth-proxy
{
    priv-lvl=15
    proxyacl#4="permit tcp any host 209.165.201.1 eq 23"
    proxyacl#5="permit tcp any host 209.165.201.1 eq 20"
    proxyacl#6="permit tcp any host 209.165.201.1 eq 21"
    proxyacl#7="permit tcp any host 209.165.201.1 eq 25"
}

}

user = http {
    login = cleartext test
    service = auth-proxy
    {
        priv-lvl=15
        proxyacl#4="permit tcp any host 209.165.201.1 eq 23"
        proxyacl#5="permit tcp any host 209.165.201.1 eq 20"
        proxyacl#6="permit tcp any host 209.165.201.1 eq 21"
    }
}

user = proxy_1 {
    login = cleartext test
    service = auth-proxy
    {
        priv-lvl=14
    }
}

user = proxy_3 {
    login = cleartext test
    service = auth-proxy
    {
        priv-lvl=15
    }
}

```

Livingston RADIUS User Profiles Example

The following examples are sample user profiles for the Livingston RADIUS server:

```

#----- Proxy user -----

http          Password = "test" User-Service-Type=Outbound-User
cisco-avpair = "auth-proxy:priv-lvl=15",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

http_1        Password = "test"
User-Service-Type = Shell-User,
User-Service-Type=Dialout-Framed-User,
cisco-avpair = "shell:priv-lvl=15",
cisco-avpair = "shell:inacl#4=permit tcp any host 209.165.200.234
eq 23
cisco-avpair = "auth-proxy:priv-lvl=15",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

http_fail     Password = "test" User-Service-Type=Outbound-User
cisco-avpair = "auth-proxy:priv-lvl=14",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

proxy Password = "cisco" User-Service-Type=Outbound-User      cisco-avpair =
"auth-proxy:proxyacl#4=permit tcp any any eq 20"

```

Ascend RADIUS User Profiles Example

The following examples are sample user profiles for the Ascend RADIUS server:

```
#----- Proxy user -----

http          Password = "test" User-Service=Dialout-Framed-User
cisco-avpair = "auth-proxy:priv-lvl=15",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

http_2        Password = "test"
User-Service=Dialout-Framed-User
cisco-avpair = "auth-proxy:priv-lvl=15",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23",
cisco-avpair = "shell:inacl#4=permit tcp any host 209.165.200.234 eq 25"

http_1        Password = "test"
User-Service=Dialout-Framed-User,
cisco-avpair = "shell:inacl#4=permit tcp any host 209.165.200.234 eq 23",
cisco-avpair = "auth-proxy:priv-lvl=15",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

http_fail     Password = "test" User-Service=Dialout-Framed-User
cisco-avpair = "auth-proxy:priv-lvl=14",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq 23"

cisco-avpair = "auth-proxy:proxyacl#1=permit tcp any any eq 23",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq ftp",
cisco-avpair = "auth-proxy:proxyacl#4=permit tcp any any eq 20"

#-----

proxy Password = "cisco" User-Service = Dialout-Framed-User

cisco-avpair = "auth-proxy:priv-lvl=15",

cisco-avpair = "auth-proxy:priv-lvl=15",
cisco-avpair = "auth-proxy:proxyacl#1=permit tcp any any eq 26",
cisco-avpair = "auth-proxy:proxyacl#3=permit tcp any any eq ftp",
```

Transparent Bridging Support for Authentication Proxy

First Published: June 29, 2007

Last Updated: June 29, 2007

The Transparent Bridging Support for Authentication Proxy feature allows network administrators to deploy authentication proxy on existing networks without changing the statically defined IP addresses of their network-connected devices. Thus, administrators can configure a security solution that dynamically authenticates and authorizes security policies on a per user basis.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Transparent Authentication Proxy](#)” section on page 10.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Restrictions for Transparent Bridging Support for Authentication Proxy

Authentication Proxy is not supported on vLAN trunk interfaces that are configured in a bridge group.

Information About Transparent Bridging Support for Authentication Proxy

To use transparent authentication proxy in your network, you should understand the following concepts:

- [Benefits of Transparent Authentication Proxy, page 2](#)
- [Transparent Authentication Proxy Overview, page 2](#)

Benefits of Transparent Authentication Proxy

Added Security with Minimum Configuration

Users can simply configure transparent authentication proxy into an existing network without having to reconfigure their statically defined devices. Thus, the tedious and costly overhead that was required to renumber devices on the trusted network is eliminated.

Authentication Proxy on Bridged and Routed Interfaces

Authentication proxy rules on bridged interfaces can coexist with router interfaces on the same device, whenever applicable. Thus, users can deploy different authentication proxy rules on bridged and routed domains.

Transparent Authentication Proxy Overview

Authentication proxy provides dynamic, per-user authentication and authorization of network access connections. It allows network administrators to enforce security policies on per-user basis. Typically, authentication proxy is a Layer 3 functionality that is configured on routed interfaces with different networks and IP subnets on each interface.

Integrating authentication proxy with transparent bridging enables network administrators to deploy authentication proxy on an existing network without impacting the existing network configuration and IP address assignments of the hosts on the network.

Transparent Bridging Overview

If configured for bridging, a Cisco IOS device can bridge any number of interfaces. The device can complete basic bridging tasks such as learning MAC addresses on ports to restrict collision domains and running Spanning Tree Protocol (STP) to prevent looping in the topology.

Within bridging, a user can configure Integrated Routed Bridging (IRB), which allows a device to bridge on some interfaces while a Layer 3 Bridged Virtual Interface (BVI) is presented for routing. The bridge can determine whether the packet is to be bridged or routed on the basis of the destination of the Layer 2 or Layer 3 IP address in the packet. Configured with an IP address, the BVI can manage the device even if no interface is configured for routing.

How to Configure Transparent Authentication Proxy

To configure authentication proxy on bridged interfaces, you must configure the interface in a bridge group and apply an authentication proxy rule on the interface. You must also set up and configure the authentication, authorization, and accounting (AAA) server (Cisco ACS) for authentication proxy. For examples on how to configure authentication proxy on a bridged interface, see the section, [“Configuration Examples for Transparent Authentication Proxy”](#) section on page 3.

Configuration Examples for Transparent Authentication Proxy

This section contains the following configuration examples, which show how to configure authentication proxy on a bridged interface:

- [Authentication Proxy in Transparent Bridge Mode: Example, page 3](#)
- [Authentication Proxy in Concurrent Route Bridge Mode: Example, page 4](#)
- [Authentication Proxy in Integrated Route Bridge Mode: Example, page 6](#)

Authentication Proxy in Transparent Bridge Mode: Example

The following example (see [Figure 1](#)) shows how to configure authentication proxy in a transparent bridged environment in which network users (that is, hosts on the bridged interface FastEthernet 5/0) are challenged for user credentials before being given access to protected resources.

Figure 1 Authentication Proxy in Transparent Bridging Mode: Sample Topology

```

Authentication Proxy in Concurrent Route Bridge Mode: Example

Concurrent routing and bridging configuration mode allows routing and bridging to occur in the same router; however, the given protocol is not switched between the two domains. Instead, routed traffic is confined to the routed interfaces and bridged traffic is confined to the bridged interfaces.

The following example (see [Figure 2](#)) shows how to configure authentication proxy in a concurrent routing and bridging environment in which network users (that is, hosts on the bridged interface FastEthernet 5/0) are challenged for user credentials before being given access to protected resources.

Figure 2 Authentication Proxy in Concurrent Route Bridge Mode: Sample Topology

```

Authentication Proxy in Integrated Route Bridge Mode: Example

In an integrated routing and bridging environment, a bridged network is interconnected with a router network. Both routing and bridging can occur in the same router with connectivity between routed and bridged domains.

The following example (see [Figure 3](#)) shows how to configure authentication proxy in an integrated routing and bridging environment in which network users (that is, hosts on the bridged interface FastEthernet 5/0) are challenged for user credentials before being given access to protected resources.

Configuring Port to Application Mapping

This chapter describes the Cisco IOS Firewall Port to Application Mapping (PAM) feature. PAM enables CBAC-supported applications to be run on nonstandard ports. Using PAM, network administrators can customize access control for specific applications and services to meet the distinct needs of their networks.

For a complete description of the PAM commands in this chapter, refer to the chapter “Port to Application Mapping Commands” of the *Cisco IOS Security Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

In This Chapter

This chapter contains the following sections:

- [About Port to Application Mapping](#)
- [PAM Configuration Task List](#)
- [Monitoring and Maintaining PAM](#)
- [PAM Configuration Examples](#)

About Port to Application Mapping

Port to Application Mapping (PAM) is a feature of the Cisco IOS Firewall feature set. PAM allows you to customize TCP or UDP port numbers for network services or applications. PAM uses this information to support network environments that run services using ports that are different from the registered or well-known ports associated with an application.

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2007 Cisco Systems, Inc. All rights reserved.

Using the port information, PAM establishes a table of default port-to-application mapping information at the firewall. The information in the PAM table enables Context-based Access Control (CBAC) supported services to run on nonstandard ports. Previously, CBAC was limited to inspecting traffic using only the well-known or registered ports associated with an application. Now, PAM allows network administrators to customize network access control for specific applications and services.

PAM also supports host or subnet specific port mapping, which allows you to apply PAM to a single host or subnet using standard access control lists (ACLs). Host or subnet specific port mapping is done using standard ACLs.

This section contains the following sections:

- [How PAM Works](#)
- [System-Defined Port Mapping](#)
- [PAM and CBAC](#)
- [When to Use PAM](#)

How PAM Works

PAM generates a table of information that identifies specific applications with specific TCP or UDP port information. When the firewall router first starts up, the PAM table is populated with system-defined mapping information. As you customize the mapping information, the PAM table is modified with the new information. The information in the PAM table serves as the default port mapping for traffic passing through the firewall.

PAM works with CBAC to identify the applications associated with various port numbers, including services running on non-standard ports, as it inspect traffic passing through the firewall. Previously, CBAC was limited to inspecting traffic using only the well-known or registered ports associated with an application.

Entries in the PAM table provide three types of mapping information:

- [System-Defined Port Mapping](#)
- [User-Defined Port Mapping](#)
- [Host-Specific Port Mapping](#)

System-Defined Port Mapping

PAM creates a table, or database, of system-defined mapping entries using the well-known or registered port mapping information set up during the system start-up. The system-defined entries comprise all the services supported by CBAC, which requires the system-defined mapping information to function properly. The system-defined mapping information cannot be deleted or changed; that is, you cannot map HTTP services to port 21 (FTP) or FTP services to port 80 (HTTP).

Note

You can override the system-defined entries for specific hosts using the PAM host-specific option. Refer to the section [“Host-Specific Port Mapping”](#) in this chapter.

[Table 42](#) lists the default system-defined services and applications in the PAM table.

Table 42 **System-Defined Port Mapping**

Application Name	Well-Known or Registered Port Number	Protocol Description
cuseeme	7648	CU-SeeMe Protocol
exec	512	Remote Process Execution
ftp	21	File Transfer Protocol (control port)
http	80	Hypertext Transfer Protocol
h323	1720	H.323 Protocol (for example, MS NetMeeting, Intel Video Phone)
login	513	Remote login

This section has the following sections:

- [User-Defined Port Mapping](#)
- [Host-Specific Port Mapping](#)

User-Defined Port Mapping

Network services or applications that use non-standard ports require user-defined entries in the PAM table. For example, your network might run HTTP services on the non-standard port 8000 instead of on the system-defined default port (port 80). In this case, you can use PAM to map port 8000 with HTTP services. If HTTP services run on other ports, use PAM to create additional port mapping entries. After you define a port mapping, you can overwrite that entry at a later time by simply mapping that specific port with a different application.

Note

If you try to map an application to a system-defined port, a message appears that warns you of a mapping conflict.

User-defined port mapping information can also specify a range of ports for an application by establishing a separate entry in the PAM table for each port number in the range.

User-defined entries are saved with the default mapping information when you save the router configuration.

Host-Specific Port Mapping

User-defined entries in the mapping table can include host-specific mapping information, which establishes port mapping information for specific hosts or subnets. In some environments, it might be necessary to override the default port mapping information for a specific host or subnet.

With host-specific port mapping, you can use the same port number for different services on different hosts. This means that you can map port 8000 with HTTP services for one host, while mapping port 8000 with Telnet services for another host.

Host-specific port mapping also allows you to apply PAM to a specific subnet when that subnet runs a service that uses a port number that is different from the port number defined in the default mapping information. For example, hosts on subnet 192.168.21.0 might run HTTP services on non-standard port 8000, while other traffic through the firewall uses the default port for HTTP services, which is port 80.

Host-specific port mapping allows you to override a system-defined entry in the PAM table. For example, if CBAC finds an entry in the PAM table that maps port 25 (the system-defined port for SMTP) with HTTP for a specific host, CBAC identifies port 25 as HTTP protocol traffic on that host.

Note

If the host-specific port mapping information is the same as an existing system-defined or user-defined default entries, host-specific port changes have no effect.

PAM and CBAC

CBAC uses the information in the PAM table to identify a service or application from traffic flowing through the firewall. With PAM, CBAC can associate non-standard port numbers with specific protocols. For example, if you use PAM to map port 8000 with HTTP services, CBAC can determine that traffic using port 8000 is an HTTP application.

When to Use PAM

Here are a few examples of when you might want to use PAM:

- Use PAM to apply a non-standard port numbers for a service or application.
- Use PAM when a specific host or subnet uses a port number for an application that is different than the default port number established in the PAM table.
- Use PAM when different hosts use the same port number for different applications.

PAM Configuration Task List

See the following sections for PAM configuration tasks. Each task in the list indicates if it is optional or required:

- [Configuring Standard ACLs](#) (Optional)
- [Configuring PAM](#) (Required)
- [Verifying PAM](#) (Optional)

Configuring Standard ACLs

If you require PAM for a specific host or subnet, use the **access-list** (standard) command in global configuration mode to define an ACL:

Command	Purpose
Router(config)# access-list <i>access-list-number</i> permit <i>source</i> [<i>source-wildcard</i>]	(Optional) Creates a standard ACL that defines the specific host or subnet for host-specific PAM. For complete information on access-list command, refer to the <i>Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services</i> .

Configuring PAM

To configure PAM, use the **ip port-map** command in global configuration mode:

Command	Purpose
Router(config)# ip port-map <i>appl_name</i> port <i>port_num</i> [list <i>acl_num</i>]	Establishes a port mapping entry using the TCP or UDP port number and the application name. (Optional) Use the list option to associate this port mapping to the specific hosts in the ACL. (PAM uses standard access lists only.) If an access list is included, the hosts defined in that ACL have the application <i>appl_name</i> running on port <i>port_num</i> .

Verifying PAM

To verify the port mapping information, enter the **show ip port-map** command in privileged EXEC mode and review the entries:

```
Router# show ip port-map
```

This command displays all entries in the PAM table, including the system-defined entries.

For PAM configuration examples using the commands in this chapter, refer to the “[PAM Configuration Examples](#)” section at the end of this chapter.

Monitoring and Maintaining PAM

The following commands can be used to monitor and maintain PAM:

Command	Purpose
Router# show ip port-map [<i>appl_name</i> port <i>port_num</i>]	Displays the port mapping information, including the system-defined entries. Include the application name to display a list of entries by application. Include the port number to display the entries by port.
Router(config)# no ip port-map <i>appl_name</i> port <i>port_num</i> [list <i>acl_num</i>]	Deletes user-defined port mapping information. This command has no effect on the system-defined port mapping information.

PAM Configuration Examples

The following sections provide PAM configuration examples:

- [Mapping an Application to a Non-Standard Port Example](#)
- [Mapping an Application with a Port Range Example](#)
- [Invalid Port Mapping Entry Example](#)
- [Mapping an Application to a Port for a Specific Host Example](#)
- [Mapping an Application to a Port for a Subnet Example](#)
- [Overriding a System-Defined Port Mapping Example](#)
- [Mapping Different Applications to the Same Port Example](#)

Mapping an Application to a Non-Standard Port Example

In this example, non-standard port 8000 is established as the user-defined default port mapping for HTTP services:

```
ip port-map http port 8000
```

Mapping an Application with a Port Range Example

The following PAM entries establish a range of non-standard ports for HTTP services:

```
ip port-map http 8001
ip port-map http 8002
ip port-map http 8003
ip port-map http 8004
```

Invalid Port Mapping Entry Example

This example is not valid because it tries to establish port 21, which is the system-defined default port for FTP, as the user-defined port for HTTP services:

```
ip port-map http port 21
```

Mapping an Application to a Port for a Specific Host Example

In this example, a specific host uses port 8000 for FTP services. ACL 10 identifies the server address (192.168.32.43), while port 8000 is mapped with FTP services.

```
access-list 10 permit 192.168.32.43
ip port-map ftp port 8000 list 10
```

Mapping an Application to a Port for a Subnet Example

In this example, a specific subnet runs HTTP services on port 8080. ACL 50 identifies the subnet, while port 8080 is mapped with HTTP services.

```
access-list 50 permit 192.168.92.0 0.0.0.255
ip port-map http 8080 list 50
```

Overriding a System-Defined Port Mapping Example

In this example, a specific host runs HTTP services on port 25, which is the system-defined port number for SMTP services. This requires a host-specific PAM entry that overrides the system-defined default port mapping for HTTP, which is port 80. ACL 15 identifies the host address (192.168.33.33), while port 25 is mapped with HTTP services.

```
access-list 15 permit 192.168.33.33
ip port-map http port 25 list 15
```

Mapping Different Applications to the Same Port Example

In this example, the same port number is required by different services running on different hosts. Port 8000 is required for HTTP services for host 192.168.3.4, while port 8000 is also required for FTP services for host 192.168.5.6. ACL 10 and ACL 20 identify the specific hosts, while the PAM entries map the ports with the services for each ACL.

```
access-list 10 permit 192.168.3.4
access-list 20 permit 192.168.5.6
ip port-map http port 8000 list 10
ip port-map http ftp 8000 list 20
```

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and

coincidental.

IPSec and IKE

Internet Key Exchange for IPSec VPNs

Configuring Internet Key Exchange for IPSec VPNs

This module describes how to configure the Internet Key Exchange (IKE) protocol for basic IP Security (IPSec) virtual private networks (VPNs). IKE is a key management protocol standard that is used in conjunction with the IPSec standard. IPSec is an IP security feature that provides robust authentication and encryption of IP packets.

IPSec can be configured without IKE, but IKE enhances IPSec by providing additional features, flexibility, and ease of configuration for the IPSec standard.

IKE is a hybrid protocol, which implements the Oakley key exchange and Skeme key exchange inside the Internet Security Association Key Management Protocol (ISAKMP) framework. (ISAKMP, Oakley, and Skeme are security protocols implemented by IKE.)

Module History

This module was first published on May 2, 2005, and last updated on May 2, 2005.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all features. To find information about feature support and configuration, use the [“Feature Information for Configuring IKE for IPSec VPNs”](#) section on page 24.

Prerequisites for IKE Configuration

- You should be familiar with the concepts and tasks explained in the module “Configuring Security for VPNs with IPSec.”
- Ensure that your access control lists (ACLs) are compatible with IKE. Because IKE negotiation uses User Datagram Protocol (UDP) on port 500, your ACLs must be configured so that UDP port 500 traffic is not blocked at interfaces used by IKE and IPSec. In some cases you might need to add a statement to your ACLs to explicitly permit UDP port 500 traffic.

Restrictions for IKE Configuration

The following restrictions are applicable when configuring IKE negotiation:

- The initiating router *must not* have a certificate associated with the remote peer.
- The preshared key *must* be by fully qualified domain name (FQDN) on both peers. (To configure the preshared key, enter the **crypto isakmp key** command.)
- The communicating routers *must* have a FQDN host entry for each other in their configurations.
- The communicating routers *must* be configured to authenticate by hostname, *not* by IP address; thus, you should use the **crypto isakmp identity hostname** command.

Information About Configuring IKE for IPSec VPNs

To configure IKE for IPSec VPNs, you should understand the following concepts:

- [Supported Standards for Use with IKE, page 2](#)
- [IKE Benefits, page 4](#)
- [IKE Main Mode and Aggressive Mode, page 4](#)

Supported Standards for Use with IKE

Cisco implements the following standards:

- IPSec—IP Security Protocol. IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer; it uses IKE to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.
- ISAKMP—Internet Security Association and Key Management Protocol. A protocol framework that defines payload formats, the mechanics of implementing a key exchange protocol, and the negotiation of a security association.
- Oakley—A key exchange protocol that defines how to derive authenticated keying material.
- Skeme—A key exchange protocol that defines how to derive authenticated keying material, with rapid key refreshment.

The component technologies implemented for use by IKE include the following:

- **AES**—Advanced Encryption Standard. A cryptographic algorithm that protects sensitive, unclassified information. AES is privacy transform for IPSec and IKE and has been developed to replace the DES. AES is designed to be more secure than DES: AES offers a larger key size, while ensuring that the only known approach to decrypt a message is for an intruder to try every possible key. AES has a variable key length—the algorithm can specify a 128-bit key (the default), a 192-bit key, or a 256-bit key.
- **DES**—Data Encryption Standard. An algorithm that is used to encrypt packet data. IKE implements the 56-bit DES-CBC with Explicit IV standard. Cipher Block Chaining (CBC) requires an initialization vector (IV) to start encryption. The IV is explicitly given in the IPSec packet.

Cisco IOS software also implements Triple DES (168-bit) encryption, depending on the software versions available for a specific platform. Triple DES (3DES) is a strong form of encryption that allows sensitive information to be transmitted over untrusted networks. It enables customers, particularly in the finance industry, to utilize network-layer encryption.

**Note**

Cisco IOS images that have strong encryption (including, but not limited to, 56-bit data encryption feature sets) are subject to United States government export controls, and have a limited distribution. Images that are to be installed outside the United States require an export license. Customer orders might be denied or subject to delay because of United States government regulations. Contact your sales representative or distributor for more information, or send e-mail to export@cisco.com.

- **SEAL**—Software Encryption Algorithm. An alternative algorithm to software-based DES, 3DES, and AES. SEAL encryption uses a 160-bit encryption key and has a lower impact to the CPU when compared to other software-based algorithms.
- **Diffie-Hellman**—A public-key cryptography protocol that allows two parties to establish a shared secret over an unsecure communications channel. Diffie-Hellman is used within IKE to establish session keys. 768-bit (the default), 1024-bit, and 1536-bit Diffie-Hellman groups are supported.
- **MD5 (HMAC variant)**—Message Digest 5. A hash algorithm used to authenticate packet data. HMAC is a variant that provides an additional level of hashing.
- **SHA (HMAC variant)**—Secure Hash Algorithm. A hash algorithm used to authenticate packet data. HMAC is a variant that provides an additional level of hashing.
- **RSA signatures and RSA encrypted nonces**—RSA is the public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. RSA signatures provide nonrepudiation, and RSA encrypted nonces provide repudiation. (Repudiation and nonrepudiation have to do with traceability.)

IKE interoperates with the following standard:

X.509v3 certificates—Used with the IKE protocol when authentication requires public keys. This certificate support allows the protected network to scale by providing the equivalent of a digital ID card to each device. When two devices intend to communicate, they exchange digital certificates to prove their identity (thus removing the need to manually exchange public keys with each peer or to manually specify a shared key at each peer).

IKE Benefits

IKE automatically negotiates IPSec security associations (SAs) and enables IPSec secure communications without costly manual preconfiguration. Specifically, IKE provides the following benefits:

- Eliminates the need to manually specify all the IPSec security parameters in the crypto maps at both peers.
- Allows you to specify a lifetime for the IPSec SA.
- Allows encryption keys to change during IPSec sessions.
- Allows IPSec to provide anti-replay services.
- Permits certification authority (CA) support for a manageable, scalable IPSec implementation.
- Allows dynamic authentication of peers.

IKE Main Mode and Aggressive Mode

IKE has two phases of key negotiation: phase 1 and phase 2. Phase 1 negotiates a security association (a key) between two IKE peers. The key negotiated in phase 1 enables IKE peers to communicate securely in phase 2. During phase 2 negotiation, IKE establishes keys (security associations) for other applications, such as IPSec.

Phase 1 negotiation can occur using main mode or aggressive mode. Main mode tries to protect all information during the negotiation, meaning that no information is available to a potential attacker. When main mode is used, the identities of the two IKE peers are hidden. Although this mode of operation is very secure, it is relatively costly in terms of the time it takes to complete the negotiation. Aggressive mode takes less time to negotiate keys between peers; however, it gives up some of the security provided by main mode negotiation. For example, the identities of the two parties trying to establish a security association are exposed to an eavesdropper.

The two modes serve different purposes and have different strengths. Main mode is slower than aggressive mode, but main mode is more secure and more flexible because it can offer an IKE peer more security proposals than aggressive mode. Aggressive mode is less flexible and not as secure, but much faster.

In Cisco IOS software, the two modes are not configurable. The default action for IKE authentication (rsa-sig, rsa-encr, or preshared) is to initiate main mode; however, in cases where there is no corresponding information to initiate authentication, and there is a preshared key associated with the hostname of the peer, Cisco IOS software can initiate aggressive mode. Cisco IOS software will respond in aggressive mode to an IKE peer that initiates aggressive mode.

How to Configure IKE for IPSec VPNs

If you do not want IKE to be used with your IPSec implementation, you can disable it at all IPSec peers via the **no crypto isakmp** command, skip the rest of this chapter, and begin your IPSec VPN.

Note

If you disable IKE, you will have to manually specify all the IPSec SAs in the crypto maps at all peers, the IPSec SAs of the peers will never time out for a given IPSec session, the encryption keys will never change during IPSec sessions between the peers, anti-replay services will not be available between the peers, and public key infrastructure (PKI) support cannot be used.

IKE is enabled by default. IKE does not have to be enabled for individual interfaces, but it is enabled globally for all interfaces at the router.

Perform the following tasks to provide authentication of IPSec peers, negotiate IPSec SAs, and establish IPSec keys:

- [Creating IKE Policies: Security Parameters for IKE Negotiation, page 5](#) (required)
- [Configuring IKE Authentication, page 9](#) (required)
- [Configuring IKE Mode Configuration, page 17](#)

Creating IKE Policies: Security Parameters for IKE Negotiation

An IKE policy defines a combination of security parameters to be used during the IKE negotiation. You must create an IKE policy at each peer participating in the IKE exchange.

If you do not configure any IKE policies, your router will use the default policy, which is always set to the lowest priority and which contains the default value of each parameter.

About IKE Policies

Because IKE negotiations must be protected, each IKE negotiation begins by agreement of both peers on a common (shared) IKE policy. This policy states which security parameters will be used to protect subsequent IKE negotiations and mandates how the peers are authenticated.

After the two peers agree upon a policy, the security parameters of the policy are identified by an SA established at each peer, and these SAs apply to all subsequent IKE traffic during the negotiation.

You can configure multiple, prioritized policies on each peer—each with a different combination of parameter values. However, at least one of these policies must contain exactly the same encryption, hash, authentication, and Diffie-Hellman parameter values as one of the policies on the remote peer. For each policy that you create, you assign a unique priority (1 through 10,000, with 1 being the highest priority).

Tip

If you are interoperating with a device that supports only one of the values for a parameter, your choice is limited to the value supported by the other device. Aside from this limitation, there is often a trade-off between security and performance, and many of these parameter values represent such a trade-off. You should evaluate the level of security risks for your network and your tolerance for these risks.

IKE Peers Agreeing Upon a Matching IKE Policy

When the IKE negotiation begins, IKE searches for an IKE policy that is the same on both peers. The peer that initiates the negotiation will send all its policies to the remote peer, and the remote peer will try to find a match. The remote peer looks for a match by comparing its own highest priority policy against the policies received from the other peer. The remote peer checks each of its policies in order of its priority (highest priority first) until a match is found.

A match is made when both policies from the two peers contain the same encryption, hash, authentication, and Diffie-Hellman parameter values, and when the remote peer's policy specifies a lifetime that is less than or equal to the lifetime in the policy being compared. (If the lifetimes are not identical, the shorter lifetime—from the remote peer's policy—will be used.)

If a match is found, IKE will complete negotiation, and IPSec security associations will be created. If no acceptable match is found, IKE refuses negotiation and IPSec will not be established.

**Note**

Depending on which authentication method is specified in a policy, additional configuration might be required (as described in the section “[Configuring IKE Authentication](#)”). If a peer’s policy does not have the required companion configuration, the peer will not submit the policy when attempting to find a matching policy with the remote peer.

Restrictions

If you are configuring an AES IKE policy, note the following restrictions:

- Your router must support IPSec and long keys (the “k9” subsystem).
- AES cannot encrypt IPSec and IKE traffic if an acceleration card is present.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp policy** *priority*
4. **encryption** {des | 3des | aes | aes 192 | aes 256}
5. **hash** {sha | md5}
6. **authentication** {rsa-sig | rsa-encr | pre-share}
7. **group** {1 | 2 | 5}
8. **lifetime** *seconds*
9. **exit**
10. **exit**
11. **show crypto isakmp policy**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto isakmp policy <i>priority</i> Example: Router(config)# crypto isakmp policy 10	Defines an IKE policy and enters config-isakmp configuration mode. <ul style="list-style-type: none"> <i>priority</i>—Uniquely identifies the IKE policy and assigns a priority to the policy. Valid values: 1 to 10,000; 1 is the highest priority.
Step 4	encryption {des 3des aes aes 192 aes 256} Example: Router(config-isakmp)# encryption aes 256	Specifies the encryption algorithm. By default, the des keyword is used. <ul style="list-style-type: none"> des—56-bit DES-CBC 3des—168-bit DES aes—128-bit AES aes 192—192-bit AES aes 256—256-bit AES
Step 5	hash {sha md5} Example: Router(config-isakmp)# hash sha	Specifies the hash algorithm. By default, SHA-1 (sha) is the used. Note MD5 has a smaller digest and is considered to be slightly faster than SHA-1.
Step 6	authentication {rsa-sig rsa-encr pre-share} Example: Router(config-isakmp)# authentication pre-share	Specifies the authentication method. By default, RSA signatures are used. <ul style="list-style-type: none"> rsa-sig—RSA signatures require that you configure your peer routers to obtain certificates from a CA. rsa-encr—RSA encrypted nonces require that you ensure each peer has the other peer's RSA public keys. pre-share—Preshared keys require that you separately configure these preshared keys.

	Command or Action	Purpose
Step 7	group {1 2 5} Example: Router(config-isakmp)# group 1	Specifies the Diffie-Hellman group identifier. By default, D-H group 1 is used. <ul style="list-style-type: none"> 1—768-bit Diffie-Hellman 2—1024-bit Diffie-Hellman 5—1536-bit Diffie-Hellman Note The 1024-bit and 1536-bit Diffie-Hellman options are harder to “crack,” but require more CPU time to execute.
Step 8	lifetime <i>seconds</i> Example: Router(config-isakmp)# lifetime 180	Specifies the lifetime of the IKE SA. <ul style="list-style-type: none"> <i>seconds</i>—Time, in seconds, before each SA expires. Valid values: 60 to 86,400 seconds; default value: 86,400. Note The shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPSec SAs can be set up more quickly.
Step 9	exit Example: Router(config-isakmp)# exit	Exits config-isakmp configuration mode.
Step 10	exit Example: Router(config)# exit	Exits the global configuration mode.
Step 11	show crypto isakmp policy Example: Router# show crypto isakmp policy	(Optional) Displays all existing IKE policies.
Step 12	—	Repeat these steps for each policy you want to create.

**Note**

These parameters apply to the IKE negotiations after the IKE SA is established.

Examples

The following sample output from the **show crypto isakmp policy** command displays a warning message after a user tries to configure an IKE encryption method that the hardware does not support:

```
Router# show crypto isakmp policy
```

```
Protection suite of priority 1
  encryption algorithm: AES - Advanced Encryption Standard (256 bit keys).
WARNING:encryption hardware does not support the configured
encryption method for ISAKMP policy 1
  hash algorithm:      Secure Hash Standard
  authentication method: Pre-Shared Key
```

```
Diffie-Hellman group:  #1 (768 bit)
lifetime:              3600 seconds, no volume limit
```

Troubleshooting Tips

- Clear (and reinitialize) IPSec SAs by using the **clear crypto sa EXEC** command.
Using the **clear crypto sa** command without parameters will clear out the full SA database, which will clear out active security sessions. You may also specify the **peer**, **map**, or **entry** keywords to clear out only a subset of the SA database. For more information, see the **clear crypto sa** command in the *Cisco IOS Security Command Reference*, Release 12.4.
- The default policy and default values for configured policies do not show up in the configuration when you issue the **show running-config** command. To see the default policy and any default values within configured policies, use the **show crypto isakmp policy** command.
- Any IPSec transforms or IKE encryption methods that the current hardware does not support should be disabled; they are ignored whenever an attempt to negotiate with the peer is made.

If a user enters an IPSec transform or an IKE encryption method that the hardware does not support, a warning message will be generated. These warning messages are also generated at boot time. When an encrypted card is inserted, the current configuration is scanned. If any IPSec transforms or IKE encryption methods are found that are not supported by the hardware, a warning message will be generated.

What to Do Next

Depending on which authentication method you specified in your IKE policies (RSA signatures, RSA encrypted nonces, or preshared keys), you must do certain additional configuration tasks before IKE and IPSec can successfully use the IKE policies. For information on completing these additional tasks, refer to the following section “[Configuring IKE Authentication](#).”

To configure an AES-based transform set, see the module “Configuring Security for VPNs with IPSec.”

Configuring IKE Authentication

After you have created at least one IKE policy in which you specified an authentication method (or accepted the default method), you need to configure an authentication method. IKE policies cannot be used by IPSec until the authentication method is successfully configured.

To configure IKE authentication, you should perform one of the following tasks, as appropriate:

- [Configuring RSA Keys Manually for RSA Encrypted Nonces, page 11](#)
- [Configuring Preshared Keys, page 13](#)
- Configuring RSA Keys to Obtain Certificates from a CA. For information on completing this task, see the module “Deploying RSA Keys Within a PKI.”

IKE Authentication Methods: Overview

IKE authentication consists of three options—RSA signatures, RSA encrypted nonces, and preshared keys. Each authentication method requires additional configuration as follows:

RSA Signatures

With RSA signatures, you can configure the peers to obtain certificates from a CA. (The CA must be properly configured to issue the certificates.) Using a CA can dramatically improve the manageability and scalability of your IPSec network. Additionally, RSA signature-based authentication uses only two public key operations, whereas RSA encryption uses four public key operations, making it costlier in terms of overall performance. To properly configure CA support, see the chapter “Implementing and Managing a PKI.”

The certificates are used by each peer to exchange public keys securely. (RSA signatures requires that each peer has the public signature key of the remote peer.) When both peers have valid certificates, they will automatically exchange public keys with each other as part of any IKE negotiation in which RSA signatures are used.

You can also exchange the public keys manually, as described in the section “[Configuring RSA Keys Manually for RSA Encrypted Nonces](#).”

RSA signatures provide nonrepudiation for the IKE negotiation. And, you can prove to a third party after the fact that you did indeed have an IKE negotiation with the remote peer.

RSA Encrypted Nonces

With RSA encrypted nonces, you must ensure that each peer has the public keys of the other peers.

Unlike RSA signatures, the RSA encrypted nonces method can not use certificates to exchange public keys. Instead, you ensure that each peer has the others’ public keys by one of the following methods:

- Manually configuring RSA keys as described in the section “[Configuring RSA Keys Manually for RSA Encrypted Nonces](#).”
- or
- Ensuring that an IKE exchange using RSA signatures with certificates has already occurred between the peers. (The peers’ public keys are exchanged during the RSA-signatures-based IKE negotiations if certificates are used.)

To make that the IKE exchange happens, specify two policies: a higher-priority policy with RSA encrypted nonces and a lower-priority policy with RSA signatures. When IKE negotiations occur, RSA signatures will be used the first time because the peers do not yet have each other’s public keys. Then future IKE negotiations can use RSA encrypted nonces because the public keys will have been exchanged.

Note This alternative requires that you already have CA support configured.

RSA encrypted nonces provide repudiation for the IKE negotiation; however, unlike RSA signatures, you cannot prove to a third party that you had an IKE negotiation with the remote peer.

Preshared Keys

With preshared keys, you must configure them as described in the section “[Configuring Preshared Keys](#).”

Preshared keys are clumsy to use if your secured network is large, and they do not scale well with a growing network. However, they do not require use of a CA, as do RSA signatures, and might be easier to set up in a small network with fewer than ten nodes. RSA signatures also can be considered more secure when compared with preshared key authentication.

**Note**

If RSA encryption is configured and signature mode is negotiated (and certificates are used for signature mode), the peer will request both signature and encryption keys. Basically, the router will request as many keys as the configuration will support. If RSA encryption is not configured, it will just request a signature key.

Prerequisites

You must have configured at least one IKE policy, which is where the authentication method was specified (or RSA signatures was accepted by default).

Configuring RSA Keys Manually for RSA Encrypted Nonces

To manually configure RSA keys, perform this task for each IPSec peer that uses RSA encrypted nonces in an IKE policy.

**Note**

This task can be performed only if a CA is not in use.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto key generate rsa** {general-keys | usage-keys} [**label** *key-label*] [**exportable**] [**modulus** *modulus-size*]
4. **exit**
5. **show crypto key mypubkey rsa**
6. **configure terminal**
7. **crypto key pubkey-chain rsa**
8. **named-key** *key-name* [encryption | signature]
or
addressed-key *key-address* [encryption | signature]
9. **address** *ip-address*
10. **key-string** *key-string*
11. **quit**
12. Repeat these steps at each peer that uses RSA encrypted nonces in an IKE policy.
13. **exit**
14. **exit**
15. **show crypto key pubkey-chain rsa** [**name** *key-name* | **address** *key-address*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto key generate rsa {general-keys usage-keys} [label key-label] [exportable] [modulus modulus-size] Example: Router(config)# crypto key generate rsa general-keys modulus 360	Generates RSA keys. <ul style="list-style-type: none"> If a <i>key-label</i> argument is not specified, the default value, which is the fully qualified domain name (FQDN) of the router, is used.
Step 4	exit Example: Router(config)# exit	(Optional) Exits global configuration mode.
Step 5	show crypto key mypubkey rsa Example: Router# show crypto key mypubkey rsa	(Optional) Displays the generated RSA public keys.
Step 6	configure terminal Example: Router# configure terminal	Returns to global configuration mode.
Step 7	crypto key pubkey-chain rsa Example: Router(config)# crypto key pubkey-chain rsa	Enters public key configuration mode (so you can manually specify the RSA public keys of other devices).
Step 8	named-key key-name [encryption signature] Example: Router(config-pubkey-chain)# named-key otherpeer.example.com or addressed-key key-address [encryption signature] Example: Router(config-pubkey-chain)# addressed-key 10.1.1.2 encryption	Indicates which remote peer's RSA public key you are going to specify and enters public key configuration mode. If the remote peer uses its host name as its ISAKMP identity, use the named-key command and specify the remote peer's FQDN, such as somerouter.example.com, as the <i>key-name</i> . If the remote peer uses its IP address as its ISAKMP identity, use the addressed-key command and specify the remote peer's IP address as the <i>key-address</i> .

	Command or Action	Purpose
Step 9	address <i>ip-address</i> Example: Router(config-pubkey-key)# address 10.5.5.1	Specifies the IP address of the remote peer. If you use the named-key command, you need to use this command to specify the IP address of the peer.
Step 10	key-string <i>key-string</i> Example: Router(config-pubkey-key)# key-string Router(config-pubkey)# 00302017 4A7D385B 1234EF29 335FC973 Router(config-pubkey)# 2DD50A37 C4F4B0FD 9DADE748 429618D5 Router(config-pubkey)# 18242BA3 2EDFBDD3 4296142A DDF7D3D8 Router(config-pubkey)# 08407685 2F2190A0 0B43F1BD 9A8A26DB Router(config-pubkey)# 07953829 791FCDE9 A98420F0 6A82045B Router(config-pubkey)# 90288A26 DBC64468 7789F76E EE21	Specifies the RSA public key of the remote peer. (This key was previously viewed by the administrator of the remote peer when the RSA keys of the remote router were generated.)
Step 11	quit Example: Router(config-pubkey-k)# quit	Returns to public key chain configuration mode.
Step 12	—	Repeat these steps at each peer that uses RSA encrypted nonces in an IKE policy.
Step 13	exit Example: Router(config-pubkey-c)# exit	Returns to global configuration mode.
Step 14	exit Example: Router(config)# exit	Returns to EXEC mode.
Step 15	show crypto key pubkey-chain rsa [<i>name key-name</i> <i>address key-address</i>] Example: Router# show crypto key pubkey-chain rsa	(Optional) Displays either a list of all RSA public keys that are stored on your router or details of a particular RSA key that is stored on your router.

Configuring Preshared Keys

To configure preshared keys, perform these steps at each peer that uses preshared keys in an IKE policy.

Setting ISAKMP Identity for Preshared Keys

You should set the ISAKMP identity for each peer that uses preshared keys in an IKE policy.

When two peers use IKE to establish IPsec SAs, each peer sends its identity to the remote peer. Each peer sends either its host name or its IP address, depending on how you have set the ISAKMP identity of the router.

By default, a peer's ISAKMP identity is the IP address of the peer. If appropriate, you could change the identity to be the peer's host name instead. As a general rule, set the identities of all peers the same way—either all peers should use their IP addresses or all peers should use their hostnames. If some peers use their host names and some peers use their IP addresses to identify themselves to each other, IKE negotiations could fail if the identity of a remote peer is not recognized and a DNS lookup is unable to resolve the identity.

Mask Preshared Keys

A mask preshared key allows a group of remote users with the same level of authentication to share an IKE preshared key. The preshared key of the remote peer must match the preshared key of the local peer for IKE authentication to occur.

A mask preshared key is usually distributed through a secure out-of-band channel. In a remote peer-to-local peer scenario, any remote peer with the IKE preshared key configured can establish IKE SAs with the local peer.

If you specify the **mask** keyword with the **crypto isakmp key** command, it is up to you to use a subnet address, which will allow more peers to share the same key. That is, the preshared key is no longer restricted to use between two users.

Note

Using 0.0.0.0 as a subnet address is not recommended because it encourages group preshared keys, which allow all peers to have the same group key, thereby reducing the security of your user authentication.

Disable Xauth on a Specific IPsec Peer

Disabling Extended Authentication (Xauth) for static IPsec peers prevents the routers from being prompted for Xauth information—username and password.

Without the ability to disable Xauth, a user cannot select which peer on the same crypto map should use Xauth. That is, if a user has router-to-router IPsec on the same crypto map as a VPN-client-to-Cisco-IOS IPsec, both peers are prompted for a username and password. In addition, a remote static peer (a Cisco IOS router) cannot establish an IKE SA with the local Cisco IOS router. (Xauth is not an optional exchange, so if a peer does not respond to an Xauth request, the IKE SA is deleted.) Thus, the same interface cannot be used to terminate IPsec to VPN clients (that need Xauth) as well as other Cisco IOS routers (that cannot respond to Xauth) unless this feature is implemented.

Note

Xauth can be disabled only if preshared keys are used as the authentication mechanism for the given crypto map.

Restrictions

- Preshared do not scale well with a growing network.
- Mask preshared keys have the following restrictions:
 - The SA cannot be established between the IPsec peers until all IPsec peers are configured for the same preshared key.

- The mask preshared key must be distinctly different for remote users requiring varying levels of authorization. You must configure a new preshared key for each level of trust and assign the correct keys to the correct parties. Otherwise, an untrusted party may obtain access to protected data.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp identity {address | hostname}**
4. **ip host *hostname* *address1* [*address2*...*address8*]**
5. **crypto isakmp key *keystring* **address** *peer-address* [**mask**] [**no-xauth**]**
or
crypto isakmp key *keystring* **hostname *hostname* [**no-xauth**]**
6. **crypto isakmp key *keystring* **address** *peer-address* [**mask**] [**no-xauth**]**
or
crypto isakmp key *keystring* **hostname *hostname* [**no-xauth**]**
7. Repeat these steps for each peer that uses preshared keys.

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto isakmp identity {address hostname} Example: Router(config)# crypto isakmp identity address	Specifies the peer's ISAKMP identity by IP address or by hostname at the local peer. <ul style="list-style-type: none"> address—Typically used when there is only one interface (and therefore only one IP address) that will be used by the peer for IKE negotiations, and the IP address is known. hostname—Should be used if there is more than one interface on the peer that might be used for IKE negotiations, or if the interface's IP address is unknown (such as with dynamically assigned IP addresses).
Step 4	ip host hostname address1 [address2...address8] Example: Router(config)# ip host RemoteRouter.example.com 192.168.0.1	If the local peer's ISAKMP identity was specified using a hostname, maps the peer's host name to its IP address(es) at all the remote peers. (This step might be unnecessary if the hostname or address is already mapped in a DNS server.)
Step 5	crypto isakmp key keystring address peer-address [mask] [no-xauth] Example: Router(config)# crypto isakmp key sharedkeystring address 192.168.1.33 no-xauth or crypto isakmp key keystring hostname hostname [no-xauth] Example: Router(config) crypto isakmp key sharedkeystring hostname RemoteRouter.example.com	Specifies at the local peer the shared key to be used with a particular remote peer. If the remote peer specified its ISAKMP identity with an address, use the address keyword in this step; otherwise use the hostname keyword in this step. <ul style="list-style-type: none"> no-xauth—Prevents the router from prompting the peer for Xauth information. Use this keyword if router-to-router IPSec is on the same crypto map as VPN-client-to-Cisco IOS IPSec. <p>Note According to the design of preshared key authentication in IKE main mode, preshared keys must be based on the IP address of the peers. Although you can send hostname as the identity of preshared key authentication, the key is searched on the IP address of the peer; if the key is not found (based on the IP address) the negotiation will fail.</p>

	Command or Action	Purpose
Step 6	<pre>crypto isakmp key <i>keystring</i> address <i>peer-address</i> [<i>mask</i>] [<i>no-xauth</i>]</pre> <p>Example:</p> <pre>Router(config) crypto isakmp key sharedkeystring address 10.0.0.1</pre> <p>or</p> <pre>crypto isakmp key <i>keystring</i> <i>hostname</i> <i>hostname</i> [no-xauth]</pre> <p>Example:</p> <pre>Router(config) crypto isakmp key sharedkeystring hostname LocalRouter.example.com</pre>	<p>Specifies at the remote peer the shared key to be used with the local peer.</p> <p>This is the same key you just specified at the local peer.</p> <p>If the local peer specified its ISAKMP identity with an address, use the address keyword in this step; otherwise use the hostname keyword in this step.</p>
Step 7	—	Repeat these steps at each peer that uses preshared keys in an IKE policy.

Configuring IKE Mode Configuration

Perform the following task to configure IKE mode configuration.

About IKE Mode Configuration

IKE mode configuration, as defined by the Internet Engineering Task Force (IETF) , allows a gateway to download an IP address (and other network level configuration) to the client as part of an IKE negotiation. Using this exchange, the gateway gives IP addresses to the IKE client to be used as an “inner” IP address encapsulated under IPSec. This method provides a known IP address for the client that can be matched against IPSec policy.

To implement IPSec VPNs between remote access clients that have dynamic IP addresses and a corporate gateway, you have to dynamically administer scalable IPSec policy on the gateway once each client is authenticated. With IKE Mode Configuration, the gateway can set up scalable policy for a very large set of clients irrespective of the IP addresses of those clients.

There are two types of IKE Mode Configuration:

- Gateway initiation—Gateway initiates the configuration mode with the client. Once the client responds, the IKE modifies the identity of the sender, the message is processed, and the client receives a response.
- Client initiation—Client initiates the configuration mode with the gateway. The gateway responds with an IP address that it has allocated for the client.

Restrictions

IKE Mode Configuration has the following restrictions:

- Interfaces with crypto maps that are configured for IKE Mode Configuration may experience a slightly longer connection setup time, which is true even for IKE peers that refuse to be configured or do not respond to the configuration mode request. In both cases, the gateway initiates the configuration of the client.
- This feature was not designed to enable the configuration mode for every IKE connection by default. Configure this feature at the global crypto map level.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip local pool** *pool-name start-addr end-addr*
4. **crypto isakmp client configuration address-pool local** *pool-name*
5. **crypto map** *tag* **client configuration address** [**initiate** | **respond**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip local pool pool-name start-addr end-addr Example: Router(config) ip local pool ire 172.16.23.0 172.16.23.255	Defines an existing local address pool that defines a set of addresses.
Step 4	crypto isakmp client configuration address-pool local pool-name Example: Router(config) crypto isakmp client configuration address-pool local ire	References the local address pool in the IKE configuration.
Step 5	crypto map tag client configuration address [initiate respond] Example: Router(config)# crypto map dyn client configuration address initiate	Configures IKE Mode Configuration in global crypto map configuration mode.

Configuration Examples for an IKE Configuration

This section contains the following configuration examples:

- [Creating IKE Policies: Examples, page 19](#)
- [Configuring IKE Authentication: Example, page 21](#)

Creating IKE Policies: Examples

This section contains the following examples, which show how to configure a 3DES IKE policy and an AES IKE policy:

- [Creating 3DES IKE Policies: Example, page 20](#)
- [Creating an AES IKE Policy: Example, page 20](#)

Creating 3DES IKE Policies: Example

This example creates two IKE policies, with policy 15 as the highest priority, policy 20 as the next priority, and the existing default priority as the lowest priority. It also creates a preshared key to be used with policy 20 with the remote peer whose IP address is 192.168.224.33.

```
crypto isakmp policy 15
  encryption 3des
  hash md5
  authentication rsa-sig
  group 2
  lifetime 5000
!
crypto isakmp policy 20
  authentication pre-share
  lifetime 10000
!
crypto isakmp key 1234567890 address 192.168.224.33
```

In the example, the encryption des of policy 15 would not appear in the written configuration because this is the default value for the encryption algorithm parameter.

If the **show crypto isakmp policy** command is issued with this configuration, the output is as follows:

```
Protection suite priority 15
encryption algorithm:3DES - Triple Data Encryption Standard (168 bit keys)
hash algorithm:Message Digest 5
authentication method:Rivest-Shamir-Adleman Signature
Diffie-Hellman group:#2 (1024 bit)
lifetime:5000 seconds, no volume limit
Protection suite priority 20
encryption algorithm:DES - Data Encryption Standard (56 bit keys)
hash algorithm:Secure Hash Standard
authentication method:preshared Key
Diffie-Hellman group:#1 (768 bit)
lifetime:10000 seconds, no volume limit
Default protection suite
encryption algorithm:DES - Data Encryption Standard (56 bit keys)
hash algorithm:Secure Hash Standard
authentication method:Rivest-Shamir-Adleman Signature
Diffie-Hellman group:#1 (768 bit)
lifetime:86400 seconds, no volume limit
```

Note that although the output shows “no volume limit” for the lifetimes, you can configure only a time lifetime (such as 86,400 seconds); volume-limit lifetimes are not configurable.

Creating an AES IKE Policy: Example

The following example is sample output from the **show running-config** command. In this example, the AES 256-bit key is enabled.

```
Current configuration : 1665 bytes
!
version 12.2
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname "Router1"
!
!
ip subnet-zero
!
```

```

!
no ip domain lookup
!
ip audit notify log
ip audit po max-events 100
!
crypto isakmp policy 10
  encryption aes 256
  authentication pre-share
  lifetime 180
crypto isakmp key cisco123 address 10.0.110.1
!
!
crypto ipsec transform-set aesset esp-aes 256 esp-sha-hmac
  mode transport
!
crypto map aesmap 10 ipsec-isakmp
  set peer 10.0.110.1
  set transform-set aesset
  match address 120
!
.
.
.

```

Configuring IKE Authentication: Example

The following example shows how to manually specify the RSA public keys of two IPSec peer—the peer at 10.5.5.1 uses general-purpose keys, and the other peer uses special-usage keys:

```

crypto key pubkey-chain rsa
  named-key otherpeer.example.com
  address 10.5.5.1
  key-string
005C300D 06092A86 4886F70D 01010105
00034B00 30480241 00C5E23B 55D6AB22
04AEF1BA A54028A6 9ACC01C5 129D99E4
64CAB820 847EDAD9 DF0B4E4C 73A05DD2
BD62A8A9 FA603DD2 E2A8A6F8 98F76E28
D58AD221 B583D7A4 71020301 0001
  quit
  exit
  addressed-key 10.1.1.2 encryption
  key-string
00302017 4A7D385B 1234EF29 335FC973

C625C389 0BFF3321 A2598935 C1B1
  quit
  exit

```

```
exit
```

Where to Go Next

After you have successfully configured IKE negotiation, you can begin configuring IPSec. For information on completing these tasks, see the module “Configuring Security for VPNs With IPSec.”

Glossary

anti-replay—Security service in which the receiver can reject old or duplicate packets to protect itself against replay attacks. IPsec provides optional anti-replay services by use of a sequence number and the use of authentication.

data authentication—Verification of the integrity and origin of the data.

Data authentication can refer either to integrity alone or to both of these concepts (although data origin authentication is dependent upon data integrity).

peer—In the context of this chapter, a “peer” is a router or other device that participates in IPsec and IKE.

PFS—perfect forward secrecy. Cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not also compromised, because subsequent keys are not derived from previous keys.

repudiation—Quality that prevents a third party from being able to prove that a communication between two other parties ever took place. Repudiation is a desirable quality if you do not want your communications to be traceable.

nonrepudiation—Quality that allows a third party to prove that a communication between two other parties took place. Nonrepudiation is desirable if you want to be able to trace your communications and prove that they occurred.

SA—security association. How two or more entities utilize security services to communicate securely.

For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection. Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

Note

Refer to *Internetworking Terms and Acronyms* for terms not included in this glossary.

Feature Information for Configuring IKE for IPsec VPNs

[Table 43](#) lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For details on when support for a specific command was introduced, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Note

[Table 43](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 43 *Feature Information for Configuring IKE for IPsec VPNs*

Call Admission Control for IKE

First Published: May 17, 2004

Last Updated: August 04, 2008

The Call Admission Control for IKE feature describes the application of Call Admission Control (CAC) to the Internet Key Exchange (IKE) protocol in Cisco IOS. CAC limits the number of simultaneous IKE security associations (SAs) (that is, calls to CAC) that a router can establish.

History for the Call Admission Control for IKE Feature

Release	Modification
12.3(8)T	This feature was introduced.
12.2(18)SXD1	This feature was integrated into Cisco IOS Release 12.2(18)SXD1 on the Cisco 6500 and Cisco 7600.
12.4(6)T	This feature was integrated into Cisco IOS Release 12.4(6)T. The ability to configure a limit on the number of in-negotiation IKE connections was added only to this and subsequent T-train releases.
12.2(33)SRA	This feature was integrated into Cisco IOS Release 12.2(33)SRA on the Cisco 7600. The in-negotiation IKE connection feature was not added to this SRA release.
12.2(33)SXH	This feature was integrated into Cisco IOS Release 12.2(33)SXH. The in-negotiation IKE connection feature was not added to this SXH release.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

Prerequisites for Call Admission Control for IKE

- Configure IKE on the router. Refer to the *Cisco IOS Security Configuration Guide*, Release 12.3.

Information About Call Admission Control for IKE

To configure CAC for IKE, you need to understand the following concepts:

- [IKE Session, page 2](#)
- [Security Association Limit, page 2](#)
- [System Resource Usage, page 3](#)

IKE Session

There are two ways to limit the number of IKE SAs that a router can establish to or from another router:

- Configure the absolute IKE SA limit by entering the **crypto call admission limit** command. The router drops new IKE SA requests when the value has been reached.
- Configure the system resource limit by entering the **call admission limit** command. The router drops new IKE SA requests when the level of system resources that are configured in the unit of charge is being used.

For information about using these commands, see the “[Command Reference](#)” section on page 8.

CAC is applied only to new SAs (that is, when an SA does not already exist between the peers). Every effort is made to preserve existing SAs. Only new SA requests will ever be denied due to a lack of system resources or because the configured IKE SA limit has been reached.

Security Association Limit

An SA is a description of how two or more entities will utilize security services to communicate securely on behalf of a particular data flow. IKE requires and uses SAs to identify the parameters of its connections. IKE can negotiate and establish its own SA. An IKE SA is used by IKE only, and it is bidirectional. An IKE SA cannot limit IPsec.

IKE drops SA requests based on a user-configured SA limit. To configure an IKE SA limit, enter the **crypto call admission limit** command. When there is a new SA request from a peer router, IKE determines if the number of active IKE SAs plus the number of SAs being negotiated meets or exceeds the configured SA limit. If the number is greater than or equal to the limit, the new SA request is rejected and a syslog is generated. This log contains the source destination IP address of the SA request.

Limit on Number of In-negotiation IKE Connections

Effective with Cisco IOS Release 12.4(6)T, a limit on the number of in-negotiation IKE connections can be configured. This type of IKE connection represents either an aggressive mode IKE SA or a main mode IKE SA prior to its authentication and actual establishment.

Using the **crypto call admission limit ike in-negotiation-sa {number}** command allows the configured number of in-negotiation IKE SAs to start negotiation without contributing to the maximum number of IKE SAs allowed.

System Resource Usage

CAC polls a global resource monitor so that IKE knows when the router is running short of CPU cycles or memory buffers. You can configure a resource limit, from 1 to 100000, that represents the level of system resources that are configured in the unit of charge. When that level of resources is being used, IKE drops (will not accept new) SA requests. To configure the system resource usage, enter the **call admission control** command.

How to Configure Call Admission Control for IKE

This section contains the following procedures:

- [Configure the IKE Security Association Limit, page 3](#) (optional)
- [Configure the System Resource Limit, page 4](#) (optional)

Note

You must perform one of the procedures.

Configure the IKE Security Association Limit

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto call admission limit {ike {in-negotiation-sa *number* | sa *number* } }**
4. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto call admission limit {ike {in-negotiation-sa number} sa number}} Example: Router(config)# crypto call admission limit ike sa 25	Specifies the maximum number of IKE SAs that the router can establish before IKE begins rejecting new SA requests. Note An ISAKMP connection needs to be built in two directions. If you have 500 spokes in your network, you should set this value at a minimum of 1000 (500 x 2).
Step 4	exit Example: Router(config)# exit	Returns to privileged EXEC mode.

Configure the System Resource Limit

SUMMARY STEPS

1. enable
2. configure terminal
3. call admission limit *charge*
4. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	call admission limit <i>charge</i> Example: Router(config)# call admission limit 90000	Sets the level of the system resources that, when used, causes IKE to stop accepting new SA requests. <ul style="list-style-type: none"> <i>charge</i>—Valid values are 1 to 100000.
Step 4	exit Example: Router(config)# exit	Returns to privileged EXEC mode.

Verifying the Call Admission Control for IKE Configuration

To verify the CAC for IKE configuration, perform the following steps.

SUMMARY STEPS

1. show call admission statistics
2. show crypto call admission statistics

DETAILED STEPS

Note

For detailed field descriptions of the command output, see the [“Command Reference” section on page 8](#).

Step 1 show call admission statistics

Use this command to monitor the global CAC configuration parameters and the behavior of CAC.

```
Router# show call admission statistics
```

```
Total Call admission charges: 0, limit 25
Total calls rejected 12, accepted 51
Load metric: charge 0, unscaled 0
```

Step 2 show crypto call admission statistics

Use this command to monitor Crypto CAC statistics.

```
Router# show crypto call admission statistics
```

```
-----
Crypto Call Admission Control Statistics
-----
System Resource Limit: 0    Max IKE SAs 0
Total IKE SA Count:      0    active:      0    negotiating: 0
Incoming IKE Requests: 0    accepted:   0    rejected:   0
Outgoing IKE Requests: 0    accepted:   0    rejected:   0
Rejected IKE Requests: 0    rsrc low:   0    SA limit:   0
-----
```

Configuration Examples for Call Admission Control for IKE

This section provides the following configuration examples:

- [Configuring the IKE Security Association Limit: Example, page 6](#)
- [Configuring the System Resource Limit: Example, page 6](#)

Configuring the IKE Security Association Limit: Example

The following example shows how to specify that there can be a maximum of 25 SAs before IKE starts rejecting new SA requests:

```
Router(config)# crypto call admission limit ike sa 25
```

Configuring the System Resource Limit: Example

The following example shows how to specify that IKE should drop SA requests when the level of system resources that are configured in the unit of charge reaches 90000:

```
Router(config)# call admission limit 90000
```

Certificate to ISAKMP Profile Mapping

First Published: May 17, 2004

Last Updated: August 21, 2007

The Certificate to ISAKMP Profile Mapping feature enables you to assign an Internet Security Association and Key Management Protocol (ISAKMP) profile to a peer on the basis of the contents of arbitrary fields in the certificate. In addition, this feature allows you to assign a group name to those peers that are assigned an ISAKMP profile.

History for Certificate to ISAKMP Profile Mapping Feature

Release	Modification
12.3(8)T	This feature was introduced.
12.2(33)SRA	This feature was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SXH	This feature was integrated into Cisco IOS Release 12.2(33)SXH.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Prerequisites for Certificate to ISAKMP Profile Mapping

- You should be familiar with configuring certificate maps.
- You should be familiar with configuring ISAKMP profiles.

Restrictions for Certificate to ISAKMP Profile Mapping

This feature will not be applicable if you use Rivest, Shamir, and Adelman- (RSA-) signature or RSA-encryption authentication without certificate exchange. ISAKMP peers must be configured to do RSA-signature or RSA-encryption authentication using certificates.

Information About Certificate to ISAKMP Profile Mapping

To configure the Certificate to ISAKMP Profile Mapping feature, you should understand the following concepts:

- [Certificate to ISAKMP Profile Mapping Overview, page 2](#)
- [How Certificate to ISAKMP Profile Mapping Works, page 2](#)
- [Assigning an ISAKMP Profile and Group Name to a Peer, page 3](#)

Certificate to ISAKMP Profile Mapping Overview

Prior to Cisco IOS Release 12.3(8)T, the only way to map a peer to an ISAKMP profile was as follows. The ISAKMP identity field in the ISAKMP exchange was used for mapping a peer to an ISAKMP profile. When certificates were used for authentication, the ISAKMP identity payload contained the subject name from the certificate. If a certificate authority (CA) did not provide the required group value in the first Organizational Unit (OU) field of a certificate, an ISAKMP profile could not be assigned to a peer.

Effective with Cisco IOS Release 12.3(8)T, a peer can still be mapped as explained above. However, the Certificate to ISAKMP Profile Mapping feature enables you to assign an ISAKMP profile to a peer on the basis of the contents of arbitrary fields in the certificate. You are no longer limited to assigning an ISAKMP profile on the basis of the subject name of the certificate. In addition, this feature allows you to assign a group to a peer to which an ISAKMP profile has been assigned.

How Certificate to ISAKMP Profile Mapping Works

[Figure 1](#) illustrates how certificate maps may be attached to ISAKMP profiles and assigned group names.

Figure 1 *Certificate Maps Mapped for Profile Group Assignment*

A certificate map can be attached to only one ISAKMP profile although an ISAKMP profile can have several certificate maps attached to it.

Certificate maps provide the ability for a certificate to be matched with a given set of criteria. ISAKMP profiles can bind themselves to certificate maps, and if the presented certificate matches the certificate map present in an ISAKMP profile, the peer will be assigned the ISAKMP profile. If the ISAKMP profile contains a client configuration group name, the same group name will be assigned to the peer. This ISAKMP profile information will override the information in the ID_KEY_ID identity or in the first OU field of the certificate.

Assigning an ISAKMP Profile and Group Name to a Peer

To assign an ISAKMP profile to a peer on the basis of arbitrary fields in the certificate, use the **match certificate** command after the ISAKMP profile has been defined.

To associate a group name with an ISAKMP profile that will be assigned to a peer, use the **client configuration group** command, also after the ISAKMP profile has been defined.

How to Configure Certificate to ISAKMP Profile Mapping

This section contains the following procedures:

- [Mapping the Certificate to the ISAKMP Profile, page 4](#) (required)
- [Verifying That the Certificate Has Been Mapped, page 4](#) (optional)
- [Assigning the Group Name to the Peer, page 5](#) (required)
- [Monitoring and Maintaining Your Certificate to ISAKMP Profile Mapping, page 6](#) (optional)

Mapping the Certificate to the ISAKMP Profile

To map the certificate to the ISAKMP profile, perform the following steps. This configuration will enable you to assign the ISAKMP profile to a peer on the basis of the contents of arbitrary fields in the certificate.

SUMMARY STEPS

- `enable`
- `configure terminal`
- `crypto isakmp profile profile-name`
- `match certificate certificate-map`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure <i>terminal</i> Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto isakmp profile <i>profile-name</i> Example: Router (config)# crypto isakmp profile vpnprofile	Defines an ISAKMP profile and enters into crypto ISAKMP profile configuration mode.
Step 4	match certificate <i>certificate-map</i> Example: Router (conf-isa-prof)# match certificate map1	Accepts the name of a certificate map.

Verifying That the Certificate Has Been Mapped

The following **show** command may be used to verify that the subject name of the certificate map has been properly configured.

SUMMARY

- `enable`
- `show crypto ca certificates`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	show crypto ca certificates Example: Router# show crypto ca certificates	Displays information about your certificate.

Assigning the Group Name to the Peer

To associate a group name with a peer when the peer is mapped to an ISAKMP profile, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp profile** *profile-name*
4. **client configuration group** *group-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto isakmp profile <i>profile-name</i> Example: Router (config)# crypto isakmp profile vpnprofile	Defines an ISAKMP profile and enters into isakmp profile configuration mode.
Step 4	client configuration group <i>group-name</i> Example: Router (conf-isa-prof)# client configuration group group1	Accepts the name of a group that will be assigned to a peer when the peer is assigned this crypto ISAKMP profile.

Monitoring and Maintaining Your Certificate to ISAKMP Profile Mapping

To monitor and maintain your certificate to ISAKMP profile mapping, you may use the following **debug** command.

SUMMARY STEPS

1. **enable**
2. **debug crypto isakmp**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Router# enable	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	debug crypto isakmp	Displays output showing that the certificate has gone through certificate map matching and that the certificate matches the ISAKMP profile.
	Example: Router# debug crypto isakmp	The command may also be used to verify that the peer has been assigned a group.

Configuration Examples for Certificate to ISAKMP Profile Mapping

This section contains the following configuration examples:

- [Certificates Mapped to the ISAKMP Profile on the Basis of Arbitrary Fields: Example, page 7](#)
- [Group Name Assigned to a Peer That Is Associated with an ISAKMP Profile: Example, page 7](#)
- [Mapping a Certificate to an ISAKMP Profile Verification: Example, page 8](#)
- [Group Name Assigned to a Peer Verification: Example, page 9](#)

Certificates Mapped to the ISAKMP Profile on the Basis of Arbitrary Fields: Example

The following configuration example shows that whenever a certificate contains “ou = green,” the ISAKMP profile “cert_pro” will be assigned to the peer:

```
crypto pki certificate map cert_map 10
  subject-name co ou = green
!
!
crypto isakmp identity dn
crypto isakmp profile cert_pro
  ca trust-point 2315
  ca trust-point LaBcA
  initiate mode aggressive
  match certificate cert_map
```

Group Name Assigned to a Peer That Is Associated with an ISAKMP Profile: Example

The following example shows that the group “some_group” is to be associated with a peer that has been assigned an ISAKMP profile:

```
crypto isakmp profile id_profile
  ca trust-point 2315
```

```
match identity host domain cisco.com
client configuration group some_group
```

Mapping a Certificate to an ISAKMP Profile Verification: Example

The following examples show that a certificate has been mapped to an ISAKMP profile. The examples include the configurations for the responder and initiator, **show command** output verifying that the subject name of the certificate map has been configured, and **debug** command output showing that the certificate has gone through certificate map matching and been matched to the ISAKMP profile.

Responder Configuration

```
crypto pki certificate map cert_map 10
! The above line is the certificate map definition.
subject-name co ou = green
! The above line shows that the subject name must have "ou = green."
!
crypto isakmp profile certpro
! The above line shows that this is the ISAKMP profile that will match if the certificate
of the peer matches cert_map (shown on third line below).
ca trust-point 2315
ca trust-point LaBcA
match certificate cert_map
initiate mode aggressive
```

Initiator Configuration

```
crypto ca trustpoint LaBcA
enrollment url http://10.76.82.20:80/cgi-bin/openscep
subject-name ou=green,c=IN
! The above line ensures that the subject name "ou = green" is set.
revocation-check none
```

show crypto ca certificates Command Output for the Initiator

```
Router# show crypto ca certificates
```

```
Certificate
Status: Available
Certificate Serial Number: 21
Certificate Usage: General Purpose
Issuer:
  cn=blue-lab CA
  o=CISCO
  c=IN
Subject:
  Name: Router1.cisco.com
  c=IN
  ou=green
! The above line is a double check that "ou = green" has been set as the subject name.
  hostname=Router1.cisco.com
Validity Date:
  start date: 14:34:30 UTC Mar 31 2004
  end date: 14:34:30 UTC Apr 1 2009
  renew date: 00:00:00 UTC Jan 1 1970
Associated Trustpoints: LaBcA
```

debug crypto isakmp Command Output for the Responder

```
Router# debug crypto isakmp
```

```

6d23h: ISAKMP (0:268435460): received packet from 192.0.0.2 dport 500 sport 500 Global (R)
MM_KEY_EXCH
6d23h: ISAKMP: Main Mode packet contents (flags 1, len 892):
6d23h:      ID payload
6d23h:      FQDN <Router1.cisco.com> port 500 protocol 17
6d23h:      CERT payload
6d23h:      SIG payload
6d23h:      KEEPALIVE payload
6d23h:      NOTIFY payload
6d23h: ISAKMP:(0:4:HW:2):Input = IKE_MSG_FROM_PEER, IKE_MM_EXCH
6d23h: ISAKMP:(0:4:HW:2):Old State = IKE_R_MM4 New State = IKE_R_MM5

6d23h: ISAKMP:(0:4:HW:2): processing ID payload. message ID = 0
6d23h: ISAKMP (0:268435460): ID payload
      next-payload : 6
      type          : 2
      FQDN name     : Router1.cisco.com
      protocol      : 17
      port          : 500
      length        : 28
6d23h: ISAKMP:(0:4:HW:2):: peer matches *none* of the profiles
6d23h: ISAKMP:(0:4:HW:2): processing CERT payload. message ID = 0
6d23h: ISAKMP:(0:4:HW:2): processing a CT_X509_SIGNATURE cert
6d23h: ISAKMP:(0:4:HW:2): peer's pubkey isn't cached
6d23h: ISAKMP:(0:4:HW:2): OU = green
6d23h: ISAKMP:(0:4:HW:2): certificate map matches certpro profile
! The above line shows that the certificate has gone through certificate map matching and
that it matches the "certpro" profile.
6d23h: ISAKMP:(0:4:HW:2): Trying to re-validate CERT using new profile
6d23h: ISAKMP:(0:4:HW:2): Creating CERT validation list: 2315, LaBcA,
6d23h: ISAKMP:(0:4:HW:2): CERT validity confirmed.

```

Group Name Assigned to a Peer Verification: Example

The following configuration and debug output show that a group has been assigned to a peer.

Initiator Configuration

```

crypto isakmp profile certpro
  ca trust-point 2315
  ca trust-point LaBcA
  match certificate cert_map
  client configuration group new_group
! The statement on the above line will assign the group "new_group" to any peer that
matches the ISAKMP profile "certpro."
  initiate mode aggressive
!

```

debug crypto isakmp profile Command Output for the Responder

The following debug output example shows that the peer has been matched to the ISAKMP profile named "certpro" and that it has been assigned a group named "new_group."

```

Router# debug crypto isakmp profile
6d23h: ISAKMP (0:268435461): received packet from 192.0.0.2 dport 500 sport 500 Global (R)
MM_KEY_EXCH
6d23h: ISAKMP: Main Mode packet contents (flags 1, len 892):
6d23h:      ID payload
6d23h:      FQDN <Router1.cisco.com> port 500 protocol 17
6d23h:      CERT payload
6d23h:      SIG payload
6d23h:      KEEPALIVE payload

```

```

6d23h:          NOTIFY payload
6d23h: ISAKMP:(0:5:HW:2):Input = IKE_MESG_FROM_PEER, IKE_MM_EXCH
6d23h: ISAKMP:(0:5:HW:2):Old State = IKE_R_MM4 New State = IKE_R_MM5

6d23h: ISAKMP:(0:5:HW:2): processing ID payload. message ID = 0
6d23h: ISAKMP (0:268435461): ID payload
      next-payload : 6
      type          : 2
      FQDN name     : Router1.cisco.com
      protocol      : 17
      port          : 500
      length        : 28
6d23h: ISAKMP:(0:5:HW:2):: peer matches *none* of the profiles
6d23h: ISAKMP:(0:5:HW:2): processing CERT payload. message ID = 0
6d23h: ISAKMP:(0:5:HW:2): processing a CT_X509_SIGNATURE cert
6d23h: ISAKMP:(0:5:HW:2): peer's pubkey isn't cached
6d23h: ISAKMP:(0:5:HW:2): OU = green
6d23h: ISAKMP:(0:5:HW:2): certificate map matches certpro profile
6d23h: ISAKMP:(0:5:HW:2): Trying to re-validate CERT using new profile
6d23h: ISAKMP:(0:5:HW:2): Creating CERT validation list: 2315, LaBcA,

Restrictions for Encrypted Preshared Key

- Old ROM monitors (ROMMONs) and boot images cannot recognize the new type 6 passwords. Therefore, errors are expected if you boot from an old ROMMON.
- For Cisco 836 routers, please note that support for Advanced Encryption Standard (AES) is available only on IP plus images.

Information About Encrypted Preshared Key

Before Using the Encrypted Preshared Key feature, you should understand the following concepts:

- [Using the Encrypted Preshared Key Feature to Securely Store Passwords, page 2](#)
- [How to Configure an Encrypted Preshared Key, page 3](#)

Using the Encrypted Preshared Key Feature to Securely Store Passwords

Using the Encrypted Preshared Key feature, you can securely store plain text passwords in type 6 format in NVRAM using a command-line interface (CLI). Type 6 passwords are encrypted. Although the encrypted passwords can be seen or retrieved, it is difficult to decrypt them to find out the actual password. Use the **key config-key password-encryption** command with the **password encryption aes** command to configure and enable the password (symmetric cipher AES is used to encrypt the keys). The password (key) configured using the **config-key password-encryption** command is the master encryption key that is used to encrypt all other keys in the router.

If you configure the **password encryption aes** command without configuring the **key config-key password-encryption** command, the following message is printed at startup or during any nonvolatile generation (NVGEN) process, such as when the **show running-config** or **copy running-config startup-config** commands have been configured:

```
"Can not encrypt password. Please configure a configuration-key with 'key config-key'"
```

Changing a Password

If the password (master key) is changed, or reencrypted, using the **key config-key password-encryption** command, the list registry passes the old key and the new key to the application modules that are using type 6 encryption.

Deleting a Password

If the master key that was configured using the **key config-key password-encryption** command is deleted from the system, a warning is printed (and a confirm prompt is issued) that states that all type 6 passwords will become useless. As a security measure, after the passwords have been encrypted, they will never be decrypted in the Cisco IOS software. However, passwords can be reencrypted as explained in the previous paragraph.

Caution

If the password configured using the **key config-key password-encryption** command is lost, it cannot be recovered. The password should be stored in a safe location.

Unconfiguring Password Encryption

If you later unconfigure password encryption using the **no password encryption aes** command, all existing type 6 passwords are left unchanged, and as long as the password (master key) that was configured using the **key config-key password-encryption** command exists, the type 6 passwords will be decrypted as and when required by the application.

Storing Passwords

Because no one can “read” the password (configured using the **key config-key password-encryption** command), there is no way that the password can be retrieved from the router. Existing management stations cannot “know” what it is unless the stations are enhanced to include this key somewhere, in which case the password needs to be stored securely within the management system. If configurations are stored using TFTP, the configurations are not standalone, meaning that they cannot be loaded onto a router. Before or after the configurations are loaded onto a router, the password must be manually added (using the **key config-key password-encryption** command). The password can be manually added to the stored configuration but is not recommended because adding the password manually allows anyone to decrypt all passwords in that configuration.

Configuring New or Unknown Passwords

If you enter or cut and paste cipher text that does not match the master key, or if there is no master key, the cipher text is accepted or saved, but an alert message is printed. The alert message is as follows:

```
"ciphertext>[for username bar>] is incompatible with the configured master key."
```

If a new master key is configured, all the plain keys are encrypted and made type 6 keys. The existing type 6 keys are not encrypted. The existing type 6 keys are left as is.

If the old master key is lost or unknown, you have the option of deleting the master key using the **no key config-key password-encryption** command. Deleting the master key using the **no key config-key password-encryption** command causes the existing encrypted passwords to remain encrypted in the router configuration. The passwords will not be decrypted.

Enabling the Encrypted Preshared Key

The **password encryption aes** command is used to enable the encrypted password.

How to Configure an Encrypted Preshared Key

This section contains the following procedures:

- [Configuring an Encrypted Preshared Key, page 4](#) (required)
- [Monitoring Encrypted Preshared Keys, page 5](#) (optional)
- [Configuring an ISAKMP Preshared Key, page 6](#) (optional)
- [Configuring an ISAKMP Preshared Key in ISAKMP Keyrings, page 7](#) (optional)
- [Configuring ISAKMP Aggressive Mode, page 8](#) (optional)
- [Configuring a Unity Server Group Policy, page 9](#) (optional)

- [Configuring an Easy VPN Client, page 10](#) (optional)

Configuring an Encrypted Preshared Key

To configure an encrypted preshared key, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **key config-key password-encryption** *[text]*
4. **password encryption aes**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	key config-key password-encryption <i>[text]</i> Example: Router (config)# key config-key password-encryption	Stores a type 6 encryption key in private NVRAM. <ul style="list-style-type: none"> • If you want to key in interactively (using the enter key) and an encrypted key already exists, you will be prompted for the following: Old key, New key, and Confirm key. • If you want to key in interactively but an encryption key is not present, you will be prompted for the following: New key and Confirm key. • If you want to remove the password that is already encrypted, you will see the following prompt: “WARNING: All type 6 encrypted keys will become unusable. Continue with master key deletion? [yes/no]:”.
Step 4	password encryption aes Example: Router (config)# password-encryption aes	Enables the encrypted preshared key.

Troubleshooting Tips

If you see the warning message “ciphertext >[for username bar] is incompatible with the configured master key,” you have entered or cut and pasted cipher text that does not match the master key or there is no master key. (The cipher text will be accepted or saved.) The warning message will allow you to locate the broken configuration line or lines.

Monitoring Encrypted Preshared Keys

To get logging output for encrypted preshared keys, perform the following steps.

1. **enable**
2. **password logging**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	password logging Example: Router# password logging	Provides a log of debugging output for a type 6 password operation.

Examples

The following **password logging** debug output shows that a new master key has been configured and that the keys have been encrypted with the new master key:

```
Router (config)# key config-key password-encrypt
New key:
Confirm key:
Router (config)#
01:40:57: TYPE6_PASS: New Master key configured, encrypting the keys with
the new master keypas

Router (config)# key config-key password-encrypt
Old key:
New key:
Confirm key:
Router (config)#
01:42:11: TYPE6_PASS: Master key change heralded, re-encrypting the keys
with the new master key
01:42:11: TYPE6_PASS: Mac verification successful
01:42:11: TYPE6_PASS: Mac verification successful
01:42:11: TYPE6_PASS: Mac verification successful
```

What To Do Next

You can perform any of the following procedures. Each procedure is independent of the others.

- [Configuring an ISAKMP Preshared Key, page 6](#)
- [Configuring an ISAKMP Preshared Key in ISAKMP Keyrings, page 7](#)
- [Configuring ISAKMP Aggressive Mode, page 8](#)
- [Configuring a Unity Server Group Policy, page 9](#)
- [Configuring an Easy VPN Client, page 10](#)

Configuring an ISAKMP Preshared Key

To configure an ISAKMP preshared key, perform the following procedure.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp key *keystring* address *peer-address***
4. **crypto isakmp key *keystring* hostname *hostname***

DETAILED STEPS

	Command	Description
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto isakmp key <i>keystring</i> address <i>peer-address</i> Example: Router (config)# crypto isakmp key cisco address 10.2.3.4	Configures a preshared authentication key. <ul style="list-style-type: none">• The <i>peer-address</i> argument specifies the IP address of the remote peer.
Step 4	crypto isakmp key <i>keystring</i> hostname <i>hostname</i> Example: Router (config)# crypto isakmp key foo hostname foo.com	Configures a preshared authentication key. <ul style="list-style-type: none">• The <i>hostname</i> argument specifies the fully qualified domain name (FQDN) of the peer.

Example

The following sample output shows that an encrypted preshared key has been configured:

```
crypto isakmp key 6 _Hg[^^ECgLGgPF^RXTQfDDWQ][YAAB address 10.2.3.4
crypto isakmp key 6 `eR\eTRaKCUZPYYQfDgXRWi_AAB hostname foo.com
```

Configuring an ISAKMP Preshared Key in ISAKMP Keyrings

To configure an ISAKMP preshared key in ISAKMP keyrings, which are used in IPSec Virtual Route Forwarding (VRF) configurations, perform the following procedure.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto keyring** *keyring-name*
4. **pre-shared-key address** *address* **key** *key*
5. **pre-shared-key hostname** *hostname* **key** *key*

DETAILED STEPS

	Command	Description
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto keyring <i>keyring-name</i> Example: Router (config)# crypto keyring foo	Defines a crypto keyring to be used during Internet Key Exchange (IKE) authentication and enters keyring configuration mode.
Step 4	pre-shared-key address <i>address</i> key <i>key</i> Example: Router (config-keyring)# pre-shared-key address 10.2.3.5 key cisco	Defines a preshared key to be used for IKE authentication. <ul style="list-style-type: none">• The <i>address</i> argument specifies the IP address of the remote peer.
Step 5	pre-shared-key hostname <i>hostname</i> key <i>key</i> Example: Router (config-keyring)# pre-shared-key hostname foo.com key cisco	Defines a preshared key to be used for IKE authentication. <ul style="list-style-type: none">• The <i>hostname</i> argument specifies the FQDN of the peer.

Example

The following **show-running-config** sample output shows that an encrypted preshared key in ISAKMP keyrings has been configured.

```
crypto keyring foo
  pre-shared-key address 10.2.3.5 key 6 `WHCJYR_Z]GRPF^RXTQfDcfZ]GPAAB
  pre-shared-key hostname foo.com key 6 aE_REHDcOfYCPF^RXTQfDJYVVNSAAB
```

Configuring ISAKMP Aggressive Mode

To configure ISAKMP aggressive mode, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp peer ip-address** *ip-address*
4. **set aggressive-mode client-endpoint** *client-endpoint*
5. **set aggressive-mode password** *password*

DETAILED STEPS

	Command	Description
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto isakmp peer ip-address <i>ip-address</i> Example: Router (config)# crypto isakmp peer ip-address 10.2.3.4	To enable an IP Security (IPSec) peer for IKE querying of authentication, authorization, and accounting (AAA) for tunnel attributes in aggressive mode and to enter ISAKMP peer configuration mode.
Step 4	set aggressive-mode client-endpoint <i>client-endpoint</i> Example: Router (config-isakmp-peer)# set aggressive-mode client-endpoint fqdn cisco.com	Specifies the Tunnel-Client-Endpoint attribute within an ISAKMP peer configuration.
Step 5	set aggressive-mode password <i>password</i> Example: Router (config-isakmp-peer)# set aggressive-mode password cisco	Specifies the Tunnel-Password attribute within an ISAKMP peer configuration.

Example

The following **show-running-config** sample output shows that an encrypted preshared key in ISAKMP aggressive mode has been configured.

```
crypto isakmp peer address 10.2.3.4
  set aggressive-mode password 6 ^aKPIQ_KJE_PPF^RXTQfDTIaLNeAAB
  set aggressive-mode client-endpoint fqdn cisco.com
```

Configuring a Unity Server Group Policy

To configure a unity server group policy, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** *group-name*
4. **pool** *name*
5. **domain** *name*
6. **key** *name*

DETAILED STEPS

	Command	Description
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto isakmp client configuration group <i>group-name</i> Example: Router (config)# crypto isakmp client configuration group foo	Specifies the policy profile of the group that will be defined and enters ISAKMP group configuration mode.
Step 4	pool <i>name</i> Example: Router (config-isakmp-group)# pool foopool	Defines a local pool address.

	Command	Description
Step 5	domain name Example: Router (config-isakmp-group)# domain cisco.com	Specifies the Domain Name Service (DNS) domain to which a group belongs.
Step 6	key name Example: Router (config-isakmp-group)# key cisco	Specifies the IKE preshared key for group policy attribute definition.

Example

The following **show-running-config** sample output shows that an encrypted key has been configured for a unity server group policy:

```
crypto isakmp client configuration group foo
key 6 cZZgDZPOE\ddPF^RXTQfDTIaLNeAAB
domain cisco.com
pool foopool
```

Configuring an Easy VPN Client

To configure an Easy VPN client, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec client ezvpn name**
4. **peer ipaddress**
5. **mode client**
6. **group group-name key group-key**
7. **connect manual**

DETAILED STEPS

	Command	Description
Step 1	enable Example: Router# enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.

	Command	Description
Step 3	crypto ipsec client ezvpn <i>name</i> Example: Router (config)# crypto ipsec client ezvpn foo	Creates a Cisco Easy VPN remote configuration and enters Cisco Easy VPN remote configuration mode.
Step 4	peer <i>ipaddress</i> Example: Router (config-isakmp-peer)# peer 10.2.3.4	Sets the peer IP address for the VPN connection.
Step 5	mode client Example: Router (config-isakmp-ezvpn)# mode client	Automatically configures the router for Cisco Easy VPNclient mode operation, which uses Network Address Translation (NAT) or Peer Address Translation (PAT) address translations.
Step 6	group <i>group-name</i> key <i>group-key</i> Example: Router (config-isakmp-ezvpn)# group foo key cisco	Specifies the group name and key value for the VPN connection.
Step 7	connect manual Example: Router (config-isakmp-ezvpn)# connect manual	Specifies the manual setting for directing the Cisco Easy VPN remote client to wait for a command or application program interface (API) call before attempting to establish the Cisco Easy VPN remote connection.

Example

The following **show-running-config** sample output shows that an Easy VPN client has been configured. The key has been encrypted.

```
crypto ipsec client ezvpn foo
connect manual
group foo key 6 gdMI`S^[GicPF^RXTQfDFKEO\RAAB
mode client
peer 10.2.3.4
```

Configuration Examples for Encrypted Preshared Key

This section provides the following configuration examples:

- [Encrypted Preshared Key: Example, page 12](#)
- [No Previous Key Present: Example, page 12](#)
- [Key Already Exists: Example, page 12](#)
- [Key Already Exists But the User Wants to Key In Interactively: Example, page 12](#)
- [No Key Present But the User Wants to Key In Interactively: Example, page 12](#)
- [Removal of the Password Encryption: Example, page 13](#)

Encrypted Preshared Key: Example

The following is an example of a configuration for which a type 6 preshared key has been encrypted. It includes the prompts and messages that a user might see.

```
Router (config)# crypto isakmp key cisco address 10.0.0.2
Router (config)# exit
Router# show running-config | include crypto isakmp key
crypto isakmp key cisco address 10.0.0.2
Router#
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router (config)# password encryption aes
Router (config)# key config-key password-encrypt
New key:
Confirm key:
Router (config)#
01:46:40: TYPE6_PASS: New Master key configured, encrypting the keys with
the new master key
Router (config)# exit
Router # show running-config | include crypto isakmp key
crypto isakmp key 6 CXWdhVTZYB_Vcd^`cIHDOahiFTa address 10.0.0.2
```

No Previous Key Present: Example

In the following configuration example, no previous key is present:

```
Router (config)# key config-key password-encryption testkey 123
```

Key Already Exists: Example

In the following configuration example, a key already exists:

```
Router (config)# key config-key password-encryption testkey123
Old key:
Router (config)#
```

Key Already Exists But the User Wants to Key In Interactively: Example

In the following configuration example, the user wants to key in interactively, but a key already exists. The Old key, New key, and Confirm key prompts will show on your screen if you enter the **key config-key password-encryption** command and press the enter key to get into interactive mode.

```
Router (config)# key config-key password-encryption
Old key:
New key:
Confirm key:
```

No Key Present But the User Wants to Key In Interactively: Example

In the following example, the user wants to key in interactively, but no key is present. The New key and Confirm key prompts will show on your screen if you are in interactive mode.

```
Router (config)# key config-key password-encryption
New key:
```

Confirm key:

Removal of the Password Encryption: Example

In the following configuration example, the user wants to remove the encrypted password. The “WARNING: All type 6 encrypted keys will become unusable. Continue with master key deletion? [yes/no]:” prompt will show on your screen if you are in interactive mode.

```
Router (config)# no key config-key password-encryption
```

```
WARNING: All type 6 encrypted keys will become unusable. Continue with master key  
deletion ? [yes/no]: y
```

Where to Go Next

Configure any other preshared keys.

Security for VPNs with IPSec

Configuring Security for VPNs with IPSec

This module describes how to configure basic IP Security (IPSec) virtual private networks (VPNs). IPSec is a framework of open standards developed by the Internet Engineering Task Force (IETF). It provides security for transmission of sensitive information over unprotected networks such as the Internet. IPSec acts at the network layer, protecting and authenticating IP packets between participating IPSec devices (“peers”), such as Cisco routers.

Module History

This module was first published on May 2, 2005, and last updated on May 2, 2005.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all features. To find information about feature support and configuration, use the [“Feature Information for Security for VPNs with IPSec” section on page 35](#).

Prerequisites for Configuring Security for VPNs with IPSec

IKE Configuration

You must configure Internet Key Exchange (IKE) as described in the module “Configuring Internet Key Exchange Security for IPSec VPNs.”

Even if you decide to not use IKE, you still must disable it as described in the module “Configuring Internet Key Exchange for IPSec VPNs.”

Ensure Access Lists Are Compatible with IPSec

IKE uses UDP port 500. The IPSec Encapsulating Security Payload (ESP) and Authentication Header (AH) protocols use protocol numbers 50 and 51. Ensure that your access lists are configured so that protocol 50, 51, and User Datagram Protocol (UDP) port 500 traffic is not blocked at interfaces used by IPSec. In some cases you might need to add a statement to your access lists to explicitly permit this traffic.

Restrictions for Configuring Security for VPNs with IPSec

Unicast IP Datagram Application Only

At this time, IPSec can be applied to unicast IP datagrams only. Because the IPSec Working Group has not yet addressed the issue of group key distribution, IPSec does not currently work with multicasts or broadcast IP datagrams.

NAT Configuration

If you use Network Address Translation (NAT), you should configure static NAT translations so that IPSec works properly. In general, NAT translation should occur before the router performs IPSec encapsulation; in other words, IPSec should be working with global addresses.

Information About Configuring Security for VPNs with IPSec

To configure basic IPSec VPNs, you should understand the following concepts:

- [Supported Standards, page 2](#)
- [Supported Hardware, Switching Paths, and Encapsulation, page 4](#)
- [IPSec Functionality Overview, page 6](#)
- [IPSec Traffic Nested to Multiple Peers, page 8](#)

Supported Standards

Cisco implements the following standards with this feature:

- IPSec—IP Security Protocol. IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer; it uses IKE to handle negotiation of protocols and algorithms

based on local policy, and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

Note The term IPSec is sometimes used to describe the entire protocol of IPSec data services and IKE security protocols and is also sometimes used to describe only the data services.

IPSec is documented in a series of Internet Drafts, all available at <http://www.ietf.org/html.charters/ipsec-charter.html>.

- IKE—A hybrid protocol that implements Oakley and SKEME key exchanges inside the ISAKMP framework. While IKE can be used with other protocols, its initial implementation is with the IPSec protocol. IKE provides authentication of the IPSec peers, negotiates IPSec security associations, and establishes IPSec keys.

The component technologies implemented for IPSec include:

- AES—Advanced Encryption Standard. A cryptographic algorithm that protects sensitive, unclassified information. AES is privacy transform for IPSec and IKE and has been developed to replace the DES. AES is designed to be more secure than DES: AES offers a larger key size, while ensuring that the only known approach to decrypt a message is for an intruder to try every possible key. AES has a variable key length—the algorithm can specify a 128-bit key (the default), a 192-bit key, or a 256-bit key.
- DES—Data Encryption Standard. An algorithm that is used to encrypt packet data. Cisco IOS implements the mandatory 56-bit DES-CBC with Explicit IV. Cipher Block Chaining (CBC) requires an initialization vector (IV) to start encryption. The IV is explicitly given in the IPSec packet. For backwards compatibility, Cisco IOS IPSec also implements the RFC 1829 version of ESP DES-CBC.

Cisco IOS also implements Triple DES (168-bit) encryption, depending on the software versions available for a specific platform. Triple DES (3DES) is a strong form of encryption that allows sensitive information to be transmitted over untrusted networks. It enables customers to utilize network layer encryption.

Note Cisco IOS images with strong encryption (including, but not limited to, 56-bit data encryption feature sets) are subject to United States government export controls, and have a limited distribution. Images to be installed outside the United States require an export license. Customer orders might be denied or subject to delay due to United States government regulations. Contact your sales representative or distributor for more information, or send e-mail to export@cisco.com.

- SEAL—Software Encryption Algorithm. An alternative algorithm to software-based DES, 3DES, and AES. SEAL encryption uses a 160-bit encryption key and has a lower impact to the CPU when compared to other software-based algorithms.
- MD5 (HMAC variant)—MD5 (Message Digest 5) is a hash algorithm. HMAC is a keyed hash variant used to authenticate data.
- SHA (HMAC variant)—SHA (Secure Hash Algorithm) is a hash algorithm. HMAC is a keyed hash variant used to authenticate data.

IPSec as implemented in Cisco IOS software supports the following additional standards:

- AH—Authentication Header. A security protocol which provides data authentication and optional anti-replay services. AH is embedded in the data to be protected (a full IP datagram).

- ESP—Encapsulating Security Payload. A security protocol which provides data privacy services and optional data authentication, and anti-replay services. ESP encapsulates the data to be protected.

Supported Hardware, Switching Paths, and Encapsulation

IPSec has certain requirements for hardware, switching paths, and encapsulation methods as follows:

- [Supported Hardware](#)
- [Supported Switching Paths](#)
- [Supported Encapsulation](#)

Supported Hardware

This section contains the following subsections:

- [VPN Accelerator Module \(VAM\) Support](#)
- [AIMs and NM Support](#)

VPN Accelerator Module (VAM) Support

The VAM is a single-width acceleration module. It provides high-performance, hardware-assisted tunneling and encryption services suitable for VPN remote access, site-to-site intranet, and extranet applications. It also provides platform scalability and security while working with all services necessary for successful VPN deployments—security, quality of service (QoS), firewall and intrusion detection, service-level validation, and management. The VAM off-loads IPSec processing from the main processor, thus freeing resources on the processor engines for other tasks.

The VAM provides hardware-accelerated support for the following multiple encryption functions:

- 56-bit DES standard mode: CBC
- 3-Key Triple DES (168-bit)
- SHA-1 and MD5
- Rivest, Shamir, Adelman (RSA) public-key algorithm
- Diffie-Hellman key exchange RC4-40

For more information on VAMs, see the document “VPN Acceleration Module (VAM).”

AIMs and NM Support

The data encryption Advanced Integration Module (AIM) and Network Module (NM) provide hardware-based encryption.

The data encryption AIMs and NM are hardware Layer 3 (IPSec) encryption modules and provide DES and Triple DES IPSec encryption for multiple T1s or E1s of bandwidth. These products also have hardware support for Diffie-Hellman, RSA, and DSA key generation.

Before using either module, note that RSA manual keying is not supported.

See [Table 44](#) to determine which VPN encryption module to use.

IPPCP Software for Use with AIMS and NMs in Cisco 2600 and Cisco 3600 Series Routers

Software IPPCP with AIMS and NMs allow customers to use Lempel-Ziv-Stac (LZS) software compression with IPSec when a VPN module is in Cisco 2600 and Cisco 3600 series routers, allowing users to effectively increase the bandwidth on their interfaces.

Without IPPCP software, compression is not supported with the VPN encryption hardware AIM and NM; that is, a user had to remove the VPN module from the router and run software encryption with software compression. IPPCP enables all VPN modules to support LZS compression in software when the VPN module is in the router, thereby, allowing users to configure data compression and increase their bandwidth, which is useful for a low data link.

Without IPPCP, compression occurs at Layer 2, and encryption occurs at Layer 3. After a data stream is encrypted, it is passed on for compression services. When the compression engine receives the encrypted data streams, the data expands and does not compress. This feature enables both compression and encryption of the data to occur at Layer 3 by selecting LZS with the IPSec transform set; that is, LZS compression occurs before encryption, and it is able to get better compression ratio.

Table 44 AIM/VPN Encryption Module Support by Cisco IOS Release

	Encryption Module Support by Cisco IOS Release				
Platform	12.2(13)T	12.3(4)T	12.3(5)	12.3(6)	12.3(7)T

Supported Switching Paths

Table 45 lists the supported switching paths that work with IPSec.

Table 45 **Supported Switching Paths for IPSec**

Switching Paths	Examples
Process switching	<pre>interface ethernet0/0 no ip route-cache</pre>
Fast switching	<pre>interface ethernet0/0 ip route-cache ! Ensure that you will not hit flow switching. no ip route-cache flow ! Disable CEF for the interface, which supercedes global CEF. no ip route-cache cef</pre>
Cisco Express Forwarding (CEF)	<pre>ip cef interface ethernet0/0 ip route-cache ! Ensure that you will not hit flow switching. no ip route-cache flow</pre>
Fast-flow switching	<pre>interface ethernet0/0 ip route-cache ! Enable flow switching p route-cache flow ! Disable CEF for the interface. no ip route-cache cef</pre>
CEF-flow switching	<pre>! Enable global CEF. ip cef interface ethernet0/0 ip route-cache ip route-cache flow ! Enable CEF for the interface ip route-cache cef</pre>

Supported Encapsulation

IPSec works with the following serial encapsulations: High-Level Data-Links Control (HDLC), PPP, and Frame Relay.

IPSec also works with the Generic Routing Encapsulation (GRE) and IPinIP Layer 3, Layer 2 Forwarding (L2F), Layer 2 Tunneling Protocol (L2TP), Data Link Switching+ (DLSw+), and SRB tunneling protocols; however, multipoint tunnels are not supported. Other Layer 3 tunneling protocols may not be supported for use with IPSec.

Because the IPSec Working Group has not yet addressed the issue of group key distribution, IPSec currently cannot be used to protect group traffic (such as broadcast or multicast traffic).

IPSec Functionality Overview

IPSec provides the following network security services. (In general, local security policy dictates the use of one or more of these services.)

- **Data Confidentiality**—The IPSec sender can encrypt packets before transmitting them across a network.
- **Data Integrity**—The IPSec receiver can authenticate packets sent by the IPSec sender to ensure that the data has not been altered during transmission.

- **Data Origin Authentication**—The IPSec receiver can authenticate the source of the IPSec packets sent. This service is dependent upon the data integrity service.
- **Anti-Replay**—The IPSec receiver can detect and reject replayed packets.

IPSec provides secure *tunnels* between two peers, such as two routers. You define which packets are considered sensitive and should be sent through these secure tunnels, and you define the parameters that should be used to protect these sensitive packets, by specifying characteristics of these tunnels. Then, when the IPSec peer recognizes such a sensitive packet, the peer sets up the appropriate secure tunnel and sends the packet through the tunnel to the remote peer. (The use of the term *tunnel* in this chapter does not refer to using IPSec in tunnel mode.)

More accurately, these *tunnels* are sets of security associations (SAs) that are established between two IPSec peers. The SAs define which protocols and algorithms should be applied to sensitive packets and specify the keying material to be used by the two peers. SAs are unidirectional and are established per security protocol (AH or ESP).

With IPSec you define what traffic should be protected between two IPSec peers by configuring access lists and applying these access lists to interfaces by way of crypto map sets. Therefore, traffic may be selected on the basis of source and destination address, and optionally Layer 4 protocol, and port. (The access lists used for IPSec are used only to determine which traffic should be protected by IPSec, not which traffic should be blocked or permitted through the interface. Separate access lists define blocking and permitting at the interface.)

A crypto map set can contain multiple entries, each with a different access list. The crypto map entries are searched in order—the router attempts to match the packet to the access list specified in that entry.

When a packet matches a **permit** entry in a particular access list, and the corresponding crypto map entry is tagged as **cisco**, connections are established if necessary. If the crypto map entry is tagged as **ipsec-isakmp**, IPSec is triggered. If no SA exists that IPSec can use to protect this traffic to the peer, IPSec uses IKE to negotiate with the remote peer to set up the necessary IPSec SAs on behalf of the data flow. The negotiation uses information specified in the crypto map entry as well as the data flow information from the specific access list entry. (The behavior is different for dynamic crypto map entries. See the section “[Creating Dynamic Crypto Maps](#)” section later in this module.)

If the crypto map entry is tagged as **ipsec-manual**, IPSec is triggered. If no SA exists that IPSec can use to protect this traffic to the peer, the traffic is dropped. In this case, the SAs are installed via the configuration, without the intervention of IKE. If the SAs did not exist, IPSec did not have all of the necessary pieces configured.

Once established, the set of SAs (outbound, to the peer) is then applied to the triggering packet and to subsequent applicable packets as those packets exit the router. “Applicable” packets are packets that match the same access list criteria that the original packet matched. For example, all applicable packets could be encrypted before being forwarded to the remote peer. The corresponding inbound SAs are used when processing the incoming traffic from that peer.

Multiple IPSec tunnels can exist between two peers to secure different data streams, with each tunnel using a separate set of SAs. For example, some data streams might be authenticated only while other data streams must both be encrypted and authenticated.

Access lists associated with IPSec crypto map entries also represent which traffic the router requires to be protected by IPSec. Inbound traffic is processed against the crypto map entries—if an unprotected packet matches a **permit** entry in a particular access list associated with an IPSec crypto map entry, that packet is dropped because it was not sent as an IPSec-protected packet.

Crypto map entries also include transform sets. A transform set is an acceptable combination of security protocols, algorithms, and other settings to apply to IPSec protected traffic. During the IPSec SA negotiation, the peers agree to use a particular transform set when protecting a particular data flow.

IPSec Traffic Nested to Multiple Peers

You can nest IPSec traffic to a series of IPSec peers. For example, in order for traffic to traverse multiple firewalls (these firewalls have a policy of not letting through traffic that they have not authenticated), the router must establish IPSec tunnels with each firewall in turn. The “nearer” firewall becomes the “outer” IPSec peer.

In the example shown in [Figure 54](#), Router A encapsulates the traffic destined for Router C in IPSec (Router C is the inner IPSec peer). However, before Router A can send this traffic, it must first reencapsulate this traffic in IPSec in order to send it to Router B (Router B is the “outer” IPSec peer).

It is possible for the traffic between the “outer” peers to have one kind of protection (such as data authentication) and for traffic between the “inner” peers to have different protection (such as both data authentication and encryption).

How to Configure IPSec VPNs

Perform the tasks in the following sections to create IPSec VPNs:

- [Creating Crypto Access Lists, page 8](#)
- [Defining Transform Sets: A Combination of Security Protocols and Algorithms, page 14](#)
- [Creating Crypto Map Sets, page 17](#)
- [Applying Crypto Map Sets to Interfaces, page 30](#)

Creating Crypto Access Lists

To create crypto access lists that define which traffic is protected via IPSec tunnels, you should understand the following concepts:

- [Crypto Access List Overview](#)
- [When to Use the permit and deny Keywords in Crypto Access Lists](#)
- [Mirror Image Crypto Access Lists at Each IPSec Peer](#)
- [When to Use the any Keyword in Crypto Access Lists](#)

Crypto Access List Overview

Crypto access lists are used to define which IP traffic is protected by crypto and which traffic is not protected by crypto. (These access lists are *not* the same as regular access lists, which determine what traffic to forward or block at an interface.) For example, access lists can be created to protect all IP traffic between Subnet A and Subnet Y or Telnet traffic between Host A and Host B.

The access lists themselves are not specific to IPSec. It is the crypto map entry referencing the specific access list that defines whether IPSec processing is applied to the traffic matching a **permit** in the access list.

Crypto access lists associated with IPSec crypto map entries have four primary functions:

- Select outbound traffic to be protected by IPSec (permit = protect).
- Indicate the data flow to be protected by the new SAs (specified by a single **permit** entry) when initiating negotiations for IPSec security associations.
- Process inbound traffic in order to filter out and discard traffic that should have been protected by IPSec.
- Determine whether or not to accept requests for IPSec security associations on behalf of the requested data flows when processing IKE negotiation from the IPSec peer.
- Negotiation is performed only for **ipsec-isakmp** crypto map entries. In order to be accepted, if the peer initiates the IPSec negotiation, it must specify a data flow that is “permitted” by a crypto access list associated with an **ipsec-isakmp** crypto map entry.

If you want certain traffic to receive one combination of IPSec protection (for example, authentication only) and other traffic to receive a different combination of IPSec protection (for example, both authentication and encryption), you need to create two different crypto access lists to define the two different types of traffic. These different access lists are then used in different crypto map entries which specify different IPSec policies.

When to Use the permit and deny Keywords in Crypto Access Lists

Crypto protection can be permitted or denied for certain IP traffic in a crypto access list as follows:

- To protect IP traffic that matches the specified policy conditions in its corresponding crypto map entry, use the **permit** keyword in an access list.
- To refuse protection for IP traffic that matches the specified policy conditions in its corresponding crypto map entry, use the **deny** keyword in an access list.

Note

IP traffic is not protected by crypto if it is refused protection in all of the crypto map entries for an interface.

After the corresponding crypto map entry is defined and the crypto map set is applied to the interface, the defined crypto access list is applied to an interface. Different access lists must be used in different entries of the same crypto map set. However, both inbound and outbound traffic is evaluated against the same “outbound” IPSec access list. Therefore, the access list’s criteria is applied in the forward direction to traffic exiting your router and in the reverse direction to traffic entering your router.

In [Figure 55](#), IPSec protection is applied to traffic between Host 10.0.0.1 and Host 192.168.0.2 as the data exits Router A’s S0 interface en route to Host 192.168.0.2. For traffic from Host 10.0.0.1 to Host 192.168.0.2, the access list entry on Router A is evaluated as follows:

```
source = host 10.0.0.1
dest = host 192.168.0.2
```

For traffic from Host 192.168.0.2 to Host 10.0.0.1, that same access list entry on Router A is evaluated as follows:

```
source = host 192.168.0.2
dest = host 10.0.0.1
```

Figure 55 How Crypto Access Lists Are Applied for Processing IPSec

If you configure multiple statements for a given crypto access list that is used for IPSec, in general the first **permit** statement that is matched is the statement used to determine the scope of the IPSec SA. That is, the IPSec SA is set up to protect traffic that meets the criteria of the matched statement only. Later, if traffic matches a different **permit** statement of the crypto access list, a new, separate IPSec SA is negotiated to protect traffic matching the newly matched access list statement.

Any unprotected inbound traffic that matches a **permit** entry in the crypto access list for a crypto map entry flagged as IPSec is dropped, because this traffic was expected to be protected by IPSec.

Note

If you view your router's access lists by using a command such as **show ip access-lists**, *all* extended IP access lists are shown in the command output. This display output includes extended IP access lists that are used for traffic filtering purposes and those that are used for crypto. The **show** command output does not differentiate between the different uses of the extended access lists.

The following example shows that if overlapping networks are used, then the most specific networks are defined in crypto sequence numbers before less specific networks are defined. In this example, the more specific network is covered by the crypto map sequence number 10, followed by the less specific network in the crypto map, which is sequence number 20.

```
crypto map mymap 10 ipsec-isakmp
  set peer 192.168.1.1
  set transform-set test
  match address 101
crypto map mymap 20 ipsec-isakmp
  set peer 192.168.1.2
  set transform-set test
  match address 102
```

```
access-list 101 permit ip 10.1.1.0 0.0.0.255 172.16.1.0 0.0.0.255  
access-list 102 permit ip 10.0.0.0 0.255.255.255 172.16.0.0 0.15.255.255
```

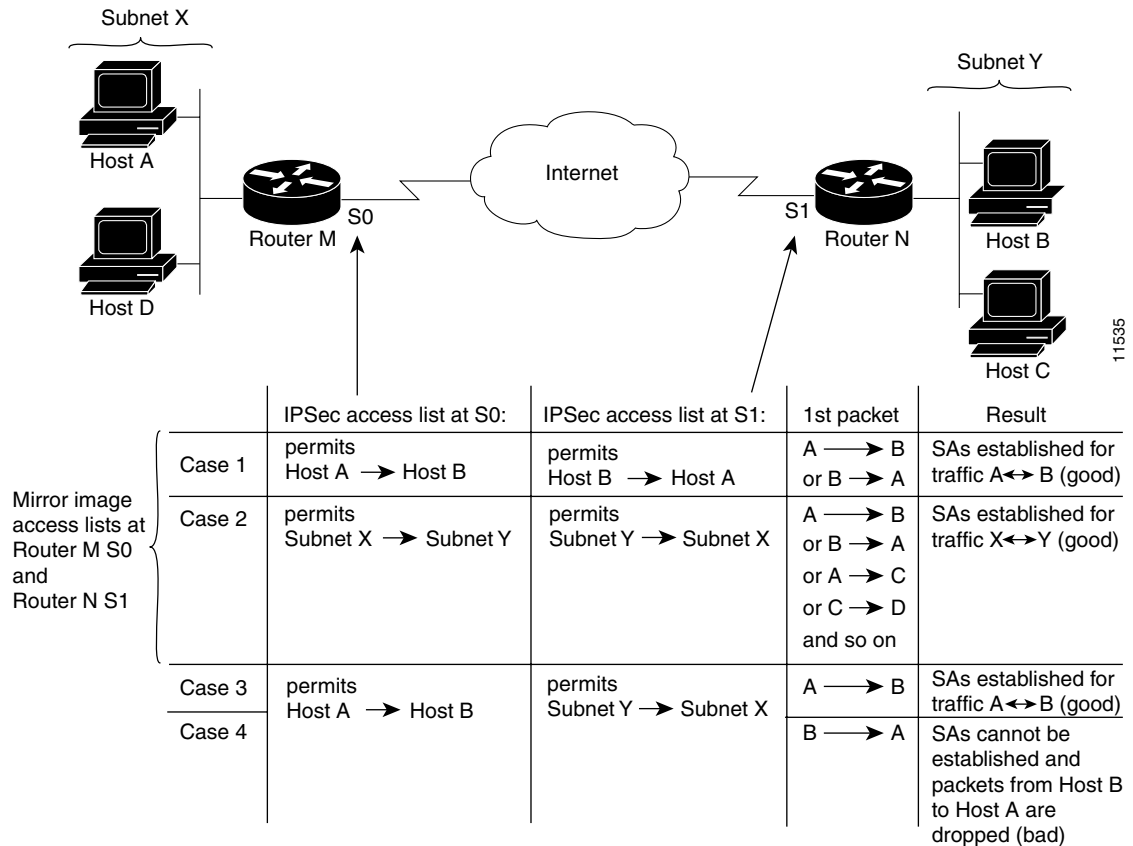

The following example shows how having a **deny** keyword in one crypto map sequence number and having a **permit** keyword for the same subnet and IP range in another crypto map sequence number is not supported.

```
crypto map mymap 10 ipsec-isakmp  
  set peer 192.168.1.1  
  set transform-set test  
  match address 101  
crypto map mymap 20 ipsec-isakmp  
  set peer 192.168.1.2  
  set transform-set test  
  match address 102  
  
access-list 101 deny ip 10.1.1.0 0.0.0.255 172.16.1.0 0.0.0.255  
access-list 101 permit ip 10.0.0.0 0.255.255.255 172.16.0.0 0.15.255.255  
  
access-list 102 permit ip 10.1.1.0 0.0.0.255 172.16.1.0 0.0.0.255
```

Mirror Image Crypto Access Lists at Each IPSec Peer

Cisco recommends that for every crypto access list specified for a static crypto map entry that you define at the local peer, you define a “mirror image” crypto access list at the remote peer. This ensures that traffic that has IPSec protection applied locally can be processed correctly at the remote peer. (The crypto map entries themselves must also support common transforms and must refer to the other system as a peer.)

[Figure 56](#) shows some sample scenarios when you have mirror image access lists and when you do not have mirror image access lists.

Figure 56 Mirror Image vs. Nonmirror Image Crypto Access Lists (for IPSec)

As Figure 56 indicates, IPSec SAs can be established as expected whenever the two peers' crypto access lists are mirror images of each other. However, an IPSec SA can be established only some of the time when the access lists are not mirror images of each other. This can happen in the case where an entry in one peer's access list is a subset of an entry in the other peer's access list, such as shown in Cases 3 and 4 of Figure 56. IPSec SA establishment is critical to IPSec—without SAs, IPSec does not work, causing any packets matching the crypto access list criteria to be silently dropped instead of being forwarded with IPSec.

In Figure 56, an SA cannot be established in Case 4. This is because SAs are always requested according to the crypto access lists at the initiating packet's end. In Case 4, Router N requests that all traffic between Subnet X and Subnet Y be protected, but this is a superset of the specific flows permitted by the crypto access list at Router M so the request is therefore not permitted. Case 3 works because Router M's request is a subset of the specific flows permitted by the crypto access list at Router N.

Because of the complexities introduced when crypto access lists are not configured as mirror images at peer IPSec devices, Cisco strongly encourages you to use mirror image crypto access lists.

When to Use the **any** Keyword in Crypto Access Lists

When you create crypto access lists, using the **any** keyword could cause problems. Cisco discourages the use of the **any** keyword to specify source or destination addresses.

The **any** keyword in a **permit** statement is discouraged when you have multicast traffic flowing through the IPSec interface; the **any** keyword can cause multicast traffic to fail.

The **permit any any** statement is strongly discouraged, because this causes all outbound traffic to be protected (and all protected traffic sent to the peer specified in the corresponding crypto map entry) and requires protection for all inbound traffic. Then, all inbound packets that lack IPSec protection are silently dropped, including packets for routing protocols, Network Time Protocol (NTP), echo, echo response, and so on.

You need to be sure you define which packets to protect. If you *must* use the **any** keyword in a **permit** statement, you must preface that statement with a series of **deny** statements to filter out any traffic (that would otherwise fall within that **permit** statement) that you do not want to be protected.

Also, use of **any** keyword in access control lists (ACLs) with reverse route injection (RRI) is not supported. (For more information on RRI, see the section “[Creating Crypto Map Sets](#).”)

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* {**deny** | **permit**} *protocol source source-wildcard destination destination-wildcard* [**log**]
or
ip access-list extended *name*
4. Repeat Step 3 for each crypto access list you want to create.

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	access-list <i>access-list-number</i> { deny permit } <i>protocol source source-wildcard destination destination-wildcard</i> [log] Example: Router(config)# access-list 100 permit ip 10.0.68.0 0.0.0.255 10.1.1.0 0.0.0.255 or ip access-list extended <i>name</i> Example: Router(config)# ip access-list extended vpn-tunnel	Specifies conditions to determine which IP packets are protected. ¹ Enable or disable crypto for traffic that matches these conditions. Tip Cisco recommends that you configure “mirror image” crypto access lists for use by IPSec and that you avoid using the any keyword.
Step 4	—	Repeat Step 3 for each crypto access list you want to create.

1. You specify conditions using an IP access list designated by either a number or a name. The **access-list** command designates a numbered extended access list; the **ip access-list extended** command designates a named access list.

What to Do Next

After at least one crypto access list is created, a transform set needs to be defined as described in the section [“Defining Transform Sets: A Combination of Security Protocols and Algorithms.”](#)

Next the crypto access lists need to be associated to particular interfaces when you configure and apply crypto map sets to the interfaces are configured and applied (following instructions in the sections [“Creating Crypto Map Sets”](#) and [“Applying Crypto Map Sets to Interfaces”](#)).

Defining Transform Sets: A Combination of Security Protocols and Algorithms

Perform this task to define a transform set that is to be used by the IPSec peers during IPSec security association negotiations with IKE.

Restrictions

If you are specifying SEAL encryption, note the following restrictions:

- Your router and the other peer must not have hardware IPSec encryption.
- Your router and the other peer must support IPSec.
- Your router and the other peer must support the k9 subsystem.
- SEAL encryption is available only on Cisco equipment. Therefore, interoperability is not possible.

About Transform Sets

A transform set represents a certain combination of security protocols and algorithms. During the IPSec SA negotiation, the peers agree to use a particular transform set for protecting a particular data flow.

You can specify multiple transform sets, and then specify one or more of these transform sets in a crypto map entry. The transform set defined in the crypto map entry is used in the IPSec SA negotiation to protect the data flows specified by that crypto map entry’s access list.

During IPSec security association negotiations with IKE, the peers search for a transform set that is the same at both peers. When such a transform set is found, it is selected and is applied to the protected traffic as part of both peers’ IPSec SAs. (With manually established SAs, there is no negotiation with the peer, so both sides must specify the same transform set.)

If you change a transform set definition, the change is only applied to crypto map entries that reference the transform set. The change is not applied to existing security associations, but is used in subsequent negotiations to establish new SAs. If you want the new settings to take effect sooner, you can clear all or part of the SA database by using the **clear crypto sa** command

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec transform-set** *transform-set-name transform1* [*transform2* [*transform3*]]

4. **mode** [**tunnel** | **transport**]
5. **exit**
6. **clear crypto sa** [peer {*ip-address* | **peer-name**} | sa map *map-name* | sa entry *destination-address protocol spi*]
7. **show crypto ipsec transform-set** [**tag** *transform-set-name*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec transform-set <i>transform-set-name transform1</i> [<i>transform2</i> [<i>transform3</i>]] Example: Router(config)# crypto ipsec transform-set aesset esp-aes 256 esp-sha-hmac	Defines a transform set and enters crypto transform configuration mode. There are complex rules defining which entries you can use for the transform arguments. These rules are explained in the command description for the crypto ipsec transform-set command, and Table 46 provides a list of allowed transform combinations.
Step 4	mode [tunnel transport] Example: Router(cfg-crypto-tran)# mode transport	(Optional) Changes the mode associated with the transform set. The mode setting is applicable only to traffic whose source and destination addresses are the IPSec peer addresses; it is ignored for all other traffic. (All other traffic is in tunnel mode only.)
Step 5	exit Example: Router(config)# exit	Exits global configuration mode.

	Command or Action	Purpose
Step 6	<pre>clear crypto sa [peer {ip-address peer-name} sa map map-name sa entry destination-address protocol spi]</pre> <p>Example: Router# clear crypto sa</p>	<p>(Optional) Clears existing IPSec security associations so that any changes to a transform set takes effect on subsequently established security associations.</p> <p>Manually established SAs are reestablished immediately.</p> <ul style="list-style-type: none"> Using the clear crypto sa command without parameters clear out the full SA database, which clears out active security sessions. You may also specify the peer, map, or entry keywords to clear out only a subset of the SA database.
Step 7	<pre>show crypto ipsec transform-set [tag transform-set-name]</pre> <p>Example: Router# show crypto ipsec transform-set</p>	<p>(Optional) Displays the configured transform sets.</p>

Table 46 shows allowed transform combinations.

Table 46 Allowed Transform Combinations

Transform Type	Transform	Description
AH Transform	ah-md5-hmac	AH with the MD5 (a Hash-based Message Authentication Code [HMAC] variant) authentication algorithm
	ah-sha-hmac	AH with the SHA (an HMAC variant) authentication algorithm
ESP Encryption Transform	esp-aes	ESP with the 128-bit AES encryption algorithm
	esp-aes 192	ESP with the 192-bit AES encryption algorithm
	esp-aes 256	ESP with the 256-bit AES encryption algorithm
	esp-des	ESP with the 56-bit DES encryption algorithm
	esp-3des	ESP with the 168-bit DES encryption algorithm (3DES or Triple DES)
	esp-null	Null encryption algorithm
	esp-seal	ESP with the 160-bit SEAL encryption algorithm.

Table 46 *Allowed Transform Combinations (continued)*

Transform Type	Transform	Description
ESP Authentication Transform	esp-md5-hmac	ESP with the MD5 (HMAC variant) authentication algorithm
	esp-sha-hmac	ESP with the SHA (HMAC variant) authentication algorithm
IP Compression Transform	comp-lzs	IP compression with the LZS algorithm

What to Do Next

After you have defined a transform set, you should create a crypto map as specified in the section [“Creating Crypto Map Sets.”](#)

Creating Crypto Map Sets

See one of the following sections, as appropriate, to help create crypto map sets:

- [Creating Static Crypto Maps](#)
- [Creating Dynamic Crypto Maps](#)
- [Creating Crypto Map Entries to Establish Manual SAs](#)

Prerequisites

Before you create crypto map entries, you should determine which type of crypto map—static, dynamic, or manual—best addresses the needs of your network. You should also understand the following concepts:

- [About Crypto Maps](#)
- [Load Sharing Among Crypto Maps](#)
- [Crypto Map Guidelines](#)

About Crypto Maps

Crypto map entries created for IPSec pull together the various parts used to set up IPSec SAs, including:

- Which traffic should be protected by IPSec (per a crypto access list)
- The granularity of the flow to be protected by a set of SAs
- Where IPSec-protected traffic should be sent (who the remote IPSec peer is)
- The local address to be used for the IPSec traffic (See the section [“Applying Crypto Map Sets to Interfaces”](#) for more details.)
- What IPSec SA should be applied to this traffic (selecting from a list of one or more transform sets)
- Whether SAs are manually established or are established via IKE
- Other parameters that might be necessary to define an IPSec SA

How Crypto Maps Work

Crypto map entries with the same crypto map name (but different map sequence numbers) are grouped into a crypto map set. Later, you apply these crypto map sets to interfaces; then, all IP traffic passing through the interface is evaluated against the applied crypto map set. If a crypto map entry sees outbound IP traffic that should be protected and the crypto map specifies the use of IKE, a SA is negotiated with the remote peer according to the parameters included in the crypto map entry; otherwise, if the crypto map entry specifies the use of manual SAs, an SA should have already been established via configuration. (If a dynamic crypto map entry sees outbound traffic that should be protected and no security association exists, the packet is dropped.)

The policy described in the crypto map entries is used during the negotiation of SAs. If the local router initiates the negotiation, it uses the policy specified in the static crypto map entries to create the offer to be sent to the specified IPSec peer. If the IPSec peer initiates the negotiation, the local router checks the policy from the static crypto map entries, as well as any referenced dynamic crypto map entries to decide whether to accept or reject the peer's request (offer).

For IPSec to succeed between two IPSec peers, both peers' crypto map entries must contain compatible configuration statements.

Compatible Crypto Maps: Establishing an SA

When two peers try to establish a SA, they must each have at least one crypto map entry that is compatible with one of the other peer's crypto map entries. For two crypto map entries to be compatible, they must at least meet the following criteria:

- The crypto map entries must contain compatible crypto access lists (for example, mirror image access lists). In the case where the responding peer is using dynamic crypto maps, the entries in the local crypto access list must be "permitted" by the peer's crypto access list.
- The crypto map entries must each identify the other peer (unless the responding peer is using dynamic crypto maps).
- The crypto map entries must have at least one transform set in common.

Load Sharing Among Crypto Maps

You can define multiple remote peers using crypto maps to allow for load sharing. Load sharing is useful because if one peer fails, there continues to be a protected path. The peer that packets are actually sent to is determined by the last peer that the router heard from (received either traffic or a negotiation request from) for a given data flow. If the attempt fails with the first peer, IKE tries the next peer on the crypto map list.

If you are not sure how to configure each crypto map parameter to guarantee compatibility with other peers, you might consider configuring dynamic crypto maps as described in the section "[Creating Dynamic Crypto Maps](#)." Dynamic crypto maps are useful when the establishment of the IPSec tunnels is initiated by the remote peer (such as in the case of an IPSec router fronting a server). They are not useful if the establishment of the IPSec tunnels is locally initiated, because the dynamic crypto maps are policy templates, not complete statements of policy. (Although the access lists in any referenced dynamic crypto map entry are used for crypto packet filtering.)

Crypto Map Guidelines

You can apply only one crypto map set to a single interface. The crypto map set can include a combination of IPSec/IKE and IPSec/manual entries. Multiple interfaces can share the same crypto map set if you want to apply the same policy to multiple interfaces.

If you create more than one crypto map entry for a given interface, use the *seq-num* argument of each map entry to rank the map entries: the lower the *seq-num* argument, the higher the priority. At the interface that has the crypto map set, traffic is evaluated against higher priority map entries first.

You must create multiple crypto map entries for a given interface if any of the following conditions exist:

- If different data flows are to be handled by separate IPSec peers.
- If you want to apply different IPSec security to different types of traffic (to the same or separate IPSec peers); for example, if you want traffic between one set of subnets to be authenticated, and traffic between another set of subnets to be both authenticated and encrypted. In this case the different types of traffic should have been defined in two separate access lists, and you must create a separate crypto map entry for each crypto access list.
- If you are not using IKE to establish a particular set of security associations, and want to specify multiple access list entries, you must create separate access lists (one per **permit** entry) and specify a separate crypto map entry for each access list.

Creating Static Crypto Maps

When IKE is used to establish SAs, the IPSec peers can negotiate the settings they use for the new security associations. This means that you can specify lists (such as lists of acceptable transforms) within the crypto map entry.

Perform this task to create crypto map entries that use IKE to establish the SAs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name seq-num ipsec-isakmp*
4. **match address** *access-list-id*
5. **set peer** {*hostname* | *ip-address*}
6. **set transform-set** *transform-set-name1* [*transform-set-name2...transform-set-name6*]
7. **set security-association lifetime** {*seconds seconds* | *kilobytes kilobytes*}
8. **set security-association level per-host**
9. **set pfs** [*group1* | *group2* | *group5*]
10. **exit**
11. **exit**
12. **show crypto map** [**interface** *interface* | tag *map-name*]

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto map <i>map-name seq-num ipsec-isakmp</i> Example: Router(config)# crypto map static-map 1 ipsec-isakmp	Names the crypto map entry to create (or modify), and enters crypto map configuration mode.
Step 4	match address <i>access-list-id</i> Example: Router(config-crypto-m)# match address vpn-tunnel	Names an extended access list. This access list determines which traffic should be protected by IPsec and which traffic should not be protected by IPsec security in the context of this crypto map entry.
Step 5	set peer { <i>hostname</i> <i>ip-address</i> } Example: Router(config-crypto-m)# set-peer 192.168.101.1	Specifies a remote IPsec peer, the peer to which IPsec protected traffic can be forwarded. Repeat for multiple remote peers.
Step 6	set transform-set <i>transform-set-name1</i> [<i>transform-set-name2</i> ... <i>transform-set-name6</i>] Example: Router(config-crypto-m)# set transform-set aasset	Specifies which transform sets are allowed for this crypto map entry. List multiple transform sets in order of priority (highest priority first).
Step 7	set security-association lifetime { seconds <i>seconds</i> kilobytes <i>kilobytes</i> } Example: Router (config-crypto-m)# set security-association lifetime seconds 2700	(Optional) Specifies a SA lifetime for the crypto map entry. By default, the SAs of the crypto map are negotiated according to the global lifetimes.
Step 8	set security-association level per-host Example: Router(config-crypto-m)# set security-association level per-host	(Optional) Specifies that separate SAs should be established for each source and destination host pair. By default, a single IPsec “tunnel” can carry traffic for multiple source hosts and multiple destination hosts.
		 Caution Use this command with care, because multiple streams between given subnets can rapidly consume resources.

	Command	Purpose
Step 9	set pfs [group1 group2 group 5] Example: Router(config-crypto-m)# set pfs group2	(Optional) Specifies that IPSec either should ask for perfect forward secrecy (PFS) when requesting new SAs for this crypto map entry or should demand PFS in requests received from the IPSec peer. By default, PFS is not requested. If no group is specified with this command, group1 is used as the default.
Step 10	exit Example: Router(config-crypto-m)# exit	Exits crypto-map configuration mode.
Step 11	exit Example: Router(config)# exit	Exits global configuration mode.
Step 12	show crypto map [interface <i>interface</i> tag <i>map-name</i>] Example: Router# show crypto map	Displays your crypto map configuration.

Troubleshooting Tips

Certain configuration changes take effect only when negotiating subsequent SAs. If you want the new settings to take immediate effect, you must clear the existing SAs so that they are re-established with the changed configuration. If the router is actively processing IPSec traffic, it is desirable to clear only the portion of the SA database that would be affected by the configuration changes (that is, clear only the SAs established by a given crypto map set). Clearing the full SA database should be reserved for large-scale changes, or when the router is processing very little other IPSec traffic.

To clear IPSec SAs, use the **clear crypto sa** command with appropriate parameters. (Omitting all parameters clears out the full SA database, which clears active security sessions.)

What to Do Next

After you have successfully created a static crypto map, you must apply the crypto map set to each interface through which IPSec traffic flows. To complete this task, see the section “[Applying Crypto Map Sets to Interfaces](#).”

Creating Dynamic Crypto Maps

Dynamic crypto maps can ease IPSec configuration and are recommended for use with networks where the peers are not always predetermined. To create dynamic crypto maps, you should understand the following concepts:

- [Dynamic Crypto Maps Overview](#)
- [Tunnel Endpoint Discovery \(TED\)](#)

Dynamic Crypto Maps Overview

Dynamic crypto maps are only available for use by IKE.

A dynamic crypto map entry is essentially a static crypto map entry without all the parameters configured. It acts as a policy template where the missing parameters are later dynamically configured (as the result of an IPSec negotiation) to match a remote peer's requirements. This allows remote peers to exchange IPSec traffic with the router even if the router does not have a crypto map entry specifically configured to meet all of the remote peer's requirements.

Dynamic crypto maps are not used by the router to initiate new IPSec security associations with remote peers. Dynamic crypto maps are used when a remote peer tries to initiate an IPSec security association with the router. Dynamic crypto maps are also used in evaluating traffic.

A dynamic crypto map set is included by reference as part of a crypto map set. Any crypto map entries that reference dynamic crypto map sets should be the lowest priority crypto map entries in the crypto map set (that is, have the highest sequence numbers) so that the other crypto map entries are evaluated first; that way, the dynamic crypto map set is examined only when the other (static) map entries are not successfully matched.

If the router accepts the peer's request, at the point that it installs the new IPSec security associations it also installs a temporary crypto map entry. This entry is filled in with the results of the negotiation. At this point, the router performs normal processing, using this temporary crypto map entry as a normal entry, even requesting new security associations if the current ones are expiring (based upon the policy specified in the temporary crypto map entry). Once the flow expires (that is, all of the corresponding security associations expire), the temporary crypto map entry is then removed.

For both static and dynamic crypto maps, if unprotected inbound traffic matches a **permit** statement in an access list, and the corresponding crypto map entry is tagged as "IPSec," then the traffic is dropped because it is not IPSec-protected. (This is because the security policy as specified by the crypto map entry states that this traffic must be IPSec-protected.)

For static crypto map entries, if outbound traffic matches a **permit** statement in an access list and the corresponding SA is not yet established, the router initiates new SAs with the remote peer. In the case of dynamic crypto map entries, if no SA existed, the traffic would simply be dropped (because dynamic crypto maps are not used for initiating new SAs).

Note

Use care when using the **any** keyword in **permit** entries in dynamic crypto maps. If it is possible for the traffic covered by such a **permit** entry to include multicast or broadcast traffic, the access list should include **deny** entries for the appropriate address range. Access lists should also include **deny** entries for network and subnet broadcast traffic, and for any other traffic that should not be IPSec protected.

Restrictions for Dynamic Crypto Maps

Dynamic crypto map entries specify crypto access lists that limit traffic for which IPSec SAs can be established. A dynamic crypto map entry that does not specify an access list is ignored during traffic filtering. A dynamic crypto map entry with an empty access list causes traffic to be dropped. If there is only one dynamic crypto map entry in the crypto map set, it must specify acceptable transform sets.

Tunnel Endpoint Discovery (TED)

Defining a dynamic crypto map allows only the receiving router to dynamically determine an IPSec peer. TED allows the initiating router to dynamically determine an IPSec peer for secure IPSec communications.

Dynamic TED helps to simplify IPSec configuration on the individual routers within a large network. Each node has a simple configuration that defines the local network that the router is protecting and the required IPSec transforms.

To have a large, fully-meshed network *without* TED, each peer needs to have static crypto maps to every other peer in the network. For example, if there are 100 peers in a large, fully-meshed network, each router needs 99 static crypto maps for each of its peers. With TED, only a single dynamic crypto map with TED enabled is needed because the peer is discovered dynamically. Thus, static crypto maps do not need to be configured for each peer.

**Note**

TED helps only in discovering peers; otherwise, TED does not function any differently than normal IPSec. TED does not improve the scalability of IPSec (in terms of performance or the number of peers or tunnels).

Figure 57 and the corresponding steps explain a sample TED network topology.

Figure 57 Tunnel Endpoint Discovery Sample Network Topology

- Step 1** Host A sends a packet that is destined for Host B.
- Step 2** Router 1 intercepts and reads the packet. According to the IKE policy, Router 1 contains the following information: the packet must be encrypted, there are no SAs for the packet, and TED is enabled. Thus, Router 1 drops the packet and sends a TED probe into the network. (The TED probe contains the IP address of Host A (as the source IP address) and the IP address of Host B (as the destination IP address) embedded in the payload.
- Step 3** Router 2 intercepts the TED probe and checks the probe against the ACLs that it protects; after the probe matches an ACL, it is recognized as a TED probe for proxies that the router protects. It then sends a TED reply with the IP address of Host B (as the source IP address) and the IP address of Host A (as the destination IP address) embedded in the payload.
- Step 4** Router 1 intercepts the TED reply and checks the payloads for the IP address and half proxy of Router 2. It then combines the source side of its proxy with the proxy found in the second payload and initiates an IKE session with Router 2; thereafter, Router 1 initiates an IPSec session with Router 2.

**Note**

IKE cannot occur until the peer is identified.

TED Versions

The following table lists the available TED versions:

Version	First Available Release	Description
TEDv1	12.0(5)T	Performs basic TED functionality on nonredundant networks.
TEDv2	12.1M	Enhanced to work with redundant networks with paths through multiple security gateways between the source and the destination.
TEDv3	12.2M	Enhanced to allow non-IP-related entries to be used in the access list.

TED Restrictions

TED has the following restrictions:

- It is Cisco proprietary.
- It is available only on dynamic crypto maps. (The dynamic crypto map template is based on the dynamic crypto map performing peer discovery. Although there are no access-list restrictions on the dynamic crypto map template, the dynamic crypto map template should cover data sourced from the protected traffic and the receiving router using the **any** keyword. When using the **any** keyword, include explicit **deny** statements to exempt routing protocol traffic prior to entering the **permit any** command.)
- TED works only in tunnel mode; that is, it does not work in transport mode.
- It is limited by the performance and scalability of limitation of IPsec on each individual platform.

Note

Enabling TED slightly decreases the general scalability of IPsec because of the set-up overhead of peer discovery, which involves an additional “round-trip” of IKE messages (TED probe and reply). Although minimal, the additional memory used to store data structures during the peer discovery stage adversely affects the general scalability of IPsec.

- The IP addresses must be able to be routed within the network.
- The access list used in the crypto map for TED can only contain IP-related entries—TCP, UDP, or any other protocol cannot be used in the access list.

Note

This restriction is no longer applicable in TEDv3.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto dynamic-map** *dynamic-map-name* *dynamic-seq-num*
4. **set transform-set** *transform-set-name1* [*transform-set-name2...transform-set-name6*]
5. **match address** *access-list-id*
6. **set peer** {*hostname* | *ip-address*}
7. **set security-association lifetime** {**seconds** *seconds* | **kilobytes** *kilobytes*}

8. **set pfs** [group1 | group2 | group5]
9. **exit**
10. **exit**
11. **show crypto dynamic-map** [tag *map-name*]
12. **configure terminal**
13. **crypto map** *map-name seq-num ipsec-isakmp dynamic dynamic-map-name* [discover]

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto dynamic-map <i>dynamic-map-name dynamic-seq-num</i> Example: Router(config)# crypto dynamic-map test-map 1	Creates a dynamic crypto map entry and enters crypto map configuration mode.
Step 4	set transform-set <i>transform-set-name1</i> [<i>transform-set-name2...transform-set-name6</i>] Example: Router(config-crypto-m)# set transform-set aasset	Specifies which transform sets are allowed for the crypto map entry. List multiple transform sets in order of priority (highest priority first). This is the only configuration statement required in dynamic crypto map entries.

	Command	Purpose
Step 5	match address <i>access-list-id</i> Example: Router(config-crypto-m)# match address 101	<p>(Optional) Accesses list number or name of an extended access list.</p> <p>This access list determines which traffic should be protected by IPSec and which traffic should not be protected by IPSec security in the context of this crypto map entry.</p> <p>Note Although access-lists are optional for dynamic crypto maps, they are highly recommended.</p> <p>If this is configured, the data flow identity proposed by the IPSec peer must fall within a permit statement for this crypto access list.</p> <p>If this is not configured, the router accepts any data flow identity proposed by the IPSec peer. However, if this is configured but the specified access list does not exist or is empty, the router drops all packets. This is similar to static crypto maps because they also require that an access list be specified.</p> <p>Care must be taken if the any keyword is used in the access list, because the access list is used for packet filtering as well as for negotiation.</p> <p>You must configure a match address; otherwise, the behavior is not secure, and you cannot enable TED because packets are sent in the clear (unencrypted.)</p>
Step 6	set peer { <i>hostname</i> <i>ip-address</i> } Example: Router(config-crypto-m)# set peer 192.168.101.1	<p>(Optional) Specifies a remote IPSec peer. Repeat for multiple remote peers.</p> <p>Note This is rarely configured in dynamic crypto map entries. Dynamic crypto map entries are often used for unknown remote peers.</p>
Step 7	set security-association lifetime { seconds <i>seconds</i> kilobytes <i>kilobytes</i> } Example: Router (config-crypto-m)# set security-association lifetime seconds 7200	<p>(Optional) Overrides (for a particular crypto map entry) the global lifetime value, which is used when negotiating IP Security SAs.</p>
Step 8	set pfs [group1 group2 group5] Example: Router(config-crypto-m)# set pfs group2	<p>(Optional) Specifies that IPSec should ask for PFS when requesting new security associations for this crypto map entry or should demand PFS in requests received from the IPSec peer.</p> <p>By default, PFS is not requested. If no group is specified with this command, group1 is used as the default.</p>
Step 9	exit Example: Router(config-crypto-m)# exit	<p>Exits crypto-map configuration mode and returns to global configuration mode.</p>

	Command	Purpose
Step 10	exit Example: Router(config)# exit	Exits global configuration mode.
Step 11	show crypto dynamic-map [<i>tag map-name</i>] Example: Router# show crypto dynamic-map	(Optional) Displays information about dynamic crypto maps.
Step 12	configure terminal Example: Router# configure terminal	Returns to global configuration mode.
Step 13	crypto map <i>map-name</i> <i>seq-num</i> ipsec-isakmp dynamic <i>dynamic-map-name</i> [discover] Example: Router(config)# crypto map static-map 1 ipsec-isakmp dynamic test-map discover	(Optional) Adds a dynamic crypto map to a crypto map set. You should set the crypto map entries referencing dynamic maps to the lowest priority entries in a crypto map set. Note You must issue the discover keyword to enable TED.

Troubleshooting Tips

Certain configuration changes take effect only when negotiating subsequent SAs. If you want the new settings to take immediate effect, you must clear the existing SAs so that they are reestablished with the changed configuration. If the router is actively processing IPSec traffic, it is desirable to clear only the portion of the SA database that would be affected by the configuration changes (that is, clear only the SAs established by a given crypto map set). Clearing the full SA database should be reserved for large-scale changes, or when the router is processing very little other IPSec traffic.

To clear IPSec SAs, use the **clear crypto sa** command with appropriate parameters. (Omitting all parameters clears the full SA database, which clears active security sessions.)

What to Do Next

After you have successfully created a crypto map set, you must apply the crypto map set to each interface through which IPSec traffic flows. To complete this task, see the section “[Applying Crypto Map Sets to Interfaces](#).”

Creating Crypto Map Entries to Establish Manual SAs

The use of manual security associations is a result of a prior arrangement between the users of the local router and the IPSec peer. The two parties may begin with manual SAs and then move to using SAs established via IKE, or the remote party’s system may not support IKE. If IKE is not used for establishing the SAs, there is no negotiation of SAs, so the configuration information in both systems must be the same in order for traffic to be processed successfully by IPSec.

The local router can simultaneously support manual and IKE-established SAs, even within a single crypto map set.

There is very little reason to disable IKE on the local router (unless the router only supports manual SAs, which is unlikely).

**Note**

Access lists for crypto map entries tagged as **ipsec-manual** are restricted to a single **permit** entry and subsequent entries are ignored. In other words, the SAs established by that particular crypto map entry are only for a single data flow. To be able to support multiple manually established SAs for different kinds of traffic, define multiple crypto access lists, and then apply each one to a separate **ipsec-manual** crypto map entry. Each access list should include one **permit** statement defining what traffic to protect.

To create crypto map entries to establish manual SAs (that is, when IKE is not used to establish the SAs), perform this task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name seq-num ipsec-manual*
4. **match address** *access-list-id*
5. **set peer** {*hostname* | *ip-address*}
6. **set transform-set** *transform-set-name*
7. **set session-key inbound ah spi hex-key-string**
or
set session-key outbound ah spi hex-key-string
8. **set session-key inbound esp spi cipher hex-key-string** [**authenticator** *hex-key-string*]
or
set session-key outbound esp spi cipher hex-key-string [**authenticator** *hex-key-string*]
9. **exit**
10. **exit**
11. **show crypto map** [**interface** *interface* | **tag** *map-name*]

DETAILED STEPS

	Command	Purpose
Step 1	enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
	Example: Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example: Router# configure terminal	

	Command	Purpose
Step 3	crypto map <i>map-name seq-num ipsec-manual</i> Example: Router(config)# crypto map mymap 10 ipsec-manual	Specifies the crypto map entry to create or modify and enters crypto map configuration mode.
Step 4	match address <i>access-list-id</i> Example: Router(config-crypto-m)# match address 102	Names an IPSec access list that determines which traffic should be protected by IPSec and which traffic should not be protected by IPSec in the context of this crypto map entry. (The access list can specify only one permit entry when IKE is not used.)
Step 5	set peer { <i>hostname</i> <i>ip-address</i> } Example: Router(config-crypto-m)# set peer 10.0.0.5	Specifies the remote IPSec peer. This is the peer to which IPSec protected traffic should be forwarded. (Only one peer can be specified when IKE is not used.)
Step 6	set transform-set <i>transform-set-name</i> Example: Router(config-crypto-m)# set transform-set someset	Specifies which transform set should be used. This must be the same transform set that is specified in the remote peer's corresponding crypto map entry. Note Only one transform set can be specified when IKE is not used.
Step 7	set session-key inbound ah <i>spi hex-key-string</i> Example: Router(config-crypto-m)# set session-key inbound ah 256 98765432109876549876543210987654 and set session-key outbound ah <i>spi hex-key-string</i> Example: Router(config-crypto-m)# set session-key outbound ah 256 fedcbafedcbafedcfedcbafedcbafedc	Sets the AH security parameter indexes (SPIs) and keys to apply to inbound and outbound protected traffic if the specified transform set includes the AH protocol. (This manually specifies the AH security association to be used with protected traffic.)
Step 8	set session-key inbound esp <i>spi cipher hex-key-string</i> [authenticator <i>hex-key-string</i>] Example: Router(config-crypto-m)# set session-key inbound esp 256 cipher 0123456789012345 and set session-key outbound esp <i>spi cipher hex-key-string</i> [authenticator <i>hex-key-string</i>] Example: Router(config-crypto-m)# set session-key outbound esp 256 cipher abcdefabcdefabcd	Sets the ESP SPIs and keys to apply to inbound and outbound protected traffic if the specified transform set includes the ESP protocol. Specifies the cipher keys if the transform set includes an ESP cipher algorithm. Specifies the authenticator keys if the transform set includes an ESP authenticator algorithm. (This manually specifies the ESP security association to be used with protected traffic.)

	Command	Purpose
Step 9	exit Example: Router(config-crypto-m)# exit	Exits crypto-map configuration mode and returns to global configuration mode.
Step 10	exit Example: Router(config)# exit	Exits global configuration mode.
Step 11	show crypto map [interface <i>interface</i> tag <i>map-name</i>] Example: Router# show crypto map	Displays your crypto map configuration.

Troubleshooting Tips

For manually established SAs, you must clear and reinitialize the SAs for the changes to take effect. To clear IPSec SAs, use the **clear crypto sa** command with appropriate parameters. (Omitting all parameters clears the full SA database, which clears active security sessions.)

What to Do Next

After you have successfully created a crypto map set, you must apply the crypto map set to each interface through which IPSec traffic flows. To complete this task, see the section “[Applying Crypto Map Sets to Interfaces](#).”

Applying Crypto Map Sets to Interfaces

You need to apply a crypto map set to each interface through which IPSec traffic flows. Applying the crypto map set to an interface instructs the router to evaluate all the interface’s traffic against the crypto map set and to use the specified policy during connection or security association negotiation on behalf of traffic to be protected by crypto.

Perform this task to apply a crypto map to an interface.

Redundant Interfaces Sharing the Same Crypto Map

For redundancy, you could apply the same crypto map set to more than one interface. The default behavior is as follows:

- Each interface has its own piece of the security association database.
- The IP address of the local interface is used as the local address for IPSec traffic originating from or destined to that interface.

If you apply the same crypto map set to multiple interfaces for redundancy purposes, you need to specify an identifying interface. One suggestion is to use a loopback interface as the identifying interface. This has the following effects:

- The per-interface portion of the IPSec security association database is established one time and shared for traffic through all the interfaces that share the same crypto map.

- The IP address of the identifying interface is used as the local address for IPSec traffic originating from or destined to those interfaces sharing the same crypto map set.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **crypto map** *map-name*
5. **exit**
6. **crypto map** *map-name* **local-address** *interface-id*
7. **exit**
8. **show crypto map** [**interface** *interface*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: Router(config)# Interface FastEthernet 0/0	Configures an interface and enters interface configuration mode.
Step 4	crypto map <i>map-name</i> Example: Router(config-if)# crypto map mymap	Applies a crypto map set to an interface.
Step 5	exit Example: Router(config-if)# exit	Exits interface configuration mode and returns to global configuration mode.
Step 6	crypto map <i>map-name</i> local-address <i>interface-id</i> Example: Router(config)# crypto map mymap local-address loopback0	(Optional) Permits redundant interfaces to share the same crypto map using the same local identity.

	Command or Action	Purpose
Step 7	exit Example: Router(config)# exit	(Optional) Exits global configuration mode.
Step 8	show crypto map [interface <i>interface</i>] Example: Router# show crypto map	(Optional) Displays your crypto map configuration

Configuration Examples for Configuring an IPsec VPN

This section contains the following configuration example:

Glossary

anti-replay—Security service where the receiver can reject old or duplicate packets to protect itself against replay attacks. IPSec provides this optional service by use of a sequence number combined with the use of data authentication. Cisco IOS IPSec provides this service whenever it provides the data authentication service, except for manually established SAs (that is, SAs established by configuration and not by IKE).

data authentication—Verification of the integrity and origin of the data.

Data authentication can refer either to integrity alone or to both of these concepts (although data origin authentication is dependent upon data integrity).

data confidentiality—Security service in which the protected data cannot be observed.

data flow—Grouping of traffic, identified by a combination of source address or mask; destination address or mask; IP next protocol field, and source and destination ports, where the protocol and port fields can have the values of **any**. IPSec protection is applied to data flows.

peer—In the context of this module, a “peer” is a router or other device that participates in IPSec.

PFS—perfect forward secrecy. Cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not compromised, because subsequent keys are not derived from previous keys.

SA—security association. Description of how two or more entities use security services in the context of a particular security protocol (AH or ESP) to communicate securely on behalf of a particular data flow. The transform and the shared secret keys are used for protecting the traffic.

SPI—security parameter index. A number which, together with a destination IP address and security protocol, uniquely identifies a particular security association. Without IKE, the SPI is manually specified for each security association.

transform—List of operations performed on a dataflow to provide data authentication, data confidentiality, and data compression. For example, one transform is the ESP protocol with the HMAC-MD5 authentication algorithm; another transform is the AH protocol with the 56-bit DES encryption algorithm and the ESP protocol with the HMAC-SHA authentication algorithm.

tunnel—In the context of this module, “tunnel” is a secure communication path between two peers, such as two routers. It does not refer to using IPSec in tunnel mode.

Note

Refer to *Internetworking Terms and Acronyms* for terms not included in this glossary.

Feature Information for Security for VPNs with IPSec

[Table 47](#) lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For details on when support for a specific command was introduced, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

[Table 47](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 47 *Feature Information for Configuring Security for IPSec VPNs*

Feature Name	Software Releases	Feature Configuration Information
Advanced Encryption Standard (AES)	12.2(8)T	<p>This feature adds support for the new encryption standard AES, which is a privacy transform for IPSec and IKE and has been developed to replace DES.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> • Supported Standards • Defining Transform Sets: A Combination of Security Protocols and Algorithms <p>The following commands were modified by this feature: crypto ipsec transform-set, encryption (IKE policy), show crypto ipsec transform-set, show crypto isakmp policy</p>
DES/3DES/AES VPN Encryption Module (AIM-VPN/EPII, AIM-VPN/HPII, AIM-VPN/BPII Family)	12.3(7)T	<p>This feature describes which VPN encryption hardware AI) and NM are supported in certain Cisco IOS software releases.</p> <p>The following section provides information about this feature:</p> <ul style="list-style-type: none"> • AIMs and NM Support
SEAL Encryption	12.3(7)T	<p>This feature adds support for SEAL encryption in IPSec.</p> <p>The following section provides information about this feature:</p> <ul style="list-style-type: none"> • Supported Standards • Defining Transform Sets: A Combination of Security Protocols and Algorithms <p>The following command was modified by this feature: crypto ipsec transform-set</p>
Software IPPCP (LZS) with Hardware Encryption	12.2(13)T	<p>This feature allows customers to use LZS software compression with IPSec when a VPN module is in Cisco 2600 and Cisco 3600 series routers.</p> <p>The following section provides information about this feature:</p> <ul style="list-style-type: none"> • AIMs and NM Support
IKE Shared Secret Using AAA Server	Cisco IOS XE Release 2.1	<p>This feature was introduced on Cisco ASR 1000 Series Routers.</p>

Cisco Easy VPN Remote

First Published: November 25, 2002

Last Updated: July 11, 2008

This document provides information on configuring and monitoring the Cisco Easy VPN Remote feature to create IPsec Virtual Private Network (VPN) tunnels between a supported router and an Easy VPN server (Cisco IOS router, VPN 3000 concentrator, or Cisco PIX Firewall) that supports this form of IPsec encryption and decryption.

For the benefits of this feature, see the section “[Benefits of the Cisco Easy VPN Remote Feature.](#)”

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Easy VPN Remote](#)” section on page 107.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Cisco Easy VPN Remote

Cisco Easy VPN Remote Feature

- A Cisco 800 series router running Cisco IOS Release 12.2(15)T, 12.3(2)T, 12.3(4)T, 12.3(7)T, or 12.3(7)XR2 configured as a Cisco Easy VPN remote.
- A Cisco 1700 series router running Cisco IOS Release 12.2(15)T, 12.3(2)T, 12.3(4)T, 12.3(7)T, or 12.3(7)XR, configured as a Cisco Easy VPN remote.
- A Cisco 1800 series fixed configuration router running Cisco IOS Release 12.3(8)YI.
- A Cisco uBR905 or Cisco uBR925 cable access router running Cisco IOS Release 12.2(15)T, configured as a Cisco Easy VPN remote.
- Another Cisco router or VPN concentrator that supports the Cisco Easy VPN Server feature and that is configured as a Cisco IOS Easy VPN server. See the “[Required Easy VPN Servers](#)” section for a detailed list.

Reactivate Primary Peer Feature

- An existing Easy VPN remote configuration can be enhanced to accommodate the Reactivate Primary Peer feature using the **peer** command (and **default** keyword) and the **idle-time** command. After the tunnel between the Easy VPN remote and a nondefault peer is working, the Reactivate Primary Peer features takes effect, that is, the Easy VPN remote periodically tries to check the connectivity with the primary peer. Any time the Easy VPN remote detects that the link is working, the Easy VPN remote tears down the existing connection and brings up the tunnel with the primary peer.

Restrictions for Cisco Easy VPN Remote

Required Easy VPN Servers

The Cisco Easy VPN Remote feature requires that the destination peer be a Cisco IOS Easy VPN server or VPN concentrator that supports the Cisco Easy VPN Server feature. At the time of publication, servers or concentrators that support this feature include the following platforms when running the indicated software releases:

- Cisco 806, Cisco 826, Cisco 827, Cisco 828, Cisco 831, Cisco 836, and Cisco 837 routers—Cisco IOS Release 12.2(8)T or later release. Cisco 800 series routers are not supported in Cisco IOS Release 12.3(7)XR, but they are supported in Cisco IOS Release 12.3(7)XR2.
- Cisco 870 series—Cisco IOS Release 12.3(8)YI1.
- Cisco 1700 series—Cisco IOS Release 12.2(8)T or later release.
- Cisco 1800 series fixed configuration router—Cisco IOS Release 12.3(8)YI.
- Cisco 1812 router—Cisco IOS Release 12.3(8)YH.
- Cisco 2600 series—Cisco IOS Release 12.2(8)T or later release.
- Cisco 3620—Cisco IOS Release 12.2(8)T or later release.
- Cisco 3640—Cisco IOS Release 12.2(8)T or later release.
- Cisco 3660—Cisco IOS Release 12.2(8)T or later release.
- Cisco 7100 series VPN routers—Cisco IOS Release 12.2(8)T or later release.
- Cisco 7200 series routers—Cisco IOS Release 12.2(8)T or later release.

- Cisco 7500 series routers—Cisco IOS Release 12.2(8)T or later release.
- Cisco PIX 500 series—Software Release 6.2 or later release.
- Cisco VPN 3000 series—Software Release 3.11 or later release.

Only ISAKMP Policy Group 2 Supported on Easy VPN Servers

The Unity Protocol supports only Internet Security Association Key Management Protocol (ISAKMP) policies that use group 2 (1024-bit Diffie-Hellman) Internet Key Exchange (IKE) negotiation, so the Easy VPN server being used with the Cisco Easy VPN Remote feature must be configured for a group 2 ISAKMP policy. The Easy VPN server cannot be configured for ISAKMP group 1 or group 5 when being used with a Cisco Easy VPN client.

Transform Sets Supported

To ensure a secure tunnel connection, the Cisco Easy VPN Remote feature does not support transform sets that provide encryption without authentication (ESP-DES and ESP-3DES) or transform sets that provide authentication without encryption (ESP-NUL ESP-SHA-HMAC and ESP-NUL ESP-MD5-HMAC).

Note

The Cisco Unity Client Protocol does not support Authentication Header (AH) authentication, but Encapsulation Security Protocol (ESP) is supported.

Dial Backup for Easy VPN Remotes

Line-status-based backup is not supported in this feature.

Network Address Translation Interoperability Support

Network Address Translation (NAT) interoperability is not supported in client mode with split tunneling.

Virtual IPsec Interface Restrictions

- For the Virtual IPsec Interface Support feature to work, virtual templates support is needed.
- If you are using a virtual tunnel interface on the Easy VPN remote device, it is recommended that you configure the server for a virtual tunnel interface.

Dual Tunnel Support

The following restrictions apply if you are using dual tunnels that share common inside and outside interfaces:

- If dual tunnels are configured, one of the tunnels should have a split tunnel configured on the server.
- Web Intercept can be configured for only one of the tunnels. Web Intercept should not be used for the voice tunnel.
- Web Intercept cannot be used for IP phones until authorization proxy becomes aware of how to bypass the IP phone.
- Some features, such as Pushing a Configuration URL Through a Mode-Configuration Exchange, can be used only through a single tunnel.

cTCP Support on Easy VPN Clients

- cTCP listens on only up to 10 ports.
- If there are other applications registered for the port on which cTCP is enabled, those applications will not work.

Information About Cisco Easy VPN Remote

To configure the Cisco Easy VPN Remote features, you should understand the following concepts:

- [Benefits of the Cisco Easy VPN Remote Feature, page 4](#)
- [Cisco Easy VPN Remote Overview, page 4](#)
- [Modes of Operation, page 5](#)
- [Authentication, page 8](#)
- [Tunnel Activation Options, page 17](#)
- [Dead Peer Detection Stateless Failover Support, page 18](#)
- [Cisco Easy VPN Remote Features, page 19](#)

Benefits of the Cisco Easy VPN Remote Feature

- Allows dynamic configuration of end-user policy, requiring less manual configuration by end users and field technicians, thus reducing errors and further service calls.
- Allows the provider to change equipment and network configurations as needed, with little or no reconfiguration of the end-user equipment.
- Provides for centralized security policy management.
- Enables large-scale deployments with rapid user provisioning.
- Eliminates the need for end users to purchase and configure external VPN devices.
- Eliminates the need for end users to install and configure Easy VPN Client software on their PCs.
- Offloads the creation and maintenance of the VPN connections from the PC to the router.
- Reduces interoperability problems between the different PC-based software VPN clients, external hardware-based VPN solutions, and other VPN applications.
- Sets up a single IPsec tunnel regardless of the number of multiple subnets that are supported and the size of the split-include list.

Cisco Easy VPN Remote Overview

Cable modems, xDSL routers, and other forms of broadband access provide high-performance connections to the Internet, but many applications also require the security of VPN connections that perform a high level of authentication and that encrypt the data between two particular endpoints. However, establishing a VPN connection between two routers can be complicated and typically requires tedious coordination between network administrators to configure the VPN parameters of the two routers.

The Cisco Easy VPN Remote feature eliminates much of this tedious work by implementing Cisco Unity Client Protocol, which allows most VPN parameters to be defined at a Cisco IOS Easy VPN server. This server can be a dedicated VPN device, such as a Cisco VPN 3000 concentrator or a Cisco PIX Firewall or a Cisco IOS router that supports the Cisco Unity Client Protocol.

After the Cisco Easy VPN server has been configured, a VPN connection can be created with minimal configuration on an Easy VPN remote, such as a Cisco 800 series router or a Cisco 1700 series router. When the Easy VPN remote initiates the VPN tunnel connection, the Cisco Easy VPN server pushes the IPsec policies to the Easy VPN remote and creates the corresponding VPN tunnel connection.

The Cisco Easy VPN Remote feature provides for automatic management of the following details:

- Negotiating tunnel parameters, such as addresses, algorithms, and lifetime.
- Establishing tunnels according to the parameters that were set.
- Automatically creating the NAT or Port Address Translation (PAT) and associated access lists that are needed, if any.
- Authenticating users, that is, ensuring that users are who they say they are by way of usernames, group names, and passwords.
- Managing security keys for encryption and decryption.
- Authenticating, encrypting, and decrypting data through the tunnel.

Modes of Operation

The Cisco Easy VPN Remote feature supports three modes of operation: client, network extension, and network extension plus:

- **Client**—Specifies that NAT or PAT be done so that the PCs and other hosts at the remote end of the VPN tunnel form a private network that does not use any IP addresses in the IP address space of the destination server.

An enhancement has been made so that the IP address that is received via mode configuration is automatically assigned to an available loopback interface. The IPsec Security Associations (SAs) for this IP address are automatically created by Easy VPN Remote. The IP address is typically used for troubleshooting (using ping, Telnet, and Secure Shell).

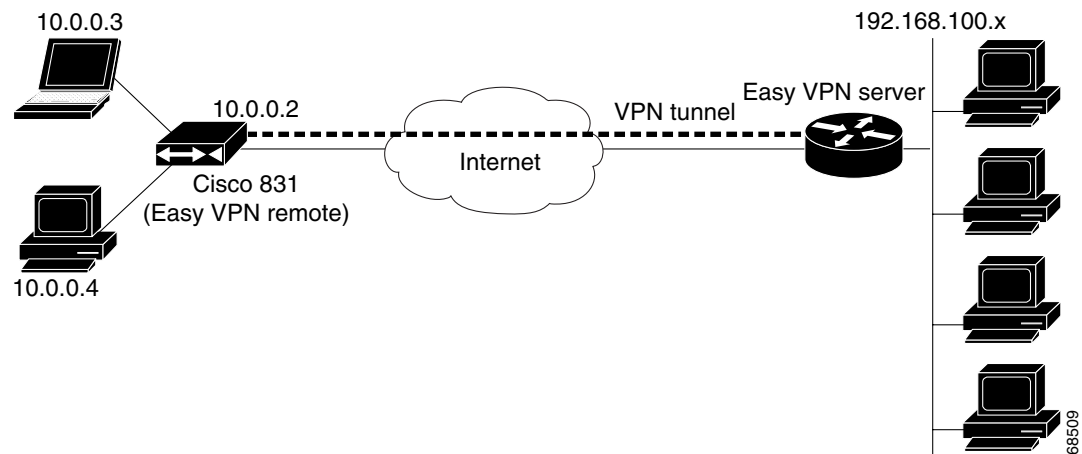

- **Network extension**—Specifies that the PCs and other hosts at the client end of the VPN tunnel should be given IP addresses that are fully routable and reachable by the destination network over the tunneled network so that they form one logical network. PAT is not used, which allows the client PCs and hosts to have direct access to the PCs and hosts at the destination network.
- **Network extension plus (mode network-plus)**—Identical to network extension mode with the additional capability of being able to request an IP address via mode configuration and automatically assign it to an available loopback interface. The IPsec SAs for this IP address are automatically created by Easy VPN Remote. The IP address is typically used for troubleshooting (using ping, Telnet, and Secure Shell).

All modes of operation also optionally support split tunneling, which allows secure access to corporate resources through the VPN tunnel while also allowing Internet access through a connection to an Internet service provider (ISP) or other service—thereby eliminating the corporate network from the path for web access.

Client Mode and Network Extension Mode Scenarios

[Figure 1](#) illustrates the client mode of operation. In this example, the Cisco 831 router provides access to two PCs, which have IP addresses in the 10.0.0.0 private network space. These PCs connect to the Ethernet interface on the Cisco 831 router, which also has an IP address in the 10.0.0.0 private network space. The Cisco 831 router performs NAT or PAT translation over the VPN tunnel so that the PCs can access the destination network.

Figure 1 Cisco Easy VPN Remote Connection

Note

The diagram in [Figure 1](#) could also represent a split tunneling connection, in which the client PCs can access public resources in the global Internet without including the corporate network in the path for the public resources.

[Figure 2](#) also illustrates the client mode of operation, in which a VPN concentrator provides destination endpoints to multiple xDSL clients. In this example, Cisco 800 series routers provide access to multiple small business clients, each of which uses IP addresses in the 10.0.0.0 private network space. The Cisco 800 series routers perform NAT or PAT translation over the VPN tunnel so that the PCs can access the destination network.

Figure 2 Cisco Easy VPN Remote Connection (using a VPN concentrator)

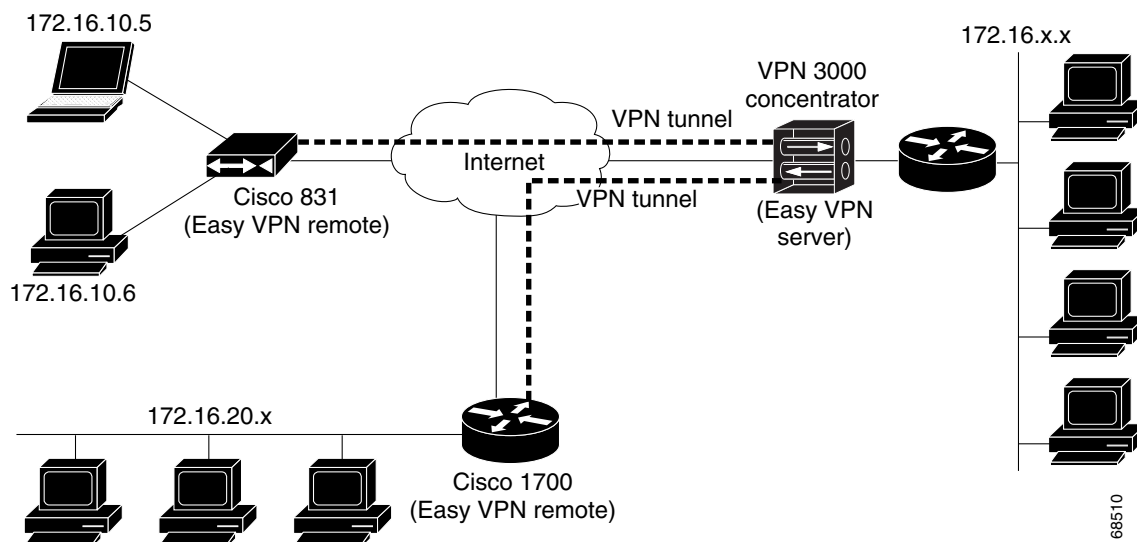

Figure 3 illustrates the network extension mode of operation. In this example, the Cisco 831 router and Cisco 1700 series router both act as Cisco Easy VPN remote devices, connecting to a Cisco VPN 3000 concentrator.

The client hosts are given IP addresses that are fully routable by the destination network over the tunnel. These IP addresses could be either in the same subnet space as the destination network or in separate subnets, assuming that the destination routers are configured to properly route those IP addresses over the tunnel.

In this example, the PCs and hosts attached to the two routers have IP addresses that are in the same address space as the destination enterprise network. The PCs connect to the Ethernet interface of the Cisco 831 router, which also has an IP address in the enterprise address space. This scenario provides a seamless extension of the remote network.

Figure 3 Cisco Easy VPN Network Extension Connection

Authentication

The Cisco Easy VPN Remote feature supports a two-stage process for authenticating the remote router to the central concentrator. The first step is Group Level Authentication and is part of the control channel creation. In this first stage, two types of authentication credentials can be used: either preshared keys or digital certificates. The following paragraphs provide details about these options.

The second authentication step is called Extended Authentication or Xauth. In this step, the remote side (in this case the Easy VPN router) submits a username and password to the central site router. This step is the same process as that which occurs when a user of the Cisco VPN software client on a PC enters his or her username and password to activate his or her VPN tunnel. When using the router, the difference is that the router itself is being authenticated to the network, not a PC with Cisco VPN Client software. Xauth is an optional step (it can be disabled) but is normally enabled to improve security. After Xauth is successful and the tunnel comes up, all PCs behind the Easy VPN remote router have access to the tunnel.

If Xauth is enabled, it is key to decide how to input the username and password. There are two options. The first option is to store the Xauth username and password in the configuration file of the router. This option is typically used if the router is shared between several PCs and the goal is to keep the VPN tunnel up all the time (see the section "[Automatic Activation](#)") or to have the router automatically bring up the tunnel whenever there is data to be sent (see the section "[Traffic-Triggered Activation](#)"). An example of this application is a branch office situation, in which the users in the branch office want the VPN tunnel to be available whenever they have data to send and do not want to have to do anything special to activate the VPN tunnel. If the PCs in the branch office must be individually authenticated on the basis of the ID of each user, the correct configuration is to put the Easy VPN router in Automatic Activation mode to keep the tunnel "up" all the time and to use Cisco IOS Authentication Proxy or 802.1x to authenticate the individual PCs. Because the tunnel is always up, Authentication Proxy or 802.1x can access a central site user database such as AAA/RADIUS to authenticate the individual user requests as they are submitted by PC users. (See the "[Related Documents](#)" sections "General information on IPsec and VPN" for a reference to configuring Authentication Proxy and "802.1x authentication" for a reference to configuring 802.1x authentication.)

The second option for entry of the Xauth username and password is not to store it on the router. Instead, a PC user who is connected to the router is presented with a special web page that allows the user to manually enter the username and password (see the section “[Manual Activation](#)”). The router sends the username and password to the central site concentrator, and if the username and password are correct, the tunnel comes up. The typical application for this configuration is a teleworker network. The teleworker wants to control when the tunnel is up and has to enter his or her personal user credentials (which could include one-time passwords) to activate the tunnel. Also, the network administrator may want teleworker tunnels up only when someone is using them to conserve resources on the central concentrators. (See the section “[Web-Based Activation](#)” for details about this configuration.)

The Xauth username and password can also be manually entered from the command-line interface (CLI) of the router. This method is not recommended for most situations because the user must first log in to the router (and needs a user ID on the router to do so). However, it can be useful for network administrators during troubleshooting.

Using Preshared Keys

Using preshared keys, each peer is aware of the key of the other peer. Preshared keys are displayed in running configurations, so they can be seen by anyone (referred to as clear format). When a more secure type of authentication is required, Cisco software also supports another type of preshared key: the encrypted preshared key.

Using an encrypted preshared key for authentication allows you to securely store plain-text passwords in type 6 (encrypted) format in NVRAM. A group preshared key can be preconfigured on both VPN-tunnel peers. The encrypted form of the keyword can be seen in the running configuration, but the actual keyword is not visible. (For more information about encrypted preshared keys, see [Encrypted Preshared Key](#).)

Using Digital Certificates

Digital certificates provide for the support of Rivest, Shamir, and Adelman (RSA) signatures on Easy VPN remote devices. The support is provided through a RSA certificate that can be stored on or off the remote device.

Note

The recommended timeout for Easy VPN using digital certificates is 40 seconds.

For more information about digital certificates, see the [Easy VPN Remote RSA Signature Support](#) feature guide, Release 12.3(7)T1.

Using Xauth

Xauth is an additional level of authentication that can be used. Xauth is applicable when either group preshared keys or digital certificates are used. Xauth credentials can be entered using a web interface manager, such as Security Device Manager (SDM), or using the CLI. (See the section “[Cisco Easy VPN Remote Web Managers](#).”)

The Save Password feature allows the Xauth username and password to be saved in the Easy VPN Remote configuration so that you are not required to enter the username and password manually. One-Time Passwords (OTPs) are not supported by the Save Password feature and must be entered manually when Xauth is requested. The Easy VPN server must be configured to “Allow Saved Passwords.” (For more information about how to configure the Save Password feature, see the section “[Dead Peer Detection Periodic Message Option](#).”)

Xauth is controlled by the Easy VPN server. When the Cisco IOS Easy VPN server requests Xauth authentication, the following messages are displayed on the console of the router:

```
EZVPN: Pending XAuth Request, Please enter the following command:
crypto ipsec client ezvpn xauth
```

When you see this message, you can provide the necessary user ID, password, and other information by entering the **crypto ipsec client ezvpn connect** command and responding to the prompts that follow.

The recommended Xauth timeout is 50 seconds or fewer.

Note

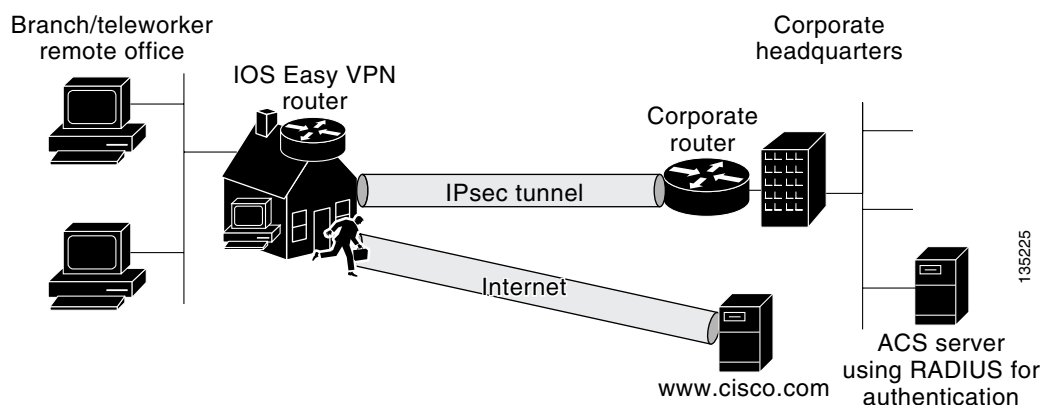

The timeout for entering the username and password is determined by the configuration of the Cisco IOS Easy VPN server. For servers running Cisco IOS software, this timeout value is specified by the **crypto isakmp xauth timeout** command.

Web-Based Activation

Web-Based Activation provides a user-friendly method for a remote teleworker to authenticate the VPN tunnel between his or her remote Easy VPN router and the central site router. This feature allows administrators to set up their remote LANs so that the initial HTTP request that is coming from any of the remote PCs is intercepted by the remote Easy VPN router. A login page is returned to the user, whereby the user may enter credentials to authenticate the VPN tunnel. After the VPN tunnel comes up, all users behind this remote site can access the corporate LAN without being reprompted for the username and password. Alternatively, the user may choose to bypass the VPN tunnel and connect only to the Internet, in which case a password is not required.

A typical application for web-based activation is a home teleworker who brings up the Easy VPN tunnel only when he or she needs to connect to the corporate LAN. If the remote teleworker is not present, other members of the household (such as a spouse or children) can use the Internet Only option to browse the Internet without activating the VPN tunnel. [Figure 4](#) shows a typical scenario for web-based activation.

Figure 4 Typical Web-Based Activation Scenario

Note

Entering the Xauth credentials brings up the tunnel for all users who are behind this remote site. After the tunnel is up, any additional PCs that are behind the remote site do not get prompted for Xauth credentials. Web-Based Activation is an authentication to bring up the VPN tunnel for all remote PCs and cannot be considered individual user authentication. Individual user authentication for VPN tunnel access is available using the Cisco IOS Authentication Proxy or 802.1x features, which can be

configured on the remote Easy VPN router. (See the “[Related Documents](#)” sections “General information on IPsec and VPN” for a reference to configuring Authentication Proxy and “802.1x authentication” for a reference to configuring 802.1x authentication.)

To configure web-based activation, see the section “[Configuring Web-Based Activation](#).”

The following sections show the various screen shots that a remote teleworker sees when the Web-Based Activation feature is turned on:

- [Web-Based Activation Portal Page, page 11](#)
- [VPN Authentication Bypass, page 12](#)
- [VPN Tunnel Authentication, page 13](#)
- [Successful Authentication, page 14](#)
- [Deactivation, page 15](#)

Web-Based Activation Portal Page

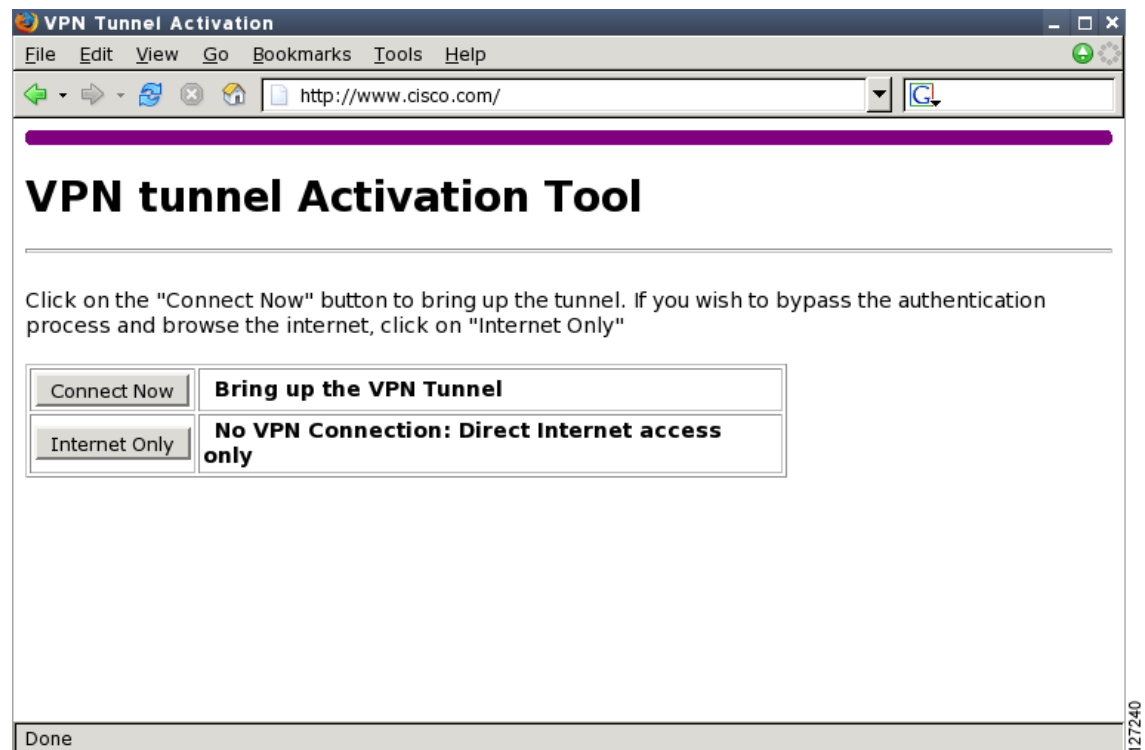

[Figure 5](#) is an example of a web-based activation portal page. The user may choose to connect to the corporate LAN by clicking Connect Now or he or she may choose to connect only to the Internet by clicking Internet Only.

Note

If the user chooses to connect only to the Internet, a password is not required.

Figure 5 *Portal Page*

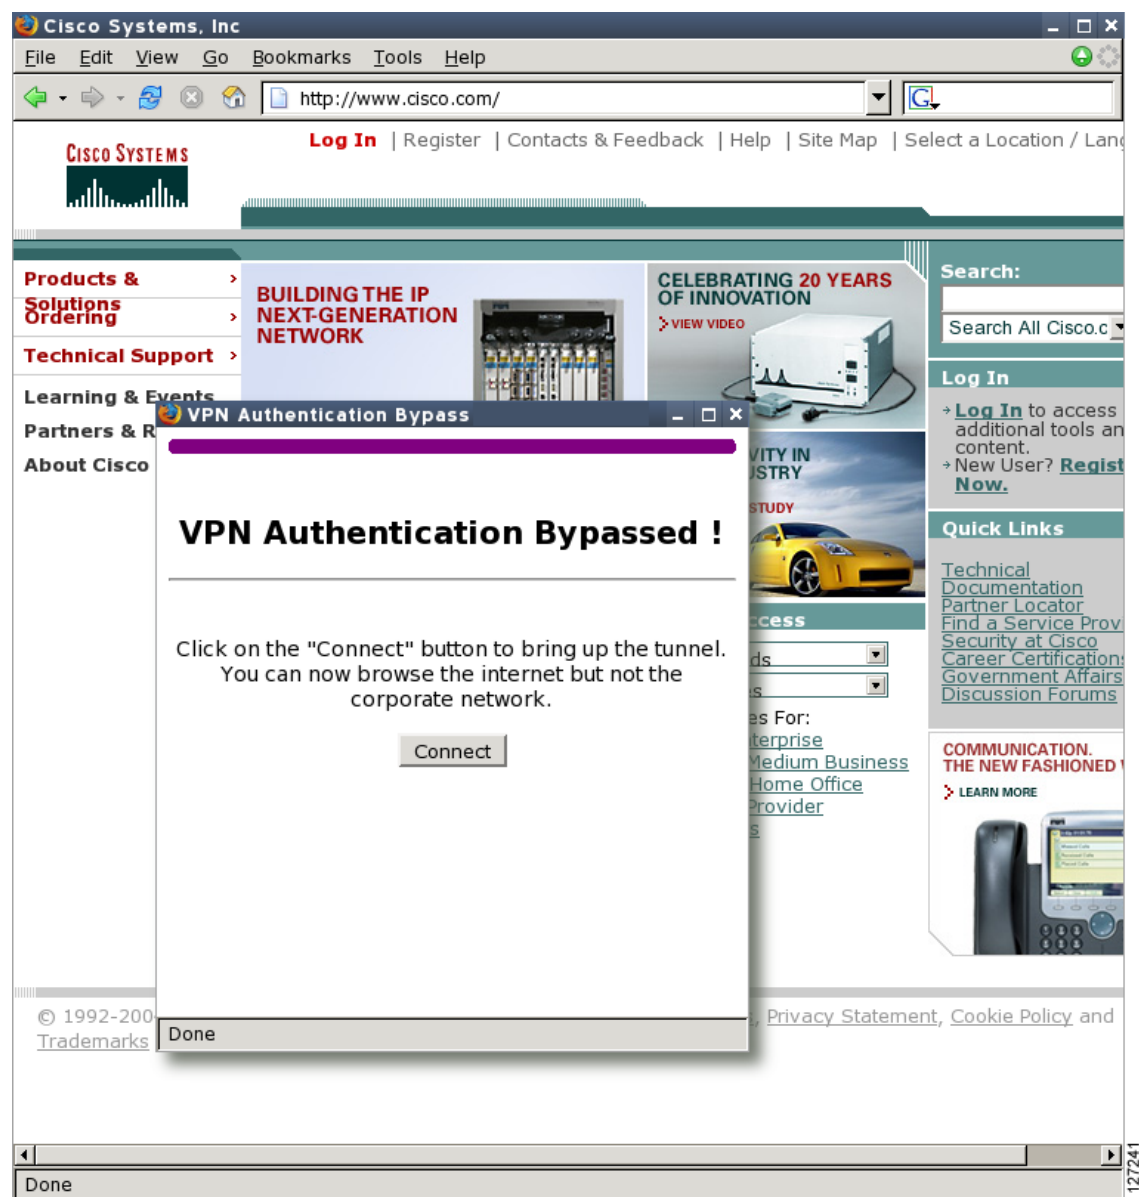

127240

VPN Authentication Bypass

Figure 6 is an example of a web-based activation in which the user chose to connect only to the Internet by clicking the Internet Only option. This option is most useful for household members who need to browse the Internet while the remote teleworker is not available to authenticate the VPN tunnel for corporate use.

Figure 6 VPN Authentication Bypass Page

**Note**

If the Web-Based Activation window is mistakenly closed, to connect again, a user should follow this two-step process:

1. In a browser, type “http://routeripaddress/ezvpn/bypass” and try to connect to the URL. Entering this URL clears the bypass state that was created for your IP address (when the “Internet only” button was pressed). If you get a message saying that no such page is found, it does not matter because the only purpose of accessing the URL is to clear the bypass state.
2. After clearing the bypass state, you can browse to any external site. The Connect and Bypass page appears again. You can connect to VPN by pressing the Connect button.

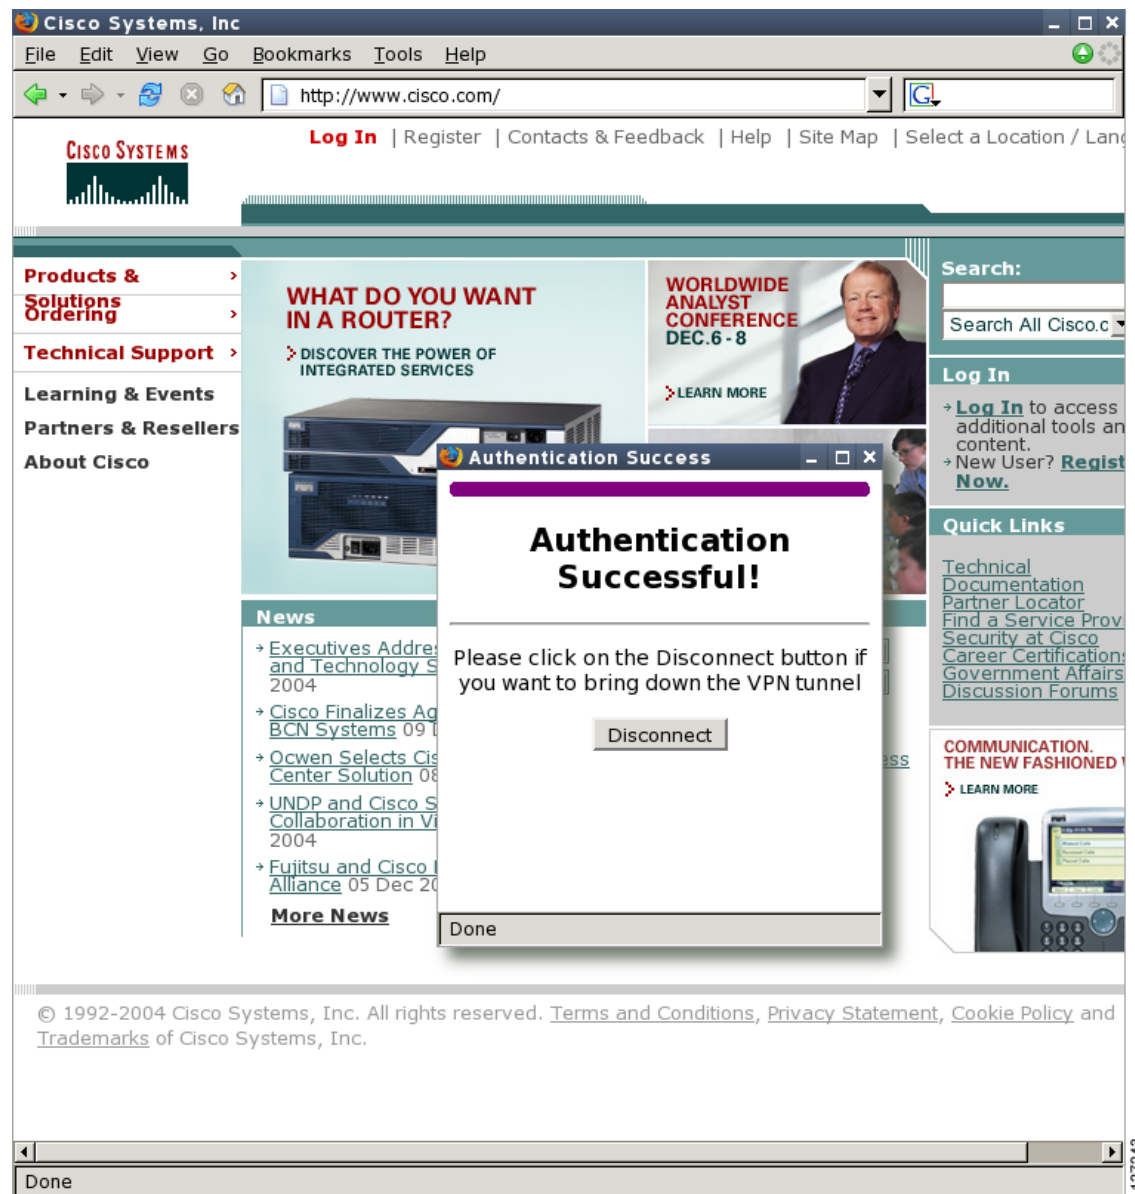

VPN Tunnel Authentication

[Figure 7](#) is an example of a web-based activation in which the user chose to connect to the corporate LAN by entering a username and password. After the user is successfully authenticated, the Easy VPN tunnel is brought up for this remote site. If there are multiple PCs behind this remote site, none of the additional users who are connecting to the corporate LAN will be requested for the Xauth credentials because the tunnel is already up.

Figure 7 VPN Tunnel Authentication

Successful Authentication

Figure 8 is an example of a successful activation. If the user chooses to deactivate the VPN tunnel, he or she should click the Disconnect button. After the IKE security association (SA) times out (the default value is 24 hours), the remote teleworker has to enter the Xauth credentials to bring up the tunnel.

Figure 8 Successful Activation

Deactivation

Figure 9 is an example of a VPN tunnel that has been deactivated successfully. The page automatically closes in 5 seconds.

Figure 9 *VPN Tunnel Deactivated Successfully*

802.1x Authentication

The 802.1x Authentication feature allows you to combine Easy VPN client mode operation with 802.1x authentication on Cisco IOS routers. For more information about this feature, see “802.1x Authentication” in the section “[Additional References](#).”

Tunnel Activation Options

There are three tunnel activation options:

- Automatic activation
- Manual activation
- Traffic-triggered activation (not available in Cisco IOS Release 12.3(11)T)

Tunnel connect and disconnect options are available with SDM.

Automatic Activation

The Cisco Easy VPN tunnel is automatically connected when the Cisco Easy VPN Remote feature is configured on an interface. If the tunnel times out or fails, the tunnel automatically reconnects and retries indefinitely.

To specify automatic tunnel control on a Cisco Easy VPN remote device, you need to configure the **crypto ipsec client ezvpn** command and then the **connect auto** subcommand. However, you do not need to use these two commands when you are creating a new Easy VPN remote configuration because the default is “automatic.”

To disconnect or reset a particular tunnel, you should use the **clear crypto ipsec client ezvpn** command, or you can use SDM.

Manual Activation

The Cisco Easy VPN Remote software implements manual control of the Cisco Easy VPN tunnels so that you can establish and terminate the tunnel on demand.

To specify manual tunnel control on a Cisco Easy VPN remote device, you need to input the **crypto ipsec client ezvpn** command and then the **connect manual** command.

The manual setting means that the Cisco Easy VPN remote will wait for a command before attempting to establish the Cisco Easy VPN Remote connection. When the tunnel times out or fails, subsequent connections will also have to wait for the command.

If the configuration is manual, the tunnel is connected only after you issue the command **crypto ipsec client ezvpn connect**.

To disconnect or reset a particular tunnel, you should use the **clear crypto ipsec client ezvpn** command, or you can use SDM.

See the “[Configuring Manual Tunnel Control](#)” section for specific information on how to configure manual control of a tunnel.

Traffic-Triggered Activation

Note

This feature is not available in Cisco IOS Release 12.3(11)T.

The Traffic-Triggered Activation feature is recommended for transactional-based VPN applications. It is also recommended for use with the Easy VPN dial backup feature for the backup Easy VPN configuration so that backup is activated only when there is traffic to send across the tunnel.

To use Access Control List (ACL) tunnel control, you must first describe the traffic that is considered “interesting.” For more information about ACLs, see the chapter “[Access Control Lists: Overview and Guidelines](#)” in the “Traffic Filtering and Firewalls” section of the *Cisco IOS Security Configuration Guide, Release 12.3*. To actually configure an ACL-triggered tunnel, use the **crypto ipsec client ezvpn** command with the **connect acl** subcommand.

Dead Peer Detection Stateless Failover Support

Two options are available for configuring Dead Peer Detection Stateless Failover Support:

- Backup Server List Local Configuration
- Backup Server List Auto Configuration

Backup Server List Local Configuration

Backup Server List Local Configuration allows users to enter multiple peer statements. With this feature configured, if the client is connecting to a peer and the negotiation fails, Easy VPN fails over to the next peer. This failover continues through the list of peers. When the last peer is reached, Easy VPN rolls over to the first peer. The IKE and IPsec SAs to the previous peer are deleted. Multiple peer statements work for both IP addresses as well as for hostnames. Setting or unsetting the peer statements will not affect the order of the peer statements.

To use this feature, use the **peer** subcommand of the **crypto ipsec client ezvpn** command.

Backup Server List Auto Configuration

Easy VPN remote that is based on Cisco IOS software can have up to 10 backup servers configured for redundancy. The Backup Server feature allows the Easy VPN server to “push” the backup server list to the Easy VPN remote.

The backup list allows the administrator to control the backup servers to which a specific Easy VPN remote will connect in case of failure, retransmissions, or dead peer detection (DPD) messages.

**Note**

Before the backup server feature can work, the backup server list has to be configured on the server.

How a Backup Server Works

If remote A goes to server A and the connection fails, remote A goes to server B. If server B has a backup list configured, that list will override the backup server list of server A. If the connection to server B fails, remote A will continue through the backup servers that have been configured.

**Note**

If you are in auto mode and you have a failure, you will transition automatically from server A to server B. However, if you are in manual mode, you have to configure the transition manually. To configure the transition manually, use the **crypto ipsec client ezvpn** command with the **connect** keyword.

No new configuration is required at the Easy VPN remote to enable this feature. If you want to display the current server, you can use the **show crypto ipsec client ezvpn** command. If you want to find out which peers were pushed by the Easy VPN server, you can use the same command.

To troubleshoot this feature, use the **debug crypto ipsec client ezvpn** command. If more information is needed for troubleshooting purposes, use the **debug crypto isakmp** command. The **show crypto ipsec client ezvpn** command may also be used for troubleshooting.

Cisco Easy VPN Remote Features

The Cisco Easy VPN Remote feature is a collection of features that improves the capabilities of the Cisco Easy VPN Remote feature introduced in Cisco IOS Release 12.2(4)YA. The Cisco Easy VPN Remote feature includes the following:

- [Default Inside Interface, page 20](#)—This feature supports the autoconfiguration of the default Easy VPN inside interface for Cisco 800 series routers.
- [Multiple Inside Interfaces, page 21](#)—This feature allows you to configure up to eight inside interfaces on the Cisco Easy VPN remote.
- [Multiple Outside Interfaces, page 21](#)—This feature allows you to configure up to four outside tunnels for outside interfaces.
- [VLAN Support, page 21](#)—This feature allows VLANs to be configured as valid Easy VPN inside interfaces.
- [Multiple Subnet Support, page 22](#)—This feature allows multiple subnets from the Easy VPN inside interface to be included in the Easy VPN tunnel.
- [NAT Interoperability Support, page 22](#)—This feature automatically restores the NAT configuration when the IPsec VPN tunnel is disconnected.
- [Local Address Support, page 22](#)—The Cisco Easy VPN Remote feature is enhanced to support an additional **local-address** attribute that specifies which interface is used to determine the IP address used to source the Easy VPN tunnel traffic.
- [Peer Hostname, page 23](#)—When a peer is defined as a hostname, the hostname is stored and the Domain Name System (DNS) lookup is done at the time of tunnel connection.
- [Proxy DNS Server Support, page 23](#)—This feature allows you to configure the router in a Cisco Easy VPN remote configuration to act as a proxy DNS server for LAN-connected users.
- [Cisco IOS Firewall Support, page 23](#)—This feature supports Cisco IOS Firewall configurations on all platforms.
- [Easy VPN Remote and Server on the Same Interface, page 23](#)—The Easy VPN remote and Easy VPN server are supported on the same interface, which makes it possible to establish a tunnel to another Easy VPN server and terminate the Easy VPN software client on the same interface simultaneously.
- [Easy VPN Remote and Site to Site on the Same Interface, page 23](#)—The Easy VPN Remote and site to site (crypto map) are supported on the same interface, which makes it possible to establish a tunnel to another Easy VPN server and have another site to site on the same interface simultaneously.
- [Cisco Easy VPN Remote Web Managers, page 24](#)—Users can manage the Cisco Easy VPN Remote feature on the Cisco uBR905 and Cisco uBR925 cable access routers using a built-in web interface.
- [Dead Peer Detection Periodic Message Option, page 24](#)—This feature allows you to configure your router to query the liveliness of its IKE peer at regular intervals.
- [Load Balancing, page 24](#)—If a remote device is loaded and unable to accept more traffic, the VPN 3000 will send a notify message that contains an IP address that represents the new IKE server to which the remote should connect.

- [Management Enhancements, page 25](#)—This feature allows for remote management of the VPN remote.
- [PFS Support, page 25](#)—The PFS configuration mode attribute is sent by the server if requested by the VPN remote device.
- [Dial Backup, page 25](#)—This feature allows you to configure a dial backup tunnel connection on your remote device.
- [Virtual IPsec Interface Support, page 27](#)—This feature allows you to selectively send traffic to different Easy VPN concentrators as well as to the Internet (includes a reference to the IPsec Virtual Tunnel Interface feature.)
- [Dual Tunnel Support, page 29](#)—This feature allows you to configure multiple Easy VPN tunnels that share common inside and outside interfaces to connect two peers to two different VPN servers simultaneously.
- [Banner, page 32](#)—The EasyVPN remote device can download a banner that has been pushed by the Easy VPN server. The banner can be used for Xauth and web-based activation. The banner is displayed when the Easy VPN tunnel is “up” on the Easy VPN remote console or as an HTML page in the case of web-based activation.
- [Configuration Management Enhancements \(Pushing a Configuration URL Through a Mode-Configuration Exchange\), page 33](#)—The Easy VPN remote device can download a URL that is pushed by the Easy VPN server, allowing the Easy VPN remote device to download configuration content and apply it to the running configuration.
- [Reactivate Primary Peer, page 33](#)—This feature allows you to designate a primary peer. When an Easy VPN device fails over from the primary peer to a backup peer and the primary peer is again available, connections with the backup peer are torn down and a connection is made with the primary peer.
- [Identical Addressing Support, page 33](#)—This feature integrates Network Address Translation (NAT) with Easy VPN to allow remotes with overlapping internal IP addressing to connect to the Easy VPN server.
- [cTCP Support on Easy VPN Clients, page 34](#)—When cTCP is enabled on a remote device (client) and headend device, IKE and ESP (Protocol 50) traffic is encapsulated in the TCP header so that the firewalls in between the client and the headend device permit this traffic (considering it the same as TCP traffic).

Default Inside Interface

Easy VPN Remote supports the autoconfiguration of the default Easy VPN inside interface for Cisco 800 series routers. The interface Ethernet 0 is the default inside interface.

If you want to disable the default inside interface and configure another inside interface on the Cisco 800 series router, you must configure the other inside interface first and then disable the default inside interface. You can use the following command to disable the default inside interface:

```
no crypto ipsec client ezvpn name inside
```

If you did not configure the other inside interface first before disabling the default inside interface, you will receive a message such as the following (see lines three and four):

```
Router (config)# interface ethernet0
Router (config-if)# no crypto ipsec client ezvpn hw-client inside
Cannot remove the single inside interface unless
one other inside interface is configured
```

Multiple Inside Interfaces

Inside interface support is enhanced in the Cisco Easy VPN Remote feature to support multiple inside interfaces for all platforms. Inside interfaces can be configured manually with the enhanced command and subcommand:

```
interface interface-name
  crypto ipsec client ezvpn name [outside | inside]
```

See the “[Configuring Multiple Inside Interfaces](#)” section for information on how to configure more than one inside interface.

Multiple inside interfaces offer the following capabilities:

- Up to eight inside interfaces are supported on the Cisco 800 and Cisco 1700 series routers.
- At least one inside interface must be configured for each outside interface; otherwise, the Cisco Easy VPN Remote feature does not establish a connection.
- Adding a new inside interface or removing an existing inside interface automatically resets the Cisco Easy VPN Remote connection (the currently established tunnel). You must reconnect a manually configured tunnel, and if Xauth is required by the Cisco Easy VPN server, the user is reprompted. If you have set the Cisco Easy VPN Remote configuration to connect automatically and no Xauth is required, no user input is required.
- Inside interfaces that are configured or the default setting can be shown by using the **show crypto ipsec client ezvpn** command.

Multiple Outside Interfaces

The Easy VPN Remote feature supports one Easy VPN tunnel per outside interface. You can configure up to four Easy VPN tunnels per Cisco router. Each Easy VPN tunnel can have multiple inside interfaces configured, but they cannot overlap with another Easy VPN tunnel unless dial backup is configured. For more information about dial backup, see the section “[Dial Backup](#).” To configure multiple outside interfaces, use the **crypto ipsec client ezvpn** command and **outside** keyword.

To disconnect or clear a specific tunnel, the **clear crypto ipsec client ezvpn** command specifies the IPsec VPN tunnel name. If there is no tunnel name specified, all existing tunnels are cleared.

See the “[Configuring Multiple Outside Interfaces](#)” section for more information on configuring more than one outside interface.

VLAN Support

Inside interface support on VLANs makes it possible to have valid Easy VPN inside interface support on a VLAN, which was not possible before Cisco IOS Release 12.3(7)XR. With this feature, SAs can be established at connection using the VLAN subnet address or mask as a source proxy.

For the inside interface support on VLANs to work, you must define each VLAN as an Easy VPN inside interface. In addition, IPsec SAs should be established for each inside interface in the same manner as for other inside interfaces. For more information about inside and outside interfaces, see the sections “[Multiple Inside Interfaces](#)” and “[Multiple Outside Interfaces](#).”

Inside interface support on VLANs is supported only on Cisco routers that support VLANs.

Multiple Subnet Support

For situations in which you have multiple subnets connected to an Easy VPN inside interface, you can optionally include these subnets in the Easy VPN tunnel. First, you must specify the subnets that should be included by defining them in an ACL. To configure an ACL, see “Access control lists, configuring” in the “[Additional References](#)” section. Next, you have to use the **acl** subcommand of the **crypto ipsec client ezvpn** (global) command to link your ACL to the Easy VPN configuration. Easy VPN Remote will automatically create the IPsec SAs for each subnet that is defined in the ACL as well as for the subnets that are defined on the Easy VPN inside interface.

**Note**

Multiple subnet support is not supported in client mode.

NAT Interoperability Support

Cisco Easy VPN Remote supports interoperability with NAT. You can have a NAT configuration and a Cisco Easy VPN Remote configuration that coexist. When an IPsec VPN tunnel is down, the NAT configuration works.

In the Cisco Easy VPN Remote feature, the router automatically restores the previous NAT configuration when the IPsec VPN tunnel is torn down. The user-defined access lists are not disturbed. Users can continue to access nontunnel areas of the Internet when the tunnel times out or disconnects.

**Note**

NAT interoperability is not supported in client mode with split tunneling.

Local Address Support

The Cisco Easy VPN Remote feature is enhanced to support an additional **local-address** attribute. This attribute specifies which interface is used to determine the IP address that is used to source the Easy VPN Remote tunnel traffic. After specifying the interface with the **local-address** subcommand, you can manually assign a static IP address to the interface or use the **cable-modem dhcp-proxy interface** command to automatically configure the specified interface with a public IP address. See the “[Configuring Proxy DNS Server Support](#)” section for configuration information.

Local Address Support is available for all platforms, but it is more applicable to the Cisco uBR905 and Cisco uBR925 cable access routers in conjunction with the **cable-modem dhcp-proxy interface** command. Typically, the loopback interface is the interface used to source tunnel traffic for the Cisco uBR905 and Cisco uBR925 cable access routers.

In a typical DOCSIS network, the Cisco uBR905 and Cisco uBR925 cable access routers are normally configured with a private IP address on the cable modem interface. In the initial Cisco Easy VPN Remote feature, a public IP address was required on the cable modem interface to support the Easy VPN remote.

In the Cisco Easy VPN Remote feature, cable providers can use the Cable DHCP Proxy feature to obtain a public IP address and assign it to the cable modem interface, which is usually the loopback interface.

For more information on the **cable-modem dhcp-proxy interface** command, see the “[Cable CPE Commands](#)” chapter in the *Cisco Broadband Cable Command Reference Guide*.

**Note**

The **cable-modem dhcp-proxy interface** command is supported only for the Cisco uBR905 and Cisco uBR925 cable access routers.

Peer Hostname

The peer in a Cisco Easy VPN Remote configuration can be defined as an IP address or a hostname. Typically, when a peer is defined as a hostname, a DNS lookup is done immediately to get an IP address. In the Cisco Easy VPN Remote feature, the peer hostname operation is enhanced to support DNS entry changes. The text string of the hostname is stored so that the DNS lookup is done at the time of the tunnel connection, not when the peer is defined as a hostname.

See the “[Configuring and Assigning the Easy VPN Remote Configuration](#)” section for information on enabling the peer hostname functionality.

Proxy DNS Server Support

When the Easy VPN tunnel is down, the DNS addresses of the ISP or cable provider should be used to resolve DNS requests. When the WAN connection is up, the DNS addresses of the enterprise should be used.

As a way of implementing use of the DNS addresses of the cable provider when the WAN connection is down, the router in a Cisco Easy VPN Remote configuration can be configured to act as a proxy DNS server. The router, acting as a proxy DNS server for LAN-connected users, receives DNS queries from local users on behalf of the real DNS server. The DHCP server then can send out the LAN address of the router as the IP address of the DNS server. After the WAN connection comes up, the router forwards the DNS queries to the real DNS server and caches the DNS query records.

See the “[Configuring Proxy DNS Server Support](#)” section for information on enabling the proxy DNS server functionality.

Cisco IOS Firewall Support

The Cisco Easy VPN Remote feature works in conjunction with Cisco IOS Firewall configurations on all platforms.

Easy VPN Remote and Server on the Same Interface

This feature allows the Easy VPN remote and Easy VPN server to be supported on the same interface, making it possible to both establish a tunnel to another Easy VPN server and terminate the Easy VPN software client on the same interface simultaneously. A typical application would be a geographically remote location for which Easy VPN Remote is being used to connect to a corporate Easy VPN server and also to terminate local software client users.

For more information about the Easy VPN Remote and Server on the Same Interface feature, see “Easy VPN Remote and Server on the Same Interface” in the section “[Additional References](#).”

Easy VPN Remote and Site to Site on the Same Interface

This feature allows the Easy VPN remote and site to site (crypto map) to be supported on the same interface, making it possible to both establish a tunnel to another Easy VPN server and have another site to site on the same interface simultaneously. A typical application would be a third-party VPN service provider that is managing a remote router via the site-to-site tunnel and using Easy VPN Remote to connect the remote site to a corporate Easy VPN server.

For more information about the Easy VPN Remote and Site to Site on the Same Interface feature, see “Easy VPN Remote and Site to Site on the Same Interface” in the section “[Additional References](#).”

Cisco Easy VPN Remote Web Managers

Web interface managers may be used to manage the Cisco Easy VPN Remote feature. One such web interface manager is SDM, which is supported on the Cisco 830 series, Cisco 1700 series, Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series routers. SDM enables you to connect or disconnect the tunnel and provides a web interface for Xauth. For more information about SDM, see [Cisco Security Device Manager](#).

A second web interface manager is the Cisco Router Web Setup (CRWS) tool, which is supported on the Cisco 806 router. The CRWS provides a similar web interface as SDM.

A third web interface manager, Cisco Easy VPN Remote Web Manager, is used to manage the Cisco Easy VPN Remote feature for Cisco uBR905 and Cisco uBR925 cable access routers. You do not need access to the CLI to manage the Cisco Easy VPN remote connection.

The web interface managers allow you to do the following:

- See the current status of the Cisco Easy VPN remote tunnel.
- Connect a tunnel that is configured for manual control.
- Disconnect a tunnel that is configured for manual control or reset a tunnel configured for automatic connection.
- Be prompted for Xauth information, if needed.

See the [“Troubleshooting the VPN Connection”](#) section for more information about Cisco Easy VPN Remote Web Manager.

Dead Peer Detection Periodic Message Option

The dead peer detection periodic message option allows you to configure your router to query the liveness of its IKE peer at regular intervals. The benefit of this approach over the default approach (on-demand dead peer detection) is earlier detection of dead peers. For more information about the dead peer detection periodic message option, see *“Dead peer detection”* in the section [“Additional References.”](#)

Load Balancing

When the Cisco VPN 3000 concentrator is configured for load balancing, the VPN 3000 will accept an incoming IKE request from the VPN remote on its virtual IP address. If the device is loaded and unable to accept more traffic, the VPN 3000 will send a notify message that contains an IP address that represents the new IKE server to which the remote should connect. The old connection will be torn down and a new connection established to the redirected VPN gateway.

There is no configuration required for load balancing to occur. If the VPN gateway is configured for load balancing, and it notifies the VPN remote that it is performing load balancing, the VPN remote has access to the load balancing feature.

To verify whether load balancing is occurring, use the **debug crypto isakmp**, **debug crypto ipsec client ezvpn**, and **show crypto ipsec** commands. To troubleshoot the load balancing process, use the **show crypto ipsec** command.

Management Enhancements

Management enhancements for Easy VPN remotes allow for the remote management of the VPN remote. The feature provides for the IPv4 address to be pushed by configuration mode to the VPN remote. The IPv4 address is assigned to the first available loopback interface on the VPN remote, and any existing statically defined loopbacks are not overridden. On disconnect, the address and loopback interface are removed from the list of active interfaces.

After the VPN remote is connected, the loopback interface should be accessible from the remote end of the tunnel. All PAT activities will be translated through this interface IP address.

If a loopback exists, and an IP address is associated with it and its state is unassigned, the interface is a good candidate for mode configuration address management.

Note

After you assign an address to the loopback interface, if you save the configuration to NVRAM and reboot the VPN remote, the configuration address is permanently contained in the configuration. If you saved the configuration to NVRAM and rebooted the VPN remote, you must enter configuration mode and remove the IP address from the loopback interface manually.

You can use the **show ip interface** command with the **brief** keyword to verify that a loopback has been removed. The output of this **show** command also displays the interface.

PFS Support

The PFS configuration mode attribute is sent by the server if requested by the VPN remote device. If any subsequent connection by the remote device shows that PFS is not received by the remote, PFS will not be sent in IPsec proposal suites.

Note

The PFS group that will be proposed in the IPsec proposal suites is the same as the group used for IKE.

You can use the **show crypto ipsec client ezvpn** command to display the PFS group and to verify that you are using PFS.

Dial Backup

Note

The Dial Backup feature is not available in Cisco IOS Release 12.3(11)T.

Dial backup for Easy VPN remotes allows you to configure a dial backup tunnel connection on your remote device. The backup feature is “brought up” only when real data has to be sent, eliminating the need for expensive dialup or ISDN links that must be created and maintained even when there is no traffic.

[Figure 10](#) illustrates a typical Easy VPN remote-with-dial-backup scenario. In this scenario, a Cisco 1751 remote device is attempting to connect to another Cisco 1751 (acting as a server). There is a failure in the primary Easy VPN tunnel, and the connection is rerouted through the Easy VPN backup tunnel to the Cisco 1751 server.

Figure 10 *Dial Backup for Easy VPN Scenario*

Dial Backup Using a Dial-on-Demand Solution

IP static route tracking enable Cisco IOS software to identify when a Point-to-Point Protocol over Ethernet (PPPoE) or IPsec VPN tunnel “goes down” and initiates a Dial-on-Demand (DDR) connection to a preconfigured destination from any alternative WAN or LAN port (for example, a T1, ISDN, analog, or auxiliary port). The failure may be caused by several catastrophic events (for example, by Internet circuit failures or peer device failure). The remote route has only a static route to the corporate network. The IP static-route-tracking feature allows an object to be tracked (using an IP address or hostname) using Internet Control Message Protocol (ICMP), TCP, or other protocols, and it installs or removes the static route on the basis of the state of the tracked object. If the tracking feature determines that Internet connectivity is lost, the default route for the primary interface is removed, and the floating static route for the backup interface is enabled.

Dial Backup Using Object Tracking

IP static route tracking must be configured for dial backup on an Easy VPN remote device to work. The object tracking configuration is independent of the Easy VPN remote dial backup configuration. (For more information about object tracking, see the feature guide [Reliable Static Routing Backup Using Object Tracking](#).)

Easy VPN Remote Dial Backup Support Configuration

You can configure dial backup for your Easy VPN remote using two Easy VPN remote options that allow a connection to the backup Easy VPN configuration and a connection to the tracking system.

- To specify the Easy VPN configuration that will be activated when backup is triggered, use the **backup** subcommand of the **crypto ipsec client ezvpn** (global) command.
- The Easy VPN remote device registers to the tracking system to get the notifications for change in the state of the object. Use the **track** subcommand to inform the tracking process that the Easy VPN remote device is interested in tracking an object, which is identified by the object number. The tracking process, in turn, informs the Easy VPN remote device when the state of this object changes. This notification prompts the Easy VPN remote device when the state of this object changes. This notification prompts the Easy VPN remote device to bring up the backup connection when the tracked object state is DOWN. When the tracked object is UP again, the backup connection is torn down and the Easy VPN remote device will switch back to using the primary connection.

**Note**

Only one backup configuration is supported for each primary Easy VPN configuration. Each inside interface must specify the primary and backup Easy VPN configuration.

Dynamically Addressed Environments

To allow dial backup to be deployed in dynamically addressed environments, use the IP SLA Pre-Routed ICMP Echo Probe feature. (For more information about this feature, see [Cisco 1700 Series- Cisco IOS Release 12.3\(7\)XR](#) release notes. To use the IP SLA Pre-Routed ICMP Echo Probe feature, use the **icmp-echo** command with the **source-interface** keyword.

Dial Backup Examples

For examples of dial backup configurations, see the section “[Dial Backup: Examples](#).”

Virtual IPsec Interface Support

The Virtual IPsec Interface Support feature provides a routable interface to selectively send traffic to different Easy VPN concentrators as well as to the Internet.

Before Cisco IOS Release 12.4(4)T, at the tunnel-up/tunnel-down transition, attributes that were pushed during the mode configuration had to be parsed and applied. When such attributes resulted in the configurations being applied on the interface, the existing configuration had to be overridden. With the Virtual IPsec Interface Support feature, the tunnel-up configuration can be applied to separate interfaces, making it easier to support separate features at tunnel-up time. Features that are applied to the traffic going into the tunnel can be separate from the features that are applied to traffic that is not going through the tunnel (for example, split-tunnel traffic and traffic leaving the device when the tunnel is not up). When the Easy VPN negotiation is successful, the line protocol state of the virtual-access interface gets changed to up. When the Easy VPN tunnel goes down because the security association (SA) expires or is deleted, the line protocol state of the virtual-access interfaces changes to down.

Routes act as traffic selectors in an Easy VPN virtual interface, that is, the routes replace the access list on the crypto map. In a virtual-interface configuration, Easy VPN negotiates a single IPsec SA if the Easy VPN server has been configured with a dynamic virtual IPsec interface. This single SA is created irrespective of the Easy VPN mode that is configured.

After the SA is established, routes that point to the virtual-access interface are added to direct traffic to the corporate network. Easy VPN also adds a route to the VPN concentrator so that IPsec-encapsulated packets get routed to the corporate network. A default route that points to the virtual-access interface is added in the case of a nonsplit mode. When the Easy VPN server “pushes” the split tunnel, the split tunnel subnet becomes the destination to which the routes that point to the virtual access are added. In either case, if the peer (VPN concentrator) is not directly connected, Easy VPN adds a route to the peer.

**Note**

- Most routers that run the Cisco Easy VPN Client software have a default route configured. The default route that is configured should have a metric value greater than 1. The metric value must be greater than 1 because Easy VPN adds a default route that has a metric value of 1. The route points to the virtual-access interface so that all traffic is directed to the corporate network when the concentrator does not “push” the split tunnel attribute.

For more information about the IPsec Virtual Tunnel Interface feature, see the document *IPSec Virtual Tunnel Interface* (URL link provided in the “[Related Documents](#)” section of this document [General Information on IPsec and VPN]).

[Table 1](#) presents the different methods of configuring a remote device and the corresponding headend IPsec aggregator configurations. Each row represents a way to configure a remote device. The third column shows the different headend configurations that can be used with IPsec interfaces. See [Table 2](#) for a description of terms that are used in [Table 1](#) and [Table 3](#).

Table 1 **How Different Remote Device Configurations Interact with Various Headends and Configurations**

Remote Device Configurations	IOS Headend – Using Crypto Maps	IOS Headend – Using IPsec Interfaces	VPN3000/ASA
Crypto maps	<ul style="list-style-type: none"> Supported. 	—	—
Easy VPN virtual interface	<ul style="list-style-type: none"> Supported. Will create multiple SAs for a split tunnel. Because there is no interface on the headend, interface features cannot be supported. Limited quality of service (QoS) is supported. 	<ul style="list-style-type: none"> Supported. Creates only a single SA in split and no-split tunnels. Route injection is accomplished on the server. Routes are injected on the remote devices to direct traffic to the interface. 	<ul style="list-style-type: none"> Supported. Will create multiple SAs for a split tunnel.
Legacy Easy VPN	<ul style="list-style-type: none"> Creates a single IPsec SA on the headend when a default policy is pushed. Creates multiple SAs when a split-tunnel policy is pushed to the remote device. 	<ul style="list-style-type: none"> Not supported. Cannot be used with split tunnels because the headend interface does not support multiple SAs on a single interface. 	<ul style="list-style-type: none"> Supported. Creates multiple SAs for split tunnels.
Static virtual interface	<ul style="list-style-type: none"> Not supported. 	<ul style="list-style-type: none"> Supported. Can be used with a static interface or dynamic interface on the headend. Routing support is mandatory to reach the network. 	<ul style="list-style-type: none"> Not supported.

[Table 2](#) provides a description of the terms used in [Table 1](#) and [Table 3](#).

Table 2 **Terms Used in [Table 1](#) and [Table 3](#)**

Terms	Description
ASA	Cisco Adaptive Security Appliance, a threat-management security appliance.
Crypto maps	Commonly used for configuring IPsec tunnels. The crypto map is attached to an interface. For more information on crypto maps, see the section “Creating Crypto Map Sets” of the “Configuring Security for VPNs with IPsec” chapter of the <i>Cisco IOS Security Configuration Guide</i> . (URL link provided in the “ Related Documents ” section of this document.)
Easy VPN dual tunnel remote device	Two Easy VPN remote device configurations in which both are using a dynamic IPsec virtual tunnel interface.
Easy VPN virtual interface remote device (Easy VPN virtual interface)	Easy VPN remote configuration that configures the usage of a dynamic IPsec virtual tunnel interface.
IPsec interface	Consists of static and dynamic IPsec virtual interfaces.
IPsec Virtual Tunnel Interface	Tunnel interface that is created from a virtual template tunnel interface using mode IPsec. For more information on virtual tunnel interface configurations, see the document <i>IPSec Virtual Tunnel Interface</i> (URL link provided in the “ Related Documents ” section of this document [General Information on IPsec and VPN]).
Legacy Easy VPN	Easy VPN remote device configuration that uses crypto maps and does not use IPsec interfaces.
Static IPsec virtual tunnel interface (static virtual tunnel interface)	Tunnel interface used with mode IPsec that proposes and accepts only an “ipv4 any any” selector. For more information on static virtual tunnel interface configurations, see the document <i>IPSec Virtual Tunnel Interface</i> (URL link provided in the “ Related Documents ” section of this document [General Information on IPsec and VPN]).
VPN 3000	Cisco VPN 3000 series routers.

Dual Tunnel Support

Easy VPN now supports the ability to configure two easy VPN tunnels that have the same inside and outside interfaces. The feature is called the Easy VPN Dual Tunnel. Configuring multiple tunnels on a single remote device can be accomplished in a number of ways, which are listed below in [Table 3](#) along with their configuration and usage considerations. Further discussion in this section refers to only one such method of configuring dual tunnels using Easy VPN tunnels that have virtual interfaces. This method will be referred to as Dual Tunnel Support.

In a dual-tunnel Easy VPN setup, each Easy VPN tunnel is configured using virtual IPsec interface support, as shown in the section “[Virtual IPsec Interface Support](#).” Each Easy VPN tunnel has its unique virtual interface, which is created when the Easy VPN configuration is complete.

There are two possible combinations in which the dual tunnels can be used.

- Dual Easy VPN tunnels that have one tunnel using a nonsplit tunnel policy and the other tunnel using a split tunnel policy that has been pushed from the respective headend.

- Dual Easy VPN tunnel in which both tunnels are using an independent split tunnel policy that has been pushed from the respective headend.

**Note**

It is not permitted to have dual Easy VPN tunnels in which both tunnels are using a nonsplit tunnel policy.

The Easy VPN dual tunnel makes use of route injections to direct the appropriate traffic through the correct Easy VPN virtual tunnel interface. When the Easy VPN tunnel on the remote device “comes up,” it “learns” the split or nonsplit policy from the headend. The Easy VPN remote device injects routes in its routing table that correspond to the nonsplit networks that have been learned. If the headend pushes a nonsplit tunnel policy to the Easy VPN remote device, the Easy VPN remote device installs a default route in its routing table that directs all traffic out of the Easy VPN virtual interface that corresponds to this Easy VPN tunnel. If the headend pushes split-tunnel networks to the remote device, the remote device installs specific routes to the split networks in its routing table, directing the traffic to these networks out of the virtual tunnel interface.

**Note**

Dual Tunnel Easy VPN uses destination-based routing to send traffic to the respective tunnels.

Output features can be applied to this virtual interface. Examples of such output features are Cisco IOS Quality of Service and Cisco IOS Firewall. These features must be configured on the virtual template that is configured in the Easy VPN client configuration.

[Table 3](#) explains how this feature should be used. See [Table 2](#) for a description of terms that are used in [Table 1](#) and [Table 3](#).

Table 3 **Dual Tunnel Usage Guidelines**

Dual Tunnel Combinations	Headends Supported	Configuration and Usage Considerations on the Easy VPN Remote Device and Headend
Two legacy Easy VPN tunnels	IOS, ASA, and VPN 3000	<ul style="list-style-type: none"> Two tunnels cannot share a common outside interface. Two tunnels cannot share a common inside interface. The two tunnels should use separate inside and outside interfaces. Traffic from an inside interface that belongs to one Easy VPN tunnel cannot be pushed into another tunnel.
One legacy Easy VPN tunnel and one crypto map	IOS, ASA, and VPN 3000	The crypto map can share the same outside interface as the legacy Easy VPN client configuration. However, the behavior of the two remote devices depends on the mode of Easy VPN as well as the IPsec selectors of the crypto map and the Easy VPN remote device. This is not a recommended combination.
One legacy Easy VPN tunnel and one static virtual interface	IOS	Both tunnels cannot terminate on the same headend. The static virtual interface remote device tunnel has to be terminated on a static virtual interface on the headend router. The legacy Easy VPN remote device tunnel can terminate on the virtual tunnel interface or crypto map that is configured on the headend.

Table 3 *Dual Tunnel Usage Guidelines (continued)*

Dual Tunnel Combinations	Headends Supported	Configuration and Usage Considerations on the Easy VPN Remote Device and Headend
One legacy Easy VPN tunnel and one Easy VPN virtual interface	IOS, ASA, and VPN 3000	<ul style="list-style-type: none"> Both tunnels cannot terminate on the same headend. The legacy Easy VPN tunnel and the Easy VPN virtual interface can share a common inside and outside interface. An Easy VPN virtual interface should be used only with split tunneling. Legacy Easy VPN can use a split tunnel or no split tunnel. The Web-Based Activation feature cannot be applied on both Easy VPN tunnels. Using two Easy VPN virtual interfaces is preferable to using this combination.
One Easy VPN virtual interface and one static virtual interface	IOS	<ul style="list-style-type: none"> Both tunnels cannot terminate on the same peer. The static virtual interface and the Easy VPN virtual interface can use the same outside interface. The Easy VPN virtual interface should use split tunneling.
Two Easy VPN virtual interfaces	IOS, ASA, and VPN 3000	<ul style="list-style-type: none"> Both tunnels cannot terminate on the same peer. At least one of the tunnels should use split tunneling. Web-Based Activation cannot be applied to both Easy VPN tunnels.

Banner

The Easy VPN server pushes a banner to the Easy VPN remote device. The Easy VPN remote device can use the banner during Xauth and web-based activation. The Easy VPN remote device displays the banner the first time that the Easy VPN tunnel is brought up.

The banner is configured under group configuration on the Easy VPN server.

Configuration Management Enhancements (Pushing a Configuration URL Through a Mode-Configuration Exchange)

After this feature has been configured on the server using the commands **configuration url** and **configuration version** (subcommands under the **crypto isakmp client configuration group** command), the server can “push” the configuration URL and configuration version number to the Easy VPN remote device. With this information, the Easy VPN remote device can download the configuration content and apply it to its running configuration. For more information about this feature, see the section “Configuration Management Enhancements” in the *Easy VPN Server* feature module.

Reactivate Primary Peer

The Reactivate Primary Peer feature allows a default primary peer to be defined. The default primary peer (a server) is one that is considered better than other peers for reasons such as lower cost, shorter distance, or more bandwidth. With this feature configured, if Easy VPN fails over during Phase 1 SA negotiations from the primary peer to the next peer in its backup list, and if the primary peer is again available, the connections with the backup peer are torn down and the connection is again made with the primary peer.

Dead Peer Detection is one of the mechanisms that acts as a trigger for primary peer reactivation. Idle timers that are configured under Easy VPN is another triggering mechanism. When configured, the idle timer detects inactivity on the tunnel and tears it down. A subsequent connect (which is immediate in auto mode) is attempted with the primary preferred peer rather than with the peer last used.

**Note**

Only one primary peer can be defined.

Identical Addressing Support

The Identical Addressing Support feature supports identically addressed LANs on Easy VPN remotes. Network resources, such as printers and web servers on the LAN side of the EasyVPN remotes, that have overlapping addressing with other Easy VPN remotes are now reachable. The Easy VPN Remote feature was enhanced to work with NAT to provide this functionality.

- The Easy VPN server requires no changes to support the Identical Addressing Support feature.
- The Identical Addressing Support feature is supported only in network extension modes (network-extension and network-plus).
- Virtual tunnel interfaces must be configured on the Easy VPN remote before using the Identical Addressing Support feature.

Figure 11 shows an example of the Identical Addressing Support feature configuration.

Figure 11 Identical Addressing Support

The Identical Addressing Support feature can be configured with the following command and enhanced subcommands:

```
crypto ipsec client ezvpn <name>
```

Enhanced subcommands

- **nat acl** {*acl-name* | *acl-number*}—Enables split tunneling for the traffic specified by the ACL name or the ACL number.
 - The *acl-name* argument is the name of the ACL.
 - The *acl-number* argument is the number of the ACL.
- **nat allow**—Allows NAT to be integrated with Cisco Easy VPN.

For detailed steps on how to configure Identical Addressing Support, see “[Configuring Identical Addressing Support](#).”

cTCP Support on Easy VPN Clients

The Cisco Tunneling Control Protocol (cTCP) feature can be used for situations in which an Easy VPN client (remote device) is operating in an environment in which standard IPsec does not function or in which it does not function transparently without modification to existing firewall rules. These situations include the following:

- Small office or home office router performing Network Address Translation (NAT) or Port Address Translation (PAT)
- PAT-provided IP address behind a larger router (for example, in a corporation)
- Non-NAT firewall (packet filtering or stateful)
- Proxy server

Figure 12 illustrates how IPsec traffic that is tunneled inside the cTCP traverses Network Address Translation (NAT) and the firewall (see the dashed line).

Figure 12 *cTCP on an Easy VPN Remote Device*

For detailed steps on how to configure cTCP on Easy VPN remote devices, see the section “[Configuring cTCP on an Easy VPN Client](#).”

For more information about cTCP support on Easy VPN remote devices, including configuration and troubleshooting examples, see “cTCP on Cisco Easy VPN remote devices” in the section “[Related Documents](#).”

How to Configure Cisco Easy VPN Remote

This section includes the following required and optional tasks.

Remote Tasks

- [Configuring and Assigning the Easy VPN Remote Configuration, page 36](#) (required)
- [Verifying the Cisco Easy VPN Configuration, page 38](#) (optional)
- [Configuring Save Password, page 39](#) (optional)
- [Configuring Manual Tunnel Control, page 40](#) (optional)
- [Configuring Automatic Tunnel Control, page 42](#) (optional)
- [Configuring Multiple Inside Interfaces, page 43](#) (optional)
- [Configuring Multiple Outside Interfaces, page 44](#) (optional)
- [Configuring Multiple Subnet Support, page 45](#) (optional)
- [Configuring Proxy DNS Server Support, page 47](#) (optional)
- [Configuring Dial Backup, page 47](#) (optional)
- [Configuring the DHCP Server Pool, page 48](#) (required)
- [Resetting a VPN Connection, page 48](#) (optional)
- [Monitoring and Maintaining VPN and IKE Events, page 49](#) (optional)
- [Configuring a Virtual Interface, page 50](#) (optional)
- [Troubleshooting Dual Tunnel Support, page 51](#) (optional)
- [Configuring Reactivate \(a Default\) Primary Peer, page 52](#) (optional)
- [Configuring Identical Addressing Support, page 53](#) (optional)
- [Configuring cTCP on an Easy VPN Client, page 56](#) (optional)

Easy VPN Server Tasks

- [Configuring a Cisco IOS Easy VPN Server, page 57](#) (required)
- [Configuring an Easy VPN Server on a VPN 3000 Series Concentrator, page 57](#) (optional)
- [Configuring an Easy VPN Server on a Cisco PIX Firewall, page 59](#) (optional)

Web Interface Tasks

- [Configuring Web-Based Activation, page 60](#) (optional)
- [Monitoring and Maintaining Web-Based Activation, page 60](#) (optional)
- [Using SDM As a Web Manager, page 64](#) (optional)

Troubleshooting the VPN Connection

- [Troubleshooting a VPN Connection Using the Cisco Easy VPN Remote Feature, page 64](#) (optional)
- [Troubleshooting the Client Mode of Operation, page 64](#) (optional)
- [Troubleshooting Remote Management, page 65](#) (optional)
- [Troubleshooting Dead Peer Detection, page 65](#) (optional)

Remote Tasks

Configuring and Assigning the Easy VPN Remote Configuration

The router acting as the Easy VPN remote must create a Cisco Easy VPN Remote configuration and assign it to the outgoing interface. To configure and assign the remote configuration, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec client ezvpn *name***
4. **group *group-name* key *group-key***
5. **peer [*ip-address* | *hostname*]**
6. **mode {**client** | **network-extension**}**
7. **exit**
8. **interface *interface***
9. **crypto ipsec client ezvpn *name* [**outside**]**
10. **exit**
11. **exit**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec client ezvpn name Example: Router (config)# crypto ipsec client ezvpn easy client remote	Creates a remote configuration and enters Cisco Easy VPN Remote configuration mode.
Step 4	group group-name key group-key Example: Router (config-crypto-ezvpn)# group easy-vpn-remote-groupname key easy-vpn-remote-password	Specifies the IPsec group and IPsec key value to be associated with this configuration. <p>Note The value of the <i>group-name</i> argument must match the group defined on the Easy VPN server. On Cisco IOS routers, use the crypto isakmp client configuration group and crypto map dynmap isakmp authorization list commands.</p> <p>Note The value of the <i>group-key</i> argument must match the key defined on the Easy VPN server. On Cisco IOS routers, use the crypto isakmp client configuration group command.</p>
Step 5	peer [ip-address hostname] Example: Router (config-crypto-ezvpn)# peer 192.185.0.5	Specifies the IP address or hostname for the destination peer (typically the IP address on the outside interface of the destination route). <ul style="list-style-type: none"> Multiple peers may be configured. <p>Note You must have a DNS server configured and available to use the <i>hostname</i> option.</p>
Step 6	mode {client network-extension} Example: Router (config-crypto-ezvpn)# mode client	Specifies the type of VPN connection that should be made. <ul style="list-style-type: none"> client—Specifies that the router is configured for VPN client operation, using NAT or PAT address translation. Client operation is the default if the type of VPN connection is not specified network-extension—Specifies that the router is to become a remote extension of the enterprise network at the destination of the VPN connection.
Step 7	exit Example: Router (config-crypto-ezvpn)# exit	Exits Cisco Easy VPN Remote configuration mode.

	Command	Purpose
Step 8	interface <i>interface</i> Example: Router (config)# interface Ethernet1	Enters interface configuration mode for the interface. <ul style="list-style-type: none">This interface will become the outside interface for the NAT or PAT translation.
Step 9	crypto ipsec client ezvpn <i>name</i> [outside] Example: Router (config-if)# crypto ipsec client ezvpn easy_vpn remotel outside	Assigns the Cisco Easy VPN Remote configuration to the interface. <ul style="list-style-type: none">This configuration automatically creates the necessary NAT or PAT translation parameters and initiates the VPN connection (if you are in client mode). Note The inside interface must be specified on Cisco 1700 and higher platforms.
Step 10	exit Example: Router (config-if)# exit	Exits interface configuration mode.
Step 11	exit Example: Router (config)# exit	Exits global configuration mode.

Verifying the Cisco Easy VPN Configuration

To verify that the Cisco Easy VPN Remote configuration has been correctly configured, that the configuration has been assigned to an interface, and that the IPsec VPN tunnel has been established, perform the following steps.

SUMMARY STEPS

1. **show crypto ipsec client ezvpn**
2. **show ip nat statistics**

DETAILED STEPS

- Step 1** Display the current state of the Cisco Easy VPN Remote connection using the **show crypto ipsec client ezvpn** command. The following is typical output for a Cisco 1700 series router using client mode:

```
Router# show crypto ipsec client ezvpn
```

```
Tunnel name : hw1
Inside interface list: FastEthernet0/0, Serial0/0,
Outside interface: Serial1/0
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
Address: 10.0.0.5
Mask: 255.255.255.255
Default Domain: cisco.com
Tunnel name : hw2
Inside interface list: Serial0/1,
Outside interface: Serial1/1
Current State: IPSEC_ACTIVE
```

```
Last Event: SOCKET_UP
Default Domain: cisco.com
```

- Step 2** Display the NAT or PAT configuration that was automatically created for the VPN connection using the **show ip nat statistics** command. The “Dynamic mappings” field of this display gives the details for the NAT or PAT translation that is occurring on the VPN tunnel.

```
Router# show ip nat statistics

Total active translations: 0 (0 static, 0 dynamic; 0 extended)
Outside interfaces:
  cable-modem0
Inside interfaces:
  Ethernet0
Hits: 1489 Misses: 1
Expired translations: 1
Dynamic mappings:
-- Inside Source
access-list 198 pool enterprise refcount 0
 pool enterprise: netmask 255.255.255.0
   start 192.168.1.90 end 192.168.1.90
   type generic, total addresses 1, allocated 0 (0%), misses 0\
```

If you are seeing IPSEC_ACTIVE in your output at this point, everything is operating as expected.

Configuring Save Password

To configure the Save Password feature, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **password encryption aes**
4. **crypto ipsec client ezvpn *name***
5. **username *name* password {0 | 6} {*password*}**
6. **exit**
7. **show running-config**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	password encryption aes Example: Router (config)# password encryption aes	Enables a type 6 encrypted preshared key.
Step 4	crypto ipsec client ezvpn name Example: Router (config)# crypto ipsec client ezvpn ezvpn1	Creates a Cisco Easy VPN remote configuration and enters the Cisco Easy VPN remote configuration mode.
Step 5	username name password {0 6} {password} Example: Router (config-crypto-ezvpn)# username server_1 password 0 blue	Allows you to save your Xauth password locally on the PC. <ul style="list-style-type: none">The 0 keyword specifies that an unencrypted password will follow.The 6 keyword specifies that an encrypted password will follow.The <i>password</i> argument is the unencrypted (cleartext) user password.
Step 6	exit Example: Router (config-crypto-ezvpn)# exit	Exits the Cisco Easy VPN remote configuration mode.
Step 7	show running-config Example: Router (config)# show running-config	Displays the contents of the configuration file that is currently running.

Configuring Manual Tunnel Control

To configure control of IPsec VPN tunnels manually so that you can establish and terminate the IPsec VPN tunnels on demand, perform the following steps.

Note

CLI is one option for connecting the tunnel. The preferred method is via the web interface (using SDM).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec client ezvpn *name***
4. **connect [auto | manual]**
5. **exit**
6. **exit**
7. **crypto ipsec client ezvpn connect *name***

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec client ezvpn <i>name</i> Example: Router (config)# crypto ipsec client ezvpn easy vpn remotel	Assigns a Cisco Easy VPN remote configuration to an interface and enters Cisco Easy VPN Remote configuration mode. <ul style="list-style-type: none"> The <i>name</i> argument specifies the configuration name to be assigned to the interface.
Step 4	connect [auto manual] Example: Router (config-crypto-ezvpn)# connect manual	Connects the VPN tunnel. Specify manual to configure manual tunnel control. <ul style="list-style-type: none"> Automatic is the default; you do not need to use the manual keyword if your configuration is automatic.
Step 5	exit Example: Router (config-crypto-ezvpn)# exit	Exits Cisco Easy VPN Remote configuration mode.
Step 6	exit Example: Router (config)# exit	Exits global configuration mode and enters privileged EXEC mode.
Step 7	crypto ipsec client ezvpn connect <i>name</i> Example: Router# crypto ipsec client ezvpn connect easy vpn remotel	Connects a given Cisco Easy VPN remote configuration. <ul style="list-style-type: none"> The <i>name</i> argument specifies the IPsec VPN tunnel name. Note If the tunnel name is not specified, the active tunnel is connected. If there is more than one active tunnel, the command fails with an error requesting that you specify the tunnel name.

Configuring Automatic Tunnel Control

To configure automatic tunnel control, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec client ezvpn** *name*
4. **connect** [auto | manual]
5. **exit**
6. **exit**
7. **crypto ipsec client ezvpn connect** *name*

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec client ezvpn <i>name</i> Example: Router (config)# crypto ipsec client ezvpn easy vpn remotel	Assigns a Cisco Easy VPN remote configuration to an interface and enters Cisco Easy VPN Remote configuration mode. <ul style="list-style-type: none"> • Specify the configuration name to be assigned to the interface.
Step 4	connect [auto manual] Example: Router (config-crypto-ezvpn)# connect auto	Connects the VPN tunnel. <ul style="list-style-type: none"> • Specify auto to configure automatic tunnel control. Automatic is the default; you do not need to use this subcommand if your configuration is automatic.
Step 5	exit Example: Router (config-crypto-ezvpn)# exit	Exits Cisco Easy VPN Remote configuration mode.
Step 6	exit Example: Router (config)# exit	Exits global configuration mode and enters privileged EXEC mode.

	Command	Purpose
Step 7	crypto ipsec client ezvpn connect <i>name</i> Example: Router# crypto ipsec client ezvpn connect easy vpn remotel	Connects a given Cisco Easy VPN remote configuration. <ul style="list-style-type: none"> The <i>name</i> argument specifies the IPsec VPN tunnel name. Note If the tunnel name is not specified, the active tunnel is connected. If there is more than one active tunnel, the command fails with an error requesting that you specify the tunnel name.

Configuring Multiple Inside Interfaces

You can configure up to three inside interfaces for all platforms. You need to manually configure each inside interface using the following procedure.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-name*
4. **exit**
5. **crypto ipsec client ezvpn** *name* [**outside** | **inside**]
6. **interface** *interface-name*
7. **exit**
8. **crypto ipsec client ezvpn** *name* [**outside** | **inside**]

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-name</i> Example: Router (config)# interface Ethernet0	Selects the interface you want to configure by specifying the interface name and enters interface configuration mode.
Step 4	exit Example: Router (config-if)# exit	Exits interface configuration mode.

	Command	Purpose
Step 5	crypto ipsec client ezvpn <i>name</i> [outside inside] Example: Router (config)# crypto ipsec client ezvpn easy vpn remote 1 inside	Specifies the Cisco Easy VPN remote configuration name to be assigned to the first inside interface. <ul style="list-style-type: none"> You must specify inside for each inside interface.
Step 6	interface <i>interface-name</i> Example: Router (config)# interface Ethernet1	Selects the next interface you want to configure by specifying the next interface name and enters interface configuration mode.
Step 7	exit Example: Router (config-if)# exit	Exits interface configuration mode.
Step 8	crypto ipsec client ezvpn <i>name</i> [outside inside] Example: Router (config)# crypto ipsec client ezvpn easy vpn remote2 inside	Specifies the Cisco Easy VPN remote configuration name to be assigned to the next inside interface. <ul style="list-style-type: none"> You must specify inside for each inside interface. Repeat Step 3 through Step 4 to configure an additional tunnel if desired.

Configuring Multiple Outside Interfaces

You can configure multiple tunnels for outside interfaces, setting up a tunnel for each outside interface. You can configure a maximum of four tunnels using the following procedure for each outside interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-name***
4. **exit**
5. **crypto ipsec client ezvpn *name* [outside | inside]**
6. **interface *interface-name***
7. **exit**
8. **crypto ipsec client ezvpn *name* [outside | inside]**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-name</i> Example: Router (config)# interface Ethernet0	Selects the first outside interface you want to configure by specifying the interface name and enters interface configuration mode.
Step 4	exit Example: Router (config-if)# exit	Exits interface configuration mode.
Step 5	crypto ipsec client ezvpn <i>name</i> [outside inside] Example: Router (config)# crypto ipsec client ezvpn easy vpn remotel outside	Specifies the Cisco Easy VPN remote configuration name to be assigned to the first outside interface. <ul style="list-style-type: none">Specify outside (optional) for each outside interface. If neither outside nor inside is specified for the interface, the default is outside.
Step 6	interface <i>interface-name</i> Example: Router (config)# interface Ethernet1	Selects the next outside interface you want to configure by specifying the next interface name.
Step 7	exit Example: Router (config-if)# exit	Exits interface configuration mode.
Step 8	crypto ipsec client ezvpn <i>name</i> [outside inside] Example: Router (config)# crypto ipsec client ezvpn easy vpn remote2 outside	Specifies the Cisco Easy VPN remote configuration name to be assigned to the next outside interface. <ul style="list-style-type: none">Specify outside (optional) for each outside interface. If neither outside nor inside is specified for the interface, the default is outside. Repeat Step 3 through Step 4 to configure additional tunnels if desired.

Configuring Multiple Subnet Support

When configuring multiple subnet support, you must first configure an access list to define the actual subnets to be protected. Each source subnet or mask pair indicates that all traffic that is sourced from this network to any destination is protected by IPsec. For information about configuring ACLs, see “Access control lists, configuring” in the section “[Additional References](#).”

After you have defined the subnets, you must configure the crypto IPsec client EZVPN profile to use the ACLs.

**Note**

Multiple subnets are not supported in client mode.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-name*
4. **exit**
5. **crypto ipsec client ezvpn** *name*
6. **acl** {*acl-name* | *acl-number*}

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-name</i> Example: Router (config)# interface Ethernet1	Selects the interface you want to configure by specifying the interface name and enters interface configuration mode.
Step 4	exit Example: Router (config-if)# exit	Exits interface configuration mode.
Step 5	crypto ipsec client ezvpn <i>name</i> Example: Router (config)# crypto ipsec client ezvpn ez1	Creates a Cisco Easy VPN remote configuration and enters crypto Easy VPN configuration mode.
Step 6	acl { <i>acl-name</i> <i>acl-number</i> } Example: Router (config-crypto-ezvpn)# acl acl-list1	Specifies multiple subnets in a VPN tunnel.

Configuring Proxy DNS Server Support

As a way of implementing the use of the DNS addresses of the ISP when the WAN connection is down, the router in a Cisco Easy VPN remote configuration can be configured to act as a proxy DNS server. To enable the proxy DNS server functionality with the **ip dns server** command, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dns server**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip dns server Example: Router (config)# ip dns server	Enables the router to act as a proxy DNS server. Note This definition is IOS specific.

What to Do Next

After configuring the router, you configure the Cisco IOS Easy VPN server as follows:

- Under the **crypto isakmp client configuration group** command, configure the *dns* subcommand as in the following example:

```
dns A.B.C.D A1.B1.C1.D1
```

These DNS server addresses should be pushed from the server to the Cisco Easy VPN remote and dynamically added to or deleted from the running configuration of the router.

For information about general DNS server functionality in Cisco IOS software applications, see [Configuring DNS](#) and [Configuring DNS on Cisco Routers](#).

Configuring Dial Backup

Note

The Dial Backup feature is not available in Cisco IOS Release 12.3(11)T.

To configure dial backup, perform the following steps.

SUMMARY STEPS

1. Create the Easy VPN backup configuration.
2. Add the backup subcommand details to the primary configuration.
3. Apply the backup Easy VPN configuration to the dial backup outside interface.
4. Apply the Easy VPN profile to the inside interfaces.

DETAILED STEPS

	Command	Purpose
Step 1	Create the Easy VPN dial backup configuration.	For details about the backup configuration, see the section “ Dial Backup .”
Step 2	Add the backup subcommand details to the primary configuration.	Use the backup subcommand and track keyword of the crypto ipsec client ezvpn command.
Step 3	Apply the backup Easy VPN configuration to the dial backup outside interface (for example, serial, async, or dialer).	For details about applying the backup configuration to the dial backup outside interface, see the section “ Configuring Multiple Outside Interfaces .”
Step 4	Apply the Easy VPN profile to the inside interfaces (there can be more than one).	For details about applying the Easy VPN profile to the inside interfaces, see the section “ Configuring Multiple Inside Interfaces .”

Configuring the DHCP Server Pool

To configure the Dynamic Host Configuration Protocol (DHCP) server pool, see the chapter “[Configuring DHCP](#)” in the *Cisco IOS IP Configuration Guide*, Release 12.3.

Resetting a VPN Connection

To reset the VPN connection, perform the following steps. The **clear** commands can be configured in any order or independent of one another.

SUMMARY STEPS

1. **enable**
2. **clear crypto ipsec client ezvpn**
3. **clear crypto sa**
4. **clear crypto isakmp**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	clear crypto ipsec client ezvpn Example: Router# clear crypto ipsec client ezvpn	Resets the Cisco Easy VPN remote state machine and brings down the Cisco Easy VPN remote connection on all interfaces or on a given interface (tunnel).
Step 3	clear crypto sa Example: Router# clear crypto sa	Deletes IPsec SAs.
Step 4	clear crypto isakmp Example: Router# clear crypto isakmp	Clears active IKE connections.

Monitoring and Maintaining VPN and IKE Events

To monitor and maintain VPN and IKE events, perform the following steps.

SUMMARY STEPS

1. enable
2. debug crypto ipsec client ezvpn
3. debug crypto ipsec
4. debug crypto isakmp

SUMMARY STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	debug crypto ipsec client ezvpn Example: Router# debug crypto ipsec client ezvpn	Displays information showing the configuration and implementation of the Cisco Easy VPN Remote feature.

	Command	Purpose
Step 3	debug crypto ipsec Example: Router# debug crypto ipsec	Displays IPsec events.
Step 4	debug crypto isakmp Example: Router# debug crypto isakmp	Displays messages about IKE events.

Configuring a Virtual Interface

To configure a virtual interface, perform the following steps.

Note

Before the virtual interface is configured, ensure that the Easy VPN profile is not applied on any outside interface. Remove the Easy VPN profile from the outside interface and then configure the virtual interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface virtual-template** *number* **type** *type-of-virtual-template*
4. **tunnel mode ipsec ipv4**
5. **exit**
6. **crypto ipsec client ezvpn** *name*
7. **virtual-interface** *virtual-template-number*

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface virtual-template <i>number</i> type <i>type-of-virtual-template</i> Example: Router (config)# interface virtual-template1 type tunnel	(Optional) Creates a virtual template of the type tunnel and enters interface configuration mode. <ul style="list-style-type: none"> • Steps 3, 4, and 5 are optional, but if one is configured, they must all be configured.

	Command	Purpose
Step 4	tunnel mode ipsec ipv4 Example: Router (if-config)# tunnel mode ipsec ipv4	(Optional) Configures the tunnel that does the IPsec tunneling.
Step 5	exit Example: Router (if-config)# exit	(Optional) Exits interface (virtual-tunnel) configuration mode.
Step 6	crypto ipsec client ezvpn name Example: Router (config)# crypto ipsec client ezvpn EasyVPN1	Creates a Cisco Easy VPN remote configuration and enters the Cisco Easy VPN remote configuration mode.
Step 7	virtual-interface virtual-template-number Example: Router (config-crypto-ezvpn)# virtual-interface 3	Instructs the Easy VPN remote to create a virtual interface to be used as an outside interface. If the virtual template number is specified, the virtual-access interface is derived from the virtual interface that was specified. If a virtual template number is not specified, a generic virtual-access interface is created.

Troubleshooting Dual Tunnel Support

The following **debug** and **show** commands may be used to troubleshoot your dual-tunnel configuration.

SUMMARY STEPS

1. **enable**
2. **debug crypto ipsec client ezvpn**
3. **debug ip policy**
4. **show crypto ipsec client ezvpn**
5. **show ip interface**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	debug crypto ipsec client ezvpn Example: Router# debug crypto ipsec client ezvpn	Displays information about Cisco Easy VPN remote connections.

	Command	Purpose
Step 3	debug ip policy Example: Router# debug ip policy	Displays IP policy routing packet activity.
Step 4	show crypto ipsec client ezvpn Example: Router# show crypto ipsec client ezvpn	Displays the Cisco Easy VPN Remote configuration.
Step 5	show ip interface Example: Router# show ip interface	Displays the usability status of interfaces that are configured for IP.

Configuring Reactivate (a Default) Primary Peer

To configure a default primary peer, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec client ezvpn** *name*
4. **peer** {*ip-address* | *hostname*} [**default**]
5. **idle-time** *idle-time*

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec client ezvpn <i>name</i> Example: Router (config)# crypto ipsec client ezvpn ez1	Creates a Cisco Easy VPN remote configuration and enters crypto Easy VPN configuration mode.

	Command	Purpose
Step 4	peer { <i>ip-address</i> <i>hostname</i> } [default] Example: Router (config-crypto-ezvpn)# peer 10.2.2.2 default	Sets the peer IP address or hostname for the VPN connection. <ul style="list-style-type: none"> A hostname can be specified only when the router has a DNS server available for hostname resolution. The peer subcommand may be input multiple times. However, only one default or primary peer entry can exist at a time (for example, 10.2.2.2 default). The default keyword defines the peer as the primary peer.
Step 5	idle-time <i>idle-time</i> Example: Router (config-crypto-ezvpn)# idle-time 60	(Optional) Idle time in seconds after which an Easy VPN tunnel is brought down. <ul style="list-style-type: none"> Idle time=60 through 86400 seconds. Note If idle time is configured, the tunnel for the primary server is not brought down.

Configuring Identical Addressing Support

Configuring Identical Addressing Support comprises the following tasks:

- Defining the Easy VPN remote in network-extension mode and enabling **nat allow**.
- Assigning the Cisco Easy VPN Remote configuration to the Outside interface.
- Creating a loopback interface and assigning the Cisco Easy VPN Remote configuration to the Inside interface of the loopback interface.
- Configuring a one-to-one static NAT translation for each host that needs to be accessible from the EasyVPN server-side network or from other client locations.
- Configuring dynamic overloaded NAT or PAT using an access list for all the desired VPN traffic. The NAT or PAT traffic is mapped to the Easy VPN inside interface IP address.
- And, if split-tunneling is required, using the **nat acl** command to enable split-tunneling for the traffic specified by the *acl-name* or the *acl-number* argument. The ACL is the same as the ACL used by the NAT or PAT mapping in the preceding bullet item.

To configure Identical Addressing Support, perform the following steps on your router.

Prerequisites

Easy VPN Remote must be configured in network extension mode before you can configure the Identical Addressing Support feature.

SUMMARY STEPS

- enable**
- configure terminal**
- crypto ipsec client ezvpn** *name*
- mode network-extension**
- nat allow**
- exit**
- interface** *interface*

8. **crypto ipsec client ezvpn name** *outside*
9. **exit**
10. **interface** *interface*
11. **ip address** *ip mask*
12. **crypto ipsec client ezvpn name** *inside*
13. **exit**
14. **ip nat inside source static** *local-ip global-ip*
15. **ip nat inside source list** {*acl-name* | *acl-number*} **interface** *interface* **overload**
16. **crypto ipsec client ezvpn name**
17. **nat acl** {*acl-name* | *acl-number*}
18. **exit**
19. **exit**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec client ezvpn name Example: Router (config)# crypto ipsec client ezvpn easyclient	Creates a remote configuration and enters Cisco Easy VPN Remote configuration mode.
Step 4	mode network-extension Example: Router (config-crypto-ezvpn)# mode network-extension	Configures Easy VPN client in network-extension mode.
Step 5	nat allow Example: Router (config-crypto-ezvpn)# nat allow	Allows NAT to be integrated with Easy VPN and enables the Identical Addressing feature.
Step 6	exit Example: Router (config-crypto-ezvpn)# exit	Exits Cisco Easy VPN Remote configuration mode.

	Command	Purpose
Step 7	interface <i>interface</i> Example: Router (config)# interface Ethernet1	Enters interface configuration mode for the interface. <ul style="list-style-type: none"> This interface will become the outside interface for the NAT or PAT translation.
Step 8	crypto ipsec client ezvpn name outside Example: Router (config-if)# crypto ipsec client ezvpn easyclient outside	Assigns the Cisco Easy VPN Remote configuration to the outside interface. <ul style="list-style-type: none"> This configuration automatically creates the necessary NAT or PAT translation parameters and initiates the VPN connection (if you are in client mode).
Step 9	exit Example: Router (config-if)# exit	Exits interface configuration mode.
Step 10	interface <i>interface</i> Example: Router (config)# interface Loopback0	Enters interface configuration mode for the loopback interface. <ul style="list-style-type: none"> This interface will become the inside interface for the NAT or PAT translation.
Step 11	ip address ip mask Example: Router (config-if)# ip address 10.1.1.1 255.255.255.252	Assigns the IP address and mask to the loopback interface.
Step 12	crypto ipsec client ezvpn name inside Example: Router (config-if)# crypto ipsec client ezvpn easyclient inside	Assigns the Cisco Easy VPN Remote configuration to the inside interface.
Step 13	exit Example: Router (config-if)# exit	Exits interface configuration mode.
Step 14	ip nat inside source static local-ip global-ip Example: Router (config)# ip nat inside source static 10.10.10.10 5.5.5.5	Configure a one-to-one static NAT translation for each host that needs to be accessible from the Easy VPN server side network, or from other client locations.
Step 15	ip nat inside source list {acl-name acl-number} interface interface overload Example: Router (config)# ip nat inside source list 100 interface Loopback0 overload	Configure dynamic overloaded NAT or PAT, which uses an ACL for all the desired VPN traffic. The NAT and PAT traffic is mapped to the Easy VPN inside interface IP address. <ul style="list-style-type: none"> The <i>acl-name</i> argument is the name of the ACL. The <i>acl-number</i> argument is the number of the ACL.

	Command	Purpose
Step 16	crypto ipsec client ezvpn <i>name</i> Example: Router (config)# crypto ipsec client ezvpn easyclient	(Optional, if using split tunneling) Enters Cisco Easy VPN Remote configuration mode.
Step 17	nat acl { <i>acl-name</i> <i>acl-number</i> } Example: Router (config-crypto-ezvpn)# nat acl 100	(Optional, if using split tunneling) Enables split-tunneling for the traffic specified by the <i>acl-name</i> or the <i>acl-number</i> argument. The ACL is the same as the ACL used by the NAT or PAT mapping in the Step 15. <ul style="list-style-type: none">• The <i>acl-name</i> argument is the name of the ACL.• The <i>acl-number</i> argument is the number of the ACL.
Step 18	exit Example: Router (config-crypto-ezvpn)# exit	Exits Cisco Easy VPN Remote configuration mode.
Step 19	exit Example: Router (config)# exit	Exits global configuration mode.

Configuring cTCP on an Easy VPN Client

To configure cTCP on an Easy VPN client (remote device), perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ctcp** [*keepalive number-of-seconds* | **port** *port-number*]
4. **crypto ipsec client ezvpn** *name*
5. **ctcp port** *port-number*

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.

	Command	Purpose
Step 3	crypto ctcp [keepalive <i>number-of-seconds</i> port <i>port-number</i>] Example: Router (config)# crypto ctcp keepalive 15	Sets cTCP keepalive interval for the remote device. <ul style="list-style-type: none"> <i>number-of-seconds</i>—Number of seconds between keepalives. Value = 5 through 3600. port <i>port-number</i>—Port number that cTCP listens to. Up to 10 numbers can be configured. Note The cTCP client has to send periodic keepalives to the server to keep NAT or firewall sessions alive.
Step 4	crypto ipsec client ezvpn <i>name</i> Example: Router (config)# crypto ipsec client ezvpn ezvpn1	Creates a Cisco Easy VPN remote configuration and enters Cisco Easy VPN remote configuration mode.
Step 5	ctcp port <i>port-number</i> Example: Router (config-crypto-ezvpn)# ctcp port 200	Sets the port number for cTCP encapsulation for Easy VPN. <ul style="list-style-type: none"> <i>port-number</i>—Port number on the hub. Value = 1 through 65535.

Easy VPN Server Tasks

Configuring a Cisco IOS Easy VPN Server

For information about configuring the Easy VPN Server, see the following document:

- [Easy VPN Server](#)

Configuring an Easy VPN Server on a VPN 3000 Series Concentrator

This section describes the guidelines required to configure the Cisco VPN 3000 series concentrator for use with the Cisco Easy VPN Remote feature. As a general rule, you can use the default configuration except for IP addresses, server addresses, routing configurations, and for the following parameters and options:

- [Peer Configuration on a Cisco Easy VPN Remote Using the Hostname](#), page 58
- [Interactive Hardware Client Authentication Version 3.5](#), page 58
- [IPsec Tunnel Protocol](#), page 58
- [IPsec Group](#), page 58
- [Group Lock](#), page 58
- [Xauth](#), page 59
- [Split Tunneling](#), page 59
- [IKE Proposals](#), page 59
- [New IPsec SA](#), page 59

**Note**

You must be using Cisco VPN 3000 series concentrator software Release 3.11 or later to support Cisco Easy VPN software clients and remotes.

Peer Configuration on a Cisco Easy VPN Remote Using the Hostname

After you have configured the Cisco Easy VPN server on the VPN 3000 concentrator to use hostname as its identity, you must configure the peer on the Cisco Easy VPN remote using the hostname. You can either configure DNS on the client to resolve the peer hostname or configure the peer hostname locally on the client using the **ip host** command. As an example, you can configure the peer hostname locally on an Easy VPN remote as follows:

```
ip host crypto-gw.cisco.com 10.0.0.1
```

Or you can configure the Easy VPN remote to use the hostname with the **peer** command and *hostname* argument, as follows:

```
peer crypto-gw.cisco.com.
```

Interactive Hardware Client Authentication Version 3.5

The Cisco Easy VPN Remote feature does not support the Interactive Hardware Client Authentication Version 3.5 feature. This feature must be disabled. You can disable the feature on the VPN 3000 series concentrator by clicking the **HW Client** tab on the **Configuration | User Management | Base Group** screen.

IPsec Tunnel Protocol

IPsec Tunnel Protocol enables the IPsec tunnel protocol so that it is available for users. The IPsec Tunnel Protocol is configured on the Cisco VPN 3000 series concentrator by clicking the **General** tab on the **Configuration | User Management | Base Group** screen.

IPsec Group

IPsec group configures the Cisco VPN 3000 series concentrator with a group name and password that match the values configured for the Cisco Easy VPN remote configuration on the router. These values are configured on the router with the **group group-name key group-key** subcommand and arguments. The values are configured on the Cisco VPN 3000 series concentrator using the **Configuration | User Management | Groups** screen.

Group Lock

If you are defining multiple users in multiple groups on the VPN 3000 series concentrator, you must check the **Group Lock** box in the IPsec tab to prevent users in one group from logging in with the parameters of another group. For example, if you have configured one group for split tunneling access and another group without split tunneling access, clicking the **Group Lock** box prevents users in the second group from gaining access to the split tunneling features. The Group Lock checkbox appears in the **IPsec** tab in the **Configuration | User Management | Base Group** screen and in the **IPsec** tab in the **Configuration | User Management | Groups | Add/Modify** screens.

Xauth

To use Xauth, set the **Authentication** parameter to **None**. The Authentication parameter appears in the **IPsec** tab in the **Configuration | User Management | Base Group** screen and in the **IPsec** tab in the **Configuration | User Management | Groups | Add/Modify** screens.

Split Tunneling

The **Configuration | User Management | Base Group, Mode Configuration Parameters Tab** screen includes a **Split Tunnel** option with a checkbox that says “Allow the networks in the list to bypass the tunnel.”

IKE Proposals

The Cisco VPN 3000 series concentrator is preconfigured with a default IKE proposal, CiscoVPNClient-3DES-MD5, that can be used with Cisco Easy VPN remotes. This IKE proposal supports preshared keys with Xauth using the MD5/HMAC-128 algorithm and Diffie-Hellman Group 2.

This IKE proposal is active by default, but you should verify that it is still an active proposal using the **Configuration | System | Tunneling Protocols | IPsec | IKE Proposals** screen.

In addition, as part of configuring the Cisco VPN 3000 series concentrator—for the Cisco Easy VPN Remote image, you do not need to create a new IPsec SA. Use the default IKE and Easy VPN remote lifetime configured on the Cisco VPN 3000 series concentrator.

Note

You can also use the default IKE proposals IKE-DES-MD5 and IKE-3DES-MD5, but they do not enable Xauth support by default.

New IPsec SA

You can create a new IPsec SA. Cisco Easy VPN clients use a SA having the following parameters:

- Authentication Algorithm=ESP/MD5/HMAC-128
- Encryption Algorithm=DES-56 or 3DES-168 (recommended)
- Encapsulation Mode=Tunnel
- IKE Proposal=CiscoVPNClient-3DES-MD5 (preferred)

The Cisco VPN 3000 series concentrator is preconfigured with several default security associations (SAs), but they do not meet the IKE proposal requirements. To use an IKE proposal of CiscoVPNClient-3DES-MD5, copy the ESP/IKE-3DES-MD5 SA and modify it to use CiscoVPNClient-3DES-MD5 as its IKE proposal. An IKE proposal is configured on the VPN 3000 series concentrator using the **Configuration | Policy Management | Traffic Management | Security Associations** screen.

Configuring an Easy VPN Server on a Cisco PIX Firewall

For information about configuring an Easy VPN Server on a Cisco PIX Firewall, see the following document:

- [Easy VPN Server](#)

Web Interface Tasks

Configuring Web-Based Activation

To configure a LAN so that any HTTP requests coming from any of the PCs on the private LAN are intercepted, providing corporate users with access to the corporate Web page, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec client ezvpn *name***
4. **xauth userid mode {http-intercept | interactive | local}**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec client ezvpn <i>name</i> Example: Router (config)# crypto ipsec client ezvpn easy vpn remotel	Assigns a Cisco Easy VPN remote configuration to an interface and enters Cisco Easy VPN Remote configuration mode. <ul style="list-style-type: none">• The <i>name</i> argument specifies the configuration name to be assigned to the interface.
Step 4	xauth userid mode {http-intercept interactive local} Example: Router (config-crypto-ezvpn)# xauth userid mode http-intercept	Specifies how the VPN device handles Xauth requests or prompts from the server.

Monitoring and Maintaining Web-Based Activation

To monitor and maintain web-based activation, perform the following steps. (The **debug** and **show** commands may be used independently, or they may all be configured.)

SUMMARY STEPS

1. **enable**
2. **debug crypto ipsec client ezvpn**

3. **debug ip auth-proxy ezvpn**
4. **show crypto ipsec client ezvpn**
5. **show ip auth-proxy config**

DETAILED STEPS

	Command	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	debug crypto ipsec client ezvpn Example: Router# debug crypto ipsec client ezvpn	Displays information about the Cisco Easy VPN connection.
Step 3	debug ip auth-proxy ezvpn Example: Router# debug ip auth-proxy ezvpn	Displays information related to proxy authentication behavior for web-based activation.
Step 4	show crypto ipsec client ezvpn Example: Router# show crypto ipsec client ezvpn	Shows that the username and password used for user credentials during Xauth negotiations will be obtained by intercepting HTTP connections from the user.
Step 5	show ip auth-proxy config Example: Router# show ip auth-proxy config	Displays the auth-proxy rule that has been created and applied by Easy VPN.

Examples

Debug Output

The following is sample **debug** output for a typical situation in which a user has opened a browser and connected to the corporate website:

```
Router# debug ip auth-proxy ezvpn
```

```
Dec 10 12:41:13.335: AUTH-PROXY: New request received by EzVPN WebIntercept
! The following line shows the ip address of the user.
from 10.4.205.205
Dec 10 12:41:13.335: AUTH-PROXY:GET request received
Dec 10 12:41:13.335: AUTH-PROXY:Normal auth scheme in operation
Dec 10 12:41:13.335: AUTH-PROXY:Ezvpn is NOT active. Sending connect-bypass page to user
```

At this point, the user chooses “connect” on his or her browser:

```
Dec 10 12:42:43.427: AUTH-PROXY: New request received by EzVPN WebIntercept
from 10.4.205.205
Dec 10 12:42:43.427: AUTH-PROXY:POST request received
Dec 10 12:42:43.639: AUTH-PROXY:Found attribute <connect> in form
Dec 10 12:42:43.639: AUTH-PROXY:Sending POST data to EzVPN
Dec 10 12:42:43.639: EZVPN(tunnel22): Communication from Interceptor
application.
```

```
Request/Response from 10.4.205.205, via Ethernet0
Dec 10 12:42:43.639:          connect: Connect Now
Dec 10 12:42:43.639: EZVPN(tunnel22): Received CONNECT from 10.4.205.205!
Dec 10 12:42:43.643: EZVPN(tunnel22): Current State: CONNECT_REQUIRED
Dec 10 12:42:43.643: EZVPN(tunnel22): Event: CONNECT
Dec 10 12:42:43.643: EZVPN(tunnel22): ezvpn_connect_request
```

Easy VPN contacts the server:

```
Dec 10 12:42:43.643: EZVPN(tunnel22): Found valid peer 192.168.0.1
Dec 10 12:42:43.643: EZVPN(tunnel22): Added PSK for address 192.168.0.1

Dec 10 12:42:43.643: EZVPN(tunnel22): New State: READY
Dec 10 12:42:44.815: EZVPN(tunnel22): Current State: READY
Dec 10 12:42:44.815: EZVPN(tunnel22): Event: IKE_PFS
Dec 10 12:42:44.815: EZVPN(tunnel22): No state change
Dec 10 12:42:44.819: EZVPN(tunnel22): Current State: READY
Dec 10 12:42:44.819: EZVPN(tunnel22): Event: CONN_UP
Dec 10 12:42:44.819: EZVPN(tunnel22): ezvpn_conn_up B8E86EC7 E88A8A18 D0D51422
8AFF32B7
```

The server requests Xauth information:

```
Dec 10 12:42:44.823: EZVPN(tunnel22): No state change
Dec 10 12:42:44.827: EZVPN(tunnel22): Current State: READY
Dec 10 12:42:44.831: EZVPN(tunnel22): Event: XAUTH_REQUEST
Dec 10 12:42:44.831: EZVPN(tunnel22): ezvpn_xauth_request
Dec 10 12:42:44.831: EZVPN(tunnel22): ezvpn_parse_xauth_msg
Dec 10 12:42:44.831: EZVPN: Attributes sent in xauth request message:
Dec 10 12:42:44.831:          XAUTH_TYPE_V2(tunnel22): 0
Dec 10 12:42:44.831:          XAUTH_USER_NAME_V2(tunnel22):
Dec 10 12:42:44.831:          XAUTH_USER_PASSWORD_V2(tunnel22):
Dec 10 12:42:44.831:          XAUTH_MESSAGE_V2(tunnel22) <Enter Username and
Password.>
Dec 10 12:42:44.831: EZVPN(tunnel22): Requesting following info for xauth
Dec 10 12:42:44.831:          username:(Null)
Dec 10 12:42:44.835:          password:(Null)
Dec 10 12:42:44.835:          message:Enter Username and Password.
Dec 10 12:42:44.835: EZVPN(tunnel22): New State: XAUTH_REQ
```

The username and password prompt are displayed in the browser of the user:

```
Dec 10 12:42:44.835: AUTH-PROXY: Response to POST is CONTINUE
Dec 10 12:42:44.839: AUTH-PROXY: Displayed POST response successfully
Dec 10 12:42:44.843: AUTH-PROXY:Served POST response to the user
```

When the user enters his or her username and password, the following is sent to the server:

```
Dec 10 12:42:55.343: AUTH-PROXY: New request received by EzVPN WebIntercept
from 10.4.205.205
Dec 10 12:42:55.347: AUTH-PROXY:POST request received
Dec 10 12:42:55.559: AUTH-PROXY:No of POST parameters is 3
Dec 10 12:42:55.559: AUTH-PROXY:Found attribute <username> in form
Dec 10 12:42:55.559: AUTH-PROXY:Found attribute <password> in form
Dec 10 12:42:55.559: AUTH-PROXY:Found attribute <ok> in form
Dec 10 12:42:55.563: AUTH-PROXY:Sending POST data to EzVPN
Dec 10 12:42:55.563: EZVPN(tunnel22): Communication from Interceptor application.
Request/Response from 10.4.205.205, via Ethernet0
Dec 10 12:42:55.563:          username:http
Dec 10 12:42:55.563:          password:<omitted>
Dec 10 12:42:55.563:          ok:Continue
Dec 10 12:42:55.563: EZVPN(tunnel22): Received username|password from 10.4.205.205!
Dec 10 12:42:55.567: EZVPN(tunnel22): Current State: XAUTH_PROMPT
Dec 10 12:42:55.567: EZVPN(tunnel22): Event: XAUTH_REQ_INFO_READY
Dec 10 12:42:55.567: EZVPN(tunnel22): ezvpn_xauth_reply
```

```
Dec 10 12:42:55.567:          XAUTH_TYPE_V2(tunnel22): 0
Dec 10 12:42:55.567:          XAUTH_USER_NAME_V2(tunnel22): http
Dec 10 12:42:55.567:          XAUTH_USER_PASSWORD_V2(tunnel22): <omitted>
Dec 10 12:42:55.567: EZVPN(tunnel22): New State: XAUTH_REPLIED
Dec 10 12:42:55.891: EZVPN(tunnel22): Current State: XAUTH_REPLIED
Dec 10 12:42:55.891: EZVPN(tunnel22): Event: XAUTH_STATUS
Dec 10 12:42:55.891: EZVPN(tunnel22): xauth status received: Success
```

After using the tunnel, the user chooses “Disconnect”:

```
Dec 10 12:48:17.267: EZVPN(tunnel22): Received authentic disconnect credential
Dec 10 12:48:17.275: EZVPN(): Received an HTTP request: disconnect
Dec 10 12:48:17.275: %CRYPTO-6-EZVPN_CONNECTION_DOWN: (Client) User=
    Group=tunnel22 Client_public_addr=192.168.0.13 Server_public_addr=192.168.0.1
    Assigned_client_addr=10.3.4.5
```

Show Output Before the User Is Connected to the Tunnel

The following output from the two **show** commands (**show crypto ipsec client ezvpn** and **show ip auth-proxy config**) displays what you might see before a user is connected to a VPN tunnel:

```
Router# show crypto ipsec client ezvpn tunnel22
```

```
Tunnel name : tunnel22
Inside interface list: Ethernet0
Outside interface: Ethernet1
Current State: CONNECT_REQUIRED
Last Event: RESET
Save Password: Disallowed
! Note the next line.
    XAuth credentials: HTTP intercepted
    HTTP return code : 200
    IP addr being prompted: 0.0.0.0
Current EzVPN Peer: 192.168.0.1
```

```
Router# show ip auth-proxy config
```

```
Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication Proxy Watch-list is disabled

Authentication Proxy Rule Configuration
! Note that the next line is the Easy VPN-defined internal rule.
    Auth-proxy name ezvpn401***
    Applied on Ethernet0
    http list not specified inactivity-timer 60 minutes
```

Show Output After the User Is Connected to the Tunnel

The following output from the two **show** commands (**show crypto ipsec client ezvpn** and **show ip auth-proxy config**) displays what you might see after the user has been connected to the tunnel:

```
Router# show crypto ipsec client ezvpn tunnel22
```

```
Tunnel name : tunnel22
Inside interface list: Ethernet0
Outside interface: Ethernet1
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
Address: 10.3.4.5
Mask: 255.255.255.255
Save Password: Disallowed
    XAuth credentials: HTTP intercepted
    HTTP return code : 200
    IP addr being prompted: 192.168.0.0
```

```
Current EzVPN Peer: 192.168.0.1

Router# show ip auth-proxy config

Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication Proxy Watch-list is disabled

Auth-proxy name ezvpnWeb*** (EzVPN-defined internal rule)
http list not specified inactivity-timer 60 minutes
```

Using SDM As a Web Manager

For information about the SDM web manager, see the following document:

- [Cisco Security Device Manager](#)

Troubleshooting the VPN Connection

Troubleshooting a VPN Connection Using the Cisco Easy VPN Remote Feature

To troubleshoot a VPN connection created using the Cisco Easy VPN Remote feature, use the following suggested techniques.

- Be aware that any changes to an active Cisco Easy VPN remote configuration or IP address changes to the involved interfaces, such as adding or removing an inside interface, result in a reset of the Cisco Easy VPN Remote connection.
- Enable debugging of the Cisco Easy VPN Remote feature using the **debug crypto ipsec client ezvpn** command.
- Enable debugging of IKE events using the **debug crypto ipsec** and **debug crypto isakmp** commands.
- Display the active IPsec VPN connections using the **show crypto engine connections active** command.
- To reset the VPN connection, use the **clear crypto ipsec client ezvpn** command. If you have debugging enabled, you might prefer to use the **clear crypto sa** and **clear crypto isakmp** commands.

Troubleshooting the Client Mode of Operation

The following information may be used to troubleshoot the Easy VPN Remote configuration for the client mode of operation.

In client mode, the Cisco Easy VPN Remote feature automatically configures the NAT or PAT translation and access lists that are needed to implement the VPN tunnel. These configurations are automatically created when the IPsec VPN connection is initiated. When the tunnel is torn down, the NAT or PAT and access list configurations are automatically deleted.

The NAT or PAT configuration is created with the following assumptions:

- The **ip nat inside** command is applied to all inside interfaces, including default inside interfaces. The default inside interface is the Ethernet 0 interface (for the Cisco 806, Cisco 826, Cisco 827, Cisco 828, Cisco 831, Cisco 836, and Cisco 837 routers).

- The **ip nat outside** command is applied to the interface that is configured with the Cisco Easy VPN Remote configuration. On the Cisco 800 series and Cisco 1700 series routers, the outside interface is configured with the Cisco Easy VPN Remote configuration. On the Cisco 1700 series routers, Cisco 2600 series routers, Cisco 3600 series routers, and Cisco 3700 series routers, multiple outside interfaces can be configured.

**Tip**

The NAT or PAT translation and access list configurations that are created by the Cisco Easy VPN Remote feature are not written to either the startup configuration or running configuration files. These configurations, however, can be displayed using the **show ip nat statistics** and **show access-list** commands.

Troubleshooting Remote Management

To troubleshoot remote management of the VPN remote, use the **show ip interface** command. Using the **brief** keyword, you can verify that the loopback has been removed and that the interface is shown correctly.

Examples

Following is a typical example of output from the **show ip interface** command.

```
Router# show ip interface brief
```

Interface	IP-Address	OK?	Method	Status	Protocol
Ethernet0	unassigned	YES	NVRAM	administratively down	down
Ethernet1	10.0.0.11	YES	NVRAM	up	up
Loopback0	192.168.6.1	YES	manual	up	up
Loopback1	10.12.12.12	YES	NVRAM	up	up

```
Router# show ip interface brief
```

Interface	IP-Address	OK?	Method	Status	Protocol
Ethernet0	unassigned	YES	NVRAM	administratively down	down
Ethernet1	10.0.0.11	YES	NVRAM	up	up
Loopback1	10.12.12.12	YES	NVRAM	up	up

Troubleshooting Dead Peer Detection

To troubleshoot dead peer detection, use the **show crypto ipsec client ezvpn** command.

Examples

The following typical output displays the current server and the peers that have been pushed by the Easy VPN server:

```
Router# show crypto ipsec client ezvpn
```

```
Easy VPN Remote Phase: 4
Tunnel name : ez1
Inside interface list: Loopback1,
Outside interface: Ethernet1
```

```
Current State: IPSEC_ACTIVE
Last Event: CONNECT
Address: 192.168.6.5
Mask: 255.255.255.255
DNS Primary: 10.2.2.2
DNS Secondary: 10.2.2.3
NBMS/WINS Primary: 10.6.6.6
Default Domain: cisco.com
Save Password: Allowed
Current EzVPN Peer:10.0.0.110
Backup Gateways

Easy VPN Remote Configuration Examples

Client Mode Configuration: Examples

The examples in this section show configurations for the Cisco Easy VPN Remote feature in client mode. Also shown are the Cisco IOS Easy VPN server configurations that correspond to these client configurations.

- [Cisco Easy VPN Client in Client Mode \(Cisco 831\): Example, page 67](#)
- [Cisco Easy VPN Client in Client Mode \(Cisco 837\): Example, page 68](#)
- [Cisco Easy VPN Client in Client Mode \(Cisco 1700 Series\): Example, page 70](#)

For more client-mode configuration examples, see [IPSec VPN](#) (under the “Technical Documents” and “Cisco IOS IPSec Configuration Documents” sections) and to [Cisco Easy VPN Solutions](#).

Note

Typically, users configure the Cisco 800 series routers with the SDM or CRWS web interface, not by entering CLI commands. However, the configurations shown here for the Cisco 800 series routers display typical configurations that can be used if manual configuration is desired.

Cisco Easy VPN Client in Client Mode (Cisco 831): Example

In the following example, a Cisco 831 router is configured as an Easy VPN remote using the Cisco Easy VPN Remote feature in client mode. This example shows the following components of the Cisco Easy VPN Remote configuration:

- DHCP server pool—The **ip dhcp pool** command creates a pool of IP addresses to be assigned to the PCs connected to the Ethernet 0 interface of the router. The pool assigns addresses in the class C private address space (192.168.100.0) and configures each PC so that its default route is 192.168.100.1, which is the IP address assigned to the Ethernet interface of the router. The DHCP lease period is one day.
- Cisco Easy VPN remote configuration—The first **crypto ipsec client ezvpn easy vpn remote** command (global configuration mode) creates a Cisco Easy VPN remote configuration named “easy vpn remote.” This configuration specifies the group name “easy vpn remote-groupname” and the shared key value “easy vpn remote-password,” and it sets the peer destination to the IP address **192.185.0.5** (which is the address assigned to the interface connected to the Internet on the destination peer router). The Cisco Easy VPN Remote configuration is configured for the default **client** mode.

Note

If DNS is also configured on the router, the **peer** keyword option also supports a hostname instead of an IP address.

- The second **crypto ipsec client ezvpn easy vpn remote** command (interface configuration mode) assigns the Cisco Easy VPN Remote configuration to the Ethernet 1 interface so that all traffic that is received and transmitted on that interface is sent through the VPN tunnel.

Cisco Easy VPN Client in Client Mode (Cisco 837): Example

In the following example, a Cisco 837 router is configured as an Easy VPN remote using the Cisco Easy VPN Remote feature in the client mode of operation. This example shows the following components of the Cisco Easy VPN remote configuration:

- PPPoE configuration—The ATM 0 interface is configured to support PPPoE connections over the Dialer 1 virtual interface. Because the interfaces use PPPoE, a DHCP IP address pool is not required to provide IP addresses to the connected PCs.
- Cisco Easy VPN Remote configuration—The first **crypto ipsec client ezvpn** command (global configuration mode) creates a Cisco Easy VPN remote configuration named “easy vpn remote.” This configuration specifies the group name “easy vpn remote-groupname” and the shared key value of “easy vpn remote-password,” and it sets the peer destination to the IP address 10.0.0.5 (which is the address assigned to the interface connected to the Internet on the destination peer router). The Cisco Easy VPN remote configuration is configured for the default client mode.

Note If DNS is also configured on the router, the **peer** keyword option also supports a hostname instead of an IP address.

- The second **crypto ipsec client ezvpn** command (interface configuration mode) assigns the Cisco Easy VPN remote configuration to the Dialer 1 interface so that all traffic received and transmitted on that interface is sent through the VPN tunnel.

Local Address Support for Easy VPN Remote: Example

The following example shows that the **local-address** command is used to specify the loopback 0 interface for sourcing tunnel traffic:

```

Router# configure terminal
Router(config)# crypto ipsec client ezvpn telecommuter-client
Router(config-crypto-ezvpn)# local-address loopback0

```

Network Extension Mode Configuration: Examples

In this section, the following examples demonstrate how to configure the Cisco Easy VPN Remote feature in the network extension mode of operation. Also shown are the Cisco IOS Easy VPN server configurations that correspond to these client configurations.

- [Cisco Easy VPN Client in Network Extension Mode \(Cisco 831\): Example, page 73](#)
- [Cisco Easy VPN Client in Network Extension Mode \(Cisco 837\): Example, page 74](#)
- [Cisco Easy VPN Client in Network Extension Mode \(Cisco 1700 Series\): Example, page 76](#)

For more network extension mode configuration examples, see *IPSec VPN* (under the “Technical Documents” and “Cisco IOS IPSec Configuration Documents” sections) and to *Cisco Easy VPN Solutions*.

Cisco Easy VPN Client in Network Extension Mode (Cisco 831): Example

In the following example, a Cisco 831 router is configured as an Easy VPN remote using the Cisco Easy VPN Remote feature. This example shows the following components of the Cisco Easy VPN remote configuration:

- The Ethernet 0 interface is assigned an address in the network address space of the Cisco IOS Easy VPN server. The **ip route** command directs all traffic for this network space from the Ethernet 1 interface to the destination server.
- Cisco Easy VPN Remote configuration—The first **crypto ipsec client ezvpn** command (global configuration mode) creates a Cisco Easy VPN remote configuration named “easy vpn remote.” This configuration specifies the group name “easy vpn remote-groupname” and the shared key value “easy vpn remote-password,” and it sets the peer destination to the IP address 192.185.0.5 (which is the address assigned to the interface connected to the Internet on the destination peer router). The Cisco Easy VPN remote configuration is configured for network extension mode.

Note If DNS is also configured on the router, the **peer** keyword option also supports a hostname instead of an IP address.

- The second **crypto ipsec client ezvpn** command (interface configuration mode) assigns the Cisco Easy VPN Remote configuration to the Ethernet 1 interface so that all traffic that is received and transmitted on that interface is sent through the VPN tunnel.

Web-Based Activation: Example

The following example shows that HTTP connections from the user are to be intercepted and that the user can do web-based authentication (192.0.0.13 is the VPN client device and 192.0.0.1 is the server device):

```

crypto ipsec client ezvpn tunnel22
 connect manual
 group tunnel22 key 22tunnel
 mode client
 peer 192.168.0.1
 xauth userid mode http-intercept
!
!
interface Ethernet0
 ip address 10.4.23.15 255.0.0.0
 crypto ipsec client ezvpn tunnel22 inside!
interface Ethernet1
 ip address 192.168.0.13 255.255.255.128
 duplex auto
 crypto ipsec client ezvpn tunnel22
!

```

Easy VPN Remote with Virtual IPsec Interface Support Configuration: Examples

The following examples indicate that Virtual IPsec Interface Support has been configured on the Easy VPN remote devices.

Virtual IPsec Interface: Generic Virtual Access

The following example shows an Easy VPN remote device with virtual-interface support using a generic virtual-access IPsec interface.

```
!
version 12.4

!
resource policy
!
clock timezone IST 0
ip subnet-zero
no ip dhcp use vrf connected
!
!
crypto ipsec client ezvpn ez
  connect manual
  group easy key cisco
  mode client
  peer 10.3.0.2
  virtual-interface 1
  xauth userid mode interactive
!
!
interface Ethernet0/0
  ip address 10.1.0.2 255.255.255.0
  no keepalive
  no cdp enable
  crypto ipsec client ezvpn ez inside
!
interface Ethernet1/0
  ip address 10.2.0.1 255.255.255.0
  no keepalive
  no cdp enable
  crypto ipsec client ezvpn ez
!
interface Virtual-Template1 type tunnel
  no ip address
  tunnel mode ipsec ipv4
!
!
ip classless
ip route 0.0.0.0 0.0.0.0 10.2.0.2 2
no ip http server
no ip http secure-server
!
!
line con 0
line aux 0
line vty 0 4
  login
!
end

```

When the Tunnel Is Down

The result of a virtual-interface configuration on an Easy VPN profile is the creation of a virtual-access interface. This interface provides IPsec encapsulation. The output below shows the configuration of a virtual-access interface when Easy VPN is “down.”

```
Router# show running-config interface virtual-access 2
```

```
Building configuration...
```

```
Current configuration : 99 bytes
!
interface Virtual-Access2
 no ip address
 tunnel source Ethernet1/0
 tunnel mode ipsec ipv4
end
```

A virtual-interface configuration results in the creation of a virtual-access interface. This virtual-access interface is made automatically outside the interface of the Easy VPN profile. The routes that are added later when the Easy VPN tunnels come up point to this virtual interface for sending the packets to the corporate network. If **crypto ipsec client ezvpn name outside (crypto ipsec client ezvpn name command and outside keyword)** is applied on a real interface, that interface is used as the IKE (IPsec) endpoint (that is, IKE and IPsec packets use the address on the interface as the source address).

```
Router# show crypto ipsec client ezvpn
```

```
Easy VPN Remote Phase: 5

Tunnel name : ez
Inside interface list: Ethernet0/0
Outside interface: Virtual-Access2 (bound to Ethernet1/0)
Current State: CONNECT_REQUIRED
Last Event: TRACKED OBJECT UP
Save Password: Disallowed
Current EzVPN Peer: 10.3.0.2
```

Because a virtual interface, or for that matter any interface, is routable, routes act like traffic selectors. When the Easy VPN tunnel is “down,” there are no routes pointing to the virtual interface, as shown in the following example:

```
Router# show ip route
```

```
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route

Gateway of last resort is 10.2.0.2 to network 0.0.0.0

    10.0.0.0/24 is subnetted, 2 subnets
C       10.2.0.0 is directly connected, Ethernet1/0
C       10.1.0.0 is directly connected, Ethernet0/0
S*    0.0.0.0/0 [2/0] via 10.2.0.2
```

When the Tunnel Is Up

In the case of client or network plus mode, Easy VPN creates a loopback interface and assigns the address that is pushed in mode configuration. To assign the address of the loopback to the interface, use the **ip unnumbered** command (**ip unnumbered loopback**). In the case of network extension mode, the virtual access will be configured as **ip unnumbered ethernet0** (the bound interface).

```
Router# show running-config interface virtual-access 2
```

```
Building configuration...
```

```
Current configuration : 138 bytes
```

```
!
interface Virtual-Access2
 ip unnumbered Loopback0
 tunnel source Ethernet1/0
 tunnel destination 10.3.0.2
 tunnel mode ipsec ipv4
end
```

```
Router# show crypto ipsec client ezvpn
```

```
Easy VPN Remote Phase: 5
```

```
Tunnel name : ez
Inside interface list: Ethernet0/0
Outside interface: Virtual-Access2 (bound to Ethernet1/0)
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
Address: 10.5.0.2
Mask: 255.255.255.255
DNS Primary: 10.6.0.2
NBMS/WINS Primary: 10.7.0.1
Default Domain: cisco.com
Using PFS Group: 2
Save Password: Disallowed
Split Tunnel List: 1
    Address      : 10.4.0.0
    Mask         : 255.255.255.0
    Protocol     : 0x0
    Source Port  : 0
    Dest Port    : 0
Current EzVPN Peer: 10.3.0.2
```

When the tunnels come up, Easy VPN adds either a default route that points to the virtual-access interface or adds routes for all the split attributes of the subnets that point to the virtual-access interface. Easy VPN also adds a route to the peer (destination or concentrator) if the peer is not directly connected to the Easy VPN device.

The following **show ip route** command output examples are for virtual IPsec interface situations in which a split tunnel attribute was sent by the server and a split tunnel attribute was not sent, respectively.

Split Tunnel Attribute Has Been Sent by the Server

```
Router# show ip route
```

```
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
        D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2
        i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
        ia - IS-IS inter area, * - candidate default, U - per-user static route
```

o - ODR, P - periodic downloaded static route

Gateway of last resort is 10.2.0.2 to network 0.0.0.0

```

10.0.0.0/8 is variably subnetted, 5 subnets, 2 masks
C    10.2.0.0/24 is directly connected, Ethernet1/0
S    10.3.0.2/32 [1/0] via 10.2.0.2, Ethernet1/0 <<< Route to
peer (EzVPN server)
C    10.1.0.0/24 is directly connected, Ethernet0/0
C    10.5.0.2/32 is directly connected, Loopback0
S    10.4.0.0/24 [1/0] via 0.0.0.0, Virtual-Access2 <<< Split
tunnel attr sent by the server
S*   10.0.0.0/0 [2/0] via 10.2.0.2

```

Split Tunnel Attribute Has Not Been Sent by the Server

All networks in the split attribute should be shown, as in the following example:

Router# **show ip route**

```

Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route

```

Gateway of last resort is 0.0.0.0 to network 0.0.0.0

```

10.0.0.0/8 is variably subnetted, 4 subnets, 2 masks
C    10.2.0.0/24 is directly connected, Ethernet1/0
! The following line is the route to the peer (the Easy VPN server).
S    10.3.0.2/32 [1/0] via 10.2.0.2, Ethernet1/0
C    10.1.0.0/24 is directly connected, Ethernet0/0
C    10.5.0.3/32 is directly connected, Loopback0
! The following line is the default route.
S*   10.0.0.0/0 [1/0] via 10.0.0.0, Virtual-Access2

```

Dual Tunnel Configuration: Example

The following is an example of a typical dual-tunnel configuration:

```

Dual Tunnel Show Output: Examples

The following **show** command examples display information about three phases of a dual tunnel that is coming up:

- First Easy VPN tunnel is up
- Second Easy VPN tunnel is initiated
- Both of the Easy VPN tunnels are up

Before the EzVPN Tunnels Are Up

```
Router# show crypto ipsec client ezvpn
```

```
Easy VPN Remote Phase: 6
```

```

Tunnel name : ezvpn1
Inside interface list: Ethernet0/0
Outside interface: Virtual-Access2 (bound to Ethernet1/0)
Current State: CONNECT_REQUIRED
Last Event: TRACKED OBJECT UP
Save Password: Disallowed
Current EzVPN Peer: 10.75.1.2

```

```

Tunnel name : ezvpn2
Inside interface list: Ethernet0/0
Outside interface: Virtual-Access3 (bound to Serial2/0)
Current State: CONNECT_REQUIRED
Last Event: TRACKED OBJECT UP
Save Password: Disallowed
Current EzVPN Peer: 10.75.2.2

```

```
Router# show ip route
```

```

Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route

```

The gateway of last resort is 10.76.1.1 to network 0.0.0.0.

```

10.0.0.0/24 is subnetted, 2 subnets
C      10.76.2.0 is directly connected, Serial2/0
C      10.76.1.0 is directly connected, Ethernet1/0
C      192.168.1.0/24 is directly connected, Ethernet0/0
S*    0.0.0.0/0 [2/0] via 10.76.1.1

```

Note

The metric of the default route should be greater than 1 so that the default route that is added later by Easy VPN takes precedence and the traffic goes through the Easy VPN virtual-access interface.

Easy VPN “ezvpn2” Tunnel Is Up

```
Router# show crypto ipsec client ezvpn
```

```
Easy VPN Remote Phase: 6
```

```
Tunnel name : ezvpn1
Inside interface list: Ethernet0/0
Outside interface: Virtual-Access2 (bound to Ethernet1/0)
Current State: CONNECT_REQUIRED
Last Event: TRACKED_OBJECT_UP
Save Password: Disallowed
Current EzVPN Peer: 10.75.1.2
```

```
Tunnel name : ezvpn2
Inside interface list: Ethernet0/0
Outside interface: Virtual-Access3 (bound to Serial2/0)
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
DNS Ezvpn1: 10.6.0.2
NBMS/WINS Ezvpn1: 10.7.0.1
Default Domain: cisco.com
Save Password: Disallowed
Current EzVPN Peer: 10.75.2.2
```

```
Router# show ip route
```

```
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
        D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2
        i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
        ia - IS-IS inter area, * - candidate default, U - per-user static route
        o - ODR, P - periodic downloaded static route
```

The gateway of last resort is 0.0.0.0 to network 0.0.0.0.

```
10.0.0.0/8 is variably subnetted, 3 subnets, 2 masks
! The next line is the Easy VPN route.

       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route
```

The gateway of last resort is 10.0.0.0 to network 10.0.0.0.

```
10.0.0.0/8 is variably subnetted, 4 subnets, 2 masks
! The next line is the Easy VPN router (ezvpn2).
S    10.75.2.2/32 [1/0] via 10.76.1.1
! The next line is the Easy VPN router (ezvpn1).
S    10.75.1.2/32 [1/0] via 10.76.1.1
C    10.76.2.0/24 is directly connected, Serial2/0
C    10.76.1.0/24 is directly connected, Ethernet1/0
C    192.168.1.0/24 is directly connected, Ethernet0/0
! The next line is the Easy VPN route (ezvpn1).
S    192.168.3.0/24 [1/0] via 0.0.0.0, Virtual-Access2
! The next line is the Easy VPN (ezvpn2).
S*   10.0.0.0/0 [1/0] via 10.0.0.0, Virtual-Access3
```

The route to split tunnel “192.168.3.0/24” that points to Virtual-Access2 is added for the Easy VPN “ezvpn” tunnel as shown in the above **show** output.

Reactivate Primary Peer: Example

The following show output illustrates that the default primary peer feature has been activated. The primary default peer is 10.3.3.2.

Router# **show crypto ipsec client ezvpn**

```
Easy VPN Remote Phase: 6

Tunnel name : ezc
Inside interface list: Loopback0
Outside interface: Ethernet0/0
Current State: IPSEC_ACTIVE
Primary EzVPN Peer: 10.3.3.2, Last Tried: Dec 30 07:21:23.071
Last Event: CONN_UP
Address: 10.7.7.1
Mask: 255.255.255.255
DNS Primary: 10.1.1.1
NBMS/WINS Primary: 10.5.254.22
```

```

Save Password: Disallowed
Current EzVPN Peer: 10.4.4.2

23:52:44: %CRYPTO-6-EZVPN_CONNECTION_UP(Primary peer):
      User: lab, Group: hw-client-g
      Client_public_addr=10.4.22.103, Server_public_addr=10.4.23.112
      Assigned_client_addr=10.7.7.1

```

Identical Addressing Support Configuration: Example

In the following example, a Cisco router is configured for the Identical Addressing Support feature:

```

interface Virtual-Templat1 type tunnel
    no ip address
    ip nat outside
!
crypto ipsec client ezvpn easy
    connect manual
    group easy key work4cisco
    mode network-extension

```

cTCP on an Easy VPN Client (Remote Device): Examples

For configuration and troubleshooting examples, see the topic “cTCP on Cisco Easy VPN remote devices” in the [“Related Documents” section on page 101](#).

Easy VPN Server Configuration Examples

This section describes basic Cisco Easy VPN server configurations that support the Cisco Easy VPN remote configurations given in the previous sections. For complete information on configuring these servers, see [Easy VPN Server](#) for Cisco IOS Release 12.3(7)T, available on Cisco.com.

- [Cisco Easy VPN Server Without Split Tunneling: Example, page 96](#)
- [Cisco Easy VPN Server Configuration with Split Tunneling: Example, page 97](#)
- [Cisco Easy VPN Server Configuration with Xauth: Example, page 99](#)
- [Easy VPN Server Interoperability Support: Example, page 101](#)

Cisco Easy VPN Server Without Split Tunneling: Example

The following example shows the Cisco Easy VPN server that is the destination peer router for the Cisco Easy VPN remote network extension mode configurations shown earlier in this section. In addition to the other IPsec configuration commands, the **crypto isakmp client configuration group** command defines the attributes for the VPN group that was assigned to the Easy VPN remote router. This includes a matching key value (easy vpn remote password), and the appropriate routing parameters, such as DNS server, for the Easy VPN remotes.

To support the network extension mode of operation, the **ip route** command instructs that incoming packets for the 172.168.0.0 network be directed from the cable modem interface to the Cisco Easy VPN remote. Other **ip route** commands might be needed, depending on the topology of your network.

Note

This example shows a Cisco uBR925 cable access router, but typically the destination Easy VPN remote is a router, such as a Cisco VPN 3000 concentrator or a Cisco IOS router, that supports the Easy VPN Server feature.

Cisco Easy VPN Server Configuration with Split Tunneling: Example

The following example shows a Cisco Easy VPN server that is configured for a split tunneling configuration with a Cisco Easy VPN remote. This example is identical to that shown in the “[Cisco Easy VPN Server Without Split Tunneling: Example](#)” except for access list 150, which is assigned as part of the **crypto isakmp client configuration group** command. This access list allows the Cisco Easy VPN remote to use the server to access one additional subnet that is not part of the VPN tunnel without compromising the security of the IPsec connection.

To support network extension mode, the **ip route** command instructs that incoming packets for the 172.168.0.0 network be directed from the cable modem interface to the Cisco Easy VPN remote. Other **ip route** commands might be necessary, depending on the topology of your network.

Note

This example shows a Cisco uBR925 cable access router, but typically the destination Easy VPN remote will be a router, such as a VPN 3000 concentrator or a Cisco IOS router, that supports the Easy VPN Server feature.

Cisco Easy VPN Server Configuration with Xauth: Example

The following example shows a Cisco Easy VPN server configured to support Xauth with the Cisco Easy VPN Remote feature. This example is identical to that shown in the “[Cisco Easy VPN Server Configuration with Split Tunneling: Example](#)” except for the following commands that enable and configure Xauth:

- **aaa authentication login userlist local**—Specifies the local username database for authentication at login time. You could also specify the use of RADIUS servers by first using the **aaa authentication login userlist group radius** command and then by specifying the RADIUS servers using the **aaa group server radius** command.
- **crypto isakmp xauth timeout**—Specifies the amount of time, in seconds, that the user has to enter the appropriate username and password to authenticate the session.
- **crypto map dynmap client authentication list userlist**—Creates a crypto map named “**dynmap**” that enables Xauth.
- **username cisco password 7 cisco**—Creates an entry in the local username database for a user with the username of “**cisco**” and an encrypted password of “**cisco**.” This command should be repeated for each separate user that accesses the server.

The following commands, which are also present in the non-Xauth configurations, are also required for Xauth use:

- **aaa authorization network easy vpn remote-groupname local**—Requires authorization for all network-related service requests for users in the group named “**easy vpn remote-groupname**” using the local username database.
- **aaa new-model**—Specifies that the router should use the new AAA authentication commands.
- **aaa session-id common**—Specifies that a unique and common session ID should be used for AAA sessions.
- **crypto map dynmap 1 ipsec-isakmp dynamic dynmap**—Specifies that IKE should be used to establish the IPsec SAs, using the crypt map named “**dynmap**” as the policy template.
- **crypto map dynmap client configuration address respond**—Enables IKE negotiation, accepting requests from any requesting peers.
- **crypto map dynmap isakmp authorization list easy vpn remote-groupname**—Configures the crypto map named “**dynmap**” to use IKE Shared Secret using the group named “**easy vpn remote-groupname**.”

Tip

This configuration shows the server configured for split tunneling, but Xauth can also be used with nonsplit tunnel configurations as well.

**Note**

This example shows a Cisco uBR925 cable access router, but typically the destination Easy VPN server is a router such as a VPN 3000 concentrator or a Cisco IOS router that supports the Easy VPN Server feature.

Feature Information for Easy VPN Remote

Table 4 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Note

Table 4 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 4 Feature Information for Easy VPN Remote

Feature Name	Releases	Feature Information
Easy VPN Remote	12.2(4)YA Cisco IOS XE Release 2.1	Support for Cisco Easy VPN Remote (Phase I) of this feature was introduced for Cisco 806, Cisco 826, Cisco 827, and Cisco 828 routers; Cisco 1700 series routers; and Cisco uBR905 and Cisco uBR925 cable access routers. In Cisco IOS XE Release 2.1, support for this feature was introduced on Cisco ASR 1000 Series Routers.
	12.2(13)T	Cisco Easy VPN Remote was integrated into Cisco IOS Release 12.2(13)T.
	12.2(8)YJ	Support for Cisco Easy VPN Remote (Phase II) of this feature was introduced for Cisco 806, Cisco 826, Cisco 827, and Cisco 828 routers; Cisco 1700 series routers; and Cisco uBR905 and Cisco uBR925 cable access routers.
	12.2(15)T	The Cisco Easy VPN Remote (Phase II) feature was integrated into Cisco IOS Release 12.2(15)T. Support for the Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series routers was added.
	12.3(2)T	The Type 6 Password in the IOS Configuration feature was added.
	12.3(4)T	The Save Password and Multiple Peer Backup features were added. The following sections provide information about the Save Password feature: <ul style="list-style-type: none"> • Using Xauth, page 9 • Configuring Save Password, page 39 • Save Password Configuration: Example, page 77

Glossary

AAA—authentication, authorization, and accounting. Framework of security services that provide the method for identifying users (authentication); for remote access control (authorization); and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

aggressive mode—Mode that eliminates several steps during Internet Key Exchange (IKE) authentication negotiation between two or more IPsec peers. Aggressive mode is faster than main mode but is not as secure.

authorization—Method for remote access control, including one-time authorization or authorization for each service; per-user account list and profile; user group support; and support of IP, IPX, ARA, and Telnet. AAA authorization works by assembling a set of attributes that describe what the user is authorized to perform. These attributes are compared to the information contained in a database for a given user and the result is returned to AAA to determine the actual capabilities and restrictions of the user. The database can be located locally on the access server or router, or it can be hosted remotely on a RADIUS or TACACS+ security server. Remote security servers, such as RADIUS and TACACS+, authorize users for specific rights by associating attribute-value (AV) pairs, which define those rights, with the appropriate user. All authorization methods must be defined through AAA.

CA—certificate authority. An entity in a network that issues and manages security credentials and public keys (in the form of X509v3 certificates) for message encryption. As part of a public key infrastructure (PKI), a CA checks with a registration authority (RA) to verify information provided by the requestor of a digital certificate. If the RA verifies the information of the requestor, the CA can then issue a certificate. Certificates generally include the public key of the owner, the expiration date of the certificate, the name of the owner, and other information about the public key owner.

CRWS—Cisco Router Web Setup Tool. Tool that provides web interface capabilities.

cTCP—Cisco Tunneling Control Protocol. When cTCP is enabled on a remote device (client) and headend device, IKE and ESP (Protocol 50) traffic is encapsulated in the TCP header so that the firewalls in between the client and the headend device permits this traffic (considering it the same as TCP traffic).

DPD—dead peer detection. Queries the liveliness of the Internet Key Exchange (IKE) peer of a router at regular intervals.

DSLAM—digital subscriber line access multiplexer. A device that connects many digital subscriber lines to a network by multiplexing the DSL traffic onto one or more network trunk lines.

IKE—Internet Key Exchange. Key management protocol standard that is used in conjunction with the IP Security (IPsec) standard. IPsec is an IP security feature that provides robust authentication and encryption of IP packets. IPsec can be configured without IKE, but IKE enhances IPsec by providing additional features, flexibility, and ease of configuration for the IPsec standard. IKE is a hybrid protocol that implements the Oakley key exchange and Skeme key exchange inside the Internet Security Association and Key Management Protocol (ISAKMP) framework. ISAKMP, Oakley, and Skeme are security protocols implemented by IKE.

IPsec—IP Security Protocol. Framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPsec provides these security services at the IP layer. IPsec uses IKE to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPsec. IPsec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

main mode—Mode that ensures the highest level of security when two or more IPsec peers are negotiating IKE authentication. It requires more processing time than aggressive mode.

MIB—Management Information Base. Database of network management information that is used and maintained by a network management protocol, such as Simple Network Management Protocol (SNMP) or Common Management Information Protocol (CMIP). The value of a MIB object can be changed or retrieved using SNMP or CMIP commands, usually through a graphical user interface (GUI) network management system (NMS). MIB objects are organized in a tree structure that includes public (standard) and private (proprietary) branches.

peer—Router or device that participates as an endpoint in IPsec and IKE.

preshared key—Shared, secret key that uses IKE for authentication.

QoS—quality of service. Capability of a network to provide better service to selected network traffic over various technologies, including Frame Relay; Asynchronous Transfer Mode (ATM); Ethernet; and 802.1 networks, SONET, and IP-routed networks that may use any or all of these underlying technologies.

RADIUS—Remote Authentication Dial-In User Service. Distributed client or server system that secures networks against unauthorized access. RADIUS clients run on Cisco routers and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

SA—security association. Instance of security policy and keying material applied to a data flow. Both IKE and IPsec use SAs, although SAs are independent of one another. IPsec SAs are unidirectional, and they are unique in each security protocol. An IKE SA is used by IKE only, and unlike the IPsec SA, it is bi-directional. IKE negotiates and establishes SAs on behalf of IPsec. A user can also establish IPsec SAs manually.

A set of SAs are needed for a protected data pipe, one per direction per protocol. For example, if you have a pipe that supports encapsulating security payload (ESP) between peers, one ESP SA is required for each direction. SAs are uniquely identified by destination (IPsec endpoint) address, security protocol (AH or ESP), and security parameter index (SPI).

SDM—Security Device Manager. Web interface manager that enables you to connect or disconnect a VPN tunnel and that provides a web interface for extended authentication (Xauth).

SNMP—Simple Network Management Protocol. Application-layer protocol that provides a message format for communication between SNMP managers and agents.

trap—Message sent by an SNMP agent to a network management system, console, or terminal to indicate the occurrence of a significant event, such as a specifically defined condition or a threshold that was reached.

VPN—virtual private network. Enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic from one network to another. A VPN uses tunnels to encrypt all information at the IP level.

Cisco Group Encrypted Transport VPN

First Published: November 17, 2006

Last Updated: August 20, 2008

Note

Effective with Cisco IOS 12.4(11)T, the Multicast Rekeying feature information (originally published as Cisco IOS Release 12.4(6)T [titled [Secure Multicast](#)]) has been integrated into this document.

Today's networked applications, such as voice and video, are accelerating the need for instantaneous, branch-interconnected, and Quality of Service- (QoS-) enabled WANs. The distributed nature of these applications results in increased demands for scale. At the same time, enterprise WAN technologies force businesses to trade off between QoS-enabled branch interconnectivity and transport security. As network security risks increase and regulatory compliance becomes essential, Cisco Group Encrypted Transport VPN (GET VPN) eliminates the need to compromise between network intelligence and data privacy.

GET VPN eliminates the need for tunnels. By removing the need for point-to-point tunnels, meshed networks are able to scale higher while maintaining network-intelligence features that are critical to voice and video quality, such as QoS, routing, and multicast. GET VPN offers a new standards-based IP security (IPsec) security model that is based on the concept of "trusted" group members. Trusted member routers use a common security methodology that is independent of any point-to-point IPsec tunnel relationship.

GET VPN is a set of features that are necessary to secure IP multicast group traffic or unicast traffic over a private WAN that originates on or flows through a Cisco IOS device. GET VPN combines the keying protocol Group Domain of Interpretation (GDOI) with IPsec encryption to provide users with an efficient method to secure IP multicast traffic or unicast traffic. GET VPN enables the router to apply encryption to nontunneled (that is, "native") IP multicast and unicast packets and eliminates the requirement to configure tunnels to protect multicast and unicast traffic.

Cisco Group Encrypted Transport VPN provides the following benefits:

- Provides data security and transport authentication, helping to meet security compliance and internal regulation by encrypting all WAN traffic
- Enables high-scale network meshes and eliminates complex peer-to-peer key management with group encryption keys
- For Multiprotocol Label Switching (MPLS) networks, maintains network intelligence (such as full-mesh connectivity, natural routing path, and QoS)

Americas Headquarters:

Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2008 Cisco Systems, Inc. All rights reserved.

- Grants easy membership control with a centralized key server
- Helps ensure low latency and jitter by enabling full-time, direct communications between sites, without requiring transport through a central hub
- Reduces traffic loads on customer premises equipment (CPE) and provider-edge (PE) encryption devices by using the core network for replication of multicast traffic, avoiding packet replication at each individual peer site

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Information About Cisco Group Encrypted Transport VPN](#)” section on [page 3](#).

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Command Reference, page 48](#)
- [Feature Information for Cisco Group Encrypted Transport VPN, page 49](#)
- [Glossary, page 50](#)
- [Appendix I: System Messages, page 51](#)

Prerequisites for Cisco Group Encrypted Transport VPN

- You must be using Cisco IOS Release 12.4(11)T.
- The following Cisco VPN acceleration modules are supported:
 - Cisco AIM-VPN/SSL Module for Cisco integrated services routers
 - Cisco VPN acceleration Module 2+ for Cisco 7200 series routers and 7301 routers
 - Cisco VSA (high-performance crypto engine) for Cisco 7200VXR/NPE-G2 routers
- You should be knowledgeable about IPsec and Internet Key Exchange (IKE).
- You should know how to configure multicast and unicast routing on a Cisco IOS global router.

- When configuring the IKE policy, the IKE lifetime should be set to the minimum of 5 minutes so that unnecessary resources are not wasted on the maintenance of the IKE security association (SA). After the registration IKE SA is established, the registration SAs no longer have to be maintained because the rekey SA has been created and will be used to accept future rekeys.

Restrictions for Cisco Group Encrypted Transport VPN

- The following platforms can be configured only as shown:
 - Cisco 870 series routers: as a group member only.
 - Cisco VSA does not support time-based anti-replay in 12.4(15)T5.
- If you are encrypting high packet rates for counter-based anti-replay, ensure that you do not make the lifetime too long or it can take several hours for the sequence number to wrap. For example, if the packet rate is 100 kilopackets per second, the lifetime should be configured as less than 11.93 hours so that the SA is used before the sequence number wraps.
- For unicast traffic and counter-based anti-replay, the sequence numbers may be out of sync between the group members if one of the group members goes down and comes back up (for example: There is traffic from Group Member 1 to Group Member 2, and the last sequence number is x. Group Member 1 goes down and comes back up. The sequence number of the Security Association (SA) at Group Member 1 now starts with 1, but Group Member 2 is expecting continuation from the previous sequence number (x+1). This situation causes subsequent traffic from Group Member 1 to be dropped until the sequence number on Group Member 1 reaches x or the next rekey.
- The Cisco VSA feature introduced in Cisco IOS Release 12.4(15)T5 does not support time-based anti-replay.
- If you are overriding the don't fragment bit (df-bit) setting in the IP header of encapsulated packets, you must configure the override commands in global configuration mode. GET VPN does not honor the interface configuration.

**Note**

This restriction is limited only to GET VPN. IPsec still honors both global configuration- and interface-specific override commands.

Because Path MTU Discovery (PMTUD) does not work for GET VPN, there is a possibility that encapsulated packets could be dropped when the df-bit is set and the MTU of an intermediate link is less than the size of the encapsulated packet. In such an event, the router that drops the packet sends a notification to the source IP address on the packet, indicating that the packet has been dropped because the router could not fragment the packet due to the df-bit setting. In GET VPN, this message goes past the encapsulating endpoint directly to the source of the data due to the header preservation feature of GET VPN. Thus, the encapsulating router never knows that it has to fragment the packet to a smaller size before setting the df-bit after encapsulation. It continues to set the df-bit on the packets and they continue to be dropped at the intermediate router. (This is known as blackholing the traffic.)

Information About Cisco Group Encrypted Transport VPN

To configure GET VPN, you should understand the following concepts:

- [Cisco Group Encrypted Transport VPN Overview, page 4](#)

- [Cisco Group Encrypted Transport VPN Architecture, page 4](#)
- [Cisco Group Encrypted Transport VPN Features, page 11](#)
- [End-User Considerations, page 19](#)
- [System Error Messages, page 20](#)

Cisco Group Encrypted Transport VPN Overview

Today's networked applications, such as voice and video, are accelerating the necessity for instantaneous, branch-interconnected, and QoS-enabled WANs. And the distributed nature of these applications results in increased demands for scale. At the same time, enterprise WAN technologies force businesses to trade off between QoS-enabled branch interconnectivity and transport security. As network security risks increase and regulatory compliance becomes essential, GET VPN, a next-generation WAN encryption technology, eliminates the need to compromise between network intelligence and data privacy.

With the introduction of GET, Cisco now delivers a new category—tunnel-less VPN—that eliminates the need for tunnels. By removing the need for point-to-point tunnels, meshed networks can scale higher while maintaining network-intelligence features critical to voice and video quality. GET offers a new standards-based security model that is based on the concept of “trusted” group members. Trusted member routers use a common security methodology that is independent of any point-to-point IPsec tunnel relationship. By using trusted groups instead of point-to-point tunnels, “any-any” networks can scale higher while maintaining network-intelligence features (such as QoS, routing, and multicast), which are critical to voice and video quality.

GET-based networks can be used in a variety of WAN environments, including IP and Multiprotocol Label Switching (MPLS). MPLS VPNs that use this encryption technology are highly scalable, manageable, and cost-effective, and they meet government-mandated encryption requirements. The flexible nature of GET allows security-conscious enterprises either to manage their own network security over a service provider WAN service or to offload encryption services to their providers. GET simplifies securing large Layer 2 or MPLS networks that require partial or full-mesh connectivity.

Cisco Group Encrypted Transport VPN Architecture

GET VPN is an enhanced solution that encompasses Multicast Rekeying, a Cisco solution for enabling encryption for “native” multicast packets, and unicast rekeying over a private WAN. Multicast Rekeying and GET VPN is based on GDOI as defined in Internet Engineering Task Force (IETF) RFC 3547. In addition, there are similarities to IPsec in the area of header preservation and SA lookup. Dynamic distribution of IPsec SAs has been added, and tunnel overlay properties of IPsec have been removed. [Figure 1](#) further illustrates the concepts of GET VPN and their relationships among one another.

Figure 1 GET VPN Concepts and Relationships

This section includes the following subsections:

- [Key Distribution: Group Domain of Interpretation, page 5](#)
- [Routing, page 9](#)
- [Secure Data Plane Multicast, page 9](#)
- [Secure Data Plane Unicast, page 10](#)

Key Distribution: Group Domain of Interpretation

GDOI

GDOI is defined as the Internet Security Association Key Management Protocol (ISAKMP) Domain of Interpretation (DOI) for group key management. In a group management model, the GDOI protocol operates between a group member and a group controller or key server (GCKS), which establishes security associations (SAs) among authorized group members. The ISAKMP defines two phases of negotiation. GDOI is protected by a Phase 1 ISAKMP security association. The Phase 2 exchange is defined in IETF RFC 3547. The topology shown in [Figure 2](#) and the corresponding explanation show how this protocol works.

Group Member

The group member registers with the key server to get the IPsec SA or SAs that are necessary to communicate with the group. The group member provides the group ID to the key server to get the respective policy and keys for this group. These keys are refreshed periodically, and before the current IPsec SAs expire, so that there is no loss of traffic.

Key Server

The responsibilities of the key server include maintaining the policy and creating and maintaining the keys for the group. When a group member registers, the key server downloads this policy and the keys to the group member. The key server also rekeys the group before existing keys expire.

The key server has two modes: servicing registration requests and sending rekeys. A group member can register at any time and receive the most current policy and keys. When a group member registers with the key server, the key server verifies the group ID that the group member is attempting to join. If this ID is a valid group ID, the key server sends the SA policy to the group member. After the group member acknowledges that it can handle the downloaded policy, the key server downloads the respective keys.

There are two types of keys that the key server can download: the key encryption key (KEK) and the traffic encryption key (TEK). The TEK becomes the IPsec SA with which the group members within the same group communicate. The KEK encrypts the rekey message.

The GDOI server sends out rekey messages either because of an impending IPsec SA expiration or because the policy has changed on the key server (using command-line interface [CLI]). The rekey messages may also be retransmitted periodically to account for possible packet loss. Packet loss can occur because rekey messages are sent without the use of any reliable transport. There is no efficient feedback mechanism by which receivers can indicate that they did not receive a rekey message, so retransmission seeks to bring all receivers up to date.

Figure 2 *Protocol Flows That Are Necessary for Group Members to Participate in a Group*

The above topology shows the protocol flows that are necessary for group members to participate in a group, which are as follows:

1. Group members register with the key server. The key server authenticates and authorizes the group members and downloads the IPsec policy and keys that are necessary for them to encrypt and decrypt IP multicast packets.
2. Group members exchange IP multicast packets that are encrypted using IPsec.
3. As needed, the key server “pushes” a rekey message to the group members. The rekey message contains new IPsec policy and keys to use when old IPsec SAs expire. Rekey messages are sent in advance of the SA expiration time to ensure that valid group keys are always available.

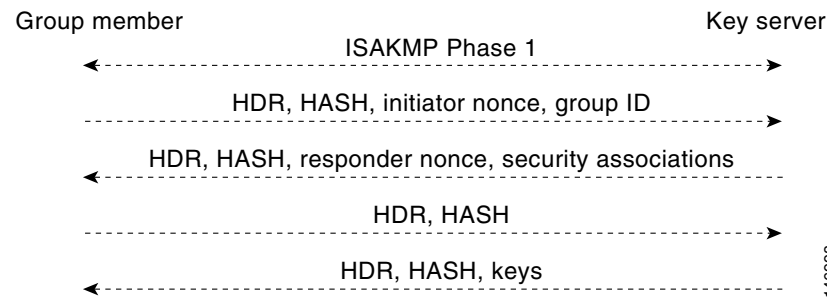

How Protocol Messages Work with the Cisco IOS

Multicast Rekeying uses the GDOI protocol (IETF RFC 3547) to distribute the policy and keys for the group. The GDOI protocol is between a key server and a group member. The key server creates and maintains the policy and keys, and it downloads the policy and keys to the authenticated group members. The group members are authenticated by the key server and communicate with other authenticated group members that are in the same group using the IPsec SAs that the group members have received from the key server.

The GDOI protocol is protected by an ISAKMP Phase 1 exchange. The GDOI key server and the GDOI group member must have the same ISAKMP policy. This Phase 1 ISAKMP policy should be strong enough to protect the GDOI protocol that follows. The GDOI protocol is a four-message exchange that follows the Phase 1 ISAKMP policy. The Phase 1 ISAKMP exchange can occur in main mode or aggressive mode.

Figure 3 shows the ISAKMP Phase 1 exchange.

Figure 3 ISAKMP Phase 1 Exchange and GDOI Registration

The above messages (the ISAKMP Phase 1 messages and the four GDOI protocol messages) are referred to as the GDOI registration, and the entire exchange that is shown above is a unicast exchange between the group member and the key server.

After the registration is successful, the key server sends a multicast rekey to all the group members that have registered within a group. During the registration, the group member receives the address of the multicast group and registers with the multicast group that is required to receive the multicast rekeys.

Note

The GDOI protocol uses User Datagram Protocol (UDP) port 848 (with Network Address Translation-Traversal (NAT-T), it floats to 4500).

IPsec

IPsec is a well-known RFC that defines an architecture to provide various security services for traffic at the IP layer. The components and how they fit together with each other and into the IP environment are described in IETF RFC 2401.

Communication Flow Between Key Servers and Group Members to Update IPsec SAs

Key servers and group members are the two components of the GET VPN architecture. The key server holds and supplies group authentication keys and IPsec SAs to the group members.

Group members provide encryption service to the interesting traffic (traffic that is worthy of being encrypted and secured by IPsec).

Communication among the key server and group members is encrypted and secured. GDOI supports the use of two keys: The TEK and the KEK. The TEK is downloaded by the key server to all the group members. The downloaded TEK is used by all the group members to communicate securely among each other. This key is essentially the group key that is shared by all the group members. The group policies and IPsec SAs are refreshed by the key server using periodic rekey messages to the group members. The KEK is also downloaded by the key server and is used by the group members to decrypt the incoming rekey messages from the key server.

The key server generates the group policy and IPsec SAs for the GDOI group. The information generated by the key server includes multiple TEK attributes, traffic encryption policy, lifetime, source and destination, a Security Parameter Index (SPI) ID that is associated with each TEK, and the rekey policy (one KEK).

Figure 4 illustrates the communication flow between group members and the key server. The key server, after receiving registration messages from a group member, generates the information that contains the group policy and new IPsec SAs. The new IPsec SA is then downloaded to the group member. The key server maintains a table that contains the IP address of each group member per group. When a group member registers, the key server adds its IP address in its associated group table, thus allowing the key server to monitor an active group member. A key server can support multiple groups. A group member can be part of multiple groups.

Figure 4 Communication Flow Between Group Members and the Key Server

IPsec and ISAKMP Timers

IPsec and ISAKMP SAs are maintained by the following timers:

- **TEK lifetime**—Determines the lifetime of the IPsec SA. Before the end of the TEK lifetime, the key server sends a rekey message, which includes a new TEK encryption key and transforms as well as the existing KEK encryption keys and transforms. The TEK lifetime is configured only on the key server, and the lifetime is "pushed down" to the group members using the GDOI protocol. The TEK lifetime value depends on the security policy of the network. If the **set security-association lifetime** command is not configured, the default value of 86400 seconds takes effect. To configure a TEK lifetime, see the [“Setting up an IPsec Lifetime Timer” section on page 28](#).
- **KEK lifetime**—Determines the lifetime of the GET VPN rekey SAs. Before the end of the lifetime, the key server sends a rekey message, which includes a new KEK encryption key and transforms as well as new TEK encryption keys and transforms. The KEK lifetime is configured only on the key server, and the lifetime is pushed down to group members dynamically using the GDOI protocol. The KEK lifetime value must be greater than the TEK lifetime value (it is recommended that the KEK

lifetime value be at least three times greater than the TEK lifetime value). If the **rekey lifetime** command is not configured, the default value of 86400 seconds takes effect. To configure a KEK lifetime, see the [“Setting up a Multicast Rekey” section on page 25](#).

- **ISAKMP SA lifetime**—Defines how long each ISAKMP SA should exist before it expires. The ISAKMP SA lifetime is configured on a group member and on the key server. If the group members and key servers do not have a cooperative key server, the ISAKMP SA is not used after the group member registration. In this case (no cooperative key server), the ISAKMP SA can have a short lifetime (a minimum of 60 seconds). If there is a cooperative key server, all key servers must have long lifetimes to keep the ISAKMP SA "up" for cooperative key server communications. If the **lifetime** command is not configured, the default value of 86400 seconds takes effect. To configure an ISAKMP SA lifetime, see the [“Setting up an ISAKMP Lifetime Timer” section on page 29](#).

Routing

GET VPN routing is explained in the following section.

Header Preservation

As shown in [Figure 5](#), IPsec-protected data packets carry the original source and destination in the outer IP header rather than replacing them with tunnel endpoint addresses. This technique is known as IPsec Tunnel Mode with Address Preservation.

Figure 5 **Header Preservation**

IP Header src=10.1.1.1 dst=10.2.1.3	ESP	IP Header src=10.1.1.1 dst=10.2.1.3	Data
---	-----	---	------

170836

Address preservation allows GET VPN to use the routing functionality present within the core network. Address preservation allows routing to deliver the packets to any customer-edge device (CE) in the network that advertises a route to the destination address. Any source and destination matching the policy for the group will be treated in a similar manner. In the situation where a link between IPsec peers is not available, address preservation also helps combat traffic "black-hole" situations.

Header preservation also maintains routing continuity throughout the enterprise address space and in the WAN. As a result, end host addresses of the campus are exposed in the WAN (for MPLS, this applies to the edge of the WAN). For this reason, GET VPN is applicable only when the WAN network acts as a "private" network (for example, in a MPLS network).

Secure Data Plane Multicast

The multicast sender uses the TEK that is obtained from the key server and encrypts the multicast data packet with header preservation before it switches out the packet. The replication of the multicast packet is carried out in the core on the basis of the (S,G) state that is retained in the multicast data packet. This process is illustrated in [Figure 6](#).

The diagram illustrates a secure communication architecture. A central cloud connects to four Group Members (routers). A Key Server (cylinder) is connected to the cloud and the Group Members via dashed lines. A key icon is shown near the Key Server. Each Group Member is also connected to a local database (cylinder) via a vertical line and a horizontal line.

The unicast sender uses the TEK that is obtained from the key server and encrypts the unicast data packet with header preservation before it switches out the packet to the destination. This process is illustrated in [Figure 7](#).

The diagram illustrates a secure communication architecture. A Unicast Sender (cylinder) is connected to a Group Member (router) via a solid line. The Group Member is connected to a central cloud. The cloud is connected to three other Group Members (routers) via solid lines. A Key Server (cylinder) is connected to the cloud and the three Group Members via dashed lines. A key icon is shown near the Key Server. Each Group Member is also connected to a local data store (cylinder) via a solid line.

Cisco Group Encrypted Transport VPN Features

This section includes the following subsections:

- [Rekeying, page 11](#)
- [Group Member Access Control List, page 14](#)
- [Time-Based Anti-Replay, page 15](#)
- [Cooperative Key Server, page 17](#)
- [Receive Only SA, page 18](#)
- [Enhanced Solutions Manageability, page 19](#)
- [Support with VRF-Lite Interfaces, page 19](#)

Rekeying

Rekey messages are used to refresh IPsec SAs. When the IPsec SAs or the rekey SAs are about to expire, one single rekey message for a particular group is generated on the key server. No new IKE sessions are created for the rekey message distribution. The rekey messages are distributed by the key server over an existing IKE SA.

Rekeying can use multicast or unicast messages. GET VPN supports both unicast and multicast rekeying.

Multicast Rekeying

Multicast rekeys are sent out using an efficient multicast rekey. Following a successful registration, the group member registers with a particular multicast group. All the group members that are registered to the group receives this multicast rekey. Multicast rekeys are sent out periodically on the basis of the configured lifetime on the key server. Multicast rekeys are also sent out if the IPsec or rekey policy is changed on the key server. Triggered by the configuration change, the rekey sends out the new updated policy to all the group members with an efficient multicast rekey.

The key server pushes the rekey time back as follows:

1. If the TEK timeout is 300 seconds:

$\text{tek_rekey_offset} = 90$ (because $300 < 900$)

If retransmissions are configured, the rekey timer is moved back more.

For three retransmissions every 10 seconds: $3 * 10$

So the rekey will actually happen at $(300 - 90 - 30) = 180$ seconds

2. If the TEK timeout is 3600 seconds:

$\text{tek_rekey_offset} = 3600 * 0\% = 360$ seconds

If retransmissions are configured, the rekey timer is moved back more.

For three retransmissions every 10 seconds: $3 * 10$

So the rekey will actually happen at $(3600 - 360 - 30) = 3210$ seconds

Unicast Rekeying and SAs

In a large unicast group, to alleviate latency issues, the key server generates rekey messages for only a small number of group members at a time. The key server is ensured that all group members receive the same rekey messages for the new SA before the expiration of the old SA. Also, in a unicast group, after receiving the rekey message from the key server, a group member sends an encrypted acknowledge (ACK) message to the key server using the keys that were received as part of the rekey message. When the key server receives this ACK message, it notes this receipt in its associated group table, which accomplishes the following:

- The key server keeps a current list of active group members.
- The key server sends rekey messages only to active members.

In addition, in a unicast group, the key server removes the group member from its active list and stops sending the rekey messages to that particular group member if the key server does not receive an ACK message for three consecutive rekeys. If no ACK message is received for three consecutive rekeys, the group member has to fully reregister with the key server after its current SA expires if the group member is still interested in receiving the rekey messages. The ejection of a nonresponsive group member is accomplished only when the key server is operating in the unicast rekey mode. The key server does not eject group members in the multicast rekey mode because group members cannot send ACK messages in that mode.

As in multicast rekeying, if retransmission is configured, each rekey will be retransmitted the configured number of times.

Rekey transport modes and authentication can be configured under a GDOI group.

If unicast rekey transport mode is not defined, multicast is applied by default.

If the TEK rekey is not received, the group member reregisters with the key server 60 seconds before the current IPsec SA expires. The key server has to send out the rekey before the group member reregistration occurs. If no retransmission is configured, the key server sends the rekey `tek_rekey_offset` before the SA expires. The `tek_rekey_offset` is calculated based on the configured rekey lifetime. If the TEK rekey lifetime is less than 900 seconds, the `tek_rekey_offset` is set to 90 seconds. If the TEK rekey lifetime is configured as more than 900 seconds, the `tek_rekey_offset` = (configured TEK rekey lifetime)/10. If retransmission is configured, the rekey occurs earlier than the `tek_rekey_offset` to let the last retransmission be sent 90 seconds before the SA expires.

The key server uses the formula in the example below to calculate when to start sending the rekey to all unicast group members. The unicast rekey process on the key server sends rekeys to unicast group members in groups of 50 within a loop. The time spent within this loop is estimated to be 5 seconds.

A key server rekeys group members in groups of 50, which equals two loops. For example, for 100 group members:

Number of rekey loops = (100 group members)/50 = 2 loops

Time it takes to rekey one loop (estimation) = 5 seconds

Time to rekey 100 group members in two loops of 50: 2 * 5 seconds = 10 seconds

So the key server pushes the rekey time back as follows:

If the TEK timeout is 300: 300 - 10 = 290

But the start has to be earlier than the TEK expiry (as in the multicast case).

Because 300 < 900, `tek_rekey_offset` = 90

So 90 seconds is subtracted from the actual TEK time: 290 - `tek_rekey_offset` = 200 seconds

If retransmissions are configured, the rekey timer is moved back more.

For three retransmissions every 10 seconds: $200 - (3 * 10) = 170$

If the TEK timeout is 3600 seconds: $3600 - 10 = 3590$

But the start has to be earlier than the TEK expiry (as in the multicast case).

Because $3600 > 900$, $\text{tek_rekey_offset} = 3600 * 10\% = 360$

So 360 seconds is subtracted from the actual TEK time: $3590 - \text{tek_rekey_offset} = 3230$ seconds.

If retransmissions are configured, the rekey timer is moved back more.

For three retransmissions every 10 seconds: $3230 - (3 * 10) = 3200$ seconds

**Note**

The `tek_rekey_offset` formula applies to unicast and multicast rekeying.

IPsec SA Usage on the Group Members

When a rekey is received and processed on a group member, the new IPsec SA (the Security Parameter Index [SPI]) is installed. There is a period of time when the old and the new IPsec SAs are used. After a certain specified interval, the old IPsec SA is deleted. This overlap ensures that all group members receive the current rekey and insert the new IPsec SAs. This behavior is independent of the transport method (multicast or unicast rekey transport) for the rekeys from the key server.

On the group member, approximately 30 seconds before the old SA expires, the group member starts to use the new SA in the outbound direction to encrypt the packet. Approximately 60 seconds before the old SA expires, if no new SA is received on the group member side via a rekey from the key server, the group member reregisters.

Figure 8 IPsec SA Usage on a Group Member

In [Figure 8](#), time T2 is when the old SA expires. T1 is 30 seconds before T2, which is when the group member (GM) starts to use the new SA in the outbound direction. T0 is another 30 seconds before T2. If no new SA is received at T0, the group member has to reregister. T is another 30 seconds from T0. The key server (KS) should send a rekey at T.

Configuration Changes Can Trigger a Rekey By a Key Server

Configuration changes on a key server can trigger a rekey by the key server. Please refer to the following sample configuration as you read through the events that will or will not cause a rekey.

```
crypto ipsec transform-set gdoi-p esp-3des esp-sha-hmac
!
crypto ipsec profile gdoi-p
```

```

set security-association lifetime seconds 900
set transform-set gdoi-p
!
crypto gdoi group diffint
identity number 3333
server local
rekey algorithm aes 128
rekey address ipv4 121
rekey lifetime seconds 3600
no rekey retransmit
rekey authentication mypubkey rsa mykeys
sa ipsec 1
profile gdoi-p
match address ipv4 120
replay counter window-size 3

```

Changes That Will Trigger a Rekey on a Key Server

- Any change in the TEK configuration (“sa ipsec 1” in the above example).
 - If the ACL (“match address ipv4 120” in the above example) is changed. Any addition, deletion, or change in the ACL causes a rekey.
 - If TEK replay is enabled or disabled on the key server, rekey is sent. Reconfiguring the replay window size does not trigger a rekey.
 - Removal or addition of the IPsec profile in the TEK (“profile gdoi-p” in the above example).
 - Changing from multicast to unicast transport.
 - Changing from unicast to multicast transport.

Changes That Will Not Trigger a Rekey on a Key Server

The following configuration changes on the key server will not trigger a rekey from the key server:

- Replay counter window size is changed under the TEK (“sa ipsec 1” in the above example).
- Changing the IPsec transform in the transform set.
- Configuring or removing rekey retransmit.
- Removing or configuring the rekey ACL.
- Changing the TEK lifetime (“set security-association lifetime seconds 300” in the above example) or changing the KEK lifetime (“rekey lifetime seconds 500” in the above example).
- Adding, deleting, or changing the rekey algorithm (“rekey algorithm aes 128” in the above example).

Group Member Access Control List

For GET VPN, the traffic that has to be protected is defined statically on the key server using the access control list (ACL). The group member gets information about what has to be protected from the key server. This structure allows the key server to choose and change the policy dynamically as needed. In Secure Multicast, the key server ACL is defined inclusively. The ACL includes only the exact traffic that should be encrypted, with an implicit deny causing all other traffic to be allowed in the clear (that is, if there is no permit, all other traffic is allowed).

GET VPN employs a different philosophy: the definition of which packets should be encrypted is delivered independently. GET VPN supports only statically defined traffic selectors. Policy can be defined by using both deny and permit ACLs on the key server. Only the deny ACL is allowed to be

manually configured on a group member. The policies that are downloaded from the key server and configured on the group member are merged. Any ACL that is configured on the group member has predominance over what is downloaded from the key server.

After the group member gets the ACL from the key server, the group member creates a temporary ACL and inserts it into the database. This ACL will be deleted if the group member is removed from the GDOI group for any reason. The packets that are going out of the interface are dropped by the group member if a packet matches the ACL but no IPsec SA exists for that packet.

The key server can send a set of traffic selectors, which may not exactly match the group member ACL on the group member. If such differences occur, the differences have to be merged and resolved. Because the group member is more aware of its topology than the key server, the downloaded ACLs are appended at the end of the group member ACL. The group member ACL (except the implicit deny) is inserted into the database first, followed by the downloaded key server ACL. The database is prioritized, and the database search stops whenever a matched entry is found.

For information about configuring a group member ACL, see [“Setting up Group Member ACLs” section on page 27.](#)

Time-Based Anti-Replay

Anti-replay is an important feature in a data encryption protocol such as IPsec (RFC 2401). Anti-replay prevents a third party from eavesdropping on an IPsec conversation, stealing packets, and injecting those packets into a session at a later time. The time-based anti-replay mechanism helps ensure that invalid packets are discarded by detecting the replayed packets that have already arrived at an earlier time.

GET VPN uses the Synchronous Anti-Replay (SAR) mechanism to provide anti-replay protection for multisender traffic. SAR is independent of real-world Network Time Protocol (NTP) clock or sequential-counter mechanisms (which guarantee packets are received and processed in order). A SAR clock advances regularly. The time tracked by this clock is called pseudotime. The pseudotime is maintained on the key server and is sent periodically to the group members within a rekey message as a timestamp field called pseudoTimeStamp. GET VPN uses a Cisco proprietary protocol called Metadata to encapsulate the pseudoTimeStamp. Group members have to be resynchronized to the pseudotime of the key server periodically. The pseudotime of the key server starts ticking from when the first group member registers. Initially, the key server sends the current pseudotime value of the key server and window size to group members during the registration process. New attributes, such as time-based replay-enabled information, window size, and the pseudotime of the keyserver, is sent under the SA payload (TEK).

The group members use the pseudotime to prevent replay as follows: the pseudoTimeStamp contains the pseudotime value at which a sender created a packet. A receiver compares the pseudotime value of senders with its own pseudotime value to determine whether a packet is a replayed packet. The receiver uses a time-based anti-replay "window" to accept packets that contain a timestamp value within that window. The window size is configured on the key server and is sent to all group members.

Note

You should not configure time-based anti-replay if you are using a Cisco VSA as a group member.

Figure 9 illustrates an anti-replay window in which the value PTr denotes the local pseudotime of the receiver, and W is the window size.

Figure 9 Anti-Replay Window

Keeping Clocks Synchronized

It is possible for the clocks of the group members to slip and lose synchronization with the key server. To keep the clocks synchronized, a rekey message (multicast or unicast, as appropriate), including the current pseudotime value of the key server, is sent periodically (either in a rekey message or at a minimum of every 30 minutes to the group member. If a packet fails this anti-replay check, the pseudotime of both the sender and receiver is printed, an error message is generated, and a count is increased.

To view anti-replay statistics, use the **show crypto gdoi group group-name gm replay** command on both the sender and receiver devices. If the configuration is changed by the administrator to affect the replay method of the size configuration, the key server initiates a rekey message.

Interval Duration

A tick is the interval duration of the SAR clock. Packets sent in this duration have the same pseudoTimeStamp. The tick is also downloaded to group members, along with the pseudotime from the key server. For example, as shown in Figure 10, packets sent between T0 and T1 would have the same pseudoTimeStamp T0. SAR provides loose anti-replay protection. The replayed packets are accepted if they are replayed during the window. The default window size is 100 seconds. It is recommended that you keep the window size small to minimize packet replay.

Anti-Replay Configurations

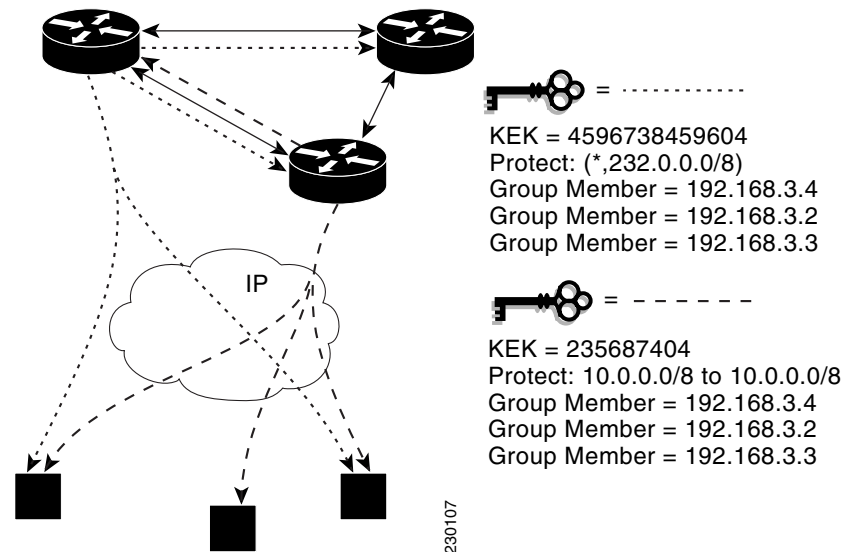

The Anti-Replay feature can be enabled under IPsec SA on a key server by using the following commands:

- **replay time window-size**—Enables the replay time option, which supports the nonsequential, or time-based, mode. The window size is in seconds. Use this mode only if you have more than two group members in a group.
- **replay counter window-size**—Enables sequential mode. This mode is useful if there are only two group members in a group.
- **no replay counter window-size**—Disables anti-replay.

Cooperative Key Server

Figure 11 illustrates cooperative key server key distribution. The text below the illustration explains the Cooperative Key Server feature.

Figure 11 Cooperative Key Server Key Distribution

Cooperative key servers provide redundancy to GET VPN. Multiple key servers are supported by GET VPN to ensure redundancy, high availability, and fast recovery if the primary key server fails. Cooperating GDOI key servers jointly manage the GDOI registrations for the group. Each key server is an active key server, handling GDOI registration requests from group members. Because the key servers are cooperating, each key server distributes the same state to the group members that register with it. Load balancing is achieved because each of the GDOI key servers can service a portion of the GDOI registrations.

The primary key server is responsible for creating and distributing group policy. The primary key server periodically sends out (or broadcasts) group information updates to all other key servers to keep those servers in synchronization. If the secondary key servers somehow miss the updates, they contact the primary key server to directly request information updates. The secondary key servers mark the primary key server as unreachable (that is, “dead”) if the updates are not received for an extended period of time.

When a new policy is created on a primary key server, regardless of which key server a group member may be registered with, it is the responsibility of the primary key server to distribute rekey messages to GDOI group members.

Note

If you are supporting a large number of group members in your cooperative key server setup (that is, more than 300), you should increase the buffer size by using the **buffers huge size** command.

Announcement Messages

Announcement messages are secured by IKE Phase 1 and are sent as IKE notify messages. Authentication and confidentiality that are provided by IKE is used to secure the messaging between the key servers. Anti-replay protection is provided by the sequence numbers in the announcement messages. Announcement messages are periodically sent from primary to secondary key servers.

Announcement messages include the following components that help maintain the current state.

Sender Priority of a Key Server

This value describes the priority of the sender, which is configurable using the CLI. The key server with the highest priority becomes the primary key server. If the priority values are the same, the key server with the highest IP address becomes the primary key server.

Maintaining the Role of the Sender

During the synchronization period, if the key servers are at geographically dispersed locations, they may suffer a network-partitioning event. If a network-partitioning event occurs, it is possible that more than one key server can become the primary key server for a period of time. When the network is operating normally again and all the key servers find each other, they need to be told the current role of the sender so the key servers can attain their proper roles.

Request for a Return Packet Flag

All messages are defined as one-way messages. When needed, a key server can request the current state from a peer to find out its role and/or request the current state of the group.

Group Policies

The group policies are the policies that are maintained for a group, such as group member information and IPsec SAs and keys.

Anti-replay functionalities and incorporated Cooperative announcement messages are supported. The primary key server updates the pseudotime value, sending it to all secondary key servers in the group. The secondary key servers should synchronize their SAR clocks to this updated value.

Receive Only SA

For multicast traffic using the GDOI protocol, bidirectional SAs are installed. The Receive Only feature enables an incremental deployment so that only a few sites can be verified before bringing up an entire network. To test the sites, one of the group members should send encrypted traffic to all the other group members and have them decrypt the traffic and forward the traffic “in the clear.” Receive Only SA mode allows encryption in only the inbound direction for a period of time. (See the steps below for the Receive Only SA process.) If you configure the **sa receive-only** command on the key server, Steps 2 and 3 happen automatically.

1. Mark IPsec SAs as "receive-only" on the GDOI key server.

This action allows the group members to install SAs in the inbound direction only. Receive-only SAs can be configured under a crypto group. (See [“Setting up the Group ID, Server Type, and SA Type” section on page 21.](#))

2. Mark GDOI TEK payloads as "receive only."

If the **sa receive-only** command is configured, all TEKs under this group are going to be marked “receive only” by the key server when they are sent to the group member.

3. Install one-way IPsec flows.

Every time a GDOI group member receives an IPsec SA from the key server that is marked as "receive only," the group member installs this IPsec SA only in the inbound direction rather than in both incoming and outgoing directions.

4. Test individual group members using the following local-conversion commands:

- **crypto gdoi gm ipsec direction inbound optional**
- **crypto gdoi gm ipsec direction both**

Local Conversion

First, individually convert each of the group members to passive mode (this change tells the outbound check that there is a valid SA) and then to bi-directional mode.

5. Globally convert from “receive only” to “receive and send.”

The following method can be used when the testing phase is over and “receive only” SAs have to be converted to bi-directional SAs.

Global Conversion

Remove the **sa receive-only** command under the group. Removing the **sa receive-only** command creates new IPsec SAs for this group and causes a rekey. On receipt, group members reinstall the SA in both directions and begin to use it in passive mode. Because the SA cannot remain in passive mode forever, the group members change those SAs to receive or send mode if there is no rekey in 5 minutes. The conversion from passive mode to bidirectional encryption mode is automatic and does not require the administrator to do anything.

Enhanced Solutions Manageability

Several **show** and **debug** commands are supported to help verify functionality. See the [“Verifying and Troubleshooting Cisco Group Encrypted Transport VPN” section on page 37](#) for the details.

Support with VRF-Lite Interfaces

VRF-Lite application supports segmentation of traffic in the control and forwarding planes by keeping the routing tables separate for each user group (or VPN) and forwards the traffic on the associated or dedicated interfaces of each user group.

There are some deployment scenarios in which remote sites that are connecting to an MPLS VPN network might be extending segmentation from a campus to the WAN. In such an extended segmentation case, a CE-PE interface on a CE (group member or key server) device “bounds” to its associated Virtual Routing Forwarding (VRF) instance. This VRF interface connects to an MPLS PE device where it is directly mapped to its associated Border Gateway Protocol (BGP) VRF process, in which case the crypto map is applied to a VRF interface. No other configuration changes are necessary.

End-User Considerations

Multicast rekeying can be used with all modes of multicast. The **rekey retransmit** command should be used whenever the Protocol Independent Multicast-sparse mode (PIM-SM) is configured because the PIM-SM shortest path tree (SPT) can be torn down if it does not receive continuing traffic. When traffic resumes, PIM-SM must reestablish the SPT. Retransmitting rekey packets increases the chance that group members receive the rekeys when PIM-SM is setting up the SPT.

System Error Messages

For a list of system error messages, see [Appendix I: System Messages, page 51](#).

How to Configure Cisco Group Encrypted Transport VPN

This section includes the following required and optional tasks:

- [Setting up a Key Server, page 20](#) (required)
- [Setting up a Group Member, page 34](#) (required)
- [Verifying and Troubleshooting Cisco Group Encrypted Transport VPN, page 37](#)

Setting up a Key Server

To set up a key server, perform the steps in the following five subtasks.

- [Setting up RSA Keys to Sign Rekey Messages, page 20](#) (optional)
- [Setting up the Group ID, Server Type, and SA Type, page 21](#) (required)
- [Setting up the Rekey, page 22](#) (optional)
- [Setting up Group Member ACLs, page 27](#) (optional)
- [Setting up an IPsec Lifetime Timer, page 28](#) (optional)
- [Setting up an ISAKMP Lifetime Timer, page 29](#) (optional)
- [Setting up the IPsec SA, page 30](#) (required)
- [Configuring Time-Based Anti-Replay for a GDOI Group, page 32](#) (optional)

Prerequisites

Before creating the GDOI group, you must first configure IKE and the IPsec transform set, and you must create an IPsec profile. For information about how to configure IKE and the IPsec transform set and to create an IPsec profile, see the “Related Documents” subsection of the [“Additional References” section on page 47](#).

Setting up RSA Keys to Sign Rekey Messages

To set up RSA keys that will be used to sign rekey messages, perform the following steps.

Note

- Skip this subtask if rekey is not in use.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto key generate rsa general-keys label *name-of-key***

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto key generate rsa general-keys label <i>name-of-key</i> Example: Router (config)# crypto key generate rsa general-keys label mykeys	Generates RSA keys that will be used to sign rekey messages. Note Skip this command if rekey is not in use.

What to Do Next

Set up the group ID, server type, and SA type. (See the section [“Setting up the Group ID, Server Type, and SA Type”](#) section on page 21.)

Setting up the Group ID, Server Type, and SA Type

To set up the group ID, server type, and SA type, perform the following steps.

**Note**

For a large number of sites, it is better to take precautions and add functionality incrementally, especially when one is migrating from any other encryption solutions like Dual Multipoint VPN (DMVPN). For example, instead of setting up all the CPE devices to encrypt the traffic bidirectionally, it is possible to set up one-way encryption so that only one or fewer members of a group are allowed to send encrypted traffic. Others are allowed to receive only encrypted traffic. After the one-way encryption is validated for one or a few members, bidirectional encryption can be turned on for all the members. This “inbound only” traffic can be controlled using the **sa receive only** command under a crypto group.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto gdoi group** *group-name*
4. **identity number** *number*
or
identity address ipv4 *address*
5. **server local**
6. **sa receive-only**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto gdoi group <i>group-name</i> Example: Router (config)# crypto gdoi group gdoigroupname	Identifies a GDOI group and enters GDOI group configuration mode.
Step 4	identity number <i>number</i> or identity address ipv4 <i>address</i> Example: Router (config-gdoi-group)# identity number 3333 or Router (config-gdoi-group)# identity address ipv4 10.2.2.2	Identifies a GDOI group number or address.
Step 5	server local Example: Router (config-gdoi-group)# server local	Designates a device as a GDOI key server and enters GDOI local server configuration mode.
Step 6	sa receive-only Example: Router (config-local-server)# sa receive-only	Specifies that an IPsec SA is to be installed by a group member as “inbound only.”

What to Do Next

Remove the receive-only configuration on the key server so that the group members are now operating in bidirectional receive and send mode.

Setting up the Rekey

Rekey is used in the control plane by the key server to periodically refresh the policy and IPsec SAs of the group. On the group-member side, instead of fully reregistering when timers expire for any other reasons, refreshing the registration with a rekey is more efficient. The initial registration is always a unicast registration.

The key server can be configured to send rekeys in unicast or multicast mode. The rekey transport mode is determined by whether the key server can use IP multicast to distribute the rekeys. If multicast capability is not present within the network of the customer, the key server will have to be configured to send rekeys using unicast messages.

Additional options for rekey use the **rekey authentication**, **rekey retransmit**, and **rekey address ipv4** commands. If unicast transport mode is configured, the **source address** command will have to be included to specify the source address of this unicast rekey message.

Multicast is the default transport type for rekey messages. The following bulleted items explain when to use rekey transport type multicast or unicast:

- If all members in a group are multicast capable, do not configure the **rekey transport unicast** command.

Note The **no rekey transport unicast** command is not needed if the rekey transport type “unicast” was not configured previously under this group because multicast rekeys are on by default.

- If all members in a group are unicast, use the **rekey transport unicast** command.
- If you have mixed members in a group (that is, the majority are multicast, but a few are unicast), do not configure the **rekey transport unicast** command. The rekeys will be distributed using multicast to the majority of group members. The remainder of the group members that do not receive the multicast messages (unicast group members) will have to reregister to the key server when their policies expire. Mixed mode (that is, unicast and multicast rekey mode) is currently not supported.

Note

- If the **no rekey transport unicast** command is used, members in the GDOI group that are unable to receive the multicast rekey messages need to reregister with the key server to get the latest group policies.

The reregistering forces the default transport type to multicast. If no transport type was configured previously, the multicast transport type will apply by default.

Prerequisites

Before configuring the **rekey authentication** command, you must have configured the router to have a RSA key generated using the **crypto key generate rsa** command and **general-keys** and **label** keywords (for example, “crypto key generate rsa general-key label my keys”).

Setting up a Unicast Rekey

To set up a unicast rekey, perform the following steps.

Note

In the configuration task table below, the address “ipv4 10.0.5.2” specifies the interface on the key server by which the unicast or multicast rekey messages are sent. This address is required for unicast rekeys, but it is optional for multicast rekeys. For multicast rekeys, the source address of the key server can be retrieved from the rekey ACL.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto gdoi group** *group-name*
4. **identity number** *number*
or
identity address ipv4 *address*
5. **server local**
6. **rekey transport unicast**
7. **rekey lifetime seconds** *number-of-seconds*
8. **rekey retransmit** *number-of-seconds* **number** *number-of-retransmissions*
9. **rekey authentication** {**mypubkey** | **pubkey**} **rsa** *key-name*
10. **address ipv4** *ipv4-address*

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto gdoi group <i>group-name</i> Example: Router (config)# crypto gdoi group gdoigroupname	Identifies a GDOI group and enters GDOI group configuration mode.
Step 4	identity number <i>number</i> or identity address ipv4 <i>address</i> Example: Router (config-gdoi-group)# identity number 3333 or Router (config-gdoi-group)# identity address ipv4 10.2.2.2	Identifies a GDOI group number or address.
Step 5	server local Example: Router (config-gdoi-group)# server local	Designates a device as a GDOI key server and enters GDOI local server configuration mode.

	Command or Action	Purpose
Step 6	rekey transport unicast Example: Router (config-local-server)# rekey transport unicast	Configures unicast delivery of rekey messages to group members.
Step 7	rekey lifetime seconds <i>number-of-seconds</i> Example: Router (gdoi-local-server)# rekey lifetime seconds 300	(Optional) Limits the number of seconds that any one encryption key should be used. If this command is not configured, the default value of 86400 seconds takes effect.
Step 8	rekey retransmit <i>number-of-seconds</i> number <i>number-of-retransmissions</i> Example: Router (gdoi-local-server)# rekey retransmit 10 number 3	(Optional) Specifies the number of times the rekey message is retransmitted. If this command is not configured, there will be no retransmits.
Step 9	rekey authentication { <i>mypubkey</i> <i>pubkey</i> } rsa <i>key-name</i> Example: Router (gdoi-local-server)# rekey authentication mypubkey rsa mykeys	(Optional) Specifies the keys to be used for a rekey to GDOI group members. This command is optional if rekeys are not required. If rekeys are required, this command is required.
Step 10	address ipv4 <i>ipv4-address</i> Example: Router (gdoi-local-server)# address ipv4 10.0.5.2	(Optional) Specifies the source information of the unicast rekey message. If rekeys are not required, this command is optional. If rekeys are required, this command is required.

Setting up a Multicast Rekey

To set up a multicast rekey, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto gdoi group** *group-name*
4. **identity number** *number*
or
identity address ipv4 *address*
5. **server local**
6. **rekey address ipv4** {*access-list-name* | *access-list-number*}
7. **rekey lifetime seconds** *number-of-seconds*
8. **rekey retransmit** *number-of-seconds* **number** *number-of-retransmissions*
9. **rekey authentication** {*mypubkey* | *pubkey*} **rsa** *key-name*

10. **exit**
11. **exit**
12. **access-list** *access-list-number* {**deny** | **permit**} **udp** **host** *source* [*operator* *port*]] **host** *source* [*operator* *port*]]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto gdoi group <i>group-name</i> Example: Router (config)# crypto gdoi group gdoigroupname	Identifies a GDOI group and enters GDOI group configuration mode.
Step 4	identity number <i>number</i> or identity address ipv4 <i>address</i> Example: Router (config-gdoi-group)# identity number 3333 or Router (config-gdoi-group)# identity address ipv4 10.2.2.2	Identifies a GDOI group number or address.
Step 5	server local Example: Router (config-gdoi-group)# server local	Designates a device as a GDOI key server and enters GDOI local server configuration mode.
Step 6	rekey address ipv4 { <i>access-list-name</i> <i>access-list-number</i> } Example: Router (gdoi-local-server)# rekey address ipv4 121	Defines to which multicast subaddress range group members will register.

	Command or Action	Purpose
Step 7	rekey lifetime seconds <i>number-of-seconds</i> Example: Router (gdoi-local-server)# rekey lifetime seconds 300	(Optional) Limits the number of seconds that any one encryption key should be used. If this command is not configured, the default value of 86400 seconds takes effect.
Step 8	rekey retransmit <i>number-of-seconds</i> number <i>number-of-retransmissions</i> Example: Router (gdoi-local-server)# rekey retransmit 10 number 3	(Optional) Specifies the number of times the rekey message is retransmitted. If this command is not configured, there will be no retransmits.
Step 9	rekey authentication { mypubkey pubkey } rsa <i>key-name</i> Example: Router (gdoi-local-server)# rekey authentication mypubkey rsa mykeys	(Optional) Specifies the keys to be used for a rekey to GDOI group members. This command is optional if rekeys are not required. If rekeys are required, this command is required.
Step 10	exit Example: Router (gdoi-local-server)# exit	Exits GDOI server local configuration mode.
Step 11	exit Example: Router (config-gdoi-group)# exit	Exits GDOI group configuration mode.
Step 12	access-list <i>access-list-number</i> { deny permit } udp host <i>source</i> [<i>operator</i> [<i>port</i>]] host <i>source</i> [<i>operator</i> [<i>port</i>]] Example: Router (config)# access-list 121 permit udp host 10.0.5.2 eq 848 host 239.0.1.2 eq 848	Defines an extended IP access list.

Setting up Group Member ACLs

To set up group member ACLs, perform the following steps.

Note

Ensure that your ACL starts with a deny statement if all traffic does not need to be encrypted.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* **deny ip** *host source* **host** *source*
4. **access-list** *access-list-number* **permit ip** *source*

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	access-list access-list-number deny ip host source host source Example: Router (config)# access-list 101 deny ip host 10.0.0.1 host 10.0.0.2	Defines a denied IP access list.
Step 4	access-list access-list-number permit ip source Example: Router (config)# Router (config)# access-list 103 permit ip 10.15.0.0. 0.255.255.255 10.20.0.0. 0.255.255.255	Defines an allowed IP access list.

What to Do Next

The above access list is the same one that should be used to set up the SA. See the [“Setting up the IPsec SA” section on page 30](#).

Setting up an IPsec Lifetime Timer

To set up an IPsec lifetime timer for a profile, perform the following steps. If this configuration task is not performed, the default is the maximum IPsec SA lifetime of 3600 seconds.

SUMMARY STEPS

- enable**
- configure terminal**
- crypto ipsec profile** *name*
- set security-association lifetime seconds** *seconds*

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec profile <i>name</i> Example: Router (config)# crypto ipsec profile profile1	Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec routers and enters crypto ipsec profile configuration mode.
Step 4	set security-association lifetime seconds <i>seconds</i> Example: Router (ipsec-profile)# set security-association lifetime seconds 2700	Overrides (for a particular crypto map entry) the global lifetime value, which is used when negotiating IPsec SAs.

What to Do Next

Configure the IPsec SA. See the [“Setting up the IPsec SA”](#) section on page 30.

Setting up an ISAKMP Lifetime Timer

To set up an ISAKMP lifetime timer, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp policy *priority***
4. **lifetime *seconds***

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto isakmp policy <i>priority</i> Example: Router (config)# crypto ipsec policy 1	Defines an IKE policy.
Step 4	lifetime <i>seconds</i> Example: Router (config-isakmp-policy)# lifetime 86400	Specifies the lifetime of an IKE SA.

Setting up the IPsec SA

To set up the IPsec SA, perform the following steps.

Note

If time-based anti-replay is configured on the key server but the group member is not capable of supporting it, the GDOI-3-GM_NO_CRYPT0_ENGINE system message is logged to the group member.

SUMMARY STEPS

- enable**
- configure terminal**
- crypto gdoi group** *group-name*
- identity number** *number*
or
identity address ipv4 *address*
- server local**
- sa ipsec** *sequence-number*
- profile** *ipsec-profile-name*
- match address ipv4** {*access-list-number* | *access-list-name*}
- exit**
- exit**
- exit**

12. **crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*] [*transform4*]
13. **crypto ipsec profile** *ipsec-profile-name*
14. **set transform-set** *transform-set-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto gdoi group <i>group-name</i> Example: Router (config)# crypto gdoi group gdoigroupname	Identifies a GDOI group and enters GDOI group configuration mode.
Step 4	identity number <i>number</i> or identity address ipv4 <i>address</i> Example: Router (config-gdoi-group)# identity number 3333 or Router (config-gdoi-group)# identity address ipv4 10.2.2.2	Identifies a GDOI group number or address.
Step 5	server local Example: Router (config-gdoi-group)# server local	Designates a device as a GDOI key server and enters GDOI local server configuration mode.
Step 6	sa ipsec <i>sequence-number</i> Example: Router (gdoi-local-server)# sa ipsec 1	Specifies the IPsec SA policy information to be used for a GDOI group and enters GDOI SA IPsec configuration mode.
Step 7	profile <i>ipsec-profile-name</i> Example: Router (gdoi-sa-ipsec)# profile gdoi-p	Defines the IPsec SA policy for a GDOI group.

	Command or Action	Purpose
Step 8	match address ipv4 { <i>access-list-number</i> <i>access-list-name</i> } Example: Router (gdoi-sa-ipsec)# match address ipv4 102	Specifies an IP extended access list for a GDOI registration.
Step 9	exit Example: Router (gdoi-sa-ipsec)# exit	Exits GDOI SA IPsec configuration mode.
Step 10	exit Example: Router (gdoi-local-server)# exit	Exits GDOI local server configuration mode.
Step 11	exit Example: Router (config-gdoi-group)# exit	Exits GDOI group configuration mode.
Step 12	crypto ipsec transform-set <i>transform-set-name</i> <i>transform1</i> [<i>transform2</i>] [<i>transform3</i>] [<i>transform4</i>] Example: Router (config)# crypto ipsec transform-set gdoi-trans esp-3des esp-sha-hmac	Defines a transform set—an acceptable combination of security protocols and algorithms.
Step 13	crypto ipsec profile <i>ipsec-profile-name</i> Example: Router (config)# crypto ipsec profile profile1	Defines an ISAKMP profile and enters crypto ipsec profile configuration mode.
Step 14	set transform-set <i>transform-set-name</i> Example: Router (ipsec-profile)# set transform-set transformset1	Specifies which transform sets can be used with the crypto map entry.

What to Do Next

Replay should be configured. If not configured, the default is counter mode.

Configuring Time-Based Anti-Replay for a GDOI Group

To configure time-based anti-replay for a GDOI group, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **crypto gdoi group** *group-name*
4. **identity number** *policy-name*
5. **server local**
6. **address** *ip-address*
7. **sa ipsec** *sequence-number*
8. **profile** *ipsec-profile-name*
9. **match address** {**ipv4** *access-list-number* | *access-list-name*}
10. **replay counter window-size** *seconds*
11. **replay time window-size** *seconds*

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto gdoi group <i>group-name</i> Example: Router (config)# crypto gdoi group gdoigroup1	Identifies a GDOI group and enters GDOI group configuration mode.
Step 4	identity number <i>policy-name</i> Example: Router (config-gdoi-group)# identity number 1234	Identifies a GDOI group number.
Step 5	server local Example: Router (config-gdoi-group)# server local	Designates a device as a GDOI key server and enters GDOI local server configuration mode.
Step 6	address <i>ip-address</i> Example: Router (config-server-local)# address ipv4 10.10.10.10	Sets the source address, which is used as the source for packets originated by the local key server.
Step 7	sa ipsec <i>sequence-number</i> Example: Router (config-server-local)#sa ipsec 1	Specifies the IPsec SA and enters GDOI SA IPsec configuration mode.

Step 8	profile <i>ipsec-profile-name</i> Example: Router (gdoi-sa-ipsec)# profile test1	Defines the IPsec SA policy for a GDOI group.
Step 9	match address { ipv4 <i>access-list-number</i> <i>access-list-name</i> } Example: Router (gdoi-sa-ipsec)# match address ipv4 101	Specifies an IP extended access list for a GDOI registration.
Step 10	replay counter window-size <i>seconds</i> Example: Router (gdoi-sa-ipsec)# replay counter window-size 512	Turns on counter-based anti-replay protection for traffic defined inside an access list using GDOI if there are only two group members in a group. Note This command and the replay time window-size command are mutually exclusive. You can configure either one without configuring the other one.
Step 11	replay time window-size <i>seconds</i> Example: Router (gdoi-sa-ipsec)# replay time window-size	Sets the window size for anti-replay protection using GDOI if there are more than two group members in a group. Note This command and the replay counter window-size command are mutually exclusive. You can configure either one without configuring the other one.

Setting up a Group Member

To set up a group member, perform the following subtasks:

- [Setting Up the Group Name, ID, and Key Server IP Address, page 34](#) (required)
- [Setting up the Crypto Map, page 35](#) (required)
- [Applying the Crypto Map to an Interface to Which the Traffic Has to Be Encrypted, page 36](#) (required)

Setting Up the Group Name, ID, and Key Server IP Address

To set up the group name, ID, and key server IP address, perform the following steps.

Note

You can set up to eight key server addresses.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto gdoi group** *group-name*

4. **identity number** *number*
or
identity address ipv4 *address*
5. **server address ipv4** *address*

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto gdoi group <i>group-name</i> Example: Router (config)# crypto gdoi group gdoigroupone	Identifies a GDOI group and enters GDOI group configuration mode.
Step 4	identity number <i>number</i> or identity address ipv4 <i>address</i> Example: Router (config-gdoi-group)# identity number 3333 or Router (config-gdoi-group)# identity address ipv4 10.2.2.2	Identifies a GDOI group number or address.
Step 5	server address ipv4 <i>address</i> Example: Router (config-gdoi-group)# server address ipv4 10.0.5.2	Specifies the address of the server a GDOI group is trying to reach. <ul style="list-style-type: none"> To disable the address, use the no form of the command.

What to Do Next

Set up the crypto map. See the section [“Setting up the Crypto Map”](#) section on page 35.

Setting up the Crypto Map

To set up the crypto map, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name seq-num gdoi*
4. **set group** *group-name*

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto map <i>map-name seq-num gdoi</i> Example: Router (config)# crypto map mymap 10 gdoi	Enters crypto map configuration mode and creates or modifies a crypto map entry.
Step 4	set group <i>group-name</i> Example: Router (config-crypto-map)# set group group1	Associates the GDOI group to the crypto map.

What to Do Next

Apply the crypto map to an interface to which the traffic has to be encrypted. See the [“Applying the Crypto Map to an Interface to Which the Traffic Has to Be Encrypted”](#) section on page 36.

Applying the Crypto Map to an Interface to Which the Traffic Has to Be Encrypted

To apply the crypto map to an interface to which the traffic has to be encrypted, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **crypto map** *map-name redundancy standby-group-name stateful*

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface <i>type slot/port</i> Example: Router (config)# interface gig0/0	Configures an interface type and enters interface configuration mode.
Step 4	crypto map <i>map-name</i> redundancy <i>standby-group-name</i> stateful Example: Router (config-if)# crypto map map1 redundancy groupred stateful	Applies the crypto map to the interface.

Verifying and Troubleshooting Cisco Group Encrypted Transport VPN

The following tasks can be used to verify and troubleshoot your GET VPN configurations. These tasks are optional and are used to gather information during troubleshooting.

- [Verifying Active Group Members on a Key Server, page 37](#)
- [Verifying Rekey-Related Statistics, page 38](#)
- [Verifying IPsec SAs That Were Created by GDOI on a Key Server, page 38](#)
- [Verifying Cooperative Key Server States and Statistics, page 39](#)
- [Verifying Anti-Replay Pseudotime-Related Statistics, page 40](#)

Verifying Active Group Members on a Key Server

To verify active group members on a key server, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **show crypto gdoi ks members**

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show crypto gdoi ks members Example: Router# show crypto gdoi ks members	Displays information about key server members.

Verifying Rekey-Related Statistics

To verify rekey-related statistics, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **show crypto gdoi ks rekey**

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show crypto gdoi ks rekey Example: Router# show crypto gdoi ks rekey	On the key server, this command displays information about the rekeys that are being sent from the key server.

Verifying IPsec SAs That Were Created by GDOI on a Key Server

To verify IPsec SAs that were created by GDOI on a key server, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **show crypto gdoi group *group-name* ipsec sa**
3. **show crypto ipsec sa**

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show crypto gdoi group <i>group-name</i> ipsec sa Example: Router# show crypto gdoi group diffint ipsec sa	Displays information about IPsec SAs that were created by GDOI on a key server. <ul style="list-style-type: none"> In this case, information will be displayed only for group “diffint.” For information about IPsec SAs for all groups, omit the group keyword and <i>group-name</i> argument.
Step 3	show crypto ipsec sa Example: Router# show crypto ipsec sa	Displays the settings used by current SAs.

Verifying Cooperative Key Server States and Statistics

To verify cooperative key server states and statistics, perform the following steps, using one or all of the **debug** and **show** commands shown.

SUMMARY STEPS

1. **enable**
2. **debug crypto gdoi ks coop**
3. **show crypto gdoi group *group-name* ks coop [version]**

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	debug crypto gdoi ks coop Example: Router# debug crypto gdoi ks coop	Displays information about a cooperative key server.
Step 3	show crypto gdoi group <i>group-name</i> ks coop [version] Example: Router# show crypto gdoi group diffint ks coop engineer	Displays key server information for the group “diffint.”

Verifying Anti-Replay Pseudotime-Related Statistics

To verify anti-replay pseudotime-related statistics, perform the following steps using one or all of the **clear**, **debug**, and **show** commands.

SUMMARY STEPS

1. **enable**
2. **clear crypto gdoi group *group-name* replay**
3. **debug crypto gdoi replay**
4. **show crypto gdoi group *group-name***
5. **show crypto gdoi group *group-name* ks replay**

DETAILED STEPS

Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	clear crypto gdoi group <i>group-name</i> replay Example: Router# clear crypto gdoi group diffint replay	Clears the replay counters.
Step 3	debug crypto gdoi replay Example: Router# debug crypto gdoi replay	Displays information about the pseudotime stamp that is contained in a packet.
Step 4	show crypto gdoi group <i>group-name</i> Example: Router# show crypto gdoi group diffint	Displays information about the current pseudotime of the group member. It also displays the different counts that are related to the anti-replay for this group.
Step 5	show crypto gdoi group <i>group-name</i> ks replay Example: Router# show crypto gdoi group diffint ks replay	Displays information about the current pseudotime of the key server.

Configuration Examples for Cisco Group Encrypted Transport VPN

This section includes the following case study and configuration examples:

- [Key Server and Group Member Case Study, page 41](#)
- [Key Server 1: Example, page 41](#)

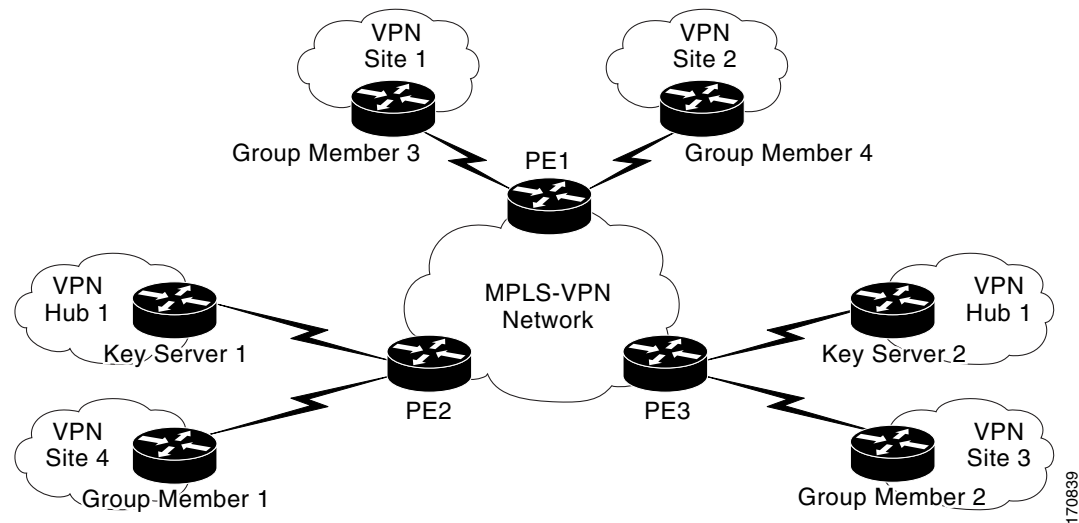

- [Key Server 2: Example, page 42](#)
- [Group Member 1: Example, page 44](#)
- [Group Member 2: Example, page 44](#)
- [Group Member 3: Example, page 45](#)
- [Group Member 4: Example, page 46](#)

Key Server and Group Member Case Study

The following case study includes encrypting traffic CE-CE in an MPLS VPN environment.

The MPLS VPN core interconnects VPN sites as is shown in [Figure 12](#). VPN site CPEs, Group Member 1 through Group Member 4, are grouped into a single GDOI group that correlates with a VPN with which these sites are a part. This scenario is an intranet VPN scenario. All the key servers and group members are part of the same VPN. Key Server 1 and Key Server 2 are the cooperative key servers that support VPN members Group Member 1 through Group Member 4. Key Server 1 is the primary key server and Key Server 2 is the secondary key server.

Figure 12 Key Server and Group Member Scenario

The following configuration examples are based on the case study in [Figure 12](#).

Key Server 1: Example

Key server 1 is the primary key server.

```
version 12.4
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
service internal
!
hostname KS1
!
```

```

logging buffered 100000 debugging
no logging console
!
no aaa new-model
!
resource policy
!
clock timezone EST 0
ip subnet-zero
no ip domain lookup
ip domain name cisco.com
!
crypto isakmp policy 1
  encr 3des
  authentication pre-share

Feature Information for Cisco Group Encrypted Transport VPN

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 1 Feature Information for Cisco Group Encrypted Transport VPN

Feature Name	Releases	Feature Information
Secure Multicast	12.4(6)T	The secure multicast part of this feature was first introduced in Cisco IOS Release 12.4(6)T in <i>Secure Multicast</i> . However, all pertinent information from that document has been integrated and updated in this current document (<i>Cisco Group Encrypted Transport VPN</i>).
Cisco Group Encrypted Transport VPN	12.4(11)T	Cisco Group Encrypted Transport VPN is an optimal encryption solution for large-scale IP or MPLS sites that require any-to-any connectivity with minimum convergence time, low processing, provisioning, managing, and troubleshooting overhead. The following commands were introduced or modified: address ipv4 (GDOI), clear crypto gdoi, crypto gdoi gm, debug crypto gdoi, local priority, peer address ipv4, redundancy, rekey address ipv4, rekey transport unicast, replay counter window-size, replay time window-size, sa receive-only, show crypto gdoi.
VSA Support for GET VPN	12.4(15)T5	Cisco VSA (high-performance crypto engine) support was added for GDOI and GET VPN. Note This platform does not support time-based anti-replay.

Glossary

DOI—Domain of Interpretation. For Internet Security Association Key Management Protocol (ISAKMP), a value in the security association (SA) payload that describes in which context the key management message is being sent (IPsec or Group Domain of Interpretation).

GDOI—Group Domain of Interpretation. For ISAKMP, a means of distributing and managing keys for groups of mutually trusted systems.

group member—Device (Cisco IOS router) that registers with a group that is controlled by the key server for purposes of communicating with other group members.

group security association—SA that is shared by all group members in a group.

IPsec—IP security. Data encryption protocol for IP packets that are defined in a set of RFCs (see IEEE RFC 2401).

ISAKMP—Internet Security Association and Key Management Protocol. Protocol that provides a framework for cryptographic key management protocols.

KEK—key encryption key. Key used to protect the rekey between the key server and group members.

key server—Device (Cisco IOS router) that distributes keys and policies to group members.

MTU—maximum transmission unit. Size (in bytes) of the largest packet or frame that a given layer of a communications protocol can pass onward.

SA—security association. SA that is shared by all group members in a group.

TEK—traffic encryption key. Key that is used to protect the rekey between group members.

**Note**

See [Internetworking Terms and Acronyms](#) for terms not included in this glossary.

Appendix I: System Messages

Table 2 lists GET VPN system messages and explanations.

Table 2 GET VPN System Messages

Error Messages	Explanation
COOP_CONFIG_MISMATCH	The configuration between the primary key server and secondary key server are mismatched.
COOP_KS_ADD	A key server has been added to the list of cooperative key servers in a group.
COOP_KS_ELECTION	The local key server has entered the election process in a group.
COOP_KS_REACH	The reachability between the configured cooperative key servers is restored.
COOP_KS_REMOVE	A key server has been removed from the list of cooperative key servers in a group.
COOP_KS_TRANS_TO_PRI	The local key server transitioned to a primary role from being a secondary server in a group.
COOP_KS_UNAUTH	An authorized remote server tried to contact the local key server in a group. Could be considered a hostile event.
COOP_KS_UNREACH	The reachability between the configured cooperative key servers is lost. Could be considered a hostile event.
COOP_KS_VER_MISMATCH	Key servers are running different versions of the IOS code.
COOP_PACKET_DROPPED	Hard limit set on the driver buffer size prevents the sending of packets this size or bigger.
GDOI-3-GM_NO_CRYPTTO_ENGINE	No crypto engine is found due to lack of resource or unsupported feature requested.
GDOI_ACL_NUM	The ACL has too many entries. GDOI will honor only the first 100 ACL entries specified.
GDOI_REKEY_FAILURE	During GDOI rekey the payload parsing failed on this group member from the key server.
GM_ACL_MERGE	The ACL differences between a group member and key server are resolved and a merge took place.
GM_ACL_PERMIT	The group member can support only an ACL for “deny.” Any traffic matching the “permit” entry will be dropped.
GM_CLEAR_REGISTER	The clear crypto gdoi command has been executed by the local group member.
GM_CM_ATTACH	A crypto map has been attached for the local group member.
GM_CM_DETACH	A crypto map has been detached for the local group member.
GM_CONV_SA_DUPLEX	IPsec SAs have been converted to bidirectional mode in a group on a group member.

Table 2 GET VPN System Messages (continued)

Error Messages	Explanation
GM_CONV_SA_DUPLEX_LOCAL	IPsec SAs have been converted to bidirectional mode in a group on a group member by a CLI command.
GM_ENABLE_GDOI_CM	Group member has enabled ACL on a GDOI crypto map in a group with a key server.
GM_HASH_FAIL	During GDOI registration protocol, a message sent by the key server has bad or no hash.
GM_INCOMPLETE_CFG	Registration cannot be completed because the GDOI group configuration may be missing the group ID, server ID, or both.
GM_NO_IPSEC_FLOWS	Hardware limitation for IPsec flow limit reached. Cannot create any more IPsec SAs.
GM_RE_REGISTER	IPsec SA created for one group may have been expired or cleared. Need to reregister to the key server.
GM_RECV_DELETE	A message sent by the key server to delete the group member has been received.
GM_RECV_REKEY	Rekey received.
GM_REGS_COMPL	Registration complete.
GM_REJECTING_SA_PAYLOAD	During GDOI registration protocol, a proposal sent by the key server was refused by the local group member.
GM_REKEY_NOT_REC'D	Group member has not received a rekey message from a key server in a group. Currently unimplemented.
GM_REKEY_TRANS_2_MULTI	Group member has transitioned from using a unicast rekey mechanism to using a multicast mechanism.
GM_REKEY_TRANS_2_UNI	Group member has transitioned from using a multicast rekey mechanism to using a unicast mechanism.
GM_SA_INGRESS	Received-only ACL has been received by a group member from a key server in a group.
GM_UNREGISTER	A group member has left the group.
KS_BAD_ID	Configuration mismatch between a local key server and a group member during GDOI registration protocol.
KS_BLACKHOLE_ACK	Key server has reached a condition of blackholing messages from a group member. Could be considered a hostile event.
KS_CLEAR_REGISTER	The clear crypto gdoi command has been executed by the local key server.
KS_CONV_SAS_DUPLEX	IPsec SAs have been converted to bidirectional mode in a group.
KS_CONV_SAS_INGRESS	IPsec SAs have been converted to receive-only mode in a group.
KS_FIRST_GM, GDOI, LOG_INFO	Local key server has received the first group member joining the group.

Table 2 **GET VPN System Messages (continued)**

Error Messages	Explanation
KS_GM_REJECTS_SA_PAYLOAD	During GDOI registration protocol, a proposal sent by the key server was refused by the group member.
KS_GM_REVOKED	During rekey protocol, an unauthorized member tried to join a group. Could be considered a hostile event.
KS_GROUP_ADD	A configuration command has been executed to add a key server in a group.
KS_GROUP_DELETE	A configuration command has been executed to remove a key server from a group.
KS_HASH_FAIL	During GDOI registration protocol, a message sent by the group member has bad or no hash.
KS_LAST_GM	Last group member has left the group on the local key server.
KS_NACK_GM_EJECT	Key server has reached a condition of not receiving an ACK message from group member and has been ejected.
KS_NO_RSA_KEYS	RSA keys were not created or they are missing.
KS_REGS_COMPL	Key server has successfully completed a registration in a group.
KS_REKEY_TRANS_2_MULTI	Group has transitioned from using a unicast rekey mechanism to a multicast mechanism.
KS_REKEY_TRANS_2_UNI	Group has transitioned from using a multicast rekey mechanism to using a unicast mechanism.
KS_SEND_MCAST_REKEY	Sending multicast rekey.
KS_SEND_UNICAST_REKEY	Sending unicast rekey.
KS_UNAUTHORIZED	During GDOI registration protocol, an unauthorized member tried to join a group. Could be considered a hostile event.
KS_UNSol_ACK	Key server has received an unsolicited ACK message from a past group member or is under a DOS attack. Could be considered a hostile event.
PSEUDO_TIME_LARGE	A group member has received a pseudotime with a value that is largely different from its own pseudotime.
REPLAY_FAILED	A group member or key server has failed an anti-replay check.
UNAUTHORIZED_IDENTITY	The registration request was dropped because the requesting device was not authorized to join the group.
UNAUTHORIZED_IPADDR	The registration request was dropped because the requesting device was not authorized to join the group.
UNEXPECTED_SIGKEY	Unexpected signature key found: freeing the signature key.
UNREGISTERED_INTERFACE	Receiving registration from unregistered interface. Stop processing it.
UNSUPPORTED_TEK_PROTO	Unexpected TEK protocol.

Crypto Access Check on Clear-Text Packets

The Crypto Access Check on Clear-Text Packets feature removes the checking of clear-text packets that go through the IP Security (IPSec) tunnel just prior to encryption or just after decryption. The clear-text packets were checked against the outside physical interface access control lists (ACLs). This checking was often referred to as a double ACL check. This feature enables easier configuration of ACLs and eliminates the security risks that are associated with a double check when using dynamic crypto maps.

Feature History for Crypto Access Check on Clear-Text Packets

Release	Modification
12.3(8)T	This feature was introduced.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. Prerequisites for Crypto Access Check on Clear-Text Packets

-
-

Restrictions for Crypto Access Check on Clear-Text Packets

- This feature does not apply to IPSec configurations on the Virtual Private Network (VPN) service module (card) on Cisco Catalyst 6500 series switches and Cisco 7600 series router platforms.

This feature supports only extended ACLs.

Information About Crypto Access Check on Clear-Text Packets

Crypto Access Check on Clear-Text Packets Overview

-
-
-
-

Configuration Changes That Are Required for This Feature

Prior to Upgrading

After Upgrading

-

used because when the IPSec tunnel is not “up,” the ACEs will allow the clear-text packets into the network. If dynamic crypto maps are not being used, the ACEs can still be removed to simplify the outside interface ACLs.

Check all outside interfaces for outbound ACLs that contain ACEs that permit outbound clear-text packets that would be encrypted. These ACEs need to be removed if dynamic crypto maps are being used because when the IPSec tunnel is not up, these ACEs will allow the clear-text packets out of the network. If dynamic crypto maps are not being used, these ACEs can still be removed to simplify the outside interface ACLs.

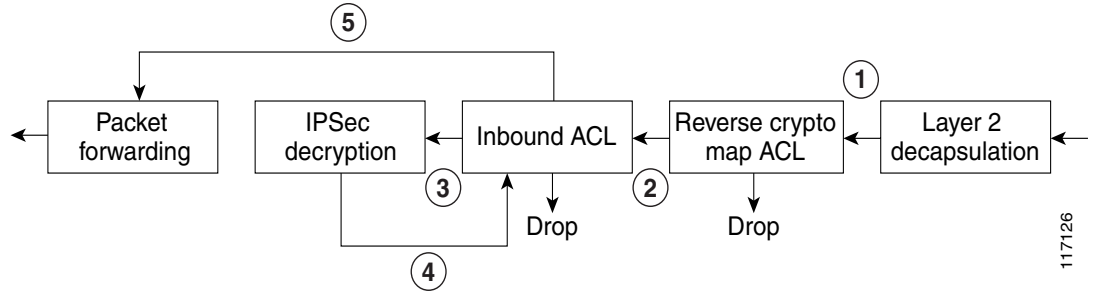

Add an outbound crypto map access ACL under the crypto map to deny to-be-encrypted, outbound clear-text packets that should be dropped. Be sure that you also permit all other packets in this ACL.

Add an inbound crypto map access ACL under the crypto map to deny just-decrypted, inbound clear-text packets that should be dropped. Be sure to also permit all other packets in this ACL.

The last two configuration changes are needed only in the rare cases in which the crypto map ACL (that selects packets to be encrypted) is more general than the packet flows that you want to encrypt. Adding outbound or inbound crypto map ACLs is usually done to keep the crypto map ACL small and simple, which saves CPU utilization and memory. The **set ip access-group**

How ACL Access Checking Worked Prior to This Feature

Figure 1 *Inbound Encrypted Packet Flow Prior to This Feature*

- 1.
- 2.
- 3.
4. Just-decrypted IP packet is again checked against the interface inbound ACL. If denied, it is dropped.
- 5.

Figure 2 *Outbound Encrypted Packet Flow Prior to This Feature*

Departing IP packet is checked against the crypto map ACL. If permitted, the packet is marked for encryption.

All IP packets are checked against the outbound interface ACL. If denied, they are dropped.

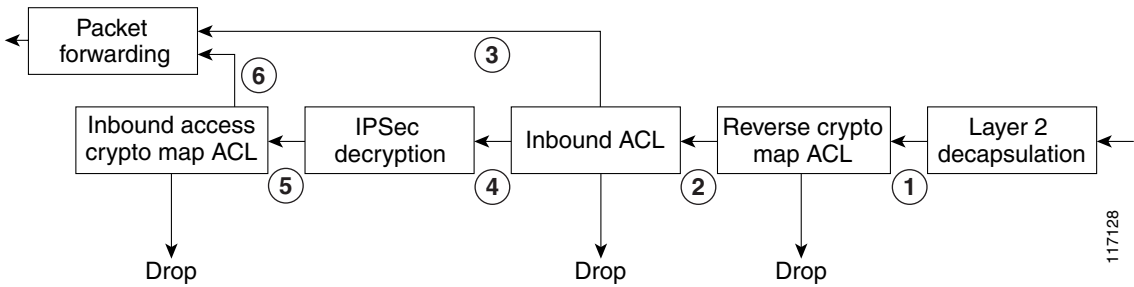

IP packets not marked for encryption are Layer 2 encapsulated.

IP packets marked for encryption are encrypted.

Encrypted IP packets are Layer 2 encapsulated.

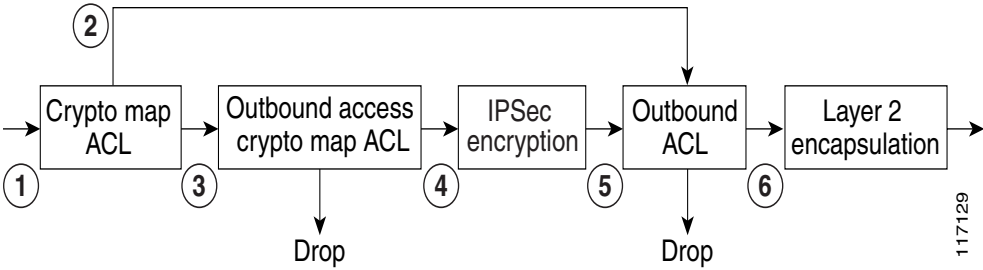

ACL Checking Behavior After Upgrading to This Feature

Figure 4 *New Outbound Encrypted Packet Flow*

Backward Compatibility

How to Configure Crypto Map Access ACLs

-
-

Adding or Removing ACLs

SUMMARY STEPS

1. **enable**
2. **configure terminal**
crypto map *map-name seq-number*
{access-list-number | access-list-name} { | }

DETAILED STEPS

Command or Action	Purpose
enable Example: Router> enable	Enables privileged EXEC mode. Enter your password if prompted.
configure terminal Router# configure terminal	
crypto map <i>map-name seq-number</i> Router(config)# crypto map vpn1 10	access ACL; also enters crypto map configuration mode.
set ip access-group { <i>access-list-number</i> <i>access-list-name</i> } { } Router(config-crypto-map)# set ip access-group 151 in	

Verifying the Configured ACLs

show ip access-list

show crypto map

enable

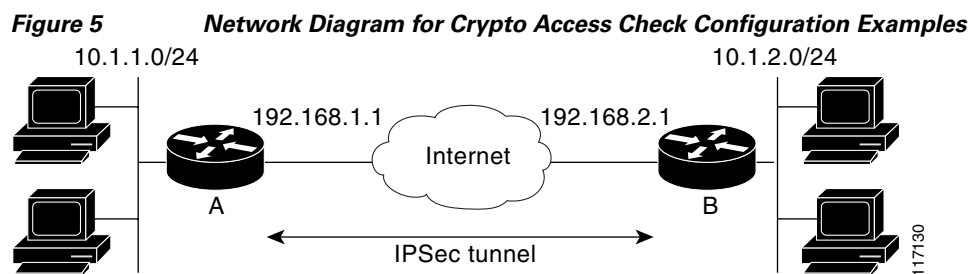

```
show ip access-list [ access-list-number | access-list-name | dynamic ]
                    [ interface | map-name ]
```

<pre>show ip access-list [dynamic]</pre>	
<pre>Router# show ip access-list Internetfilter</pre>	
<pre>show crypto map interface interface map-name</pre>	

Configuration Examples for Crypto Access Check on Clear-Text Packets

- [New IPSec ACL Configuration Without Crypto Access ACLs: Example, page 9](#)
[New IPSec ACL Configuration with Crypto Access ACLs: Example, page 10](#)

DF Bit Override Functionality with IPSec Tunnels

Feature History

Release	Modification
Cisco IOS	For information about feature support in Cisco IOS software, use Cisco Feature Navigator.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

This feature module describes the DF Bit Override Functionality with IPSec Tunnels feature and contains the following sections:

- [Feature Overview, page 1](#)
- [Supported Platforms, page 2](#)
- [Supported Standards, MIBs, and RFCs, page 3](#)
- [Prerequisites, page 3](#)
- [Configuration Tasks, page 4](#)
- [Configuration Examples, page 4](#)
- [Command Reference, page 5](#)

Feature Overview

The DF Bit Override Functionality with IPSec Tunnels feature allows customers to specify whether their router can clear, set, or copy the Don't Fragment (DF) bit from the encapsulated header. A DF bit is a bit within the IP header that determines whether a router is allowed to fragment a packet.

Some customer configurations have hosts that perform the following functions:

- Set the DF bit in packets they send
- Use firewalls that block Internet Control Message Protocol (ICMP) errors from outside the firewall, preventing hosts from learning about the maximum transmission unit (MTU) size outside the firewall
- Use IP Security (IPSec) to encapsulate packets, reducing the available MTU size

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2007 Cisco Systems, Inc. All rights reserved.

Customers whose configurations have hosts that prevent them from learning about their available MTU size can configure their router to clear the DF bit and fragment the packet.

**Note**

In compliance with RFC 2401, this feature can be configured globally or per interface. If both levels are configured, the interface configuration will override the global configuration.

Benefits

The DF Bit Override Functionality with IPSec Tunnels feature allows customers to configure the setting of the DF bit when encapsulating tunnel mode IPSec traffic on a global or per-interface level. Thus, if the DF bit is set to clear, routers can fragment packets regardless of the original DF bit setting.

Restrictions

Performance Impact

Because each packet is reassembled at the process level, a significant performance impact occurs at a high data rate. Two major caveats are as follows:

- The reassemble queue can fill up and force fragments to be dropped.
- The traffic is slower because of the process switching.

DF Bit Setting Requirement

If several interfaces share the same crypto map using the local address feature, these interfaces must share the same DF bit setting.

Feature Availability

This feature is available only for IPSec tunnel mode. (IPSec transport mode is not affected because it does not provide an encapsulating IP header.)

Related Documents

The following documents provide information related to the DF Bit Override Functionality with IPSec Tunnels feature:

- “Configuring IPSec Network Security” chapter, *Cisco IOS Security Configuration Guide*, Release 12.2
- “IPSec Network Security Commands” chapter, *Cisco IOS Security Command Reference*, Release 12.2

Supported Platforms

This feature is supported on the following platforms:

- Cisco 800
- Cisco 827

- Cisco 1600
- Cisco 1600R
- Cisco 1700
- Cisco 2600
- Cisco 3620
- Cisco 3640
- Cisco 3660
- Cisco 4000
- Cisco 4500
- Cisco 5200
- Cisco 5300
- Cisco 5400
- Cisco 6400
- Cisco 7100
- Cisco 7200
- Cisco 7500
- Cisco uBR7200
- Cisco uBR900
- Cisco uBR905
- Cisco uBR910

This feature runs on all platforms that support IPSec.

Supported Standards, MIBs, and RFCs

Standards

No new or modified standards are supported by this feature.

MIBs

No new or modified MIBS are supported by this feature.

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at <http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>.

RFCs

- RFC 2401, *Security Architecture for the Internet Protocol*

Prerequisites

IPSec must be enabled on your router.

Configuration Tasks

See the following section for configuration tasks for the DF-Bit Override Functionality with IPsec Tunnels feature:

- [Configuring the DF Bit for the Encapsulating Header in Tunnel Mode](#)

Configuring the DF Bit for the Encapsulating Header in Tunnel Mode

To set the DF bit for the encapsulating header in tunnel mode, use the following command in global configuration mode:

Command	Purpose
Router(config)# crypto ipsec df-bit [clear set copy]	<p>Sets the DF bit for the encapsulating header in tunnel mode for all interfaces.</p> <p>To set the DF bit for a specified interface, use the crypto ipsec df-bit command in interface configuration mode.</p> <p>Note DF bit interface configuration settings override all DF bit global configuration settings.</p>

Verifying DF Bit Setting

To verify the current DF Bit settings on your router, use the **show running-config** command in EXEC mode.

Configuration Examples

This section provides the following configuration example:

- [DF Bit Setting Configuration Example](#)

DF Bit Setting Configuration Example

In following example, the router is configured to globally clear the setting for the DF bit and copy the DF bit on the interface named Ethernet0. Thus, all interfaces *except* Ethernet0 will allow the router to send packets larger than the available MTU size; Ethernet0 will allow the router to fragment the packet.

Distinguished Name Based Crypto Maps

Feature History

Release	Modification
12.2(4)T	This feature was introduced.
Cisco IOS XE Release 2.1	This feature was introduced on Cisco ASR 1000 Series Routers.

This feature module describes the Distinguished Name Based Crypto Map feature in Cisco IOS Release 12.2(4)T. It includes the following sections:

- [Feature Overview, page 1](#)
- [Supported Platforms, page 2](#)
- [Supported Standards, MIBs, and RFCs, page 3](#)
- [Prerequisites, page 3](#)
- [Configuration Tasks, page 3](#)
- [Configuration Examples, page 5](#)
- [Command Reference, page 6](#)

Feature Overview

The Distinguished Name Based Crypto Maps feature allows you to configure the router to restrict access to selected encrypted interfaces for those peers with specific certificates, especially certificates with particular Distinguished Names (DNs).

Previously, if the router accepted a certificate or a shared secret from the encrypting peer, Cisco IOS did not have a method of preventing the peer from communicating with any encrypted interface other than the restrictions on the IP address of the encrypting peer. This feature allows you to configure which crypto maps are usable to a peer based on the DN that a peer used to authenticate itself, thereby, enabling you to control which encrypted interfaces a peer with a specified DN can access.

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2007 Cisco Systems, Inc. All rights reserved.

Benefits

The Distinguished Name Based Crypto Maps feature allows you to set restrictions in the router configuration that prevent peers with specific certificates—especially certificates with particular DNs—from having access to selected encrypted interfaces.

Restrictions

System Requirements

To configure this feature, your router must support IP Security.

Performance Impact

If you restrict access to a large number of DNs, it is recommended that you specify a few number of crypto maps referring to large identity sections instead of specifying a large number of crypto maps referring to small identity sections.

Related Documents

The following documents provide information related to the Distinguished Name Based Crypto Maps feature:

- *Cisco IOS Security Command Reference*, Release 12.2
- *Cisco IOS Security Configuration Guide*, Release 12.2

Supported Platforms

This feature is supported on the following platforms:

- Cisco 1700 series
- Cisco 2600 series
- Cisco 3620
- Cisco 3640
- Cisco 3660
- Cisco 7100 series
- Cisco 7200 series
- Cisco uBR905 Cable Access Router
- Cisco uBR925 Cable Access Router

Determining Platform Support Through Feature Navigator

Cisco IOS software is packaged in feature sets that support specific platforms. To get updated information regarding platform support for this feature, access Feature Navigator. Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Feature Navigator is a web-based tool that enables you to quickly determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image.

To access Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions at <http://www.cisco.com/register>.

Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Feature Navigator home page at the following URL: <http://www.cisco.com/go/fn>

Supported Standards, MIBs, and RFCs

Standards

None

MIBs

None

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

RFCs

None

Prerequisites

Before configuring a DN based crypto map, you must perform the following tasks:

- Create an Internet Key Exchange (IKE) policy at each peer.
For more information on creating IKE policies, refer to the chapter “Configuring Internet Key Exchange Security Protocol” of the *Cisco IOS Security Configuration Guide*.
- Create crypto map entries for IPsec.
For more information on creating crypto map entries, refer to the chapter “Configuring IPsec Network Security” of the *Cisco IOS Security Configuration Guide*.

Configuration Tasks

See the following sections for configuration tasks for the Distinguished Name Based Crypto Maps feature. Each task in the list is identified as either required or optional.

- [Configuring DN Based Crypto Maps \(authenticated by DN\)](#) (required)
- [Configuring DN Based Crypto Maps \(authenticated by hostname\)](#) (required)
- [Applying Identity to DN Based Crypto Maps](#) (required)
- [Verifying DN Based Crypto Maps](#) (optional)

Configuring DN Based Crypto Maps (authenticated by DN)

To configure a DN based crypto map that can be used only by peers that have been authenticated by a DN, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	<code>Router(config)# crypto identity name</code>	Configures the identity of a router with the given list of DNs in the certificate of the router and enters crypto identity configuration mode.
Step 2	<code>Router(crypto-identity)# dn name=string [,name=string]</code>	Associates the identity of the router with the DN in the certificate of the router. Note The identity of the peer must match the identity in the exchanged certificate.

Configuring DN Based Crypto Maps (authenticated by hostname)

To configure a DN based crypto map that can be used only by peers that have been authenticated by a hostname, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	<code>Router(config)# crypto identity name</code>	Configures the identity of a router with the given list of DNs in the certificate of the router and enters crypto identity configuration mode.
Step 2	<code>Router(crypto-identity)# fqdn name</code>	Associates the identity of the router with the hostname that the peer used to authenticate itself. Note The identity of the peer must match the identity in the exchanged certificate.

Applying Identity to DN Based Crypto Maps

To apply the identity (within the crypto map context), use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# crypto map <i>map-name seq-num ipsec-isakmp</i>	Creates or modifies a crypto map entry and enters the crypto map configuration mode.
Step 2	Router(config-crypto-map)# identity <i>name</i>	<p>Applies the identity to the crypto map.</p> <p>When this command is applied, only the hosts that match a configuration listed within the identity <i>name</i> can use the specified crypto map.</p> <p>Note If the identity command does not appear within the crypto map, the encrypted connection does not have any restrictions other than the IP address of the encrypting peer.</p>

Verifying DN Based Crypto Maps

To verify that this functionality is properly configured, use the following command in EXEC mode:

Command	Purpose
Router# show crypto identity	Displays the configured identities.

Troubleshooting Tips

If an encrypting peer attempts to establish a connection that is blocked by the DN based crypto map configuration, the following error message will be logged:

```
<time>: %CRYPTO-4-IKE_QUICKMODE_BAD_CERT: encrypted connection attempted with a peer
without the configured certificate attributes.
```

Configuration Examples

This section provides the following configuration example:

- [DN Based Crypto Map Configuration Example](#)

DN Based Crypto Map Configuration Example

The following example shows how to configure DN based crypto maps that have been authenticated by DN and hostname. Comments are included inline to explain various commands.

```
! DN based crypto maps require you to configure an IKE policy at each peer.
crypto isakmp policy 15
  encryption 3des
  hash md5
  authentication rsa-sig
  group 2
  lifetime 5000
crypto isakmp policy 20
```

```

authentication pre-share
lifetime 10000
crypto isakmp key 1234567890 address 171.69.224.33
!
! The following is an IPSec crypto map (part of IPSec configuration). It can be used only
! by peers that have been authenticated by DN and if the certificate belongs to BigBiz.
crypto map map-to-bigbiz 10 ipsec-isakmp
set peer 172.21.114.196
set transform-set my-transformset
match address 124
identity to-bigbiz
!
crypto identity to-bigbiz
dn ou=BigBiz
!
!
! This crypto map can be used only by peers that have been authenticated by hostname
! and if the certificate belongs to little.com.
crypto map map-to-little-com 10 ipsec-isakmp

Dynamic Multipoint VPN (DMVPN)

First Published: November 25, 2002

Last Updated: December 11, 2006

The Dynamic Multipoint VPN (DMVPN) feature allows users to better scale large and small IP Security (IPsec) Virtual Private Networks (VPNs) by combining generic routing encapsulation (GRE) tunnels, IPsec encryption, and Next Hop Resolution Protocol (NHRP).

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for Dynamic Multipoint VPN \(DMVPN\)” section on page 53](#).

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Contents

- [Glossary, page 54](#)

Americas Headquarters:

Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

© 2007 Cisco Systems, Inc. All rights reserved.

Prerequisites for Dynamic Multipoint VPN (DMVPN)

- Before a multipoint GRE (mGRE) and IPsec tunnel can be established, you must define an Internet Key Exchange (IKE) policy by using the **crypto isakmp policy** command.
- For the NAT-Transparency Aware enhancement to work, you must use IPsec transport mode on the transform set. Also, even though NAT-Transparency can support two peers (IKE and IPsec) being translated to the same IP address (using the User Datagram Protocol [UDP] ports to differentiate them [that is, Peer Address Translation (PAT)]), this functionality is not supported for DMVPN. All DMVPN spokes must have a unique IP address after they have been NAT translated. They can have the same IP address before they are NAT translated.
- To enable 2547oDMPVN—Traffic Segmentation Within DMVPN you must configure multiprotocol label switching (MPLS) by using the **mpls ip** command.

Restrictions for Dynamic Multipoint VPN (DMVPN)

- If you use the [Dynamic Creation for Spoke-to-Spoke Tunnels](#) benefit of this feature, you must use IKE certificates or wildcard preshared keys for Internet Security Association Key Management Protocol (ISAKMP) authentication.

Note

It is highly recommended that you *do not use* wildcard preshared keys because the attacker will have access to the VPN if one spoke router is compromised.

- GRE tunnel keepalives (that is, the **keepalive** command under a GRE interface) are not supported on point-to-point or multipoint GRE tunnels in a DMVPN Network.
- For best DMVPN functionality, it is recommended that you run the latest Cisco IOS software Release 12.4 mainline, 12.4T, or 12.2(18)SXF.

DMVPN Support on the Cisco 6500 and Cisco 7600

Blade-to-Blade Switchover on the Cisco 6500 and Cisco 7600

- DMVPN does not support blade-to-blade switchover on the Cisco 6500 and Cisco 7600.

Cisco 6500 or Cisco 7600 As a DMVPN Hub

- A Cisco 6500 or Cisco 7600 that is functioning as a DMVPN hub cannot be located behind a NAT router.
- If a Cisco 6500 or Cisco 7600 is functioning as a DMVPN hub, the spoke behind NAT must be a Cisco 6500 or Cisco 7600, respectively, or the router must be upgraded to Cisco IOS software Release 12.3(11)T02 or a later release.

Cisco 6500 or Cisco 7600 As a DMVPN Spoke

- If a Cisco 6500 or Cisco 7600 is functioning as a spoke, the hub cannot be behind NAT.
- If a Cisco 6500 or Cisco 7600 is functioning as a DMVPN spoke behind NAT, the hub must be a Cisco 6500 or Cisco 7600, respectively, or the router must be upgraded to Cisco IOS Release 12.3(11)T02 or a later release.

DMVPN Hub or Spoke Supervisor Engine

- Only a Supervisor Engine 720 can be used as a DMVPN hub or spoke. A Supervisor Engine 2 cannot be used.

Encrypted Multicast with GRE

- Encrypted Multicast with GRE is not supported on the Cisco 6500 nor on the Cisco 7600.

mGRE Interfaces

- If there are two mGRE interfaces on the same DMVPN node and they both do not have a tunnel key, the two mGRE interfaces must each have a unique tunnel source address (or interface) configured.
- On the Cisco 6500 and Cisco 7600, each GRE interface (multipoint or point-to-point) must have a unique tunnel source address (or interface).
- The following commands are not supported under mGRE with DMVPN: **ip tcp adjust-mss**, **qos pre-classify tunnel vrf**, **tunnel path-mtu-discovery**, and **tunnel vrf**.

Quality of Service (QoS)

- You cannot use QoS for DMVPN packets on a Cisco 6500 or Cisco 7600.

Tunnel Key

- The use of a tunnel key on a GRE (multipoint or point-to-point) interface is not supported in the hardware switching ASICs on the Cisco 6500 and Cisco 7600 platforms. If a tunnel key is configured, throughput performance is greatly reduced.
- In Cisco IOS Release 12.3(11)T3 and Release 12.3(14)T, the requirement that a mGRE interface must have a tunnel key was removed. Therefore, in a DMVPN network that includes a Cisco 6500 or Cisco 7600 as a DMVPN node, you should remove the tunnel key from all DMVPN nodes in the DMVPN network, thus preserving the throughput performance on the Cisco 6500 and Cisco 7600 platforms.
- If the tunnel key is not configured on any DMVPN node within a DMVPN network, it must not be configured on all DMVPN nodes with the DMVPN network.

VRF-Aware DMVPN Scenarios

- The **mls mpls tunnel-recir** command must be configured on the provider equipment (PE) DMVPN hub if customer equipment (CE) DMVPN spokes need to “talk” to other CEs across the MPLS cloud.
- The mGRE interface should be configured with a large enough IP maximum transmission unit (1400 packets to avoid having the route processor doing fragmentation).
- Enhanced Interior Gateway Routing Protocol (EIGRP) should be avoided.

Information About Dynamic Multipoint VPN (DMVPN)

To configure the Dynamic Multipoint VPN (DMVPN) feature, you must understand the following concepts:

- [Benefits of Dynamic Multipoint VPN \(DMVPN\), page 4](#)
- [Feature Design of Dynamic Multipoint VPN \(DMVPN\), page 5](#)
- [IPsec Profiles, page 6](#)

- [VRF Integrated DMVPN, page 6](#)
- [DMVPN—Enabling Traffic Segmentation Within DMVPN, page 7](#)
- [NAT-Transparency Aware DMVPN, page 9](#)
- [Call Admission Control with DMVPN, page 10](#)
- [NHRP Rate-Limiting Mechanism, page 10](#)

Benefits of Dynamic Multipoint VPN (DMVPN)

Hub Router Configuration Reduction

- Currently, for each spoke router, there is a separate block of configuration lines on the hub router that define the crypto map characteristics, the crypto access list, and the GRE tunnel interface. This feature allows users to configure a single mGRE tunnel interface, a single IPsec profile, and no crypto access lists on the hub router to handle all spoke routers. Thus, the size of the configuration on the hub router remains constant even if spoke routers are added to the network.
- DMVPN architecture can group many spokes into a single multipoint GRE interface, removing the need for a distinct physical or logical interface for each spoke in a native IPsec installation.

Automatic IPsec Encryption Initiation

- GRE has the peer source and destination address configured or resolved with NHRP. Thus, this feature allows IPsec to be immediately triggered for the point-to-point GRE tunneling or when the GRE peer address is resolved via NHRP for the multipoint GRE tunnel.

Support for Dynamically Addressed Spoke Routers

- When using point-to-point GRE and IPsec hub-and-spoke VPN networks, the physical interface IP address of the spoke routers must be known when configuring the hub router because IP address must be configured as the GRE tunnel destination address. This feature allows spoke routers to have dynamic physical interface IP addresses (common for cable and DSL connections). When the spoke router comes online, it will send registration packets to the hub router: within these registration packets, is the current physical interface IP address of this spoke.

Dynamic Creation for Spoke-to-Spoke Tunnels

- This feature eliminates the need for spoke-to-spoke configuration for direct tunnels. When a spoke router wants to transmit a packet to another spoke router, it can now use NHRP to dynamically determine the required destination address of the target spoke router. (The hub router acts as the NHRP server, handling the request for the source spoke router.) The two spoke routers dynamically create an IPsec tunnel between them so data can be directly transferred.

VRF Integrated DMVPN

- DMVPNs can be used to extend the Multiprotocol Label Switching (MPLS) networks that are deployed by service providers to take advantage of the ease of configuration of hub and spokes, to provide support for dynamically addressed customer premises equipment (CPEs), and to provide zero-touch provisioning for adding new spokes into a DMVPN.

Feature Design of Dynamic Multipoint VPN (DMVPN)

The Dynamic Multipoint VPN (DMVPN) feature combines GRE tunnels, IPsec encryption, and NHRP routing to provide users an ease of configuration via crypto profiles—which override the requirement for defining static crypto maps—and dynamic discovery of tunnel endpoints.

This feature relies on the following two Cisco enhanced standard technologies:

- NHRP—A client and server protocol where the hub is the server and the spokes are the clients. The hub maintains an NHRP database of the public interface addresses of the each spoke. Each spoke registers its real address when it boots and queries the NHRP database for real addresses of the destination spokes to build direct tunnels.
- mGRE Tunnel Interface —Allows a single GRE interface to support multiple IPsec tunnels and simplifies the size and complexity of the configuration.

The topology shown in [Figure 1](#) and the corresponding bullets explain how this feature works.

Figure 1 *Sample mGRE and IPsec Integration Topology*

- Each spoke has a permanent IPsec tunnel to the hub, not to the other spokes within the network. Each spoke registers as clients of the NHRP server.
- When a spoke needs to send a packet to a destination (private) subnet on another spoke, it queries the NHRP server for the real (outside) address of the destination (target) spoke.
- After the originating spoke “learns” the peer address of the target spoke, it can initiate a dynamic IPsec tunnel to the target spoke.
- The spoke-to-spoke tunnel is built over the multipoint GRE interface.
- The spoke-to-spoke links are established on demand whenever there is traffic between the spokes. Thereafter, packets can bypass the hub and use the spoke-to-spoke tunnel.

Note

After a preconfigured amount of inactivity on the spoke-to-spoke tunnels, the router will tear down those tunnels to save resources (IPsec security associations [SAs]).

IPsec Profiles

IPsec profiles abstract IPsec policy information into a single configuration entity, which can be referenced by name from other parts of the configuration. Therefore, users can configure functionality such as GRE tunnel protection with a single line of configuration. By referencing an IPsec profile, the user does not have to configure an entire crypto map configuration. An IPsec profile contains only IPsec information; that is, it does not contain any access list information or peering information.

VRF Integrated DMVPN

VPN Routing and Forwarding (VRF) Integrated DMVPN enables users to map DMVPN multipoint interfaces into MPLS VPNs. This mapping allows Internet service providers (ISPs) to extend their existing MPLS VPN services by mapping off-network sites (typically a branch office) to their respective MPLS VPNs. Customer equipment (CE) routers are terminated on the DMVPN PE router, and traffic is placed in the VRF instance of an MPLS VPN.

DMVPN can interact with MPLS VPNs in two ways:

1. The **ip vrf forwarding** command is used to inject the data IP packets (those packets inside the mGRE+IPsec tunnel) into the MPLS VPN. The **ip vrf forwarding** command is supported for DMVPN in Cisco IOS Release 12.3(6) and Release 12.3(7)T.
2. The **tunnel vrf** command is used to transport (route) the mGRE+IPsec tunnel packet itself within an MPLS VPN. The **tunnel vrf** command is supported in Cisco IOS Release 12.3(11)T but not in Cisco IOS Release 12.2(18)SXE.

**Note**

Clear-text data IP packets are forwarded in a VRF using the **ip vrf forwarding** command, and encrypted tunnel IP packets are forwarded in a VRF using the **tunnel vrf** command.

The **ip vrf forwarding** and **tunnel vrf** commands may be used at the same time. If they are used at the same time, the VRF name of each command may be the same or different.

For information about configuring the forwarding of clear-text data IP packets into a VRF, see the section “[Configuring the Forwarding of Clear-Text Data IP Packets into a VRF](#).” For information about configuring the forwarding of encrypted tunnel packets into a VRF, see the section “[Configuring the Forwarding of Encrypted Tunnel Packets into a VRF](#).”

For more information about configuring VRF, see reference in the “[Related Documents](#)” section.

[Figure 2](#) illustrates a typical VRF Integrated DMVPN scenario.

Figure 2 ***VRF Integrated DMVPN***

DMVPN—Enabling Traffic Segmentation Within DMVPN

Cisco IOS Release 12.4(11)T provides an enhancement that allows you to segment VPN traffic within a DMVPN tunnel. VRF instances are labeled, using MPLS, to indicate their source and destination.

The diagram in [Figure 3](#) and the corresponding bullets explain how traffic segmentation within DMVPN works.

Figure 3 **Traffic Segmentation with DMVPN**

- The hub shown in the diagram is a WAN-PE and a route reflector, and the spokes (PE routers) are clients.
- There are three VRFs, designated “red,” “green,” and “blue.”
- Each spoke has both a neighbor relationship with the hub (multiprotocol Border Gateway Protocol [MP-iBGP] peering) and a GRE tunnel to the hub.
- Each spoke advertises its routes and VPNv4 prefixes to the hub.
- The hub sets its own IP address as the next-hop route for all the VPNv4 addresses it learns from the spokes and assigns a local MPLS label for each VPN when it advertises routes back to the spokes. As a result, traffic from Spoke A to Spoke B is routed via the hub.

An example illustrates the process:

1. Spoke A advertises a VPNv4 route to the hub, and applies the label *X* to the VPN.
2. The hub changes the label to *Y* when the hub advertises the route to Spoke B.
3. When Spoke B has traffic to send to Spoke A, it applies the *Y* label, and the traffic goes to the hub.
4. The hub swaps the VPN label, by removing the *Y* label and applying an *X* label, and sends the traffic to Spoke A.

NAT-Transparency Aware DMVPN

DMVPN spokes are often situated behind a NAT router (which is often controlled by the ISP for the spoke site) with the outside interface address of the spoke router being dynamically assigned by the ISP using a private IP address (per Internet Engineering Task Force [IETF] RFC 1918).

Prior to Cisco IOS Release 12.3(6) and 12.3(7)T, these spoke routers had to use IPsec tunnel mode to participate in a DMVPN network. In addition, their assigned outside interface private IP address had to be unique across the DMVPN network. Even though ISAKMP and IPsec would negotiate NAT-T and “learn” the correct NAT public address for the private IP address of this spoke, NHRP could only “see” and use the private IP address of the spoke for its mapping entries. Effective with the NAT-Transparency Aware DMVPN enhancement, NHRP can now learn and use the NAT public address for its mappings as long as IPsec transport mode is used (which is the recommended IPsec mode for DMVPN networks). The restriction that the private interface IP address of the spoke must be unique across the DMVPN network has been removed. It is recommended that all DMVPN routers be upgraded to the new code before you try to use the new functionality even though spoke routers that are not behind NAT do not need to be upgraded. In addition, you cannot convert upgraded spoke routers that are behind NAT to the new configuration (IPsec transport mode) until the hub routers have been upgraded.

Also added in Cisco IOS Releases 12.3(9a) and 12.3(11)T is the capability to have the hub DMVPN router behind static NAT. This was a change in the ISAKMP NAT-T support. For this functionality to be used, all the DMVPN spoke routers and hub routers must be upgraded, and IPsec must use transport mode.

For these NAT-Transparency Aware enhancements to work, you must use IPsec transport mode on the transform set. Also, even though NAT-Transparency (IKE and IPsec) can support two peers (IKE and IPsec) being translated to the same IP address (using the UDP ports to differentiate them), this functionality is not supported for DMVPN. All DMVPN spokes must have a unique IP address after they have been NAT translated. They can have the same IP address before they are NAT translated.

Figure 4 illustrates a NAT-Transparency Aware DMVPN scenario.

Note

In Cisco IOS Release 12.4(6)T or earlier, DMVPN spokes behind NAT *will not* participate in dynamic direct spoke-to-spoke tunnels. Any traffic to or from a spoke that is behind NAT will be forwarded using the DMVPN hub routers. DMVPN spokes that are not behind NAT in the same DMVPN network may create dynamic direct spoke-to-spoke tunnels between each other.

In Cisco IOS Release 12.4(6)T or later releases, DMVPN spokes behind NAT *will* participate in dynamic direct spoke-to-spoke tunnels. The spokes must be behind NAT boxes that are performing NAT, not PAT. The NAT box must translate the spoke to the same outside NAT IP address for the spoke-spoke connections as the NAT box does for the spoke-hub connection. If there is more than one DMVPN spoke behind the same NAT box, then the NAT box *must* translate the DMVPN spokes to different outside NAT IP addresses. It is also likely that you may not be able to build a direct spoke-spoke tunnel between these spokes. If a spoke-spoke tunnel fails to form, then the spoke-spoke packets will continue to be forwarded via the spoke-hub-spoke path.

Figure 4 NAT-Transparency Aware DMVPN

Call Admission Control with DMVPN

In a DMVPN network, it is easy for a DMVPN router to become “overwhelmed” with the number of tunnels it is trying to build. Call Admission Control can be used to limit the number of tunnels that can be built at any one time, thus protecting the memory of the router and CPU resources.

It is most likely that Call Admission Control will be used on a DMVPN spoke to limit the total number of ISAKMP sessions (DMVPN tunnels) that a spoke router will attempt to initiate or accept. This limiting is accomplished by configuring an IKE SA limit under Call Admission Control, which configures the router to drop new ISAKMP session requests (inbound and outbound) if the current number of ISAKMP SAs exceeds the limit.

It is most likely that Call Admission Control will be used on a DMVPN hub to rate limit the number of DMVPN tunnels that are attempting to be built at the same time. The rate limiting is accomplished by configuring a system resource limit under Call Admission Control, which configures the router to drop new ISAKMP session requests (new DMVPN tunnels) when the system utilization is above a specified percentage. The dropped session requests allow the DMVPN hub router to complete the current ISAKMP session requests, and when the system utilization drops, it can process the previously dropped sessions when they are reattempted.

No special configuration is required to use Call Admission Control with DMVPN. For information about configuring Call Admission Control, see the reference in the section “[Related Documents](#).”

NHRP Rate-Limiting Mechanism

NHRP has a rate-limiting mechanism that restricts the total number of NHRP packets from any given interface. The default values, which are set using the **ip nhrp max-send** command, are 100 packets every 10 seconds per interface. If the limit is exceeded, you will get the following system message:

```
%NHRP-4-QUOTA: Max-send quota of [int]pkts/[int]Sec. exceeded on [chars]
```

For more information about this system message, see the document [12.4T System Message Guide](#).

How to Configure Dynamic Multipoint VPN (DMVPN)

To enable mGRE and IPsec tunneling for hub and spoke routers, you must configure an IPsec profile that uses a global IPsec policy template and configure your mGRE tunnel for IPsec encryption. This section contains the following procedures:

- [Configuring an IPsec Profile, page 11](#) (required)
- [Configuring the Hub for DMVPN, page 13](#) (required)
- [Configuring the Spoke for DMVPN, page 17](#) (required)
- [Configuring the Forwarding of Clear-Text Data IP Packets into a VRF, page 20](#) (optional)
- [Configuring the Forwarding of Encrypted Tunnel Packets into a VRF, page 21](#) (optional)
- [Configuring DMVPN—Traffic Segmentation Within DMVPN, page 22](#)
- [Troubleshooting Dynamic Multipoint VPN \(DMVPN\), page 27](#) (optional)

Configuring an IPsec Profile

The IPsec profile shares most of the same commands with the crypto map configuration, but only a subset of the commands are valid in an IPsec profile. Only commands that pertain to an IPsec policy can be issued under an IPsec profile; you cannot specify the IPsec peer address or the access control list (ACL) to match the packets that are to be encrypted.

Prerequisites

Before configuring an IPsec profile, you must define a transform set by using the **crypto ipsec transform-set** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec profile** *name*
4. **set transform-set** *transform-set-name*
5. **set identity**
6. **set security association lifetime** {**seconds** *seconds* | **kilobytes** *kilobytes*}
7. **set pfs** [*group1* | *group2*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	crypto ipsec profile name Example: Router(config)# crypto ipsec profile vpnprof	Defines the IPsec parameters that are to be used for IPsec encryption between “spoke and hub” and “spoke and spoke” routers. This command enters crypto map configuration mode. <ul style="list-style-type: none"> The <i>name</i> argument specifies the name of the IPsec profile.
Step 4	set transform-set transform-set-name Example: Router(config-crypto-map)# set transform-set trans2	Specifies which transform sets can be used with the IPsec profile. <ul style="list-style-type: none"> The <i>transform-set-name</i> argument specifies the name of the transform set.
Step 5	set identity Example: Router(config-crypto-map)# set identity	(Optional) Specifies identity restrictions to be used with the IPsec profile.
Step 6	set security association lifetime {seconds seconds kilobytes kilobytes} Example: Router(config-crypto-map)# set security association lifetime seconds 1800	(Optional) Overrides the global lifetime value for the IPsec profile. <ul style="list-style-type: none"> The seconds seconds option specifies the number of seconds a security association will live before expiring; the kilobytes kilobytes option specifies the volume of traffic (in kilobytes) that can pass between IPsec peers using a given security association before that security association expires. The default for the <i>seconds</i> argument is 3600 seconds.
Step 7	set pfs [group1 group2] Example: Router(config-crypto-map)# set pfs group2	(Optional) Specifies that IPsec should ask for perfect forward secrecy (PFS) when requesting new security associations for this IPsec profile. If this command is not specified, the default (group1) will be enabled. <ul style="list-style-type: none"> The group1 keyword specifies that IPsec should use the 768-bit Diffie-Hellman (DH) prime modulus group when performing the new DH exchange; the group2 keyword specifies the 1024-bit DH prime modulus group.

What to Do Next

Proceed to the following sections “[Configuring the Hub for DMVPN](#)” and “[Configuring the Spoke for DMVPN](#).”

Configuring the Hub for DMVPN

To configure the hub router for mGRE and IPsec integration (that is, associate the tunnel with the IPsec profile configured in the previous procedure), use the following commands:

**Note**

NHRP network IDs are locally significant and can be different. It makes sense from a deployment and maintenance perspective to use unique network ID numbers (using the **ip nhrp network-id** command) across all routers in a DMVPN network, but it is not necessary that they be the same.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **ip address** *ip-address mask [secondary]*
5. **ip mtu** *bytes*
6. **ip nhrp authentication** *string*
7. **ip nhrp map multicast dynamic**
8. **ip nhrp network-id** *number*
9. **tunnel source** {*ip-address* | *type number*}
10. **tunnel key** *key-number*
11. **tunnel mode gre multipoint**
12. **tunnel protection ipsec profile** *name*
13. **bandwidth** *kbps*
14. **ip tcp adjust-mss** *max-segment-size*
15. **ip nhrp holdtime** *seconds*
16. **delay** *number*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface tunnel number Example: Router(config)# interface tunnel 5	Configures a tunnel interface and enters interface configuration mode <ul style="list-style-type: none"> The <i>number</i> argument specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.
Step 4	ip address ip-address mask [secondary] Example: Router(config-if)# ip address 10.0.0.1 255.255.255.0	Sets a primary or secondary IP address for the tunnel interface. Note All hubs and spokes that are in the same DMVPN network must be addressed in the same IP subnet.
Step 5	ip mtu bytes Example: Router(config-if)# ip mtu 1400	Sets the maximum transmission unit (MTU) size, in bytes, of IP packets sent on an interface.
Step 6	ip nhrp authentication string Example: Router(config-if)# ip nhrp authentication donttell	Configures the authentication string for an interface using NHRP. Note The NHRP authentication string must be set to the same value on all hubs and spokes that are in the same DMVPN network.
Step 7	ip nhrp map multicast dynamic Example: Router(config-if)# ip nhrp map multicast dynamic	Allows NHRP to automatically add spoke routers to the multicast NHRP mappings.
Step 8	ip nhrp network-id number Example: Router(config-if)# ip nhrp network-id 99	Enables NHRP on an interface. <ul style="list-style-type: none"> The <i>number</i> argument specifies a globally unique 32-bit network identifier from a nonbroadcast multiaccess (NBMA) network. The range is from 1 to 4294967295.
Step 9	tunnel source {ip-address type number} Example: Router (config-if)# tunnel source Ethernet0	Sets source address for a tunnel interface.

	Command or Action	Purpose
Step 10	tunnel key <i>key-number</i> Example: Router (config-if)# tunnel key 100000	(Optional) Enables an ID key for a tunnel interface. <ul style="list-style-type: none"> The <i>key-number</i> argument specifies a number from 0 to 4,294,967,295 that identifies the tunnel key. Note The key number must be set to the same value on all hubs and spokes that are in the same DMVPN network. Note This command should not be configured if you are using a Cisco 6500 or Cisco 7600 platform.
Step 11	tunnel mode gre multipoint Example: Router(config-if)# tunnel mode gre multipoint	Sets the encapsulation mode to mGRE for the tunnel interface.
Step 12	tunnel protection ipsec profile <i>name</i> Example: Router(config-if)# tunnel protection ipsec profile vpnprof	Associates a tunnel interface with an IPsec profile. <ul style="list-style-type: none"> The <i>name</i> argument specifies the name of the IPsec profile; this value must match the <i>name</i> specified in the crypto ipsec profile <i>name</i> command.
Step 13	bandwidth <i>kbps</i> Example: Router(config-if)# bandwidth 1000	Sets the current bandwidth value for an interface to higher-level protocols. <ul style="list-style-type: none"> The <i>kbps</i> argument specifies the bandwidth in kilobits per second. The default value is 9. The recommend bandwidth value is 1000 or greater. Setting the bandwidth value to at least 1000 is critical if EIGRP is used over the tunnel interface. Higher bandwidth values may be necessary depending on the number of spokes supported by a hub.
Step 14	ip tcp adjust-mss <i>max-segment-size</i> Example: Router(config-if)# ip tcp adjust-mss 1360	Adjusts the maximum segment size (MSS) value of TCP packets going through a router. <ul style="list-style-type: none"> The <i>max-segment-size</i> argument specifies the maximum segment size, in bytes. The range is from 500 to 1460. The recommended value is 1360 when the number of IP MTU bytes is set to 1400. With these recommended settings, TCP sessions quickly scale back to 1400-byte IP packets so the packets will “fit” in the tunnel.

	Command or Action	Purpose
Step 15	ip nhrp holdtime <i>seconds</i> Example: Router(config-if)# ip nhrp holdtime 450	Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses. <ul style="list-style-type: none">The <i>seconds</i> argument specifies the time in seconds that NBMA addresses are advertised as valid in positive authoritative NHRP responses. The recommended value ranges from 300 seconds to 600 seconds.
Step 16	delay <i>number</i> Example: Router(config-if)# delay 1000	(Optional) Used to change the EIGRP routing metric for routes learned over the tunnel interface. <ul style="list-style-type: none">The <i>number</i> argument specifies the delay time in seconds. The recommend value is 1000.

Configuring the Spoke for DMVPN

To configure spoke routers for mGRE and IPsec integration, use the following commands.

**Note**

NHRP network IDs are locally significant and can be different. It makes sense from a deployment and maintenance perspective to use unique network ID numbers (using the **ip nhrp network-id** command) across all routers in a DMVPN network, but it is not necessary that they be the same.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **ip address** *ip-address mask [secondary]*
5. **ip mtu** *bytes*
6. **ip nhrp authentication** *string*
7. **ip nhrp map** *hub-tunnel-ip-address hub-physical-ip-address*
8. **ip nhrp map multicast** *hub-physical-ip-address*
9. **ip nhrp nhs** *hub-tunnel-ip-address*
10. **ip nhrp network-id** *number*
11. **tunnel source** {*ip-address* | *type number*}
12. **tunnel key** *key-number*
13. **tunnel mode gre multipoint**
or
tunnel destination *hub-physical-ip-address*
14. **tunnel protection ipsec profile** *name*
15. **bandwidth** *kbps*
16. **ip tcp adjust-mss** *max-segment-size*
17. **ip nhrp holdtime** *seconds*
18. **delay** *number*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	interface tunnel number Example: Router(config)# interface tunnel 5	Configures a tunnel interface and enters interface configuration mode. <ul style="list-style-type: none">The <i>number</i> argument specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.
Step 4	ip address ip-address mask [secondary] Example: Router(config-if)# ip address 10.0.0.2 255.255.255.0	Sets a primary or secondary IP address for the tunnel interface. Note All hubs and spokes that are in the same DMVPN network must be addressed in the same IP subnet.
Step 5	ip mtu bytes Example: Router(config-if)# ip mtu 1400	Sets the MTU size, in bytes, of IP packets sent on an interface.
Step 6	ip nhrp authentication string Example: Router(config-if)# ip nhrp authentication donttell	Configures the authentication string for an interface using NHRP. Note The NHRP authentication string be set to the same value on all hubs and spokes that are in the same DMVPN network.
Step 7	ip nhrp map hub-tunnel-ip-address hub-physical-ip-address Example: Router(config-if)# ip nhrp map 10.0.0.1 172.17.0.1	Statically configures the IP-to-NBMA address mapping of IP destinations connected to an MBMA network. <ul style="list-style-type: none"><i>hub-tunnel-ip-address</i>—Defines the NHRP server at the hub, which is permanently mapped to the static public IP address of the hub.<i>hub-physical-ip-address</i>—Defines the static public IP address of the hub.
Step 8	ip nhrp map multicast hub-physical-ip-address Example: Router(config-if)# ip nhrp map multicast 172.17.0.1	Enables the use of a dynamic routing protocol between the spoke and hub, and sends multicast packets to the hub router.

	Command or Action	Purpose
Step 9	ip nhrp nhs <i>hub-tunnel-ip-address</i> Example: Router(config-if)# ip nhrp nhs 10.0.0.1	Configures the hub router as the NHRP next-hop server.
Step 10	ip nhrp network-id <i>number</i> Example: Router(config-if)# ip nhrp network-id 99	Enables NHRP on an interface. <ul style="list-style-type: none"> The <i>number</i> argument specifies a globally unique 32-bit network identifier from a NBMA network. The range is from 1 to 4294967295.
Step 11	tunnel source { <i>ip-address</i> <i>type number</i> } Example: Router (config-if)# tunnel source Ethernet0	Sets the source address for a tunnel interface.
Step 12	tunnel key <i>key-number</i> Example: Router (config-if)# tunnel key 100000	(Optional) Enables an ID key for a tunnel interface. <ul style="list-style-type: none"> The <i>key-number</i> argument specifies a number from 0 to 4,294,967,295 that identifies the tunnel key. The key number must be set to the same value on all hubs and spokes that are in the same DMVPN network. Note This command should not be configured if you are using a Cisco 6500 or Cisco 7600 platform.
Step 13	tunnel mode gre multipoint or tunnel destination <i>hub-physical-ip-address</i> Example: Router(config-if)# tunnel mode gre multipoint or Router(config-if)# tunnel destination 172.17.0.1	Sets the encapsulation mode to mGRE for the tunnel interface. Use this command if data traffic can use dynamic spoke-to-spoke traffic. Specifies the destination for a tunnel interface. Use this command if data traffic can use hub-and-spoke tunnels.
Step 14	tunnel protection ipsec profile <i>name</i> Example: Router(config-if)# tunnel protection ipsec profile vpnprof	Associates a tunnel interface with an IPsec profile. <ul style="list-style-type: none"> The <i>name</i> argument specifies the name of the IPsec profile; this value must match the <i>name</i> specified in the crypto ipsec profile name command.
Step 15	bandwidth <i>kbps</i> Example: Router(config-if)# bandwidth 1000	Sets the current bandwidth value for an interface to higher-level protocols. <ul style="list-style-type: none"> The <i>kbps</i> argument specifies the bandwidth in kilobits per second. The default value is 9. The recommend bandwidth value is 1000 or greater. The bandwidth setting for the spoke does not need to equal the bandwidth setting for the DMVPN hub. It is usually easier if all of the spokes use the same or similar value.

	Command or Action	Purpose
Step 16	ip tcp adjust-mss <i>max-segment-size</i> Example: Router(config-if)# ip tcp adjust-mss 1360	Adjusts the maximum segment size (MSS) value of TCP packets going through a router. <ul style="list-style-type: none"> The <i>max-segment-size</i> argument specifies the maximum segment size, in bytes. The range is from 500 to 1460. The recommended number value is 1360 when the number of IP MTU bytes is set to 1400. With these recommended settings, TCP sessions quickly scale back to 1400-byte IP packets so the packets will “fit” in the tunnel.
Step 17	ip nhrp holdtime <i>seconds</i> Example: Router(config-if)# ip nhrp holdtime 450	Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses. <ul style="list-style-type: none"> The <i>seconds</i> argument specifies the time in seconds that NBMA addresses are advertised as valid in positive authoritative NHRP responses. The recommended value ranges from 300 seconds to 600 seconds.
Step 18	delay <i>number</i> Example: Router(config-if)# delay 1000	(Optional) Used to change the EIGRP routing metric for routes learned over the tunnel interface. <ul style="list-style-type: none"> The <i>number</i> argument specifies the delay time in seconds. The recommend value is 1000.

Configuring the Forwarding of Clear-Text Data IP Packets into a VRF

To configure the forwarding of clear-text data IP packets into a VRF, perform the following steps. This configuration assumes that the VRF BLUE has already been configured.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip vrf forwarding** *vrf-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables higher privilege levels, such as privileged EXEC mode.
	Example: Router> enable	Enter your password if prompted.
Step 2	configure terminal	Enters global configuration mode.
	Example: Router# configure terminal	
Step 3	interface <i>type number</i>	Configures an interface type and enters interface configuration mode.
	Example: Router (config)# interface tunnel0	
Step 4	ip vrf forwarding <i>vrf-name</i>	Associates a VPN VRF with an interface or subinterface.
	Example: Router (config-if)# ip vrf forwarding BLUE	

Configuring the Forwarding of Encrypted Tunnel Packets into a VRF

To configure the forwarding of encrypted tunnel packets into a VRF, perform the following steps. This configuration assumes that the VRF RED has already been configured.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. interface *type number*
4. **tunnel vrf** *vrf-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables higher privilege levels, such as privileged EXEC mode.
	Example: Router> enable	Enter your password if prompted.
Step 2	configure terminal	Enters global configuration mode.
	Example: Router# configure terminal	

	Command or Action	Purpose
Step 3	<code>interface type number</code> Example: Router (config)# interface tunnel0	Configures an interface type and enters interface configuration mode.
Step 4	<code>tunnel vrf vrf-name</code> Example: Router (config-if)# tunnel vrf RED	Associates a VPN VRF instance with a specific tunnel destination, interface, or subinterface.

Configuring DMVPN—Traffic Segmentation Within DMVPN

There are no new commands to use for configuring traffic segmentation, but there are tasks you must complete in order to segment traffic within a DMVPN tunnel:

- [Enabling MPLS on the VPN Tunnel, page 22](#)
- [Configuring Multiprotocol BGP on the Hub Router, page 23](#)
- [Configuring Multiprotocol BGP on the Spoke Routers, page 25](#)

Prerequisites

The tasks that follow assume that the DMVPN tunnel and the VRFs “red” and “blue” have already been configured.

For information on configuring a DMVPN tunnel, see the “[Configuring the Hub for DMVPN](#)” section on [page 13](#) and the “[Configuring the Spoke for DMVPN](#)” section on [page 17](#). For details about VRF configuration, see the “[Configuring the Forwarding of Clear-Text Data IP Packets into a VRF](#)” section on [page 20](#) and the “[Configuring the Forwarding of Encrypted Tunnel Packets into a VRF](#)” section on [page 21](#).

Enabling MPLS on the VPN Tunnel

Because traffic segmentation within a DMVPN tunnel depends upon MPLS, you must configure MPLS for each VRF instance in which traffic will be segmented. For detailed information about configuring MPLS, see [Cisco IOS Multiprotocol Label Switching Configuration Guide](#), Release 12.4.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. `interface type number`
4. **mpls ip**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables higher privilege levels, such as privileged EXEC mode.
	Example: Router> enable	Enter your password if prompted.
Step 2	configure terminal	Enters global configuration mode.
	Example: Router# configure terminal	
Step 3	interface type number	Configures an interface type and enters interface configuration mode.
	Example: Router (config)# interface tunnel0	
Step 4	mpls ip	Enables MPLS tagging of packets on the specified tunnel interface.
	Example: Router (config-if)# mpls ip	

Configuring Multiprotocol BGP on the Hub Router

You must configure multiprotocol iBGP (MP-iBGP) to enable advertisement of VPNv4 prefixes and labels to be applied to the VPN traffic. Use BGP to configure the hub as a route reflector. To force all traffic to be routed via the hub, configure the BGP route reflector to change the next hop to itself when it advertises VPNv4 prefixes to the route reflector clients (spokes).

For more information about the BGP routing protocol, see the “BGP” chapter in the *Cisco IOS IP Routing Protocols Configuration Guide*, Release 12.4.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp**
4. **neighbor ipaddress remote-as as-number**
5. **neighbor ipaddress update-source interface**
6. **address-family vpnv4**
7. **neighbor ipaddress activate**
8. **neighbor ipaddress send-community extended**
9. **neighbor ipaddress route-reflector-client**
10. **neighbor ipaddress route-map nexthop out**
11. **exit-address family**
12. **address-family ipv4 vrf-name**

13. redistribute connected
14. route-map
15. set ip next-hop *ipaddress*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp Example: Router (config)# router bgp	Enters BGP configuration mode.
Step 4	neighbor ipaddress remote-as as-number Example: Router (config)# neighbor 10.0.0.11 remote-as 1	Adds an entry to the BGP or multiprotocol BGP neighbor table.
Step 5	neighbor ipaddress update-source interface Example: Router (config)# neighbor 10.10.10.11 update-source Tunnell	Configures the Cisco IOS software to allow BGP sessions to use any operational interface for TCP connections.
Step 6	address-family vpnv4 Example: Router (config)# address-family vpnv4	Enters address family configuration mode to configure a routing session using Virtual Private Network (VPN) Version 4 address prefixes.
Step 7	neighbor ipaddress activate Example: Router (config)# neighbor 10.0.0.11 activate	Enables the exchange of information with a BGP neighbor.
Step 8	neighbor ipaddress send-community extended Example: Router (config)# neighbor 10.0.0.11 send-community extended	Specifies that extended community attributes should be sent to a BGP neighbor.

	Command or Action	Purpose
Step 9	neighbor <i>ipaddress</i> route-reflector-client Example: Router (config)# neighbor 10.0.0.11 route-reflector-client	Configures the router as a BGP route reflector and configures the specified neighbor as its client.
Step 10	neighbor <i>ipaddress</i> route-map <i>nexthop</i> out Example: Router (config)# neighbor 10.0.0.11 route-map nexthop out	Forces all traffic to be routed via the hub.
Step 11	exit-address-family Example: Router (config)# exit-address-family	Exits the address family configuration mode for VPNv4.
Step 12	address-family <i>ipv4</i> <i>vrf-name</i> Example: Router (config)# address-family ipv4 vrf red	Enters address family configuration mode to configure a routing session using standard IP Version 4 address prefixes.
Step 13	redistribute connected Example: Router (config)# redistribute connected	Redistributes routes that are established automatically by virtue of having enabled IP on an interface from one routing domain into another routing domain.
Step 14	route-map Example: Router (config)# route-map nexthop permit 10	Enters route map configuration mode to configure the next-hop that will be advertised to the spokes.
Step 15	set ip next-hop <i>ipaddress</i> Example: Router (config)# set ip next-hop 10.0.0.1	Sets the next hop to be the hub.

Configuring Multiprotocol BGP on the Spoke Routers

Multiprotocol-iBGP (MP-iBGP) must be configured on the spoke routers and the hub. Follow the steps below for each spoke router in the DMVPN.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp**
4. **neighbor *ipaddress* remote-as *as-number***
5. **neighbor *ipaddress* update-source *interface***
6. **address-family vpnv4**

7. **neighbor ipaddress activate**
8. **neighbor ipaddress send-community extended**
9. **exit-address-family**
10. **address-family ipv4 vrf-name**
11. **redistribute connected**
12. **exit-address-family**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables higher privilege levels, such as privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	router bgp Example: Router (config)# router bgp 1	Enters BGP configuration mode.
Step 4	neighbor ipaddress remote-as as-number Example: Router (config)# neighbor 10.0.0.1 remote-as 1	Adds an entry to the BGP or multiprotocol BGP neighbor table.
Step 5	neighbor ipaddress update-source interface Example: Router (config)# neighbor 10.10.10.1 update-source Tunnell	Configures the Cisco IOS software to allow BGP sessions to use any operational interface for TCP connections.
Step 6	address-family vpngv4 Example: Router (config)# address-family vpngv4	Enters address family configuration mode to configure a routing session using Virtual Private Network (VPN) Version 4 address prefixes.
Step 7	neighbor ipaddress activate Example: Router (config)# neighbor 10.0.0.1 activate	Enables the exchange of information with a BGP neighbor.
Step 8	neighbor ipaddress send-community extended Example: Router (config)# neighbor 10.0.0.1 send-community extended	Specifies that extended community attributes should be sent to a BGP neighbor.

	Command or Action	Purpose
Step 9	exit-address-family Example: Router (config)# exit-address-family	Exits the address family configuration mode.
Step 10	address-family ipv4 vrf-name Example: Router (config)# address-family ipv4 vrf red	Enters address family configuration mode to configure a routing session using standard IP Version 4 address prefixes.
Step 11	redistribute connected Example: Router (config)# redistribute connected	Redistributes routes that are established automatically by virtue of having enabled IP on an interface from one routing domain into another routing domain.
Step 12	exit-address-family Example: Router (config)# exit-address-family	Exits the address family configuration mode. Note Repeat Steps 10–12 for each VRF.

Troubleshooting Dynamic Multipoint VPN (DMVPN)

After configuring DMVPN, to verify that DMVPN is operating correctly, to clear DMVPN statistics or sessions, or to debug DMVPN, you may perform the following optional steps:

SUMMARY STEPS

1. **clear dmvpn session** [peer {nbma | tunnel} ip-address] [interface {tunnel number}] [vrf vrf-name] [static]
2. **clear dmvpn statistics** [peer {nbma | tunnel} ip-address] [interface {tunnel number}] [vrf vrf-name]
3. **debug dmvpn** {[condition [unmatched] | [peer [nbma | tunnel {ip-address}]] | [vrf {vrf-name}]] | [interface {tunnel number}]} | [{error | detail | packet | all} {nhrp | crypto | tunnel | socket | all}]}
4. **debug nhrp condition**
5. **debug nhrp error**
6. **logging dmvpn** [rate-limit seconds]
7. **show crypto ipsec sa** [active | standby]
8. **show crypto isakmp sa**
9. **show crypto map**
10. **show dmvpn** [peer [nbma | tunnel {ip-address}] | [network {ip-address} {mask}]] [vrf {vrf-name}] [interface {tunnel number}] [detail] [static] [debug-condition]
11. **show ip nhrp traffic** [interface {tunnel number}]

DETAILED STEPS

-
- Step 1** The **clear dmvpn session** command is used to clear DMVPN sessions.
- The following example clears only dynamic DMVPN sessions:
- ```
Router# clear dmvpn session peer nbma
```
- The following example clears all DMVPN sessions, both static and dynamic, for the specified tunnel:
- ```
Router# clear dmvpn session interface tunnel 100 static
```
- Step 2** The **clear dmvpn statistics** command is used to clear DMVPN related counters. The following example shows how to clear DMVPN related session counters for the specified tunnel interface:
- ```
Router# clear dmvpn statistics peer tunnel 192.0.2.3
```
- Step 3** The **debug dmvpn** command is used to debug DMVPN sessions. You can enable or disable DMVPN debugging based on a specific condition. There are three levels of DMVPN debugging, listed in the order of details from lowest to highest:
- Error level
  - Detail level
  - Packet level
- The following example shows how to enable conditional DMVPN debugging that displays all error debugs for next hop routing protocol (NHRP), sockets, tunnel protection and crypto information:
- ```
Router# debug dmvpn error all
```
- Step 4** The **debug nhrp condition** command enables or disables debugging based on a specific condition. The following example shows how to enable conditional NHRP debugging:
- ```
Router# debug nhrp condition
```
- Step 5** The **debug nhrp error** command displays information about NHRP error activity. The following example shows how to enable debugging for NHRP error messages:
- ```
Router# debug nhrp error
```
- Step 6** The **logging dmvpn** command is used to enable DMVPN system logging. The following command shows how to enable DMVPN system logging at the rate of 1 message every 20 seconds:
- ```
Router(config)# logging dmvpn rate-limit 20
```
- The following example shows a sample system log with DMVPN messages:
- ```
%DMVPN-7-CRYPTO_SS: Tunnel101-192.0.2.1 socket is UP
%DMVPN-5-NHRP_NHS: Tunnel101 192.0.2.251 is UP
%DMVPN-5-NHRP_CACHE: Client 192.0.2.2 on Tunnel1 Registered.
%DMVPN-5-NHRP_CACHE: Client 192.0.2.2 on Tunnel101 came UP.
%DMVPN-3-NHRP_ERROR: Registration Request failed for 192.0.2.251 on Tunnel101
```
- Step 7** The **show crypto ipsec sa** command displays the settings used by the current SAs. The following example output shows the IPsec SA status of only the active device:
- ```
Router# show crypto ipsec sa active

interface: Ethernet0/0
 Crypto map tag: to-peer-outside, local addr 209.165.201.3
 protected vrf: (none)
 local ident (addr/mask/prot/port): (192.168.0.1/255.255.255.255/0/0)
 remote ident (addr/mask/prot/port): (172.16.0.1/255.255.255.255/0/0)
 current_peer 209.165.200.225 port 500
 PERMIT, flags={origin_is_acl,}
 #pkts encaps: 3, #pkts encrypt: 3, #pkts digest: 3
```

```
#pkts decaps: 4, #pkts decrypt: 4, #pkts verify: 4
#pkts compressed: 0, #pkts decompressed: 0
#pkts not compressed: 0, #pkts compr. failed: 0
#pkts not decompressed: 0, #pkts decompress failed: 0
#send errors 0, #recv errors 0
local crypto endpt.: 209.165.201.3, remote crypto endpt.: 209.165.200.225

ike_cookies: 9263635C CA4B4E99 C14E908E 8EE2D79C
IV size: 8 bytes
replay detection support: Y
Status: ACTIVE
```

**Step 8** The **show crypto isakmp sa** command displays all current IKE SAs at a peer. For example, the following sample output is displayed after IKE negotiations have successfully completed between two peers.

Router# **show crypto isakmp sa**

| dst           | src           | state   | conn-id | slot |
|---------------|---------------|---------|---------|------|
| 172.17.63.19  | 172.16.175.76 | QM_IDLE | 2       | 0    |
| 172.17.63.19  | 172.17.63.20  | QM_IDLE | 1       | 0    |
| 172.16.175.75 | 172.17.63.19  | QM_IDLE | 3       | 0    |

**Step 9** The **show crypto map** command displays the crypto map configuration.

The following sample output is displayed after a crypto map has been configured:

Router# **show crypto map**

```
Crypto Map "Tunnel5-head-0" 10 ipsec-isakmp
 Profile name: vpnprof
 Security association lifetime: 4608000 kilobytes/3600 seconds
 PFS (Y/N): N
 Transform sets={trans2, }

Crypto Map "Tunnel5-head-0" 20 ipsec-isakmp
 Map is a PROFILE INSTANCE.
 Peer = 172.16.175.75
 Extended IP access list
 access-list permit gre host 172.17.63.19 host 172.16.175.75
 Current peer: 172.16.175.75
 Security association lifetime: 4608000 kilobytes/3600 seconds
 PFS (Y/N): N
 Transform sets={trans2, }

Crypto Map "Tunnel5-head-0" 30 ipsec-isakmp
 Map is a PROFILE INSTANCE.
 Peer = 172.17.63.20
 Extended IP access list
 access-list permit gre host 172.17.63.19 host 172.17.63.20
 Current peer: 172.17.63.20
 Security association lifetime: 4608000 kilobytes/3600 seconds
 PFS (Y/N): N
 Transform sets={trans2, }

Crypto Map "Tunnel5-head-0" 40 ipsec-isakmp
 Map is a PROFILE INSTANCE.
 Peer = 172.16.175.76
```

```

Extended IP access list
 access-list permit gre host 172.17.63.19 host 172.16.175.76
Current peer: 172.16.175.76
Security association lifetime: 4608000 kilobytes/3600 seconds
PFS (Y/N): N
Transform sets={trans2, }
Interfaces using crypto map Tunnel5-head-0:
Tunnel5

```

**Step 10** The **show dmvpn** command displays DMVPN specific session information. The following example shows example summary output:

```

Router# show dmvpn

Legend: Attrb --> S - Static, D - Dynamic, I - Incomplete
 N - NATed, L - Local, X - No Socket
 # Ent --> Number of NHRP entries with same NBMA peer

! The line below indicates that the sessions are being displayed for Tunnel1.
! Tunnel1 is acting as a spoke and is a peer with three other NBMA peers.

Tunnel1, Type: Spoke, NBMA Peers: 3,
Ent Peer NBMA Addr Peer Tunnel Add State UpDn Tm Attrb

 2 192.0.2.21 192.0.2.116 IKE 3w0d D
 1 192.0.2.102 192.0.2.11 NHRP 02:40:51 S

Ent Peer NBMA Addr Peer Tunnel Add State UpDn Tm Attrb

 1 192.0.2.25 192.0.2.171 IKE never S

```

**Step 11** The **show ip nhrp traffic** command displays NHRP statistics. The following example shows output for a specific tunnel, tunnel7:

```

Router# show ip nhrp traffic interface tunnel7

Tunnel7: Max-send limit:100Pkts/10Sec, Usage:0%
Sent: Total 79
 18 Resolution Request 10 Resolution Reply 42 Registration Request

 0 Error Indication 0 Traffic Indication
Rcvd: Total 69
 10 Resolution Request 15 Resolution Reply 0 Registration Request
 36 Registration Reply 6 Purge Request 2 Purge Reply
 0 Error Indication 0 Traffic Indication

```

## What to Do Next

If you have troubleshooted your DMVPN configuration and proceed to contact technical support, the **show tech-support** command includes information for DMVPN sessions. For more information, see the **show tech-support** command in the Cisco IOS Configuration Fundamentals Command Reference.

# Configuration Examples for Dynamic Multipoint VPN (DMVPN) Feature

This section provides the following comprehensive configuration examples:

- [Hub Configuration for DMVPN: Example, page 31](#)
- [Spoke Configuration for DMVPN: Example, page 32](#)
- [VRF Aware DMVPN: Example, page 33](#)

## Hub Configuration for DMVPN: Example

In the following example, which configures the hub router for multipoint GRE and IPsec integration, no explicit configuration lines are needed for each spoke; that is, the hub is configured with a global IPsec policy template that all spoke routers can talk to. In this example, EIGRP is configured to run over the private physical interface and the tunnel interface.

```
crypto isakmp policy 1
 authentication pre-share
crypto isakmp key cisco47 address 0.0.0.0
!
crypto ipsec transform-set trans2 esp-des esp-md5-hmac
mode transport
!
crypto ipsec profile vpnprof
 set transform-set trans2
!
interface Tunnel0
 bandwidth 1000
 ip address 10.0.0.1 255.255.255.0
! Ensures longer packets are fragmented before they are encrypted; otherwise, the
receiving router would have to do the reassembly.
 ip mtu 1400
! The following line must match on all nodes that "want to use" this mGRE tunnel:
 ip nhrp authentication donttell
! Note that the next line is required only on the hub.
 ip nhrp map multicast dynamic
! The following line must match on all nodes that want to use this mGRE tunnel:
 ip nhrp network-id 99
 ip nhrp holdtime 300
! Turns off split horizon on the mGRE tunnel interface; otherwise, EIGRP will not
advertise routes that are learned via the mGRE interface back out that interface.
 no ip split-horizon eigrp 1
! Enables dynamic, direct spoke-to-spoke tunnels when using EIGRP.
 no ip next-hop-self eigrp 1
 ip tcp adjust-mss 1360
 delay 1000
! Sets IPsec peer address to Ethernet interface's public address.
 tunnel source Ethernet0
 tunnel mode gre multipoint
! The following line must match on all nodes that want to use this mGRE tunnel.
 tunnel key 100000
 tunnel protection ipsec profile vpnprof
!
interface Ethernet0
 ip address 172.17.0.1 255.255.255.0
!
interface Ethernet1
 ip address 192.168.0.1 255.255.255.0
```

```

!
router eigrp 1
 network 10.0.0.0 0.0.0.255
 network 192.168.0.0 0.0.0.255
!

```

For information about defining and configuring ISAKMP profiles, see the references in the ["Related Documents"](#) section.

## Spoke Configuration for DMVPN: Example

In the following example, all spokes are configured the same except for tunnel and local interface address, thereby, reducing necessary configurations for the user:

```

crypto isakmp policy 1
 authentication pre-share
crypto isakmp key cisco47 address 0.0.0.0
!
crypto ipsec transform-set trans2 esp-des esp-md5-hmac
 mode transport
!
crypto ipsec profile vpnprof
 set transform-set trans2
!
interface Tunnel0
 bandwidth 1000
 ip address 10.0.0.2 255.255.255.0
 ip mtu 1400
! The following line must match on all nodes that want to use this mGRE tunnel:
 ip nhrp authentication donttell
! Definition of NHRP server at the hub (10.0.0.1), which is permanently mapped to the
static public address of the hub (172.17.0.1).
 ip nhrp map 10.0.0.1 172.17.0.1
! Sends multicast packets to the hub router, and enables the use of a dynamic routing
protocol between the spoke and the hub.
 ip nhrp map multicast 172.17.0.1
! The following line must match on all nodes that want to use this mGRE tunnel:
 ip nhrp network-of 99
 ip nhrp holdtime 300
! Configures the hub router as the NHRP next-hop server.
 ip nhrp nhs 10.0.0.1
 ip tcp adjust-mss 1360
 delay 1000
 tunnel source Ethernet0
 tunnel mode gre multipoint
! The following line must match on all nodes that want to use this mGRE tunnel:
 tunnel key 100000
 tunnel protection ipsec profile vpnprof
!
! This is a spoke, so the public address might be dynamically assigned via DHCP.
interface Ethernet0
 ip address dhcp hostname Spoke1
!
interface Ethernet1
 ip address 192.168.1.1 255.255.255.0
!
! EIGRP is configured to run over the inside physical interface and the tunnel.
router eigrp 1
 network 10.0.0.0 0.0.0.255
 network 192.168.1.0 0.0.0.255

```

## VRF Aware DMVPN: Example

When configuring VRF Aware DMVPN, you must create a separate DMVPN network for each VRF instance. In the following example, there are two DMVPN networks: BLUE and RED. In addition, a separate source interface has been used on the hub for each DMVPN tunnel—a must for Cisco IOS Release 12.2(18)SXE. For other Cisco IOS releases, you can configure the same tunnel source for both of the tunnel interfaces, but you must configure the **tunnel key** and **tunnel protection (tunnel protection ipsec profile {name} shared)** commands.

### Note

If you use the **shared** keyword, then you should be running Cisco IOS Release 12.4(5) or Release 12.4(6)T, or a later release. Otherwise the IPsec/GRE tunnels under the two mGRE tunnel interfaces may not function correctly.

### Hub Configuration

```
interface Tunnel0
! Note the next line.
 ip vrf forwarding BLUE
 bandwidth 1000
 ip address 10.0.0.1 255.255.255.0
 ip mtu 1436
 ! Note the next line.
 ip nhrp authentication BLUE!KEY
 ip nhrp map multicast dynamic
 ! Note the next line
 ip nhrp network-id 100000
 ip nhrp holdtime 600
 no ip split-horizon eigrp 1
 no ip next-hop-self eigrp 1
 ip tcp adjust-mss 1360
 delay 1000
 ! Note the next line.
 tunnel source Ethernet0
 tunnel mode gre multipoint
 tunnel protection ipsec profile vpnprof!
interface Tunnel1
! Note the next line.
 ip vrf forwarding RED
 bandwidth 1000
 ip address 10.0.0.1 255.255.255.0
 ip mtu 1436
 ! Note the next line.
 ip nhrp authentication RED!KEY
 ip nhrp map multicast dynamic
 ! Note the next line.
 ip nhrp network-id 20000
 ip nhrp holdtime 600
 no ip split-horizon eigrp 1
 no ip next-hop-self eigrp 1
 ip tcp adjust-mss 1360
 delay 1000
 ! Note the next line.
 tunnel source Ethernet1
 tunnel mode gre multipoint
 tunnel protection ipsec profile vpnprof!
interface Ethernet0
 ip address 172.17.0.1 255.255.255.0
!
interface Ethernet1
```

```
ip address 192.0.2.171 255.255.255.0
```

**Note**

For the hub configuration shown above, a separate DMVPN network is configured for each VPN. The NHRP network ID and authentication keys must be unique on the two mGRE interfaces.

**EIGRP Configuration on the Hub**

```
router eigrp 1
auto-summary
!
address-family ipv4 vrf BLUE
network 10.0.0.0 0.0.0.255
no auto-summary

Spoke2#

**Sample Command Output: show ip bgp neighbors**

Spoke2# **show ip bgp neighbors**

BGP neighbor is 10.9.9.1, remote AS 1, internal link

BGP version 4, remote router ID 10.9.9.1

BGP state = Established, up for 00:02:09

Last read 00:00:08, last write 00:00:08, hold time is 180, keepalive interval is 60 seconds

Neighbor capabilities:

Route refresh: advertised and received(old & new)

Address family IPv4 Unicast: advertised and received

Address family VPNv4 Unicast: advertised and received

Message statistics:

InQ depth is 0

OutQ depth is 0

# Command Reference

The following commands are introduced or modified in the feature or features

- **clear dmvpn session**
- **clear dmvpn statistics**
- **debug dmvpn**
- **debug nhrp condition**
- **debug nhrp error**
- **logging dmvpn**
- **show dmvpn**
- **show ip nhrp traffic**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Feature Information for Dynamic Multipoint VPN (DMVPN)

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for Dynamic Multipoint VPN (DMVPN)

## Glossary

**AM**—aggressive mode. A mode during IKE negotiation. Compared to MM, AM eliminates several steps, making it faster but less secure than MM. Cisco IOS software will respond in aggressive mode to an IKE peer that initiates aggressive mode.

**GRE**—generic routing encapsulation. Tunnels that provide a specific pathway across the shared WAN and encapsulate traffic with new packet headers to ensure delivery to specific destinations. The network is private because traffic can enter a tunnel only at an endpoint. Tunnels do not provide true confidentiality (encryption does) but can carry encrypted traffic.

GRE tunneling can also be used to encapsulate non-IP traffic into IP and send it over the Internet or IP network. The Internet Package Exchange (IPX) and AppleTalk protocols are examples of non-IP traffic.

**IKE**—Internet Key Exchange. A hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the ISAKMP framework. Although IKE can be used with other protocols, its initial implementation is with IPsec. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

**IPsec**—IP security. A framework of open standards developed by the Internet Engineering Task Force (IETF). IPsec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPsec acts at the network layer, protecting and authenticating IP packets between participating IPsec devices (“peers”), such as Cisco routers.

**ISAKMP**—Internet Security Association Key Management Protocol. A protocol framework that defines payload formats, the mechanics of implementing a key exchange protocol, and the negotiation of a security association.

**MM**—main mode. Mode that is slower than aggressive mode but more secure and more flexible than aggressive mode because it can offer an IKE peer more security proposals. The default action for IKE authentication (rsa-sig, rsa-encr, or preshared) is to initiate main mode.

**NHRP**—Next Hop Resolution Protocol. Routers, access servers, and hosts can use NHRP to discover the addresses of other routers and hosts connected to a NBMA network.

The Cisco implementation of NHRP supports the IETF draft version 11 of *NBMA Next Hop Resolution Protocol (NHRP)*.

The Cisco implementation of NHRP supports IP Version 4, Internet Packet Exchange (IPX) network layers, and, at the link layer, ATM, Ethernet, SMDS, and multipoint tunnel networks. Although NHRP is available on Ethernet, NHRP need not be implemented over Ethernet media because Ethernet is capable of broadcasting. Ethernet support is unnecessary (and not provided) for IPX.

**PFS**—Perfect Forward Secrecy. A cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not compromised, because subsequent keys are not derived from previous keys.

**SA**—security association. Describes how two or more entities will utilize security services to communicate securely. For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection.

Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

**transform**—The list of operations done on a dataflow to provide data authentication, data confidentiality, and data compression. For example, one transform is the ESP protocol with the HMAC-MD5 authentication algorithm; another transform is the AH protocol with the 56-bit DES encryption algorithm and the ESP protocol with the HMAC-SHA authentication algorithm.

**VPN**—Virtual Private Network. A framework that consists of multiple peers transmitting private data securely to one another over an otherwise public infrastructure. In this framework, inbound and outbound network traffic is protected using protocols that tunnel and encrypt all data. This framework permits networks to extend beyond their local topology, while remote users are provided with the appearance and functionality of a direct network connection.

# Easy VPN Remote RSA Signature Support

---

**First Published: March 1, 2004**  
**Last Updated: August 21, 2007**

The Easy VPN Remote RSA Signature Support feature provides for the support of Rivest, Shamir, and Adelman (RSA) signatures on Easy VPN remote devices. The support is provided through RSA certificates that can be stored on or off the remote device.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Easy VPN Remote RSA Signature Support](#)” section on page 6.*

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Contents

- [Prerequisites for Easy VPN Remote RSA Signature Support, page 1](#)
- [Restrictions for Easy VPN Remote RSA Signature Support, page 2](#)
- [Information About Easy VPN Remote RSA Signature Support, page 2](#)
- [How to Configure Easy VPN Remote RSA Signature Support, page 2](#)
- [Additional References, page 3](#)

## Prerequisites for Easy VPN Remote RSA Signature Support

- You must have a Cisco Virtual Private Network (VPN) remote device and be familiar with configuring the device.

---

**Americas Headquarters:**  
**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

© 2007 Cisco Systems, Inc. All rights reserved.

- You must have a certification authority (CA) available to your network before you configure this interoperability feature. The CA must support the public key infrastructure (PKI) protocol of Cisco Systems, which is the Simple Certificate Enrollment Protocol (SCEP) (formerly called certificate enrollment protocol [CEP]).
- You should be familiar with IP Security (IPSec) and PKI.
- You should be familiar with configuring RSA key pairs.
- You should be familiar with configuring CAs.

## Restrictions for Easy VPN Remote RSA Signature Support

- This feature should be configured only when you also configure both IPSec and Internet Key Exchange (IKE) in your network.
- The Cisco IOS software does not support CA server public keys greater than 2048 bits.

## Information About Easy VPN Remote RSA Signature Support

To configure the Easy VPN Remote RSA Signature Support feature, you should understand the following concept:

- [Easy VPN Remote RSA Signature Support Overview, page 2](#)

## Easy VPN Remote RSA Signature Support Overview

The Easy VPN Remote RSA Signature Support feature allows you to configure RSA signatures on your Easy VPN remote device. The signatures can be stored on or off your remote device.

## How to Configure Easy VPN Remote RSA Signature Support

This section contains the following procedure:

- [Configuring Easy VPN Remote RSA Signature Support, page 2](#)

## Configuring Easy VPN Remote RSA Signature Support

The RSA signatures for an Easy VPN remote device are configured the same way that you would configure RSA signatures for any other Cisco device. (For information about configuring RSA signatures, refer to the “Configuring Certification Authority Interoperability” chapter of the “IP Security and Encryption” section of the *Cisco IOS Security Configuration Guide*, Release 12.4.)

To enable the RSA signatures, when you are configuring the Easy VPN remote and assigning the configuration to the outgoing interface, you must omit the **group** command. The content of the first Organizational Unit (OU) field will be used as the group. (For information about configuring Cisco Easy VPN remote devices, refer to the feature document “[Cisco Easy VPN Remote](#),” Release 12.4(11)T.)

To troubleshoot your Easy VPN remote RSA signature configuration, you can use the following **debug** commands. The **debug** commands can be used in any order or individually.

## SUMMARY STEPS

1. `enable`
2. `debug crypto ipsec client ezvpn`
3. `debug crypto isakmp`

## DETAILED STEPS

|        | Command or Action                                                                                                           | Purpose                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> <code>enable</code>                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <code>debug crypto ipsec client ezvpn</code><br><br><b>Example:</b><br>Router# <code>debug crypto ipsec client ezvpn</code> | Displays information about the VPN tunnel as it relates to the Easy VPN remote configuration.                    |
| Step 3 | <code>debug crypto isakmp</code><br><br><b>Example:</b><br>Router# <code>debug crypto isakmp</code>                         | Displays messages about IKE events.                                                                              |

# Feature Information for Easy VPN Remote RSA Signature Support

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for Easy VPN Remote RSA Signature Support

| Feature Name                            | Releases                                | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# Easy VPN Server

---

**First Published: February 25, 2002**

**Last Updated: June 16, 2008**

The Easy VPN Server feature introduces server support for the Cisco VPN Client Release 3.x and later software clients and Cisco VPN hardware clients (such as the Cisco 800, Cisco 900, Cisco 1700, VPN 3002, and PIX 501 devices). This feature allows a remote end user to communicate using IP Security (IPsec) with any Cisco IOS Virtual Private Network (VPN) gateway. Centrally managed IPsec policies are “pushed” to the client device by the server, minimizing configuration by the end user.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Easy VPN Server](#)” section on page 75.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Restrictions for Easy VPN Server

## Nonsupported Protocols

Table 1 outlines IPsec protocol options and attributes that currently are *not* supported by Cisco VPN clients, so these options and attributes should not be configured on the router for these clients.

**Table 1** *Nonsupported IPsec Protocol Options and Attributes*

| Options                     | Attributes                                                                    |
|-----------------------------|-------------------------------------------------------------------------------|
| Authentication Types        | Authentication with public key encryption<br>Digital Signature Standard (DSS) |
| Diffie-Hellman (D-H) groups | 1                                                                             |
| IPsec Protocol Identifier   | IPSEC_AH                                                                      |
| IPsec Protocol Mode         | Transport mode                                                                |
| Miscellaneous               | Manual keys<br>Perfect Forward Secrecy (PFS)                                  |

## Cisco Secure VPN Client 1.x Restrictions

When used with this feature, the Cisco Secure VPN Client 1.x has the following restrictions:

- It does not support dead peer detection (DPD) or any other keepalive scheme.
- It does not support initial contact.

This feature cannot use per-group attribute policy profiles such as IP addresses, and Domain Name Service (DNS). Thus, customers must continue to use existing, globally defined parameters for IP address assignment, Windows Internet Naming Service (WINS) and DNS, and preshared keys.

## Virtual IPsec Interface Restrictions

The Virtual IPsec Interface Support feature works only with a Cisco software VPN Client that is version 4.x or later, and an Easy VPN remote device that is configured to use a virtual interface.

## cTCP Restrictions

- If a port is being used for Cisco Tunnel Control Protocol (cTCP), it cannot be used for other applications.
- cTCP can be used on only ten ports at a time.
- cTCP is supported on only Cisco IOS Easy VPN servers.
- If a cTCP connection is set up on a port, cTCP cannot be disabled on that port because doing so would cause the existing connection to stop receiving traffic.
- High Availability of cTCP is not currently supported on the Easy VPN server.

# Information About Easy VPN Server

Before using the Easy VPN Server Enhancements feature, you should understand the following concepts:

- [How It Works, page 3](#)
- [RADIUS Support for Group Profiles, page 4](#)
- [RADIUS Support for User Profiles, page 7](#)
- [Supported Protocols, page 8](#)
- [Functions Supported by Easy VPN Server, page 9](#)

## How It Works

When the client initiates a connection with a Cisco IOS VPN device, the “conversation” that occurs between the peers consists of device authentication via Internet Key Exchange (IKE), followed by user authentication using IKE Extended Authentication (Xauth), VPN policy push (using Mode Configuration), and IPsec security association (SA) creation. An overview of this process is as follows:

- The client initiates IKE Phase 1 via aggressive mode (AM) if a preshared key is to be used for authentication; the client initiates main mode (MM) if digital certificates are used. If the client identifies itself with a preshared key, the accompanying group name entered in the configuration GUI (ID\_KEY\_ID) is used to identify the group profile associated with this client. If digital certificates are used, the organizational unit (OU) field of a distinguished name (DN) is used to identify the group profile.

**Note**

Because the client may be configured for preshared key authentication, which initiates IKE AM, it is recommended that the administrator change the identity of the Cisco IOS VPN device via the **crypto isakmp identity hostname** command. This will not affect certificate authentication via IKE MM.

- The client attempts to establish an IKE SA between its public IP address and the public IP address of the Cisco IOS VPN device. To reduce the amount of manual configuration on the client, every combination of encryption and hash algorithms, in addition to authentication methods and D-H group sizes, is proposed.
- Depending on its IKE policy configuration, the Cisco IOS VPN device will determine which proposal is acceptable to continue negotiating Phase 1.

**Tip**

IKE policy is global for the Cisco IOS VPN device and can consist of several proposals. In the case of multiple proposals, the Cisco IOS VPN device will use the first match, so you should always list your most secure policies first.

**Note**

Device authentication ends and user authentication begins at this point.

- After the IKE SA is successfully established, and if the Cisco IOS VPN device is configured for Xauth, the client waits for a “username/password” challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, it is also possible for a user-specific attribute to be retrieved if the credentials of that user are validated via RADIUS.

**Note**

VPN devices that are configured to handle remote clients should always be configured to enforce user authentication.

- If the Cisco IOS VPN device indicates that authentication was successful, the client requests further configuration parameters from the peer. The remaining system parameters (for example, IP address, DNS, and split tunnel attributes) are pushed to the client at this time using Mode Configuration.

**Note**

The IP address pool and group preshared key (if Rivest, Shamir, and Adelman [RSA] signatures are not being used) are the only required parameter in a group profile, all other parameters are optional.

- After each client is assigned an internal IP address via Mode Configuration, it is important that the Cisco IOS VPN device knows how to route packets through the appropriate VPN tunnel. Reverse route injection (RRI) will ensure that a static route is created on the Cisco IOS VPN device for each client internal IP address.

**Note**

It is recommended that you enable RRI on the crypto map (static or dynamic) for the support of VPN clients unless the crypto map is being applied to a Generic Routing Encapsulation (GRE) tunnel that is already being used to distribute routing information.

- After the configuration parameters have been successfully received by the client, IKE quick mode is initiated to negotiate IPsec SA establishment.
- After IPsec SAs are created, the connection is complete.

## RADIUS Support for Group Profiles

Group policy information is stored in a profile that can be defined locally in the router configuration or on a RADIUS server that is accessible by the Cisco IOS VPN device. If RADIUS is used, you must configure access to the server and allow the Cisco IOS VPN device to send requests to the server.

To define group policy attributes for RADIUS, you must do the following task on your RADIUS server:

- Define a user that has a name equal to the group name as defined in the client graphical user interface (GUI). For example, if users will be connecting to the Cisco IOS VPN device using the group name “sales,” you will need a user whose name is “sales.” The password for this user is “cisco,” which is a special identifier that is used by the router for RADIUS purposes. The username must then be made a member of a group in which the correct policy is defined. For simplicity, it is recommended that the group name be the same as the username.

### For a Cisco Secure Access Control Server

If you are using a Cisco Secure access control server (ACS), you may configure your remote access VPN group profiles on this server. To perform this task, you must ensure that Internet Engineering Task Force (IETF) RADIUS attributes are selected for group configuration as shown in [Figure 1](#). (This figure also shows the compulsory attributes required for a remote access VPN group.) All values must be entered except the Tunnel-Password attribute, which is actually the preshared key for IKE purposes; if digital certificates are preferred, this attribute may be omitted.

**Figure 1** IETF RADIUS Attributes Selection for Group Configuration

The screenshot shows the Cisco Systems Group Setup web interface. On the left is a navigation menu with icons and labels for: User Setup, Group Setup (highlighted), Network Configuration, System Configuration, Interface Configuration, Administration Control, External User Databases, Reports and Activity, and Online Documentation. The main content area is titled "Group Setup" and contains a tabbed interface with three tabs: "Access Restrictions", "Enable Options", and "IP Address Assignment". The "Enable Options" tab is active, showing a sub-tabbed interface with "TACACS+", "IETF Radius" (selected), and "Cisco IOS/PIX Radius". Below these tabs is the "IETF RADIUS Attributes" section, which includes a list of attributes with checkboxes and input fields. The attributes shown are: [006] Service-Type (checked, value: Outbound), [027] Session-Timeout (unchecked, value: 0), [028] Idle-Timeout (unchecked, value: 0), [064] Tunnel-Type (checked, with Tag 1 Value: IP ESP and Tag 2 Value: ), [065] Tunnel-Medium-Type (unchecked, with Tag 1 Value: and Tag 2 Value: ), and [069] Tunnel-Password (checked, with Tag 1 Value: cisco and Tag 2 Value: ). At the bottom are three buttons: "Submit", "Submit + Restart", and "Cancel".

**CISCO SYSTEMS**

## Group Setup

Access Restrictions    Enable Options    IP Address Assignment

TACACS+    IETF Radius    Cisco IOS/PIX Radius

### IETF RADIUS Attributes

☒ [006] Service-Type  
Outbound

☐ [027] Session-Timeout  
0

☐ [028] Idle-Timeout  
0

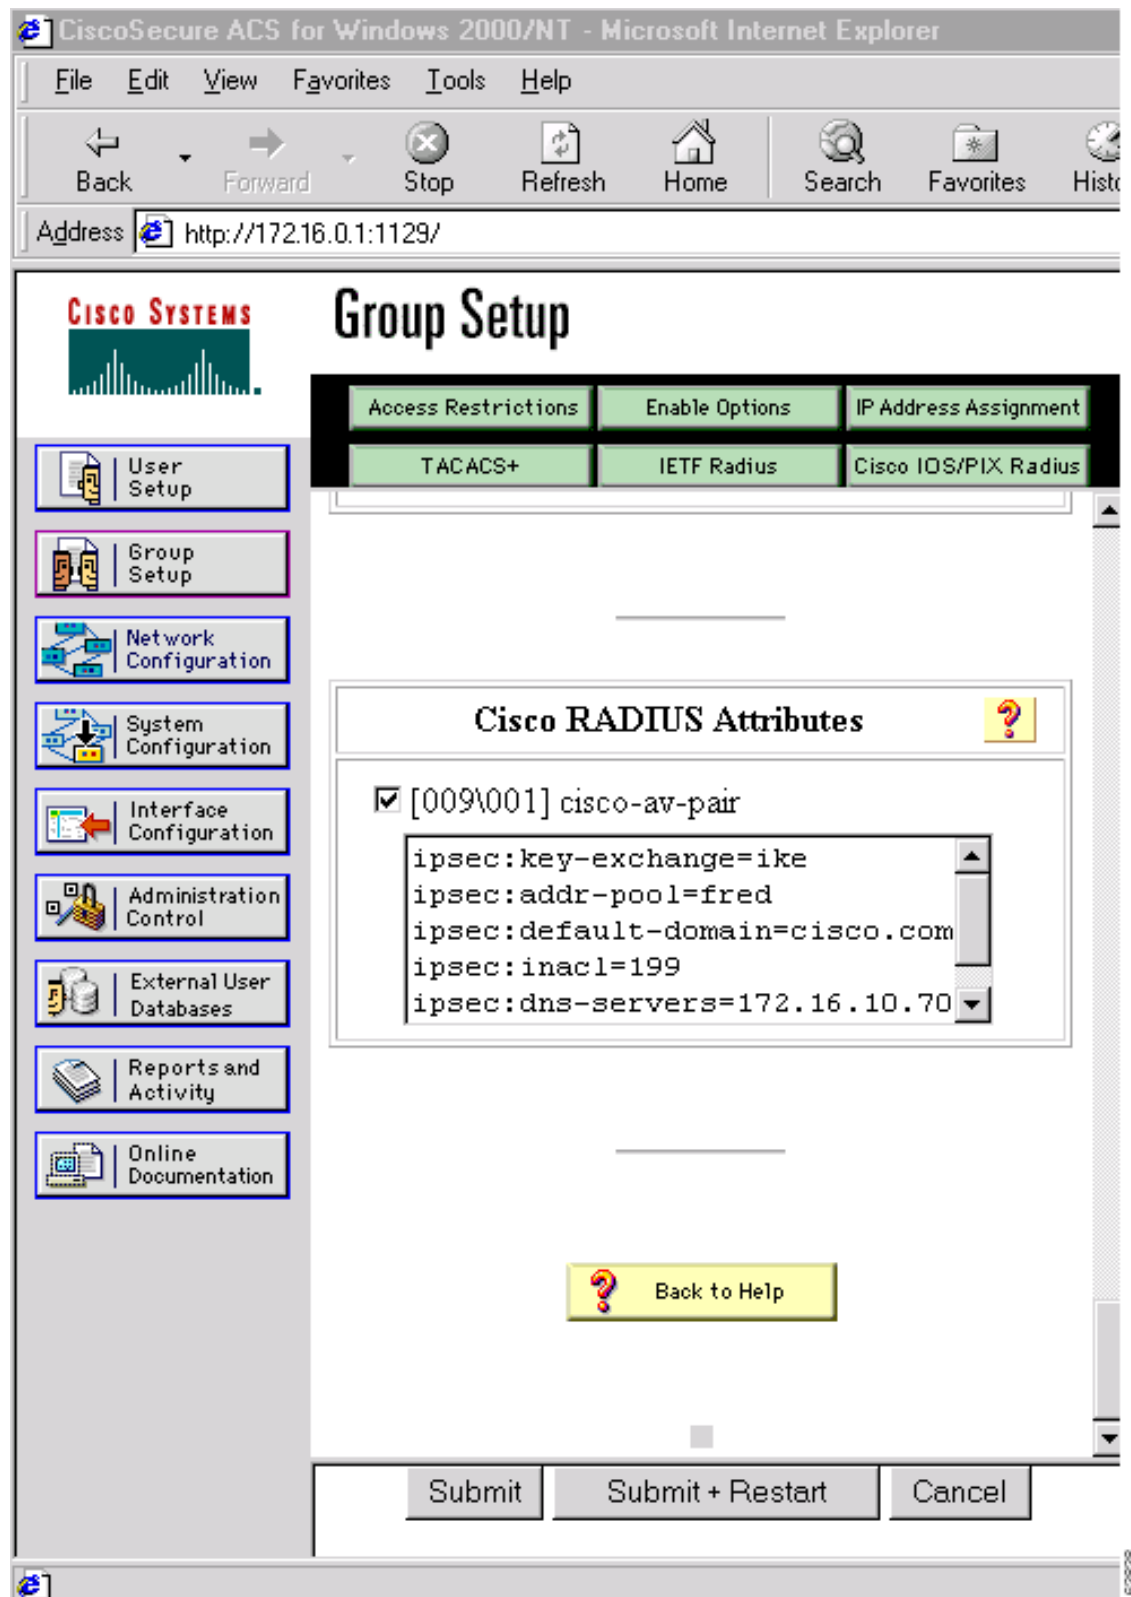

☒ [064] Tunnel-Type  
Tag 1 Value IP ESP  
Tag 2 Value

☐ [065] Tunnel-Medium-Type  
Tag 1 Value  
Tag 2 Value

☒ [069] Tunnel-Password  
Tag 1 Value cisco  
Tag 2 Value

Submit    Submit + Restart    Cancel

In addition to the compulsory attributes shown in [Figure 1](#), other values can be entered that represent the group policy that is pushed to the remote client via Mode Configuration. [Figure 2](#) shows an example of a group policy. All attributes are optional except the `addr-pool`, `key-exchange=preshared-key`, and `key-exchange=ike` attributes. The values of the attributes are the same as the setting that is used if the policy is defined locally on the router rather than in a RADIUS server. (These values are explained in the section “[Defining Group Policy Information for Mode Configuration Push](#)” later in this document.)

**Figure 2** CiscoSecure ACS Group Policy Setup

After the group profile is created, a user who is a member of the group should be added. (Remember that the username that is defined maps to the group name as defined on the remote client, and the password defined for the username in the RADIUS database must be “cisco.”) If digital certificates are the preferred method of IKE authentication, the username should reflect the OU field in the certificate presented by the remote client.

## For All Other RADIUS Servers

Ensure that your RADIUS server allows you to define attribute-value (AV) pairs. (For an example, see the section “[Configuring Cisco IOS for Easy VPN Server: Example](#)” later in this document).

**Note**

If digital certificates are used, the username defined in RADIUS must be equal to the OU field of the DN of the certificate of the client.

## RADIUS Support for User Profiles

Attributes may also be applied on a per-user basis. If you apply attributes on a per-user basis, you can override a group attribute value with an individual user attribute. The attributes are retrieved at the time that user authentication via Xauth occurs. The attributes are then combined with group attributes and applied during Mode Configuration.

User-based attributes are available only if RADIUS is being used for user authentication.

To define user policy attributes for RADIUS, you must do the following task on your RADIUS server:

- Define a user or add attributes to the existing profile of a user in your RADIUS database. The password for the user will be used during Xauth user authentication, or you may proxy to a third-party server, such as a token card server.

[Figure 3](#) shows how CiscoSecure ACS may be used for user authentication and for the assignment of a Framed-IP-Address attribute that may be pushed to the client. The presence of this attribute means that the local address pool defined for the group to which that user belongs will be overridden.

**Figure 3** *CiscoSecure ACS User Profile Setup*

## For All Other RADIUS Servers

Ensure that your RADIUS server allows you to define AV pairs. (For an example, see the [“Configuring Cisco IOS for Easy VPN Server: Example”](#) section later in this document.)

## Supported Protocols

[Table 2](#) outlines supported IPsec protocol options and attributes that can be configured for this feature. (See [Table 1](#) for nonsupported options and attributes.)

**Table 2** *Supported IPsec Protocol Options and Attributes*

| Options                   | Attributes                                                                                                                                                               |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Algorithms | <ul style="list-style-type: none"> <li>Hashed Message Authentication Codes with Message Digest 5 (HMAC-MD5)</li> <li>HMAC-Secure Hash Algorithm 1 (HMAC-SHA1)</li> </ul> |
| Authentication Types      | <ul style="list-style-type: none"> <li>Preshared keys</li> <li>RSA digital signatures</li> </ul>                                                                         |

**Table 2**      **Supported IPsec Protocol Options and Attributes (continued)**

| Options                       | Attributes                                                                                                                           |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| D-H groups                    | <ul style="list-style-type: none"> <li>• 2</li> <li>• 5</li> </ul>                                                                   |
| Encryption Algorithms (IKE)   | <ul style="list-style-type: none"> <li>• Data Encryption Standard (DES)</li> <li>• Triple Data Encryption Standard (3DES)</li> </ul> |
| Encryption Algorithms (IPsec) | <ul style="list-style-type: none"> <li>• DES</li> <li>• 3DES</li> <li>• NULL</li> </ul>                                              |
| IPsec Protocol Identifiers    | <ul style="list-style-type: none"> <li>• Encapsulating Security Payload (ESP)</li> <li>• IP LZS compression (IPCOMP-LZS)</li> </ul>  |
| IPsec Protocol Mode           | Tunnel mode                                                                                                                          |

## Mode Configuration Version 6 Support

Mode Configuration version 6 is now supported for more attributes (as described in an IETF draft submission).

## Xauth Version 6 Support

Cisco IOS has been enhanced to support version 6 of Xauth. Xauth for user authentication is based on an IETF draft submission.

## IKE DPD

The client implements a new keepalives scheme—IKE DPD.

DPD allows two IPsec peers to determine whether the other is still “alive” during the lifetime of a VPN connection. DPD is useful because a host may reboot, or the dialup link of a remote user may disconnect without notifying the peer that the VPN connection has gone away. When an IPsec host determines that a VPN connection no longer exists, the host can notify a user, attempt to switch to another IPsec host, or clean up valuable resources that were allocated for the peer that no longer exists.

A Cisco IOS VPN device can be configured to send and reply to DPD messages. DPD messages are sent if no other traffic is being passed through the VPN tunnel. If a configured amount of time has lapsed since the last inbound data was received, DPD will send a message (“DPD R-U-THERE”) the next time it sends outbound IPsec data to the peer. DPD messages are unidirectional and are automatically sent by Cisco VPN clients. DPD *must* be configured on the router *only* if the router wishes to send DPD messages to the VPN client to determine the health of the client.

## Split Tunneling Control

Remote clients can support split tunneling, which enables a client to have intranet and Internet access at the same time. If split tunneling is not configured, the client will direct all traffic through the tunnel, even traffic destined for the Internet.

## Initial Contact

If a client is suddenly disconnected, the gateway may not be notified. Consequently, removal of connection information (IKE and IPsec SAs) for that client will not immediately occur. Thus, if the client attempts to reconnect to the gateway again, the gateway will refuse the connection because the previous connection information is still valid.

To avoid such a scenario, a new capability called initial contact has been introduced; it is supported by all Cisco VPN products. If a client or router is connecting to another Cisco gateway for the first time, an initial contact message is sent that tells the receiver to ignore and delete any old connection information that has been maintained for that newly connecting peer. Initial contact ensures that connection attempts are not refused because of SA synchronization problems, which are often identified via invalid security parameter index (SPI) messages and which require devices to have their connections cleared.

## Group-Based Policy Control

Policy attributes such as IP addresses, DNS, and split tunnel access can be provided on a per-group or per-user basis.

## User-Based Policy Control

Attributes may also be applied on a per-user basis. You can override a group attribute value with an individual user attribute. The attributes are retrieved at the time that user authentication via Xauth occurs. They are then combined with group attributes and applied during Mode Configuration.

From Cisco IOS Release 12.3(4)T forward, attributes can be applied on a per-user basis after the user has been authenticated. These attributes can override any similar group attributes. User-based attributes are available only if RADIUS is used as the database.

### Framed-IP-Address

To select the Framed-IP-Address attribute for CiscoSecure for NT, do the following: Under the user profile, choose the “use this IP address” option under addressing and manually enter the address. (You should check the method of configuring a framed IP address with your own RADIUS server because this procedure will vary.)

**Note**

If a framed IP address is present, and there is also a local pool address configured for the group that the user belongs to, the framed IP address will override the local pool setting.

### DHCP Client Proxy

Easy VPN servers currently assign an IP address to a remote device using either a local pool that is configured on the router or the framed IP address attribute that is defined in RADIUS. Effective with Cisco IOS Release 12.4(9)T, the DHCP Client Proxy feature provides the option of configuring an Easy VPN server to obtain an IP address from a DHCP server. The IP address is pushed to the remote device using mode configuration.

**Note**

This feature does not include functionality for the DHCP server to push the DNS, WINS server, or domain name to the remote client.

To configure DHCP Client Proxy, see the section [“Configuring an Easy VPN Server to Obtain an IP Address from a DHCP Server.”](#)

#### Benefits of DHCP Client Proxy

- The functionality provided with this feature helps in the creation of DDNS (dynamic Domain Name System) entries when a DNS server exists in conjunction with the DHCP server.
- The user is not restricted to IP address pools.

### User-Save-Password

As per the group description, the User-Save-Password attribute can be received in addition to the group variant (Save-Password), but if it is received, it will override the value asserted by the group.

The following is an output example of a RADIUS AV pair for the User-Save-Password attribute:

```
ipsec:user-save-password=1
```

### User-Include-Local-LAN

As per the group description, the User-Include-Local-LAN attribute can be received in addition to the group variant (Include-Local-LAN), but if it is received, it will override the value asserted by the group.

The following is an output example of a RADIUS AV pair for the User-Include-Local LAN attribute:

```
ipsec:user-include-local-lan=1
```

## User-VPN-Group

The User-VPN-Group attribute is a replacement for the [Group-Lock](#) attribute. It allows support for both preshared key and RSA signature authentication mechanisms such as certificates.

If you need to check that the group a user is attempting to connect to is indeed the group the user belongs to, use the User-VPN-Group attribute. The administrator sets this attribute to a string, which is the group that the user belongs to. The group the user belongs to is matched against the VPN group as defined by group name (ID\_KEY\_ID) for preshared keys or by the OU field of a certificate. If the groups do not match, the client connection is terminated.

This feature works only with AAA RADIUS. Local Xauth authentication must still use the Group-Lock attribute.

The following is an output example of a RADIUS AV pair for the Use-VPN-Group attribute:

```
ipsec:user-vpn-group=cisco
```

## Group-Lock

If you are only using pre-shared keys (no certificates or other RSA signature authentication mechanisms) with RADIUS or local AAA, you can continue to use the Group-Lock attribute. If you are only using pre-shared keys (no certificates or other RSA signature authentication mechanisms) with RADIUS, you can either continue to use the Group-Lock attribute or you can use the new [User-VPN-Group](#) attribute.

### Caution

Do not use the Group-Lock attribute if you are using RSA signature authentication mechanisms such as certificates. Use the [User-VPN-Group](#) attribute instead.

## Session Monitoring for VPN Group Access

It is possible to mimic the functionality provided by some RADIUS servers for limiting the maximum number of connections to a specific server group and also for limiting the number of simultaneous logins for users in that group. After user-defined thresholds are defined in each VPN group, connections will be denied until counts drop below these thresholds.

If you use a RADIUS server, such as CiscoSecure ACS, it is recommended that you enable this session control on the RADIUS server if the functionality is provided. In this way, usage can be controlled across a number of servers by one central repository. When enabling this feature on the router itself, only connections to groups on that specific device are monitored. Load-sharing scenarios are not accurately accounted for.

To configure session monitoring using command-line interface (CLI), use the **crypto isakmp client configuration group** command and the **max-users** and **max-logins** subcommands.

The following is an output example of RADIUS AV pairs that have been added to the relevant group:

```
ipsec:max-users=1000
ipsec:max-logins=1
```

## Virtual IPsec Interface Support on a Server

Virtual IPsec Interface Support on a Server allows you to selectively send traffic to different Easy VPN concentrators (servers) as well as to the Internet.

Before Cisco IOS Release 12.4(4)T, at the tunnel-up/tunnel-down transition, attributes that were pushed during the mode configuration had to be parsed and applied. When such attributes resulted in the configurations being applied on the interface, the existing configuration had to be overridden.

With the Virtual Ipsec Interface Support feature, the tunnel-up configuration can be applied to separate interfaces, making it easier to support separate features at tunnel-up. Features that are applied to the traffic going into the tunnel can be separate from the features that are applied to traffic that is not going through the tunnel (for example, split-tunnel traffic and traffic leaving the device when the tunnel is not up). When the Easy VPN negotiation is successful, the line protocol state of the virtual-access interface gets changed to up. When the Easy VPN tunnel goes down because the SA expires or is deleted, the line protocol state of the virtual-access interfaces changes to down.

**Note**

---

This feature does not support multicast.

---

For more information about this feature, see the document [Cisco Easy VPN Remote](#). (This feature is configured on the Easy VPN remote device.)

For information about the IPsec Virtual Tunnel Interface feature, see the document “IPSec Virtual Tunnel Interface” (link in the “[Related Documents](#)” section of this document).

## Virtual Tunnel Interface Per-User Attribute Support

Effective with Cisco IOS Release 12.4(9)T, Virtual Tunnel Interface provides per-user attribute support for Easy VPN servers.

For more information about this feature, see the document [IPsec Virtual Tunnel Interface](#).

## Banner, Auto-Update, and Browser Proxy

The following features provide support for attributes that aid in the management of the Cisco Easy VPN remote device.

### Banner

An Easy VPN server can be configured to push the banner to the Easy VPN remote device. A banner is needed for the web-based activation feature. The banner is displayed when the Easy VPN tunnel is up on the Easy VPN remote console or as a HTML page in the case of web-based activation.

### Auto-Update

An Easy VPN server can be configured to provide an automated mechanism for software and firmware upgrades on an Easy VPN remote device.

## Browser Proxy

An Easy VPN server can be configured so that an Easy VPN remote device can access resources on the corporate network. Using this feature, the user does not have to manually modify the proxy settings of his or her web browser when connecting to the corporate network using Cisco IOS VPN Client or manually revert the proxy settings upon disconnecting.

## Configuration Management Enhancements

### Pushing a Configuration URL Through a Mode-Configuration Exchange

When remote devices connect to a corporate gateway for creating an IPsec VPN tunnel, some policy and configuration information has to be applied to the remote device when the VPN tunnel is active to allow the remote device to become a part of the corporate VPN.

The Pushing a Configuration URL Through a Mode-Configuration Exchange feature provides for a mode-configuration attribute that “pushes” a URL from the concentrator (server) to the Cisco IOS Easy VPN remote device. The URL contains the configuration information that the remote device has to download and apply to the running configuration, and it contains the Cisco IOS CLI listing. (For more information about a Cisco IOS CLI listing, see Cisco IOS documentation for the **configuration url** command.) The CLI for this feature is configured on the concentrator.

The configuration that is pushed to the remote device is persistent by default. That is, the configuration is applied when the IPsec tunnel is “up,” but it is not withdrawn when the IPsec tunnel goes “down.” However, it is possible to write a section of configuration that is transient in nature, in which case the configuration of the section is reverted when the tunnel is disconnected.

There are no restrictions on where the configuration distribution server is physically located. However, it is recommended that a secure protocol such as HTTPS (Secure HTTP) be used to retrieve the configuration. The configuration server can be located in the corporate network, so because the transfer happens through the IPsec tunnel, insecure access protocols (HTTP) can be used.

Regarding backward compatibility: the remote device asks for the CONFIGURATION-URL and CONFIGURATION-VERSION attributes. Because the CONFIGURATION-URL and CONFIGURATION-VERSION attributes are not mandatory attributes, the server sends them only if it has them configured for the group. There is no built-in restriction to push the configuration, but bootstrap configurations (such as for the IP address) cannot be sent because those configurations are required to set up the Easy VPN tunnel, and the CONFIGURATION-URL comes into effect only after the Easy VPN tunnel comes up.

### After the Configuration Has Been Acquired by the Easy VPN Remote Device

After the configuration has been acquired by the Easy VPN remote device, the remote device sends a new ISAKMP notification to the Easy VPN server. The notification contains several manageability information messages about the client (remote device). The Easy VPN server takes two actions when this information is received:

- The Easy VPN server caches the information in its peer database. The information can be displayed by using the **show crypto isakmp peer config** command. This command output displays all manageability information that is sent by the client (remote device).
- If accounting is enabled, the Easy VPN server sends an accounting update record that contains the manageability information messages about the remote device to the accounting RADIUS server. This accounting update is later available in the accounting log of the RADIUS server.

## How to Configure This Feature

The commands that are used to configure this feature and the attributes CONFIGURATION-URL and CONFIGURATION-VERSION are described in the **crypto isakmp client configuration group** command documentation.

## Per User AAA Policy Download with PKI

With the Support of Per User AAA Policy Download with PKI feature, user attributes are obtained from the AAA server and pushed to the remote device through mode configuration. The username that is used to get the attributes is retrieved from the remote device certificate.

## Per-User Attribute Support for Easy VPN Servers

The Per-User Attribute Support for Easy VPN Servers feature provides users with the ability to support per-user attributes on Easy VPN servers. These attributes are applied on the virtual access interface.

### Local Easy VPN AAA Server

For a local Easy VPN AAA server, the per-user attributes can be applied at the group level or at the user level using the command-line interface (CLI).

To configure per-user attributes for a local Easy VPN server, see “[Configuring Per-User Attributes on a Local Easy VPN AAA Server](#).”

### Remote Easy VPN AAA Server

Attribute value (AV) pairs can be defined on a remote Easy VPN AAA server as shown in this example:  
cisco-avpair = “ip:outacl#101=permit tcp any any established

### Per-User Attributes

The following per-user attributes are currently defined in the AAA server and are applicable to IPsec:

- inacl
- interface-config
- outacl
- route
- rte-fltr-in
- rte-fltr-out
- sub-policy-In
- sub-policy-Out
- policy-route
- prefix

## Syslog Message Enhancements

Some new syslog messages have been added for Easy VPN in Cisco IOS Release 12.4(4)T. The syslog messages can be enabled on your server by using the command-line interface (CLI). The format of the syslog messages is as follows:

```
timestamp: %CRYPTO-6-VPN_TUNNEL_STATUS: (Server) <event message> User=<username>
Group=<groupname> Client_public_addr=<ip_addr> Server_public_addr=<ip_addr>
```

For an authentication-passed event, the syslog message looks like the following:

```
Jul 25 23:33:06.847: %CRYPTO-6-VPN_TUNNEL_STATUS: (Server) Authentication PASS
ED User=blue Group=Cisco1760group Client_public_addr=10.20.20.1
Server_public_addr=10.20.20.2
```

Three of the messages (Max users, Max logins, and Group does not exist) are authorization issues and are printed only with the group name in the format. The reason for only the group name being printed is that authorization check happens much before mode configuration happens. Therefore, the peer information is not yet present and cannot be printed. The following is an example of a “Group does not exist” message.

```
*Jun 30 18:02:58.107: %CRYPTO-6-VPN_TUNNEL_STATUS: Group: group_1 does not exist
```

## Easy VPN Syslog Messages That Are Supported

Both `ezvpn_connection_up` and `ezvpn_connection_down` were already supported in a previous release of syslog messages. The enhancements in Cisco IOS Release 12.4(4)T follow the same format, but new syslogs are introduced. The added syslogs are as follows:

- Authentication Passed
- Authentication Rejected
  - Group Lock Enabled
  - Incorrect Username or Password
  - Max Users exceeded/Max Logins exceeded
  - No. of Retries exceeded
- Authentication Failed (AAA Not Contactable)
- IP Pool Not present/No Free IP Address available in the pool
- ACL associated with Ezvpn policy but NOT defined (hence, no split tunneling possible)
- Save password Turned ON
- Incorrect firewall record being sent by Client (incorrect vendor | product | capability)
- Authentication Rejected
  - Access restricted via incoming interface
  - Group does not exist

## Network Admission Control Support for Easy VPN

Network Admission Control was introduced in Cisco IOS Release 12.3(8)T as a way to determine whether a PC client should be allowed to connect to the LAN. Network Admission Control uses Extensible Authentication Protocol over UDP (EAPoUDP) to query the Cisco trust agent on the PC and allows a PC to access the network if the client status is healthy. Different policies can be applied on the server to deny or limit access of PCs that are infected.

Effective with Cisco IOS Release 12.4(4)T, Network Admission Control can now be used to monitor the status of remote PC clients as well. After the Easy VPN tunnel comes up and the PC starts to send traffic, the traffic is intercepted at the Easy VPN server, and the posture validation process starts. The posture validation process consists of sending an EAPoUDP request over the Easy VPN tunnel and querying the Cisco trust agent. The authentication server is configured inside the trusted network, behind the IPsec aggregator.

The configuration of an Easy VPN server that has Network Admission Control enabled is shown in the output in [Network Admission Control: Example, page 64](#).

## Central Policy Push Firewall Policy Push

The Easy VPN server supports Central Policy Push (CPP) Firewall Policy Push. This feature allows administrators to push policies that enforce security to the Cisco Easy VPN (software) Client and related firewall software.

A split tunnel enables access to corporate networks, but it also allows a remote device to be exposed to attacks from the Internet. This feature enables the server to determine whether to allow or deny a tunnel if the remote device does not have a required firewall, thereby reducing exposure to attacks.

The following firewall types are supported:

- Cisco-Integrated-firewall (central-policy-push)
- Cisco-Security-Agent (check-presence)
- Zonelabs-Zonealarm (both)
- Zonelabs-ZonealarmPro (both)

The server can be used either to check the presence of a firewall on the client (remote device) using the check-presence option or to specify the specifics of the firewall policies that must be applied by the client using the central-policy-push.

### Note

The **policy check-presence command and keyword**, which are used with this feature, replace the **firewall are-u-there command functionality** that was supported before Cisco IOS Release 12.4(6)T. The **firewall are-u-there command** will continue to be supported for backward compatibility.

To enable this feature, see the sections “[Defining a CPP Firewall Policy Push Using a Local AAA Server](#)” and “[Applying a CPP Firewall Policy Push to the Configuration Group](#).”

## Syslog Support for CPP Firewall Policy Push

Syslog support can be enabled using the **crypto logging ezvpn** command on your router. CPP syslog messages will be printed for the following error conditions:

- If policy is configured on a group configuration (using the **firewall policy** command), but a global policy with the same name is not defined (using the **crypto isakmp client firewall** command). The syslog message is as follows:

```
Policy enabled on group configuration but not defined
```

Tunnel setup proceeds as normal (with the firewall).

- If an incorrect firewall request (vendor/product/cap incorrect order) is received, the syslog message is as follows:

```
Incorrect firewall record received from client
```

- If a policy mismatch occurs between the Cisco VPN Client and the server, the syslog is as follows:  
`CPP policy mismatch between client and headend`

## Password Aging

Prior to Cisco IOS Release 12.4(6)T, EasyVPN remote devices (clients) sent username and password values to the Easy VPN server, which in turn sent them to the AAA subsystem. The AAA subsystem generated an authentication request to the RADIUS server. If the password had expired, the RADIUS server replied with an authentication failure. The reason for the failure was not passed back to the AAA subsystem. The user was denied access due to authentication failure, but he or she did not know that the failure was due to password expiration.

Effective with Cisco IOS Release 12.4(6)T, if you have configured the Password Aging feature, the EasyVPN client is notified when a password has expired, and you are prompted to enter a new password. To configure the Password Aging feature, see the section “[Configuring Password Aging](#).”

For more information about Password Aging, see the reference for “Password Aging” in the section [Additional References](#) (subsection “Related Documents”).

## Split DNS

Effective with Cisco IOS Release 12.4(9)T, split DNS functionality is available on Easy VPN servers. This feature enables the Easy VPN hardware client to use primary and secondary DNS values to resolve DNS queries. These values are pushed by the Easy VPN server to the Easy VPN remote device. To configure this feature on your server, use the **split-dns** command (see the section “[Defining Group Policy Information for Mode Configuration Push](#)”). Configuring this command adds the split-dns attribute to the policy group. The attribute will include the list of domain names that you configured. All other names will be resolved using the public DNS server.

For more information about configuring split DNS, see “Configuring Split and Dynamic DNS on the Cisco VPN 3000” at the following URL:

[http://www.cisco.com/warp/public/471/dns\\_split\\_dynam.pdf](http://www.cisco.com/warp/public/471/dns_split_dynam.pdf)

## cTCP

The Cisco Tunneling Control Protocol (cTCP) feature can be used for situations in which an Easy VPN remote device is operating in an environment in which standard IPsec does not function or in which it does not function transparently without modification to existing firewall rules. These situations include the following:

- Small or home office router performing Network Address Translation (NAT) or Port Address Translation (PAT)
- PAT-provided IP address behind a larger router (for example, in a corporation)
- Non-NAT firewall (packet filtering or stateful)
- Proxy server

The firewall should be configured to allow the headend to accept cTCP connections on the configured cTCP port. This configuration is enabled on the Easy VPN server. If the firewall is not configured, it will not allow the cTCP traffic.

**Note**

cTCP traffic is actually Transmission Control Protocol (TCP) traffic. cTCP packets are IKE or Encapsulating Security Payload (ESP) packets that are being transmitted over TCP.

## How to Configure Easy VPN Server

This section includes the following procedures:

- [Enabling Policy Lookup via AAA, page 20](#) (required)
- [Defining Group Policy Information for Mode Configuration Push, page 21](#) (required)
- [Enabling VPN Session Monitoring, page 24](#) (optional)
- [Verifying a VPN Session, page 25](#) (optional)
- [Applying Mode Configuration and Xauth, page 26](#) (required)
- [Enabling Reverse Route Injection for the Client, page 27](#) (optional)
- [Enabling IKE Dead Peer Detection, page 28](#) (optional)
- [Configuring RADIUS Server Support, page 29](#) (optional)
- [Verifying Easy VPN Server, page 30](#) (optional)

## Enabling Policy Lookup via AAA

To enable policy lookup via AAA, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication password-prompt** *text-string*
5. **aaa authentication username prompt** *text-string*
6. **aaa authentication login** [*list-name method1*] [*method2...*]
7. **aaa authorization network** *list-name* **local group radius**
8. **username** *name* **password** *encryption-type* *encrypted-password*

### DETAILED STEPS

|        | Command                                                                                                                                                               | Purpose                                                                                                               |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                        | Enters global configuration mode.                                                                                     |
| Step 3 | <b>aaa new-model</b><br><br><b>Example:</b><br>Router (config)# aaa new-model                                                                                         | Enables AAA.                                                                                                          |
| Step 4 | <b>aaa authentication password-prompt</b> <i>text-string</i><br><br><b>Example:</b><br>Router (config)# aaa authentication password-prompt "Enter your password now:" | (Optional) Changes the text displayed when users are prompted for a password.                                         |

|        | Command                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>aaa authentication username-prompt</b><br><i>text-string</i><br><br><b>Example:</b><br>Router (config)# aaa authentication<br>username-prompt "Enter your name here:"                        | (Optional) Changes the text displayed when users are prompted to enter a username.                                                                                                                                        |
| Step 6 | <b>aaa authentication login</b> [ <i>list-name</i><br><i>method1</i> ] [ <i>method2...</i> ]<br><br><b>Example:</b><br>Router (config)# aaa authentication login<br>userlist local group radius | Sets AAA authentication at login. <ul style="list-style-type: none"> <li>A local and RADIUS server may be used together and will be tried in order.</li> </ul> <b>Note</b> This command must be enabled to enforce Xauth. |
| Step 7 | <b>aaa authorization network</b> <i>list-name</i> <b>local</b><br><b>group radius</b><br><br><b>Example:</b><br>Router (config)# aaa authorization<br>network grouplist local group radius      | Enables group policy lookup. <ul style="list-style-type: none"> <li>A local and RADIUS server may be used together and will be tried in order.</li> </ul>                                                                 |
| Step 8 | <b>username</b> <i>name</i> <b>password</b> <i>encryption-type</i><br><i>encrypted-password</i><br><br><b>Example:</b><br>Router (config)# username server_r<br>password 7 121F0A18             | (Optional) Defines local users for Xauth if RADIUS or TACACS+ is not used. <b>Note</b> Use this command only if no external validation repository will be used.                                                           |

## Defining Group Policy Information for Mode Configuration Push

Although users can belong to only one group per connection, they may belong to specific groups with different policy requirements. Thus, users may decide to connect to the client using a different group ID by changing their client profile on the VPN device. To define the policy attributes that are pushed to the client via Mode Configuration, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** {*group-name* | **default**}
4. **key** *name*
5. **dns** *primary-server secondary-server*
6. **wins** *primary-server secondary-server*
7. **domain** *name*
8. **pool** *name*
9. **acl** *number*
10. **access-restrict** {*interface-name*}
11. **policy check-presence**

- or
- firewall are-u-there**
12. **group-lock**
  13. **include-local-lan**
  14. **save-password**
  15. **backup-gateway**
  16. **pfs**

## DETAILED STEPS

|        | Command                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                            |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                  |
| Step 3 | <b>crypto isakmp client configuration group</b><br>{group-name   default}<br><br><b>Example:</b><br>Router (config)# crypto isakmp client<br>configuration group group1 | Specifies the policy profile of the group that will be defined and enters Internet Security Association Key Management Protocol (ISAKMP) group configuration mode. <ul style="list-style-type: none"> <li>If no specific group matches and a default group is defined, users will automatically be given the policy of a default group.</li> </ul> |
| Step 4 | <b>key name</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# key group1                                                                                      | Specifies the IKE preshared key for group policy attribute definition. <p><b>Note</b> This command <i>must</i> be enabled if the client identifies itself with a preshared key.</p>                                                                                                                                                                |
| Step 5 | <b>dns primary-server secondary-server</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# dns 10.2.2.2<br>10.3.3.3                                             | (Optional) Specifies the primary and secondary DNS servers for the group.                                                                                                                                                                                                                                                                          |
| Step 6 | <b>wins primary-server secondary-server</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# wins<br>10.10.10.10 10.12.12.12                                     | (Optional) Specifies the primary and secondary WINS servers for the group.                                                                                                                                                                                                                                                                         |
| Step 7 | <b>domain name</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# domain<br>domain.com                                                                         | (Optional) Specifies the DNS domain to which a group belongs.                                                                                                                                                                                                                                                                                      |

|         | Command                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Step 8  | <b>pool</b> <i>name</i><br><br><b>Example:</b><br>Router (config-isakmp-group)# pool green                                                                                                                                        | Defines a local pool address. <ul style="list-style-type: none"> <li>Although a user must define at least one pool name, a separate pool may be defined for each group policy.</li> </ul> <b>Note</b> This command <i>must</i> be defined and refer to a valid IP local pool address or the client connection will fail.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 9  | <b>acl</b> <i>number</i><br><br><b>Example:</b><br>Router (config-isakmp-group)# acl 199                                                                                                                                          | (Optional) Configures split tunneling. <ul style="list-style-type: none"> <li>The <i>number</i> argument specifies a group of access control list (ACL) rules that represent protected subnets for split tunneling purposes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 10 | <b>access-restrict</b> { <i>interface-name</i> }<br><br><b>Example:</b><br>Router (config-isakmp-group)#<br>access-restrict fastethernet0/0                                                                                       | Restricts clients in a group to an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 11 | <b>policy check-presence</b><br><br>or<br><br><b>firewall are-u-there</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# policy<br>check-presence<br><br>or<br><br>Router (config-isakmp-group)# firewall<br>are-u-there | (Optional) Denotes that the server should check for the presence of the specified firewall (as shown as the firewall type on the client).<br><br>or<br><br>Adds the firewall are-u-there attribute to the server group if your PC is running the Black Ice or Zone Alarm personal firewalls.<br><br><b>Note</b> The <b>policy</b> command and <b>check-presence</b> keyword were added to Cisco IOS documentation in Cisco IOS 12.4(6)T. It is recommended that the <b>policy</b> command be used instead of the <b>firewall are-u-there</b> command because the <b>policy</b> command is supported in local AAA and remote AAA configurations. The <b>firewall are-u-there</b> command can be figured only locally, but it is still supported for backward compatibility. |
| Step 12 | <b>group-lock</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# group-lock                                                                                                                                              | Enforces the group lock feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 13 | <b>include-local-lan</b><br><br><b>Example:</b><br>Router (config-isakmp-group)#<br>include-local-lan                                                                                                                             | (Optional) Configures the Include-Local-LAN attribute to allow a nonsplit-tunneling connection to access the local subnetwork at the same time as the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 14 | <b>save-password</b><br><br><b>Example:</b><br>Router (config-isakmp-group)#<br>save-password                                                                                                                                     | (Optional) Saves your Xauth password locally on your PC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|         | Command                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 15 | <b>backup-gateway</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# backup gateway | (Optional) Rather than have backup gateways added to client configurations manually, it is possible to have the server “push down” a list of backup gateways to the client device. <ul style="list-style-type: none"> <li>These gateways are tried in order in the case of a failure of the previous gateway. The gateways may be specified using IP addresses or host names.</li> </ul>                                                                                                        |
| Step 16 | <b>pfs</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# pfs                       | (Optional) Notifies the client of the central-site policy regarding whether PFS is required for any IPsec SA. <ul style="list-style-type: none"> <li>Because the client device does not have a user interface option to enable or disable PFS negotiation, the server will notify the client device of the central site policy using this parameter. The Diffie-Hellman (D-H) group that is proposed for PFS will be the same that was negotiated in Phase 1 of the IKE negotiation.</li> </ul> |

## Enabling VPN Session Monitoring

If you wish to set restrictions on the maximum number of connections to the router per VPN group and the maximum number of simultaneous logins per user, add the following attributes to the VPN group.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** *group-name*
4. **exit**
5. **max-logins** *number-of-logins*
6. **max-users** *number-of-users*

### DETAILED STEPS

|        | Command                                                                        | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                |

|        | Command                                                                                                                                                      | Purpose                                                                                                                                                                                                                                             |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>crypto isakmp client configuration group</b> <i>group-name</i><br><br><b>Example:</b><br>Router (config)# crypto isakmp client configuration group group1 | Specifies the policy profile of the group that will be defined and enters ISAKMP group configuration mode. <ul style="list-style-type: none"> <li><i>group-name</i>—Group definition that identifies which policy is enforced for users.</li> </ul> |
| Step 4 | <b>exit</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# exit                                                                                     | Exits ISAKMP group configuration mode.                                                                                                                                                                                                              |
| Step 5 | <b>max-logins</b> <i>number-of-logins</i><br><br><b>Example:</b><br>Router (config-isakmp-group)# max-logins 10                                              | (Optional) Limits the number of simultaneous logins for users in a specific server group.                                                                                                                                                           |
| Step 6 | <b>max-users</b> <i>number-of-users</i><br><br><b>Example:</b><br>Router (config)# max-users 1000                                                            | (Optional) Limits the number of connections to a specific server group.                                                                                                                                                                             |

## Verifying a VPN Session

To verify a VPN session, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **show crypto session group**
3. **show crypto session summary**

### DETAILED STEPS

|        | Command                                                                                      | Purpose                                                                                                          |
|--------|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |

|        | Command                                                                                          | Purpose                                                                                                                |
|--------|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>show crypto session summary</b><br><br><b>Example:</b><br>Router# show crypto session summary | Displays groups that are currently active on the VPN device and the users that are connected for each of those groups. |

## Applying Mode Configuration and Xauth

Mode Configuration and Xauth must be applied to a crypto map to be enforced. To apply Mode Configuration and Xauth to a crypto map, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map tag client configuration address [initiate | respond]**
4. **crypto map map-name isakmp authorization list list-name**
5. **crypto map map-name client authentication list list-name**

### DETAILED STEPS

|        | Command                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                  | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                               |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                 |
| Step 3 | <b>crypto map tag client configuration address [initiate   respond]</b><br><br><b>Example:</b><br>Router (config)# crypto map dyn client configuration address initiate | Configures the router to initiate or reply to Mode Configuration requests.<br><br><b>Note</b> Cisco clients require the <b>respond</b> keyword to be used; however, if the Cisco Secure VPN Client 1.x is used, the <b>initiate</b> keyword must be used; <b>initiate</b> and <b>respond</b> keywords may be used simultaneously. |
| Step 4 | <b>crypto map map-name isakmp authorization list list-name</b><br><br><b>Example:</b><br>Router (config)# crypto map ikessaaamap isakmp authorization list ikessaaalist | Enables IKE querying for group policy when requested by the client.<br><ul style="list-style-type: none"><li>• The <i>list-name</i> argument is used by AAA to determine which storage source is used to find the policy (local or RADIUS) as defined in the <b>aaa authorization network</b> command.</li></ul>                  |

|        | Command                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                  |

## Enabling Reverse Route Injection for the Client

To enable RRI on the crypto map (static or dynamic) for VPN client support, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto dynamic** *map-name* *seq-num*  
or  
**crypto map** *map-name* *seq-num* **ipsec-isakmp**
4. **set peer** *ip-address*
5. **set transform-set** *transform-set-name*
6. **reverse-route**
7. **match-address**

### DETAILED STEPS

|        | Command                                                                               | Purpose                                                                                                         |
|--------|---------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> <b>enable</b>                         | Enables privileged EXEC mode <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# <b>configure terminal</b> | Enters global configuration mode.                                                                               |

|               | Command                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>crypto dynamic</b> <i>map-name seq-num</i><br>or<br><b>crypto map</b> <i>map-name seq-num ipsec-isakmp</i><br><br><b>Example:</b><br>Router (config)# <b>crypto dynamic</b> mymap 10<br><br>or<br>Router (config)# <b>crypto map</b> yourmap 15<br>ipsec-isakmp | Creates a dynamic crypto map entry and enters crypto map configuration mode.<br><br>or<br><br>Adds a dynamic crypto map set to a static crypto map set and enters crypto map configuration mode.                                                                                                      |
| <b>Step 4</b> | <b>set peer</b> <i>ip-address</i><br><br><b>Example:</b><br>Router (config-crypto-map)# <b>set peer</b> 10.20.20.20                                                                                                                                                | Specifies an IPsec peer IP address in a crypto map entry. <ul style="list-style-type: none"> <li>This step is optional when configuring dynamic crypto map entries.</li> </ul>                                                                                                                        |
| <b>Step 5</b> | <b>set transform-set</b> <i>transform-set-name</i><br><br><b>Example:</b><br>Router (config-crypto-map)# <b>set transform-set</b> dessha                                                                                                                           | Specifies which transform sets are allowed for the crypto map entry. <ul style="list-style-type: none"> <li>Lists multiple transform sets in order of priority (highest priority first).</li> </ul> <b>Note</b> This list is the only configuration statement required in dynamic crypto map entries. |
| <b>Step 6</b> | <b>reverse-route</b><br><br><b>Example:</b><br>Router (config-crypto-map)# <b>reverse-route</b>                                                                                                                                                                    | Creates source proxy information.                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <b>match address</b><br><br><b>Example:</b><br>Router (config-crypto-map)# <b>match address</b>                                                                                                                                                                    | Specifies an extended access list for a crypto map entry. <ul style="list-style-type: none"> <li>This step is optional when configuring dynamic crypto map entries.</li> </ul>                                                                                                                        |

## Enabling IKE Dead Peer Detection

To enable a Cisco IOS VPN gateway (instead of the client) to send IKE DPD messages, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp keepalive** *secs retries*

## DETAILED STEPS

|        | Command                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                             |
|--------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                   |
| Step 3 | <b>crypto isakmp keepalive secs retries</b><br><br><b>Example:</b><br>Router (config)# crypto isakmp keepalive 20 10 | Allows the gateway to send DPD messages to the router. <ul style="list-style-type: none"> <li>The <i>secs</i> argument specifies the number of seconds between DPD messages (the range is from 1 to 3600 seconds); the <i>retries</i> argument specifies the number of seconds between retries if DPD messages fail (the range is from 2 to 60 seconds).</li> </ul> |

## Configuring RADIUS Server Support

To configure access to the server and allow the Cisco IOS VPN device to send requests to the server, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius server host *ip-address* [auth-port *port-number*] [acct-port *port-number*] [key string]**

### DETAILED STEPS

|        | Command                                                | Purpose                                                                                                          |
|--------|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |

|        | Command                                                                                                                                                  | Purpose                                                                                               |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Step 2 | <b>configure terminal</b>                                                                                                                                | Enters global configuration mode.                                                                     |
|        | <b>Example:</b><br>Router# configure terminal                                                                                                            |                                                                                                       |
| Step 3 | <b>radius server host</b> <i>ip-address</i> [ <b>auth-port</b> <i>port-number</i> ] [ <b>acct-port</b> <i>port-number</i> ] [ <b>key</b> <i>string</i> ] | Specifies a RADIUS server host.                                                                       |
|        | <b>Example:</b><br>Router (config)# radius server host<br>192.168.1.1. auth-port 1645 acct-port 1646<br>key XXXX                                         | <b>Note</b> This step is required if you choose to store group policy information in a RADIUS server. |

## Verifying Easy VPN Server

To verify your configurations for this feature, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **show crypto map** [*interface interface* | *tag map-name*]

### DETAILED STEPS

|        | Command                                                                     | Purpose                                                                              |
|--------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                               | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br>Router> enable                                           | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>show crypto map</b> [ <i>interface interface</i>   <i>tag map-name</i> ] | Displays the crypto map configuration.                                               |
|        | <b>Example:</b><br>Router# show crypto map interface ethernet 0             |                                                                                      |

## Configuring a Banner

To configure an Easy VPN server to push a banner to an Easy VPN remote device, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** {*group-name*}

#### 4. `banner c {banner-text} c`

### DETAILED STEPS

|        | Command                                                                                                                                                 | Purpose                                                                                                          |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                          | Enters global configuration mode.                                                                                |
| Step 3 | <b>crypto isakmp client configuration group {group-name}</b><br><br><b>Example:</b><br>Router (config)# crypto isakmp client configuration group Group1 | Specifies to which group a policy profile will be defined and enters crypto ISAKMP group configuration mode.     |
| Step 4 | <b>banner c {banner-text} c</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# banner c The quick brown fox jumped over the lazy dog c         | Specifies the text of the banner.                                                                                |

## Configuring Auto Upgrade

To configure an Easy VPN server to provide an automated mechanism to make software and firmware upgrades automatically available to an Easy VPN remote device, perform the following steps.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto isakmp client configuration group {group-name}`
4. `auto-update client {type-of-system} {url url} {rev review-version}`

## DETAILED STEPS

|        | Command                                                                                                                                                                                                                     | Purpose                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                              | Enters global configuration mode.                                                                                |
| Step 3 | <b>crypto isakmp client configuration group</b> {group-name}<br><br><b>Example:</b><br>Router (config)# crypto isakmp client configuration group Group2                                                                     | Specifies to which group a policy profile will be defined and enters crypto ISAKMP group configuration mode.     |
| Step 4 | <b>auto-update client</b> {type-of-system} {url} {rev review-version}<br><br><b>Example:</b><br>Router (config-isakmp-group)# auto-update client Win2000 url http:www.ourcompanysite.com/newclient rev 3.0.1(Rel), 3.1(Rel) | Configures auto-update parameters for an Easy VPN remote device.                                                 |

## Configuring Browser Proxy

To configure an EasyVPN server so that the Easy VPN remote device can access resources on the corporate network when using Cisco IOS VPN Client software, perform the following steps. With this configuration, the user does not have to manually modify the proxy settings of his or her web browser when connecting and does not have to manually revert the proxy settings when disconnecting.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration browser-proxy** {browser-proxy-name}
4. **proxy** {proxy-parameter}

## DETAILED STEPS

|        | Command                                                                                                                                                                         | Purpose                                                                                                               |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>      |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                  | Enters global configuration mode.                                                                                     |
| Step 3 | <b>crypto isakmp client configuration browser-proxy {browser-proxy-name}</b><br><br><b>Example:</b><br>Router (config)# crypto isakmp client configuration browser-proxy bproxy | Configures browser-proxy parameters for an Easy VPN remote device and enters ISAKMP Browser Proxy configuration mode. |
| Step 4 | <b>proxy {proxy-parameter}</b><br><br><b>Example:</b><br>Router (config-ikmp-browser-proxy)# proxy auto-detect                                                                  | Configures proxy parameters for an Easy VPN remote device.                                                            |

## Configuring the Pushing of a Configuration URL Through a Mode-Configuration Exchange

To configure an Easy VPN server to push a configuration URL through a Mode-Configuration Exchange, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group {group-name}**
4. **configuration url {url}**
5. **configuration version {version-number}**

## DETAILED STEPS

|        | Command                                                                                                                                                 | Purpose                                                                                                                                                                                                                                               |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                          | Enters global configuration mode.                                                                                                                                                                                                                     |
| Step 3 | <b>crypto isakmp client configuration group</b> {group-name}<br><br><b>Example:</b><br>Router (config)# crypto isakmp client configuration group Group1 | Specifies to which group a policy profile will be defined and enters crypto ISAKMP group configuration mode.                                                                                                                                          |
| Step 4 | <b>configuration url</b> {url}<br><br><b>Example:</b><br>Router (config-isakmp-group)# configuration url http://10.10.88.8/easy.cfg                     | Specifies the URL the remote device must use to get the configuration from the server. <ul style="list-style-type: none"><li>The URL must be a non-NULL terminated ASCII string that specifies the complete path of the configuration file.</li></ul> |
| Step 5 | <b>configuration version</b> {version-number}<br><br><b>Example:</b><br>Router (config-isakmp-group)# configuration version 10                          | Specifies the version of the configuration. <ul style="list-style-type: none"><li>The version number will be an unsigned integer in the range 1 through 32767.</li></ul>                                                                              |

## Configuring Per User AAA Download with PKI—Configuring the Crypto PKI Trustpoint

To configure a AAA server to push user attributes to a remote device, perform the following steps.

### Prerequisites

Before configuring a AAA server to push user attributes to a remote device, you must have configured AAA. The crypto PKI trustpoint must also be configured (see the first configuration task below). It is preferable that the trustpoint configuration contain the **authorization username** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment url** *url*

5. **revocation-check none**
6. **rsakeypair** *key-label*
7. **authorization username** {**subjectname** *subjectname*}
8. **exit**

## DETAILED STEPS

|        | Command                                                                                                                                                                           | Purpose                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                    | Enters global configuration mode.                                                                                |
| Step 3 | <b>crypto pki trustpoint</b> <i>name</i><br><br><b>Example:</b><br>Router (config)# crypto pki trustpoint<br>ca-server                                                            | Declares the trustpoint that your router should use and enters ca-trustpoint configuration mode.                 |
| Step 4 | <b>enrollment url</b> <i>url</i><br><br><b>Example:</b><br>Router (config-ca-trustpoint)# enrollment<br>url http://10.7.7.2:80                                                    | Specifies the URL of the certification authority (CA) server to which to send enrollment requests.               |
| Step 5 | <b>revocation-check none</b><br><br><b>Example:</b><br>Router (config-ca-trustpoint)#<br>revocation-check none                                                                    | Checks the revocation status of a certificate.                                                                   |
| Step 6 | <b>rsakeypair</b> <i>key-label</i><br><br><b>Example:</b><br>Router (config-ca-trustpoint)# rsakeypair<br>rsa-pair                                                                | Specifies which key pair to associate with the certificate.                                                      |
| Step 7 | <b>authorization username</b> { <b>subjectname</b> <i>subjectname</i> }<br><br><b>Example:</b><br>Router (config-ca-trustpoint)# authorization<br>username subjectname commonname | Specifies the parameters for the different certificate fields that are used to build the AAA username.           |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router (config-ca-trustpoint)# exit                                                                                                         | Exits ca-trustpoint configuration mode.                                                                          |

## Configuring the Actual Per User AAA Download with PKI

To configure the actual per-user download with PKI, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp policy** *priority*
4. **group** {1 | 2}
5. **exit**
6. **crypto isakmp profile** *profile-name*
7. **match certificate** *certificate-map*
8. **client pki authorization list** *listname*
9. **client configuration address** {*initiate* | *respond*}
10. **virtual-template** *template-number*
11. **exit**
12. **crypto ipsec transform-set** [*transform-set-name transform1*] [*transform2*] [*transform3*] [*transform4*]
13. **crypto ipsec profile** *name*
14. **set transform-set** *transform-set-name*

### DETAILED STEPS

|        | Command                                                                                                        | Purpose                                                                                                             |
|--------|----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                 | Enters global configuration mode.                                                                                   |
| Step 3 | <b>crypto isakmp policy</b> <i>priority</i><br><br><b>Example:</b><br>Router (config)# crypto isakmp policy 10 | Defines an IKE policy and enters ISAKMP policy configuration mode.                                                  |
| Step 4 | <b>group</b> {1   2}<br><br><b>Example:</b><br>Router (config-isakmp-policy)# group 2                          | Specifies the Diffie-Hellman group identifier within an IKE policy.                                                 |

|         | Command                                                                                                                                                                                                                           | Purpose                                                                                                                                                                |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5  | <b>exit</b><br><br><b>Example:</b><br>Router (config-isakmp-policy)# exit                                                                                                                                                         | Exits ISAKMP policy configuration mode.                                                                                                                                |
| Step 6  | <b>crypto isakmp profile</b> <i>profile-name</i><br><br><b>Example:</b><br>Router (config)# crypto isakmp profile<br>ISA-PROF                                                                                                     | Defines an ISAKMP profile and audits IPsec user sessions and enters crypto ISAKMP profile configuration mode.                                                          |
| Step 7  | <b>match certificate</b> <i>certificate-map</i><br><br><b>Example:</b><br>Router (config-isakmp-profile)# match<br>certificate cert_map                                                                                           | Assigns an ISAKMP profile to a peer on the basis of the contents of arbitrary fields in the certificate.                                                               |
| Step 8  | <b>client pki authorization list</b> <i>listname</i><br><br><b>Example:</b><br>Router (config-isakmp-profile)# client pki<br>authorization list usrgrp                                                                            | Specifies the authorization list of AAA servers that will be used for obtaining per-user AAA attributes on the basis of the username constructed from the certificate. |
| Step 9  | <b>client configuration address</b> { <b>initiate</b>   <b>respond</b> }<br><br><b>Example:</b><br>Router (config-isakmp-profile)# client<br>configuration address respond                                                        | Configures IKE configuration mode in the ISAKMP profile.                                                                                                               |
| Step 10 | <b>virtual-template</b> <i>template-number</i><br><br><b>Example:</b><br>Router(config-isakmp-profile)#<br>virtual-template 2                                                                                                     | Specifies which virtual template will be used to clone virtual access interfaces.                                                                                      |
| Step 11 | <b>exit</b><br><br><b>Example:</b><br>Router(config-isakmp-profile)# exit                                                                                                                                                         | Exits crypto ISAKMP profile configuration mode.                                                                                                                        |
| Step 12 | <b>crypto ipsec transform-set</b><br><i>transform-set-name transform1 [transform2]</i><br><i>[transform3] [transform4]</i><br><br><b>Example:</b><br>Router (config)# crypto ipsec transform-set<br>trans2 esp-3des esp-sha-hmac1 | Defines a transform set—an acceptable combination of security protocols and algorithms.                                                                                |

|         | Command                                                                                                                | Purpose                                                                                          |
|---------|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Step 13 | <b>crypto ipsec profile</b> <i>name</i><br><br><b>Example:</b><br>Router (config)# crypto ipsec profile<br>IPSEC_PROF  | Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec routers. |
| Step 14 | <b>set transform-set</b> <i>transform-set-name</i><br><br><b>Example:</b><br>Router (config)# set transform-set trans2 | Specifies which transform sets can be used with the crypto map entry.                            |

## Configuring Per-User Attributes on a Local Easy VPN AAA Server

To configure per-user attributes on a local Easy VPN AAA server, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa attribute list** *list-name*
4. **attribute type** *name value* [**service** *service*] [**protocol** *protocol*]
5. **exit**
6. **crypto isakmp client configuration group** *group-name*
7. **crypto aaa attribute list** *list-name*

### DETAILED STEPS

|        | Command or Action                                                                                             | Purpose                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                | Enters global configuration mode.                                                                                  |
| Step 3 | <b>aaa attribute list</b> <i>list-name</i><br><br><b>Example:</b><br>Router(config)# aaa attribute list list1 | Defines a AAA attribute list locally on a router and enters attribute list configuration mode.                     |

|        | Command or Action                                                                                                                                                                   | Purpose                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Step 4 | <b>attribute type name value [service service] [protocol protocol]</b><br><br><b>Example:</b><br>Router(config-attr-list)# attribute type<br>attribute xxxx service ike protocol ip | Defines an attribute type that is to be added to an attribute list locally on a router.               |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-attr-list)# exit                                                                                                                | Exits attribute list configuration mode.                                                              |
| Step 6 | <b>crypto isakmp client configuration group group-name</b><br><br><b>Example:</b><br>Router (config)# crypto isakmp client<br>configuration group group1                            | Specifies to which group a policy profile will be defined and enters ISAKMP group configuration mode. |
| Step 7 | <b>crypto aaa attribute list list-name</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# crypto aaa<br>attribute list listname1                                           | Defines a AAA attribute list locally on a router.                                                     |

## Enabling Easy VPN Syslog Messages

To enable Easy VPN syslog messages on a server, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto logging ezvpn group group-name**

### DETAILED STEPS

|        | Command                                                | Purpose                                                                                                            |
|--------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command                                                               | Purpose                                                                                                                                                                                                                                                                                                                   |
|--------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>configure terminal</b>                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                         |
|        | <b>Example:</b><br>Router# configure terminal                         |                                                                                                                                                                                                                                                                                                                           |
| Step 3 | <b>crypto logging ezvpn</b> [ <i>group group-name</i> ]               | Enables Easy VPN syslog messages on a server.                                                                                                                                                                                                                                                                             |
|        | <b>Example:</b><br>Router (config)# crypto logging ezvpn group group1 | <ul style="list-style-type: none"> <li>The <b>group</b> keyword and <i>group-name</i> argument are optional. If a group name is not provided, syslog messages are enabled for all Easy VPN connections to the server. If a group name is provided, syslog messages are enabled for that particular group only.</li> </ul> |

## Defining a CPP Firewall Policy Push Using a Local AAA Server

To define a CPP firewall policy push on a server to allow or deny a tunnel on the basis of whether a remote device has a required firewall for a local AAA server, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client firewall** {*policy-name*} {**required** | **optional**} {*firewall-type*}
4. **policy** {**check-presence** | **central-policy-push** {**access-list** {**in** | **out**} *access-list-name* | *access-list-number*}}

### DETAILED STEPS

|        | Command                                       | Purpose                                                                            |
|--------|-----------------------------------------------|------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode.                                                      |
|        | <b>Example:</b><br>Router> enable             | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                  |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                    |

|        | Command                                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p><b>crypto isakmp client firewall</b> {<i>policy-name</i>}<br/>{<b>required</b>   <b>optional</b>} {<i>firewall-type</i>}</p> <p><b>Example:</b><br/>Router (config)# crypto isakmp client<br/>firewall hw-client-g-cpp required<br/>Cisco-Security-Agent</p>                                                                                                             | <p>Defines the CPP firewall push policy on a server and enters ISAKMP client firewall configuration mode.</p> <p>The arguments and keywords are as follows:</p> <ul style="list-style-type: none"> <li>• <b>policy-name</b>—Uniquely identifies a policy. A policy name can be associated with the Easy VPN client group configuration of the server (local group configuration) or on the AAA server.</li> <li>• <b>required</b>—Policy is mandatory. If the CPP policy is defined as mandatory and is included in the Easy VPN server configuration, the tunnel setup is allowed only if the client confirms this policy. Otherwise, the tunnel is terminated.</li> <li>• <b>optional</b>—Policy is optional. If the CPP policy is defined as optional, and is included in the Easy VPN server configuration, the tunnel setup is continued even if the client does not confirm the defined policy.</li> <li>• <b>firewall-type</b>—Type of firewall (see the <b>crypto isakmp client firewall</b> command for a list of firewall types).</li> </ul> |
| Step 4 | <p><b>policy</b> {<b>check-presence</b>   <b>central-policy-push</b>}<br/>{<b>access-list</b> {<b>in</b>   <b>out</b>} <i>access-list-name</i>  <br/><i>access-list-number</i>}}</p> <p><b>Example:</b><br/>Router (config-ikmp-client-fw)# policy<br/>central-policy-push access-list out acl1</p> <p>or<br/>Router (config-ikmp-client-fw)# policy<br/>check-presence</p> | <p>Defines the CPP firewall policy push.</p> <p>The arguments and keywords are as follows:</p> <ul style="list-style-type: none"> <li>• <b>check-presence</b>—Denotes that the server should check for the presence of the specified firewall as shown by the value of the <i>firewall-type</i> argument on the client.</li> <li>• <b>central-policy-push</b>—The configuration following this keyword specifies the actual policy, such as the input and output access lists that have to be applied by the client firewall, which is of the type specified by the value of the <i>firewall-type</i> argument.</li> <li>• <b>access-list {in   out}</b>—Defines the inbound and outbound access lists.</li> <li>• <b>access-list-name   access-list-number</b>—Name or number of the access list.</li> </ul>                                                                                                                                                                                                                                          |

## What to Do Next

Apply the CPP firewall policy push to the configured group.

## Applying a CPP Firewall Policy Push to the Configuration Group

Now that the CPP firewall policy push has been defined, it must be applied to the configuration group by performing the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** {*group-name*}
4. **firewall policy** {*policy-name*}

## DETAILED STEPS

|        | Command                                                                                                                                                               | Purpose                                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                 |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                        | Enters global configuration mode.                                                                                                   |
| Step 3 | <b>crypto isakmp client configuration group</b> { <i>group-name</i> }<br><br><b>Example:</b><br>Router (config)# crypto isakmp client configuration group hw-client-g | Specifies to which group a policy profile will be defined and enters ISAKMP group configuration mode.                               |
| Step 4 | <b>firewall policy</b> { <i>policy-name</i> }<br><br><b>Example:</b><br>Router (crypto-isakmp-group)# firewall policy hw-client-g-cpp                                 | Specifies the CPP firewall push policy name for the crypto ISAKMP client configuration group on a local authentication, AAA server. |

## Defining a CPP Firewall Policy Push Using a Remote AAA Server

To define a CPP firewall policy push using a remote AAA server, see the section “[Defining a CPP Firewall Policy Push Using a Local AAA Server](#).” The steps are the same for this configuration.

## What to Do Next

After defining the CPP firewall policy push, you should add the VSA cpp-policy under the group definition.

## Adding the VSA CPP-Policy Under the Group Definition

To add the the VSA cpp-policy under the group definition that is defined in RADIUS, perform the following step.

## SUMMARY STEPS

1. Add the VSA cpp-policy under the group definition that is defined in RADIUS.

## DETAILED STEPS

|        | Command                                                                                                                                         | Purpose                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Step 1 | Add the VSA “cpp-policy” under the group definition that is defined in RADIUS.<br><br><b>Example:</b><br>ipsec:cpp-policy=”Enterprise Firewall” | Defines the CPP firewall push policy for a remote server. |

## Verifying CPP Firewall Policy Push

To verify the CPP firewall push policy on a local or remote AAA server, perform the following steps.

## SUMMARY STEPS

1. `enable`
2. `debug crypto isakmp`

## DETAILED STEPS

|        | Command                                                                                             | Purpose                                                                                                               |
|--------|-----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> <code>enable</code>                           | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <code>debug crypto isakmp</code><br><br><b>Example:</b><br>Router# <code>debug crypto isakmp</code> | Displays messages about IKE events.                                                                                   |

## Configuring Password Aging

To configure Password Aging so that the Easy VPN client is notified if the password has expired, perform the following steps.

## Restrictions

The following restrictions apply to the Password Aging feature:

- It works only with VPN software clients. It does not work with VPN client hardware.
- It works only with RADIUS servers.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login {list-name} password-expiry method1 [method2...]**
5. **radius-server host {ip-address} auth-port port-number acct-port port-number key string**
6. Configure the ISAKMP profile
7. **client authentication list {list-name}**

## DETAILED STEPS

|        | Command                                                                                                                                                                                                                                                               | Purpose                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                        | Enters global configuration mode.                                                                                   |
| Step 3 | <b>aaa new-model</b><br><br><b>Example:</b><br>Router (config)# aaa new-model                                                                                                                                                                                         | Enables AAA.                                                                                                        |
| Step 4 | <b>aaa authentication login {list-name} password-expiry method1 [method2...]</b><br><br><b>Example:</b><br>Router (config)# aaa authentication login userauth paswd-expiry group radius                                                                               | Configures the authentication list so that the Password Aging feature is enabled.                                   |
| Step 5 | <b>radius-server host {ip-address} auth-port port-number acct-port port-number key string</b><br><br><b>Example:</b><br>Router (config)# radius-server host 172.19.217.96 255.255.255.0 auth-port 1645 acct-port 1646 key cisco radius-server vsa send authentication | Configures the RADIUS server.                                                                                       |

|        | Command                                                                                                                                           | Purpose                                                                                                                                               |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | Configure the ISAKMP profile.<br><br><b>Example:</b><br>see the section “ <a href="#">Configuring Password Aging: Example</a> ”                   | Configures the ISAKMP profile and enters ISAKMP profile configuration mode (see the section “ <a href="#">Configuring Password Aging: Example</a> ”). |
| Step 7 | <code>client authentication list {list-name}</code><br><br><b>Example:</b><br>Router (config-isakmp-profile)# client authentication list userauth | Configures IKE extended authentication (Xauth) in an ISAKMP profile and includes the authentication list that was defined above.                      |

## Configuring Split DNS

To configure Split DNS, perform the following steps.

### Prerequisites

Before the Split DNS feature can work, the following commands should have been configured on the Easy VPN remote:

- `ip dns server`
- `ip domain-lookup`

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto isakmp client configuration group group-name`
4. `dns primary-server secondary-server`
5. `split-dns domain-name`

### DETAILED STEPS

|        | Command                                                                              | Purpose                                                                                                             |
|--------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                   |

|        | Command                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                    |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>crypto isakmp client configuration group</b> <i>{group-name   default}</i><br><br><b>Example:</b><br>Router (config)# crypto isakmp client configuration group group1 | Specifies the policy profile of the group that will be defined and enters ISAKMP group configuration mode. <ul style="list-style-type: none"> <li>If no specific group matches and a default group is defined, users will automatically be given the policy of a default group.</li> </ul> |
| Step 4 | <b>dns primary-server secondary-server</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# dns 10.2.2.2 10.3.3.3                                                 | Specifies the primary and secondary DNS servers for the group.                                                                                                                                                                                                                             |
| Step 5 | <b>split-dns domain-name</b><br><br><b>Example:</b><br>Router (config-isakmp-group)# split-dns green.com                                                                 | Specifies a domain name that must be tunneled or resolved to the private network.                                                                                                                                                                                                          |

## Verifying Split DNS

To verify a split DNS configuration, perform the following steps (the **show** commands can be used one at a time or together).

### SUMMARY STEPS

1. **enable**
2. **show ip dns name-list** *[name-list-number]*
3. **show ip dns view** *[vrf vrf-name] [default | view-name]*
4. **show ip dns view-list** *[view-list-name]*

### DETAILED STEPS

|        | Command                                                                                                          | Purpose                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>show ip dns name-list</b> <i>[name-list-number]</i><br><br><b>Example:</b><br>Router# show ip dns name-list 1 | Displays information about DNS name lists.                                                                       |

|        | Command                                                                                                                                                 | Purpose                                    |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| Step 3 | <b>show ip dns view</b> [ <b>vrf</b> <i>vrf-name</i> ] [ <b>default</b>   <i>view-name</i> ]<br><br><b>Example:</b><br>Router# show ip dns view default | Displays information about DNS views.      |
| Step 4 | <b>show ip dns view-list</b> [ <i>view-list-name</i> ]<br><br><b>Example:</b><br>Router# show ip dns view-list<br>ezvpn-internal-viewlist               | Displays information about DNS view lists. |

## Monitoring and Maintaining Split DNS

To monitor and maintain the split DNS configuration on Easy VPN remote devices, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **debug ip dns name-list**
3. **debug ip dns view**
4. **debug ip dns view-list**

### DETAILED STEPS

|        |                                                                                        |                                                                                                                    |
|--------|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>debug ip dns name-list</b><br><br><b>Example:</b><br>Router# debug ip dns name-list | Enables debugging output for Domain Name System (DNS) name-list events.                                            |
| Step 3 | <b>debug ip dns view</b><br><br><b>Example:</b><br>Router# debug ip dns view           | Enables debugging output for DNS view events.                                                                      |
| Step 4 | <b>debug ip dns view-list</b><br><br><b>Example:</b><br>Router# debug ip dns view-list | Enables debugging output for DNS view-list events.                                                                 |

## Configuring an Easy VPN Server to Obtain an IP Address from a DHCP Server

When the Easy VPN server selects the method for address assignment, it does so in the following order of precedence:

1. Selects the Framed IP address
2. Uses the IP address from the authentication server (group/user)
3. Uses the global IKE address pools
4. Uses DHCP

### Note

To enable the Easy VPN server to obtain an IP address from a DHCP server, remove other address assignments.

To configure an Easy VPN server to obtain an IP address from a DHCP server, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** *group-name*
4. **dhcp server** {*ip-address* | *hostname*}
5. **dhcp timeout** *time*
6. **dhcp giaddr** *scope*

### DETAILED STEPS

|                                                                                                              |                                                                   |                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b><br><br><br><b>Example:</b><br>Router> enable                                                   | <b>enable</b>                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                |
| <b>Step 2</b><br><br><br><b>Example:</b><br>Router# configure terminal                                       | <b>configure terminal</b>                                         | Enters global configuration mode.                                                                                                                                                                                                               |
| <b>Step 3</b><br><br><br><b>Example:</b><br>Router (config)# crypto isakmp client configuration group group1 | <b>crypto isakmp client configuration group</b> <i>group-name</i> | Specifies to which group a policy profile will be defined. <p><b>Note</b> Entering this command places the CLI in ISAKMP group configuration mode. From this mode, you can use subcommands to specify characteristics for the group policy.</p> |
| <b>Step 4</b><br><br><br><b>Example:</b><br>Router (config-isakmp-group)# dhcp server 10.10.1.2              | <b>dhcp server</b> { <i>ip-address</i>   <i>hostname</i> }        | Specifies a primary (and backup) DHCP server to allocate IP addresses to MS users entering a particular public data network (PDN) access point.                                                                                                 |

|               |                                                                                                              |                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>dhcp timeout</b> <i>time</i><br><br><b>Example:</b><br>Router (config-isakmp-group)# dhcp timeout 6       | Sets the wait time in seconds before the next DHCP server on the list is tried. |
| <b>Step 6</b> | <b>dhcp giaddr</b> <i>scope</i><br><br><b>Example:</b><br>Router (config-isakmp-group)# dhcp giaddr 10.1.1.4 | Specifies the giaddr for the DHCP scope.                                        |

## Verifying DHCP Client Proxy

To verify your DHCP client proxy configuration, perform the following steps (use the **show** commands one at a time or together).

### SUMMARY STEPS

1. **enable**
2. **show dhcp lease**
3. **show ip dhcp pool**
4. **show ip dhcp binding**

### DETAILED STEPS

|               |                                                                                    |                                                                                                                                                                                                                                               |
|---------------|------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                            |
| <b>Step 1</b> | <b>show dhcp lease</b><br><br><b>Example:</b><br>Router# show dhcp lease           | Displays information about the DHCP address pools.<br><br><b>Note</b> Use this command when an external DHCP is used.                                                                                                                         |
| <b>Step 2</b> | <b>show ip dhcp pool</b><br><br><b>Example:</b><br>Router# show ip dhcp pool       | Displays information about the DHCP address pools.<br><br><b>Note</b> This command is applicable only when the Easy VPN server is also the DHCP server (generally not the case because in most cases, the DHCP server is an external server). |
| <b>Step 3</b> | <b>show ip dhcp binding</b><br><br><b>Example:</b><br>Router# show ip dhcp binding | Displays address bindings on the DHCP server.<br><br><b>Note</b> This command is applicable only when the Easy VPN server is also the DHCP server (generally not the case because in most cases, the DHCP server is an external server).      |

## Monitoring and Maintaining DHCP Client Proxy

To monitor and maintain your DHCP client proxy configuration, perform the following steps (use the **debug** commands one at a time or together).

### SUMMARY STEPS

1. **enable**
2. **debug crypto isakmp**
3. **debug dhcp**
4. **debug dhcp detail**
5. **debug ip dhcp server events**

### DETAILED STEPS

|        |                                                                                                  |                                                                                                                                                                                                                                                                  |
|--------|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                 |
| Step 2 | <b>debug crypto isakmp</b><br><br><b>Example:</b><br>Router# debug crypto isakmp                 | Displays messages about Internet Key Exchange (IKE) event.                                                                                                                                                                                                       |
| Step 3 | <b>debug dhcp</b><br><br><b>Example:</b><br>Router# debug dhcp                                   | Reports server events, like address assignments and database updates.                                                                                                                                                                                            |
| Step 4 | <b>debug dhcp detail</b><br><br><b>Example:</b><br>Router# debug dhcp detail                     | Displays detailed DHCP debugging information.                                                                                                                                                                                                                    |
| Step 5 | <b>debug ip dhcp server events</b><br><br><b>Example:</b><br>Router# debug ip dhcp server events | Reports server events, like address assignments and database updates.<br><br><b>Note</b> This command is applicable only when the Easy VPN server is also the DHCP server (generally not the case because in most cases, the DHCP server is an external server). |

## Configuring cTCP

To enable cTCP, perform the following steps on your Easy VPN server.

### Prerequisites

Before configuring cTCP, you should have configured crypto IPsec.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ctcp port** [*port-number*]

## DETAILED STEPS

|               |                                                                                                                |                                                                                                                                                                                                                                               |
|---------------|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                 | Enters global configuration mode.                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>crypto ctcp port</b> [ <i>port-number</i> ]<br><br><b>Example:</b><br>Router (config)# crypto ctcp port 120 | Configures cTCP encapsulation for Easy VPN. <ul style="list-style-type: none"><li>• Up to 10 port numbers can be configured.</li><li>• If the <i>port-number</i> argument is not configured, cTCP is enabled on port 80 by default.</li></ul> |

## Verifying cTCP

To verify your cTCP configuration, perform the following steps (the **show** commands can be used one at a time or together).

## SUMMARY STEPS

1. **enable**
2. **show crypto ctcp** [*peer ip-address*]

## DETAILED STEPS

|               |                                                                                                                         |                                                                                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| <b>Step 2</b> | <b>show crypto ctcp</b> [ <i>peer ip-address</i> ]<br><br><b>Example:</b><br>Router# show crypto ctcp peer 10.76.235.21 | Displays information about a specific cTCP peer.                                                                 |

## Monitoring and Maintaining a cTCP Configuration

To monitor and maintain your cTCP configuration, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **debug crypto ctcp**

## DETAILED STEPS

|                                                                           |                          |                                                                                                                  |

## Troubleshooting a cTCP Configuration

To troubleshoot a cTCP configuration, perform the following steps.

### SUMMARY STEPS

1. Ensure that the cTCP session is in the CTCP\_ACK\_RECEIVED state.
2. If the cTCP session is not in the CTCP\_ACK\_RECEIVED state, enable the **debug crypto ctcp** command.
3. If no cTCP bugs are seen, ensure that the firewall is allowing the cTCP packets to get to the server.
4. If the firewall configuration is correct, debugging is enabled, and you do not see any cTCP debugs on your console, you must find out why the cTCP port on the router is not receiving packets.

### DETAILED STEPS

- 
- |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | To ensure that the cTCP session is in the CTCP_ACK_RECEIVED state, use the <b>show crypto ctcp</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 2</b> | If the cTCP session is not in the CTCP_ACK_RECEIVED state, enable the <b>debug crypto ctcp</b> command and then try using the <b>show crypto ctcp</b> command again.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | If no cTCP bugs are seen, ensure that the firewall is allowing the cTCP packets to get to the server (check the firewall configuration).                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 4</b> | If the firewall configuration is correct, debugging is enabled, and you do not see any cTCP debugs on your console, you must find out why the cTCP port on the router is not receiving packets. If you do not see any cTCP debugs and a cTCP session has not been set up, there is a possibility that cTCP packets that are actually TCP packets could have been delivered to a TCP stack instead of to the cTCP port. By enabling the <b>debug ip packet</b> and <b>debug ip tcp packet</b> commands, you may be able to determine whether the packet is being given to the TCP stack. |

## RADIUS Group Profile with IPsec AV Pairs: Example

The following is an example of a standard RADIUS group profile that includes RADIUS IPsec AV pairs. To get the group authorization attributes, “cisco” must be used as the password.

```

client_r Password = "cisco"
Service-Type = Outbound

cisco-avpair = "ipsec:tunnel-type*ESP"
cisco-avpair = "ipsec:key-exchange=ike"
cisco-avpair = "ipsec:tunnel-password=lab"
cisco-avpair = "ipsec:addr-pool=pool1"
cisco-avpair = "ipsec:default-domain=cisco"
cisco-avpair = "ipsec:inac1=101"
cisco-avpair = "ipsec:access-restrict=fastethernet 0/0"
cisco-avpair = "ipsec:group-lock=1"
cisco-avpair = "ipsec:dns-servers=10.1.1.1 10.2.2.2"
cisco-avpair = "ipsec:firewall=1"
cisco-avpair = "ipsec:include-local-lan=1"
cisco-avpair = "ipsec:save-password=1"
cisco-avpair = "ipsec:wins-servers=10.3.3.3 10.4.4.4"
cisco-avpair = "ipsec:split-dns=green.com"
cisc-avpair = "ipsec:ipsec-backup-gateway=10.1.1.1"

```

```

ciscoc-vpair = "ipsec:ipsec-backup-gateway=10.1.1.2"
ciscoc-vpair = "ipsec:pfs=1"
ciscoc-vpair = "ipsec:cpp-policy="Enterprise Firewall"
ciscoc-vpair = "ipsec:auto-update="Win http://abc.com 4.0.1"
ciscoc-vpair = "ipsec:browser-proxy=bproxy_profile_A"
ciscoc-vpair = "ipsec:xauth-banner="Xauth banner text here"

```

## RADIUS User Profile with IPsec AV Pairs: Example

The following is an example of a standard RADIUS user profile that includes RADIUS IPsec AV pairs. These user attributes will be obtained during Xauth.

```

ualluall Password = "uall1234"
 cisco-vpair = "ipsec:user-vpn-group=unity"
 cisco-vpair = "ipsec:user-include-local-lan=1"
 cisco-vpair = "ipsec:user-save-password=1"
 Framed-IP-Address = 10.10.10.10

```

## Backup Gateway with Maximum Logins and Maximum Users: Example

The following example shows that five backup gateways have been configured, that the maximum users have been set to 250, and that maximum logins have been set to 2:

```

crypto isakmp client configuration group sdm
 key 6 RMZPPMRQMSdiZNJg`EBbCWTkSTi\d[
 pool POOL1
 acl 150
 backup-gateway 172.16.12.12
 backup-gateway 172.16.12.13
 backup-gateway 172.16.12.14
 backup-gateway 172.16.12.130
 backup-gateway 172.16.12.131
 max-users 250
 max-logins 2

```

## Pushing a Configuration URL Through a Mode-Configuration Exchange: Examples

The following **show crypto ipsec client ezvpn** command output displays the mode configuration URL location and version:

```
Router# show crypto ipsec client ezvpn
```

```

Easy VPN Remote Phase: 5

Tunnel name : branch
Inside interface list: Vlan1
Outside interface: FastEthernet0
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
Address: 172.16.1.209
Mask: 255.255.255.255
Default Domain: cisco.com
Save Password: Allowed
Configuration URL [version]: tftp://172.16.30.2/branch.cfg [11]
Config status: applied, Last successfully applied version: 11
Current EzVPN Peer: 192.168.10.1

```

The following **show crypto isakmp peers config** command output displays all manageability information that is sent by the remote device.

```
Router# show crypto isakmp peers config
```

```

## Network Admission Control: Example

The following is output for an Easy VPN server that has been enabled with Network Admission Control.

### Note

Network Admission Control is supported on an Easy VPN server only when the server uses IPsec virtual interfaces. Network Admission Control is enabled on the virtual template interface and applies to all PC clients that use this virtual template interface.

```
Router# show running-config
```

```
Building configuration...
```

```
Current configuration : 5091 bytes
```

```

!
version 12.4
!
hostname Router
!

```

```
aaa new-model
```

```

!
!
aaa authentication login userlist local
!

```

```

aaa authentication eou default group radius
aaa authorization network hw-client-groupname local
aaa accounting update newinfo
aaa accounting network acclist start-stop broadcast group radius
aaa session-id common
!

```

```

! Note 1: EAPoUDP packets will use the IP address of the loopback interface when sending
the EAPoUDP hello to the Easy VPN client. Using the IP address ensures that the returning
EAPoUDP packets come back encrypted and are associated with the correct virtual access
interface. The ip admission (ip admission source-interface Loopback10) command is
optional. Instead of using this command, you can specify the IP address of the virtual
template to be an address in the inside network space as shown in the configuration of the
virtual template below in Note 2.

```

```

ip admission source-interface Loopback10
ip admission name test eapoudp inactivity-time 60

## Split DNS: Examples

In the following example, the split tunnel list named “101” contains the 10.168.0.0/16 network. It is necessary to include this network information so that the DNS requests to the internal DNS server of 10.168.1.1 are encrypted.

```
crypto isakmp client configuration group home
 key abcd
 acl 101
 dns 10.168.1.1. 10.168.1.2
```

### show Output

The following **show** command output example shows that `www.ciscoexample1.com` and `www.ciscoexample2.com` have been added to the policy group:

```
Router# show running-config | security group

crypto isakmp client configuration group 831server
key abcd
dns 10.104.128.248
split-dns www.ciscoexample1.com
split-dns www.ciscoexample2.com
group home2 key abcd
```

The following **show** command output example displays currently configured DNS views:

```
Router# show ip dns view

DNS View default parameters:
Logging is off
DNS Resolver settings:
 Domain lookup is enabled
 Default domain name: cisco.com
 Domain search list:
 Lookup timeout: 3 seconds
 Lookup retries: 2
 Domain name-servers:
 172.16.168.183
DNS Server settings:
 Forwarding of queries is enabled
 Forwarder addresses:

DNS View ezvpn-internal-view parameters:
Logging is off
DNS Resolver settings:
 Domain lookup is enabled
 Default domain name:
 Domain search list:
 Lookup timeout: 3 seconds
 Lookup retries: 2
 Domain name-servers:
 10.104.128.248
DNS Server settings:
 Forwarding of queries is enabled
 Forwarder addresses:
```

The following **show** command output example displays currently configured DNS view lists.

```
Router# show ip dns view-list

View-list ezvpn-internal-viewlist:
View ezvpn-internal-view:
 Evaluation order: 10
```

```

Restrict to ip dns name-list: 1
View default:
Evaluation order: 20

```

The following **show** command output displays DNS name lists.

```
Router# show ip dns name-list
```

```

ip dns name-list 1
 permit www.ciscoexample1.com
 permit www.ciscoexample2.com

```

## DHCP Client Proxy: Examples

The following examples display DHCP client proxy output information using **show** and **debug** commands.

### show Output

#### Note

To use the **show ip dhcp** command, the DHCP server must be a Cisco IOS server.

The following **show ip dhcp pool** command output provides information about the DHCP parameters:

```
Router# show ip dhcp pool
```

```

Pool dynpool :
 Utilization mark (high/low) : 100 / 0
 Subnet size (first/next) : 0 / 0
 Total addresses : 254
 Leased addresses : 1
 Pending event : none
 1 subnet is currently in the pool:
 Current index IP address range Leased addresses
 10.3.3.1 - 10.3.3.254 1
 No relay targets associated with class aclass

```

The following **show ip dhcp** command output provides information about the DHCP bindings:

```
Router# show ip dhcp binding
```

```

Bindings from all pools not associated with VRF:
IP address Client-ID/ Lease expiration Type
 Hardware address/User name
10.3.3.5 0065.7a76.706e.2d63. Apr 04 2006 06:01 AM Automatic
6c69.656e.74

```

### debug Output

The following example shows how the **debug crypto isakmp** and **debug ip dhcp server events** commands can be used to troubleshoot your DHCP client proxy support configuration:

```

```

## cTCP Session: Example

The following **debug crypto ctcp** command output displays information about a cTCP session, and it includes comments about the output:

```
Router# debug crypto ctcp
```

```

! In the following two lines, a cTCP SYN packet is received from the client, and the cTCP
connection is created.
*Sep 26 11:14:37.135: cTCP: Connection[648B50C0] 10.76.235.21:3519 10.76.248.239:10000:
created
*Sep 26 11:14:37.135: cTCP: SYN from 10.76.235.21:3519
! In the following line, the SYN acknowledgement is sent to the client.
*Sep 26 11:14:37.135: cTCP: Sending SYN(680723B2)ACK(100C637) to 10.76.235.21:3519
! In the following two lines, an acknowledgement is received, and connection setup is
complete. IKE packets should now be received on this newly created cTCP session.
*Sep 26 11:14:37.135: cTCP: Connection[648B50C0] 10.76.235.21:3519 10.76.248.239:10000:
found
*Sep 26 11:14:37.135: cTCP: ACK from 10.76.235.21:3519
*Sep 26 11:14:37.727: cTCP: Connection[648B50C0] 10.76.235.21:3519 10.76.248.239:10000:
found

```

```

*Sep 26 11:14:37.731: cTCP: updating PEER Seq number to 168288031
*Sep 26 11:14:37.731: cTCP: Pak with contiguous buffer
*Sep 26 11:14:37.731: cTCP: mangling IKE packet from peer: 10.76.235.21:500->3519
 10.76.248.239:500->500
*Sep 26 11:14:37.731: cTCP: Connection[648B50C0] 10.76.235.21:3519 10.76.248.239:10000:
found
*Sep 26 11:14:37.799: cTCP: demangling outbound IKE packet: 10.76.248.239:500->500
 10.76.235.21:3519->500
*Sep 26 11:14:37.799: cTCP: encapsulating IKE packet
*Sep 26 11:14:37.799: cTCP: updating LOCAL Seq number to 17452987271
! The above lines show that after the required number of IKE packets are exchanged, IKE
and IPsec SAs are created.
*Sep 26 11:14:40.335: cTCP: updating PEER Seq number to 168304311
*Sep 26 11:14:40.335: cTCP: Pak with particles
*Sep 26 11:14:40.335: cTCP: encapsulating pak
*Sep 26 11:14:40.339: cTCP: datagramstart 0xF2036D8, network_start 0xF2036D8, size 112
*Sep 26 11:14:40.339: cTCP: Pak with contiguous buffer
*Sep 26 11:14:40.339: cTCP: allocated new buffer
*Sep 26 11:14:40.339: cTCP: updating LOCAL Seq number to 17452995351
*Sep 26 11:14:40.339: IP: s=10.76.248.239 (local), d=10.76.235.21 (FastEthernet1/1), len
148, cTCP
! The above lines show that Encapsulating Security Payload (ESP) packets are now being
sent and received.

```

## Command Reference

The following commands are introduced or modified in the feature or features.

- **aaa authentication login**
- **access-restrict**
- **acl (ISAKMP)**
- **auto-update client**
- **backup-gateway**
- **banner**
- **browser-proxy**
- **clear crypto ctp**
- **clear crypto session**
- **client authentication list**
- **client pki authorization list**
- **configuration url**
- **configuration version**
- **crypto aaa attribute list**
- **crypto ctp**
- **crypto ipsec server send-update**
- **crypto isakmp client configuration browser-proxy**
- **crypto isakmp client configuration group**
- **crypto isakmp client firewall**
- **crypto logging ezvpn**
- **debug crypto ctp**
- **debug crypto condition**

- **debug ip dns name-list**
- **debug ip dns view**
- **debug ip dns view-list**
- **dhcp server (isakmp)**
- **dhcp timeout**
- **domain (isakmp-group)**
- **firewall are-u-there**
- **firewall policy**
- **group-lock**
- **include-local-lan**
- **key (isakmp-group)**
- **max-logins**
- **max-users**
- **pfs**
- **policy**
- **pool (isakmp-group)**
- **proxy**
- **save-password**
- **show crypto ctp**
- **show crypto debug-condition**
- **show crypto isakmp peers**
- **show crypto isakmp profile**
- **show crypto isakmp sa**
- **show crypto session**
- **show crypto session group**
- **show crypto session summary**
- **show ip dns name-list**
- **show ip dns view**
- **show ip dns view-list**
- **split-dns**
- **wins**
- **Glossary**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Feature Information for Easy VPN Server

Table 3 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

Table 3 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 3** Feature Information for Easy VPN Server

| Feature Name    | Releases                | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Easy VPN Server | 12.2(8)T                | The Easy VPN Server feature introduces server support for the Cisco VPN Client Release 3.x and later software clients and Cisco VPN hardware clients (such as the Cisco 800, Cisco 900, Cisco 1700, VPN 3002, and PIX 501 devices). This feature allows a remote end user to communicate using IP Security (IPsec) with any Cisco IOS Virtual Private Network (VPN) gateway. Centrally managed IPsec policies are “pushed” to the client device by the server, minimizing configuration by the end user. |
|                 | 12.3(2)T                | RADIUS support for user profiles, user-based policy control, session monitoring for VPN group access, backup-gateway list, and PFS were added.                                                                                                                                                                                                                                                                                                                                                           |
|                 | 12.4(2)T<br>12.2(33)SXH | The following feature was added in this release: <ul style="list-style-type: none"> <li>Banner, Auto-Update, and Browser Proxy Enhancements</li> </ul>                                                                                                                                                                                                                                                                                                                                                   |
|                 | 12.4(4)T<br>12.2(33)SXH | The following features were added in this release: <ul style="list-style-type: none"> <li>Configuration Management Enhancements (Pushing a Configuration URL Through a Mode-Configuration Exchange)</li> <li>Per User AAA Policy Download with PKI</li> <li>Syslog Message Enhancements</li> <li>Network Admission Control for Easy VPN</li> <li>Password Aging</li> <li>Virtual IPsec Interface Support</li> </ul>                                                                                      |
|                 | 12.4(6)T                | The Central Policy Push Firewall Policy Push feature was added.                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 3** *Feature Information for Easy VPN Server (continued)*

| Feature Name | Releases    | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|              | 12.2(33)SRA | This feature was integrated into Cisco IOS Release 12.2(33)SRA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Glossary

**AAA**—authentication, authorization, and accounting. Framework of security services that provides the method for identifying users (authentication), for remote access control (authorization), and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

**aggressive mode (AM)**—Mode during Internet Key Exchange negotiation. Compared to main mode (MM), AM eliminates several steps, which makes it faster but less secure than MM. Cisco IOS software will respond in aggressive mode to an Internet Key Exchange (IKE) peer that initiates aggressive mode.

**AV pair**—attribute-value pair. Additional authentication and authorization information in the following format: Cisco:AVPair=“protocol:attribute=value”.

**IKE**—Internet Key Exchange. Hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the ISAKMP framework. Although IKE can be used with other protocols, its initial implementation is with IPsec. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

**IPsec**—IP Security Protocol. Framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPsec provides these security services at the IP layer. IPsec uses IKE to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPsec. IPsec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

**ISAKMP**—Internet Security Association Key Management Protocol. Protocol framework that defines payload formats, the mechanics of implementing a key exchange protocol, and the negotiation of a security association.

**MM**—main mode. Mode that is slower than aggressive mode but more secure and more flexible than aggressive mode because it can offer an IKE peer more security proposals. The default action for IKE authentication (Rivest, Shamir, and Adelman signature (rsa-sig), RSA encryption (rsa-encr), or preshared) is to initiate main mode.

**policy push**—Allows administrators to push policies that enforce security to the Cisco Easy VPN (software) Client and related firewall software.

**reverse route injection (RRI)**—Simplified network design for VPNs on which there is a requirement for redundancy or load balancing. RRI works with both dynamic and static crypto maps.

In the dynamic case, as remote peers establish IPsec security associations with an RRI enabled router, a static route is created for each subnet or host protected by that remote peer. For static crypto maps, a static route is created for each destination of an extended access-list rule.

**SA**—security association. Description of how two or more entities will utilize security services to communicate securely. For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection.

Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

**VPN**—Virtual Private Network. Framework that consists of multiple peers transmitting private data securely to one another over an otherwise public infrastructure. In this framework, inbound and outbound network traffic is protected using protocols that tunnel and encrypt all data. This framework permits networks to extend beyond their local topology, while remote users are provided with the appearance and functionality of a direct network connection.

# Invalid Security Parameter Index Recovery

---

When an invalid security parameter index error (shown as “Invalid SPI”) occurs in IP Security (IPSec) packet processing, the feature allows for an Internet Key Exchange (IKE) security association (SA) to be established. The “IKE” module sends notification of the “Invalid SPI” error to the originating IPSec peer so that Security Association Databases (SADB) can be resynchronized and successful packet processing can be resumed.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for](#)” [section on page 17](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for

Before configuring the feature, you must have enabled Internet Key Exchange (IKE) and IPsec on your router.

## Restrictions for

If an IKE SA is being initiated to notify an IPsec peer of an “Invalid SPI” error, there is the risk that a denial-of-service (DoS) attack can occur. The feature has a built-in mechanism to minimize such a risk, but because there is a risk, the feature is not enabled by default. You must enable the command using command-line interface (CLI).

## Information About

To use the feature, you should understand the following concept.

- [How the Feature Works, page 2](#)

## How the Feature Works

An IPsec “black hole” occurs when one IPsec peer “dies” (for example, a peer can “die” if a reboot occurs or if an IPsec peer somehow gets reset). Because one of the peers (the receiving peer) is completely reset, it loses its IKE SA with the other peer. Generally, when an IPsec peer receives a packet for which it cannot find an SA, it tries to send an IKE “INVALID SPI NOTIFY” message to the data originator. This notification is sent using the IKE SA. If there is no IKE SA available, the receiving peer drops the packet.

### Note

---

A single security association (SA) has only two peers. However, a SADB can have multiple SAs, whereby each SA has an association with a different peer.

---

When an invalid security parameter index (SPI) is encountered, the Invalid Security Parameter Index feature provides for the setting up of an IKE SA with the originator of the data, and the IKE “INVALID SPI NOTIFY” message is sent. The peer that originated the data “sees” the “INVALID SPI NOTIFY” message and deletes the IPsec SA that has the invalid SPI. If there is further traffic from the originating peer, there will not be any IPsec SAs, and new SAs will be set up. Traffic will flow again. The default behavior (that is, without configuring the feature) is that the data packet that caused the invalid SPI error is dropped. The originating peer keeps on sending the data using the IPsec SA that has the invalid SPI, and the receiving peer keeps dropping the traffic (thus creating the “black hole”).

The IPsec module uses the IKE module to send an IKE “INVALID SPI NOTIFY” message to the other peer. Once the invalid SPI recovery is in place, there should not be any significant dropping of packets although the IPsec SA setup can itself result in the dropping of a few packets.

To configure your router for the feature, use the **crypto isakmp invalid-spi-recovery** command. The IKE SA will not be initiated unless you have configured this command.

# How to Configure

This section contains the following procedure.

- [Configuring, page 3](#)

## Configuring

To configure the feature, perform the following steps.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto isakmp invalid-spi-recovery`

### DETAILED STEPS

|        | Command or Action                                                                                                                          | Purpose                                                                                                                       |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> <code>enable</code>                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>              |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# <code>configure terminal</code>                                          | Enters global configuration mode.                                                                                             |
| Step 3 | <code>crypto isakmp invalid-spi-recovery</code><br><br><b>Example:</b><br>Router (config)# <code>crypto isakmp invalid-spi-recovery</code> | Initiates the IKE module process whereby the IKE module notifies the receiving peer that an “Invalid SPI” error has occurred. |

## Verifying an Configuration

To determine the status of the IPsec SA for traffic between two peers, you can use the **show crypto ipsec sa** command. If the IPsec SA is available on one peer and not on the other, there is a “black hole” situation, in which case you will see the invalid SPI errors being logged for the receiving peer. If you turn console logging on or check the syslog server, you will see that these errors are also being logged.

Figure 1 shows the topology of a typical preshared configuration setup. Host 1 is the initiating peer (initiator), and Host 2 is the receiving peer (responder).

**Figure 1** Preshared Configuration Topology

### SUMMARY STEPS

To verify the preshared configuration, perform the following steps.

1. Initiate the IKE and IPsec SAs between Host 1 and Host 2
2. Clear the IKE and IPsec SAs on Router B
3. Send traffic from Host 1 to Host 2 and ensure that IKE and IPsec SAs are correctly established
4. Check for an invalid SPI message on Router B

### DETAILED STEPS

#### Step 1 Initiate the IKE and IPsec SAs between Host 1 and Host 2

##### Router A

```
Router# show crypto isakmp sa
```

| f_vrf/i_vrf | dst      | src      | state   | conn-id | slot |
|-------------|----------|----------|---------|---------|------|
| /           | 10.2.2.2 | 10.1.1.1 | QM_IDLE | 1       | 0    |

##### Router B

```
Router# show crypto isakmp sa
```

| f_vrf/i_vrf | dst      | src      | state   | conn-id | slot |
|-------------|----------|----------|---------|---------|------|
| /           | 10.1.1.1 | 10.2.2.2 | QM_IDLE | 1       | 0    |

##### Router A

```
Router# show crypto ipsec sa interface fastethernet0/0
```

```
interface: FastEthernet0/0
 Crypto map tag: testtag1, local addr. 10.1.1.1

protected vrf:
 local ident (addr/mask/prot/port): (10.0.0.1/255.255.255.255/0/0)
 remote ident (addr/mask/prot/port): (10.0.2.2/255.255.255.255/0/0)
```

```

current_peer: 10.2.2.2:500
 PERMIT, flags={origin_is_acl,}

# Command Reference

The following commands are introduced or modified in the feature or features

- **crypto isakmp invalid-spi-recovery**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

## Feature Information for

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1**      **Feature Information for**

| Feature Name                                   | Releases                 | Feature Information                                             |
|------------------------------------------------|--------------------------|-----------------------------------------------------------------|
|                                                | 12.3(2)T                 | This feature was introduced.                                    |
|                                                | 12.2(18)SXE              | This feature was integrated into Cisco IOS Release 12.2(18)SXE. |
| Invalid Special Parameter Index (SPI) Recovery | Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers.   |

# IP Security VPN Monitoring

---

The IP Security VPN Monitoring feature provides VPN session monitoring enhancements that will allow you to troubleshoot the Virtual Private Network (VPN) and monitor the end-user interface. Session monitoring enhancements include the following:

- Ability to specify an Internet Key Exchange (IKE) peer description in the configuration file
- Summary listing of crypto session status
- Syslog notification for crypto session up or down status
- Ability to clear both IKE and IP Security (IPSec) security associations (SAs) using one command-line interface (CLI)

## Feature History for IP Security VPN Monitoring

| Release                  | Modification                                                  |
|--------------------------|---------------------------------------------------------------|
| 12.3(4)T                 | This feature was introduced.                                  |
| Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers. |

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

- [Additional References, page 7](#)
- [Command Reference, page 8](#)

## Prerequisites for IP Security VPN Monitoring

- You should be familiar with IPSec and encryption.
- Your router must support IPSec, and before using the IP Security VPN Monitoring feature, you must have configured IPSec on your router.

## Restrictions for IP Security VPN Monitoring

- You must be running Cisco IOS k8 or k9 crypto images on your router.

## Information About IPSec VPN Monitoring

To troubleshoot the IPSec VPN and monitor the end-user interface, you should understand the following concepts:

- [Background: Crypto Sessions, page 2](#)
- [Per-IKE Peer Description, page 2](#)
- [Summary Listing of Crypto Session Status, page 3](#)
- [Syslog Notification for Crypto Session Up or Down Status, page 3](#)
- [IKE and IPSec Security Exchange Clear Command, page 3](#)

## Background: Crypto Sessions

A crypto session is a set of IPSec connections (flows) between two crypto endpoints. If the two crypto endpoints use IKE as the keying protocol, they are IKE peers to each other. Typically, a crypto session consists of one IKE security association (for control traffic) and at least two IPSec security associations (for data traffic—one per each direction). There may be duplicated IKE security associations (SAs) and IPSec SAs or duplicated IKE SAs or IPSec SAs for the same session in the duration of rekeying or because of simultaneous setup requests from both sides.

## Per-IKE Peer Description

The Per-IKE Peer Description function allows you to enter a description of your choosing for an IKE peer. (Before Cisco IOS Release 12.3(4)T, you could use only the IP address or fully qualified domain name [FQDN] to identify the peer; there was no way to configure a description string.) The unique peer description, which can include up to 80 characters, can be used whenever you are referencing that particular IKE peer. To add the peer description, use the **description** command.

**Note**

IKE peers that “sit” behind a Network Address Translation (NAT) device cannot be uniquely identified; therefore, they have to share the same peer description.

The primary application of this description field is for monitoring purposes (for example, when using **show** commands or for logging [syslog messages]). The description field is purely informational (for example, it cannot act as a substitute for the peer address or FQDN when defining crypto maps).

## Summary Listing of Crypto Session Status

You can get a list of all the active VPN sessions by entering the **show crypto session** command. The listing will include the following:

- Interface
- IKE peer description, if available
- IKE SAs that are associated with the peer by whom the IPsec SAs are created
- IPsec SAs serving the flows of a session

Multiple IKE or IPsec SAs may be established for the same peer (for the same session), in which case IKE peer descriptions will be repeated with different values for the IKE SAs that are associated with the peer and for the IPsec SAs that are serving the flows of the session.

You can also use the **show crypto session detail** variant of this command to obtain more detailed information about the sessions.

## Syslog Notification for Crypto Session Up or Down Status

The Syslog Notification for Crypto Session Up or Down Status function provides syslog notification every time the crypto session comes up or goes down.

The following is a sample syslog notification showing that a crypto session is up:

```
%CRYPTO-5-SESSION_STATUS: Crypto session is UP. Peer 10.6.6.1:500 fvrf=name10 ivrf=name20
Description: SJC24-2-VPN-Gateway Id: 10.5.5.2
```

The following is a sample syslog notification showing that a crypto session is down:

```
%CRYPTO-5-SESSION_STATUS: Crypto session is DOWN. Peer 10.6.6.1:500 fvrf=name10
ivrf=name20 Description: SJC24-2-VPN-Gateway Id: 10.5.5.2
```

## IKE and IPsec Security Exchange Clear Command

In previous IOS versions, there was no single command to clear both IKE and IPsec connections (that is, SAs). Instead, you had to use the **clear crypto isakmp** command to clear IKE and the **clear crypto ipsec** command to clear IPsec. The new **clear crypto session** command allows you to clear both IKE and IPsec with a single command. To clear a specific crypto session or a subset of all the sessions (for example, a single tunnel to one remote site), you need to provide session-specific parameters, such as a local or remote IP address, a local or remote port, a front door VPN routing and forwarding (FVRF) name, or an inside VRF (IVRF) name. Typically, the remote IP address will be used to specify a single tunnel to be deleted.

If a local IP address is provided as a parameter when you use the **clear crypto session** command, all the sessions (and their IKE SAs and IPSec SAs) that share the IP address as a local crypto endpoint (IKE local address) will be cleared. If you do not provide a parameter when you use the **clear crypto session** command, all IPSec SAs and IKE SAs that are in the router will be deleted.

## How to Configure IP Security VPN Monitoring

See the following sections for configuration tasks for this feature. Each task in the list is identified as either required or optional.

- [Adding the Description of an IKE Peer, page 4](#) (optional)
- [Verifying Peer Descriptions, page 5](#) (optional)
- [Clearing a Crypto Session, page 6](#) (optional)

### Adding the Description of an IKE Peer

To add the description of an IKE peer to an IPSec VPN session, perform the following steps.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp peer {ip-address ip-address}**
4. **description**

#### DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                                                                               |
|--------|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |

|        | Command or Action                                                                                                                       | Purpose                                                                                                                                                                           |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>crypto isakmp peer</b> {ip-address ip-address}<br><br><b>Example:</b><br>Router (config)# <b>crypto isakmp peer</b> address 10.2.2.9 | Enables an IPSec peer for IKE querying of authentication, authorization, and accounting (AAA) for tunnel attributes in aggressive mode and enters ISAKMP peer configuration mode. |
| Step 4 | <b>description</b><br><br><b>Example:</b><br>Router (config-isakmp-peer)# <b>description</b> connection from site A                     | Adds a description for an IKE peer.                                                                                                                                               |

## Verifying Peer Descriptions

To verify peer descriptions, use the **show crypto isakmp peer** command.

### SUMMARY STEPS

1. **enable**
2. **show crypto isakmp peer**

### DETAILED STEPS

|        | Command or Action                                                                               | Purpose                                                                                                            |
|--------|-------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> <b>enable</b>                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>show crypto isakmp peer</b><br><br><b>Example:</b><br>Router# <b>show crypto isakmp peer</b> | Displays peer descriptions.                                                                                        |

## Examples

The following output example verifies that the description “connection from site A” has been added for IKE peer 10.2.2.9:

```
Router# show crypto isakmp peer

Peer: 10.2.2.9 Port: 500
Description: connection from site A
flags: PEER_POLICY
```

When the peer at address 10.2.2.9 connects and the session comes up, the syslog status will be shown as follows:

```
%CRYPTO-5-SESSION_STATUS: Crypto tunnel is UP. Peer 10.2.2.9:500 Description: connection from site A Id: ezvpn
```

## Clearing a Crypto Session

To clear a crypto session, use the **clear crypto session** command from the router command line. No configuration statements are required in the configuration file to use this command.

### SUMMARY STEPS

1. **enable**
2. **clear crypto session**

### DETAILED STEPS

|        | Command or Action                                                                  | Purpose                                                                                                             |
|--------|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>clear crypto session</b><br><br><b>Example:</b><br>Router# clear crypto session | Deletes crypto sessions (IPSec and IKE SAs).                                                                        |

## Configuration Examples for IP Security VPN Monitoring

This section provides the following configuration example:

- [show crypto session Command Output: Examples, page 6](#)

### show crypto session Command Output: Examples

The following is sample output for the **show crypto session** output without the **detail** keyword:

```
Router# show crypto session

Crypto session current status

Interface: FastEthernet0/1
Session status: UP-ACTIVE
Peer: 172.0.0.2/500
 IKE SA: local 172.0.0.1/500 remote 172.0.0.2/500 Active
 IPSEC FLOW: permit ip 10.10.10.0/255.255.255.0 10.30.30.0/255.255.255.0
 Active SAs: 2, origin: crypto map
```

The following is sample output using the **show crypto session command and the detail** keyword:

```
Router# show crypto session detail

Interface: Tunnel0
Session status: UP-ACTIVE
Peer: 10.1.1.3 port 500 fvrf: (none) ivrf: (none)
 Desc: this is my peer at 10.1.1.3:500 Green
```

```
Phase1_id: 10.1.1.3
IKE SA: local 10.1.1.4/500 remote 10.1.1.3/500 Active
 Capabilities:(none) connid:3 lifetime:22:03:24
IPSEC FLOW: permit 47 host 10.1.1.4 host 10.1.1.3
 Active SAs: 0, origin: crypto map
 Inbound: #pkts dec'ed 0 drop 0 life (KB/Sec) 0/0
 Outbound: #pkts enc'ed 0 drop 0 life (KB/Sec) 0/0
IPSEC FLOW: permit ip host 10.1.1.4 host 10.1.1.3
 Active SAs: 4, origin: crypto map
 Inbound: #pkts dec'ed 4 drop 0 life (KB/Sec) 4605665/2949
 Outbound: #pkts enc'ed 4 drop 1 life (KB/Sec) 4605665/2949
```

## Command Reference

The following commands are introduced or modified in the feature or features

- **clear crypto session**

- **description (isakmp peer)**
- **show crypto isakmp peer**
- **show crypto session**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

# IPsec and IKE MIB Support for Cisco VRF-Aware IPsec

The IPsec and IKE MIB Support for Cisco VRF-Aware IPsec feature provides manageability of Virtual Private Network routing and forwarding- (VRF-) aware IP security (IPsec) using MIBs. The benefit of this feature is that VRF-aware IPsec MIBs provide the granular details of IPsec statistics and performance metrics on a VRF basis.

## History for the IPsec and IKE MIB Support for Cisco VRF-Aware IPsec Feature

| Release  | Modification                 |
|----------|------------------------------|
| 12.4(4)T | This feature was introduced. |

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

# Prerequisites for IPsec and IKE MIB Support for Cisco VRF-Aware IPsec

- You should be familiar with configuring Simple Network Management Protocol (SNMP).

## Information About IPsec and IKE MIB Support for Cisco VRF-Aware IPsec

To configure IPsec and MIB Support for Cisco VRF-Aware IPsec, you should understand the following concepts:

- [MIBs Supported by the IPsec and IKE MIB Support for Cisco VRF-Aware IPsec Feature, page 2](#)

## MIBs Supported by the IPsec and IKE MIB Support for Cisco VRF-Aware IPsec Feature

The following MIBs are supported by the IPsec and IKE MIB Support for Cisco VRF-Aware IPsec feature:

- CISCO-IPSEC-FLOW-MONITOR-MIB
- CISCO-IPSEC-MIB
- The CISCO-IPSEC-POLICY-MAP-MIB continues to be supported. However, because this MIB applies to the entire router rather than to a specific VPN VRF instance, it is not VRF aware; therefore, polling of the object identifiers (OIDs) that belong to this MIB is accomplished with respect to the global VRF context.

## How to Configure IPsec and IKE MIB Support for Cisco VRF-Aware IPsec

No special configuration is needed for this feature. The SNMP framework can be used to manage VRF-aware IPsec using MIBs. See the section “[Configuration Examples for IPsec and IKE MIB Support for Cisco VRF-Aware IPsec](#)” for a reference to configuring SNMP.

The following section provides information about troubleshooting this feature:

- [How to Troubleshoot the IPsec and IKE MIB Support for Cisco VRF-Aware IPsec Feature, page 2](#)

## How to Troubleshoot the IPsec and IKE MIB Support for Cisco VRF-Aware IPsec Feature

The following **debug crypto mib** command and keywords may be used to display information about the IPsec and Internet Key Exchange (IKE) MIB as it relates to Cisco VRF-aware IPsec.

## SUMMARY STEPS

1. `enable`
2. `debug crypto mib detail`
3. `debug crypto mib error`

## DETAILED STEPS

|        | Command or Action                                                                                     | Purpose                                                                                                                                                                                                                                                                  |
|--------|-------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> <code>enable</code>                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                       |
| Step 2 | <b>debug crypto mib detail</b><br><br><b>Example:</b><br>Router# <code>debug crypto mib detail</code> | Displays different events as they occur in the IPsec MIB subsystem. <ul style="list-style-type: none"> <li>• Due consideration should be given to enabling <b>debug crypto mib detail</b> because the output for the <b>detail</b> keyword can be quite long.</li> </ul> |
| Step 3 | <b>debug crypto mib error</b><br><br><b>Example:</b><br>Router# <code>debug crypto mib error</code>   | Displays error events in the MIB agent.                                                                                                                                                                                                                                  |

# Configuration Examples for IPsec and IKE MIB Support for Cisco VRF-Aware IPsec

This section includes the following example:

- [Configuration That Has Two VRFs: Examples, page 3](#)

## Configuration That Has Two VRFs: Examples

The following output example is for a typical hub configuration that has two VRFs. The output is what you would see if you were to poll for the IPsec security association (SA). Router 3745b is the VRF-aware router.

### Two VRFs Configured

The following output shows that two VRFs have been configured (vrf1 and vrf2).

```
Router3745b# show running-config

**Both VRFs Cleared**

The following output, for abc1 and abc2, shows that both VRFs have been “cleared” to ensure that all the counters are initialized to a known value.

The following output shows that VRF abc1 has been cleared:

```

### VRF abc1 Pinged

The following output shows that VRF abc1 has been pinged:

Router3745a# **ping**

```

Protocol [ip]:
Target IP address: 10.22.1.1
Repeat count [5]:
Datagram size [100]:
Timeout in seconds [2]:
Extended commands [n]: y
Source address or interface: 10.20.1.1
Type of service [0]:
Set DF bit in IP header? [no]:
Validate reply data? [no]:
Data pattern [0xABCD]:
Loose, Strict, Record, Timestamp, Verbose[none]:
Sweep range of sizes [n]:
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.22.1.1, timeout is 2 seconds:
Packet sent with a source address of 10.20.1.1

```

**VRF abc1 Polled**

Polling VRF abc1 results in the following output:

**Note**

After the ping, the counters should show some nonzero values.

```

# Command Reference

The following commands are introduced or modified in the feature or features

- **debug crypto mib**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

---

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

# IPSec and Quality of Service

---

The IPSec and Quality of Service feature allows Cisco IOS quality of service (QoS) policies to be applied to IP Security (IPSec) packet flows on the basis of a QoS group that can be added to the current Internet Security Association and Key Management Protocol (ISAKMP) profile.

## Feature History for IPSec and Quality of Service

| Release  | Modification                 |
|----------|------------------------------|
| 12.3(8)T | This feature was introduced. |

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Contents

- [Prerequisites for IPSec and Quality of Service, page 1](#)
- [Restrictions for IPSec and Quality of Service, page 2](#)
- [Information About IPSec and Quality of Service, page 2](#)
- [How to Configure IPSec and Quality of Service, page 2](#)
- [Configuration Examples for IPSec and Quality of Service, page 4](#)
- [Additional References, page 7](#)
- [Command Reference, page 9](#)

## Prerequisites for IPSec and Quality of Service

- You should be familiar with IPSec and the concept of ISAKMP profiles.
- You should be familiar with Cisco IOS QoS.

# Restrictions for IPSec and Quality of Service

- This feature can be applied only via the ISAKMP profile. The limit of 128 QoS groups that exists for QoS applications applies to this feature as well.
- You can apply an IPSec QoS group only to outbound service policies.
- QoS is not supported for software encryption.

## Information About IPSec and Quality of Service

To configure the IPSec and Quality of Service feature, you should understand the following concept:

- [IPSec and Quality of Service Overview, page 2](#)

## IPSec and Quality of Service Overview

The IPSec and Quality of Service feature allows you to apply QoS policies, such as traffic policing and shaping, to IPSec-protected packets by adding a QoS group to ISAKMP profiles. After the QoS group has been added, this group value will be mapped to the same QoS group as defined in QoS class maps. Any current QoS method that makes use of this QoS group tag can be applied to IPSec packet flows. Common groupings of packet flows can have specific policy classes applied by having the IPSec QoS group made available to the QoS mechanism. Marking IPSec flows allows QoS mechanisms to be applied to classes of traffic that could provide support for such things as restricting the amount of bandwidth that is available to specific groups or devices or marking the type of service (ToS) bits on certain flows.

The application of the QoS group is applied at the ISAKMP profile level because it is the profile that can uniquely identify devices through its concept of match identity criteria. These criteria are on the basis of the Internet Key Exchange (IKE) identity that is presented by incoming IKE connections and includes such things as IP address, fully qualified domain name (FQDN), and group (that is, the virtual private network [VPN] remote client grouping). The granularity of the match identity criteria will impose the granularity of the specified QoS policy, for example, to mark all traffic belonging to the VPN client group named “Engineering” as “TOS 5”. Another example of having the granularity of a specified QoS policy imposed would be to allocate 30 percent of the bandwidth on an outbound WAN link to a specific group of remote VPN devices.

## How to Configure IPSec and Quality of Service

This section includes the following procedures:

- [Configuring IPSec and Quality of Service, page 2](#) (required)
- [Verifying IPSec and Quality of Service Sessions, page 3](#) (optional)
- [Troubleshooting Tips, page 4](#) (optional)

## Configuring IPSec and Quality of Service

To apply QoS policies to an ISAKMP profile, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp-profile** *profile-name*
4. **qos-group** *group-number*

## DETAILED STEPS

|        | Command or Action                                                                                                                 | Purpose                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                    | Enters global configuration mode.                                                                                |
| Step 3 | <b>crypto isakmp-profile</b> <i>profile-number</i><br><br><b>Example:</b><br>Router (config)# crypto isakmp-profile<br>vpnprofile | Defines an ISAKMP profile, audits IPSec user sessions, and enters ISAKMP profile configuration mode.             |
| Step 4 | <b>qos-group</b> <i>group-number</i><br><br><b>Example:</b><br>Router(config-isa-prof)# qos-group 1                               | Applies a QoS group value to an ISAKMP profile.                                                                  |

## Verifying IPSec and Quality of Service Sessions

To verify your IPSec and QoS sessions, perform the following steps. The **show** commands can be used in any order or independent of each other.

## SUMMARY STEPS

1. **enable**
2. **show crypto isakmp profile**
3. **show crypto ipsec sa**

## DETAILED STEPS

|        | Command or Action                                                                              | Purpose                                                                                                          |
|--------|------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>show crypto isakmp profile</b><br><br><b>Example:</b><br>Router# show crypto isakmp profile | Shows that the QoS group is applied to the profile.                                                              |
| Step 3 | <b>show crypto ipsec sa</b><br><br><b>Example:</b><br>Router# show crypto ipsec sa             | Shows that the QoS group is applied to a particular pair of IPSec security associations (SAs).                   |

## Troubleshooting Tips

If you have a problem with your IPSec and QoS sessions, ensure that you have done the following:

- Validated the application of QoS by the QoS service using the QoS-specific commands in the *Cisco IOS Quality of Service Solutions Command Reference*, Release 12.3 T.
- Configured a QoS policy on the router that matches the same QoS group as that specified for the class map match criterion.
- Applied the service policy to the same interface to which a crypto map is applied.

## Configuration Examples for IPSec and Quality of Service

This section provides the following output examples:

- [QoS Policy Applied to Two Groups of Remote Users: Example, page 4](#)
- [show crypto isakmp profile Command: Example, page 6](#)
- [show crypto ipsec sa Command: Example, page 6](#)

## QoS Policy Applied to Two Groups of Remote Users: Example

In the following example, a specific QoS policy is applied to two groups of remote users. Two ISAKMP profiles are configured so that upon initial connection via IKE, remote users are mapped to a specific profile. From that profile, all IPSec SAs that have been created for that remote will be marked with the specific QoS group. As traffic leaves the outbound interface, the QoS service will map the IPSec set QoS group with the QoS group that is specified in the class maps that comprise the service policy that is applied on that outbound interface.

## show crypto isakmp profile Command: Example

The following output shows that QoS group “2” has been applied to the ISAKMP profile “blue” and that QoS group “3” has been applied to the ISAKMP profile “yellow”:

```

Router# show crypto isakmp profile

ISAKMP PROFILE blue
 Identities matched are:
 group blue
 QoS Group 2 is applied

ISAKMP PROFILE yellow
 Identities matched are:
 ip-address 10.0.0.13 255.255.255.255
 group yellow
 QoS Group 3 is applied

```

## show crypto ipsec sa Command: Example

The following output shows that the QoS group has been applied to a particular pair of IPsec SAs:

```

Router# show crypto ipsec sa

interface: FastEthernet0/0
 Crypto map tag: mode, local addr. 10.0.0.110

 protected vrf:

# IPsec Anti-Replay Window: Expanding and Disabling

---

**First Published: February 28, 2005**  
**Last Updated: September 12, 2006**

Cisco IP security (IPsec) authentication provides anti-replay protection against an attacker duplicating encrypted packets by assigning a unique sequence number to each encrypted packet. The decryptor keeps track of which packets it has seen on the basis of these numbers. Currently, the default window size is 64 packets. Generally, this number (window size) is sufficient, but there are times when you may want to expand this window size. The IPsec Anti-Replay Window: Expanding and Disabling feature allows you to expand the window size, allowing the decryptor to keep track of more than 64 packets.

## History for the IPsec Anti-Replay Window: Expanding and Disabling Feature

| Release                  | Modification                                                     |

## Prerequisites for IPsec Anti-Replay Window: Expanding and Disabling

- Before configuring this feature, you should have already created a crypto map or crypto profile.

## Information About IPsec Anti-Replay Window: Expanding and Disabling

To configure the IPsec Anti-Replay Window: Expanding and Disabling feature, you should understand the following concept:

- [IPsec Anti-Replay Window, page 2](#)

### IPsec Anti-Replay Window

Cisco IPsec authentication provides anti-replay protection against an attacker duplicating encrypted packets by assigning a unique sequence number to each encrypted packet. (Security association [SA] anti-replay is a security service in which the receiver can reject old or duplicate packets to protect itself against replay attacks.) The decryptor checks off the sequence numbers that it has seen before. The encryptor assigns sequence numbers in an increasing order. The decryptor remembers the value X of the highest sequence number that it has already seen. N is the window size, and the decryptor also remembers whether it has seen packets having sequence numbers from X-N+1 through X. Any packet with the sequence number X-N is discarded. Currently, N is set at 64, so only 64 packets can be tracked by the decryptor.

At times, however, the 64-packet window size is not sufficient. For example, Cisco quality of service (QoS) gives priority to high-priority packets, which could cause some low-priority packets to be discarded even though they could be one of the last 64 packets received by the decryptor. The IPsec Anti-Replay Window: Expanding and Disabling feature allows you to expand the window size, allowing the decryptor to keep track of more than 64 packets.

Increasing the anti-replay window size has no impact on throughput and security. The impact on memory is insignificant because only an extra 128 bytes per incoming IPsec SA is needed to store the sequence number on the decryptor. It is recommended that you use the full 1024 window size to eliminate any future anti-replay problems.

# How to Configure IPsec Anti-Replay Window: Expanding and Disabling

This section contains the following procedures:

- [Configuring IPsec Anti-Replay Window: Expanding and Disabling Globally, page 3](#) (optional)
- [Configuring IPsec Anti-Replay Window: Expanding and Disabling on a Crypto Map, page 4](#) (optional)

## Configuring IPsec Anti-Replay Window: Expanding and Disabling Globally

To configure IPsec Anti-Replay Window: Expanding and Disabling globally (so that it affects all SAs that are created— except for those that are specifically overridden on a per-crypto map basis), perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec security-association replay window-size [N]**
4. **crypto ipsec security-association replay disable**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                           |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                              | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                 |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                      | Enters global configuration mode.                                                                                                                                                                                 |
| Step 3 | <b>crypto ipsec security-association replay window-size [N]</b><br><br><b>Example:</b><br>Router (config)# crypto ipsec security-association replay window-size 256 | Sets the size of the SA replay window globally.<br><br><b>Note</b> Configure this command or the <b>crypto ipsec security-association replay disable</b> command. The two commands are not used at the same time. |
| Step 4 | <b>crypto ipsec security-association replay disable</b><br><br><b>Example:</b><br>Router (config)# crypto ipsec security-association replay disable                 | Disables checking globally.<br><br><b>Note</b> Configure this command or the <b>crypto ipsec security-association replay window-size</b> command. The two commands are not used at the same time.                 |

## Configuring IPsec Anti-Replay Window: Expanding and Disabling on a Crypto Map

To configure IPsec Anti-Replay Window: Expanding and Disabling on a crypto map so that it affects those SAs that have been created using a specific crypto map or profile, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name seq-num* [**ipsec-isakmp**]
4. **set security-association replay window-size [N]**
5. **set security-association replay disable**

## DETAILED STEPS

|        | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                        |
| Step 3 | <b>crypto map map-name seq-num [ipsec-isakmp]</b><br><br><b>Example:</b><br>Router (config)# crypto map ETH0 17 ipsec-isakmp                          | Enters crypto map configuration mode and creates a crypto profile that provides a template for configuration of dynamically created crypto maps.                                                                                                                                         |
| Step 4 | <b>set security-association replay window-size [N]</b><br><br><b>Example:</b><br>Router (crypto-map)# set security-association replay window-size 128 | Controls the SAs that are created using the policy specified by a particular crypto map, dynamic crypto map, or crypto profile. <p><b>Note</b> Configure this command or the <b>set security-association replay disable</b> command. The two commands are not used at the same time.</p> |
| Step 5 | <b>set security-association replay disable</b><br><br><b>Example:</b><br>Router (crypto-map)# set security-association replay disable                 | Disables replay checking for a particular crypto map, dynamic crypto map, or crypto profile. <p><b>Note</b> Configure this command or the <b>set security-association replay window-size</b> command. The two commands are not used at the same time.</p>                                |

## Troubleshooting Tips

- If your replay window size has not been set to a number that is high enough for the number of packets received, you will receive a system message such as the following:

```
*Nov 17 19:27:32.279: %CRYPTO-4-PKT_REPLAY_ERR: decrypt: replay check failed
connection id=1
```

The above message is generated when a received packet is judged to be outside the anti-replay window.

## Configuration Examples for IPsec Anti-Replay Window: Expanding and Disabling

This section includes the following configuration examples:

- [Global Expanding and Disabling of an Anti-Replay Window: Example, page 6](#)

- [Expanding and Disabling of an Anti-Replay Window for a Particular Crypto Map, Dynamic Crypto Map, or Crypto Profile: Example, page 7](#)

## Global Expanding and Disabling of an Anti-Replay Window: Example

The following example shows that the anti-replay window size has been set globally to 1024:

```

version 12.3
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption

# Command Reference

The following commands are introduced or modified in the feature or features

- **crypto ipsec security-association replay disable**
- **crypto ipsec security-association replay window-size**
- **set security-association replay disable**
- **set security-association replay window-size**

For information about these commands, see the Cisco IOS Security Command Reference at

[http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at

<http://tools.cisco.com/Support/CLILookup> or the Master Command List.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

# IPSec Dead Peer Detection Periodic Message Option

---

**First Published: May 1, 2004**  
**Last Updated: August 21, 2007**

The IPSec Dead Peer Detection Periodic Message Option feature allows you to configure your router to query the liveliness of its Internet Key Exchange (IKE) peer at regular intervals. The benefit of this approach over the default approach (on-demand dead peer detection) is earlier detection of dead peers.

## History for IPSec Dead Peer Detection Periodic Message Option Feature

| Release                  | Modification                                                    |
|--------------------------|-----------------------------------------------------------------|
| 12.3(7)T                 | This feature was introduced.                                    |
| 12.2(33)SRA              | This feature was integrated into Cisco IOS Release 12.2(33)SRA. |
| 12.2(33)SXH              | This feature was integrated into Cisco IOS Release 12.2(33)SXH. |
| Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers.   |

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Prerequisites for IPSec Dead Peer Detection Periodic Message Option

Before configuring the IPSec Dead Peer Detection Periodic Message Option feature, you should have the following:

- Familiarity with configuring IP Security (IPSec).
- An IKE peer that supports DPD (dead peer detection). Implementations that support DPD include the Cisco VPN 3000 concentrator, Cisco PIX Firewall, Cisco VPN Client, and Cisco IOS software in all modes of operation—site-to-site, Easy VPN remote, and Easy VPN server.

## Restrictions for IPSec Dead Peer Detection Periodic Message Option

Using periodic DPD potentially allows the router to detect an unresponsive IKE peer with better response time when compared to on-demand DPD. However, use of periodic DPD incurs extra overhead. When communicating to large numbers of IKE peers, you should consider using on-demand DPD instead.

## Information About IPSec Dead Peer Detection Periodic Message Option

To configure IPSec Dead Peer Detection Periodic Message Option, you should understand the following concepts:

- [How DPD and Cisco IOS Keepalive Features Work, page 2](#)
- [Using the IPSec Dead Peer Detection Periodic Message Option, page 3](#)
- [Using DPD and Cisco IOS Keepalive Features with Multiple Peers in the Crypto Map, page 3](#)
- [Using DPD in an Easy VPN Remote Configuration, page 3](#)

## How DPD and Cisco IOS Keepalive Features Work

DPD and Cisco IOS keepalives function on the basis of the timer. If the timer is set for 10 seconds, the router will send a “hello” message every 10 seconds (unless, of course, the router receives a “hello” message from the peer). The benefit of IOS keepalives and periodic DPD is earlier detection of dead peers. However, IOS keepalives and periodic DPD rely on periodic messages that have to be sent with considerable frequency. The result of sending frequent messages is that the communicating peers must encrypt and decrypt more packets.

DPD also has an on-demand approach. The contrasting on-demand approach is the default. With on-demand DPD, messages are sent on the basis of traffic patterns. For example, if a router has to send outbound traffic and the liveliness of the peer is questionable, the router sends a DPD message to query the status of the peer. If a router has no traffic to send, it never sends a DPD message. If a peer is dead, and the router never has any traffic to send to the peer, the router will not find out until the IKE or IPSec security association (SA) has to be rekeyed (the liveliness of the peer is unimportant if the router is not trying to communicate with the peer). On the other hand, if the router has traffic to send to the peer, and the peer does not respond, the router will initiate a DPD message to determine the state of the peer.

## Using the IPSec Dead Peer Detection Periodic Message Option

With the IPSec Dead Peer Detection Periodic Message Option feature, you can configure your router so that DPD messages are “forced” at regular intervals. This forced approach results in earlier detection of dead peers. For example, if a router has no traffic to send, a DPD message is still sent at regular intervals, and if a peer is dead, the router does not have to wait until the IKE SA times out to find out.

If you want to configure the DPD periodic message option, you should use the **crypto isakmp keepalive** command with the **periodic** keyword. If you do not configure the **periodic** keyword, the router defaults to the on-demand approach.

### Note

When the **crypto isakmp keepalive** command is configured, the Cisco IOS software negotiates the use of Cisco IOS keepalives or DPD, depending on which protocol the peer supports.

## Using DPD and Cisco IOS Keepalive Features with Multiple Peers in the Crypto Map

DPD and IOS keepalive features can be used in conjunction with multiple peers in the crypto map to allow for stateless failover. DPD allows the router to detect a dead IKE peer, and when the router detects the dead state, the router deletes the IPSec and IKE SAs to the peer. If you configure multiple peers, the router will switch over to the next listed peer for a stateless failover.

## Using DPD in an Easy VPN Remote Configuration

DPD can be used in an Easy VPN remote configuration. See the section [“Configuring DPD for an Easy VPN Remote” section on page 5](#).

## How to Configure IPSec Dead Peer Detection Periodic Message Option

This section contains the following procedures:

- [Configuring a Periodic DPD Message, page 4](#)
- [Configuring DPD and Cisco IOS Keepalives with Multiple Peers in the Crypto Map, page 4](#)
- [Configuring DPD for an Easy VPN Remote, page 5](#)
- [Verifying That DPD Is Enabled, page 6](#)

## Configuring a Periodic DPD Message

To configure a periodic DPD message, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp keepalive *seconds* [*retries*] [**periodic** | **on-demand**]**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 3 | <b>crypto isakmp keepalive <i>seconds</i> [<i>retries</i>] [<b>periodic</b>   <b>on-demand</b>]</b><br><br><b>Example:</b><br>Router (config)# crypto isakmp keepalive 10 periodic | Allows the gateway to send DPD messages to the peer. <ul style="list-style-type: none"> <li>• <i>seconds</i>—Number of seconds between DPD messages.</li> <li>• <i>retries</i>—(Optional) Number of seconds between DPD retries if the DPD message fails.</li> <li>• <b>periodic</b>—(Optional) DPD messages are sent at regular intervals.</li> <li>• <b>on-demand</b>—(Optional) DPD retries are sent on demand. This is the default behavior.</li> </ul> |

## Configuring DPD and Cisco IOS Keepalives with Multiple Peers in the Crypto Map

To configure DPD and IOS keepalives to be used in conjunction with the crypto map to allow for stateless failover, perform the following steps. This configuration will cause a router to cycle through the peer list when it detects that the first peer is dead.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map *map-name seq-num ipsec-isakmp***
4. **set peer {*host-name* [**dynamic**] | *ip-address*}**

5. **set transform-set** *transform-set-name*
6. **match address** [*access-list-id* | *name*]

## DETAILED STEPS

|        | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                            |
| Step 3 | <b>crypto map</b> <i>map-name</i> <i>seq-num</i> <b>ipsec-isakmp</b><br><br><b>Example:</b><br>Router (config)# crypto map green 1 ipsec-isakmp        | Enters crypto map configuration mode and creates or modifies a crypto map entry. <ul style="list-style-type: none"> <li>The <b>ipsec-isakmp</b> keyword indicates that IKE will be used to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</li> </ul> |
| Step 4 | <b>set peer</b> { <i>host-name</i> [ <b>dynamic</b> ]   <i>ip-address</i> }<br><br><b>Example:</b><br>Router (config-crypto-map)# set peer 10.12.12.12 | Specifies an IPSec peer in a crypto map entry. <ul style="list-style-type: none"> <li>You can specify multiple peers by repeating this command.</li> </ul>                                                                                                                                   |
| Step 5 | <b>set transform-set</b> <i>transform-set-name</i><br><br><b>Example:</b><br>Router (config-crypto-map)# set transform-set txfm                        | Specifies which transform sets can be used with the crypto map entry. <ul style="list-style-type: none"> <li>You can specify more than one transform set name by repeating this command.</li> </ul>                                                                                          |
| Step 6 | <b>match address</b> [ <i>access-list-id</i>   <i>name</i> ]<br><br><b>Example:</b><br>Router (config-crypto-map)# match address 101                   | Specifies an extended access list for a crypto map entry.                                                                                                                                                                                                                                    |

## Configuring DPD for an Easy VPN Remote

To configure DPD in an Easy VPN remote configuration, perform the following steps. This configuration also will cause a router to cycle through the peer list when it detects that the first peer is dead.

### Note

IOS keepalives are not supported for Easy VPN remote configurations.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **crypto ipsec client ezvpn** *name*
4. **connect** {**auto** | **manual**}
5. **group** *group-name* **key** *group-key*
6. **mode** {**client** | **network-extension**}
7. **peer** {*ipaddress* | *hostname*}

## DETAILED STEPS

|               |                                                                                                                                                 |                                                                                                                                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                  | Enters global configuration mode.                                                                                                                                                                                                                                        |
| <b>Step 3</b> | <b>crypto ipsec client ezvpn</b> <i>name</i><br><br><b>Example:</b><br>Router (config)# crypto ipsec client ezvpn<br>ezvpn-config1              | Creates a Cisco Easy VPN remote configuration and enters the Cisco Easy VPN Remote configuration mode.                                                                                                                                                                   |
| <b>Step 4</b> | <b>connect</b> { <b>auto</b>   <b>manual</b> }<br><br><b>Example:</b><br>Router (config-crypto-ezvpn)# connect manual                           | Manually establishes and terminates an IPSec VPN tunnel on demand. <ul style="list-style-type: none"><li>The <b>auto</b> keyword option is the default setting.</li></ul>                                                                                                |
| <b>Step 5</b> | <b>group</b> <i>group-name</i> <b>key</b> <i>group-key</i><br><br><b>Example:</b><br>Router (config-crypto-ezvpn)# group unity key<br>preshared | Specifies the group name and key value for the Virtual Private Network (VPN) connection.                                                                                                                                                                                 |
| <b>Step 6</b> | <b>mode</b> { <b>client</b>   <b>network-extension</b> }<br><br><b>Example:</b><br>Router (config-crypto-ezvpn)# mode client                    | Specifies the VPN mode of operation of the router.                                                                                                                                                                                                                       |
| <b>Step 7</b> | <b>peer</b> { <i>ipaddress</i>   <i>hostname</i> }<br><br><b>Example:</b><br>Router (config-crypto-ezvpn)# peer 10.10.10.10                     | Sets the peer IP address or host name for the VPN connection. <ul style="list-style-type: none"><li>A hostname can be specified only when the router has a DNS server available for host-name resolution.</li><li>This command can be repeated multiple times.</li></ul> |

## Verifying That DPD Is Enabled

DPD allows the router to clear the IKE state when a peer becomes unreachable. If DPD is enabled and the peer is unreachable for some time, you can use the **clear crypto session** command to manually clear IKE and IPSec SAs.

The **debug crypto isakmp** command can be used to verify that DPD is enabled.

## SUMMARY STEPS

1. **enable**
2. **clear crypto session** [**local** *ip-address* [**port** *local-port*]] [**remote** *ip-address* [**port** *remote-port*]] | [**fvrif** *vrf-name*] [**ivrf** *vrf-name*]
3. **debug crypto isakmp**

- [DPD Used in Conjunction with Multiple Peers for an Easy VPN Remote: Example, page 11](#)

## Site-to-Site Setup with Periodic DPD Enabled: Example

The following configurations are for a site-to-site setup with no periodic DPD enabled. The configurations are for the IKE Phase 1 policy and for the IKE preshared key.

### IKE Phase 1 Policy

```
crypto isakmp policy 1
 encryption 3des
```

```

authentication pre-share
group 2
!

```

### IKE Preshared Key

```

crypto isakmp key kd94j1ksldz address 10.2.80.209 255.255.255.0
crypto isakmp keepalive 10 periodic
crypto ipsec transform-set esp-3des-sha esp-3des esp-sha-hmac
crypto map test 1 ipsec-isakmp
 set peer 10.2.80.209
 set transform-set esp-3des-sha
 match address 101
!
!
interface FastEthernet0
 ip address 10.1.32.14 255.255.255.0
 speed auto
 crypto map test
!

```

## Easy VPN Remote with DPD Enabled: Example

The following configuration tells the router to send a periodic DPD message every 30 seconds. If the peer fails to respond to the DPD R\_U\_THERE message, the router will resend the message every 20 seconds (four transmissions altogether).

```

crypto isakmp keepalive 30 20 periodic
crypto ipsec client ezvpn ezvpn-config
 connect auto
 group unity key preshared
 mode client
 peer 10.2.80.209
!
!
interface Ethernet0
 ip address 10.2.3.4 255.255.255.0
 half-duplex
 crypto ipsec client ezvpn ezvpn-config inside
!
interface FastEthernet0
 ip address 10.1.32.14 255.255.255.0
 speed auto
 crypto ipsec client ezvpn ezvpn-config outside

```

## Verifying DPD Configuration Using the debug crypto isakmp Command: Example

The following sample output from the **debug crypto isakmp** command verifies that IKE DPD is enabled:

```
*Mar 25 15:17:14.131: ISAKMP:(0:1:HW:2):IKE_DPD is enabled, initializing timers
```

To see that IKE DPD is enabled (and that the peer supports DPD): when periodic DPD is enabled, you should see the following debug messages at the interval specified by the command:

```
*Mar 25 15:18:52.107: ISAKMP:(0:1:HW:2): sending packet to 10.2.80.209 my_port
500 peer_port 500 (I) QM_IDLE
*Mar 25 15:18:52.107: ISAKMP:(0:1:HW:2):purging node 899852982 *Mar 25 15:18:52.111:
ISAKMP:(0:1:HW:2):Input = IKE_MSG_FROM_TIMER,
IKE_TIMER_IM_ALIVE
*Mar 25 15:18:52.111: ISAKMP:(0:1:HW:2):Old State = IKE_P1_COMPLETE New State =
IKE_P1_COMPLETE
```

The above message corresponds to sending the DPD R\_U\_THERE message.

```
*Mar 25 15:18:52.123: ISAKMP (0:268435457): received packet from 10.2.80.209
dport 500 sport 500 Global (I) QM_IDLE
*Mar 25 15:18:52.123: ISAKMP: set new node -443923643 to QM_IDLE *Mar 25 15:18:52.131:
ISAKMP:(0:1:HW:2): processing HASH payload. message ID =
-443923643
*Mar 25 15:18:52.131: ISAKMP:(0:1:HW:2): processing NOTIFY R_U_THERE_ACK protocol 1
spi 0, message ID = -443923643, sa = 81BA4DD4
*Mar 25 15:18:52.135: ISAKMP:(0:1:HW:2): DPD/R_U_THERE_ACK received from peer
10.2.80.209, sequence 0x9
*Mar 25 15:18:52.135: ISAKMP:(0:1:HW:2):deleting node -443923643 error FALSE
reason "informational (in) state 1"
*Mar 25 15:18:52.135: ISAKMP:(0:1:HW:2):Input = IKE_MSG_FROM_PEER, IKE_INFO_NOTIFY *Mar
25 15:18:52.135: ISAKMP:(0:1:HW:2):Old State = IKE_P1_COMPLETE New State =
IKE_P1_COMPLETE
```

The above message corresponds to receiving the acknowledge (ACK) message from the peer.

```
Router#

IKE_DEST_SA
```

The above message shows what happens when the remote peer is unreachable. The router sends one DPD R\_U\_THERE message and four retransmissions before it finally deletes the IPsec and IKE SAs.

## DPD and Cisco IOS Keepalives Used in Conjunction with Multiple Peers in a Crypto Map: Example

The following example shows that DPD and Cisco IOS keepalives are used in conjunction with multiple peers in a crypto map configuration when IKE will be used to establish the security associations (SAs). In this example, an SA could be set up to the IPsec peer at 10.0.0.1, 10.0.0.2, or 10.0.0.3.

```
crypto map green 1 ipsec-isakmp
 set peer 10.0.0.1
 set peer 10.0.0.2
 set peer 10.0.0.3
 set transform-set txfm
 match address 101
```

## DPD Used in Conjunction with Multiple Peers for an Easy VPN Remote: Example

The following example shows that DPD is used in conjunction with multiple peers in an Easy VPN remote configuration. In this example, an SA could be set up to the IPsec peer at 10.10.10.10, 10.2.2.2, or 10.3.3.3.

```
crypto ipsec client ezvpn ezvpn-config
 connect auto
 group unity key preshared
 mode client
 peer 10.10.10.10
 peer 10.2.2.2
 peer 10.3.3.3
```

# IPsec Diagnostics Enhancement

---

**First Published: June 19, 2006**

**Last Updated: June 19, 2006**

The Cisco IPsec Diagnostics Enhancement feature adds four sets of event statistics and an error history buffer to the Cisco IOS software for use in troubleshooting a virtual private network (VPN) that encrypts the data path.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.*

, use the “Feature Information for the IPsec Diagnostics Enhancement” section on page 16.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Tracking Packet Processing Within a Switch or Router

Standard packet analyzers used for troubleshooting network issues capture packets between devices in the network but they cannot capture packet processing events inside a device, such as a router. Beginning with Cisco IOS Release 12.4(9)T, Cisco IOS software includes four sets of event statistics to track packet processing within a switch or router. These statistics help Cisco TAC engineers diagnose and resolve issues in encrypted networks. Each set of statistics tracks a different aspect of packet processing within a switch or router:

Error counters track packet processing errors and associated packet drops. When a packet encounters an error, the first 64 bytes of that packet are stored in a buffer, to facilitate troubleshooting.

Internal counters show the detailed movement of a packet, end to end, across an encryption data path.

Punt counters track instances when the configured packet processing method failed, and an alternative method was used.

Success counters record the data path checkpoints where packets are successfully forwarded.

You can view any one set of statistics, or all of them, or only those that have recorded errors. You must choose the display timeframe for the statistics, either **realtime**

**snapshot**

# IPSec NAT Transparency

---

The IPSec NAT Transparency feature introduces support for IP Security (IPSec) traffic to travel through Network Address Translation (NAT) or Port Address Translation (PAT) points in the network by addressing many known incompatibilities between NAT and IPSec.

## Feature Specifications for the IPSec NAT Transparency feature

---

### Feature History

| Release                  | Modification                                                  |
|--------------------------|---------------------------------------------------------------|
| 12.2(13)T                | This feature was introduced.                                  |
| Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers. |

---

### Supported Platforms

For platforms supported in Cisco IOS Release 12.2(13)T, consult Cisco Feature Navigator.

---

## Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

#### **Availability of Cisco IOS Software Images**

Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

## **Restrictions for IPSec NAT Transparency**

Although this feature addresses many incompatibilities between NAT and IPSec, the following problems still exist:

#### **Internet Key Exchange (IKE) IP Address and NAT**

This incompatibility applies only when IP addresses are used as a search key to find a preshared key. Modification of the IP source or destination addresses by NAT or reverse NAT results in a mismatch between the IP address and the preshared key.

#### **Embedded IP Addresses and NAT**

Because the payload is integrity protected, any IP address enclosed within IPSec packets cannot be translated by NAT. Protocols that use embedded IP addresses include FTP, Internet Relay Chat (IRC), Simple Network Management Protocol (SNMP), Lightweight Directory Access Protocol (LDAP), H.323, and Session Initiation Protocol (SIP).

## **Information About IPSec NAT Transparency**

To configure the IPSec NAT Transparency feature, you must understand the following concepts:

- [Benefit of IPSec NAT Transparency, page 3](#)
- [Feature Design of IPSec NAT Traversal, page 3](#)
- [NAT Keepalives, page 6](#)

## Benefit of IPSec NAT Transparency

Before the introduction of this feature, a standard IPSec virtual private network (VPN) tunnel would not work if there were one or more NAT or PAT points in the delivery path of the IPSec packet. This feature makes NAT IPSec-aware, thereby, allowing remote access users to build IPSec tunnels to home gateways.

## Feature Design of IPSec NAT Traversal

The IPSec NAT Transparency feature introduces support for IPSec traffic to travel through NAT or PAT points in the network by encapsulating IPSec packets in a User Datagram Protocol (UDP) wrapper, which allows the packets to travel across NAT devices. The following sections define the details of NAT traversal:

- [IKE Phase 1 Negotiation: NAT Detection](#)
- [IKE Phase 2 Negotiation: NAT Traversal Decision](#)
- [UDP Encapsulation of IPSec Packets for NAT Traversal](#)
- [UDP Encapsulated Process for Software Engines: Transport Mode and Tunnel Mode ESP Encapsulation](#)

### IKE Phase 1 Negotiation: NAT Detection

During Internet Key Exchange (IKE) phase 1 negotiation, two types of NAT detection occur before IKE Quick Mode begins—NAT support and NAT existence along the network path.

To detect NAT support, you should exchange the vendor identification (ID) string with the remote peer. During Main Mode (MM) 1 and MM 2 of IKE phase 1, the remote peer sends a vendor ID string payload to its peer to indicate that this version supports NAT traversal. Thereafter, NAT existence along the network path can be determined.

Detecting whether NAT exists along the network path allows you to find any NAT device between two peers and the exact location of NAT. A NAT device can translate the private IP address and port to public value (or from public to private). This translation changes the IP address and port if the packet goes through the device. To detect whether a NAT device exists along the network path, the peers should send a payload with hashes of the IP address and port of both the source and destination address from each end. If both ends calculate the hashes and the hashes match, each peer knows that a NAT device does not exist on the network path between them. If the hashes do not match (that is, someone translated the address or port), then each peer needs to perform NAT traversal to get the IPSec packet through the network.

The hashes are sent as a series of NAT discovery (NAT-D) payloads. Each payload contains one hash; if multiple hashes exist, multiple NAT-D payloads are sent. In most environments, there are only two NAT-D payloads—one for the source address and port and one for the destination address and port. The destination NAT-D payload is sent first, followed by the source NAT-D payload, which implies that the receiver should expect to process the local NAT-D payload first and the remote NAT-D payload second. The NAT-D payloads are included in the third and fourth messages in Main Mode and in the second and third messages in Aggressive Mode (AM).

## IKE Phase 2 Negotiation: NAT Traversal Decision

While IKE phase 1 detects NAT support and NAT existence along the network path, IKE phase 2 decides whether or not the peers at both ends will use NAT traversal. Quick Mode (QM) security association (SA) payload in QM1 and QM2 is used to for NAT traversal negotiation.

Because the NAT device changes the IP address and port number, incompatibilities between NAT and IPsec can be created. Thus, exchanging the original source address bypasses any incompatibilities.

## UDP Encapsulation of IPsec Packets for NAT Traversal

In addition to allowing IPsec packets to traverse across NAT devices, UDP encapsulation also addresses many incompatibility issues between IPsec and NAT and PAT. The resolved issues are as follows:

### Incompatibility Between IPsec ESP and PAT—Resolved

If PAT found a legislative IP address and port, it would drop the Encapsulating Security Payload (ESP) packet. To prevent this scenario, UDP encapsulation is used to hide the ESP packet behind the UDP header. Thus, PAT treats the ESP packet as a UDP packet, processing the ESP packet as a normal UDP packet.

### Incompatibility Between Checksums and NAT—Resolved

In the new UDP header, the checksum value is always assigned to zero. This value prevents an intermediate device from validating the checksum against the packet checksum, thereby, resolving the TCP UDP checksum issue because NAT changes the IP source and destination addresses.

### Incompatibility Between Fixed IKE Destination Ports and PAT—Resolved

PAT changes the port address in the new UDP header for translation and leaves the original payload unchanged.

To see how UDP encapsulation helps to send IPsec packets see [Figure 1](#) and [Figure 2](#).

**Figure 1**      ***Standard IPSec Tunnel Through a NAT/PAT Point (No UDP Encapsulation)***

**Figure 2**      ***IPSec Packet with UDP Encapsulation***

## UDP Encapsulated Process for Software Engines: Transport Mode and Tunnel Mode ESP Encapsulation

After the IPsec packet is encrypted by a hardware accelerator or a software crypto engine, a UDP header and a non-IKE marker (which is 8 bytes in length) are inserted between the original IP header and ESP header. The total length, protocol, and checksum fields are changed to match this modification. [Figure 3](#) shows an IPsec packet before and after transport mode is applied; [Figure 4](#) shows an IPsec packet before and after tunnel mode is applied.

**Figure 3**      *Transport Mode—IPsec Packet Before and After ESP Encapsulation*

**Figure 4**      *Tunnel Mode—IPsec Packet Before and After ESP Encapsulation*

## NAT Keepalives

NAT keepalives are enabled to keep the dynamic NAT mapping alive during a connection between two peers. NAT keepalives are UDP packets with an unencrypted payload of 1 byte. Although the current dead peer detection (DPD) implementation is similar to NAT keepalives, there is a slight difference: DPD is used to detect peer status, while NAT keepalives are sent if the IPsec entity did not send or receive the packet at a specified period of time—valid range is between 5 to 3600 seconds.

If NAT keepalives are enabled (via the `crypto isamkp nat keepalive` command), users should ensure that the idle value is shorter than the NAT mapping expiration time, which is 20 seconds.

# How to Configure NAT and IPSec

This section contains the following procedures:

- [Configuring NAT Traversal, page 7](#) (optional)
- [Disabling NAT Traversal, page 7](#) (optional)
- [Configuring NAT Keepalives, page 8](#) (optional)
- [Verifying IPSec Configuration, page 8](#) (optional)

## Configuring NAT Traversal

NAT Traversal is a feature that is auto detected by VPN devices. There are no configuration steps for a router running Cisco IOS Release 12.2(13)T. If both VPN devices are NAT-T capable, NAT Traversal is auto detected and auto negotiated.

## Disabling NAT Traversal

You may wish to disable NAT traversal if you already know that your network uses IPSec-awareness NAT (spi-matching scheme). To disable NAT traversal, use the following commands:

### SUMMARY STEPS:

1. `enable`
2. `configure terminal`
3. `no crypto ipsec nat-transparency udp-encapsulation`

### DETAILED STEPS

|        | Command or Action                                                                                      | Purpose                                                        |
|--------|--------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <code>enable</code>                                                                                    | Enables higher privilege levels, such as privileged EXEC mode. |
|        | <b>Example:</b><br><code>Router&gt; enable</code>                                                      | Enter your password if prompted.                               |
| Step 2 | <code>configure terminal</code>                                                                        | Enters global configuration mode.                              |
|        | <b>Example:</b><br><code>Router# configure terminal</code>                                             |                                                                |
| Step 3 | <code>no crypto ipsec nat-transparency<br/>udp-encapsulation</code>                                    | Disables NAT traversal.                                        |
|        | <b>Example:</b><br><code>Router(config)# no crypto ipsec nat-transparency<br/>udp-encapsulation</code> |                                                                |

## Configuring NAT Keepalives

To configure your router to send NAT keepalives, use the following commands:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp nat keepalive *seconds***

### DETAILED STEPS

|        | Command or Action                                                 | Purpose                                                                                                                                                  |
|--------|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                     | Enables higher privilege levels, such as privileged EXEC mode.                                                                                           |
|        | <b>Example:</b><br>Router> enable                                 | Enter your password if prompted.                                                                                                                         |
| Step 2 | <b>configure terminal</b>                                         | Enters global configuration mode.                                                                                                                        |
|        | <b>Example:</b><br>Router# configure terminal                     |                                                                                                                                                          |
| Step 3 | <b>crypto isakmp nat keepalive <i>seconds</i></b>                 | Allows an IPSec node to send NAT keepalive packets.                                                                                                      |
|        | <b>Example:</b><br>Router(config)# crypto isakmp nat keepalive 20 | <ul style="list-style-type: none"> <li>• <i>seconds</i>—The number of seconds between keepalive packets; range is between 5 to 3,600 seconds.</li> </ul> |

## Verifying IPSec Configuration

To verify your configuration, perform the following optional steps:

### SUMMARY STEPS

1. **enable**
2. **show crypto ipsec sa [map *map-name* | address | identity] [detail]**

## DETAILED STEPS

|        | Command or Action                                                                                               | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                                                                   | Enables higher privilege levels, such as privileged EXEC mode. |
|        | <b>Example:</b><br>Router> enable                                                                               | Enter your password if prompted.                               |
| Step 2 | <b>show crypto ipsec sa</b> [ <b>map</b> <i>map-name</i>   <b>address</b>   <b>identity</b> ] [ <b>detail</b> ] | Displays the settings used by current SAs.                     |
|        | <b>Example:</b><br>Router# show crypto ipsec sa                                                                 |                                                                |

# Configuration Examples for IPSec and NAT

This section provides the following configuration example:

- [NAT Keepalives Configuration Example, page 9](#)

## NAT Keepalives Configuration Example

The following example shows how to enable NAT keepalives to be sent every 20 seconds:

```
crypto isakmp policy 1
 authentication pre-share
crypto isakmp key 1234 address 56.0.0.1
crypto isakmp nat keepalive 20
!
!
crypto ipsec transform-set t2 esp-des esp-sha-hmac
!
crypto map test2 10 ipsec-isakmp
 set peer 56.0.0.1
 set transform-set t2
 match address 101
```

## Command Reference

The following commands are introduced or modified in the feature or features

- **crypto isamkp nat keepalive**
- **access-list (IP extended)**
- **show crypto ipsec sa**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Glossary

**IKE**—Internet Key Exchange. Hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the Internet Security Association Key Management Protocol (ISAKMP) framework. Although IKE can be used with other protocols, its initial implementation is with IPSec. IKE provides authentication of the IPSec peers, negotiates IPSec keys, and negotiates IPSec security associations (SAs).

**IPSec**—IP Security. Framework of open standards developed by the Internet Engineering Task Force (IETF). IPSec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPSec acts at the network layer, protecting and authenticating IP packets between participating IPSec devices (“peers”), such as Cisco routers.

**NAT**—Network Address Translation. Translates a private IP address used inside the corporation to a public, routable address for use on the outside of the corporation, such as the Internet. NAT is considered a one-to-one mapping of addresses from private to public.

**PAT**—Port Address Translation. Like NAT, PAT also translated private IP address to public, routable addresses. Unlike NAT, PAT provides a many-to-one mapping of private addresses to a public address; each instance of the public address is associated with a particular port number to provide uniqueness. PAT can be used in environments where the cost of obtaining a range of public addresses is too expensive for an organization.

**Note**

# IPsec Preferred Peer

---

**First Published: March 28, 2005**  
**Last Updated: August 21, 2007**

The IP Security (IPsec) Preferred Peer feature allows you to control the circumstances by which multiple peers on a crypto map are tried in a failover scenario.

This feature includes the following capabilities:

- Default peer configuration
- IPsec idle-timer usage with default peer

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for IPsec Preferred Peer” section on page 9](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for IPsec Preferred Peer

- You must have a properly defined, complete crypto map.

## Restrictions for IPsec Preferred Peer

Default peer:

- This feature must be used in conjunction with Dead Peer Detection (DPD). It is most effective on a remote site running DPD in periodic mode. DPD detects the failure of a device quickly and resets the peer list so that the default peer is tried for the next attempted connection.
- Only one peer can be designated as the default peer in a crypto map.
- The default peer must be the first peer in the peer list.

IPsec idle-timer usage with default peer:

- This feature works only on the crypto map for which it is configured. You cannot configure the capability globally for all crypto maps.
- If there is a global idle timer, the crypto map idle-timer value must be different from the global value; otherwise, the idle timer is not added to the crypto map.

## Information About IPsec Preferred Peer

To configure IPsec Preferred Peer, you need to understand the following concepts:

- [IPsec, page 2](#)
- [Dead Peer Detection, page 3](#)
- [Default Peer Configuration, page 3](#)
- [Idle Timers, page 4](#)
- [IPsec Idle-Timer Usage with Default Peer, page 4](#)
- [Peers on Crypto Maps, page 4](#)

## IPsec

IPsec is a framework of open standards developed by the Internet Engineering Task Force (IETF). IPsec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPsec acts at the network layer, protecting and authenticating Internet Protocol (IP) packets between participating IPsec devices (peers), such as Cisco routers.

IPsec provides the following network security services. These services are optional. In general, local security policy dictates the use of one or more of these services:

- **Data Confidentiality**—The IPsec sender can encrypt packets before transmitting them across a network.

- **Data Integrity**—The IPsec receiver can authenticate packets sent by the IPsec sender to ensure that the data has not been altered during transmission.
- **Data Origin Authentication**—The IPsec receiver can authenticate the source of the IPsec packets sent.
- **Anti-Replay**—The IPsec receiver can detect and reject replayed packets.

With IPsec, data can be transmitted across a public network without fear of observation, modification, or spoofing. This enables applications such as Virtual Private Networks (VPNs), including intranets, extranets, and remote user access.

IPsec provides secure tunnels between two peers, such as two routers. You define which packets are considered sensitive and should be sent through these secure tunnels, and you define the parameters that should be used to protect these sensitive packets, by specifying characteristics of these tunnels. When the IPsec peer sees such a sensitive packet, it sets up the appropriate secure tunnel and sends the packet through the tunnel to the remote peer.

## Dead Peer Detection

The VPN Client uses a keepalive mechanism called Dead Peer Detection (DPD) to check the availability of the VPN device on the other side of an IPsec tunnel. If the network is unusually busy or unreliable, you can increase the number of seconds that the VPN Client will wait before deciding whether the peer is no longer active.

Keepalive packets are not sent if traffic is received. This lowers the overhead associated with DPD, because on a heavily loaded network very few keepalive packets will be sent because traffic is being received on the tunnels. In addition, DPD sends keepalive packets only if there is user traffic to send (and no user traffic is received).

You can configure Internet Key Exchange (IKE) DPD so that DPD sends the keepalive packets whether or not there is outbound user data. That is, as long as there is no inbound user data, the keepalive packets are sent at the configured keepalive interval.

## Default Peer Configuration

If a connection timeout occurs, the connection to the current peer is closed. The **set peer** command allows you to configure the first peer as the default peer. If there is a default peer, the next time a connection is initiated, the connection is directed to the default peer instead of to the next peer in the peer list. If the default peer is unresponsive, the next peer in the peer list becomes the current peer and future connections through the crypto map try that peer.

This capability is useful when traffic on a physical link stops due to the failure of a remote peer. DPD indicates that the remote peer is unavailable, but that peer remains the current peer.

A default peer facilitates the failover to a preferred peer that was previously unavailable, but has returned to service. Users can give preference to certain peers in the event of a failover. This is useful if the original failure was due to a network connectivity problem rather than failure of the remote peer.

## Idle Timers

When a router running Cisco IOS software creates an IPsec security association (SA) for a peer, resources must be allocated to maintain the SA. The SA requires both memory and several managed timers. For idle peers, these resources are wasted. If enough resources are wasted by idle peers, the router could be prevented from creating new SAs with other peers.

IPsec SA idle timers increase the availability of resources by deleting SAs associated with idle peers. Because IPsec SA idle timers prevent the wasting of resources by idle peers, more resources are available to create new SAs when required.

If IPsec SA idle timers are not configured, only the global lifetimes for IPsec SAs are applied. SAs are maintained until the global timers expire, regardless of peer activity.

## IPsec Idle-Timer Usage with Default Peer

If all connections to the current peer time out, the next time a connection is initiated it is directed to the default peer configured in the **set peer** command. If a default peer is not configured and there is a connection timeout, the current peer remains the one that timed out.

This enhancement helps facilitate a failover to a preferred peer that was previously unavailable but is in service now.

## Peers on Crypto Maps

A crypto map set can contain multiple entries, each with a different access list. The router searches the crypto map entries in order, and attempts to match the packet to the access list specified in that entry.

When a packet matches a **permit** entry in a particular access list, and the corresponding crypto map entry is tagged as Cisco, connections are established with the remote peer as specified in the set peer statements within the crypto map.

## How to Configure IPsec Preferred Peer

This section contains the following procedures:

- [Configuring a Default Peer, page 4](#) (required)
- [Configuring the Idle Timer, page 5](#) (optional)

## Configuring a Default Peer

To configure a default peer, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name seq-num* [**ipsec-isakmp**] [**dynamic** *dynamic-map-name*] [**discover**] [**profile** *profile-name*]

4. **set peer** {*host-name* [dynamic] [default] | *ip-address* [default] }
5. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                          | Enters global configuration mode.                                                                                                                                                                                             |
| Step 3 | <b>crypto map</b> <i>map-name</i> <i>seq-num</i> [ipsec-isakmp] [dynamic <i>dynamic-map-name</i> ] [discover] [profile <i>profile-name</i> ]<br><br><b>Example:</b><br>Router(config)# crypto map mymap 10 ipsec-isakmp | Enters crypto map configuration mode. Creates or modifies a crypto map entry, creates a crypto profile that provides a template for configuration of dynamically created crypto maps, or configures a client accounting list. |
| Step 4 | <b>set peer</b> { <i>host-name</i> [dynamic] [default]   <i>ip-address</i> [default] }<br><br><b>Example:</b><br>Router(config-crypto-map)# set peer 10.0.0.2 default                                                   | Specifies an IPsec peer in a crypto map entry. Ensures that the first peer specified is defined as the default peer.                                                                                                          |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-crypto-map)# exit                                                                                                                                                   | Exits crypto map configuration mode and returns to global configuration mode.                                                                                                                                                 |

## Configuring the Idle Timer

To configure the idle timer, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name* *seq-num* [ipsec-isakmp] [dynamic *dynamic-map-name*] [discover] [profile *profile-name*]
4. **set security-association idletime** *seconds* [default]
5. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                       |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                     | Enters global configuration mode.                                                                                                                                                                                             |
| Step 3 | <b>crypto map</b> <i>map-name seq-num</i> [ <b>ipsec-isakmp</b> ] [ <b>dynamic</b> <i>dynamic-map-name</i> ] [ <b>discover</b> ] [ <b>profile</b> <i>profile-name</i> ]<br><br><b>Example:</b><br>Router(config)# crypto map mymap 10 ipsec-isakmp | Enters crypto map configuration mode. Creates or modifies a crypto map entry, creates a crypto profile that provides a template for configuration of dynamically created crypto maps, or configures a client accounting list. |
| Step 4 | <b>set security-association idletime</b> <i>seconds</i> [ <b>default</b> ]<br><br><b>Example:</b><br>Router(config-crypto-map)# set security-association idletime 120 default                                                                      | Specifies the maximum amount of time for which the current peer can be idle before the default peer is used.                                                                                                                  |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-crypto-map)# exit                                                                                                                                                                              | Exits crypto map configuration mode and returns to global configuration mode.                                                                                                                                                 |

## Configuration Examples for IPsec Preferred Peer

- [Configuring a Default Peer: Example, page 6](#)
- [Configuring the IPsec Idle Timer: Example, page 6](#)

### Configuring a Default Peer: Example

The following example shows that the first peer, at IP address 10.1.1.1, is the default peer:

```
crypto map tohub 1 ipsec-isakmp
 set peer 10.1.1.1 default
 set peer 10.2.2.2
```

### Configuring the IPsec Idle Timer: Example

In the following example, if the current peer is idle for 120 seconds, the default peer 10.1.1.1 (which was specified in the **set peer** command) is used for the next attempted connection:

```
crypto map tohub 1 ipsec-isakmp
```

```
set peer 10.1.1.1 default
set peer 10.2.2.2
set security-association idletime 120 default
```

## Command Reference

The following commands are introduced or modified in the feature or features

- **set peer (IPsec)**
- **set security-association idle-time**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

## Feature Information for IPsec Preferred Peer

[Table 1](#) lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

[Table 1](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** *Feature Information for IPsec Preferred Peer*

| Feature Name         | Releases                                | Feature Information                                                                                                                                                                                                                                                                                                                                                         |

## Glossary

**crypto access list**—A list that defines which IP traffic will be protected by crypto and which traffic will not be protected by crypto.

**crypto map**—A map that specifies which traffic should be protected by IPsec, where IPsec-protected traffic should be sent, and what IPsec transform sets should be applied to this traffic.

**dead peer detection**—A feature that allows the router to detect an unresponsive peer.

**keepalive message**—A message sent by one network device to inform another network device that the virtual circuit between the two is still active.

**peer**—Router or other device that participates in IPsec and IKE. In IPsec, peers are devices or entities that communicate securely either through the exchange of keys or the exchange of digital certificates.

**SA**—security association. An instance of security policy and keying material applied to a data flow. Both IKE and IPsec use SAs, although SAs are independent of one another. IPsec SAs are unidirectional and are unique in each security protocol. An IKE SA is used by IKE only, and unlike the IPsec SA, it is bidirectional. IKE negotiates and establishes SAs on behalf of IPsec. A user also can establish IPsec SAs manually. A set of SAs are needed for a protected data pipe, one per direction per protocol. For example, if you have a pipe that supports Encapsulating Security Payload (ESP) between peers, one ESP SA is required for each direction. SAs are identified uniquely by destination (IPsec endpoint) address, security protocol (AH or ESP), and security parameter index (SPI).

**transform set**—An acceptable combination of security protocols, algorithms, and other settings to apply to IPsec-protected traffic. During the IPsec security association negotiation, the peers agree to use a particular transform set when protecting a particular data flow.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

# IPSec Security Association Idle Timers

When a router running the Cisco IOS software creates an IPsec security association (SA) for a peer, resources must be allocated to maintain the SA. The SA requires both memory and several managed timers. For idle peers, these resources are wasted. If enough resources are wasted by idle peers, the router could be prevented from creating new SAs with other peers. The IPsec Security Association Idle Timers feature introduces a configurable idle timer to monitor SAs for activity, allowing SAs for idle peers to be deleted. Benefits of this feature include:

- Increased availability of resources
- Improved scalability of Cisco IOS IPsec deployments

## Feature Specifications for IPsec Security Association Idle Timers

### Feature History

| Release                  | Modification                                                                                                                                       |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(15)T                | This feature was introduced.                                                                                                                       |
| 12.3(14)T                | The <b>set security-association idle-time</b> command was added, allowing for the configuration of an IPsec idle timer for a specified crypto map. |
| Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers.                                                                                      |

### Supported Platforms

Cisco 1700 series access routers, Cisco 2400 series integrated access devices, Cisco 2600 series multiservice platforms, Cisco 3600 series multiservice platforms, Cisco 3700 series multiservice access routers, Cisco 7100 series VPN routers, Cisco 7200 series routers, Cisco 7400 series routers, Cisco 7500 series routers, Cisco 801–804 ISDN routers, Cisco 805 serial router, Cisco 806 broadband router, Cisco 811, Cisco 813, Cisco 820, Cisco 827 ADSL router, Cisco 828 G.SHDSL router, Cisco 8850-RPM, Cisco 950, Cisco AS5350 universal gateway, Cisco AS5400 series universal gateways, Cisco integrated communications system 7750, Cisco MC3810 series multiservice access concentrators, Cisco ubr7200, Cisco ubr900 series cable access routers

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

- [Additional References, page 5](#)
- [Command Reference, page 7](#)

## Prerequisites for IPsec Security Association Idle Timers

You must configure Internet Key Exchange (IKE) as described in the “[Configuring Internet Key Exchange Security Protocol](#)” chapter of the *Cisco IOS Security Configuration Guide*, Release 12.2.

## Information About IPsec Security Association Idle Timers

To configure the IPsec Security Association Idle Timers feature, you must understand the following concepts:

- [Lifetimes for IPsec Security Associations, page 2](#)
- [IPsec Security Association Idle Timers, page 2](#)
- [Benefits of IPsec Security Association Idle Timers, page 3](#)

## Lifetimes for IPsec Security Associations

The Cisco IOS software currently allows the configuration of lifetimes for IPsec SAs. Lifetimes can be configured globally or per crypto map. There are two lifetimes: a “timed” lifetime and a “traffic-volume” lifetime. A security association expires after the first of these lifetimes is reached.

## IPsec Security Association Idle Timers

The IPsec SA idle timers are different from the global lifetimes for IPsec SAs. The expiration of the global lifetime is independent of peer activity. The IPsec SA idle timer allows SAs associated with inactive peers to be deleted before the global lifetime has expired.

If the IPsec SA idle timers are not configured, only the global lifetimes for IPsec SAs are applied. SAs are maintained until the global timers expire, regardless of peer activity.

**Note**

If the last IPsec SA to a given peer is deleted due to idle timer expiration, the Internet Key Exchange (IKE) SA to that peer will also be deleted.

## Benefits of IPSec Security Association Idle Timers

### Increased Availability of Resources

Configuring the IPSec Security Association Idle Timers feature increases the availability of resources by deleting SAs associated with idle peers.

### Improved Scalability of Cisco IOS IPSec Deployments

Because the IPSec Security Association Idle Timers feature prevents the wasting of resources by idle peers, more resources will be available to create new SAs as required.

## How to Configure IPSec Security Association Idle Timers

- [Configuring the IPSec SA Idle Timer Globally, page 3](#)
- [Configuring the IPSec SA Idle Timer per Crypto Map, page 4](#)

### Configuring the IPSec SA Idle Timer Globally

This task configures the IPSec SA idle timer globally. The idle timer configuration will be applied to all SAs.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec security-association idle-time *seconds***

#### DETAILED STEPS

|        | Command or Action                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                         |
| Step 3 | <b>crypto ipsec security-association idle-time <i>seconds</i></b><br><br><b>Example:</b><br>Router(config)# crypto ipsec security-association idle-time 600 | Configures the IPSec SA idle timer. <ul style="list-style-type: none"><li>• The <i>seconds</i> argument specifies the time, in seconds, that the idle timer will allow an inactive peer to maintain an SA. Valid values for the <i>seconds</i> argument range from 60 to 86400.</li></ul> |

# Configuring the IPsec SA Idle Timer per Crypto Map

This task configures the IPsec SA idle timer for a specified crypto map. The idle timer configuration will be applied to all SAs under the specified crypto map.

Note

This configuration task was available effective with Cisco IOS Release 12.3(14)T.

## SUMMARY STEPS

- 1. **enable**
- 2. **configure terminal**
- 3. **crypto map** *map-name seq-number ipsec-isakmp*
- 4. **set security-association idle-time** *seconds*

## DETAILED STEPS

|        | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                   |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                         |
| Step 3 | <b>crypto map</b> <i>map-name seq-number ipsec-isakmp</i><br><br><b>Example:</b><br>Router(config)# crypto map test 1 ipsec-isakmp                   | Creates or modifies a crypto map entry and enters crypto map configuration mode.                                                                                                                                                                                                                                          |
| Step 4 | <b>set security-association idle-time</b> <i>seconds</i><br><br><b>Example:</b><br>Router(config-crypto-map)# set security-association idle-time 600 | Specifies the maximum amount of time for which the current peer can be idle before the default peer is used. <ul style="list-style-type: none"><li>• The <i>seconds</i> argument is the number of seconds for which the current peer can be idle before the default peer is used. Valid values are 60 to 86400.</li></ul> |

# Configuration Examples for IPSec Security Association Idle Timers

- [Configuring the IPSec SA Idle Timer Globally Example, page 5](#)
- [Configuring the IPSec SA Idle Timer per Crypto Map Example, page 5](#)

## Configuring the IPSec SA Idle Timer Globally Example

The following example globally configures the IPSec SA idle timer to drop SAs for inactive peers after 600 seconds:

```
crypto ipsec security-association idle-time 600
```

## Configuring the IPSec SA Idle Timer per Crypto Map Example

The following example configures the IPSec SA idle timer for the crypto map named test to drop SAs for inactive peers after 600 seconds:

```
crypto map test 1 ipsec-isakmp
set security-association idle-time 600
```

**Note**

---

The above configuration was not available until Cisco IOS Release 12.3(14)T.

# IPSec—SNMP Support

## Feature History

| Release                  | Modification                                                                                                                                                                                                                                                                           |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(4)E                 | This feature was introduced on the Cisco 7100, 7200, and 7500 series.                                                                                                                                                                                                                  |
| 12.1(5a)E                | Support for CISCO-IPSEC-FLOW-MONITOR-MIB notifications was added.                                                                                                                                                                                                                      |
| 12.2(4)T                 | Support for this feature was added for platforms in Release 12.2 T.                                                                                                                                                                                                                    |
| 12.2(8)T, 12.1(11b)E     | The following Command Line Interface (CLI) commands were added to enable and disable IP Security (IPSec) MIB notifications: <ul style="list-style-type: none"><li>• <a href="#">snmp-server enable traps ipsec</a></li><li>• <a href="#">snmp-server enable traps isakmp</a></li></ul> |
| 12.2(14)S                | This feature was integrated into Cisco IOS Release 12.2(14)S.                                                                                                                                                                                                                          |
| Cisco IOS XE Release 2.1 | This feature was introduced on the Cisco ASR 1000 Series Routers.                                                                                                                                                                                                                      |

This document describes the IPSec—SNMP Support feature in Cisco IOS Release 12.1 E, 12.2 T, and 12.2 S and includes the following sections:

- [Feature Overview, page 2](#)
- [Supported Platforms, page 3](#)
- [Supported Standards, MIBs, and RFCs, page 5](#)
- [Configuration Tasks, page 5](#)
- [Monitoring and Maintaining IPSec MIB, page 7](#)
- [Configuration Examples, page 7](#)
- [Command Reference, page 8](#)
- [Glossary, page 9](#)

**Americas Headquarters:**  
**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

© 2007 Cisco Systems, Inc. All rights reserved.

**Note**

This document focuses on Cisco IOS CLI support for the Cisco IPSec MIBs. This document also lists which elements of the MIBs are currently supported. This document does not describe SNMP configuration (from a Network Management Station) of the Cisco IPSec MIBs.

## Feature Overview

The IP Security (IPSec) - SNMP Support feature introduces support for industry-standard IPSec MIBs and Cisco IOS-software specific IPSec MIBs.

The IPSec MIBs allow IPSec configuration monitoring and IPSec status monitoring using SNMP, and can be integrated in a variety of Virtual Private Network (VPN) management solutions.

For example, this feature allows you to specify the desired size of a tunnel history table or a tunnel failure table using the Cisco IOS CLI. The history table archives attribute and statistic information about the tunnel; the failure table archives tunnel failure reasons along with the time failure occurred. A failure history table can be used as a simple method to distinguish between a normal and an abnormal tunnel termination. That is, if a tunnel entry in the tunnel history table has no associated failure record, the tunnel must have terminated normally. However, a tunnel history table does not accompany every failure table because every failure does not correspond to a tunnel. Thus, supported setup failures are recorded in the failure table, but an associated history table is not recorded because a tunnel was never set up.

This feature also provides IPSec Simple Network Management Protocol (SNMP) notifications for use with network management systems.

## Benefits

The commands in this feature allow you to examine the version of the IPSec MIB feature, to enable and disable SNMP traps, and to monitor and control the size of the buffers used by this feature.

## Restrictions

Only the following tunnel setup failure logs are supported with the IPSec - SNMP Support feature:

- NOTIFY\_MIB\_IPSEC\_PROPOSAL\_INVALID  
“A tunnel could not be established because the peer did not supply an acceptable proposal.”
- NOTIFY\_MIB\_IPSEC\_ENCRYPT\_FAILURE  
“A tunnel could not be established because it failed to encrypt a packet to be sent to a peer.”
- NOTIFY\_MIB\_IPSEC\_SYSCAP\_FAILURE  
“A tunnel could not be established because the system ran out of resources.”
- NOTIFY\_MIB\_IPSEC\_LOCAL\_FAILURE  
“A tunnel could not be established because of an internal error.”

Note that these failure notices are recorded in the failure tables, but are not available as SNMP notifications (traps).

The following functions are not supported with the IPSec MIB feature:

- Checkpointing
- The Dynamic Cryptomap table of the CISCO-IPSEC-MIB

**Note**

CISCO-IPSEC-FLOW-MONITOR-MIB notifications are not supported before Cisco IOS Release 12.1(5a)E.

The CISCO-IPSEC-POLICY-MAP-MIB (ciscoIpSecPolMap) defines no notifications (the “IPSec Policy Map Notifications Group” is empty).

## Related Features and Technologies

The IPSec—SNMP Support feature was designed to support the VPN Device Manager (VDM). VDM enables network administrators to manage and configure site-to-site VPNs on a single device from a web browser and to see the effects of changes in real time. VDM implements a wizard-based graphical user interface (GUI) to simplify the process of configuring site-to-site VPNs using the IPSec protocol. VDM software is installed directly on Cisco VPN routers, and is designed for use and compatibility with future Device Manager products.

For more information on Cisco VDM, refer to the following URL:

<http://www.cisco.com/warp/public/cc/pd/nemnsw/vpdvmn/>

## Related Documents

### IPSec and Related Security Information

- Cisco IOS Security Configuration Guide
- Cisco IOS Security Command Reference

### SNMP Configuration Information

- Cisco IOS Configuration Fundamentals Configuration Guide
- *Cisco IOS Configuration Fundamentals Command Reference*

For the Cisco IOS Release 12.1 E implementation of security and SNMP features, refer to the Cisco IOS Release 12.1 versions of these documents. For Cisco IOS Release 12.2 T and 12.2 S implementation of these features, refer to the Cisco IOS Release 12.2 versions of these documents.

## Supported Platforms

The IPSec MIB feature is supported on the following platforms in Cisco IOS Release 12.1(4)E:

- Cisco 7100 series
- Cisco 7200 series
- Cisco 7500 series (RSP7000 and 7500)

The IPSec MIB feature is supported on the following platforms in Cisco IOS Release 12.2(4)T:

- Cisco 800 series (800, 805, 806, 820, 827, 828)

- Cisco 900 series
- Cisco 1600 and 1600R series
- Cisco 1700 series (1710, 1720, 1750, 1751, 1760)
- Cisco 2400 series
- Cisco 2600 and 2600XM series
- Cisco 3600 series (Cisco 3620, 3640, and 3660)
- Cisco 3745
- Cisco 4000
- Cisco 4500
- Cisco 5300 series
- Cisco 5400 series
- Cisco 5800 series
- Cisco 7100 series
- Cisco 7200 series
- Cisco 7400 series
- Cisco 7500 series (Cisco IOS Release 12.2(4)T2 and later releases)
- Cisco 7700 series
- Cisco MC3810
- Cisco uBR900 series (uBR900, uBR904, uBR905, uBR910, uBR920, uBR925)
- Cisco uBR7200

The IPSec MIB feature is supported on the following platforms in Cisco IOS Release 12.2(14)S:

- Cisco 7200 series
- Cisco 7400 series
- Cisco 7500 series

#### **Determining Platform Support Through Cisco Feature Navigator**

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

<http://www.cisco.com/go/fn>

#### **Availability of Cisco IOS Software Images**

Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

## **Supported Standards, MIBs, and RFCs**

### **Standards**

No new or modified standards are supported by this feature.

### **MIBs**

The following MIBs are supported by the IPSec—SNMP Support feature:

- CISCO-IPSEC-FLOW-MONITOR- MIB
- CISCO-IPSEC-MIB
- CISCO-IPSEC-POLICY-MAP-MIB

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

<http://tools.cisco.com/ITDIT/MIBS/servlet/index>

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

### **RFCs**

No new or modified RFCs are supported by this feature.

## **Configuration Tasks**

See the following sections for configuration tasks for the IPSec—SNMP Support feature. Each task in the list is identified as either required or optional:

- [Enabling IPSec SNMP Notifications](#) (required)

- [Configuring IPSec Failure History Table Size](#) (optional)
- [Configuring IPSec Tunnel History Table Size](#) (optional)

## Enabling IPSec SNMP Notifications

To enable a router to send IPSec trap or inform notifications to a specified host, use the following commands in global configuration mode:

|               | Command                                                                                                | Purpose                                                        |
|---------------|--------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | Router(config)# <b>snmp-server enable traps ipsec cryptomap</b> [add   delete   attach   detach]       | Enables a router to send IPSec SNMP notifications.             |
| <b>Step 2</b> | Router(config)# <b>snmp-server enable traps isakmp</b> [policy {add   delete}   tunnel {start   stop}] | Enables a router to send IPSec ISAKMP SNMP notifications.      |
| <b>Step 3</b> | Router(config)# <b>snmp-server host</b> host-address <b>traps</b> community-string <b>ipsec</b>        | Specifies the recipient of IPSec SNMP notification operations. |

For more information on configuring SNMP, refer to the chapter “Configuring SNMP Support” in the *Cisco IOS Configuration Fundamentals Configuration Guide*.

## Configuring IPSec Failure History Table Size

The default failure history table size is 200. To change the size of the failure history table, use the following command in global configuration mode:

| Command                                                                     | Purpose                                              |
|-----------------------------------------------------------------------------|------------------------------------------------------|
| Router(config)# <b>crypto mib ipsec flowmib history failure size</b> number | Changes the size of the IPSec failure history table. |

## Configuring IPSec Tunnel History Table Size

The default tunnel history table size is 200. To change the size of the tunnel history table, use the following command in global configuration mode:

| Command                                                                    | Purpose                                             |
|----------------------------------------------------------------------------|-----------------------------------------------------|
| Router(config)# <b>crypto mib ipsec flowmib history tunnel size</b> number | Changes the size of the IPSec tunnel history table. |

## Verifying IPSec MIB Configuration

To verify that the IPSec MIB feature is configured properly, perform the following tasks:

- Enter the **show crypto mib ipsec flowmib history failure size** privileged EXEC command to display the size of the failure history table:

```
Router# show crypto mib ipsec flowmib history failure size
```

```
IPSec Failure Window Size: 140
```

- Enter the **show crypto mib ipsec flowmib history tunnel size** privileged EXEC command to display the size of the tunnel history table:

```
Router# show crypto mib ipsec flowmib history tunnel size
IPSec History Window Size: 130
```

- Enter the **show crypto mib ipsec flowmib version** privileged EXEC command to display the MIB version used by the management applications to identify the feature set:

```
Router# show crypto mib ipsec flowmib version
IPSec Flow MIB version: 1
```

- Enter the **debug crypto mib** command to display the IPSec MIB debug message notifications:

```
Router# debug crypto mib
Crypto IPSec Mgmt Entity debugging is on
```

## Monitoring and Maintaining IPSec MIB

To monitor the status of IPSec MIB information, use any of the following commands in EXEC mode:

| Command                                                           | Purpose                                                 |
|-------------------------------------------------------------------|---------------------------------------------------------|
| Router# <b>show crypto mib ipsec flowmib history failure size</b> | Displays the size of the IPSec failure history table.   |
| Router# <b>show crypto mib ipsec flowmib history tunnel size</b>  | Displays the size of the IPSec tunnel history table.    |
| Router# <b>show crypto mib ipsec flowmib version</b>              | Displays the IPSec Flow MIB version used by the router. |

## Configuration Examples

This section provides the following configuration examples:

- [Enabling IPSec Notifications Examples](#)
- [Specifying History Table Size Examples](#)

### Enabling IPSec Notifications Examples

In the following example, IPSec notifications are enabled:

```
snmp-server enable traps ipsec isakmp
```

In the following example, the router is configured to send IPSec notifications to the host nms1.cisco.com:

```
snmp-server host nms1.cisco.com public ipsec isakmp
Translating "nms1.cisco.com"...domain server (171.00.0.01) [OK]
```

## Specifying History Table Size Examples

In the following example, the specified failure history table size is 140:

```
crypto mib ipsec flowmib history failure size 140
```

In the following example, the specified tunnel history table size is 130:

```
crypto mib ipsec flowmib history tunnel size 130
```

## Command Reference

The following commands are introduced or modified in the feature or features

- **crypto mib ipsec flowmib history failure size**
- **crypto mib ipsec flowmib history tunnel size**
- **debug crypto mib**
- **show crypto mib ipsec flowmib history failure size**
- **show crypto mib ipsec flowmib history tunnel size**
- **show crypto mib ipsec flowmib version**
- **snmp-server enable traps ipsec**
- **snmp-server enable traps isakmp**
- **snmp-server host**

For information about these commands, see the *Cisco IOS Security Command Reference* at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Glossary

**CA**—certificate authority. A certificate authority (CA) is an entity in a network that issues and manages security credentials and public keys (in the form of X509v3 certificates) for message encryption. As part of a public key infrastructure (PKI), a CA checks with a registration authority (RA) to verify information provided by the requestor of a digital certificate. If the RA verifies the requestor's information, the CA can then issue a certificate. Certificates generally include the owner's public key, the expiration date of the certificate, the owner's name, and other information about the public key owner.

**IP Security**—See IPSec.

**IPSec**—Internet Protocol Security. A framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses Internet Key Exchange (IKE) to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

**Management Information Base**—See MIB.

**MIB**—Management Information Base. Database of network management information that is used and maintained by a network management protocol such as Simple Network Management Protocol (SNMP) or Common Management Information Protocol (CMIP). The value of a MIB object can be changed or retrieved using SNMP or CMIP commands, usually through a graphical user interface (GUI) network management system (NMS). MIB objects are organized in a tree structure that includes public (standard) and private (proprietary) branches.

**Simple Network Management Protocol**—See SNMP.

**SNMP**—Simple Network Management Protocol. An application-layer protocol that provides a message format for communication between SNMP managers and agents.

**trap**—Message sent by an SNMP agent to a network management system, console, or terminal to indicate the occurrence of a significant event, such as a specifically defined condition or a threshold that was reached.

# IPsec Virtual Tunnel Interface

---

**First Published: October 18, 2004**

**Last Updated: June 11, 2008**

IP security (IPsec) virtual tunnel interfaces (VTIs) provide a routable interface type for terminating IPsec tunnels and an easy way to define protection between sites to form an overlay network. IPsec VTIs simplify configuration of IPsec for protection of remote links, support multicast, and simplify network management and load balancing.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for IPsec Virtual Tunnel Interface”](#) section on page 24.

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Restrictions for IPsec Virtual Tunnel Interface

## IPsec Transform Set

The IPsec transform set must be configured in tunnel mode only.

## IKE Security Association

The Internet Key Exchange (IKE) security association (SA) is bound to the VTI. Because IKE SA is bound to the VTI, the same IKE SA cannot be used for a crypto map.

## IPsec SA Traffic Selectors

Static VTIs support only a single IPsec SA that is attached to the VTI interface. The traffic selector for the IPsec SA is always “IP any any.”

A dynamic VTI also is a point-point interface that supports only a single IPsec SA, but the dynamic VTI is flexible in that it can accept the IPsec selectors that are proposed by the initiator.

## Proxy

Static VTIs support only the “IP any any” proxy.

Dynamic VTIs support only one proxy, which can be “IP any any” or any subset of it.

## QoS Traffic Shaping

The shaped traffic is process switched.

## Stateful Failover

IPsec stateful failover is not supported with IPsec VTIs.

## Tunnel Protection

The **shared** keyword is not required and must not be configured when using the **tunnel mode ipsec ipv4** command for IPsec IPv4 mode.

## Static VTIs Versus GRE Tunnels

The IPsec VTI is limited to IP unicast and multicast traffic only, as opposed to GRE tunnels, which have a wider application for IPsec implementation.

## VRF-Aware IPsec Configuration

In VRF-aware IPsec configurations with either static or dynamic VTIs (DVTIs), the VRF must *not* be configured in the Internet Security Association and Key Management Protocol (ISAKMP) profile.

Instead, the VRF must be configured on the tunnel interface for static VTIs. For DVTIs, you must apply VRF to the vtemplate using the **ip vrf forwarding** command.

# Information About IPsec Virtual Tunnel Interface

The use of IPsec VTIs both greatly simplifies the configuration process when you need to provide protection for remote access and provides a simpler alternative to using generic routing encapsulation (GRE) or Layer 2 Tunneling Protocol (L2TP) tunnels for encapsulation and crypto maps with IPsec. A major benefit associated with IPsec VTIs is that the configuration does not require a static mapping of

IPsec sessions to a physical interface. The IPsec tunnel endpoint is associated with an actual (virtual) interface. Because there is a routable interface at the tunnel endpoint, many common interface capabilities can be applied to the IPsec tunnel.

The IPsec VTI allows for the flexibility of sending and receiving both IP unicast and multicast encrypted traffic on any physical interface, such as in the case of multiple paths. Traffic is encrypted or decrypted when it is forwarded from or to the tunnel interface and is managed by the IP routing table. Using IP routing to forward the traffic to the tunnel interface simplifies the IPsec VPN configuration compared to the more complex process of using access control lists (ACLs) with the crypto map in native IPsec configurations. DVTIs function like any other real interface so that you can apply quality of service (QoS), firewall, and other security services as soon as the tunnel is active.

Without Virtual Private Network (VPN) Acceleration Module2+ (VAM2+) accelerating virtual interfaces, the packet traversing an IPsec virtual interface is directed to the router processor (RP) for encapsulation. This method tends to be slow and has limited scalability. In hardware crypto mode, all the IPsec VTIs are accelerated by the VAM2+ crypto engine, and all traffic going through the tunnel is encrypted and decrypted by the VAM2+.

The following sections provide details about the IPsec VTI:

- [Benefits of Using IPsec Virtual Tunnel Interfaces, page 3](#)
- [Routing with IPsec Virtual Tunnel Interfaces, page 5](#)
- [Static Virtual Tunnel Interfaces, page 3](#)
- [Dynamic Virtual Tunnel Interfaces, page 4](#)
- [Dynamic Virtual Tunnel Interface Life Cycle, page 5](#)
- [Traffic Encryption with the IPsec Virtual Tunnel Interface, page 6](#)

## Benefits of Using IPsec Virtual Tunnel Interfaces

IPsec VTIs allow you to configure a virtual interface to which you can apply features. Features for clear-text packets are configured on the VTI. Features for encrypted packets are applied on the physical outside interface. When IPsec VTIs are used, you can separate the application of features such as NAT, ACLs, and QoS and apply them to clear-text or encrypted text, or both. When crypto maps are used, there is no simple way to apply encryption features to the IPsec tunnel.

There are two types of VTI interfaces: static VTIs (SVTIs) and dynamic VTIs (DVTIs).

## Static Virtual Tunnel Interfaces

SVTI configurations can be used for site-to-site connectivity in which a tunnel provides always-on access between two sites. The advantage of using SVTIs as opposed to crypto map configurations is that users can enable dynamic routing protocols on the tunnel interface without the extra 4 bytes required for GRE headers, thus reducing the bandwidth for sending encrypted data.

Additionally, multiple Cisco IOS software features can be configured directly on the tunnel interface and on the physical egress interface of the tunnel interface. This direct configuration allows users to have solid control on the application of the features in the pre- or post-encryption path.

[Figure 1](#) illustrates how a static VTI is used.

**Figure 1** *IPsec Static VTI*

The IPsec VTI supports native IPsec tunneling and exhibits most of the properties of a physical interface.

## Dynamic Virtual Tunnel Interfaces

DVTIs can provide highly secure and scalable connectivity for remote-access VPNs. The DVTI technology replaces dynamic crypto maps and the dynamic hub-and-spoke method for establishing tunnels.

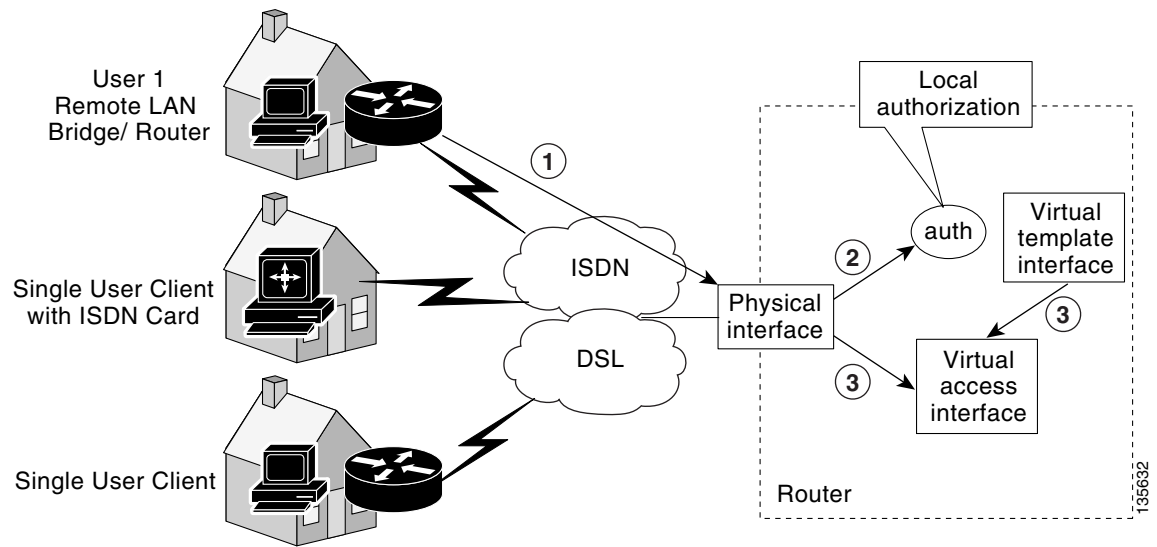

Dynamic VTIs can be used for both the server and remote configuration. The tunnels provide an on-demand separate virtual access interface for each VPN session. The configuration of the virtual access interfaces is cloned from a virtual template configuration, which includes the IPsec configuration and any Cisco IOS software feature configured on the virtual template interface, such as QoS, NetFlow, or ACLs.

Dynamic VTIs function like any other real interface so that you can apply QoS, firewall, other security services as soon as the tunnel is active. QoS features can be used to improve the performance of various applications across the network. Any combination of QoS features offered in Cisco IOS software can be used to support voice, video, or data applications.

Dynamic VTIs provide efficiency in the use of IP addresses and provide secure connectivity. Dynamic VTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. The per-group or per-user definition can be created using extended authentication (Xauth) User or Unity group, or it can be derived from a certificate. Dynamic VTIs are standards based, so interoperability in a multiple-vendor environment is supported. IPsec DVTIs allow you to create highly secure connectivity for remote access VPNs and can be combined with Cisco Architecture for Voice, Video, and Integrated Data (AVVID) to deliver converged voice, video, and data over IP networks. The DVTI simplifies Virtual Private Network (VRF) routing and forwarding- (VRF-) aware IPsec deployment. The VRF is configured on the interface.

A DVTI requires minimal configuration on the router. A single virtual template can be configured and cloned.

The DVTI creates an interface for IPsec sessions and uses the virtual template infrastructure for dynamic instantiation and management of dynamic IPsec VTIs. The virtual template infrastructure is extended to create dynamic virtual-access tunnel interfaces. Dynamic VTIs are used in hub-and-spoke configurations. A single DVTI can support several static VTIs. [Figure 2](#) illustrates the DVTI authentication path.

**Figure 2**      **Dynamic IPsec VTI**

The authentication shown in [Figure 2](#) follows this path:

1. User 1 calls the router.
2. Router 1 authenticates User 1.
3. IPsec clones virtual access interface from virtual template interface.

## Dynamic Virtual Tunnel Interface Life Cycle

IPsec profiles define policy for dynamic VTIs. The dynamic interface is created at the end of IKE Phase 1 and IKE Phase 1.5. The interface is deleted when the IPsec session to the peer is closed. The IPsec session is closed when both IKE and IPsec SAs to the peer are deleted.

## Routing with IPsec Virtual Tunnel Interfaces

Because VTIs are routable interfaces, routing plays an important role in the encryption process. Traffic is encrypted only if it is forwarded out of the VTI, and traffic arriving on the VTI is decrypted and routed accordingly. VTIs allow you to establish an encryption tunnel using a real interface as the tunnel endpoint. You can route to the interface or apply services such as QoS, firewalls, network address translation, and Netflow statistics as you would to any other interface. You can monitor the interface, route to it, and it has an advantage over crypto maps because it is a real interface and provides the benefits of any other regular Cisco IOS interface.

### Note

Dynamic routing can be used with SVTIs. Routing with DVTIs is **not** supported or recommended.

## Traffic Encryption with the IPsec Virtual Tunnel Interface

When an IPsec VTI is configured, encryption occurs in the tunnel. Traffic is encrypted when it is forwarded to the tunnel interface. Traffic forwarding is handled by the IP routing table, and dynamic or static routing can be used to route traffic to the SVTI. DVTI uses reverse route injection to further simplify the routing configurations. Using IP routing to forward the traffic to encryption simplifies the IPsec VPN configuration because the use of ACLs with a crypto map in native IPsec configurations is not required. The IPsec virtual tunnel also allows you to encrypt multicast traffic with IPsec.

IPsec packet flow into the IPsec tunnel is illustrated in [Figure 3](#).

**Figure 3** Packet Flow into the IPsec Tunnel

After packets arrive on the inside interface, the forwarding engine switches the packets to the VTI, where they are encrypted. The encrypted packets are handed back to the forwarding engine, where they are switched through the outside interface.

[Figure 4](#) shows the packet flow out of the IPsec tunnel.

**Figure 4** Packet Flow out of the IPsec Tunnel

## How to Configure IPsec Virtual Tunnel Interface

- [Configuring Static IPsec Virtual Tunnel Interfaces, page 7](#)
- [Configuring Dynamic IPsec Virtual Tunnel Interfaces, page 9](#)

### Configuring Static IPsec Virtual Tunnel Interfaces

This configuration shows how to configure a static IPsec VTI.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto IPsec profile** *profile-name*
4. **set transform-set** *transform-set-name*
5. **interface** *type number*
6. **ip address** *address mask*
7. **tunnel mode ipsec ipv4**
8. **tunnel source** *interface*
9. **tunnel destination** *ip-address*
10. **tunnel protection IPsec profile** *profile-name* [**shared**]

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                    | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                       | Enters global configuration mode.                                                                                |
| Step 3 | <b>crypto IPsec profile</b> <i>profile-name</i><br><br><b>Example:</b><br>Router(config)# crypto IPsec profile PROF                                                                  | Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec routers.                 |
| Step 4 | <b>set transform-set</b> <i>transform-set-name</i><br>[ <i>transform-set-name2</i> ... <i>transform-set-name6</i> ]<br><br><b>Example:</b><br>Router(config)# set transform-set tset | Specifies which transform sets can be used with the crypto map entry.                                            |
| Step 5 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel0                                                                                      | Specifies the interface on which the tunnel will be configured and enters interface configuration mode.          |
| Step 6 | <b>ip address</b> <i>address mask</i><br><br><b>Example:</b><br>Router(config-if)# ip address 10.1.1.1<br>255.255.255.0                                                              | Specifies the IP address and mask.                                                                               |
| Step 7 | <b>tunnel mode ipsec ipv4</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode ipsec ipv4                                                                                    | Defines the mode for the tunnel.                                                                                 |
| Step 8 | <b>tunnel source</b> <i>interface</i><br><br><b>Example:</b><br>Router(config-if)# tunnel source loopback0                                                                           | Specifies the tunnel source as a loopback interface.                                                             |

|         | Command or Action                                                                                                                                                    | Purpose                                              |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| Step 9  | <b>tunnel destination</b> <i>ip-address</i><br><br><b>Example:</b><br>Router(config-if)# tunnel destination<br>172.16.1.1                                            | Identifies the IP address of the tunnel destination. |
| Step 10 | <b>tunnel protection IPsec profile</b> <i>profile-name</i><br>[ <b>shared</b> ]<br><br><b>Example:</b><br>Router(config-if)# tunnel protection IPsec<br>profile PROF | Associates a tunnel interface with an IPsec profile. |

## Configuring Dynamic IPsec Virtual Tunnel Interfaces

This task shows how to configure a dynamic IPsec VTI.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto IPsec profile** *profile-name*
4. **set transform-set** *transform-set-name*
5. **interface virtual-template** *number*
6. **tunnel mode** *mode*
7. **tunnel protection IPsec profile** *profile-name* [**shared**]
8. **exit**
9. **crypto isakamp profile** *profile-name*
10. **virtual-template** *template-number*

### DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                                                                            |
|--------|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                  |

|         | Command or Action                                                                                                                                                                    | Purpose                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Step 3  | <b>crypto IPsec profile</b> <i>profile-name</i><br><br><b>Example:</b><br>Router(config)# crypto IPsec profile PROF                                                                  | Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec routers. |
| Step 4  | <b>set transform-set</b> <i>transform-set-name</i><br>[ <i>transform-set-name2</i> ... <i>transform-set-name6</i> ]<br><br><b>Example:</b><br>Router(config)# set transform-set tset | Specifies which transform sets can be used with the crypto map entry.                            |
| Step 5  | <b>interface virtual-template</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface virtual-template 2                                                               | Defines a virtual-template tunnel interface and enters interface configuration mode.             |
| Step 6  | <b>tunnel mode ipsec ipv4</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode ipsec ipv4                                                                                    | Defines the mode for the tunnel.                                                                 |
| Step 7  | <b>tunnel protection IPsec profile</b> <i>profile-name</i><br>[ <i>shared</i> ]<br><br><b>Example:</b><br>Router(config-if)# tunnel protection IPsec profile PROF                    | Associates a tunnel interface with an IPsec profile.                                             |
| Step 8  | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                        | Exits interface configuration mode.                                                              |
| Step 9  | <b>crypto isakamp profile</b> <i>profile-name</i><br><br><b>Example:</b><br>Router(config)# crypto isakamp profile red                                                               | Defines the ISAKAMP profile to be used for the virtual template.                                 |
| Step 10 | <b>virtual-template</b> <i>template-number</i><br><br><b>Example:</b><br>Router(config)# virtual-template 1                                                                          | Specifies the virtual template attached to the ISAKAMP profile.                                  |

## Configuration Examples for IPsec Virtual Tunnel Interface

The following examples are provided to illustrate configuration scenarios for IPsec VTIs:

- [Static Virtual Tunnel Interface with IPsec: Example, page 11](#)
- [VRF-Aware Static Virtual Tunnel Interface: Example, page 14](#)
- [Static Virtual Tunnel Interface with QoS: Example, page 14](#)
- [Static Virtual Tunnel Interface with Virtual Firewall: Example, page 15](#)

- [Dynamic Virtual Tunnel Interface Easy VPN Server: Example, page 16](#)
- [Dynamic Virtual Tunnel Interface Easy VPN Client: Example, page 18](#)
- [VRF-Aware IPsec with Dynamic VTI: Example, page 20](#)
- [Dynamic Virtual Tunnel Interface with Virtual Firewall: Example, page 20](#)
- [Dynamic Virtual Tunnel Interface with QoS: Example, page 21](#)

## Static Virtual Tunnel Interface with IPsec: Example

The following example configuration uses a preshared key for authentication between peers. VPN traffic is forwarded to the IPsec VTI for encryption and then sent out the physical interface. The tunnel on subnet 10 checks packets for IPsec policy and passes them to the Crypto Engine (CE) for IPsec encapsulation. [Figure 5](#) illustrates the IPsec VTI configuration.

**Figure 5** VTI with IPsec

## Verifying the Results for the IPsec Static Virtual Tunnel Interface: Example

This section provides information that you can use to confirm that your configuration is working properly. In this display, Tunnel 0 is “up,” and the line protocol is “up.” If the line protocol is “down,” the session is not active.

### Verifying the C7206 Status

```
Router# show interface tunnel 0
```

```
Tunnel0 is up, line protocol is up
Hardware is Tunnel
Internet address is 10.0.51.203/24
MTU 1514 bytes, BW 9 Kbit, DLY 500000 usec,
reliability 255/255, txload 103/255, rxload 110/255
Encapsulation TUNNEL, loopback not set
Keepalive not set
Tunnel source 10.0.149.203, destination 10.0.149.217
Tunnel protocol/transport IPsec/IP, key disabled, sequencing disabled
Tunnel TTL 255

Checksumming of packets disabled, fast tunneling enabled
Tunnel transmit bandwidth 8000 (kbps)
Tunnel receive bandwidth 8000 (kbps)
Tunnel protection via IPsec (profile "P1")
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 1/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/0 (size/max)
30 second input rate 13000 bits/sec, 34 packets/sec
30 second output rate 36000 bits/sec, 34 packets/sec
191320 packets input, 30129126 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
59968 packets output, 15369696 bytes, 0 underruns
0 output errors, 0 collisions, 0 interface resets
0 output buffer failures, 0 output buffers swapped out
```

```
Router# show crypto session
```

```
Crypto session current status
Interface: Tunnel0
Session status: UP-ACTIVE
Peer: 10.0.149.217 port 500

o - ODR, P - periodic downloaded static route
Gateway of last resort is not set
10.0.0.0/8 is variably subnetted, 4 subnets, 2 masks
C 10.0.35.0/24 is directly connected, Ethernet3/3
S 10.0.36.0/24 is directly connected, Tunnel0
```

```
C 10.0.51.0/24 is directly connected, Tunnel0
C 10.0.149.0/24 is directly connected, Ethernet3/0
```

## VRF-Aware Static Virtual Tunnel Interface: Example

To add VRF to the static VTI example, include the **ip vrf** and **ip vrf forwarding** commands to the configuration as shown in the following example.

### C7206 Router Configuration

```
hostname c7206
.
.
ip vrf sample-vti1
 rd 1:1
 route-target export 1:1
 route-target import 1:1
!
.
.
interface Tunnel0
 ip vrf forwarding sample-vti1
 ip address 10.0.51.217 255.255.255.0
 tunnel source 10.0.149.217
 tunnel destination 10.0.149.203
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile P1
.
.
!
end
```

## Static Virtual Tunnel Interface with QoS: Example

You can apply any QoS policy to the tunnel endpoint by including the **service-policy** statement under the tunnel interface. The following example is policing traffic out the tunnel interface.

### C7206 Router Configuration

```
hostname c7206
.
.
class-map match-all VTI
 match any
!
policy-map VTI
 class VTI
 police cir 2000000
 conform-action transmit
 exceed-action drop
!
.
.
interface Tunnel0
 ip address 10.0.51.217 255.255.255.0
 tunnel source 10.0.149.217
 tunnel destination 10.0.149.203
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile P1
```

```

service-policy output VTI
!
.
.
!
end

```

## Static Virtual Tunnel Interface with Virtual Firewall: Example

Applying the virtual firewall to the static VTI tunnel allows traffic from the spoke to pass through the hub to reach the internet. [Figure 6](#) illustrates a static VTI with the spoke protected inherently by the corporate firewall.

**Figure 6**      *Static VTI with Virtual Firewall*

The basic static VTI configuration has been modified to include the virtual firewall definition.

### C7206 Router Configuration

```

hostname c7206
.
.
ip inspect max-incomplete high 1000000
ip inspect max-incomplete low 800000

```

## Dynamic Virtual Tunnel Interface Easy VPN Server: Example

The following example illustrates the use of the DVTI Easy VPN server, which serves as an IPsec remote access aggregator. The client can be a home user running a Cisco VPN client or it can be a Cisco IOS router configured as an Easy VPN client.

### C7206 Router Configuration

```

hostname c7206
!
aaa new-model
aaa authentication login local_list local
aaa authorization network local_list local
aaa session-id common
!
ip subnet-zero

```

```

 192.168.1.0/32 is subnetted, 1 subnets
S 192.168.1.1 [1/0] via 0.0.0.0, Virtual-Access2
 10.0.0.0/24 is subnetted, 1 subnets
C 10.2.1.0 is directly connected, GigabitEthernet0/2
S* 0.0.0.0/0 [1/0] via 172.18.143.1

```

## Dynamic Virtual Tunnel Interface Easy VPN Client: Example

The following example shows how you can set up a router as the Easy VPN client. This example uses basically the same idea as the Easy VPN client that you can run from a PC to connect. In fact, the configuration of the Easy VPN server will work for the software client or the Cisco IOS client.

```

hostname c1841
!
no aaa new-model
!
ip cef
!
username cisco password 0 cisco123
!
crypto ipsec client ezvpn CLIENT
 connect manual
 group group1 key cisco123
 mode client
 peer 172.18.143.246
 virtual-interface 1
 username cisco password cisco123
 xauth userid mode local
!
interface Loopback0
 ip address 10.1.1.1 255.255.255.255
!
interface FastEthernet0/0
 description Internet Connection
 ip address 172.18.143.208 255.255.255.0
 crypto ipsec client ezvpn CLIENT
!
interface FastEthernet0/1
 ip address 10.1.1.252 255.255.255.0
 crypto ipsec client ezvpn CLIENT inside
!
interface Virtual-Template1 type tunnel
 ip unnumbered Loopback0
!
ip route 0.0.0.0 0.0.0.0 172.18.143.1 254
!
end

```

The client definition can be set up in many different ways. The mode specified with the **connect** command can be automatic or manual. If the connect mode is set to manual, the IPsec tunnel has to be initiated manually by a user.

Also note use of the **mode** command. The mode can be client, network-extension, or network-extension-plus. This example indicates client mode, which means that the client is given a private address from the server. Network-extension mode is different from client mode in that the client specifies for the server its attached private subnet. Depending on the mode, the routing table on either end will be slightly different. The basic operation of the IPsec tunnel remains the same, regardless of the specified mode.

## Verifying the Results for the Dynamic Virtual Tunnel Interface Easy VPN Client: Example

The following examples illustrate different ways to display the status of the DVTI.

```
Router# show running-config interface Virtual-Access2
```

```
Building configuration...
```

```
Current configuration : 148 bytes
!
interface Virtual-Access2
 ip unnumbered Loopback1
 tunnel source FastEthernet0/0
 tunnel destination 172.18.143.246
 tunnel mode ipsec ipv4
end
```

```
Router# show running-config interface Loopback1
```

```
Building configuration...
```

```
Current configuration : 65 bytes
!
interface Loopback1
 ip address 192.168.1.1 255.255.255.255
end
```

```
Router# show ip route
```

```
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
 D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
 ia - IS-IS inter area, * - candidate default, U - per-user static route
 o - ODR, P - periodic downloaded static route
```

```
Gateway of last resort is 172.18.143.1 to network 0.0.0.0
```

```
 10.0.0.0/32 is subnetted, 1 subnets
C 10.1.1.1 is directly connected, Loopback0
 172.18.0.0/24 is subnetted, 1 subnets
C 172.18.143.0 is directly connected, FastEthernet0/0
 192.168.1.0/32 is subnetted, 1 subnets
C 192.168.1.1 is directly connected, Loopback1
S* 0.0.0.0/0 [1/0] via 0.0.0.0, Virtual-Access2
```

```
Router# show crypto ipsec client ezvpn
```

```
Easy VPN Remote Phase: 6
```

```
Tunnel name : CLIENT
Inside interface list: FastEthernet0/1
Outside interface: Virtual-Access2 (bound to FastEthernet0/0)
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
Address: 192.168.1.1
Mask: 255.255.255.255
Save Password: Allowed
Current EzVPN Peer: 172.18.143.246
```

## VRF-Aware IPsec with Dynamic VTI: Example

This example shows how to configure VRF-Aware IPsec to take advantage of the dynamic VTI:

```
hostname c7206
.
.
ip vrf test-vti1
 rd 1:1
 route-target export 1:1
 route-target import 1:1
!
.
.
interface Virtual-Template1 type tunnel
 ip vrf forwarding test-vti1
 ip unnumbered Loopback0
 ip virtual-reassembly
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile test-vti1
!
.
.
end
```

## Dynamic Virtual Tunnel Interface with Virtual Firewall: Example

The DVTI Easy VPN server can be configured behind a virtual firewall. Behind-the-firewall configuration allows users to enter the network, while the network firewall is protected from unauthorized access. The virtual firewall uses Context-Based Access Control (CBAC) and NAT applied to the Internet interface as well as to the virtual template.

```
hostname c7206
.
.
ip inspect max-incomplete high 1000000
ip inspect max-incomplete low 800000
ip inspect one-minute high 1000000
ip inspect one-minute low 800000
ip inspect tcp synwait-time 60
ip inspect tcp max-incomplete host 100000 block-time 2
ip inspect name IOSFW1 tcp timeout 300
ip inspect name IOSFW1 udp
!
.
.
interface GigabitEthernet0/1
 description Internet Connection
 ip address 172.18.143.246 255.255.255.0
 ip access-group 100 in
 ip nat outside
!
interface GigabitEthernet0/2
 description Internal Network
 ip address 10.2.1.1 255.255.255.0
!
interface Virtual-Template1 type tunnel
 ip unnumbered Loopback0
 ip nat inside
 ip inspect IOSFW1 in
```

```

tunnel mode ipsec ipv4
tunnel protection ipsec profile test-vti1
!
ip classless
ip route 0.0.0.0 0.0.0.0 172.18.143.1
!
ip nat translation timeout 120
ip nat translation finrst-timeout 2
ip nat translation max-entries 300000
ip nat pool test1 10.2.100.1 10.2.100.50 netmask 255.255.255.0
ip nat inside source list 110 pool test1 vrf test-vti1 overload
!
access-list 100 permit esp any any
access-list 100 permit udp any eq isakmp any
access-list 100 permit udp any eq non500-isakmp any
access-list 100 permit icmp any any
access-list 110 deny esp any any
access-list 110 deny udp any eq isakmp any
access-list 110 permit ip any any
access-list 110 deny udp any eq non500-isakmp any
!
end

```

## Dynamic Virtual Tunnel Interface with QoS: Example

You can add QoS to the DVTI tunnel by applying the service policy to the virtual template. When the template is cloned to make the virtual-access interface, the service policy will be applied there. The following example shows the basic DVTI configuration with QoS added.

```

hostname c7206
.
.
class-map match-all VTI
 match any
!
policy-map VTI
 class VTI
 police cir 2000000
 conform-action transmit
 exceed-action drop
!
.
.
interface Virtual-Templat1 type tunnel
 ip vrf forwarding test-vti1
 ip unnumbered Loopback0
 ip virtual-reassembly
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile test-vti1
 service-policy output VTI
!
.
.
!
end

```

## Command Reference

The following commands are introduced or modified in the feature or features

- **crypto isakmp profile**
- **interface virtual-template**
- **show vtemplate**
- **tunnel mode**
- **virtual-template**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html). For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Feature Information for IPsec Virtual Tunnel Interface

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for IPsec Virtual Tunnel Interface

| Feature Name                   | Releases                                            | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

IPsec VTIs simplify configuration of IPsec for protection of remote links, support multicast, and simplify network management and load balancing.<br><br>Static tunnel interfaces can be configured to encapsulate IPv6 or IPv4 packets in IPv6.                                                                                                                                                                                                                                                                                                                                                                               |
| Dynamic IPsec VTIs             | 12.3(7)T<br>12.3(14)T                               | Dynamic VTIs provide efficiency in the use of IP addresses and provide secure connectivity. Dynamic VTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. The per-group or per-user definition can be created using Xauth User or Unity group, or it can be derived from a certificate. Dynamic VTIs are standards based, so interoperability in a multiple-vendor environment is supported. IPsec dynamic VTIs allow you to create highly secure connectivity for remote access VPNs and can be combined with Cisco Architecture for Voice, Video, and Integrated Data (AVVID) to deliver converged voice, video, and data over IP networks. The dynamic VTI simplifies VRF-aware IPsec deployment. The VRF is configured on the interface. |
| IPSec Virtual Tunnel Interface | Cisco IOS XE Release 2.1                            | This feature was introduced on Cisco ASR 1000 Series Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# IPSec VPN Accounting

The IPSec VPN Accounting feature allows for a session to be accounted for by indicating when the session starts and when it stops.

A VPN session is defined as an Internet Key Exchange (IKE) security association (SA) and the one or more SA pairs that are created by the IKE SA. The session starts when the first IP Security (IPSec) pair is created and stops when all IPSec SAs are deleted.

Session identifying information and session usage information is passed to the Remote Authentication Dial-In User Service (RADIUS) server via standard RADIUS attributes and vendor-specific attributes (VSAs).

## Feature Specifications for IPSec VPN Accounting

| Feature History                                                                                                                                                                              |                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|

## Prerequisites for IPsec VPN Accounting

You need to understand how to configure RADIUS and authentication, authorization, and accounting (AAA) accounting. For information about configuring RADIUS and AAA, refer to the following documents:

- *Configuring Basic AAA RADIUS for Dial-In Clients*
- [How Does RADIUS Work?](#)
- The chapter “[Configuring RADIUS](#)” in the *Cisco IOS Security Configuration Guide*
- The chapter “[RADIUS Commands](#)” in the *Cisco IOS Security Command Reference*, Release 12.2
- The chapter “[Configuring Accounting](#)” in the *Cisco IOS Security Configuration Guide*, Release 12.2

You also need to know how to configure IPsec accounting. For information about configuring IPsec accounting, refer to the chapter “[Configuring IPsec Network Security](#)” in the *Cisco IOS Security Configuration Guide*, Release 12.2.

## Information About IPsec VPN Accounting

To configure IPsec VPN accounting, you must understand the following concepts:

- [RADIUS Accounting](#), page 2
- [IKE and IPsec Subsystem Interaction](#), page 4

## RADIUS Accounting

For many large networks, it is required that user activity be recorded for auditing purposes. The method that is used most is RADIUS accounting.

RADIUS accounting allows for a session to be accounted for by indicating when the session starts and when it stops. Additionally, session identifying information and session usage information will be passed to the RADIUS server via RADIUS attributes and VSAs.

## RADIUS Start Accounting

The RADIUS Start packet contains many attributes that generally identify who is requesting the service and of what the property of that service consists. [Table 1](#) represents the attributes required for the start.

**Table 1** *RADIUS Accounting Start Packet Attributes*

| <b>RADIUS Attributes Value</b> | <b>Attribute</b>    | <b>Description</b>                                                                                                                                              |
|--------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1                              | user-name           | Username used in extended authentication (XAUTH). The username may be NULL when XAUTH is not used.                                                              |
| 4                              | nas-ip-address      | Identifying IP address of the network access server (NAS) that serves the user. It should be unique to the NAS within the scope of the RADIUS server.           |
| 5                              | nas-port            | Physical port number of the NAS that serves the user.                                                                                                           |
| 8                              | framed-ip-address   | Private address allocated for the IP Security (IPSec) session.                                                                                                  |
| 40                             | acct-status-type    | Status type. This attribute indicates whether this accounting request marks the beginning (start), the end (stop), or an update of the session.                 |
| 41                             | acct-delay-time     | Number of seconds the client has been trying to send a particular record.                                                                                       |
| 44                             | acct-session-id     | Unique accounting identifier that makes it easy to match start and stop records in a log file.                                                                  |
| 26                             | vrf-id              | String that represents the name of the Virtual Route Forwarder (VRF).                                                                                           |
| 26                             | isakmp-initiator-ip | Endpoint IP address of the remote Internet Key Exchange (IKE) initiator (V4).                                                                                   |
| 26                             | isakmp-group-id     | Name of the VPN group profile used for accounting.                                                                                                              |
| 26                             | isakmp-phase1-id    | Phase 1 identification (ID) used by IKE (for example, domain name [DN], fully qualified domain name [FQDN], IP address) to help identify the session initiator. |

## RADIUS Stop Accounting

The RADIUS Stop packet contains many attributes that identify the usage of the session. Table 2 represents the additional attributes required for the RADIUS stop packet. It is possible that only the stop packet will be sent without the start if configured to do so. If only the stop packet is sent, this allows an easy way to reduce the number of records going to the AAA server.

**Table 2** *RADIUS Accounting Stop Packet Attributes*

| <b>RADIUS Attributes Value</b> | <b>Attribute</b>   | <b>Description</b>                                                                                                    |
|--------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| 42                             | acct-input-octets  | Number of octets that have been received from the Unity client over the course of the service that is being provided. |
| 43                             | acct-output-octets | Number of octets that have been sent to the Unity client in the course of delivering this service.                    |

**Table 2** *RADIUS Accounting Stop Packet Attributes (continued)*

| <b>RADIUS Attributes Value</b> | <b>Attribute</b>      | <b>Description</b>                                                                                                                  |
|--------------------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 46                             | acct-session-time     | Length of time (in seconds) that the Unity client has received service.                                                             |
| 47                             | acct-input-packets    | Quantity of packets that have been received from the Unity client in the course of delivering this service.                         |
| 48                             | acct-output-packets   | Quantity of packets that have been sent to the Unity client in the course of delivering this service.                               |
| 49                             | acct-terminate-cause  | For future use.                                                                                                                     |
| 52                             | acct-input-gigawords  | How many times the Acct-Input-Octets counter has wrapped around the $2^{32}$ (2 to the 32nd power) over the course of this service. |
| 52                             | acct-output-gigawords | How many times the Acct-Input-Octets counter has wrapped around the $2^{32}$ (2 to the 32nd power) over the course of this service. |

## RADIUS Update Accounting

RADIUS accounting updates are supported. Packet and octet counts are shown in the updates. To learn more about AAA, refer to the following documents:

- [Configuring Basic AAA RADIUS for Dial-In Clients](#)
- The chapter “[RADIUS Commands](#)” in the *Cisco IOS Security Command Reference*, Release 12.2 T
- [How to Assign Privilege Levels with TACACS+ and RADIUS](#)
- Other AAA documentation at the [Cisco.com](#) website

## IKE and IPSec Subsystem Interaction

### Accounting Start

If IPSec accounting is configured, after IKE phases are complete, an accounting start record is generated for the session. New accounting records are not generated during a rekeying.

The following is an account start record that was generated on a router and that is to be sent to the AAA server that is defined:

```
*Aug 23 04:06:20.131: RADIUS(00000002): sending
*Aug 23 04:06:20.131: RADIUS(00000002): Send Accounting-Request to 10.1.1.4:1646 id 4, len 220
*Aug 23 04:06:20.131: RADIUS: authenticator 38 F5 EB 46 4D BE 4A 6F - 45 EB EF 7D B7 19 FB 3F
*Aug 23 04:06:20.135: RADIUS: Acct-Session-Id [44] 10 "00000001"
*Aug 23 04:06:20.135: RADIUS: Vendor, Cisco [26] 31
*Aug 23 04:06:20.135: RADIUS: Cisco AVpair [1] 25 "isakmp-group-id=cclient"
*Aug 23 04:06:20.135: RADIUS: Framed-IP-Address [8] 6 10.13.13.1
*Aug 23 04:06:20.135: RADIUS: Vendor, Cisco [26] 20
*Aug 23 04:06:20.135: RADIUS: Cisco AVpair [1] 14 "vrf-id=cisco"
*Aug 23 04:06:20.135: RADIUS: Vendor, Cisco [26] 35
```

```
*Aug 23 04:06:20.135: RADIUS: Cisco AVpair [1] 29 "isakmp-initator-ip=11.1.2.2"
*Aug 23 04:06:20.135: RADIUS: Vendor, Cisco [26] 36
*Aug 23 04:06:20.135: RADIUS: Cisco AVpair [1] 30 "connect-progress=No
Progress"
*Aug 23 04:06:20.135: RADIUS: User-Name [1] 13 "joe@cclient"
*Aug 23 04:06:20.135: RADIUS: Acct-Status-Type [40] 6 Start [1]
*Aug 23 04:06:20.135: RADIUS: Vendor, Cisco [26] 25
*Aug 23 04:06:20.135: RADIUS: cisco-nas-port [2] 19 "FastEthernet0/0.1"
*Aug 23 04:06:20.135: RADIUS: NAS-Port [5] 6 0
*Aug 23 04:06:20.135: RADIUS: NAS-IP-Address [4] 6 10.1.1.147
*Aug 23 04:06:20.135: RADIUS: Acct-Delay-Time [41] 6 0
*Aug 23 04:06:20.139: RADIUS: Received from id 21645/4 10.1.1.4:1646, Accounting-response,
len 20
*Aug 23 04:06:20.139: RADIUS: authenticator B7 E3 D0 F5 61 9A 89 D8 - 99 A6 8A 8A 98 79
9D 5D
```

## Accounting Stop

An accounting stop packet is generated when there are no more flows (IPSec SA pairs) with the remote peer.

The accounting stop records contain the following information:

- Packets out
- Packets in
- Octets out
- Gigawords in
- Gigawords out

Below is an account start record that was generated on a router. The account start record is to be sent to the AAA server that is defined.

```
*Aug 23 04:20:16.519: RADIUS(00000003): Using existing nas_port 0
*Aug 23 04:20:16.519: RADIUS(00000003): Config NAS IP: 100.1.1.147
*Aug 23 04:20:16.519: RADIUS(00000003): sending
*Aug 23 04:20:16.519: RADIUS(00000003): Send Accounting-Request to 100.1.1.4:1646 id 19,
len 238
*Aug 23 04:20:16.519: RADIUS: authenticator 82 65 5B 42 F0 3F 17 C3 - 23 F3 4C 35 A2 8A
3E E6
*Aug 23 04:20:16.519: RADIUS: Acct-Session-Id [44] 10 "00000002"

*Aug 23 04:20:16.519: RADIUS: Acct-Input-Packets [47] 6 1004
*Aug 23 04:20:16.519: RADIUS: Acct-Output-Packets [48] 6 1004
*Apr 23 04:20:16.519: RADIUS: Acct-Input-Giga-Word[52] 6 0
*Apr 23 04:20:16.519: RADIUS: Acct-Output-Giga-Wor[53] 6 0
*Aug 23 04:20:16.519: RADIUS: Acct-Terminate-Cause[49] 6 none [0]
*Aug 23 04:20:16.519: RADIUS: Vendor, Cisco [26] 32
*Aug 23 04:20:16.519: RADIUS: Cisco AVpair [1] 26 "disc-cause-ext=No Reason"
*Aug 23 04:20:16.519: RADIUS: Acct-Status-Type [40] 6 Stop [2]
*Aug 23 04:20:16.519: RADIUS: Vendor, Cisco [26] 25
*Aug 23 04:20:16.519: RADIUS: cisco-nas-port [2] 19 "FastEthernet0/0.1"
```

```
*Aug 23 04:20:16.519: RADIUS: NAS-Port [5] 6 0
*Aug 23 04:20:16.519: RADIUS: NAS-IP-Address [4] 6 100.1.1.147
*Aug 23 04:20:16.519: RADIUS: Acct-Delay-Time [41] 6 0
*Aug 23 04:20:16.523: RADIUS: Received from id 21645/19 100.1.1.4:1646,
Accounting-response, len 20
*Aug 23 04:20:16.523: RADIUS: authenticator F1 CA C1 28 CE A0 26 C9 - 3E 22 C9 DA EA B8
22 A0
```

## Accounting Updates

If accounting updates are enabled, accounting updates are sent while a session is “up.” The update interval is configurable. To enable the accounting updates, use the **aaa accounting update** command.

The following is an accounting update record that is being sent from the router:

```
Router#
*Aug 23 21:46:05.263: RADIUS(00000004): Using existing nas_port 0
*Aug 23 21:46:05.263: RADIUS(00000004): Config NAS IP: 100.1.1.147
*Aug 23 21:46:05.263: RADIUS(00000004): sending
*Aug 23 21:46:05.263: RADIUS(00000004): Send Accounting-Request to 100.1.1.4:1646 id 22,
len 200
*Aug 23 21:46:05.263: RADIUS: authenticator 30 FA 48 86 8E 43 8E 4B - F9 09 71 04 4A F1
52 25
*Aug 23 21:46:05.263: RADIUS: Acct-Session-Id [44] 10 "00000003"
*Aug 23 21:46:05.263: RADIUS: Vendor, Cisco [26] 20
*Aug 23 21:46:05.263: RADIUS: Cisco AVpair [1] 14 "vrf-id=cisco"
*Aug 23 21:46:05.263: RADIUS: Vendor, Cisco [26] 35
*Aug 23 21:46:05.263: RADIUS: Cisco AVpair [1] 29 "isakmp-initator-ip=11.1.1.2"
*Aug 23 21:46:05.263: RADIUS: Vendor, Cisco [26] 36
*Aug 23 21:46:05.263: RADIUS: Cisco AVpair [1] 30 "connect-progress=No

## How to Configure IPSec VPN Accounting

This section contains the following procedures:

- [Configuring IPSec VPN Accounting, page 7](#)
- [Configuring Accounting Updates, page 10](#)
- [Troubleshooting for IPSec VPN Accounting, page 11](#)

# Configuring IPSec VPN Accounting

To enable IPSec VPN Accounting, you need to perform the following required task:

## Prerequisites

Before configuring IPSec VPN accounting, you must first configure IPSec. To learn about configuring IPSec, refer to the following documents:

- The chapter “[Configuring IPSec Network Security](#)” in the *Cisco IOS Security Configuration Guide*, Release 12.2
- Other IPSec documentation at the [Cisco.com](#) website

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login** *list-name method*
5. **aaa authorization network** *list-name method*
6. **aaa accounting network** *list-name start-stop [broadcast] group group-name*
7. **aaa session-id** common
8. **crypto isakmp profile** *profile-name*
9. **vrf** *ivrf*
10. **match identity group** *group-name*
11. **client authentication list** *list-name*
12. **isakmp authorization list** *list-name*
13. **client configuration address** [**initiate** | **respond**]
14. **accounting** *list-name*
15. **exit**
16. **crypto dynamic-map** *dynamic-map-name dynamic-seq-num*
17. **set transform-set** *transform-set-name*
18. **set isakmp-profile** *profile-name*
19. **reverse-route** [**remote-peer**]
20. **exit**
21. **crypto map** *map-name ipsec-isakmp dynamic dynamic-template-name*
22. **radius-server host** *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*]
23. **radius-server key** *string*
24. **radius-server vsa send accounting**
25. **interface** *interface-id*
26. **crypto map** *map-name*

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                          | Purpose                                                                                                                                                                                   |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                             | Enters global configuration mode.                                                                                                                                                         |
| Step 3 | <b>aaa new-model</b><br><br><b>Example:</b><br>Router (config)# aaa new-model                                                                                                              | Enables periodic interim accounting records to be sent to the accounting server.                                                                                                          |
| Step 4 | <b>aaa authentication login list-name method</b><br><br><b>Example:</b><br>Router (config)# aaa authentication login<br>cisco-client group radius                                          | Enforces authentication, authorization, and accounting (AAA) authentication for extended authorization (XAUTH) via RADIUS or local.                                                       |
| Step 5 | <b>aaa authorization network list-name method</b><br><br><b>Example:</b><br>Router (config)# aaa authorization network<br>cisco-client group radius                                        | Sets AAA authorization parameters on the remote client from RADIUS or local.                                                                                                              |
| Step 6 | <b>aaa accounting network list-name start-stop [broadcast] group group-name</b><br><br><b>Example:</b><br>Router (config)# aaa accounting network acc<br>start-stop broadcast group radius | Enables AAA accounting of requested services for billing or security purposes when you use RADIUS or TACACS+.                                                                             |
| Step 7 | <b>aaa session-id common</b><br><br><b>Example:</b><br>Router (config)# aaa session-id common                                                                                              | Specifies whether the same session ID will be used for each AAA accounting service type within a call or whether a different session ID will be assigned to each accounting service type. |
| Step 8 | <b>crypto isakmp profile profile-name</b><br><br><b>Example:</b><br>Route (config)# crypto isakmp profile cisco                                                                            | Audits IP security (IPSec) user sessions and enters isakmp-profile submode.                                                                                                               |
| Step 9 | <b>vrf ivrf</b><br><br><b>Example:</b><br>Router (conf-isa-prof)# vrf cisco                                                                                                                | Associates the on-demand address pool with a Virtual Private Network (VPN) routing and forwarding (VRF) instance name.                                                                    |

|         | Command or Action                                                                                                                                           | Purpose                                                                                                                                                                                                          |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 10 | <b>match identity group</b> <i>group-name</i><br><br><b>Example:</b><br>Router(conf-isa-prof)# match identity group cisco                                   | Matches an identity from a peer in an ISAKMP profile.                                                                                                                                                            |
| Step 11 | <b>client authentication list</b> <i>list-name</i><br><br><b>Example:</b><br>Router(conf-isa-prof)# client authentication list cisco                        | Configures Internet Key Exchange (IKE) extended authentication (XAUTH) in an Internet Security Association and Key Management Protocol (ISAKMP) profile.                                                         |
| Step 12 | <b>isakmp authorization list</b> <i>list-name</i><br><br><b>Example:</b><br>Router(conf-isa-prof)# <b>isakmp authorization list cisco-client</b>            | Configures an IKE shared secret and other parameters using the AAA server in an ISAKMP profile. The shared secret and other parameters are generally pushed to the remote peer via mode configuration (MODECFG). |
| Step 13 | <b>client configuration address</b> [initiate   respond]<br><br><b>Example:</b><br>Router(conf-isa-prof)# client configuration address respond              | Configures IKE mode configuration (MODECFG) in the ISAKMP profile.                                                                                                                                               |
| Step 14 | <b>accounting</b> <i>list-name</i><br><br><b>Example:</b><br>Router(conf-isa-prof)# accounting acc                                                          | Enables AAA accounting services for all peers that connect via this ISAKMP profile.                                                                                                                              |
| Step 15 | <b>exit</b><br><br><b>Example:</b><br>Router(conf-isa-prof)# exit                                                                                           | Exits isakmp-profile submode.                                                                                                                                                                                    |
| Step 16 | <b>crypto dynamic-map</b> <i>dynamic-map-name</i> <i>dynamic-seq-num</i><br><br><b>Example:</b><br>Router(config)# crypto dynamic-map mymap 10 ipsec-isakmp | Creates a dynamic crypto map template and enters the crypto map configuration command mode.                                                                                                                      |
| Step 17 | <b>set transform-set</b> <i>transform-set-name</i><br><br><b>Example:</b><br>Router(config-crypto-map)# set transform-set aswan                             | Specifies which transform sets can be used with the crypto map template.                                                                                                                                         |
| Step 18 | <b>set isakmp-profile</b> <i>profile-name</i><br><br><b>Example:</b><br>Router(config-crypto-map)# set isakmp-profile cisco                                 | Sets the ISAKMP profile name.                                                                                                                                                                                    |

|         | Command or Action                                                                                                                                                                                   | Purpose                                                                                                                                                                                                            |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 19 | <b>reverse-route</b> [ <b>remote-peer</b> ]<br><br><b>Example:</b><br>Router(config-crypto-map)# reverse-route                                                                                      | Allows routes (ip addresses) to be injected for destinations behind the VPN remote tunnel endpoint and may include a route to the tunnel endpoint itself (using the <b>remote-peer</b> keyword for the crypto map. |
| Step 20 | <b>exit</b><br><br><b>Example:</b><br>Router(config-crypto-map)# exit                                                                                                                               | Exits dynamic crypto map configuration mode.                                                                                                                                                                       |
| Step 21 | <b>crypto map</b> <i>map-name</i> ipsec-isakmp dynamic <i>dynamic-template-name</i><br><br><b>Example:</b><br>Router(config)# crypto map mymap ipsec-isakmp dynamic dmap                            | Enters crypto map configuration mode                                                                                                                                                                               |
| Step 22 | <b>radius-server host</b> <i>ip-address</i> [ <b>auth-port</b> <i>port-number</i> ] [ <b>acct-port</b> <i>port-number</i> ]<br><br><b>Example:</b><br>Router(config)# radius-server host 172.16.1.4 | Specifies a RADIUS server host.                                                                                                                                                                                    |
| Step 23 | <b>radius-server key</b> <i>string</i><br><br><b>Example:</b><br>Router(config)# radius-server key nsite                                                                                            | Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon.                                                                                                 |
| Step 24 | <b>radius-server vsa send accounting</b><br><br><b>Example:</b><br>Router(config)# radius-server vsa send accounting                                                                                | Configures the network access server to recognize and use vendor-specific attributes.                                                                                                                              |
| Step 25 | <b>interface</b> <i>type slot/port</i><br><br><b>Example:</b><br>Router(config)# interface FastEthernet 1/0                                                                                         | Configures an interface type and enters interface configuration mode.                                                                                                                                              |
| Step 26 | <b>crypto map</b> <i>map-name</i><br><br><b>Example:</b><br>Router(config-if)# crypto map mymap                                                                                                     | Applies a previously defined crypto map set to an interface.                                                                                                                                                       |

## Configuring Accounting Updates

To send accounting updates while a session is “up,” perform the following optional task:

### Prerequisites

Before you configure accounting updates, you must first configure IPSec VPN accounting. See the section “[Configuring IPSec VPN Accounting](#).”

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa accounting update periodic *number***

## DETAILED STEPS

|        | Command or Action                                                               | Purpose                                                                                     |
|--------|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                                   | Enables privileged EXEC mode.                                                               |
|        | <b>Example:</b><br>Router> enable                                               | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>        |
| Step 2 | <b>configure terminal</b>                                                       | Enters global configuration mode.                                                           |
|        | <b>Example:</b><br>Router# configure terminal                                   |                                                                                             |
| Step 3 | <b>aaa accounting update periodic <i>number</i></b>                             | (Optional) Enables periodic interim accounting records to be sent to the accounting server. |
|        | <b>Example:</b><br>Router (config)# aaa accounting update periodic 1-2147483647 |                                                                                             |

## Troubleshooting for IPSec VPN Accounting

To display messages about IPSec accounting events, perform the following optional task:

## SUMMARY STEPS

1. **enable**
2. **debug crypto isakmp aaa**

## DETAILED STEPS

|        | Command or Action                                  | Purpose                                                                                                 |
|--------|----------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                      | Enables privileged EXEC mode.                                                                           |
|        | <b>Example:</b><br>Router> enable                  | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                    |
| Step 2 | <b>debug crypto isakmp aaa</b>                     | Displays messages about Internet Key Exchange (IKE) events.                                             |
|        | <b>Example:</b><br>Router# debug crypto isakmp aaa | <ul style="list-style-type: none"> <li>• The <b>aaa</b> keyword specifies accounting events.</li> </ul> |

# Configuration Examples for IPsec VPN Accounting

- [Accounting and ISAKMP-Profile Example, page 12](#)
- [Accounting Without ISAKMP Profiles Example, page 14](#)

## Accounting and ISAKMP-Profile Example

The following example shows a configuration for supporting remote access clients with accounting and ISAKMP profiles:

```
version 12.2
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname sheep
!
aaa new-model
!
!
aaa accounting network ipsecaaa start-stop group radius
aaa accounting update periodic 1
aaa session-id common

## Command Reference

The following commands are introduced or modified in the feature or features

- **client authentication list**
- **client configuration address**
- **crypto isakmp profile**
- **crypto map (global IPSec)**
- **debug crypto isakmp**
- **isakmp authorization list**
- **match identity**
- **set isakmp-profile**
- **vrf**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at

<http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Glossary

**IKE**—Internet Key Exchange. IKE establishes a shared security policy and authenticates keys for services (such as IP security [IPSec]) that require keys. Before any IPSec traffic can be passed, each router, firewall, and host must verify the identity of its peer. This can be done by manually entering preshared keys into both hosts or by a certification authority (CA) service.

**IPSec**—IP security. IPSec is A framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses IKE to handle the negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

**ISAKMP**—Internet Security Association and Key Management Protocol. ISAKMP is an Internet IPSec protocol (RFC 2408) that negotiates, establishes, modifies, and deletes security associations. It also exchanges key generation and authentication data (independent of the details of any specific key generation technique), key establishment protocol, encryption algorithm, or authentication mechanism.

**L2TP session**—Layer 2 Transport Protocol. L2TP are communications transactions between the L2TP access concentrator (LAC) and the L2TP network server (LNS) that support tunneling of a single PPP connection. There is a one-to-one relationship among the PPP connection, L2TP session, and L2TP call.

**NAS**—network access server. A NAS is a Cisco platform (or collection of platforms, such as an AccessPath system) that interfaces between the packet world (for example, the Internet) and the circuit world (for example, the public switched telephone network [PSTN]).

**PFS**—perfect forward secrecy. **PFS is a cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not compromised because subsequent keys are not derived from previous keys.**

**QM**—Queue Manager. The Cisco IP Queue Manager (IP QM) is an intelligent, IP-based, call-treatment and routing solution that provides powerful call-treatment options as part of the Cisco IP Contact Center (IPCC) solution.

**RADIUS**—Remote Authentication Dial-In User Service. RADIUS is a database for authenticating modem and ISDN connections and for tracking connection time.

**RSA**—Rivest, Shamir, and Adelman. Rivest, Shamir, and Adelman are the inventors of the Public-key cryptographic system that can be used for encryption and authentication.

**SA**—security association. A SA is an instance of security policy and keying material that is applied to a data flow.

**TACACS+**—Terminal Access Controller Access Control System Plus. TACACS+ is a security application that provides centralized validation of users attempting to gain access to a router or network access server.

**TED**—Tunnel Endpoint Discovery. TED is a Cisco IOS software feature that allows routers to discover IPSec endpoints.

**VPN**—Virtual Private Network. A VPN enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic from one network to another. A VPN uses "tunneling" to encrypt all information at the IP level.

**VRF**—A VPN routing/forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a PE router.

**VSA**—vendor-specific attribute. A VSA is an attribute that has been implemented by a particular vendor. It uses the attribute Vendor-Specific to encapsulate the resulting AV pair: essentially, Vendor-Specific = protocol:attribute = value.

**XAUTH**—Extended authentication. XAUTH is an optional exchange between IKE Phase 1 and IKE Phase 2, in which the router demands additional authentication information in an attempt to authenticate the actual user (as opposed to authenticating the peer).

**Note**

| 12.2(11)T | This feature was integrated into Cisco IOS Release 12.2(11)T and support was added for the Cisco AS5300 and Cisco AS5800 platforms. |
| 12.2(9)YE | This feature was integrated into Cisco IOS Release 12.2(9)YE.                                                                       |
| 12.2(14)S | This feature was integrated into Cisco IOS Release 12.2(14)S.                                                                       |

This feature module describes the IPSec VPN High Availability Enhancements. It includes the following sections:

- [Feature Overview, page 1](#)
- [Supported Platforms, page 4](#)
- [Supported Standards, MIBs, and RFCs, page 5](#)
- [Configuration Tasks, page 6](#)
- [Configuration Examples, page 8](#)
- [Command Reference, page 10](#)

## Feature Overview

The IPSec VPN High Availability Enhancements feature consists of two new features—[Reverse Route Injection](#) (RRI) and [Hot Standby Router Protocol and IPSec](#) (HSRP)—that work together to provide users with a simplified network design for VPNs, and reduced configuration complexity on remote peers with respect to defining gateway lists. When used together, RRI and HSRP provide a more reliable network design for VPNs and reduce configuration complexity on remote peers.

## Reverse Route Injection

Reverse Route Injection (RRI) is a feature designed to simplify network design for Virtual Private Networks (VPNs) in which there is a requirement for redundancy or load balancing. RRI works with both dynamic and static crypto maps.

In the dynamic case, as remote peers establish IPSec security associations (SAs) with an RRI-enabled router, a static route is created for each subnet or host protected by that remote peer. For static crypto maps, a static route is created for each destination of an extended access list rule. When RRI is used on a static crypto map with an access control list (ACL), routes will always exist, even without the negotiation of IPSec SAs.

### Note

Use of any keyword in ACLs with RRI is not supported.

When routes are created, they are injected into any dynamic routing protocol and distributed to surrounding devices. This traffic flows, requiring IPSec to be directed to the appropriate RRI router for transport across the correct SAs to avoid IPSec policy mismatches and possible packet loss.

Figure 87 shows a RRI configuration functionality topology. Remote A is being serviced by Router A and Remote B connected to Router B, providing load balancing across VPN gateways at the central site. RRI on the central site devices will ensure that the other router on the inside of the network can automatically make the correct forwarding decision. RRI also eliminates the need to administer static routes on the inside router.

**Figure 87**      **Topology Showing Reverse Route Injection Configuration Functionality**

61616

## Hot Standby Router Protocol and IPSec

Hot Standby Router Protocol (HSRP) is designed to provide high network availability by routing IP traffic from hosts on Ethernet networks without relying on the availability of any single router. HSRP is particularly useful for hosts that do not support a router discovery protocol, such as ICMP Router Discovery Protocol (IRDP), and do not have the functionality to switch to a new router when their selected router reloads or loses power. Without this functionality, a router that loses its default gateway because of a router failure is unable to communicate with the network.

HSRP is configurable on LAN interfaces using standby command-line interface (CLI) commands. It is now possible to use the standby IP address from an interface as the local IPSec identity, or local tunnel endpoint.

By using the standby IP address as the tunnel endpoint, failover can be applied to VPN routers by using HSRP. Remote VPN gateways connect to the local VPN router via the standby address that belongs to the *active* device in the HSRP group. In the event of failover, the *standby* device takes over ownership of the standby IP address and begins to service remote VPN gateways.

Figure 88 shows the enhanced HSRP functionality topology. Traffic is serviced by the active Router P, the active device in the standby group. In the event of failover, traffic is diverted to Router S, the original standby device. Router S assumes the role of the new active router and takes ownership of the standby IP address.

**Figure 88**      **Topology Showing Hot Standby Router Protocol Functionality**

### Note

In case of a failover, HSRP does not facilitate IPSec state information transference between VPN routers. This means that without this state transference, SAs to remotes will be deleted requiring Internet Key Exchange (IKE) and IPSec SAs to be reestablished. To make IPSec failover more efficient, it is recommended that IKE keepalives be enabled on all routers.

## Benefits

### Reverse Route Injection

- Enables routing of IPSec traffic to a specific VPN headend device in environments that have multiple (redundant) VPN headend devices.

- Ensures predictable failover time of remote sessions between headend devices when using IKE keepalives, especially in environments in which remote device route flapping is common (not taking into consideration the effects of route convergence, which may vary depending on the routing protocol used and the size of the network).
- Eliminates the need for the administration of static routes on upstream devices as routes are dynamically learned by these devices.

#### Hot Standby Router Protocol with IPSec

Failover can be applied to VPN routers through the use of HSRP. Remote VPN gateways connect to the local VPN router through the standby address that belongs to the active device in the HSRP group. This functionality reduces configuration complexity on remote peers with respect to defining gateway lists because only the HSRP standby address needs to be defined.

**Finding Support Information for Platforms and Cisco IOS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Supported Standards, MIBs, and RFCs

**Standards**

- No new or modified standards are supported by this feature.

**MIBs**

- No new or modified standards are supported by this feature.

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

<http://tools.cisco.com/ITDIT/MIBS/servlet/index>

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

**RFCs**

- No new or modified RFCs are supported by this feature.

## Configuration Tasks

See the following sections for configuration tasks for the IPSec VPN High Availability Enhancements feature. Each task in the list is identified as either required or optional.

- [Configuring Reverse Route Injection on a Dynamic Crypto Map](#) (required)
- [Configuring Reverse Route Injection on a Static Crypto Map](#) (required)
- [Configuring HSRP with IPSec](#) (required)
- [Verifying VPN IPSec Crypto Configuration](#) (optional)

### Configuring Reverse Route Injection on a Dynamic Crypto Map

Dynamic crypto map entries, like regular static crypto map entries, are grouped into sets. A set is a group of dynamic crypto map entries all with the same dynamic map name but each with a different dynamic sequence number. Each member of the set may be configured for RRI.

To create a dynamic crypto map entry and enable RRI, use the following commands beginning in global configuration mode:

|        | Command                                                 | Purpose                                                                                                                                                                                                                                         |
|--------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Router (config)# <b>crypto dynamic</b> map-name seq-num | Creates a dynamic crypto map entry and enters crypto map configuration mode.                                                                                                                                                                    |
| Step 2 | Router (config-crypto-m)# <b>set transform-set</b>      | Specifies which transform sets are allowed for the crypto map entry. Lists multiple transform sets in order of priority (highest priority first).<br><br>This entry is the only configuration statement required in dynamic crypto map entries. |
| Step 3 | Router (config-crypto-m)# <b>reverse-route</b>          | Creates source proxy information.                                                                                                                                                                                                               |

### Configuring Reverse Route Injection on a Static Crypto Map

Before configuring RRI on a static crypto map, please note the following items:

- Routes are not created based on access list 102 as reverse-route is not enabled on mymap 2. RRI is not enabled by default and is not displayed in the router configuration.
- Enable a routing protocol to distribute the VPN routes to upstream devices.
- If Cisco Express Forwarding (CEF) is run on a VPN router configured for RRI, adjacencies need to be formed for each RRI injected network through the next hop device. As the next hop is not explicitly defined in the routing table for these routes, proxy-ARP should be enabled on the next hop router which allows the CEF adjacency to be formed using the layer two addresses of that device. In cases where there are many RRI injected routes, adjacency tables may become quite large as an entry is created for each device from each of the subnets represented by the RRI route. This issue is to be resolved in a future release.

To add RRI to a static crypto map set, use the following commands beginning in global configuration mode:

|        | Command                                                                    | Purpose                                                                                                                                           |
|--------|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Router (config)# <b>crypto map</b> map-name seq-num<br><b>ipsec-isakmp</b> | Adds a dynamic crypto map set to a static crypto map set and enters interface configuration mode.                                                 |
| Step 2 | Router (config-if)# <b>set peer ip address</b>                             | Specifies an IPSec peer IP address in a crypto map entry.                                                                                         |
| Step 3 | Router (config-if)# <b>reverse-route</b>                                   | Creates dynamically static routes based on crypto access control lists (ACLs).                                                                    |
| Step 4 | Router (config-if)# <b>match address</b>                                   | Specifies an extended access list for a crypto map entry.                                                                                         |
| Step 5 | Router (config-if)# <b>set transform-set</b>                               | Specifies which transform sets are allowed for the crypto map entry. Lists multiple transform sets in order of priority (highest priority first). |

## Configuring HSRP with IPSec

When configuring HSRP with IPSec, the following conditions may apply:

- When HSRP is applied to a crypto map on an interface, the crypto map must be reapplied if the standby IP address or the standby name is changed on that interface.
- If HSRP is applied to a crypto map on an interface, and the user deletes the standby IP address or the standby name from that interface, the crypto tunnel endpoint is reinitialized to the actual IP address of that interface.
- If a user adds the standby IP address and the standby name to an interface with the requirement IPSec failover, the crypto map must be reapplied with the appropriate redundancy information.
- Standby priorities should be equal on active and standby routers. If they are not, the higher priority router takes over as the active router. When that occurs, the active router goes into a cycle where it continuously goes down and comes back up.
- The IP addresses on the HSRP-tracked interfaces on the standby and active routers should both be either lower or higher on one router than the other. In the case of equal priorities (an HA requirement), HSRP will assign the active state-based IP address. If an addressing scheme exists so that the public IP address of router A is lower than the public IP address of router B, but the opposite is true for their private interfaces, an active/standby-standby/active split condition could exist which will break connectivity.

### Note

To configure HSRP without IPSec refer to the “[Configuring IP Services](#)” chapter of the *Cisco IOS IP Configuration Guide*, Release 12.2.

To apply a crypto map set to an interface, use the following commands beginning in global configuration mode:

|        | Command                                                                  | Purpose                                                                                |
|--------|--------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Step 1 | Router (config)# <b>interface</b> <i>type slot/port</i>                  | Specifies an interface and enters interface configuration mode.                        |
| Step 2 | Router (config-if)# <b>standby name</b> <i>group-name</i>                | Specifies the standby group name (required).                                           |
| Step 3 | Router (config-if)# <b>standby ip</b> <i>ip-address</i>                  | Specifies the IP address of the standby groups (required for one device in the group). |
| Step 4 | Router (config-if)# <b>crypto map map-name redundancy [standby-name]</b> | Specifies IP redundancy address as the tunnel endpoint for IPSec.                      |

## Verifying VPN IPSec Crypto Configuration

To verify your VPN IPSec crypto configuration, use the following EXEC commands:

| Command                                                                                 | Purpose                                         |
|-----------------------------------------------------------------------------------------|-------------------------------------------------|
| Router# <b>show crypto ipsec transform-set</b>                                          | Displays your transform set configuration.      |
| Router# <b>show crypto map [interface <i>interface</i>   tag <i>map-name</i>]</b>       | Displays your crypto map configuration.         |
| Router# <b>show crypto ipsec sa [map <i>map-name</i>   address   identity] [detail]</b> | Displays information about IPSec SAs.           |
| Router# <b>show crypto dynamic-map [tag <i>map-name</i>]</b>                            | Displays information about dynamic crypto maps. |

## Configuration Examples

This section provides the following configuration examples:

- [Reverse Route Injection on a Dynamic Crypto Map Example](#)
- [Reverse Route Injection on a Static Crypto Map Example](#)
- [HSRP and IPSec Example](#)

### Reverse Route Injection on a Dynamic Crypto Map Example

In the following example, using the reverse route crypto map subcommand in the definition of the dynamic crypto map template ensures that routes are created for any remote proxies (subnets or hosts), protected by the connecting remote IPSec peers.

```
crypto dynamic mydynmap 1
 set transform-set esp-3des-sha
 reverse-route
```

This template is then associated with a “parent” crypto map statement and then applied to an interface.

```
crypto map mymap 3 ipsec-isakmp dynamic mydynmap

interface FastEthernet 0/0
crypto map mymap
```

## Reverse Route Injection on a Static Crypto Map Example

RRI is a good solution for topologies that require encrypted traffic to be diverted to a VPN router and all other traffic to a different router.

In these scenarios, RRI eliminates the need to manually define static routes on devices.

RRI is not required if a single VPN router is used and all traffic passes through the VPN router during its path in and out of the network.

If the user chooses to manually define static routes on the VPN router for remote proxies, and have these routes permanently installed in the routing table, RRI should not be enabled on the crypto map instance that covers the same remote proxies. In this case, there is no possibility of user defined static routes being removed by RRI.

Routing convergence can affect the success of a failover based on the routing protocol used to advertise routes (link state versus periodic update). It is recommended that a link state routing protocol such as OSPF be used to help speed convergence time by ensuring that routing updates are sent as soon as a change in routing state is detected.

In the following example, RRI is enabled for mymap 1, but not for mymap 2. Upon the application of the crypto map to the interface, a route is created based on access-list 101 analogous to the following:

```
IP route 172.17.11.0 255.255.255.0 FastEthernet 0/0

crypto map mymap 1 ipsec-isakmp
 set peer 172.17.11.1
 reverse-route
 set transform-set esp-3des-sha
 match address 101
crypto map mymap 2 ipsec-isakmp
 set peer 10.1.1.1
 set transform-set esp-3des-sha
 match address 102

access-list 101 permit ip 192.168.1.0 0.0.0.255 172.17.11.0 0.0.0.255
access-list 102 permit ip 192.168.1.0 0.0.0.255 10.0.0.0 0.0.255.255

interface FastEthernet 0/0
 crypto map mymap
```

## HSRP and IPSec Example

The following example shows how all remote VPN gateways connect to the router via 192.168.0.3. The crypto map on the interface binds this standby address as the local tunnel endpoint for all instances of *mymap* and at the same time ensures that HSRP failover is facilitated between an active and standby device belonging to the same standby group, group1.

Note that RRI is also enabled to provide the ability for only the *active* device in the HSRP group to be advertising itself to inside devices as the next hop VPN gateway to the remote proxies. If there is a failover, routes are deleted on the formerly active device and created on the newly active device.

```
crypto map mymap 1 ipsec-isakmp
 set peer 10.1.1.1
 reverse-route
 set transform-set esp-3des-sha
 match address 102

Interface FastEthernet 0/0
 ip address 192.168.0.2 255.255.255.0
 standby name group1
 standby ip 192.168.0.3
 crypto map mymap redundancy group1

access-list 102 permit ip 192.168.1.0 0.0.0.255 10.0.0.0 0.0.255.255
```

The standby name needs to be configured on all devices in the standby group and the standby address needs to be configured on at least one member of the group. If the standby name is removed from the router, the IPSec SAs will be deleted. If the standby name is added again, regardless of whether the same name or a different name is used, the crypto map (using the redundancy option) will have to be reapplied to the interface.

## Command Reference

The following commands are introduced or modified in the feature or features:  
documented in this module:

- [crypto map \(interface IPSec\)](#)
- [reverse-route](#)

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Low Latency Queueing (LLQ) for IPSec Encryption Engines

---

## Feature History

| Release   | Modification                                                  |
|-----------|---------------------------------------------------------------|
| 12.2(13)T | This feature was introduced.                                  |
| 12.2(14)S | This feature was integrated into Cisco IOS Release 12.2(14)S. |

This feature module describes the Low Latency Queueing (LLQ) for IPSec encryption engines feature in Cisco IOS Release 12.2(13)T and 12.2(14)S. It includes the following sections:

- [Feature Overview, page 1](#)
- [Supported Platforms, page 3](#)
- [Supported Standards, MIBs, and RFCs, page 4](#)
- [Prerequisites, page 4](#)
- [Configuration Tasks, page 4](#)
- [Monitoring and Maintaining LLQ for IPSec Encryption Engines, page 8](#)
- [Configuration Examples, page 8](#)
- [Command Reference, page 9](#)
- [Glossary, page 9](#)

## Feature Overview

Low Latency Queueing (LLQ) for IPSec encryption engines helps reduce packet latency by introducing the concept of queueing before crypto engines. Prior to this, the crypto processing engine gave data traffic and voice traffic equal status. Administrators now designate voice traffic as priority. Data packets arriving at a router interface are directed into a data packet inbound queue for crypto engine processing. This queue is called the best effort queue. Voice packets arriving on a router interface are directed into

a priority packet inbound queue for crypto engine processing. This queue is called the priority queue. The crypto engine undertakes packet processing in a favorable ratio for voice packets. Voice packets are guaranteed a minimum processing bandwidth on the crypto engine.

## Benefits

The Low Latency Queueing (LLQ) for IPSec encryption engines feature guarantees a certain level of crypto engine processing time for priority designated traffic.

### Note

On the Cisco 2600 platform, with the exception of the Cisco 2691 router, the CPU utilization maximizes out before the crypto engine becomes congested, so latency is not improved.

### Better Voice Performance

Voice packets can be identified as priority, allowing the crypto engine to guarantee a certain percentage of processing bandwidth. This feature impacts the end user experience by assuring voice quality if voice traffic is directed onto a congested network.

### Improved Latency and Jitters

Predictability is a critical component of network performance. The Low Latency Queueing (LLQ) for IPSec encryption engines feature delivers network traffic predictability relating to VPN. With this feature disabled, an end user employing an IP phone over VPN might experience jitter or latency, both symptoms of overall network latency and congestion. With this feature enabled, these undesirable characteristics are dissipated.

## Restrictions

- No per-tunnel QoS policy. An interface QoS policy represents all tunnels.
- Assume the same IP precedence/DSCP marking for inbound and outbound voice packets.
- Assume the IP precedence/DSCP marking for voice packets are done at the source.
- Limited match criteria for voice traffic in the interface QoS policy.
- Assume call admission control is enforced within the enterprise.
- No strict error checking when aggregate policy's bandwidth exceeds crypto engine bandwidth. Only a warning is displayed but configuration is allowed.
- Assume voice packets are either all encrypted or unencrypted.

## Related Features and Technologies

- CBWFQ
- Priority Queueing
- Weighted Fair Queueing

## Related Documents

## Supported Platforms

### 12.2(14)S and higher

The LLQ for IPSec encryption engines feature is supported on the following platform:

- Cisco 7200 series

### 12.2(13)T

The LLQ for IPSec encryption engines feature is supported on all platforms using Cisco IOS Release 12.2(13)T or later, including:

- Cisco 2600 series
- Cisco 3600 series
- Cisco 7100 series
- Cisco 7200 series

## Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to quickly determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side-by-side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

<http://www.cisco.com/go/fn>

## Availability of Cisco IOS Software Images

Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

## Supported Standards, MIBs, and RFCs

### Standards

- No new or modified standards are supported by this feature.

### MIBs

- No new or modified standards are supported by this feature.

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

<http://tools.cisco.com/ITDIT/MIBS/servlet/index>

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

### RFCs

- No new or modified RFCs are supported by this feature.

## Prerequisites

To use this feature, you should be familiar with the following:

- Access control lists
- Bandwidth management
- CBWFQ

## Configuration Tasks

To configure LLQ for IPSec encryption engines, perform the tasks described in the following section.

**Note**

See the [Quality of Service Solutions Command Reference](#), Cisco IOS Release 12.2, to learn more about configuring server policies on interfaces.

- [Defining Class Maps](#) (required)
- [Configuring Class Policy in the Policy Map](#) (required)
- [Configuring Class Policy for a Priority Queue](#) (required)
- [Configuring Class Policy Using a Specified Bandwidth](#) (optional)
- [Configuring the Class-Default Class Policy](#) (optional)
- [Attaching the Service Policy](#) (required)
- [Verifying Configuration of Policy Maps and Their Classes](#) (optional)

## Defining Class Maps

To create a class map containing match criteria against which a packet is checked to determine if it belongs to a class, use the following commands beginning in global configuration mode:

|               | Command                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Router(config)# <b>class-map</b> class-map-name                                                                                                                                                                                               | Specifies the name of the class map to be created.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | Router(config-cmap)# <b>match access-group</b> {access-group / name access-group-name}<br><br>or<br><br>Router(config-cmap)# <b>match input-interface</b> interface-name<br><br>or<br><br>Router(config-cmap)# <b>match protocol</b> protocol | Specifies the name of the access control list (ACL) against whose contents packets are checked to determine if they belong to the class.<br><br>Specifies the name of the input interface used as a match criterion against which packets are checked to determine if they belong to the class.<br><br>Specifies the name of the protocol used as a match criterion against which packets are checked to determine if they belong to the class. |

## Configuring Class Policy in the Policy Map

To configure a policy map and create class policies that make up the service policy, begin with the **policy-map** command to specify the policy map name. Then use one or more of the following commands to configure the policy for a standard class or the default class:

- **priority**
- **bandwidth**
- **queue-limit** or **random-detect**
- **fair-queue** (for class-default class only)

For each class that you define, you can use one or more of the commands listed to configure the class policy. For example, you might specify bandwidth for one class and both bandwidth and queue limit for another class.

The default class of the policy map (commonly known as the class-default class) is the class to which traffic is directed if that traffic does not satisfy the match criteria of the other classes defined in the policy map.

You can configure class policies for as many classes as are defined on the router, up to the maximum of 64. However, the total amount of bandwidth allocated for all classes in a policy map must not exceed the minimum committed information rate (CIR) configured for the virtual circuit (VC) minus any bandwidth reserved by the **frame-relay voice bandwidth** and **frame-relay ip rtp priority** commands. If the minimum CIR is not configured, the bandwidth defaults to one half of the CIR. If all of the bandwidth is not allocated, the remaining bandwidth is allocated proportionally among the classes on the basis of their configured bandwidth.

To configure class policies in a policy map, perform the tasks described in the following sections. The task in the first section is required; the tasks in the remaining sections are optional.

## Configuring Class Policy for a Priority Queue

To configure a policy map and give priority to a class within the policy map, use the following commands beginning in global configuration mode:

|               | Command                                                | Purpose                                                                                                      |
|---------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Router(config) # <b>policy-map</b> policy-map          | Specifies the name of the policy map to be created or modified.                                              |
| <b>Step 2</b> | Router(config-cmap) # <b>class</b> class-name          | Specifies the name of a class to be created and included in the service policy.                              |
| <b>Step 3</b> | Router(config-pmap-c) # <b>priority</b> bandwidth-kbps | Creates a strict priority class and specifies the amount of bandwidth, in kbps, to be assigned to the class. |

## Configuring Class Policy Using a Specified Bandwidth

To configure a policy map and create class policies that make up the service policy, use the following commands beginning in global configuration mode:

|               | Command                                                 | Purpose                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Router(config) # <b>policy-map</b> policy-map           | Specifies the name of the policy map to be created or modified.                                                                                                                                                                                                         |
| <b>Step 2</b> | Router(config-cmap) # <b>class</b> class-name           | Specifies the name of a class to be created and included in the service policy.                                                                                                                                                                                         |
| <b>Step 3</b> | Router(config-pmap-c) # <b>bandwidth</b> bandwidth-kbps | Specifies the amount of bandwidth to be assigned to the class, in kbps, or as a percentage of the available bandwidth. Bandwidth must be specified in kbps or as a percentage consistently across classes. (Bandwidth of the priority queue must be specified in kbps.) |

To configure more than one class in the same policy map, repeat [Step 2](#) and [Step 3](#).

## Configuring the Class-Default Class Policy

The class-default class is used to classify traffic that does not fall into one of the defined classes. Even though the class-default class is predefined when you create the policy map, you still have to configure it. If a default class is not configured, then traffic that does not match any of the configured classes is given best-effort treatment, which means that the network will deliver the traffic if it can, without any assurance of reliability, delay prevention, or throughput.

To configure a policy map and the class-default class, use the following commands beginning in global configuration mode:

|        | Command                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                        |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Router(config)# <b>policy-map</b> policy-map                                                                                                               | Specifies the name of the policy map to be created or modified.                                                                                                                                                                                                                |
| Step 2 | Router(config-cmap)# <b>class class-default</b><br><i>default-class-name</i>                                                                               | Specifies the default class so that you can configure or modify its policy.                                                                                                                                                                                                    |
| Step 3 | Router(config-pmap-c)# <b>bandwidth</b><br>bandwidth-kbps<br><br>or<br><br>Router(config-pmap-c)# <b>fair-queue</b><br>[ <i>number-of-dynamic-queues</i> ] | Specifies the amount of bandwidth, in kbps, to be assigned to the class.<br><br><br>Specifies the number of dynamic queues to be reserved for use by flow-based WFQ running on the default class. The number of dynamic queues is derived from the bandwidth of the interface. |

## Attaching the Service Policy

To attach a service policy to the output interface and enable LLQ for IPSec encryption engines, use the following command in map-class configuration mode:

|        | Command                                                       | Purpose                                                                                                         |
|--------|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Step 1 | Router(config)# <b>interface</b> type number                  | Specifies the interface using the LLQ for IPSec encryption engines.                                             |
| Step 2 | Router(config-if)# <b>service-policy output</b><br>policy-map | Attaches the specified service policy map to the output interface and enables LLQ for IPSec encryption engines. |

## Verifying Configuration of Policy Maps and Their Classes

To display the contents of a specific policy map or all policy maps configured on an interface, use the following commands in EXEC mode, as needed:

|        | Command                                  | Purpose                                                                                                                                        |
|--------|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Router# <b>show frame-relay pvc dlci</b> | Displays statistics about the PVC and the configuration of classes for the policy map on the specified data-link connection identifier (DLCI). |

|        | Command                                                                     | Purpose                                                                                                 |
|--------|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| Step 2 | Router# <b>show policy-map interface</b><br><i>interface-name</i>           | When LLQ is configured, displays the configuration of classes for all policy maps.                      |
| Step 3 | Router# <b>show policy-map interface</b><br><i>interface-name dlci dlci</i> | When LLQ is configured, displays the configuration of classes for the policy map on the specified DLCI. |

## Monitoring and Maintaining LLQ for IPsec Encryption Engines

To monitor and maintain LLQ for IPsec encryption engines, use the following command in EXEC mode:

|        | Command                            | Purpose                                                                               |
|--------|------------------------------------|---------------------------------------------------------------------------------------|
| Step 1 | Router# <b>show crypto eng qos</b> | Displays quality of service queueing statistics for LLQ for IPsec encryption engines. |

For a more detailed list of commands that can be used to monitor LLQ for IPsec encryption engines, see the section [“Verifying Configuration of Policy Maps and Their Classes”](#)

## Configuration Examples

This section provides the following configuration example:

- [LLQ for IPsec Encryption Engines Example](#)

### LLQ for IPsec Encryption Engines Example

In the following example, a strict priority queue with a guaranteed allowed bandwidth of 50 kbps is reserved for traffic that is sent from the source address 10.10.10.10 to the destination address 10.10.10.20, in the range of ports 16384 through 20000 and 53000 through 56000.

First, the following commands configure access list 102 to match the desired voice traffic:

```
Router(config)# access-list 102 permit udp host 10.10.10.10 host 10.10.10.20 range 16384 20000
Router(config)# access-list 102 permit udp host 10.10.10.10 host 10.10.10.20 range 53000 56000
```

Next, the class map voice is defined, and the policy map called policy1 is created; a strict priority queue for the class voice is reserved, a bandwidth of 20 kbps is configured for the class bar, and the default class is configured for WFQ. The service-policy command then attaches the policy map to the fas0/0.

```
Router(config)# class-map voice
Router(config-cmap)# match access-group 102
Router(config)# policy-map policy1
Router(config-pmap)# class voice
Router(config-pmap-c)# priority 50
Router(config-pmap)# class bar
Router(config-pmap-c)# bandwidth 20
Router(config-pmap)# class class-default
Router(config-pmap-c)# fair-queue
Router(config)# interface fas0/0
```

```
Router(config-if)# service-policy output policy1
```

## Command Reference

The following new command is pertinent to this feature. To see the command pages for this command and other commands used with this feature, go to the *Cisco IOS Master Commands List*, Release 12.4, at <http://www.cisco.com/univercd/cc/td/doc/product/software/ios124/124mindx/124index.htm>.

- **show crypto eng qos**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

## Glossary

**IKE**—Internet Key Exchange. IKE establishes a shared security policy and authenticates keys for services (such as IPSec). Before any IPSec traffic can be passed, each router/firewall/host must verify the identity of its peer. This can be done by manually entering preshared keys into both hosts or by a CA service.

**IPSec**—IP Security. A framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses IKE to handle the negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

# L2TP—IPSec Support for NAT and PAT Windows Clients

The L2TP—IPSec Support for NAT and PAT Windows Clients feature allows more than one Windows client to connect to a Layer 2 Tunneling Protocol (L2TP) Network Server (LNS) at one time with IP Security (IPSec) enabled and a network address translation (NAT) or port address translation (PAT) server between the Windows client and LNS.

Currently, if one Windows client is connected to a Cisco IOS LNS router through a NAT or PAT server with IPSec enabled, and then another Windows client connects to the same Cisco IOS LNS router, the first client's connection is effectively terminated. Enabling L2TP—IPSec Support for NAT and PAT Windows Clients ensures that Windows client connections in this environment are established and maintained until the connection is closed.

## History for the L2TP—IPSec Support for NAT and PAT Windows Clients Feature

| Release    | Modification                                      |
|------------|---------------------------------------------------|
| 12.3(11)T4 | This feature was introduced.                      |
| 12.4(1)    | This feature was integrated into Release 12.4(1). |

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Prerequisites for L2TP—IPSec Support for NAT and PAT Windows Clients

- You have an environment consisting of Windows clients and Cisco IOS LNS routers with IPSec enabled and a NAT or PAT server between the Windows client and LNS router.
- You must have a version of IPSec that contains the L2TP—IPSec Support for NAT and PAT Windows Clients feature.
- You must understand Windows 2000 concepts and configuration requirements.
- You must understand Cisco IOS LNS routers concepts and configuration requirements.
- You must understand NAT and PAT concepts and configuration requirements.
- You must understand IPSec concepts and configuration requirements.
- You must understand L2TP concepts and configuration requirements.

## Restrictions for L2TP—IPSec Support for NAT and PAT Windows Clients

- Tested only with Windows 2000 L2TP/IPsec clients running hotfix 818043.
- Port translation is not a standard default behavior. Port translation is incompatible with standard IPSec because it changes the LNS header port information.
- L2TP requires the client to have Microsoft DUN configured. L2TP is supported solely by Windows 2000 MS-DUN (L2TP is not supported by Windows 95, Windows 98, or Windows NT).

## Information About L2TP—IPSec Support for NAT and PAT Windows Clients

To use the L2TP—IPSec Support for NAT and PAT Windows Clients feature, the following concept should be understood:

- [How L2TP—IPSec Support for NAT and PAT Windows Clients Works, page 2](#)

## How L2TP—IPSec Support for NAT and PAT Windows Clients Works

With the L2TP—IPSec Support for NAT and PAT Windows Clients feature not enabled, Windows clients lose connection with the Cisco IOS LNS router when another Windows client establishes an IPSec-protected L2TP tunnel to the Cisco IOS LNS router when IPSec is enabled and there is a NAT or PAT server between the Windows clients and the LNS.

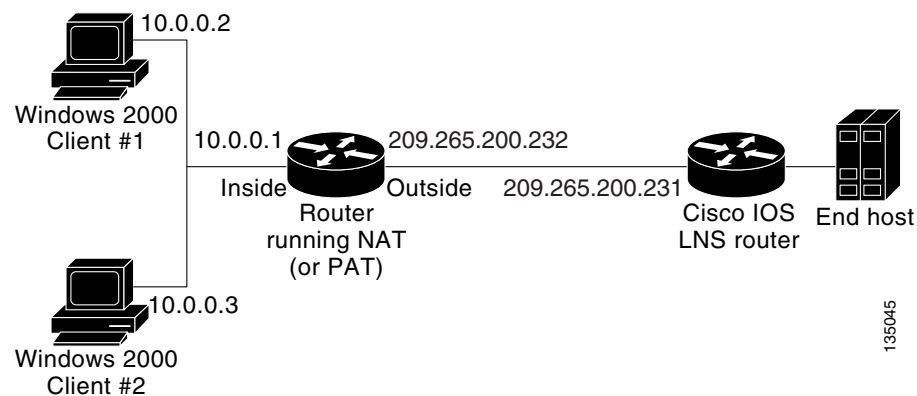

**Note**

If you do not have IPSec enabled, or you do not have a NAT or PAT server, you can have multiple Windows clients connect to a LNS without this command enabled.

### Without L2TP—IPSec Support for NAT and PAT Windows Clients Feature Enabled

For example, [Figure 91](#) shows two Windows 2000 clients that are trying to connect to the end host through the router running NAT or PAT and the same Cisco IOS LNS router. IPSec is enabled.

**Figure 91** Multiple Windows 2000 Clients, NAT Router, and Cisco IOS LNS Router with IP Addresses

The Windows 2000 Client #1 establishes an IPSec-protected L2TP tunnel to the Cisco IOS LNS router. The Windows 2000 client and the Cisco IOS LNS router recognize that there is a router running NAT between them and IPSec and NAT-Traversal (NAT-T) are enabled. The Windows 2000 client attempts to establish an IPSec security association (SA) and requests transport mode (which it does by default) with proxies from 10.0.0.2, its local address, to 209.265.200.231, the Cisco IOS LNS router's address.

In transport mode NAT, running on the router, translates all outgoing connections (including 10.0.0.2) to its outside IP address (209.265.200.232), the address the traffic will come in on. However, NAT cannot modify the L2TP port designation (1701), which is protected by the IPSec encrypted area. So now, we have a local address of 209.265.200.231, a remote address of 209.265.200.232 and a remote port of 1701. All traffic is sent to the Windows 2000 Client #1 that matches the tunnel 209.265.200.231, port 1701.

Then Windows 2000 Client #2 establishes an IPSec-protected L2TP tunnel to the Cisco IOS LNS router, again in transport mode. And NAT, again, translates all outgoing connections to its outside IP address (209.265.200.232), but it cannot modify the L2TP port designation (1701). All traffic is now sent to Windows 2000 Client #2 that matches tunnel 209.265.200.231, port 1701. This second Windows client connection has effectively ended Windows Client #1's connection to the Cisco IOS LNS router since it is no longer receiving traffic.

### With L2TP—IPSec Support for NAT and PAT Windows Clients Feature Enabled

With the L2TP—IPSec Support for NAT and PAT Windows Clients feature enabled, IPSec can translate the L2TP ports after decryption. This feature allows IPSec to map traffic from different hosts to different source ports. L2TP can now distinguish between traffic destined for multiple Windows 2000 clients.

So now, when an SA is created, a translated port will be assigned to it. This port is client-specific. The same port will be used for any new SA created by that client. When an encrypted request is received and decrypted, the source port is translated from the standard value, 1701, to a client specific value. The request with the translated port is then forwarded to L2TP.

As shown in [Figure 91](#) with port translation enabled, the Windows 2000 Client #1 would have a translated port number of 1024 assigned and Windows 2000 Client #2 would have a translated port number of 1025 assigned.

When L2TP sends the reply packet, it uses the translated port number and creates a packet to that destination port. IPSec uses the destination port number to select the SA with which to encrypt the packet. Before encrypting the packet, IPSec translates the destination port back to the standard port number, 1701, which the Windows 2000 client expects. IPSec encrypts the packet, either with the SA to Windows 2000 Client #1 if the destination port was 1024 or with the SA to Windows 2000 Client #2 if the destination port was 1025. And now, all traffic is sent to the appropriate client and multiple Windows clients can be connected to a Cisco IOS LNS router through a NAT server at the same time.

The connection is maintained until one of the following actions occurs:

- The IPSec connection is closed.
- The NAT or PAT device ends the session.
- The LNS closes the session.
- The Windows client closes the session.

## How to Enable L2TP—IPSec Support for NAT and PAT Windows Clients

This section contains the following procedure that allows you to enable NAT/PAT port translation:

- [Enabling L2TP—IPSec Support, page 4](#)

### Enabling L2TP—IPSec Support

Use the following task to enable L2TP—IPSec Support for NAT and PAT Windows Clients for environments that have IPSec enabled and include multiple windows clients, a NAT or PAT server, L2TP, and a Cisco IOS LNS router.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name seq-num* [**ipsec-isakmp**]  
or  
**crypto dynamic-map** *dynamic-map-name dynamic-seq-num*
4. **set nat demux**
5. **exit**
6. **exit**
7. **show crypto map** [**interface** *interface* | **tag** *map-name*]  
or  
**show crypto dynamic-map** [**tag** *map-name*]
8. **show crypto ipsec sa**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                           |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                               | Enters global configuration mode.                                                                                                                                                                                 |
| Step 3 | <b>crypto map</b> <i>map-name</i> <i>seq-num</i> [ <b>ipsec-isakmp</b> ]<br><br><b>Example:</b><br>Router(config)# crypto map STATIC_MAP 5<br><br>or<br><b>crypto dynamic-map</b> <i>dynamic-map-name</i> <i>dynamic-seq-num</i><br><br><b>Example:</b><br>Router(config)# crypto dynamic-map DYNAMIC_MAP 10 | Names the static crypto map entry to create (or modify) and enters crypto map configuration mode.<br><br>or<br>Names the dynamic crypto map entry to create (or modify) and enters crypto map configuration mode. |
| Step 4 | <b>set nat demux</b><br><br><b>Example:</b><br>Router(config-crypto-map)# set nat demux                                                                                                                                                                                                                      | Enables L2TP—IPSec support.                                                                                                                                                                                       |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-crypto-map)# exit                                                                                                                                                                                                                                        | Exits crypto map configuration mode and returns to global configuration mode.                                                                                                                                     |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                                                                                                                   | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                              |

|        | Command or Action                                                                         | Purpose                                                                 |
|--------|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Step 7 | <b>show crypto map</b> [ <b>interface</b> <i>interface</i>   <b>tag</b> <i>map-name</i> ] | (Optional) Displays information about crypto map configuration.         |
|        | <b>Example:</b><br>Router# show crypto map                                                | or                                                                      |
|        | or                                                                                        |                                                                         |
|        | <b>show crypto dynamic-map</b> [ <b>tag</b> <i>map-name</i> ]                             | (Optional) Displays information about dynamic crypto map configuration. |
|        | <b>Example:</b><br>Router# show crypto dynamic-map                                        |                                                                         |
| Step 8 | <b>show crypto ipsec sa</b>                                                               | (Optional) Displays the settings used by current SAs.                   |
|        | <b>Example:</b><br>Router# show crypto ipsec sa                                           |                                                                         |

## Configuration Examples for L2TP—IPSec Support for NAT and PAT Windows Clients

This section provides the following configuration example:

- [Dynamic Map Configuration: Example, page 6](#)

### Dynamic Map Configuration: Example

The following example shows how to enable the L2TP—IPSec Support for NAT and PAT Windows Clients feature for a dynamic crypto map:

```
!
version 12.3
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname 72_LNS
!
boot-start-marker
boot-end-marker
!
aaa new-model
!
!
aaa authentication ppp default local
aaa session-id common
ip subnet-zero
!
!
no ip cef
no ip domain lookup
ip domain name cisco.com
```

```
ip dhcp excluded-address 20.0.0.8
ip dhcp excluded-address 20.0.0.10
!
!
ip vrf VPN
 rd 1:1
!
!Enable virtual private networking.

# Pre-Fragmentation for IPSec VPNs

---

## Feature History

| Release                  | Modification                                                  |
|--------------------------|---------------------------------------------------------------|
| 12.1(11b)E               | This feature was introduced.                                  |
| 12.2(13)T                | This feature was integrated into Cisco IOS Release 12.2(13)T. |
| 12.2(14)S                | This feature was integrated into Cisco IOS Release 12.2(14)S. |
| Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers. |

This feature module describes the Pre-fragmentation for IPSec VPNs feature in Cisco IOS Release 12.2(13)T and 12.2(14)S. It includes the following sections:

- [Feature Overview, page 1](#)
- [Supported Platforms, page 4](#)
- [Configuration Tasks, page 6](#)
- [Configuration Tasks, page 6](#)
- [Configuration Examples, page 8](#)
- [Command Reference, page 9](#)

## Feature Overview

When a packet is nearly the size of the maximum transmission unit (MTU) of the outbound link of the encrypting router, and it is encapsulated with IPSec headers, it is likely to exceed the MTU of the outbound link. This causes packet fragmentation after encryption, which makes the decrypting router reassemble in the process path. Pre-fragmentation for IPSec VPNs increases the decrypting router's performance by enabling it to operate in the high performance CEF path instead of the process path.

This feature allows an encrypting router to predetermine the encapsulated packet size from information available in transform sets, which are configured as part of the IPSec security association (SA). If it is predetermined that the packet will exceed the MTU of the output interface, the packet is fragmented before encryption. This function avoids process level reassembly before decryption and helps improve decryption performance and overall IPSec traffic throughput.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

© 2007 Cisco Systems, Inc. All rights reserved.

**Note**

---

The pre-fragmentation feature is turned off by default for tunnel interfaces. To receive pre-fragmentation performance benefits, turn pre-fragmentation on after insuring that the tunnel interfaces have the same MTU on both ends.

---

## Benefits

### Increased Performance

Delivers encryption throughput at maximum encryption hardware accelerator speeds. This performance increase is for near MTU-sized packets.

### Uniform Fragmentation

Packets are fragmented into equally sized units to prevent further downstream fragmentation.

### Interoperability

This feature is interoperable with all Cisco IOS platforms and a number of Cisco VPN clients.

## Restrictions

Take the following information into consideration before this feature is configured:

- Pre-fragmentation for IPsec VPNs operates in IPsec tunnel mode and IPsec tunnel mode with GRE, but not with IPsec transport mode.
- Pre-fragmentation for IPsec VPNs configured on the decrypting router in a unidirectional traffic scenario does not improve the performance or change the behavior of either of the peers.
- Pre-fragmentation for IPsec VPNs occurs before the transform is applied if compression is turned on for outgoing packets.
- Pre-fragmentation for IPsec VPNs functionality depends on the egress interface **crypto ipsec df-bit** configuration and the incoming packet “do not fragment” (DF) bit state. See [Table 1](#).

**Table 1** Pre-Fragmentation for IPsec VPNs Dependencies

| Pre-Fragmentation for IPsec VPNs Feature State (Enabled/Disabled) | Egress Interface “crypto ipsec df-bit” Configuration | Incoming Packet DF Bit State | Result                                                                               |
|-------------------------------------------------------------------|------------------------------------------------------|------------------------------|--------------------------------------------------------------------------------------|
| Enabled                                                           | crypto ipsec df-bit clear                            | 0                            | Fragmentation occurs before encryption.                                              |
| Enabled                                                           | crypto ipsec df-bit clear                            | 1                            | Fragmentation occurs before encryption.                                              |
| Disabled                                                          | crypto ipsec df-bit clear                            | 0                            | Fragmentation occurs after encryption and packets are reassembled before decryption. |
| Disabled                                                          | crypto ipsec df-bit clear                            | 1                            | Fragmentation occurs after encryption and packets are reassembled before decryption. |
| Enabled                                                           | crypto ipsec df-bit set                              | 0                            | Fragmentation occurs before encryption.                                              |

**Table 1** *Pre-Fragmentation for IPSec VPNs Dependencies (continued)*

## Supported Platforms

### 12.2(14)S and higher

The Pre-fragmentation for IPSec VPN feature is supported on the following platforms:

- Cisco 7200 series
- Cisco 7400 series

### 12.2(13)T

The Pre-fragmentation for IPSec VPN feature is supported on all platforms using Cisco IOS Release 12.2(13)T or higher, including:

- Cisco 1710
- Cisco 1720
- Cisco 1721
- Cisco 1751
- Cisco 1760
- Cisco 2600
- Cisco 2691
- Cisco 3620
- Cisco 3640
- Cisco 3660

- Cisco 3725
- Cisco 3745
- Cisco 7100 series
- Cisco 7200 series
- Cisco 7400 series

#### 12.1(11b)E

The Pre-fragmentation for IPSec VPN feature is supported on all platforms using Cisco IOS Release 12.1(11b)E or higher, including:

- Cisco 7100 series

#### Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

<http://www.cisco.com/go/fn>

#### Availability of Cisco IOS Software Images

Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

# Supported Standards, MIBs, and RFCs

## Standards

- No new or modified standards are supported by this feature.

## MIBs

- No new or modified standards are supported by this feature.

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

<http://tools.cisco.com/ITDIT/MIBS/servlet/index>

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to [cco-locksmith@cisco.com](mailto:cco-locksmith@cisco.com). An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

<http://www.cisco.com/register>

## RFCs

- No new or modified RFCs are supported by this feature.

## Configuration Tasks

See the following sections for configuration tasks for the Pre-fragmentation for IPSec VPNs feature. Each task in the list is identified as either required or optional.

- [Configuring Pre-Fragmentation For IPSec VPNs](#) (required)
- [Verifying Pre-Fragmentation For IPSec VPNs](#) (optional)

## Configuring Pre-Fragmentation For IPSec VPNs

Pre-fragmentation for IPSec VPNs is globally enabled by default. To enable or disable pre-fragmentation for IPSec VPNs while in interface configuration mode, enter the commands in the following table. Use the **no** form of the commands to revert back to the default configuration, or use the commands themselves to enable configuration of the pre-fragmentation IPSec VPNs.

### Note

---

Manually enabling or disabling this feature will override the global configuration.

---

| Command                                                                | Purpose                                                     |
|------------------------------------------------------------------------|-------------------------------------------------------------|
| Router(config-if)# <b>crypto ipsec fragmentation before-encryption</b> | Enables pre-fragmentation for IPsec VPNs on the interface.  |
| Router(config-if)# <b>crypto ipsec fragmentation after-encryption</b>  | Disables pre-fragmentation for IPsec VPNs on the interface. |
| Router(config)# <b>crypto ipsec fragmentation before-encryption</b>    | Enables pre-fragmentation for IPsec VPNs globally.          |
| Router(config)# <b>crypto ipsec fragmentation after-encryption</b>     | Disables pre-fragmentation for IPsec VPNs globally.         |

## Verifying Pre-Fragmentation For IPsec VPNs

To verify that this feature is enabled, consult the interface statistics on the encrypting router and the decrypting router. If fragmentation occurs on the encrypting router, and no reassembly occurs on the decrypting router, fragmentation is happening before encryption, and thus the packets are not being reassembled before decryption. This means that the feature is enabled.

### Note

This method of verification does not apply to packets destined for the decrypting router.

- Step 1** Enter the **show running-configuration** command on the encrypting router. If the feature is enabled, you will observe output similar to the following:

```
Router# show running-configuration
crypto isakmp policy 10
 authentication pre-share
crypto isakmp key abcd123 address 25.0.0.7
!
!
crypto ipsec transform-set fooprime esp-3des esp-sha-hmac
!
crypto map bar 10 ipsec-isakmp
 set peer 25.0.0.7
 set transform-set fooprime
 match address 102
```

If the feature has been disabled, you will observe output similar to the following:

```
Router# show running-configuration
crypto isakmp policy 10
 authentication pre-share
crypto isakmp key abcd123 address 25.0.0.7
!
!
crypto ipsec transform-set fooprime esp-3des esp-sha-hmac
crypto ipsec fragmentation after-encryption
!
crypto map bar 10 ipsec-isakmp
 set peer 25.0.0.7
 set transform-set fooprime
 match address 102
```

- Step 2** Enter the **show running-configuration interface *type number*** command to display statistics for the encrypting router egress interface. If the feature is enabled, you will observe output similar to the following:

```
Router# show running-configuration interface fastethernet 0/0
interface FastEthernet0/0
 ip address 25.0.0.6 255.0.0.0
 no ip mroute-cache
 load-interval 30
 duplex full
 speed 100
 crypto map bar
```

If the feature has been disabled, you will observe output similar to the following:

```
Router# show running-configuration interface fastethernet 0/0

interface FastEthernet0/0
 ip address 25.0.0.6 255.0.0.0
 no ip mroute-cache
 load-interval 30
 duplex full
 speed 100
 crypto map bar
 crypto ipsec fragmentation after-encryption
```

## Configuration Examples

This section provides the following configuration example:

- [Enabling Pre-Fragmentation For IPSec VPNs Example](#)

### Enabling Pre-Fragmentation For IPSec VPNs Example

The following configuration example shows how to configure the Pre-Fragmentation for IPSec VPNs feature:

#### Note

This feature does not show up in the running configuration in this example because the default global pre-fragmentation for IPSec VPNs feature is enabled. Pre-fragmentation for IPSec VPNs shows in the running configuration only when you explicitly enable the feature on the interface.

```
crypto isakmp policy 10
 authentication pre-share
 crypto isakmp key abcd123 address 25.0.0.7
 !
 !
 crypto ipsec transform-set fooprime esp-3des esp-sha-hmac
 !
 crypto map bar 10 ipsec-isakmp
 set peer 25.0.0.7
 set transform-set fooprime
 match address 102
```

# Command Reference

The following commands are introduced or modified in the feature or features

- **crypto ipsec fragmentation**
- **crypto ipsec fragmentation (interface configuration)**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

# Real-Time Resolution for IPSec Tunnel Peer

---

After a user specifies a host name (instead of an IP address) for remote IP Security (IPSec) peer, the Real-Time Resolution for IPSec Tunnel Peer feature allows the host name to be domain name server (DNS) resolved before the router establishes the IPSec tunnel. Thus, the router can immediately discover whether the IP address of the peer has changed.

## Feature History for Real-Time Resolution for IPSec Tunnel Peer

| Release                  | Modification                                                  |
|--------------------------|---------------------------------------------------------------|
| 12.3(4)T                 | This feature was introduced.                                  |
| Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers. |

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

# Restrictions for Real-Time Resolution for IPsec Tunnel Peer

## Secure DNS Requirement

It is recommended that you use this feature only with secure DNS and when the DNS responses can be authenticated. Otherwise, an attacker can spoof or forge DNS responses and have access to Internet Key Exchange (IKE) authentication data, such as a certificate. If an attacker has a certificate that is trusted by the initiating host, the attacker can successfully establish Phase 1 IKE security association (SA), or the attacker can try to guess the preshared key that is shared between the initiator and the actual responder.

## DNS Initiator

DNS names resolution for remote IPsec peers will work only if they are used as an initiator. The first packet that is to be encrypted will trigger a DNS lookup; after the DNS lookup is complete, subsequent packets will trigger IKE.

# Information About Real-Time Resolution for IPsec Tunnel Peer

To configure real-time resolution for your IPsec peer, you should understand the following concept:

- [Benefits of Real-Time Resolution Via Secure DNS, page 2](#)

## Benefits of Real-Time Resolution Via Secure DNS

When specifying the host name of a remote IPsec peer via the **set peer** command, you can also issue the **dynamic** keyword, which defers DNS resolution of the host name until right before the IPsec tunnel has been established. Deferring resolution enables the Cisco IOS software to detect whether the IP address of the remote IPsec peer has changed. Thus, the software can contact the peer at the new IP address.

If the **dynamic** keyword is not issued, the host name is resolved immediately after it is specified. So, the Cisco IOS software cannot detect an IP address change and, therefore, attempts to connect to the IP address that it previously resolved.

DNS resolution assures users that their established IPsec tunnel is secure and authenticated.

# How to Configure Real-Time Resolution

This section contains the following procedure:

- [Configuring Real-Time Resolution for IPsec Peers, page 2](#)

## Configuring Real-Time Resolution for IPsec Peers

Use this task to configure a router to perform real-time DNS resolution with a remote IPsec peer; that is, the host name of peer is resolved via a DNS lookup right before the router establishes a connection (an IPsec tunnel) with the peer.

## Prerequisites

Before creating a crypto map, you should perform the following tasks:

- Define Internet Security Association Key Management Protocol (ISAKMP) policies.
- Define IPSec transform sets.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name seq-num ipsec-isakmp*
4. **match address** *access-list-id*
5. **set peer** {*host-name* [**dynamic**] | *ip-address*}
6. **set transform-set** *transform-set-name1* [*transform-set-name2...transform-set-name6*]

## DETAILED STEPS

|        | Command or Action                                                                                                                       | Purpose                                                                                                                                                                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                  | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                          | Enters global configuration mode.                                                                                                                                                                        |
| Step 3 | <b>crypto map</b> <i>map-name seq-num ipsec-isakmp</i><br><br><b>Example:</b><br>Router(config)# crypto map secure_b 10<br>ipsec-isakmp | Specifies the crypto map entry to create (or modify) and enters crypto map configuration mode.                                                                                                           |
| Step 4 | <b>match address</b> <i>access-list-id</i><br><br><b>Example:</b><br>Router(config-crypto-m)# match address 140                         | Names an extended access list.<br><br>This access list determines which traffic should be protected by IPSec and which traffic should not be protected by IPSec in the context of this crypto map entry. |

|        | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>set peer</b> {host-name [ <b>dynamic</b> ]   ip-address}<br><br><b>Example:</b><br>Router(config-crypto-m)# set peer b.cisco.com dynamic                         | Specifies a remote IPSec peer.<br><br>This is the peer to which IPSec-protected traffic can be forwarded. <ul style="list-style-type: none"> <li><b>dynamic</b>—Allows the host name to be resolved via a DNS lookup just before the router establishes the IPSec tunnel with the remote peer. If this keyword is not specified, the host name will be resolved immediately after the host name is specified.</li> </ul> Repeat for multiple remote peers. |
| Step 6 | <b>set transform-set</b> transform-set-name1 [transform-set-name2...transform-set-name6]<br><br><b>Example:</b><br>Router(config-crypto-m)# set transform-set myset | Specifies which transform sets are allowed for this crypto map entry. List multiple transform sets in order of priority (highest priority first).                                                                                                                                                                                                                                                                                                          |

## Troubleshooting Tips

To display crypto map configuration information, use the **show crypto map** command.

## What to Do Next

You need to apply a crypto map set to each interface through which IPSec traffic will flow. Applying the crypto map set to an interface instructs the router to evaluate all the interface's traffic against the crypto map set and to use the specified policy during connection or security association (SA) negotiation on behalf of traffic to be protected by crypto.

# Configuration Examples for Real-Time Resolution

This section provides the following configuration example:

- [Configuring Real-Time Resolution for an IPSec Peer: Example, page 4](#)

## Configuring Real-Time Resolution for an IPSec Peer: Example

[Figure 1](#) and the following example illustrate how to create a crypto map that configures the host name of a remote IPSec peer to DNS resolved via a DNS lookup right before the Cisco IOS software attempts to establish a connection with that peer.

**Figure 1      Real-Time Resolution Sample Topology**

```
! Configure the initiating router.
hostname a.cisco.com
ip domain name cisco.com
ip name server 10.0.0.1
!
crypto map secure_b 10 ipsec-isakmp
 match address 140
 set peer b.cisco.com dynamic
 set transform-set xset
interface serial1
 ip address 30.0.0.1
 crypto map secure_b
access-list 140 permit ...
!
! Configure the responding router (the remote IPSec peer).
hostname b.cisco.com
!
crypto map secure_a 10 ipsec-isakmp
 match address 150
 set peer 30.0.0.1
 set transform-set
interface serial0/1
 ip address 40.0.0.1
 crypto map secure_a
access-list 150 ...

! DNS server configuration

b.cisco.com 40.0.0.1 # the address of serial0/1 of b.cisco.com
```

# Reverse Route Injection

---

**First Published: August 16, 2001**

**Last Updated: November 5, 2007**

Reverse route injection (RRI) is the ability for static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities.

Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote Virtual Private Network (VPN) router as the next hop, the traffic is forced through the crypto process to be encrypted.

Enhancements to the default behavior of RRI, the addition of a route tag value, and enhancements to how RRI is configured were added to the Reverse Route Injection feature in Cisco IOS Release 12.3(14)T.

An enhancement was added in Cisco IOS Release 12.4(15)T that allows a distance metric to be set for routes that are created by a VPN process so that the dynamically learned route on a router can take precedence over a locally configured static route.

## **Finding Feature Information in This Module**

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for Reverse Route Injection”](#) section on page 18.

## **Finding Support Information for Platforms and Cisco IOS Catalyst OS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Additional References, page 16](#)
- [Command Reference, page 17](#)
- [Feature Information for Reverse Route Injection, page 26](#)

## Prerequisites for Reverse Route Injection

- IP routing should be enabled and static routes should be redistributed if dynamic routing protocols are to be used to propagate RRI-generated static routes.

## Restrictions for Reverse Route Injection

- If RRI is applied to a crypto map, that map must be unique to one interface on the router. In other words, the same crypto map cannot be applied to multiple interfaces. If more than one crypto map is applied to multiple interfaces, routes may not be cleaned up correctly. If multiple interfaces require a crypto map, each must use a uniquely defined map. This restriction applies only to RRI before Cisco IOS Release 12.3(14)T.
- For static crypto maps, routes are always present if RRI is configured on an applied crypto map. In Cisco IOS Release 12.3(14)T, the default behavior—of routes always being present for a static map—will not apply unless the **static keyword** is added to the **reverse-route** command.

## Information About Reverse Route Injection

To configure the Reverse Route Injection enhancements, you should understand the following concepts:

- [Reverse Route Injection, page 2](#)
- [Enhancements to Reverse Route Injection in Cisco IOS Release 12.4\(15\)T, page 3](#)

## Reverse Route Injection

RRI is the ability for static routes to be automatically inserted into the routing process for those networks and hosts that are protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities.

Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote VPN router as the next hop, the traffic is forced through the crypto process to be encrypted.

After the static route is created on the VPN router, this information is propagated to upstream devices, allowing them to determine the appropriate VPN router to which to send returning traffic in order to maintain IPsec state flows. Being able to determine the appropriate VPN router is particularly useful if multiple VPN routers are used at a site to provide load balancing or failover or if the remote VPN devices are not accessible via a default route. Routes are created in either the global routing table or the appropriate virtual route forwarding (VRF) table.

RRI is applied on a per-crypto map basis, whether this is via a static crypto map or a dynamic crypto map template. The default behavior for the two map types is as follows:

- In the case of a dynamic crypto map, routes are created upon the successful establishment of IPsec security associations (SAs) for those remote proxies. The next hop back to those remote proxies is via the remote VPN router whose address is learned and applied during the creation of the dynamic crypto map template. The routes are deleted after the SAs are deleted. In Cisco IOS Release 12.3(14)T, the creation of routes on the basis of IPsec source proxies on static crypto maps was added. This behavior became the default behavior on static maps and overrode the creation of routes on the basis of crypto ACLs (see the next bullet).
- For static crypto maps, routes are created on the basis of the destination information defined in the crypto access list. The next hop is taken from the first set peer statement that is attached to the crypto map. If at any time, RRI, the peer, or the access list is removed from the crypto map, routes will be deleted. This behavior changes with the addition of the RRI enhancements, as explained in the sections below.

## Enhancements to Reverse Route Injection in Cisco IOS Release 12.4(15)T

The following enhancements have been added to the Reverse Route Injection feature in Cisco IOS Release 12.4(15)T:

- [RRI Distance Metric, page 3](#)
- [Gateway Option, page 3](#)
- [Support for RRI on IPsec Profiles, page 4](#)
- [Tag Option Configuration Changes, page 4](#)
- [show crypto route Command, page 4](#)

### RRI Distance Metric

In general, a static route is created having an administrative distance of 1, which means that static routes always have precedence in the routing table. In some scenarios, however, it is required that dynamically learned routes take precedence over static routes, with the static route being used in the absence of a dynamically learned route. The addition of the **set reverse-route distance** command under either a crypto map or IPsec profile allows you to specify a different distance metric for VPN-created routes so that those routes will be in effect only if a dynamic or more favored route becomes unavailable.

### Gateway Option

This RRI gateway option is relevant to the crypto map only.

This option allows you to configure unique next hops or gateways for remote tunnel endpoints. The option is identical to the way the **reverse-route remote-peer** {*ip-address*} command worked prior to Cisco IOS Release 12.3(14)T in that two routes are created for each VPN tunnel. The first route is to the destination-protected subnet via the remote tunnel endpoint. The second route specifies the next hop to be taken to reach this tunnel endpoint. This RRI gateway option allows specific default paths to be specified for specific groups of VPN connections on platforms that support recursive route lookups.

#### Note

In 12.4(15)T and later releases, the **gateway** keyword option replaces the **reverse-route remote-peer** command (with no *ip-address*). Due to changes to Cisco Express Forwarding (CEF), an interface as a next-hop cannot be used without also adding a next-hop IP address.

## Support for RRI on IPsec Profiles

Previously RRI was available for crypto map configurations only. Cisco IOS Release 12.4(15)T introduces support for relevant RRI options on IPsec profiles that are predominantly used for virtual tunnel interfaces. On tunnel interfaces, only the distance metric and tag options are useful with the generic RRI capability.

**Note**

It is not necessary to specifically enable RRI on dynamic virtual interfaces for Easy VPN clients. Route support is enabled by default. It is necessary to specify tag or distance metric values if these are required.

## Tag Option Configuration Changes

The tag option was introduced in 12.3(14)T for crypto maps. This option is now supported with IPsec profiles under the **set reverse-route tag** command syntax. The **set reverse-route tag** command is also available under the crypto map for uniformity although the legacy **reverse-route tag** command is no longer supported.

## show crypto route Command

The **show crypto route** command displays routes that are created through IPsec via RRI or Easy VPN virtual tunnel interfaces (VTIs). The routes are displayed in one table. To see sample output for the **show crypto route** command, see the section “[show crypto route Command Output: Example](#).”

# How to Configure Reverse Route Injection

The following sections show how to configure reverse route injection for Cisco IOS software before Release 12.4(15)T and for Release 12.4(15)T.

- [Configuring RRI on Crypto Maps for Cisco IOS Releases Prior to 12.4\(15\)T, page 4](#)
- [Configuring RRI with Enhancements Added in Cisco IOS Release 12.4\(15\)T, page 6](#)

## Configuring RRI on Crypto Maps for Cisco IOS Releases Prior to 12.4(15)T

This section includes the following tasks:

- [Configuring RRI Under a Static Crypto Map, page 4](#)
- [Configuring RRI Under a Dynamic Map Template, page 5](#)

## Configuring RRI Under a Static Crypto Map

To configure RRI under a static crypto map for Cisco IOS software prior to Release 12.4(15)T, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **crypto map** {*map-name*} {*seq-name*} **ipsec-isakmp**
4. **reverse-route** [**static** | **tag** *tag-id* [**static**] | **remote-peer** [**static**] | **remote-peer** *ip-address* [**static**]]

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                              | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                 | Enters global configuration mode.                                                                                |
| Step 3 | <b>crypto map</b> { <i>map-name</i> } { <i>seq-name</i> } <b>ipsec-isakmp</b><br><br><b>Example:</b><br>Router (config)# crypto map mymap 1<br>ipsec-isakmp                                                                                                                    | Creates or modifies a crypto map entry and enters crypto map configuration mode.                                 |
| Step 4 | <b>reverse-route</b> [ <b>static</b>   <b>tag</b> <i>tag-id</i> [ <b>static</b> ]   <b>remote-peer</b> [ <b>static</b> ]   <b>remote-peer</b> <i>ip-address</i> [ <b>static</b> ]]<br><br><b>Example:</b><br>Router (config-crypto-map)# reverse-route<br>remote peer 10.1.1.1 | Creates source proxy information for a crypto map entry.                                                         |

## Configuring RRI Under a Dynamic Map Template

To configure RRI under a dynamic map template for Cisco IOS software prior to Release 12.4(15)T, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto dynamic-map** *dynamic-map-name* *dynamic-seq-name*
4. **reverse-route** [**static** | **tag** *tag-id* [**static**] | **remote-peer** [**static**] | **remote-peer** *ip-address* [**static**]]

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                        | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                           | Enters global configuration mode.                                                                                |
| Step 3 | <b>crypto dynamic-map</b> <i>dynamic-map-name</i> <i>dynamic-seq-name</i><br><br><b>Example:</b><br>Router (config)# crypto dynamic-map mymap 1                                                                                                                          | Creates a dynamic crypto map entry and enters the crypto map configuration command mode.                         |
| Step 4 | <b>reverse-route</b> [ <b>static</b>   <b>tag</b> <i>tag-id</i> [ <b>static</b>   <b>remote-peer</b> [ <b>static</b>   <b>remote-peer</b> <i>ip-address</i> [ <b>static</b> ]]]<br><br><b>Example:</b><br>Router (config-crypto-map)# reverse-route remote peer 10.1.1.1 | Creates source proxy information for a crypto map entry.                                                         |

## Configuring RRI with Enhancements Added in Cisco IOS Release 12.4(15)T

The following sections show how to configure RRI with the enhancements that were added in Cisco IOS Release 12.4(15)T:

- [Configuring RRI with Enhancements Under a Static Crypto Map, page 6](#)
- [Configuring RRI with Enhancements Under a Dynamic Map Template, page 7](#)
- [Configuring a RRI Distance Metric Under an IPsec Profile, page 8](#)
- [Verifying Routes That Are Created Through IPsec via RRI or Easy VPN VTIs, page 9](#)

## Configuring RRI with Enhancements Under a Static Crypto Map

To configure RRI with enhancements under a static crypto map (for Cisco IOS Release 12.4(15)T and later releases), perform the following steps.

## SUMMARY STEPS

- enable**
- configure terminal**
- crypto map** *map-name* *seq-name* **ipsec-isakmp**
- reverse-route** [**static** | **remote-peer** *ip-address* [**gateway** ] [**static**]]
- set reverse-route** [**distance** *number* | **tag** *tag-id*]

## DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                | Enters global configuration mode.                                                                                                                                                       |
| Step 3 | <b>crypto map map-name seq-name ipsec-isakmp</b><br><br><b>Example:</b><br>Router (config)# crypto map mymap 1 ipsec-isakmp                   | Creates or modifies a crypto map entry and enters crypto map configuration mode.                                                                                                        |
| Step 4 | <b>reverse-route [static   remote-peer ip-address [gateway] [static]]</b><br><br><b>Example:</b><br>Router (config-crypto-map)# reverse-route | Creates source proxy information for a crypto map entry.<br><br><b>Note</b> The <b>gateway</b> keyword can be added to enable the dual route functionality for default gateway support. |
| Step 5 | <b>set reverse-route [distance number   tag tag-id]</b><br><br><b>Example:</b><br>Router (config-crypto-map)# set reverse-route distance 20   | Specifies a distance metric to be used or a tag value to be associated with these routes.                                                                                               |

## Configuring RRI with Enhancements Under a Dynamic Map Template

To configure RRI with enhancements under a dynamic map template (for Cisco IOS Release 12.4(15)T and later releases), perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto dynamic-map dynamic-map-name dynamic-seq-name**
4. **reverse-route [static | remote-peer ip-address [gateway] [static]]**
5. **set reverse-route [distance number | tag tag-id]**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                        | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                           | Enters global configuration mode.                                                                                |
| Step 3 | <b>crypto dynamic-map</b> <i>dynamic-map-name</i><br><i>dynamic-seq-name</i><br><br><b>Example:</b><br>Router (config)# crypto dynamic-map mymap 1                                                                       | Creates a dynamic crypto map entry and enters the crypto map configuration command mode.                         |
| Step 4 | <b>reverse-route</b> [ <b>static</b>   <b>remote-peer</b> <i>ip-address</i><br>[ <i>gateway</i> ] [ <b>static</b> ]]<br><br><b>Example:</b><br>Router (config-crypto-map)# reverse-route<br>remote peer 10.1.1.1 gateway | Creates source proxy information for a crypto map entry.                                                         |
| Step 5 | <b>set reverse-route</b> [ <b>distance</b> <i>number</i>   <b>tag</b><br><i>tag-id</i> ]<br><br><b>Example:</b><br>Router (config-crypto-map)# set reverse-route<br>distance 20                                          | Specifies a distance metric to be used or a tag value to be associated with these routes.                        |

## Configuring a RRI Distance Metric Under an IPsec Profile

To configure a RRI distance metric under an IPsec profile for Cisco IOS Release 12.4(15)T and later releases, perform the following steps:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec profile** *name*
4. **set reverse-route** [**distance** *number* | **tag** *tag-id*]

## DETAILED STEPS

|        | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                   |
| Step 3 | <b>crypto ipsec profile name</b><br><br><b>Example:</b><br>Router (config)# crypto ipsec profile myprofile                                      | Creates or modifies an IPsec profile and enters IPsec profile configuration mode.                                                                                                                                                                                                                                                                   |
| Step 4 | <b>set reverse-route [distance number   tag tag-id]</b><br><br><b>Example:</b><br>Router (config-crypto-profile)# set reverse-route distance 20 | Defines a distance metric for each static route or tags a reverse route injection- (RRI-) created route. <ul style="list-style-type: none"> <li><b>distance</b>—Defines a distance metric for each static route.</li> <li><b>tag</b>—Sets a tag value that can be used as a “match” value for controlling distribution using route maps.</li> </ul> |

## Verifying Routes That Are Created Through IPsec via RRI or Easy VPN VTIs

To display routes that are created through IPsec via RRI or Easy VPN VTIs, perform the following steps.

## SUMMARY STEPS

1. enable
2. show crypto route

## DETAILED STEPS

|        | Command or Action                                                            | Purpose                                                                                                          |
|--------|------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>show crypto route</b><br><br><b>Example:</b><br>Router# show crypto route | Displays routes that are created through IPsec via RRI or Easy VPN VTIs.                                         |

## Troubleshooting Tips

To observe the behavior of RRI and its relationship to the creation and deletion of an IPsec SA, you can use the **debug crypto ipsec** command (see the [Cisco IOS Debug Command Reference](#), Release 12.4T).

# Configuration Examples for Reverse Route Injection

This section contains the following sections:

- [Configuring RRI Prior to Cisco IOS Release 12.3\(14\)T: Examples, page 10](#)
- [Configuring RRI with Enhancements Added in Cisco IOS Release 12.3\(14\)T: Examples, page 11](#)
- [Configuring RRI with Enhancements Added in Cisco IOS Release 12.4\(15\)T: Examples, page 12](#)

## Configuring RRI Prior to Cisco IOS Release 12.3(14)T: Examples

The following are examples of RRI configurations and output before Cisco IOS Release 12.3(14)T:

- [Configuring RRI When Crypto ACLs Exist: Example, page 10](#)
- [Configuring RRI When Two Routes Are Created, One for the Remote Endpoint and One for Route Recursion: Example, page 11](#)

### Configuring RRI When Crypto ACLs Exist: Example

The following example shows that all remote VPN gateways connect to the router via 192.168.0.3. RRI is added on the static crypto map, which creates routes on the basis of the source network and source netmask that are defined in the crypto access control list (ACL):

```
crypto map mymap 1 ipsec-isakmp
 set peer 10.1.1.1
 reverse-route
 set transform-set esp-3des-sha
 match address 102

Interface FastEthernet 0/0
 ip address 192.168.0.2 255.255.255.0
 standby name group1
 standby ip 192.168.0.3
 crypto map mymap redundancy group1

access-list 102 permit ip 192.168.1.0 0.0.0.255 10.0.0.0 0.0.255.255
```

In Cisco IOS Release 12.3(14)T and later releases, for the static map to retain this same behavior of creating routes on the basis of crypto ACL content, the **static** keyword is required, that is, **reverse-route static**.

#### Note

The **reverse-route** command in this situation creates routes that are analogous to the following static route command-line interface (CLI) commands (**ip route**):

#### Remote Tunnel Endpoint

```
ip route 10.1.1.1 255.255.255.255 192.168.1.1
```

**VPNSM**

```
ip route 10.1.1.1 255.255.255.255 vlan0.1
```

---

## Configuring RRI When Two Routes Are Created, One for the Remote Endpoint and One for Route Recursion: Example

In the following example, two routes are created, one for the remote endpoint and one for route recursion to the remote endpoint via the interface on which the crypto map is configured:

```
reverse-route remote-peer
```

## Configuring RRI with Enhancements Added in Cisco IOS Release 12.3(14)T: Examples

The following are examples of configurations and output for RRI enhancements that were added in Cisco IOS Release 12.3(14)T.

- [Configuring RRI When Crypto ACLs Exist: Example, page 11](#)
- [Configuring RRI with Route Tags: Example, page 11](#)
- [Configuring RRI for One Route to the Remote Proxy via a User-Defined Next Hop: Example, page 12](#)

### Configuring RRI When Crypto ACLs Exist: Example

The following example shows that RRI has been configured for a situation in which there are existing ACLs:

```
crypto map mymap 1 ipsec-isakmp
 set peer 172.17.11.1
 reverse-route static
 set transform-set esp-3des-sha
 match address 101

access-list 101 permit ip 192.168.1.0 0.0.0.255 172.17.11.0 0.0.0.255
```

### Configuring RRI with Route Tags: Example

The following example shows how RRI-created routes can be tagged with a tag number and then used by a routing process to redistribute those tagged routes via a route map:

```
crypto dynamic-map ospf-clients 1
 reverse-route tag 5

router ospf 109
 redistribute rip route-map rip-to-ospf

route-map rip-to-ospf permit
 match tag 5
 set metric 5
 set metric-type type1

Router# show ip ospf topology
```

```
P 10.81.7.48/29, 1 successors, FD is 2588160, tag is 5
 via 192.168.82.25 (2588160/2585600), FastEthernet0/1
```

## Configuring RRI for One Route to the Remote Proxy via a User-Defined Next Hop: Example

**Note** This option is applicable only to crypto maps.

The preceding example shows that one route has been created to the remote proxy via a user-defined next hop. This next hop should not require a recursive route lookup unless it will recurse to a default route.

```
reverse-route remote-peer 10.4.4.4
```

The preceding example yields the following prior to Cisco IOS Release 12.3(14)T:

```
10.0.0.0/24 via 10.1.1.1 (in the VRF table if VRFs are configured)
10.1.1.1/32 via 10.4.4.4 (in the global route table)
```

And this result occurs with RRI enhancements:

```
10.0.0.0/24 via 10.4.4.4 (in the VRF table if VRFs are configured, otherwise in the global
table)
```

## Configuring RRI with Enhancements Added in Cisco IOS Release 12.4(15)T: Examples

The following are examples of configurations and output for RRI enhancements that were added in Cisco IOS Release 12.4(15)T.

- [Configuring a RRI Distance Metric Under a Crypto Map: Example, page 12](#)
- [Configuring RRI with Route Tags: Example, page 11](#)
- [debug and show Command Output for a RRI Distance Metric Configuration Under a Crypto Map: Example, page 13](#)
- [Configuring a RRI Distance Metric for a VTI: Example, page 14](#)
- [debug and show Command Output for a RRI Metric Configuration Having a VTI: Example, page 14](#)
- [show crypto route Command Output: Example, page 15](#)

## Configuring a RRI Distance Metric Under a Crypto Map: Example

The following configuration shows a server and client configuration for which a RRI distance metric has been set under a crypto map:

### Server

```
crypto dynamic-map mymap
 set security-association lifetime seconds 300
 set transform-set 3dessa
 set isakmp-profile profile1
 set reverse-route distance 20
 reverse-route
```

### Client

```
crypto ipsec client ezvpn ez
 connect auto
 group cisco key cisco
```

```

mode client
peer 10.0.0.119
username XXX password XXX
xauth userid mode local

```

## Configuring RRI with Route Tags: Example

The following example shows how RRI-created routes can be tagged with a tag number and then used by a routing process to redistribute those tagged routes via a route map:

```

crypto dynamic-map ospf-clients 1
 set reverse-route tag 5

router ospf 109
 redistribute rip route-map rip-to-ospf

route-map rip-to-ospf permit
 match tag 5
 set metric 5
 set metric-type type1

Router# show ip ospf topology

P 10.81.7.48/29, 1 successors, FD is 2588160, tag is 5
 via 192.168.82.25 (2588160/2585600), FastEthernet0/1

```

## debug and show Command Output for a RRI Distance Metric Configuration Under a Crypto Map: Example

The following are **debug** and **show** command output for a RRI distance metric configuration under a crypto map on a server:

```

Router# debug crypto ipsec

00:23:37: IPSEC(validate_proposal_request): proposal part #1,
 (key eng. msg.) INBOUND local= 10.0.0.119, remote= 10.0.0.14,

C 10.30.30.30 is directly connected, Loopback4
C 192.168.5.0/24 is directly connected, Loopback3
 10.20.20.20/24 is subnetted, 2 subnets
S 10.3.1.0 [1/0] via 10.0.0.113
C 10.20.20.20 is directly connected, FastEthernet0/0
 192.168.6.0/32 is subnetted, 1 subnets
S 192.168.6.1 [20/0] via 10.0.0.14
C 192.168.3.0/24 is directly connected, Loopback2
 10.15.0.0/24 is subnetted, 1 subnets
C 10.15.0.0 is directly connected, Loopback6
S* 0.0.0.0/0 [1/0] via 10.0.0.14

```

## Configuring a RRI Distance Metric for a VTI: Example

The following configuration shows a server and client configuration in which a RRI distance metric has been set for a VTI:

### Server Configuration

```

crypto isakmp profile profile1
 keyring mykeyring
 match identity group cisco
 client authentication list authenlist
 isakmp authorization list autholist
 client configuration address respond
 virtual-template 1
crypto ipsec profile vi
 set transform-set 3dessa
 set reverse-route distance 20
 set isakmp-profile profile1
!
interface Virtual-Template1 type tunnel
 ip unnumbered
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile vi

```

### Client Configuration

```

crypto ipsec client ezvpn ez
 connect auto
 group cisco key cisco
 mode client
 peer 10.0.0.119
 username XXX password XXX
 virtual-interface 1

```

## debug and show Command Output for a RRI Metric Configuration Having a VTI: Example

The following are **debug** and **show** command output for a RRI metric configuration for a VTI on a server:

```

Router# debug crypto ipsec

00:47:56: IPSEC(key_engine): got a queue event with 1 KMI message(s)
00:47:56: Crypto mapdb : proxy_match
 src addr : 0.0.0.0
 dst addr : 192.168.6.1
 protocol : 0
 src port : 0

```

```

dst port : 0

```

Router# **show ip route**

```

Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, * - candidate default, U - per-user static route
o - ODR, P - periodic downloaded static route

```

Gateway of last resort is 10.0.0.14 to network 0.0.0.0

```

C 192.200.200.0/24 is directly connected, Loopback0
 10.20.20.20/24 is subnetted, 1 subnets
C 10.30.30.30 is directly connected, Loopback4
C 192.168.5.0/24 is directly connected, Loopback3
 10.20.20.20/24 is subnetted, 2 subnets
S 10.3.1.0 [1/0] via 10.0.0.113
C 10.20.20.20 is directly connected, FastEthernet0/0
 192.168.6.0/32 is subnetted, 1 subnets
S 192.168.6.1 [20/0] via 0.0.0.0, Virtual-Access2
C 192.168.3.0/24 is directly connected, Loopback2
 10.15.0.0/24 is subnetted, 1 subnets
C 10.15.0.0 is directly connected, Loopback6
S* 0.0.0.0/0 [1/0] via 10.0.0.14

```

## show crypto route Command Output: Example

The following output example displays routes, in one table, that are created through IPsec via RRI or Easy VPN VTIs:

Router# **show crypto route**

```

VPN Routing Table: Shows RRI and VTI created routes
Codes: RRI - Reverse-Route, VTI- Virtual Tunnel Interface
S - Static Map ACLs

```

```

Routes created in table GLOBAL DEFAULT
192.168.6.2/255.255.255.255 [0/0] via 10.0.0.133
 on Virtual-Access3 RRI
10.1.1.0/255.255.255.0 [10/0] via Virtual-Access2 VTI
192.168.6.1/255.255.255.255 [0/0] via Virtual-Access2 VTI

```

## Command Reference

The following commands are introduced or modified in the feature or features

- **reverse-route**
- **set reverse-route**
- **show crypto route**

For information about these commands, see the Cisco IOS Security Command Reference at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html).

For information about all Cisco IOS commands, see the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the Master Command List.

# Feature Information for Reverse Route Injection

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for Reverse Route Injection

| Feature Name                      | Releases                          | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reverse Route Injection           | 12.1(9)E<br>12.2(8)T<br>12.2(8)YE | <p>Reverse route injection (RRI) is the ability for static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities.</p> <p>Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote Virtual Private Network (VPN) router as the next hop, the traffic is forced through the crypto process to be encrypted.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>“Reverse Route Injection” section on page 2</li> </ul> <p>The following commands were introduced or modified by this feature: <b>reverse-route</b>.</p> |
| Reverse Route Remote Peer Options | 12.2(13)T<br>12.2(14)S            | <p>An enhancement was added to RRI to allow you to specify an interface or address as the explicit next hop to the remote VPN device. This functionality allows the overriding of a default route to properly direct outgoing encrypted packets.</p> <p>The following sections provide information about the remote peer options:</p> <ul style="list-style-type: none"> <li>“Enhancements to Reverse Route Injection in Cisco IOS Release 12.4(15)T” section on page 3.</li> </ul>                                                                                                                                                                                                                                                                                                                                                           |

**Table 1**      **Feature Information for Reverse Route Injection (continued)**

| Feature Name                         | Releases                                | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reverse Route Injection Enhancements | 12.3(14)T<br>12.2(33)SRA<br>12.2(33)SXH | <p>The following enhancements were added to the Reverse Route Injection feature:</p> <ul style="list-style-type: none"> <li>• The default behavior of static crypto maps will be the same as that of dynamic crypto maps unless the <b>reverse-route</b> command and <b>static</b> keyword are used.</li> <li>• A route tag value was added for any routes that are created using RRI.</li> <li>• RRI can be configured on the same crypto map that is applied to multiple router interfaces.</li> <li>• RRI configured with the <b>reverse-route remote-peer {ip-address}</b> command, keyword, and argument will create one route instead of two.</li> </ul> <p>The following sections provide information about the Reverse Route Injection enhancements:</p> <ul style="list-style-type: none"> <li>• <a href="#">“Reverse Route Injection” section on page 2</a></li> <li>• <a href="#">“Configuring RRI on Crypto Maps for Cisco IOS Releases Prior to 12.4(15)T” section on page 4</a></li> <li>• <a href="#">“Configuring RRI with Enhancements Added in Cisco IOS Release 12.4(15)T” section on page 6</a></li> <li>• <a href="#">“Configuring RRI When Crypto ACLs Exist: Example” section on page 10</a></li> <li>• <a href="#">“Configuring RRI with Route Tags: Example” section on page 11</a></li> <li>• <a href="#">“Configuring RRI for One Route to the Remote Proxy via a User-Defined Next Hop: Example” section on page 12</a></li> </ul> <p>The following command was modified by these feature enhancements: <b>reverse-route</b>.</p> |
| Gateway Option                       | 12.4(15)T                               | <p>This option allows you to configure unique next hops or gateways for remote tunnel endpoints.</p> <p>The following section provides information about the Gateway Option:</p> <ul style="list-style-type: none"> <li>• <a href="#">“Gateway Option” section on page 3</a></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 1**      **Feature Information for Reverse Route Injection (continued)**

| Feature Name                      | Releases                 | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RRI Distance Metric               | 12.4(15)T                | <p>This enhancement allows you to define a metric distance for each static route.</p> <p>The following sections provide information about the RRI distance metric enhancement.</p> <ul style="list-style-type: none"> <li>• “RRI Distance Metric” section on page 3</li> <li>• “Configuring a RRI Distance Metric Under an IPsec Profile” section on page 8</li> <li>• “Configuring a RRI Distance Metric Under a Crypto Map: Example” section on page 12</li> <li>• “debug and show Command Output for a RRI Metric Configuration Having a VTI: Example” section on page 14</li> </ul> <p>The following commands were introduced or modified by this feature: <b>reverse-route</b>, <b>set reverse-route</b>.</p> |
| <b>show crypto route</b> Command  | 12.4(15)T                | This command displays routes that are created through IPsec via RRI or Easy VPN VTIs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# SafeNet IPSec VPN Client Support

---

The SafeNet IPSec VPN Client Support feature allows you to limit the scope of an Internet Security Association and Key Management Protocol (ISAKMP) profile or ISAKMP keyring configuration to a local termination address or interface. The benefit of this feature is that different customers can use the same peer identities and ISAKMP keys by using different local termination addresses.

## History for the SafeNet IPSec VPN Client Support Feature

| Release     | Modification                                                    |
|-------------|-----------------------------------------------------------------|
| 12.3(14)T   | This feature was introduced.                                    |
| 12.2(18)SXE | This feature was integrated into Cisco IOS Release 12.2(18)SXE. |

# Information About SafeNet IPSec VPN Client Support

Before configuring SafeNet IPSec VPN Client Support, you should understand the following concepts:

- [ISAKMP Profile and ISAKMP Keyring Configurations: Background, page 2](#)
- [Local Termination Address or Interface, page 2](#)

## ISAKMP Profile and ISAKMP Keyring Configurations: Background

Prior to Cisco IOS Release 12.3(14)T, ISAKMP-profile and ISAKMP-keyring configurations could be only global, meaning that the scope of these configurations could not be limited by any locally defined parameters (VRF instances were an exception). For example, if an ISAKMP keyring contained a preshared key for address 10.11.12.13, the same key would be used if the peer had the address 10.11.12.13, irrespective of the interface or local address to which the peer was connected. There are situations, however, in which users prefer that associate keyrings be bound not only with virtual route forwarding (VRF) instances but also to a particular interface. For example, if instead of VRF instances, there are virtual LANS, and the Internet Key Exchange (IKE) is negotiated with a group of peers using one fixed virtual LAN (VLAN) interface. Such a group of peers uses a single preshared key, so if keyrings could be bound to an interface, it would be easy to define a wildcard key without risking that the keys would also be used for other customers.

Sometimes the identities of the peer are not in the control of the administrator, and even if the same peer negotiates for different customers, the local termination address is the only way to distinguish the peer. After such a distinction is made, if the traffic is sent to different VRF instances, configuring an ISAKMP profile is the only way to distinguish the peer. Unfortunately, when the peer uses an identical identity for all such situations, the ISAKMP profile cannot distinguish among the negotiations. For such scenarios, it would be beneficial to bind ISAKMP profiles to a local termination address. If a local termination address could be assigned, identical identities from the peer would not be a problem.

## Local Termination Address or Interface

## Benefit of SafeNet IPSec VPN Client Support

## How to Configure SafeNet IPSec VPN Client Support

- 
- 
- 
- [Examples, page 6](#) (optional)

To configure an ISAKMP profile and limit it to a local termination address or interface, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp profile** *profile-name*
4. *keyring-name*
5. **match identity address** *address*
6. **local-address** { *interface-name* | *ip-address* [*vrf-tag*] }

### DETAILED STEPS

|        | Command or Action                 | Purpose |
|--------|-----------------------------------|---------|
| Step 1 | <b>enable</b>                     |         |
|        | <b>Example:</b><br>Router> enable |         |
|        | <b>configure terminal</b>         |         |
|        | Router# configure terminal        |         |

|                                                                                         |                                                                         |
|-----------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>crypto isakmp profile</b> <i>profile-name</i>                                        | Defines an ISAKMP profile and enters ISAKMP profile configuration mode. |
| Router (config)# crypto isakmp profile profile1<br><i>keyring-name</i>                  |                                                                         |
| Router (conf-isa-profile)# keyring keyring1                                             |                                                                         |
| <b>match identity address</b> <i>address</i>                                            |                                                                         |
| Router (conf-isa-profile)# match identity<br>address 10.0.0.0 255.0.0.0                 |                                                                         |
| <b>local-address</b> { <i>interface-name</i>   <i>ip-address</i><br>[ <i>vrf-tag</i> ]} |                                                                         |
| Router (conf-isa-profile)# local-address<br>serial2/0                                   |                                                                         |

|  |  |
|--|--|
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

**show**

- enable**
- debug crypto isakmp**
- show crypto isakmp profile**

## DETAILED STEPS

|                                    |  |
|------------------------------------|--|
|                                    |  |
| Router> enable                     |  |
| Router# debug crypto isakmp        |  |
| <b>show crypto isakmp profile</b>  |  |
| Router# show crypto isakmp profile |  |

## Examples

### debug crypto isakmp Command Output for an ISAKMP Keyring That Is Bound to Local Termination Addresses: Example

```
! Scope of the keyring is limited to interface serial2/0.
local-address serial2/0
! The following is the key string used by the peer.
pre-shared-key address 10.0.0.3 key somerandomkeystring
crypto keyring keyring2
local-address serial2/1
! The following is the keystring used by the peer coming into serial2/1.
pre-shared-key address 10.0.0.3 key someotherkeystring
```

Router#

```
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0):Keyring keyring2 is bound to
10.0.0.0, skipping
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0):Looking for a matching key for
10.0.0.3 in keyring1
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0): : success
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0):found peer pre-shared key
matching 10.0.0.3
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0): local preshared key found
```

```
crypto isakmp profile profile1
```

```
self-identity fqdn
match identity address 10.0.0.1 255.255.255.255
local-address serial2/1
```

```
Router# debug crypto isakmp
```

```
*Feb 11 15:01:29.935: ISAKMP:(0:1:SW:1):: peer matches profile1 profile
```

### show crypto isakmp profile Command Output: Example

```
ISAKMP PROFILE profile1
Identities matched are:
 ip-address 10.0.0.0 255.0.0.0
Certificate maps matched are:
keyring(s): keyring1
trustpoint(s): <all>
Interface binding: serial2/0 (10.20.0.1:global)
```

## Troubleshooting SafeNet IPSec VPN Client Support

# Stateful Failover for IPSec

---

Stateful failover for IP Security (IPSec) enables a router to continue processing and forwarding IPSec packets after a planned or unplanned outage occurs. Customers employ a backup (secondary) router that automatically takes over the tasks of the active (primary) router if the active router loses connectivity for any reason. This process is transparent to the user and does not require adjustment or reconfiguration of any remote peer.

Stateful failover for IPSec is designed to work in conjunction with stateful switchover (SSO) and Hot Standby Routing Protocol (HSRP). HSRP provides network redundancy for IP networks, ensuring that user traffic immediately and transparently recovers from failures in network edge devices or access circuits. That is, HSRP monitors both the inside and outside interfaces so that if either interface goes down, the whole router is deemed to be down and ownership of Internet Key Exchange (IKE) and IPSec security associations (SAs) is passed to the standby router (which transitions to the HSRP active state). SSO allows the active and standby routers to share IKE and IPSec state information so that each router has enough information to become the active router at any time. To configure stateful failover for IPSec, a network administrator should enable HSRP, assign a virtual IP address, and enable the SSO protocol.

## Feature History for Stateful Failover for IPSec

## Prerequisites for Stateful Failover for IPSec

### Complete, Duplicate IPSec and IKE Configuration on the Active and Standby Devices

This document assumes that you have a complete IKE and IPSec configuration. (This document describes only how to add stateful failover to a working IPSec configuration.)

The IKE and IPSec configuration that is set up on the active device must be duplicated on the standby device. That is, the crypto configuration must be identical with respect to Internet Security Association and Key Management Protocol (ISAKMP) policy, ISAKMP keys (preshared), IPSec profiles, IPSec transform sets, all crypto map sets that are used for stateful failover, all access control lists (ACLs) that are used in match address statements on the crypto map sets, all AAA configurations used for crypto, client configuration groups, ip local pools used for crypto, and ISAKMP profiles.

#### Note

None of the configuration information between the active and standby device is automatically transferred; the user is responsible for ensuring that the crypto configurations match on both devices. If the crypto configurations on both devices do not match, failover from the active device to the standby device will not be successful.

### Device Requirements

- Stateful failover for IPSec requires that your network contains two identical routers that are available to be either the primary or secondary device. Both routers should be the same type of device, have the same CPU and memory, and have either no encryption accelerator or identical encryption accelerators.
- This feature is currently supported only on a limited number of platforms. To check the latest platform support, go to Cisco Feature Navigator at <http://www.cisco.com/go/fn>.

## Restrictions for Stateful Failover for IPSec

When configuring redundancy for a virtual private network (VPN), the following restrictions exist:

- Both the active and standby devices must run the identical version of the Cisco IOS software, and both the active and standby devices must be connected via hub or switch.
- Only the VPN Acceleration Module (VAM), VAM2, and AIM-VPN/HPII+ hardware encryption accelerators are supported in a Cisco 3845 router, and the AIM-VPN/EPII+ hardware encryption accelerators are supported in a Cisco 3825 router.
- Only “box-to-box” failover is supported; that is, intrachassis failover is currently not supported.
- WAN interfaces between the active (primary) router and the standby (secondary) router are not supported. (HSRP requires inside interfaces and outside interfaces to be connected via LANs.)
- Load balancing is not supported; that is, no more than one device in a redundancy group can be active at any given time.
- Stateful failover of IPSec with Layer 2 Tunneling Protocol (L2TP) is not supported.

- Public key infrastructure (PKI) is not supported when used with stateful failover. (Only preshared keys for IKE are supported.)
- IKE keepalives are not supported. (Enabling this functionality will cause the connection to be torn down after the standby router assumes ownership control.) However, dead peer detection (DPD) and periodic DPD are supported.
- IPSec idle timers are not supported when used with stateful failover.
- A stateful failover crypto map applied to an interface in a virtual route forwarding (VRF) instance is not supported. However, VRF-aware IPSec features are supported when a stateful failover crypto map is applied to an interface in the global VRF.
- Stateful failover is not compatible or interoperable with the State Synchronization Protocol (SSP) version of stateful failover (which is available in Cisco IOS Release 12.2YX1 and Cisco IOS Release 12.2SU).

## Information About Stateful Failover for IPSec

To configure stateful failover for VPNs, you should understand the following concepts:

- [Supported Deployment Scenarios: Stateful Failover for IPSec, page 3](#)
- [IPSec Stateful Failover for Remote Access Connections, page 5](#)
- [Dead Peer Detection with IPSec High Availability, page 6](#)

## Supported Deployment Scenarios: Stateful Failover for IPSec

It is recommended that you implement IPSec stateful failover in one of the following recommended deployment scenarios—a single interface scenario or a dual interface scenario.

In a single interface scenario, the VPN gateways use one LAN connection for both encrypted traffic arriving from remote peers and decrypted traffic flowing to inside hosts (see [Figure 1](#)). The single interface design allows customers to save money on router ports and subnets. This design is typically used if all traffic flowing in and out of the organization does not traverse the VPN routers.

**Figure 93**      **Single Interface Network Topology**

In a dual interface scenario, a VPN gateway has more than one interface, enabling traffic to flow in and out of the router via separate interfaces (see [Figure 2](#)). This scenario is typically used if traffic flowing in and out of a site must traverse the routers, so the VPN routers will provide the default route out of the network.

**Figure 94 Dual Interface Network Topology**

[Table 1](#) lists the functionality available in both a single interface scenario and a dual interfaces scenario.

**Table 55 IPSec StateFul Failover: Single and Dual Interface Functionality Overview**

| Single Interface                                                                                                                                                                                                                                           | Dual Interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Route Injection</b>                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Routes must be injected to provide the devices that are behind the VPN gateways with a next hop for traffic that requires encryption. Stateful failover for IPSec typically requires routes to be injected for this network topology.                      | <p>If the VPN gateways are not the logical next hop for devices inside the network, the routes must be created and injected into the routing process. Thus, traffic that is returning from inside the network can be sent back to the VPN routers for IPSec services before it is sent out. A virtual IP (VIP) address cannot be used as the advertiser of routing updates, so flows must be synchronized via the injected routes.</p> <p>If the VPN gateways are the next hop (default route) for all devices inside the network, the VIP address that is used on the inside interfaces can be used as the next hop. Thus, injection of the VPN routes is not required. However, static routes on inside hosts must be used to direct the routes to the next hop VIP address.</p> |
| <b>HSRP Configuration</b>                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| The role of HSRP is simplified in a single interface design because if the only interface is disabled, the entire device is deemed unavailable. This functionality helps to avoid some of the routing considerations to be discussed in the next scenario. | <p>Because each interface pair functions independently, you should configure HSRP so that multiple pairs of interfaces can be tracked. (That is, HSRP should not be configured on only one pair of interfaces or on both pairs of interfaces without each pair mutually tracking each other.) Mutual tracking means that if the outside interface does fail, the inside interface on the same router will also be deemed down, allowing for complete router failover to the secondary router.</p>                                                                                                                                                                                                                                                                                  |
| <b>Secure State Information</b>                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 55** *IPSec Stateful Failover: Single and Dual Interface Functionality Overview (continued)*

| Single Interface                                                                                                                | Dual Interface                                                                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| If secured-state information is passed between routers, the information is passed over the same interface as all other traffic. | The router has a separate inside and outside interface; thus, the inside interface can be used as a more secure channel for the exchange of state information. |
| Firewall Configuration                                                                                                          |                                                                                                                                                                |
| The VPN gateways can sit in front of the firewall or behind the firewall.                                                       | VPN gateways may sit behind or in front of a firewall, a firewall can be installed in parallel to the VPN gateways.                                            |

## IPSec Stateful Failover for Remote Access Connections

The main difference between a remote access and a LAN-to-LAN connection is the use of Xauth and mode-config. IKE Xauth is often used to authenticate the user. IKE mode-config is often used to push security policy from the hub (concentrator) router to the user's IPSec implementation. Mode-config is also typically used to assign an internal company network IP address to a user.

In addition to the differences between a remote access configuration and a LAN-to-LAN configuration, you should note the following remote-access-server-specific functions:

- Assigned IP address—The IP address can be assigned to the client via one of the following options:
  - Local IP pools. For local IP pools, the administrator must first configure identical local IP address pools on each router in the high availability (HA) pair (via the **ip local pool client-address-pool** command). This pool name can be applied in one of two places—in a group policy via the **crypto isakmp client configuration group group-name** (and the submode command **pool pool-name**) or in a client configuration via the **crypto isakmp client configuration address-pool local local-pool** command.
  - RADIUS-assigned address. If you are using RADIUS authentication and the RADIUS server returns the Framed-IP-Address attribute, the concentrator will always assign that address to the client. It is recommended that you refer to your RADIUS server vendor's documentation, especially for vendors that allow you to configure address pools on the RADIUS server. Typically those servers require crypto accounting to work properly.

To enable accounting on the HA pair, you should issue the following commands on both Active and Standby devices: **aaa accounting network radius-accounting start-stop group radius** then apply radius-accounting either to the crypto isakmp profile or the crypto map set.

- RADIUS NAS-IP address—The HA pair should appear as a single device to the RADIUS server. Thus, both HA routers must communicate with the RADIUS server using the same IP address. However, when communicating with the RADIUS server, the router must use a physical IP address, not a virtual IP (VIP) address as the NAS-IP address of the router. To configure the RADIUS NAS-IP address for the HA pair, you must configure the same loopback address in the HA pair via **interface loopback ip address** command; thereafter, you must issue the **ip radius source-interface loopback** command in the HA pair. Finally, add the new loopback IP address to the RADIUS servers configuration so the RADIUS server can process requests from the HA pair.

For additional information on how to configure IPSec stateful failover for a remote access connection, see the section [“Configuring IPSec Stateful Failover for an Easy VPN Server: Example”](#) in this document.

## Dead Peer Detection with IPsec High Availability

To configure Dead Peer Detection (DPD) with IPsec High Availability (HA), it is recommended that you use a value other than the default (2 seconds). A keepalive time of 10 seconds with 5 retries seems to work well with HA because of the time it takes for the router to get into active mode.

To configure DPD with IPsec HA, use the **crypto isakmp keepalive** command.

## How to Use Stateful Failover for IPsec

This section contains the following the procedures:

- [Enabling HSRP: IP Redundancy and a Virtual IP Address, page 6](#) (required)
- [Enabling SSO, page 9](#) (required)
- [Configuring Reverse Route Injection on a Crypto Map, page 13](#) (required)
- [Enabling Stateful Failover for IKE and IPsec, page 15](#) (required)
- [Protecting SSO Traffic, page 18](#) (optional)
- [Managing and Verifying High Availability Information, page 20](#) (optional)

## Enabling HSRP: IP Redundancy and a Virtual IP Address

HSRP provides two services—IP redundancy and a VIP address. Each HSRP group may provide either or both of these services. IPsec stateful failover uses the IP redundancy services from only one HSRP standby group. It can use the VIP address from one or more HSRP groups. Use the following task to configure HSRP on the outside and inside interfaces of the router.

**Note**

---

Perform this task on both routers (active and standby) and of both interfaces on each router.

---

## Prerequisites for Spanning Tree Protocol and HSRP Stability

If a switch connects the active and standby routers, you must perform one of the following steps to ensure that the correct settings are configured on that switch:

- Enable the **spanning-tree portfast** command on every switch port that connects to a HSRP-enabled router interface.
- Disable the Spanning Tree Protocol (STP) on the switch only if your switch does not connect to other switches. Disabling spanning tree in a multi-switch environment may cause network instability.
- Enable the **standby delay minimum** *[min-delay]* **reload** *[reload-delay]* command if you do not have access to the switch. The *reload-delay* argument should be set to a value of at least 120 seconds. This command must be applied to all HSRP interfaces on both routers.

For more information on HSRP instability, see the document [Avoiding HSRP Instability in a Switching Environment with Various Router Platforms](#).

**Note**

---

You must perform at least one of these steps for correct HSRP operation.

---

## Restrictions

- Both the inside (private) interface and the outside (public) interface must belong to separate HSRP groups, but the HSRP group number can be the same.
- The state of the inside interface and the outside interface must be the same—both interfaces must be in the active state or standby state; otherwise, the packets will not have a route out of the private network.
- Standby priorities should be equal on both active and standby routers. If the priorities are not equal, the higher priority router will unnecessarily take over as the active router, negatively affecting uptime.
- The IP addresses on the HSRP-tracked interfaces of the standby and active routers should both be either lower or higher on one router than the other. In the case of equal priorities (an HA requirement), HSRP will assign the active state on the basis of the IP address. If an addressing scheme exists so that the public IP address of Router A is lower than the public IP address of Router B, but the opposite is true for their private interfaces, an active/standby-standby/active split condition could exist which will break connectivity.

**Note**

Each time an active device relinquishes control to become the standby device, the active device will reload. This functionality ensures that the state of the new standby device synchronizes correctly with the new active device.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **standby** *standby-group-number* **name** *standby-group-name*
5. **standby** *standby-group-number* **ip** *ip-address*
6. **standby** *standby-group-number* **track** *interface-name*
7. **standby** [*group-number*] **preempt**
8. **standby** [*group-number*] **timers** [*msec*] *hellotime* [*msec*] *holdtime*
9. **standby delay minimum** [*min-delay*] **reload** [*reload-delay*]
10. Repeat.

## DETAILED STEPS

|        | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet 0/0                                                   | Configures an interface type for the router and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                     |
| Step 4 | <b>standby</b> <i>standby-group-number</i> <b>name</b> <i>standby-group-name</i><br><br><b>Example:</b><br>Router(config-if)# standby 1 name HA-out    | Assigns a user-defined group name to the HSRP redundancy group.<br><br><b>Note</b> The <i>standby-group-number</i> argument should be the same for both routers that are on directly connected interfaces. However, the <i>standby-group-name</i> argument should be different between two (or more) groups on the same router.<br><br>The <i>standby-group-number</i> argument can be the same on the other pair of interfaces as well. |
| Step 5 | <b>standby</b> <i>standby-group-number</i> <b>ip</b> <i>ip-address</i><br><br><b>Example:</b><br>Router(config-if)# standby 1 ip 209.165.201.1         | Assigns an IP address that is to be “shared” among the members of the HSRP group and owned by the primary IP address.<br><br><b>Note</b> The virtual IP address must be configured identically on both routers (active and standby) that are on directly connected interfaces.                                                                                                                                                           |
| Step 6 | <b>standby</b> <i>standby-group-number</i> <b>track</b> <i>interface-name</i><br><br><b>Example:</b><br>Router(config-if)# standby 1 track Ethernet1/0 | Configures HSRP to monitor the second interface so that if either of the two interfaces goes down, HSRP causes failover to the standby device.<br><br><b>Note</b> Although this command is not required, it is recommended for dual interface configurations.                                                                                                                                                                            |
| Step 7 | <b>standby</b> [ <i>group-number</i> ] <b>preempt</b><br><br><b>Example:</b><br>Router(config-if)# standby 1 preempt                                   | Enables the active device to relinquish control because of an interface tracking event.                                                                                                                                                                                                                                                                                                                                                  |

|         | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 8  | <b>standby</b> [ <i>group-number</i> ] <b>timers</b> [ <i>msec</i> ] <i>hellotime</i> [ <i>msec</i> ] <i>holdtime</i><br><br><b>Example:</b><br>Router(config-if)# standby 1 timers 1 5 | (Optional) Configures the time between hello packets and the time before other routers declare the active Hot Standby or standby router to be down. <ul style="list-style-type: none"> <li><i>holdtime</i>—Amount of time the routers take to detect types of failure. A larger hold time means that failure detection will take longer.</li> </ul> For the best stability, it is recommended that you set the hold time between 5 and 10 times the hello interval time; otherwise, a failover could falsely occur when no actual failure has happened. |
| Step 9  | <b>standby delay minimum</b> [ <i>min-delay</i> ] <b>reload</b> [ <i>reload-delay</i> ]<br><br><b>Example:</b><br>Router(config-if)# standby delay minimum reload 120                   | Configures the delay period before the initialization of HSRP groups. <p><b>Note</b> It is suggested that you enter 120 as the value for the <i>reload-delay</i> argument and leave the <i>min-delay</i> argument at the preconfigured default value.</p>                                                                                                                                                                                                                                                                                               |
| Step 10 | Repeat.                                                                                                                                                                                 | Repeat this task on both routers (active and standby) and on both interfaces of each router.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Troubleshooting Tips

To help troubleshoot possible HSRP-related configuration problems, issue any of the following HSRP-related debug commands—**debug standby errors**, **debug standby events**, and **debug standby packets [terse]**.

## Examples

The following example shows how to configure HSRP on a router:

```
interface Ethernet0/0
 ip address 209.165.201.1 255.255.255.224
 standby 1 ip 209.165.201.3
 standby 1 preempt
 standby 1 name HA-out
 standby 1 track Ethernet1/0
 standby delay reload 120
```

## What to Do Next

After you have successfully configured HSRP on both the inside and outside interfaces, you should enable SSO as described in the section “[Enabling SSO](#).”

## Enabling SSO

Use this task to enable SSO, which is used to transfer IKE and IPSec state information between two routers.

## SSO: Interacting with IPSec and IKE

SSO is a method of providing redundancy and synchronization for many Cisco IOS applications and features. SSO is necessary for IPSec and IKE to learn about the redundancy state of the network and to synchronize their internal application state with their redundant peers.

### Prerequisites

- You should configure HSRP before enabling SSO.
- To avoid losing SCTP communication between peers, be sure to include the following commands to the local address section of the SCTP section of the IPC configuration:
  - **retransmit-timeout** *retran-min [msec] retra-max [msec]*
  - **path-retransmit** *max-path-retries*
  - **assoc-retransmit** *retries*

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **redundancy inter-device**
4. **scheme standby** *standby-group-name*
5. **exit**
6. **ipc zone default**
7. **association 1**
8. **protocol sctp**
9. **local-port** *local-port-number*
10. **local-ip** *device-real-ip-address [device-real-ip-address2]*
11. **retransmit-timeout** *retran-min [msec] retra-max [msec]*
12. **path-retransmit** *max-path-retries*
13. **assoc-retransmit** *retries*
14. **exit**
15. **remote-port** *remote-port-number*
16. **remote-ip** *peer-real-ip-address [peer-real-ip-address2]*

## DETAILED STEPS

|        | Command or Action                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>redundancy inter-device</b><br><br><b>Example:</b><br>Router(config)# redundancy inter-device                         | Configures redundancy and enters inter-device configuration mode.<br><br>To exit inter-device configuration mode, use the <b>exit</b> command. To remove all inter-device configuration, use the <b>no</b> form of the command.                                                                                                                                                                                                                                                                                                                                                         |
| Step 4 | <b>scheme standby standby-group-name</b><br><br><b>Example:</b><br>Router(config-red-interdevice)# scheme standby HA-out | Defines the redundancy scheme that is to be used. Currently, “standby” is the only supported scheme. <ul style="list-style-type: none"> <li><i>standby-group-name</i>—Must match the standby name specified in the <b>standby name</b> interface configuration command. Also, the standby name should be the same on both routers.</li> </ul> <b>Note</b> Only the active or standby state of the standby group is used for SSO. The VIP address of the standby group is not required or used by SSO. Also, the standby group does not have to be part of any crypto map configuration. |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-red-interdevice)# exit                                               | Exits inter-device configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 6 | <b>ipc zone default</b><br><br><b>Example:</b><br>Router(config)# ipc zone default                                       | Configures the inter-device communication protocol, Inter-Process Communication (IPC), and enters IPC zone configuration mode.<br><br>Use this command to initiate the communication link between the active router and standby router.                                                                                                                                                                                                                                                                                                                                                 |
| Step 7 | <b>association 1</b><br><br><b>Example:</b><br>Router(config-ipczzone)# association 1                                    | Configures an association between the two devices and enters IPC association configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 8 | <b>protocol sctp</b><br><br><b>Example:</b><br>Router(config-ipczzone-assoc)# protocol sctp                              | Configures Stream Control Transmission Protocol (SCTP) as the transport protocol and enters SCTP protocol configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|         | Command or Action                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <b>local-port</b> <i>local-port-number</i><br><br><b>Example:</b><br>Router(config-ipc-protocol-sctp)# local-port 5000                                                             | Defines the local SCTP port number that is used to communicate with the redundant peer and puts you in IPC transport - SCTP local configuration mode. <ul style="list-style-type: none"> <li><i>local-port-number</i>—There is not a default value. This argument must be configured for the local port to enable inter-device redundancy. Valid port values: 1 to 65535.</li> </ul> <p>The local port number should be the same as the remote port number on the peer router.</p> |
| Step 10 | <b>local-ip</b> <i>device-real-ip-address</i> [ <i>device-real-ip-address2</i> ]<br><br><b>Example:</b><br>Router(config-ipc-local-sctp)# local-ip 10.0.0.1                        | Defines at least one local IP address that is used to communicate with the redundant peer. <p>The local IP addresses must match the remote IP addresses on the peer router. There can be either one or two IP addresses, which must be in the global VRF. A virtual IP address cannot be used.</p>                                                                                                                                                                                 |
| Step 11 | <b>retransmit-timeout</b> <i>retran-min</i> [ <i>msec</i> ] <i>retra-max</i> [ <i>msec</i> ]<br><br><b>Example:</b><br>Router(config-ipc-local-sctp)# retransmit-timeout 300 10000 | Configures the maximum amount of time, in milliseconds, that SCTP will wait before retransmitting data. <ul style="list-style-type: none"> <li><i>retran-min</i>: 300 to 60000; default: 300</li> <li><i>retra-max</i>: 300 to 60000; default: 600</li> </ul>                                                                                                                                                                                                                      |
| Step 12 | <b>path-retransmit</b> <i>max-path-retries</i><br><br><b>Example:</b><br>Router(config-ipc-local-sctp)# path-retransmit 10                                                         | Configures the number of consecutive retransmissions SCTP will perform before failing a path within an association. <ul style="list-style-type: none"> <li><i>max-path-retries</i>: 2 to 10; default: 4 retries</li> </ul>                                                                                                                                                                                                                                                         |
| Step 13 | <b>assoc-retransmit</b> <i>retries</i><br><br><b>Example:</b><br>Router(config-ipc-local-sctp)# assoc-retransmit 10                                                                | Configures the number of consecutive retransmissions SCTP will perform before failing an association. <ul style="list-style-type: none"> <li><i>max-association-retries</i>: 2 to 10; default: 4 retries</li> </ul>                                                                                                                                                                                                                                                                |
| Step 14 | <b>exit</b><br><br><b>Example:</b><br>Router(config-ipc-local-sctp)# exit                                                                                                          | Exits IPC transport - SCTP local configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                               |

|         | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 15 | <b>remote-port</b> <i>remote-port-number</i><br><br><b>Example:</b><br>Router(config-ipc-protocol-sctp)# remote-port 5000                                     | Defines the remote SCTP port number that is used to communicate with the redundant peer and puts you in IPC transport - SCTP remote configuration mode.<br><br><b>Note</b> <i>remote-port-number</i> —There is not a default value. This argument must be configured for the remote port to enable inter-device redundancy. Valid port values: 1 to 65535.<br><br>The remote port number should be the same as the local port number on the peer router. |
| Step 16 | <b>remote-ip</b> <i>peer-real-ip-address</i><br>[ <i>peer-real-ip-address2</i> ]<br><br><b>Example:</b><br>Router(config-ipc-remote-sctp)# remote-ip 10.0.0.2 | Defines at least one remote IP address of the redundant peer that is used to communicate with the local device. All remote IP addresses must refer to the same device. A virtual IP address cannot be used.                                                                                                                                                                                                                                              |

## Troubleshooting Tips

To help troubleshoot possible SSO-related configuration problems, issue the **debug redundancy** command.

## Examples

The following example shows how to enable SSO:

```

!
redundancy inter-device
 scheme standby HA-out
!
!
ipc zone default
 association 1
 no shutdown
 protocol sctp
 local-port 5000
 local-ip 10.0.0.1
 retransmit-timeout 300 10000
 path-retransmit 10
 assoc-retransmit 10
 remote-port 5000
 remote-ip 10.0.0.2
!

```

## What to Do Next

After you have enabled SSO, you should configure reverse route injection (RRI) on a crypto map as shown in the following section.

## Configuring Reverse Route Injection on a Crypto Map

You should configure RRI on all existing crypto maps that you want to use with stateful failover. RRI is used with stateful failover so routers on the inside network can learn about the correct path to the current active device. When failover occurs, the new active device injects the RRI routes into its IP routing table and sends out routing updates to its routing peers.

Use one of the following tasks to configure RRI on a dynamic or static crypto map.

- [Configuring RRI on Dynamic Crypto Map, page 13](#)
- [Configuring RRI on a Static Crypto Map, page 14](#)

### Configuring RRI on Dynamic Crypto Map

Dynamic crypto map entries, like regular static crypto map entries, are grouped into sets. A set is a group of dynamic crypto map entries all with the same dynamic map name but each with a different dynamic sequence number. Each member of the set may be configured for RRI.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto dynamic-map** *map-name seq-num*
4. **reverse-route**

#### DETAILED STEPS

|        | Command or Action                                                                                                       | Purpose                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                  | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                          | Enters global configuration mode.                                                                                     |
| Step 3 | <b>crypto dynamic-map</b> <i>map-name seq-num</i><br><br><b>Example:</b><br>Router(config)# crypto dynamic-map mymap 10 | Creates a dynamic crypto map entry and enters crypto map configuration mode.                                          |
| Step 4 | <b>reverse-route</b><br><br><b>Example:</b><br>Router(config-crypto-map)# reverse-route                                 | Enables RRI for a dynamic crypto map.                                                                                 |

## Configuring RRI on a Static Crypto Map

Static crypto map entries are grouped into sets. A set is a group of static crypto map entries all with the same static map name but each with a different sequence number. Each static crypto map in the map set can be configured for RRI. Use this task to configure RRI on a static crypto map.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map *map-name seq-num* ipsec-isakmp**
4. **reverse-route**

### DETAILED STEPS

|        | Command or Action                                                                                                                           | Purpose                                                                                                               |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                      | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                              | Enters global configuration mode.                                                                                     |
| Step 3 | <b>crypto map <i>map-name seq-num</i> ipsec-isakmp</b><br><br><b>Example:</b><br>Router(config)# crypto map to-peer-outside 10 ipsec-isakmp | Enters crypto map configuration mode and creates or modifies a crypto map entry.                                      |
| Step 4 | <b>reverse-route</b><br><br><b>Example:</b><br>Router(config-crypto-map)# reverse-route                                                     | Dynamically creates static routes based on crypto ACLs.                                                               |

## Examples

The following example shows how to configure RRI on the static crypto map “to-peer-outside”:

```
crypto map to-peer-outside redundancy replay-interval inbound 1000 outbound 10000
crypto map to-peer-outside 10 ipsec-isakmp
 set peer 209.165.200.225
 set transform-set trans1
 match address peer-outside
 reverse-route
```

## What to Do Next

After you have configured RRI, you can enable stateful failover for IPSec and IKE.

## Enabling Stateful Failover for IKE and IPSec

Use the following tasks to configure stateful failover for IPSec, IKE, and tunnel protection:

- [Enabling Stateful Failover for IKE, page 15](#)
- [Enabling Stateful Failover for IPSec, page 15](#)
- [Enabling Stateful Failover for Tunnel Protection, page 17](#)

### Enabling Stateful Failover for IKE

There is no specific command-line interface (CLI) necessary to enable stateful failover for IKE. It is enabled for a particular VIP address when a stateful failover crypto map is applied to an interface.

### Enabling Stateful Failover for IPSec

Use this task to enable stateful failover for IPSec. All IPSec state information is transferred from the active router to the standby router via the SSO redundancy channel that was specified in the task “[Enabling SSO](#).”

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **crypto map** *map-name* [**redundancy** *standby-group-name* [**stateful**]]

#### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                                                            |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
|        | <b>Example:</b><br>Router> enable             |                                                                                                                    |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                                                  |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                                                    |

|        | Command or Action                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet 0/0                                                                                                    | Defines an interface that has already been configured for redundancy and enters interface configuration mode.                                                                                                                                                                                                                                                                                                  |
| Step 4 | <b>crypto map</b> <i>map-name</i> [ <b>redundancy</b> <i>standby-group-name</i> [ <b>stateful</b> ]]<br><br><b>Example:</b><br>Router(config-if)# crypto map to-peer-outside redundancy HA-out stateful | <p>Binds the crypto map on the specified interface to the redundancy group.</p> <p><b>Note</b> Although the standby group does not have to be the same group that was used when enabling SSO, it does have to be the same group that was used with the <b>standby ip</b> command on this interface.</p> <p>This crypto map will use the same VIP address for both IKE and IPSec to communicate with peers.</p> |

## Troubleshooting Tips

To help troubleshoot possible IPSec HA-related problems, issue the **debug crypto ipsec ha** [detail] [update] command.

## Examples

The following example shows how to configure IPSec stateful failover on the crypto map “to-peer-outside”:

```
interface Ethernet0/0
 ip address 209.165.201.1 255.255.255.224
 standby 1 ip 209.165.201.3
 standby 1 preempt
 standby 1 name HA-out
 standby 1 track Ethernet1/0
 crypto map to-peer-outside redundancy HA-out stateful
```

## Enabling Stateful Failover for Tunnel Protection

Use an existing IPSec profile to configure stateful failover for tunnels using IPSec. (You do not configure the tunnel interface as you would with a crypto map configuration.)

## Restrictions

The tunnel source address must be a VIP address, and it must not be an interface name.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec profile** *name*
4. **redundancy** *standby-group-name* **stateful**
5. **exit**
6. **interface tunnel** *number*

7. **tunnel protection ipsec profile** *name*
8. **tunnel source** *virtual-ip-address*

## DETAILED STEPS

|        | Command or Action                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                       |
| Step 3 | <b>crypto ipsec profile</b> <i>name</i><br><br><b>Example:</b><br>Router(config)# crypto ipsec profile<br>peer-profile                         | Defines the IPSec parameters that are to be used for IPSec encryption between two routers and enters crypto map configuration mode.                                                                                                                                                     |
| Step 4 | <b>redundancy</b> <i>standby-group-name</i> <b>stateful</b><br><br><b>Example:</b><br>Router(config-crypto-map)# redundancy HA-out<br>stateful | Configures stateful failover for tunnels using IPSec.                                                                                                                                                                                                                                   |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-crypto-map)# exit                                                                          | Exits crypto map configuration mode.                                                                                                                                                                                                                                                    |
| Step 6 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 5                                             | Configures a tunnel interface and enters interface configuration mode<br><ul style="list-style-type: none"><li><i>number</i>—Specifies the number of the interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.</li></ul> |
| Step 7 | <b>tunnel protection ipsec profile</b> <i>name</i><br><br><b>Example:</b><br>Router(config-if)# tunnel protection ipsec<br>profile catprofile  | Associates a tunnel interface with an IPSec profile.<br><i>name</i> —Specifies the name of the IPSec profile; this value must match the name specified in the <b>crypto ipsec profile name</b> command.                                                                                 |
| Step 8 | <b>tunnel source</b> <i>virtual-ip-address</i><br><br><b>Example:</b><br>Router(config-if)# tunnel source 10.1.1.1                             | Sets source address for a tunnel interface.<br><ul style="list-style-type: none"><li><i>virtual-ip-address</i>—Must be a VIP address.</li></ul> <b>Note</b> Do not use the interface name as the tunnel source.                                                                         |

## Examples

The following example shows how to configure stateful failover for tunnel protection:

```
crypto ipsec profile peer-profile
```

```
redundancy HA-out stateful

interface Tunnel1
 ip unnumbered Loopback0
 tunnel source 209.165.201.3
 tunnel destination 10.0.0.5
 tunnel protection ipsec profile peer-profile
!
interface Ethernet0/0
 ip address 209.165.201.1 255.255.255.224
 standby 1 ip 209.165.201.3
 standby 1 name HA-out
```

## What to Do Next

After you have configured stateful failover, you can use the CLI to protect, verify, and manage your configurations. For more information on completing these tasks, see the sections “[Protecting SSO Traffic](#)” and “[Managing and Verifying High Availability Information](#).”

## Protecting SSO Traffic

Use this task to secure a redundancy group via an IPSec profile. To configure SSO traffic protection, the active and standby devices must be directly connected to each other via Ethernet networks.

The crypto maps that are automatically generated when protecting SSO traffic are applied to each interface, which corresponds to an IP address that was specified via the **local-ip** command. Traffic that is destined for an IP address that was specified via the **remote-ip** command is forced out of the crypto-map-configured interface via an automatically created static host route.

### Note

If you are certain that the SSO traffic between the redundancy group runs on a physically secure interface, you do not have to configure SSO traffic protection.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp key** *keystring* **address** *peer-address*
4. **crypto ipsec transform-set** *transform-set-name* *transform-set-list*
5. **crypto ipsec profile** *profile-name*
6. **set transform-set** *transform-set-name*
7. **exit**
8. **redundancy inter-device**
9. **security ipsec** *profile-name*

## DETAILED STEPS

|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                        | Enters global configuration mode.                                                                                                                  |
| Step 3 | <b>crypto isakmp key</b> <i>keystring</i> <b>address</b> <i>peer-address</i><br><br><b>Example:</b><br>Router(config)# crypto isakmp key cisco123 address 0.0.0.0 0.0.0.0             | Configures a preshared authentication key. <ul style="list-style-type: none"> <li><i>peer-address</i>—The SCTP remote IP address.</li> </ul>       |
| Step 4 | <b>crypto ipsec transform-set</b> <i>transform-set-name</i> <i>transform-set-list</i><br><br><b>Example:</b><br>Router(config)# crypto ipsec transform-set trans2 ah-md5-hmac esp-aes | Configures a transform set that defines the packet format and cryptographic algorithms used for IPSec.                                             |
| Step 5 | <b>crypto ipsec profile</b> <i>profile-name</i><br><br><b>Example:</b><br>Router(config)# crypto ipsec profile sso-secure                                                             | Defines an IPSec profile that describes how the traffic will be protected.                                                                         |
| Step 6 | <b>set transform-set</b> <i>transform-set-name</i><br><br><b>Example:</b><br>Router(config-crypto-map)# set transform-set trans2                                                      | Specifies which transform sets can be used with the IPSec profile.                                                                                 |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-crypto-map)# exit                                                                                                                 | Exits crypto map configuration mode.                                                                                                               |
| Step 8 | <b>redundancy inter-device</b><br><br><b>Example:</b><br>Router(config)# redundancy inter-device                                                                                      | Configures redundancy and enters inter-device configuration mode.                                                                                  |
| Step 9 | <b>security ipsec</b> <i>profile-name</i><br><br><b>Example:</b><br>Router(config-red-interdevice)# security ipsec sso-secure                                                         | Applies the IPSec profile to the redundancy group communications, protecting all SSO traffic that is passed between the active and standby device. |

## Examples

The following example shows how to configure SSO traffic protection:

```
crypto isakmp key cisco123 address 0.0.0.0 0.0.0.0 no-xauth
!
crypto ipsec transform-set trans2 ah-md5-hmac esp-aes
!
crypto ipsec profile sso-secure
 set transform-set trans2
!
redundancy inter-device
 scheme standby HA-out
 security ipsec sso-secure
```

## Managing and Verifying High Availability Information

Use any of the following optional tasks to secure and manage your high availability configurations:

- [Managing Anti-Replay Intervals, page 21](#)
- [Managing and Verifying HA Configurations, page 22](#)

### Managing Anti-Replay Intervals

Use this optional task to modify the interval in which an IP redundancy-enabled crypto map forwards anti-replay updates from the active router to the standby router.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map *map-name* redundancy replay-interval inbound *in-value* outbound *out-value***

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 3 | <b>crypto map</b> <i>map-name</i> <b>redundancy replay-interval</b><br><b>inbound</b> <i>in-value</i> <b>outbound</b> <i>out-value</i><br><br><b>Example:</b><br>Router(config)# crypto map to-peer-outside<br>redundancy replay-interval inbound 1000<br>outbound 10000 | Modifies the interval at which inbound and outbound replay counters are passed from an active device to a standby device. <ul style="list-style-type: none"> <li><b>inbound</b> <i>in-value</i>—Number of inbound packets that are processed before an anti-replay update is sent from the active router to the standby router. Default value: one update every 1,000 packets.</li> <li><b>outbound</b> <i>out-value</i>—Number of outbound packets that are processed before an anti-replay update is sent from the active router to the standby router. Default value: one update every 100,000 packets.</li> </ul> |

## Examples

The following example shows how to modify replay counter intervals between the active and standby devices on the crypto map “to-peer-outside”:

```
crypto map to-peer-outside redundancy replay-interval inbound 1000 outbound 10000
crypto map to-peer-outside 10 ipsec-isakmp
 set peer 209.165.200.225
 set transform-set trans1
 match address peer-outside
```

## Managing and Verifying HA Configurations

Use any of the steps within this optional task to display and verify the high availability configurations.

### SUMMARY STEPS

1. **enable**
2. **show redundancy** [states | inter-device]
3. **show crypto isakmp sa** [active | standby]
4. **show crypto ipsec sa** [active | standby]
5. **show crypto session** [active | standby]
6. **show crypto ha**
7. **clear crypto isakmp** [active | standby]

8. **clear crypto sa** [active | standby]
9. **clear crypto session** [active | standby]

## DETAILED STEPS

|        | Command or Action                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                         |
| Step 2 | <b>show redundancy</b> [states   inter-device]<br><br><b>Example:</b><br>Router# show redundancy states        | Displays the current state of SSO on the configured device.<br><br>After the two devices have negotiated with each other, one device should show an “ACTIVE” state and the other device should show a “STANDBY HOT” state.                                                                                                                               |
| Step 3 | <b>show crypto isakmp sa</b> [active   standby]<br><br><b>Example:</b><br>Router# show crypto isakmp sa active | Displays IKE SAs present on the device.<br><br>An “ACTIVE” or “STDBY” state is shown for each SA. <ul style="list-style-type: none"> <li>The <b>active</b> keyword displays only ACTIVE, HA-enabled SAs; The <b>standby</b> keyword displays only STDBY, HA-enabled SAs.</li> </ul>                                                                      |
| Step 4 | <b>show crypto ipsec sa</b> [active   standby]<br><br><b>Example:</b><br>Router# show crypto ipsec sa active   | Displays IPsec SAs present on the device.<br><br>An “ACTIVE” or “STDBY” state is shown for each SA. <ul style="list-style-type: none"> <li>The <b>active</b> keyword displays only ACTIVE, HA-enabled SAs; The <b>standby</b> keyword displays only STDBY, HA-enabled SAs.</li> </ul>                                                                    |
| Step 5 | <b>show crypto session</b> [active   standby]<br><br><b>Example:</b><br>Router# show crypto session active     | Displays crypto sessions that are currently present on the device.<br><br>An “ACTIVE” or “STANDBY” state is shown as part of the state of each session, such as “UP-STANDBY.”<br><br>Only HA-enabled SAs are shown.                                                                                                                                      |
| Step 6 | <b>show crypto ha</b><br><br><b>Example:</b><br>Router# show crypto ha                                         | Displays all virtual IP addresses that are currently in use by IPsec and IKE.                                                                                                                                                                                                                                                                            |
| Step 7 | <b>clear crypto isakmp</b> [active   standby]<br><br><b>Example:</b><br>Router# clear crypto isakmp active     | Clears IKE SAs.<br><br>When this command is issued on the standby device, all standby IKE SAs are resynchronized from the active device. <ul style="list-style-type: none"> <li>The <b>active</b> keyword clears only IKE HA-enabled SAs in the active state; the <b>standby</b> keyword clears only IKE HA-enabled SAs in the standby state.</li> </ul> |

|        | Command or Action                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 8 | <b>clear crypto sa</b> [active   standby]<br><br><b>Example:</b><br>Router# clear crypto sa active           | Clears IPSec SAs.<br><br>When this command is issued on the standby device, all standby IPSec SAs are resynchronized from the active device. <ul style="list-style-type: none"> <li>The <b>active</b> keyword clears only IPSec HA-enabled SAs in the active state; the <b>standby</b> keyword clears only IPSec HA-enabled SAs in the standby state.</li> </ul> |
| Step 9 | <b>clear crypto session</b> [active   standby]<br><br><b>Example:</b><br>Router# clear crypto session active | Clears both IKE and IPSec SAs.<br><br>Any standby SAs will resynchronize from the active device after they are cleared on the standby. Only HA-enabled SAs are cleared from the device.                                                                                                                                                                          |

## Examples

### Verifying the Active Device:Examples

Router# **show redundancy states**

```

my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
 Mode = Duplex
 Unit ID = 0

Split Mode = Disabled
Manual Swact = Enabled
Communications = Up

# Configuration Examples for Stateful Failover

This section contains the following comprehensive IPSec stateful failover configuration examples:

- [Configuring IPSec Stateful Failover: Example, page 27](#)
- [Configuring IPSec Stateful Failover for an Easy VPN Server: Example, page 31](#)

## Configuring IPSec Stateful Failover: Example

Figure 3 and the following sample outputs from the show running-config command illustrate how to configure stateful failover on two devices—Ha-R1 and Ha-R2.

**Figure 95** *IPSec Stateful Failover Sample Topology*

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Security Command Reference* at [http://www.cisco.com/en/US/docs/ios/security/command/reference/sec\\_book.html](http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or a Cisco IOS master commands list.

### New Commands

- **crypto map redundancy replay-interval**
- **debug crypto ha**
- **debug crypto ipsec ha**
- **debug crypto isakmp ha**
- **local-ip (IPC transport-SCTP local)**
- **local-port**
- **redundancy inter-device**
- **redundancy stateful**
- **remote-ip (IPC transport-SCTP remote)**
- **remote-port**
- **scheme**
- **security ipsec**
- **show crypto ha**

### Modified Commands

- **clear crypto isakmp**
- **clear crypto sa**
- **clear crypto session**

- **crypto map (interface IPSec)**
- **show crypto ipsec sa**
- **show crypto isakmp sa**
- **show crypto session**
- **show redundancy**

## VRF-Aware IPSec

---

The VRF-Aware IPSec feature introduces IP Security (IPSec) tunnel mapping to Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). Using the VRF-Aware IPSec feature, you can map IPSec tunnels to Virtual Routing and Forwarding (VRF) instances using a single public-facing address.

### Feature Specifications for VRF-Aware IPSec

---

#### Feature History

| Release   | Modification                 |
|-----------|------------------------------|
| 12.2(15)T | This feature was introduced. |

---

#### Supported Platforms

---

Cisco 1710, Cisco 1760, Cisco 2610-Cisco 2613, Cisco 2620-Cisco 2621, Cisco 2650-Cisco 2651, Cisco 3620, Cisco 3640, Cisco 3660, Cisco 7100, Cisco 7200, Cisco 7400, Cisco 870 Series

---

### Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Restrictions for VRF-Aware IPsec

- If you are configuring VRF-Aware IPsec using a crypto map configuration and the Inside VRF (IVRF) is not the same as the Front Door VRF (FVRF), this feature is not interoperable with unicast reverse path forwarding (uRPF) if uRPF is enabled on the crypto map interface. If your network requires uRPF, it is recommended that you use Virtual Tunnel Interface (VTI) for IPsec instead of crypto maps.
- The VRF-Aware IPsec feature does not allow IPsec tunnel mapping between VRFs. For example, it does not allow IPsec tunnel mapping from VRF vpn1 to VRF vpn2.

## Information About VRF-Aware IPsec

The VRF-Aware IPsec feature maps an IPsec tunnel to a MPLS VPN. To configure and use the feature, you need to understand the following concepts:

- [VRF Instance, page 2](#)
- [MPLS Distribution Protocol, page 2](#)
- [VRF-Aware IPsec Functional Overview, page 2](#)

### VRF Instance

A VRF instance is a per-VPN routing information repository that defines the VPN membership of a customer site attached to the Provider Edge (PE) router. A VRF comprises an IP routing table, a derived Cisco Express Forwarding (CEF) table, a set of interfaces that use the forwarding table, and a set of rules and routing protocol parameters that control the information that is included in the routing table. A separate set of routing and CEF tables is maintained for each VPN customer.

### MPLS Distribution Protocol

The MPLS distribution protocol is a high-performance packet-forwarding technology that integrates the performance and traffic management capabilities of data link layer switching with the scalability, flexibility, and performance of network-layer routing.

### VRF-Aware IPsec Functional Overview

Front Door VRF (FVRF) and Inside VRF (IVRF) are central to understanding the feature.

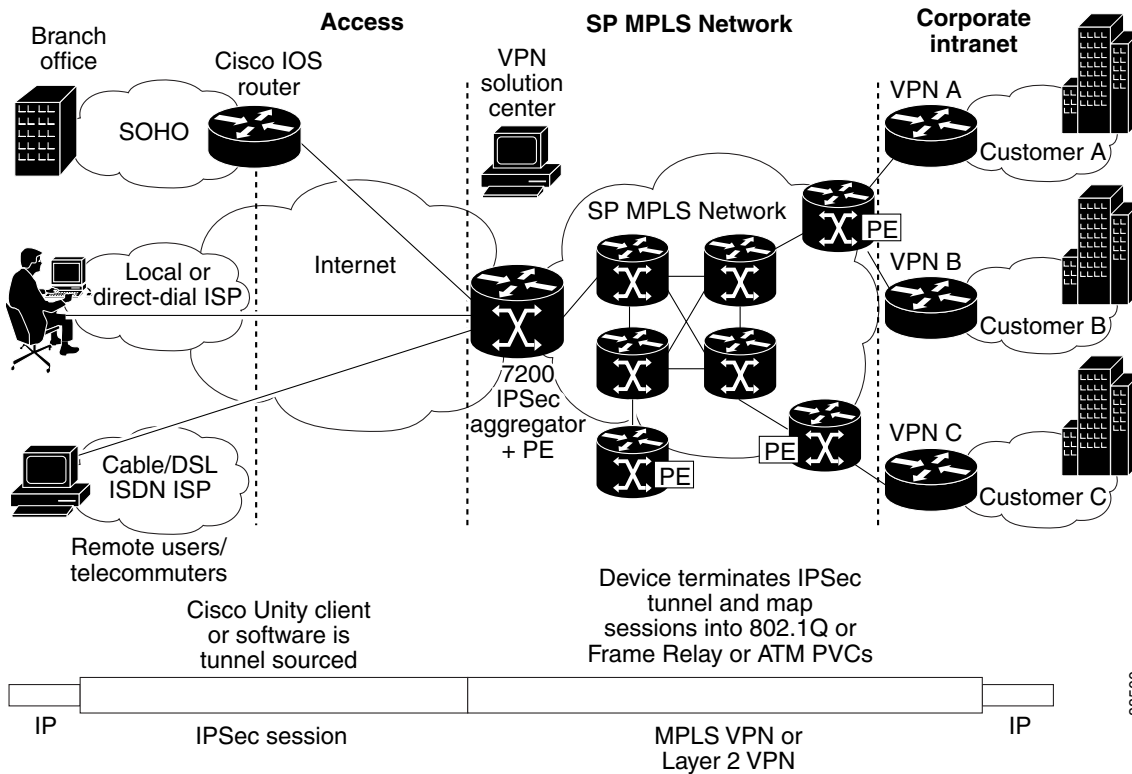

Each IPsec tunnel is associated with two VRF domains. The outer encapsulated packet belongs to one VRF domain, which we shall call the FVRF, while the inner, protected IP packet belongs to another domain called the IVRF. Another way of stating the same thing is that the local endpoint of the IPsec tunnel belongs to the FVRF while the source and destination addresses of the inside packet belong to the IVRF.

One or more IPsec tunnels can terminate on a single interface. The FVRF of all these tunnels is the same and is set to the VRF that is configured on that interface. The IVRF of these tunnels can be different and depends on the VRF that is defined in the Internet Security Association and Key Management Protocol (ISAKMP) profile that is attached to a crypto map entry.

Figure 96 is an illustration of a scenario showing IPSec to MPLS and Layer 2 VPNs.

**Figure 96** *IPSec to MPLS and Layer 2 VPNs*

## Packet Flow into the IPSec Tunnel

- A VPN packet arrives from the Service Provider MPLS backbone network to the PE and is routed through an interface facing the Internet.
- The packet is matched against the Security Policy Database (SPD), and the packet is IPSec encapsulated. The SPD includes the IVRF and the access control list (ACL).
- The IPSec encapsulated packet is then forwarded using the FVRF routing table.

## Packet Flow from the IPSec Tunnel

- An IPSec-encapsulated packet arrives at the PE router from the remote IPSec endpoint.
- IPSec performs the Security Association (SA) lookup for the Security Parameter Index (SPI), destination, and protocol.
- The packet is decapsulated using the SA and is associated with IVRF.
- The packet is further forwarded using the IVRF routing table.

# How to Configure VRF-Aware IPSec

This section contains the following procedures:

- [Configuring Crypto Keyrings, page 4](#) (Optional)
- [Configuring ISAKMP Profiles, page 6](#) (Required)
- [Configuring an ISAKMP Profile on a Crypto Map, page 10](#) (Required)
- [Configuring to Ignore Extended Authentication During IKE Phase 1 Negotiation, page 11](#) (Optional)
- [Verifying VRF-Aware IPSec, page 12](#)
- [Clearing Security Associations, page 13](#)
- [Troubleshooting VRF-Aware IPSec, page 13](#)

## Configuring Crypto Keyrings

A crypto keyring is a repository of preshared and Rivest, Shamir, and Adelman (RSA) public keys. There can be zero or more keyrings on the Cisco IOS router.

Perform the following optional task to configure a crypto keyring.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto keyring** *keyring-name* [**vrf** *fvr-f-name*]
4. **description** *string* (Optional)
5. **pre-shared-key** {**address** *address* [*mask*] | **hostname** *hostname*} **key** *key* (Optional)
6. **rsa-pubkey** {**address** *address* | **name** *fqdn*} [**encryption** | **signature**] (Optional)
7. **address** *ip-address* (Optional)
8. **serial-number** *serial-number* (Optional)
9. **key-string**
10. **text**
11. **quit**
12. **exit**
13. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>crypto keyring</b> <i>keyring-name</i> [ <b>vrf</b> <i>fvrf-name</i> ]<br><br><b>Example:</b><br>Router (config)# crypto keyring VPN1                                                                                       | Defines a keyring with <i>keyring-name</i> as the name of the keyring and enters keyring configuration mode. <ul style="list-style-type: none"> <li>(Optional) The <b>vrf</b> keyword and <i>fvrf-name</i> argument imply that the keyring is bound to Front Door Virtual Routing and Forwarding (FVRF). The key in the keyring is searched if the local endpoint is in FVRF. If <b>vrf</b> is not specified, the keyring is bound to the global.</li> </ul>                 |
| Step 4 | <b>description</b> <i>string</i><br><br>Router (config-keyring)# description The keys for VPN1                                                                                                                                 | (Optional) Specifies a one-line description of the keyring.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 5 | <b>pre-shared-key</b> { <b>address</b> <i>address</i> [ <i>mask</i> ]   <b>hostname</b> <i>hostname</i> } <b>key</b> <i>key</i><br><br><b>Example:</b><br>Router (config-keyring)# pre-shared-key address 10.72.23.11 key VPN1 | (Optional) Defines a preshared key by address or host name.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 6 | <b>rsa-pubkey</b> { <b>address</b> <i>address</i>   <b>name</b> <i>fqdn</i> } [ <b>encryption</b>   <b>signature</b> ]<br><br><b>Example:</b><br>Router(config-keyring)# rsa-pubkey name host.vpn.com                          | (Optional) Defines a Rivest, Shamir, and Adelman (RSA) public key by address or host name and enters rsa-pubkey configuration mode. <ul style="list-style-type: none"> <li>By default, the key is used for signature.</li> <li>The optional <b>encryption</b> keyword specifies that the key should be used for encryption. The optional <b>signature</b> keyword specifies that the key should be used for signature. By default, the key is used for signature.</li> </ul> |
| Step 7 | <b>address</b> <i>ip-address</i><br><br><b>Example:</b><br>Router(config-pubkey-key)# address 10.5.5.1                                                                                                                         | (Optional) Defines the RSA public key IP address.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 8 | <b>serial-number</b> <i>serial-number</i><br><br><b>Example:</b><br>Router(config-pubkey-key)# serial-number 1000000                                                                                                           | (Optional) Specifies the serial number of the public key. The value is from 0 through infinity.                                                                                                                                                                                                                                                                                                                                                                              |

|         | Command or Action                                                                                    | Purpose                                                                                 |
|---------|------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| Step 9  | <b>key-string</b><br><br><b>Example:</b><br>Router (config-pubkey-key)# key-string                   | Enters into the text mode in which you define the public key.                           |
| Step 10 | <b>text</b><br><br><b>Example:</b><br>Router (config-pubkey)# 00302017 4A7D385B<br>1234EF29 335FC973 | Specifies the public key.<br><b>Note</b> Only one public key may be added in this step. |
| Step 11 | <b>quit</b><br><br><b>Example:</b><br>Router (config-pubkey)# quit                                   | Quits to the public key configuration mode.                                             |
| Step 12 | <b>exit</b><br><br><b>Example:</b><br>Router (config-pubkey)# exit                                   | Exits to the keyring configuration mode.                                                |
| Step 13 | <b>exit</b><br><br><b>Example:</b><br>Router(config-keyring)# exit#                                  | Exits to global configuration mode.                                                     |

## Configuring ISAKMP Profiles

An ISAKMP profile is a repository for IKE Phase 1 and IKE Phase 1.5 configuration for a set of peers. An ISAKMP profile defines items such as keepalive, trustpoints, peer identities, and XAUTH AAA list during the IKE Phase 1 and Phase 1.5 exchange. There can be zero or more ISAKMP profiles on the Cisco IOS router.

### Note

- If traffic from the router to a certification authority (CA) (for authentication, enrollment, or for obtaining a certificate revocation list [CRL]) or to an Lightweight Directory Access Protocol (LDAP) server (for obtaining a CRL) needs to be routed via a VRF, the **vrf** command must be added to the trustpoint. Otherwise, such traffic will use the default routing table.
- If a profile does not specify one or more trustpoints, all trustpoints in the router will be used to attempt to validate the certificate of the peer (Internet Key Exchange (IKE) main mode or signature authentication). If one or more trustpoints are specified, only those trustpoints will be used.

## Restriction

A router initiating IKE and a router responding to the IKE request should have symmetrical trustpoint configurations. For example, a responding router (in IKE Main Mode) performing RSA signature encryption and authentication might use trustpoints that were defined in the global configuration when sending the CERT-REQ payloads. However, the router might use a restricted list of trustpoints that were defined in the ISAKMP profile for the certificate verification. If the peer (the IKE initiator) is configured

to use a certificate whose trustpoint is in the global list of the responding router but not in ISAKMP profile of the responding router, the certificate will be rejected. (However, if the initiating router does not know about the trustpoints in the global configuration of the responding router, the certificate can still be authenticated.)

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp profile** *profile-name*
4. **description** *string* (Optional)
5. **vrf** *ivrf-name* (Optional)
6. **keepalive** *seconds* **retry** *retry-seconds* (Optional)
7. **self-identity** {**address** | **fqdn** | **user-fqdn** *user-fqdn*} (Optional)
8. **keyring** *keyring-name* (Optional)
9. **ca trust-point** *trustpoint-name* (Optional)
10. **match identity** {**group** *group-name* | **address** *address* [*mask*] [*fvr*] | **host** *host-name* | **host domain** *domain-name* | **user** *user-fqdn* | **user domain** *domain-name*}
11. **client configuration address** {**initiate** | **respond**} (Optional)
12. **client authentication list** *list-name* (Optional)
13. **isakmp authorization list** *list-name* (Optional)
14. **initiate mode aggressive**
15. **exit**

## DETAILED STEPS

|        | Command or Action                                                       | Purpose                                                                                                                                  |
|--------|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                           | Enables privileged EXEC mode.                                                                                                            |
|        | <b>Example:</b><br>Router> enable                                       | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                       |
| Step 2 | <b>configure terminal</b>                                               | Enters global configuration mode.                                                                                                        |
|        | <b>Example:</b><br>Router# configure terminal                           |                                                                                                                                          |
| Step 3 | <b>crypto isakmp profile</b> <i>profile-name</i>                        | Defines an Internet Security Association and Key Management Protocol (ISAKMP) profile and enters into isakmp profile configuration mode. |
|        | <b>Example:</b><br>Router (config)# crypto isakmp profile<br>vpnprofile |                                                                                                                                          |

|        | Command or Action                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>description</b> <i>string</i><br><br><b>Example:</b><br>Router (conf-isa-prof)# description<br>configuration for VPN profile                                      | (Optional) Specifies a one-line description of an ISAKMP profile.                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 5 | <b>vrf</b> <i>ivrf-name</i><br><br><b>Example:</b><br>Router (conf-isa-prof)# vrf VPN1                                                                               | (Optional) Maps the IPSec tunnel to a Virtual Routing and Forwarding (VRF) instance.<br><br><b>Note</b> The VRF also serves as a selector for matching the Security Policy Database (SPD). If the VRF is not specified in the ISAKMP profile, the IVRF of the IPSec tunnel will be the same as its FVRF.                                                                                                                                              |
| Step 6 | <b>keepalive</b> <i>seconds</i> <b>retry</b> <i>retry-seconds</i><br><br><b>Example:</b><br>Router (conf-isa-prof)# keepalive 60 retry 5                             | (Optional) Allows the gateway to send dead peer detection (DPD) messages to the peer. <ul style="list-style-type: none"> <li>If not defined, the gateway uses the global configured value.</li> <li><i>seconds</i>—Number of seconds between DPD messages. The range is from 10 to 3600 seconds.</li> <li><b>retry</b> <i>retry-seconds</i>—Number of seconds between retries if the DPD message fails. The range is from 2 to 60 seconds.</li> </ul> |
| Step 7 | <b>self-identity</b> { <i>address</i>   <i>fqdn</i>   <i>user-fqdn</i><br><i>user-fqdn</i> }<br><br><b>Example:</b><br>Router (conf-isa-prof)# self-identity address | (Optional) Specifies the identity that the local Internet Key Exchange (IKE) should use to identify itself to the remote peer. <ul style="list-style-type: none"> <li>If not defined, IKE uses the global configured value.</li> <li><b>address</b>—Uses the IP address of the egress interface.</li> <li><b>fqdn</b>—Uses the fully qualified domain name (FQDN) of the router.</li> <li><b>user-fqdn</b>—Uses the specified value.</li> </ul>       |
| Step 8 | <b>keyring</b> <i>keyring-name</i><br><br><b>Example:</b><br>Router (conf-isa-prof)# keyring VPN1                                                                    | (Optional) Specifies the keyring to use for Phase 1 authentication. <ul style="list-style-type: none"> <li>If the keyring is not specified, the global key definitions are used.</li> </ul>                                                                                                                                                                                                                                                           |
| Step 9 | <b>ca trust-point</b> { <i>trustpoint-name</i> }<br><br><b>Example:</b><br>Router (conf-isa-prof)# ca trustpoint<br>VPN1-trustpoint                                  | (Optional) Specifies a trustpoint to validate a Rivest, Shamir, and Adelman (RSA) certificate. <ul style="list-style-type: none"> <li>If no trustpoint is specified in the ISAKMP profile, all the trustpoints that are configured on the Cisco IOS router are used to validate the certificate.</li> </ul>                                                                                                                                           |

|         | Command or Action                                                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 10 | <p><b>match identity</b> {<b>group</b> <i>group-name</i>   <b>address</b> <i>address</i> [<i>mask</i>] [<i>fvrfl</i>]   <b>host</b> <i>host-name</i>   <b>host domain</b> <i>domain-name</i>   <b>user</b> <i>user-fqdn</i>   <b>user domain</b> <i>domain-name</i>}</p> <p><b>Example:</b><br/>Router (conf-isa-prof)# match identity address 10.1.1.1</p> | <p>Specifies the client IKE Identity (ID) that is to be matched.</p> <ul style="list-style-type: none"> <li>• <b>group</b> <i>group-name</i>—Matches the <i>group-name</i> with the ID type ID_KEY_ID. It also matches the <i>group-name</i> with the Organizational Unit (OU) field of the Distinguished Name (DN).</li> <li>• <b>address</b> <i>address</i> [<i>mask</i>] <i>fvrfl</i>—Matches the <i>address</i> with the ID type ID_IPV4_ADDR. The <i>mask</i> argument can be used to specify a range of addresses. The <i>fvrfl</i> argument specifies that the address is in Front Door Virtual Routing and Forwarding (FVRF).</li> <li>• <b>host</b> <i>hostname</i>—Matches the <i>hostname</i> with the ID type ID_FQDN.</li> <li>• <b>host domain</b> <i>domainname</i>—Matches the <i>domainname</i> to the ID type ID_FQDN whose domain name is the same as the <i>domainname</i>. Use this command to match all the hosts in the domain.</li> <li>• <b>user</b> <i>username</i>—Matches the <i>username</i> with the ID type ID_USER_FQDN.</li> <li>• <b>user domain</b> <i>domainname</i>—Matches the ID type ID_USER_FQDN whose domain name matches the <i>domainname</i>.</li> </ul> |
| Step 11 | <p><b>client configuration address</b> {<b>initiate</b>   <b>respond</b>}</p> <p><b>Example:</b><br/>Router (conf-isa-prof)# client configuration address initiate</p>                                                                                                                                                                                      | <p>(Optional) Specifies whether to initiate the mode configuration exchange or responds to mode configuration requests.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 12 | <p><b>client authentication list</b> <i>list-name</i></p> <p><b>Example:</b><br/>Router (conf-isa-prof)# client authentication list xauthlist</p>                                                                                                                                                                                                           | <p>(Optional) Authentication, authorization, and accounting (AAA) to use for authenticating the remote client during the extended authentication (XAUTH) exchange.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 13 | <p><b>isakmp authorization list</b> <i>list-name</i></p> <p><b>Example:</b><br/>Router (conf-isa-prof)# isakmp authorization list ikessaaalist</p>                                                                                                                                                                                                          | <p>(Optional) Network authorization server for receiving the Phase 1 preshared key and other attribute-value (AV) pairs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## What to Do Next

Go to the section “[Configuring an ISAKMP Profile on a Crypto Map](#).”

## Configuring an ISAKMP Profile on a Crypto Map

An ISAKMP profile must be applied to the crypto map. The IVRF on the ISAKMP profile is used as a selector when matching the VPN traffic. If there is no IVRF on the ISAKMP profile, the IVRF will be equal to the FVRF. Perform this required task to configure an ISAKMP profile on a crypto map.

## Prerequisites

Before configuring an ISAKMP profile on a crypto map, you must first have configured your router for basic IPSec.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name* **isakmp-profile** *isakmp-profile-name* (*Optional*)
4. **set isakmp-profile** *profile-name* (*Optional*)
5. **exit**

## DETAILED STEPS

## Configuring to Ignore Extended Authentication During IKE Phase 1 Negotiation

To ignore XAUTH during an IKE Phase 1 negotiation, use the **no crypto xauth** command. Use the **no crypto xauth** command if you do not require extended authentication for the Unity clients.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no crypto xauth** *interface*

### DETAILED STEPS

|--------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                            |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                              | Enters global configuration mode.                                                                                                                             |
| Step 3 | <b>no crypto xauth</b> <i>interface</i><br><br><b>Example:</b><br>Router(config)# no crypto xauth ethernet0 | Ignores XAUTH proposals for requests that are destined to the IP address of the interface. By default, Internet Key Exchange (IKE) processes XAUTH proposals. |

## Verifying VRF-Aware IPSec

To verify your VRF-Aware IPSec configurations, use the following **show** commands. These **show** commands allow you to list configuration information and security associations (SAs):

### SUMMARY STEPS

- **enable**
- **show crypto ipsec sa** [**map** *map-name* | **address** | **identity** | **interface** *interface* | **peer** [**vrf** *fvrf-name*] **address** | **vrf** *ivrf-name*] [**detail**]
- **show crypto isakmp key**
- **show crypto isakmp profile**
- **show crypto key pubkey-chain rsa**

### DETAILED STEPS

## Clearing Security Associations

The following **clear** commands allow you to clear SAs.

### SUMMARY STEPS

- **enable**
- **clear crypto sa** [**counters** | **map** *map-name* | **peer** [**vrf** *fvrf-name*] *address* | **spi** *address* {**ah** | **esp**} *spi* | **vrf** *ivrf-name*]

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                               | Purpose                                                                                                            |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>clear crypto sa</b> [ <b>counters</b>   <b>map</b> <i>map-name</i>   <b>peer</b> [ <b>vrf</b> <i>fvrf-name</i> ] <i>address</i>   <b>spi</b> <i>address</i> { <b>ah</b>   <b>esp</b> } <i>spi</i>   <b>vrf</b> <i>ivrf-name</i> ]<br><br><b>Example:</b><br>Router# clear crypto sa vrf VPN1 | Clears the IPSec security associations (SAs).                                                                      |

## Troubleshooting VRF-Aware IPSec

To troubleshoot VRF-Aware IPSec, use the following **debug** commands:

### SUMMARY STEPS

1. **enable**
2. **debug crypto ipsec**
3. **debug crypto isakmp**

## DETAILED STEPS

|        | Command or Action                                                                        | Purpose                                                                                                          |
|--------|------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>debug crypto ipsec</b><br><br><b>Example:</b><br>Router# debug crypto ipsec           | Displays IP security (IPSec) events.                                                                             |
| Step 3 | <b>debug crypto isakmp</b><br><br><b>Example:</b><br>Router(config)# debug crypto isakmp | Displays messages about Internet Key Exchange (IKE) events.                                                      |

## Debug Examples for VRF-Aware IPSec

The following sample debug outputs are for a VRF-aware IPSec configuration:

## IPSec PE

Router# **debug crypto ipsec**

```

Crypto IPSEC debugging is on

## Configuration Examples for VRF-Aware IPSec

The following examples show how to configure VRF-Aware IPSec:

- [Static IPSec-to-MPLS VPN Example, page 22](#)
- [IPSec-to-MPLS VPN Using RSA Encryption Example, page 24](#)
- [IPSec-to-MPLS VPN with RSA Signatures Example, page 25](#)
- [Upgrade from Previous Versions of the Cisco Network-Based IPSec VPN Solution, page 28](#)

### Static IPSec-to-MPLS VPN Example

The following sample shows a static configuration that maps IPSec tunnels to MPLS VPNs. The configurations map IPSec tunnels to MPLS VPNs “VPN1” and “VPN2.” Both of the IPSec tunnels terminate on a single public-facing interface.

#### IPSec PE Configuration

```
ip vrf vpn1
 rd 100:1
 route-target export 100:1
 route-target import 100:1
!
ip vrf vpn2
 rd 101:1

## Upgrade from Previous Versions of the Cisco Network-Based IPSec VPN Solution

The VRF-Aware IPSec feature in the Cisco network-based IPSec VPN solution release 1.5 requires that you change your existing configurations.

The sample configurations that follow indicate the changes you must make to your existing configurations. These samples include the following:

- [Site-to-Site Configuration Upgrade, page 28](#)
- [Remote Access Configuration Upgrade, page 29](#)
- [Combination Site-to-Site and Remote Access Configuration Upgrade, page 31](#)

### Site-to-Site Configuration Upgrade

The following configurations show the changes that are necessary for a site-to-site configuration upgrade from a previous version of the network-based IPSec VPN solution to the Cisco network-based IPSec VPN solution release 1.5:

#### Previous Version Site-to-Site Configuration

```

crypto isakmp key VPN1 address 172.21.25.74
crypto isakmp key VPN2 address 172.21.21.74
!
crypto ipsec transform-set VPN1 esp-des esp-sha-hmac
crypto ipsec transform-set VPN2 esp-3des esp-sha-hmac
!
crypto map VPN1 10 ipsec-isakmp
 set peer 172.21.25.74
 set transform-set VPN1
 match address 101
!
crypto map VPN2 10 ipsec-isakmp
 set peer 172.21.21.74
 set transform-set VPN2
 match address 102
!
interface FastEthernet0/0.1
 encapsulation dot1Q 1 native
 ip vrf forwarding VPN1
 ip address 172.21.25.73 255.255.255.0
 crypto map VPN1
!
interface FastEthernet0/0.2
 encapsulation dot1Q 2 native
 ip vrf forwarding VPN2
 ip address 172.21.21.74 255.255.255.0
 crypto map VPN2

```

## New Version Site-to-Site Configuration

The following is an upgraded version of the same site-to-site configuration to the Cisco network-based IPSec VPN solution release 1.5 solution:

### Note

You must change to keyrings. The VRF-Aware IPSec feature requires that keys be associated with a VRF if the IKE local endpoint is in the VRF.

```
crypto keyring VPN1-KEYS vrf VPN1
 pre-shared-key address 172.21.25.74 key VPN1
!
crypto keyring VPN2-KEYS vrf VPN2
 pre-shared-key address 172.21.21.74 key VPN2
!
crypto ipsec transform-set VPN1 esp-des esp-sha-hmac
crypto ipsec transform-set VPN2 esp-3des esp-sha-hmac
!
crypto map VPN1 10 ipsec-isakmp
 set peer 172.21.25.74
 set transform-set VPN1
 match address 101
!
crypto map VPN2 10 ipsec-isakmp
 set peer 172.21.21.74
 set transform-set VPN2
 match address 102
!
interface FastEthernet0/0.1
 encapsulation dot1Q 1 native
 ip vrf forwarding VPN1
 ip address 172.21.25.73 255.255.255.0
 crypto map VPN1
!
interface FastEthernet0/0.2
 encapsulation dot1Q 2 native
 ip vrf forwarding VPN2
 ip address 172.21.21.74 255.255.255.0
 crypto map VPN2
```

## Remote Access Configuration Upgrade

The following configurations show the changes that are necessary for a remote access configuration upgrade from a previous version of the network-based IPSec VPN solution to the Cisco network-based IPSec VPN solution release 1.5:

### Previous Version Remote Access Configuration

```
crypto isakmp client configuration group VPN1-RA-GROUP

!
interface FastEthernet0/0.2
encapsulation dot1Q 2 native
ip vrf forwarding VPN2
ip address 172.21.21.74 255.255.255.0
crypto map VPN2

```

## New Version Remote Access Configuration

In the following instance, there is no upgrade; it is recommended that you change to the following configuration:

```

crypto isakmp client configuration group VPN1-RA-GROUP
key VPN1-RA
pool VPN1-RA
!
crypto isakmp client configuration group VPN2-RA-GROUP
key VPN2-RA
pool VPN2-RA
!
crypto isakmp profile VPN1-RA
match identity group VPN1-RA-GROUP
client authentication list VPN1-RA-LIST
isakmp authorization list VPN1-RA-LIST
client configuration address initiate
client configuration address respond
!
crypto isakmp profile VPN2-RA
match identity group VPN2-RA-GROUP
client authentication list VPN2-RA-LIST
isakmp authorization list VPN2-RA-LIST
client configuration address initiate
client configuration address respond
!
crypto ipsec transform-set VPN1-RA esp-3des esp-sha-hmac
crypto ipsec transform-set VPN2-RA esp-3des esp-md5-hmac
!
crypto dynamic-map VPN1-RA 1

```

```

set transform-set VPN1-RA
set isakmp-profile VPN1-RA
reverse-route
!
crypto dynamic-map VPN2-RA 1
set transform-set VPN2-RA
set isakmp-profile VPN2-RA
reverse-route
!
crypto map VPN1 10 ipsec-isakmp dynamic VPN1-RA
!
crypto map VPN2 10 ipsec-isakmp dynamic VPN2-RA
!
interface FastEthernet0/0.1
encapsulation dot1Q 1 native
ip vrf forwarding VPN1
ip address 172.21.25.73 255.255.255.0
crypto map VPN1
!
interface FastEthernet0/0.2
encapsulation dot1Q 2 native
ip vrf forwarding VPN2
ip address 172.21.21.74 255.255.255.0
crypto map VPN2

```

## Combination Site-to-Site and Remote Access Configuration Upgrade

The following configurations show the changes that are necessary for a site-to-site and remote access configuration upgrade from a previous version of the network-based IPSec VPN solution to the Cisco network-based IPSec VPN solution release 1.5:

### Previous Version Site-to-Site and Remote Access Configuration

```

crypto isakmp key VPN1 address 172.21.25.74 no-xauth
crypto isakmp key VPN2 address 172.21.21.74 no-xauth
!
crypto isakmp client configuration group VPN1-RA-GROUP
key VPN1-RA
pool VPN1-RA
!
crypto isakmp client configuration group VPN2-RA-GROUP
key VPN2-RA
pool VPN2-RA
!
crypto ipsec transform-set VPN1 esp-des esp-sha-hmac
crypto ipsec transform-set VPN2 esp-3des esp-sha-hmac
!
crypto ipsec transform-set VPN1-RA esp-3des esp-sha-hmac
crypto ipsec transform-set VPN2-RA esp-3des esp-md5-hmac
!
crypto dynamic-map VPN1-RA 1
set transform-set VPN1-RA
reverse-route
!
crypto dynamic-map VPN2-RA 1
set transform-set VPN2-RA
reverse-route
!
crypto map VPN1 client authentication list VPN1-RA-LIST
crypto map VPN1 isakmp authorization list VPN1-RA-LIST
crypto map VPN1 client configuration address initiate

```

```

crypto map VPN1 client configuration address respond
crypto map VPN1 10 ipsec-isakmp
set peer 172.21.25.74
set transform-set VPN1
match address 101
crypto map VPN1 20 ipsec-isakmp dynamic VPN1-RA
!
crypto map VPN2 client authentication list VPN2-RA-LIST
crypto map VPN2 isakmp authorization list VPN2-RA-LIST
crypto map VPN2 client configuration address initiate
crypto map VPN2 client configuration address respond
crypto map VPN2 10 ipsec-isakmp
set peer 172.21.21.74
set transform-set VPN2
match address 102
crypto map VPN2 20 ipsec-isakmp dynamic VPN2-RA
!
interface FastEthernet0/0.1
encapsulation dot1Q 1 native
ip vrf forwarding VPN1
ip address 172.21.25.73 255.255.255.0
crypto map VPN1
!
interface FastEthernet0/0.2
encapsulation dot1Q 2 native
ip vrf forwarding VPN2
ip address 172.21.21.74 255.255.255.0
crypto map VPN2

```

## New Version Site-to-Site and Remote Access Configuration

You must upgrade to this configuration:

### Note

For site-to-site configurations that do not require XAUTH, configure an ISAKMP profile without XAUTH configuration. For remote access configurations that require XAUTH, configure an ISAKMP profile with XAUTH.

```

crypto keyring VPN1-KEYS vrf VPN1
pre-shared-key address 172.21.25.74 key VPN1
!
crypto keyring VPN2-KEYS vrf VPN2
pre-shared-key address 172.21.21.74 key VPN2
!
crypto isakmp client configuration group VPN1-RA-GROUP
key VPN1-RA
pool VPN1-RA
!
crypto isakmp client configuration group VPN2-RA-GROUP
key VPN2-RA
pool VPN2-RA
!
crypto isakmp profile VPN1
keyring VPN1-KEYS
match identity address 172.21.25.74 VPN1
!
crypto isakmp profile VPN2
keyring VPN2-KEYS
match identity address 172.21.21.74 VPN2
!
crypto isakmp profile VPN1-RA

```

```
match identity group VPN1-RA-GROUP
client authentication list VPN1-RA-LIST
isakmp authorization list VPN1-RA-LIST
client configuration address initiate
client configuration address respond
!
crypto isakmp profile VPN2-RA
match identity group VPN2-RA-GROUP
client authentication list VPN2-RA-LIST
isakmp authorization list VPN2-RA-LIST
client configuration address initiate
client configuration address respond
!
crypto ipsec transform-set VPN1 esp-des esp-sha-hmac
crypto ipsec transform-set VPN2 esp-3des esp-sha-hmac
!
crypto ipsec transform-set VPN1-RA esp-3des esp-sha-hmac
crypto ipsec transform-set VPN2-RA esp-3des esp-md5-hmac
!
crypto dynamic-map VPN1-RA 1
set transform-set VPN1-RA
set isakmp-profile VPN1-RA
reverse-route
!
crypto dynamic-map VPN2-RA 1
set transform-set VPN2-RA
set isakmp-profile VPN2-RA
reverse-route
!
crypto map VPN1 10 ipsec-isakmp
set peer 172.21.25.74
set transform-set VPN1
set isakmp-profile VPN1
match address 101
crypto map VPN1 20 ipsec-isakmp dynamic VPN1-RA
!
crypto map VPN2 10 ipsec-isakmp
set peer 172.21.21.74
