Urban Design and Networked Development

The way people live, work, learn, and play in 21st-century cities is changing. As a result, city designs and developments are becoming increasingly characterized by a people-centric approach toward a networked-built environment differentiated by interaction, collaboration, responsiveness, on-demand uses, and ubiquitous availability of digital technology.

This session will engage participants in a discussion on how people-driven, technologically enhanced city design and development can transform urban life, the experience of "place," and real estate demand. The session will explore perspectives on citizen experience, new trends in urban design and the impacts on traditional real estate uses, and public-private partnerships and other new operating models.

Panelists will explore:

1. How has the citizen experience of the city been enhanced?
2. What are trends in new city design to create connection, collaboration and convenience? How is the resulting real estate impacted as cities transition to multipurpose, space on demand programmable entities?
3. How are these new cities disrupting traditional real estate uses of space?
4. What is the impact on the real estate business models and what are the resulting value propositions?
