The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established.

This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

Creates unintercepted coroutine without receiver and with result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

Intercepts this continuation with [ContinuationInterceptor]. This function shall be used on the immediate result of [createCoroutineUnintercepted] or [suspendCoroutineUninterceptedOrReturn], in which case it checks for [ContinuationInterceptor] in the continuation's [context][Continuation.context], invokes [ContinuationInterceptor.interceptContinuation], caches and returns the result. If this function is invoked on other [Continuation] instances it returns `this` continuation unchanged.

compiler gives same name in JavaScript, you can\n        * mark one with `@JsName(...)` to prevent the compiler from
reporting error.\n        * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names\n        * for functions with parameters, which is unnatural for usual JavaScript developer.\n        * You can put `@JsName(...)`
on functions you want to be available from JavaScript.\n        * * For some reason you want to rename declaration, e.g.
there's common term in JavaScript\n        * for a concept provided by the declaration, which is uncommon in Kotlin.\n        * Example:\n        * ``` kotlin\n        * class Person(val name: String) {\n        * fun hello() {\n        * println(\"Hello
$name!\")\n        * }\n        * @JsName(\"helloWithGreeting\")\n        * fun hello(greeting: String) {\n        *
println(\"$greeting $name!\")\n        * }\n        * }\n        * ```\n        * \n        * @property name the name which compiler uses both for
declaration itself and for all references to the declaration.\n        * It's required to denote a valid JavaScript
identifier.\n        * \n        * @Retention(AnnotationRetention.BINARY)\n        @Target(CLASS, FUNCTION, PROPERTY,

val name: String)\n        \n        */\n        * Denotes an `external` declaration that must be imported from native JavaScript
library.\n        * The compiler produces the code relevant for the target module system, for example, in case of
CommonJS,\n        * it will import the declaration via the `require(...)` function.\n        * The annotation can be used on
top-level external declarations (classes, properties, functions) and files.\n        * In case of file (which can't be `external`)
the following rule applies: all the declarations in\n        * the file must be `external`. By applying `@JsModule(...)` on a
file you tell the compiler to import a JavaScript object\n        * that contain all the declarations from the file.\n        * Example:\n        * ``` kotlin\n        * @JsModule(\"jquery\")\n        * external abstract class JQuery() {\n        * // some
declarations here\n        * }\n        * @JsModule(\"jquery\")\n        * external fun JQuery(element: Element): JQuery\n        * ```\n        * \n        * @property import name of a module to import declaration from.\n        * It is not interpreted by the Kotlin
compiler, it's passed as is directly to the target module system.\n        * \n        * @see JsNonModule\n        * \n        * @Retention(AnnotationRetention.BINARY)\n        @Target(CLASS, PROPERTY, FUNCTION, FILE)\n        public
annotation class JsModule(val import: String)\n        \n        */\n        * Denotes an `external` declaration that can be used without
module system.\n        * By default, an `external` declaration is available regardless your target module system.\n        *

```

However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.

Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available as an npm package. To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation. For example:

```
kotlin
@JsModule("jquery")
@JsNonModule
@JsName("$")
external abstract class JQuery() {
    // some declarations here
}
@JsModule("jquery")
@JsNonModule
@JsName("$")
external fun JQuery(element: Element):

 * Adds prefix to `external`
 * declarations in a source file.
 * JavaScript does not have concept of packages (namespaces). They are usually
 * emulated by nested objects.
 * The compiler turns references to `external` declarations either to plain unprefixd
 * names (in case of *plain* modules) or to plain imports.
 * However, if a JavaScript library provides its
 * declarations in packages, you won't be satisfied with this.
 * You can tell the compiler to generate additional prefix

 * annotation.
 * Note that a file

 * declarations.
 * Example:

 * @file:JsQualifier("my.jsPackageName")
 * package some.kotlinPackage

 *
 * @property value the qualifier to add to the declarations in the

 * Represents a source of elements with a [keyOf] function, which can be applied to each element to get its key.
 * A [Grouping] structure serves as an intermediate step in group-and-fold operations:
 * they group elements by their keys and then fold each group with some aggregating operation.
 * It is created by attaching `keySelector: (T) -> K` function to a source of elements.
 * To get an instance of [Grouping] use one of `groupingBy` extension functions:
 * - [Iterable.groupingBy]
 * - [Sequence.groupingBy]
 * - [Array.groupingBy]
 * - [CharSequence.groupingBy]
 * For the list of group-and-fold operations available, see the [extension functions](#extension-functions) for `Grouping`.

returned from lambda argument.
* When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter.
* Example:
@OverloadResolutionByLambdaReturnType fun create(intProducer: () -> Int): Int fun create(doubleProducer: () -> Double): Double val newValue = create { 3.14 }
* The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function.
* This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported.

kotlin.native.concurrent.SharedImmutable\n\n/**\n * Defines deep recursive function that keeps its stack on the
heap,\n * which allows very deep recursive computations that do not use the actual call stack.\n * To initiate a call to
this deep recursive function use its [invoke] function.\n * As a rule of thumb, it should be used if recursion goes
deeper than a thousand calls.\n *\n * The [DeepRecursiveFunction] takes one parameter of type [T] and returns a
result of type [R].\n * The [block] of code defines the body of a recursive function. In this block\n *
[callRecursive][DeepRecursiveScope.callRecursive] function can be used to make a recursive call\n * to the
declared function. Other instances of [DeepRecursiveFunction] can be called\n * in this scope with `callRecursive`
extension, too.\n *\n * For example, take a look at the following recursive tree class and a deeply\n * recursive
instance of this tree with 100K nodes:\n *\n * ```\n * class Tree(val left: Tree? = null, val right: Tree? = null)\n * val
deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()\n * ```\n *\n * A regular recursive function
can be defined to compute a depth of a tree:\n *\n * ```\n * fun depth(t: Tree?): Int =\n *     if (t == null) 0 else
max(depth(t.left), depth(t.right)) + 1\n * println(depth(deepTree)) // StackOverflowError\n * ```\n *\n * If this
`depth` function is called for a `deepTree` it produces [StackOverflowError] because of deep recursion.\n *
However, the `depth` function can be rewritten using `DeepRecursiveFunction` in the following way, and then\n * it
successfully computes [depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n *\n * ```\n * val depth =
DeepRecursiveFunction<Tree?, Int> { t ->\n *     if (t == null) 0 else max(callRecursive(t.left),
callRecursive(t.right)) + 1\n * }\n * println(depth(deepTree)) // Ok\n * ```\n *\n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]
extension. For example, the\n * following pair of mutually recursive functions computes the number of tree nodes at
even depth in the tree.\n *\n * ```\n * val mutualRecursion = object {\n *     val even:
DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->\n *         if (t == null) 0 else
odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1\n *     }\n *     val odd: DeepRecursiveFunction<Tree?,
Int> = DeepRecursiveFunction { t ->\n *         if (t == null) 0 else even.callRecursive(t.left) +
even.callRecursive(t.right)\n *     }\n * }\n * ```\n *\n * @param [T] the function parameter type.\n * @param [R]
