DEALINGS IN THE SOFTWARE.\n\n// a transform stream is a readable/writable stream where you do\n// something with the
data. Sometimes it's called a \"filter\",
\n// but that's not a great name for it, since that implies a thing where\n// some bits pass through, and others
are simply ignored. (That would\n// be a valid example of a transform, of course.)\n\n// While the output is
causally related to the input, it's not a\n// necessarily
symmetric or synchronous transformation. For example,\n// a zlib stream might take multiple plain-text writes(),
and then\n// emit a single compressed chunk some time in the future.\n\n// Here's how this works:\n\n// The
Transform stream has all the aspects of the readable and writable\n// stream classes. When you write(chunk), that
calls _write(chunk,cb)\n// internally, and returns false if there's a lot of pending writes\n// buffered up. When
you call read(), that calls _read(n) until\n// there's enough pending readable data buffered up.\n\n// In a transform
stream, the written data is placed in a buffer. When\n// _read(n) is called, it transforms the queued up data, calling
the\n// buffered _write cb's as it consumes chunks. If consuming a single\n// written chunk would result in multiple
output chunks, then the first\n// outputted bit calls the readcb, and subsequent chunks just go into\n// the read
buffer, and will cause it to emit 'readable' if necessary.\n\n//
This way, back-pressure is actually determined by the reading side,\n// since _read has to be called to start
processing a new chunk. However,\n// a pathological inflate type of transform can cause excessive buffering\n//
here. For example, imagine a stream where every byte of input is\n// interpreted as an integer from 0-255, and then
results in that many\n// bytes of output. Writing the 4 bytes {ff,ff,ff,ff} would result in\n// 1kb of data being
output. In this case, you could write a very small\n// amount of input, and end up with a very large amount of
output. In\n// such a pathological inflating mechanism, there'd be no way to tell\n// the system to stop doing the
transform. A single 4MB write could\n// cause the system to run out of memory.\n\n// However, even in such a
pathological case, only a single written chunk\n// would be consumed, and then the rest would wait (un-transformed)
until\n// the results of the previous transformed chunk were consumed.\n\n'use strict';\n\nmodule.exports

In modern non-IE browsers, we can support both forward and backward selections.
Note: IE10+ supports the Selection object, but it does not support the `extend` method, which means that even in modern IE, it's not possible to programmatically create a backward selection. Thus, for all IE versions, we use the old IE API to create our selections.

@param {DOMElement|DOMTextNode} node
@param {object} offsets
function setModernOffsets(node, offsets) {
 if (!window.getSelection) {
 return;
 }
 var selection = window.getSelection();
 var length = node[getTextContentAccessor()].length;
 var start = Math.min(offsets.start, length);
 var end = offsets.end === undefined ? start : Math.min(offsets.end, length);
 // IE 11 uses modern selection, but doesn't support the extend method.
 // Flip backward selections, so we can set with a single range.
 if (!selection.extend && start > end) {
 var temp = end;
 end = start;
 start = temp;
 }
 var startMarker = getNodeForCharacterOffset(node, start);
 var endMarker = getNodeForCharacterOffset(node, end);
 if (startMarker && endMarker) {
 var range = document.createRange();
 range.setStart(startMarker.node, startMarker.offset);

```

Currently this is all private API, but this is the minimal API necessary that an Emitter must implement to fully support the parser.

Minimal interface:

- addKeyword(text, kind)
- addText(text)
- addSublanguage(emitter, subLanguageName)
- finalize()
- openNode(kind)
- closeNode()
- closeAllNodes()
- toHTML()

`TokenTreeEmitter` extends

```

It does\n * this by creating a huge (a|b|c) regex - each individual item\n * wrapped with ()\n * and joined by `|` - using match groups to track position. When a match is\n * found checking\n * which position in the array has content allows us to figure\n * out which of the original regexes / match groups\n * triggered the match.\n *\n * The match object itself (the result of `Regex.exec`) is returned but also\n * enhanced by\n * merging in any meta-data that was registered with the regex.\n * This is how we keep track of which mode matched,\n * and what type of rule\n * (illegal, `begin`, end, etc).\n */
```

```
\n class MultiRegex {\n constructor() {\n this.matchIndexes = {};\n // @ts-ignore\n this.regexes =\n [];\n this.matchAt = 1;\n this.position = 0;\n }\n\n // @ts-ignore\n addRule(re, opts) {\n opts.position\n = this.position++;\n // @ts-ignore\n this.matchIndexes[this.matchAt] = opts;\n this.regexes.push([opts,\n re]);\n this.matchAt += countMatchGroups(re) + 1;\n }\n\n compile() {\n if (this.regexes.length === 0) {\n // avoids the need to check length every time exec is called\n // @ts-ignore\n this.exec = () => null;\n }\n const terminators = this.regexes.map(el => el[1]);\n this.matcherRe = langRe(join(terminators), true);\n this.lastIndex = 0;\n }\n\n /** @param {string} s */\n exec(s) {\n this.matcherRe.lastIndex =\n this.lastIndex;\n const match = this.matcherRe.exec(s);\n if (!match) { return null; }\n // eslint-disable-\n next-line no-undefined\n }
```

```
 const i = match.findIndex((el, i) => i > 0 && el !== undefined);\n // @ts-ignore\n const matchData =\n this.matchIndexes[i];\n // trim off any earlier non-relevant match groups (ie, the other regex\n // match groups\n that make up the multi-matcher)\n match.splice(0, i);\n return Object.assign(match, matchData);\n }\n\n /**\n * Created to solve the key deficiency with MultiRegex - there is no way to\n * test for multiple matches\n * at a single location. Why would we need to do\n * that? In the future a more dynamic engine will allow certain\n * matches to be\n * ignored. An example: if we matched say the 3rd regex in a large group but\n * decided to ignore\n * it - we'd need to start testing again at the 4th\n * regex... but MultiRegex itself gives us no real way to do that.\n *\n * So what this class creates MultiRegexes on the fly for whatever search\n * position they are needed.\n *\n * NOTE:\n * These additional MultiRegex objects are
```

created dynamically. For most grammars most of the time we will never actually need anything more than the first MultiRegex - so this shouldn't have too much overhead.

Say this is our search group, and we match regex3, but wish to ignore it.

```
regex1 | regex2 | regex3 | regex4 | regex5
```

'ie, startAt = 0

What we need is a new MultiRegex that only includes the remaining possibilities:

```
regex4 | regex5
```

'ie, startAt = 3

This class wraps all that complexity up in a simple API... `startAt` decides where in the array of expressions to start doing the matching. It auto-increments, so if a match is found at position 2, then startAt will be set to 3. If the end is reached startAt will return to 0.

MOST of the time the parser will be setting startAt manually to 0.

```
*/\n class ResumableMultiRegex {\n constructor() {\n // @ts-ignore\n this.rules =\n [];\n // @ts-ignore
```

```
 this.multiRegexes = [];\n this.count = 0;\n this.lastIndex = 0;\n this.regexIndex = 0;\n }\n\n // @ts-\n ignore\n getMatcher(index) {\n if (this.multiRegexes[index]) return this.multiRegexes[index];\n const\n matcher = new MultiRegex();\n this.rules.slice(index).forEach(([re, opts]) => matcher.addRule(re, opts));\n matcher.compile();\n this.multiRegexes[index] = matcher;\n return matcher;\n }\n\n resumingScanAtSamePosition() {\n return this.regexIndex !== 0;\n }\n\n considerAll() {\n this.regexIndex\n = 0;\n }\n\n // @ts-ignore\n addRule(re, opts) {\n this.rules.push([re, opts]);\n if (opts.type ===\n \"begin\") this.count++;\n }\n\n /** @param {string} s */\n exec(s) {\n const m =\n this.getMatcher(this.regexIndex);\n m.lastIndex = this.lastIndex;\n let result = m.exec(s);\n // The\n following is because we have no easy way to say \"resume scanning at the
```

```
existing position but also skip the current rule ONLY\". What happens is
```

```
// all prior rules are also skipped\n// which can result in matching the wrong\n// thing. Example of matching \"booger\":\n// our matcher is
```

```

[string, \"booger\", number]\n //\n // ...booger...\n\n // if \"booger\" is ignored then we'd really need a
regex to scan from the\n // SAME position for only: [string, number] but ignoring \"booger\" (if it\n // was the
first match), a simple resume would scan ahead who knows how\n // far looking only for \"number\", ignoring
potential string matches (or\n // future \"booger\" matches that might be valid.)\n\n // So what we do: We
execute two matchers, one resuming at the same\n // position, but the second full matcher starting at the position
after:\n\n // /--- resume first regex match here (for [number])\n // |---- full match here for [string,
\"booger\", number]\n // vv\n // ...booger...\n\n
// Which ever results in a match first is then used. So this 3-4 step\n // process essentially allows us to say
\"match at this position, excluding\n // a prior rule that was ignored\".\n // 1. Match \"booger\" first,
ignore. Also proves that [string] does non match.\n // 2. Resume matching for [number]\n // 3. Match at index
+ 1 for [string, \"booger\", number]\n // 4. If #2 and #3 result in matches, which came first?\n // if
(this.resumeScanAtSamePosition()) {\n // if (result && result.index === this.lastIndex) ; else { // use the second
matcher result\n // const m2 = this.getMatcher(0);\n // m2.lastIndex = this.lastIndex + 1;\n // result =
m2.exec(s);\n // }\n // }\n // if (result) {\n // this.regexIndex += result.position + 1;\n // if (this.regexIndex
=== this.count) {\n // // wrap-around to considering all matches again\n // this.considerAll();\n // }\n // }\n\n
}\n\n
return result;\n }\n }\n\n /**\n * Given a mode, builds a huge ResumableMultiRegex that can be used to
walk\n * the content and find matches.\n * @param {CompiledMode} mode\n * @returns

/**
 * Gets the timestamp of the number of milliseconds that
 * have elapsed since the Unix epoch (1 January 1970 00:00:00 UTC).
 * @static
 * @memberOf _
 * @since 2.4.0
 * @category Date
 * @returns {number} Returns the timestamp.
 * @example
 * _defer(function(stamp) {
 * console.log(_now() - stamp);
 * }, _now()); // => Logs the number of
 * milliseconds it took for the deferred invocation.
 */
var now = function() {
 return root.Date.now();
};

/**
 * Creates a debounced function that delays invoking `func` until after `wait`
 * milliseconds have elapsed since the last time the debounced function was
 * invoked. The debounced function comes with a `cancel` method to
 * cancel delayed `func` invocations and a `flush` method to immediately
 * invoke them. Provide `options` to indicate whether `func` should be
 * invoked on the leading and/or trailing edge of the `wait` timeout.
 * The `func` is invoked with the last arguments provided to the
 * debounced function. Subsequent calls to the debounced function
 * return the result of the last `func` invocation.
 *
 * **Note:** If `leading` and `trailing` options are `true`,
 * `func` is invoked on the trailing edge of the timeout only if the
 * debounced function is invoked more than once during the `wait`
 * timeout. If `wait` is `0` and `leading` is `false`, `func`
 * invocation is deferred until to the next tick, similar to
 * `setTimeout` with a timeout of `0`. See [David Corbacho's
 * article](https://css-tricks.com/debouncing-throttling-explained-examples/)
 * for details over the differences between `_.debounce` and
 * `_.throttle`.
 * @static
 * @memberOf _
 * @since 0.1.0
 * @category Function
 * @param {Function} func The function to debounce.
 * @param {number} [wait=0] The number of milliseconds to delay.
 * @param {Object} [options={}] The options object.
 * @param {boolean} [options.leading=false] Specify
 * invoking on the leading edge of the timeout.
 * @param {number} [options.maxWait] The maximum
 * time `func` is allowed to be delayed before it's invoked.
 * @param {boolean} [options.trailing=true] Specify
 * invoking on the trailing edge of the timeout.
 * @returns {Function} Returns the new debounced function.
 * @example
 * // Avoid costly calculations while the window size is in flux.
 * jQuery(window).on('resize',
 * _.debounce(calculateLayout, 150));
 * // Invoke `sendMail` when clicked, debouncing subsequent calls.
 * jQuery(element).on('click',
 * _.debounce(sendMail, 300, {
 * 'leading': true,
 * 'trailing': false
 * }));
 * // Ensure `batchLog` is invoked once after 1 second of
 * debounced calls.
 * var debounced = _.debounce(batchLog,
 * 250, { 'maxWait': 1000 });
 * var source = new EventSource('/stream');
 * jQuery(source).on('message',
 * debounced);
 * // Cancel the trailing debounced invocation.
 * jQuery(window).on('popstate',
 * debounced.cancel);
