// match groups that make up the multi-matcher)\n match.splice(0, i);\n\n return Object.assign(match,

```

matchData); } } } Created to solve the key deficiency with MultiRegex - there is no way to test for multiple matches at a single location. Why would we need to do that? In the future a more dynamic engine will allow certain matches to be ignored. An

example: if we matched say the 3rd regex in a large group but decided to ignore it - we'd need to start testing again at the 4th regex... but MultiRegex itself gives us no real way to do that. So what this class creates MultiRegexes on the fly for whatever search position they are needed. NOTE: These additional MultiRegex objects are created dynamically. For most grammars most of the time we will never actually need anything more than the first MultiRegex - so this shouldn't have too much overhead. Say this is our search group, and we match regex3, but wish to ignore it. regex1 | regex2 | regex3 | regex4 | regex5 'ie, startAt = 0 What we need is a new MultiRegex that only includes the remaining possibilities: regex4 | regex5

'ie, startAt = 3 This class wraps all that complexity up in a simple API... `startAt` decides where in the array of expressions to start doing

the matching. It auto-increments, so if a match is found at position 2, then startAt will be set to 3. If the end is reached startAt will return to 0. MOST of the time the parser will be setting startAt manually to 0.

```

class ResumableMultiRegex {
  constructor() {
    // @ts-ignore
    this.rules = [];
    // @ts-ignore
    this.multiRegexes = [];
    this.count = 0;
    this.lastIndex = 0;
    this.regexIndex = 0;
  }
  // @ts-ignore
  getMatcher(index) {
    if (this.multiRegexes[index]) return this.multiRegexes[index];
    const
    matcher = new MultiRegex();
    this.rules.slice(index).forEach((re, opts) => matcher.addRule(re, opts));
    matcher.compile();
    this.multiRegexes[index] = matcher;
    return matcher;
  }
  resumingScanAtSamePosition() {
    return this.regexIndex !== 0;
  }
  considerAll() {
    this.regexIndex = 0;
  }
  // @ts-ignore
  addRule(re,
  opts) {
    this.rules.push([re, opts]);
    if (opts.type === "begin") this.count++;
  }
  /** @param
  {string} s
  */
  exec(s) {
    const m = this.getMatcher(this.regexIndex);
    m.lastIndex = this.lastIndex;
    let result = m.exec(s);
    // The following is because we have no easy way to say "resume scanning at the
    // existing position but also skip the current rule ONLY". What happens is
    // all prior rules are also skipped
    // which can result in matching the wrong
    // thing. Example of matching "booger":
    // our matcher is
    [string, "booger", number]
    // ...booger...
    // if "booger" is ignored then we'd really need a
    // regex to scan from the
    // SAME position for only: [string, number] but ignoring "booger" (if it
    // was the
    // first match), a simple resume would scan ahead who knows how
    // far looking only for "number", ignoring
    // potential string matches (or
    // future
    // "booger" matches that might be valid.)
    // So what we do: We execute two matchers, one resuming at the
    // position, but the second full matcher starting at the position after:
    // /--- resume first regex
    // match here (for [number])
    // /---- full match here for [string, "booger", number]
    // vv
    // ...booger...
    // Which ever results in a match first is then used. So this 3-4 step
    // process essentially
    // allows us to say "match at this position, excluding
    // a prior rule that was ignored".
    // 1. Match
    // "booger" first, ignore. Also proves that [string] does non match.
    // 2. Resume matching for [number]
    // 3. Match at index + 1 for [string, "booger", number]
    // 4. If #2 and #3 result in matches, which came first?
    if (this.resumingScanAtSamePosition()) {
      if (result && result.index === this.lastIndex) ; else { // use the
      second matcher result

```

```

      const m2 = this.getMatcher(0);
      m2.lastIndex = this.lastIndex + 1;
      result = m2.exec(s);
    }
  }

```

input's value using JavaScript value property APIs instead of React's `value` implementation that uses HTML value attributes. This is useful in situations where we don't want to surface an input's value into the HTML/CSS-exposed side of the DOM, for example to avoid sequential input chaining attacks [1].

from '@babel/runtime-corejs3/regenerator';\n\n// The subtree resolver is a higher-level interface that allows you
to\n// get the same result that you would from `Swagger.resolve`, but focuses on\n// a subtree of your object.\n\n// It
makes several assumptions that allow you to think less about what resolve,\n// specmap, and normalizeSwagger
are doing: if this is not suitable for you,\n// you can emulate `resolveSubtree`'s behavior by talking to the
traditional\n\n// resolver directly.\n\n// By providing a top-level `obj` and a `path` to resolve within, the subtree\n// at `path` will be
resolved and normalized in the context of your top-level\n// `obj`. You'll get the resolved subtree you're interest in
as a return value\n// (or, you can use `returnEntireTree` to get everything back).\n\n// This is useful for cases where
resolving your entire object is unnecessary\n// and/or non-performant; we use this interface for lazily resolving
operations\n// and models in Swagger-UI, which allows us to handle larger definitions.\n\n// It's likely that
Swagger-Client will rely entirely on lazy resolving in\n// future versions.\n\n// TODO: move the remarks above

The debounced function comes with a `cancel` method\n      to cancel\n      `func`

```

invocations and a `flush` method to immediately invoke them.
 * Provide `options` to indicate whether `func` should be invoked on the leading and/or trailing edge of the `wait` timeout. The `func` is invoked with the last arguments provided to the debounced function. Subsequent calls to the debounced function return the result of the last `func` invocation.
 * **Note:** If `leading` and `trailing` options are `true`, `func` is invoked on the trailing edge of the timeout only if the debounced function is invoked more than once during the `wait` timeout.
 * If `wait` is `0` and `leading` is `false`, `func` invocation is deferred until to the next tick, similar to `setTimeout` with a timeout of `0`.
 * See [David Corbacho's article](https://css-tricks.com/debouncing-throttling-explained-examples/)

```

* for details over the differences between `_.debounce` and `_.throttle`
@static
@memberOf _
@since 0.1.0
@category Function
@param {Function} func The function to debounce.
@param {number} [wait=0] The number of milliseconds to delay.
@param {Object} [options={}] The options object.
  @param {boolean} [options.leading=false] Specify invoking on the leading edge of the timeout.
  @param {number} [options.maxWait] The maximum time `func` is allowed to be delayed before it's invoked.
  @param {boolean} [options.trailing=true] Specify invoking on the trailing edge of the timeout.
@returns {Function} Returns the new debounced function.
@example
// Avoid costly calculations while the window size is in flux.
jQuery(window).on('resize', _.debounce(calculateLayout, 150));
// Invoke `sendMail` when clicked, debouncing subsequent calls.
jQuery(element).on('click', _.debounce(sendMail, 300, {
  'leading': true,
  'trailing': false
}));
// Ensure `batchLog` is invoked once after 1 second of debounced calls.
var debounced = _.debounce(batchLog, 250, { 'maxWait': 1000 });
