/**
 * An extension of the "same-value" algorithm as [described for use by ES6 Map and Set](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Map#Key_equality)
 * NaN is considered the same as NaN, however -0 and 0 are considered the same value, which is different from the algorithm described by Object.is](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Object/is).
 * This is extended further to allow Objects to describe the values they represent, by way of `valueOf` or `equals` (and `hashCode`).
 * Note: because of this extension, the key equality of Immutable.Map and the value equality of Immutable.Set will differ from ES6 Map and Set.
 * ### Defining custom values
 * The easiest way to describe the value an object represents is by implementing
 * `valueOf`. For example, `Date` represents a value by returning a unix timestamp for `valueOf`:
 * var date1 = new Date(1234567890000); // Fri Feb 13 2009 ...
 * var date2 = new Date(1234567890000);
 * date1.valueOf(); // 1234567890000
 * assert( date1 !== date2 );
 * assert( Immutable.is( date1, date2 ) );
 * Note: overriding `valueOf` may have other implications if you use this object where JavaScript expects a primitive, such as implicit string coercion.
 * For more complex types, especially collections, implementing `valueOf` may not be performant. An alternative is to implement `equals` and `hashCode`.
 * `equals` takes another object, presumably of similar type, and returns true if the it is equal. Equality is symmetrical, so the same result should be returned if this and the argument are flipped.
 * assert( a.equals(b) === b.equals(a) );
 * `hashCode` returns a 32bit integer number representing the object which will be used to determine how to store the value object in a Map or Set. You must provide both or neither methods, one must not exist without the other.
 * Also, an important relationship between these methods must be upheld: if two values are equal, they must return the same hashCode. If the values are not equal, they might have the same hashCode; this is called a hash collision, and while undesirable for performance reasons, it is acceptable.
 * if (a.equals(b)) {
assert( a.hashCode() === b.hashCode() );
}
 * All Immutable collections implement `equals` and `hashCode`.
 * function is(valueA, valueB) {
if (valueA === valueB || (valueA !== valueA && valueB !== valueB)) {
return true;
}

Edge, appending nodes with no children is dramatically faster than appending a full subtree, so we essentially queue up the .appendChild calls here and apply them so each node is added to its parent before any children are added. In other browsers, doing so is

slower or neutral compared to the other order (in Firefox, twice as slow) so we only do this inversion in IE. See <https://github.com/spicyj/innerHTML-vs-createelement-vs-clonode>.

Copies properties of `source` to `object`.
@private
@param {Object} source The object to copy properties from.
@param {Array} props The property identifiers to copy.
@param {Object} [object={}] The object to copy properties to.
@param {Function} [customizer] The function to customize copied values.
@returns {Object} Returns `object`.
function copyObject(source, props, object, customizer) {
 var isNew = !object;
 object || (object = {});
 var index = -1,
 length = props.length;
 while (++index < length) {
 var key = props[index];
 var newValue = customizer ? customizer(object[key], source[key], key, object, source) : undefined;
 if (newValue === undefined) {

 }
 }
 return object;
}
module.exports = copyObject;
var baseGetTag = require('./_baseGetTag'),
getPrototype = require('./_getPrototype'),
isObjectLike = require('./isObjectLike');

Object#toString result references.
var objectTag = '[object Object]';
Used for built-in method references.
var funcProto = Function.prototype,
 objectProto = Object.prototype;
Used to resolve the decompiled source of functions.
var funcToString = funcProto.toString;
Used to check objects for own properties.
var hasOwnProperty = objectProto.hasOwnProperty;
Used to infer the `Object` constructor.
var objectCtorString = funcToString.call(Object);
Checks if `value` is a plain object, that is, an object created

```

by the `Object` constructor or one with a `[[Prototype]]` of `null`.
@static @memberOf _
@since 0.8.0
@category Lang
@param {*} value The value to check.
@returns {boolean} Returns `true` if `value` is a plain object, else `false`.
@example
function Foo() {
  this.a = 1;
}
_isPlainObject(new Foo()); // => false
_isPlainObject([1, 2, 3]); // => false
_isPlainObject({ 'x': 0, 'y': 0 }); // => true
_isPlainObject(Object.create(null)); // => true

 * Adds a change listener. It will be called any time an action is dispatched,
 * and some part of the state tree may
potentially have changed. You may then
 * call `getState()` to read the current state tree inside
the callback.
 * You may call `dispatch()` from a change listener, with the following
 * caveats:
 *
 * 1. The subscriptions are snapshotted just before every `dispatch()` call.
 * If you subscribe or unsubscribe while
the listeners are being invoked, this
 * will not have any effect on the `dispatch()` that is currently in progress.
 * However, the next `dispatch()` call, whether nested or not, will use a more
 * recent snapshot of the subscription
list.
 *
 * 2. The listener should not expect to see all state changes, as the state
 * might have been updated
multiple times during a nested `dispatch()` before
 * the listener is called. It is, however, guaranteed that all
subscribers
 * registered before the `dispatch()` started will be called with the latest
 * state by the time it
exits.

```

Performs the functionality of what modern browsers do when `String.prototype.split()` is called with a regular expression that contains capturing parenthesis. For example: // Modern browsers: `"a,b,c".split(/(,)/);` // --> `['a', ',', 'b', ',', 'c']` // Old IE (including IE8): `"a,b,c".split(/(,)/);` // --> `['a', 'b', 'c']`

This method emulates the functionality of modern browsers for the old IE case.

**@param** {String} str The string to split.

**@param** {RegExp} splitRegex The regular expression to split the input `str` on. The splitting character(s) will be spliced into the array, as in the "modern browsers" example in the description of this method. Note #1: the supplied regular expression **must** have the 'g' flag specified. Note #2: for simplicity's sake, the regular expression does not need to contain capturing parenthesis - it will be assumed that any match has them.

**@return** {String[]} The split array of strings, with the splitting character(s) included.

**^/next export function**

```

splitAndCapture(str, splitRegex) {\n if (!splitRegex.global)\n throw new Error("`splitRegex` must have the 'g' flag set");\n var result = [], lastIdx = 0, match;\n while (match = splitRegex.exec(str)) {\n result.push(str.substring(lastIdx, match.index));\n result.push(match[0]); // push the splitting char(s)\n lastIdx = match.index + match[0].length;\n }\n result.push(str.substring(lastIdx));\n\n return result;\n}

```

Function that should never be called but is used to check that every enum value is handled using TypeScript's 'never' type.

**^/next export function** `throwUnhandledCaseError(theValue)` {  
 throw new Error("Unhandled case for value: " + theValue + "");  
 // sourceMappingURL=utils.js.map\n", "import { indexOf } from './utils';  
 @class Autolinker.HtmlTag  
 @extends Object  
 Represents an HTML tag, which can be used to easily build/modify HTML tags programmatically. Autolinker uses this abstraction to create HTML tags, and then write them out as strings. You may also use this class in your code, especially within a `{@link Autolinker#replaceFn replaceFn}`.  
 ## Examples  
 Example instantiation:  

```

var tag = new Autolinker.HtmlTag({\n tagName : 'a',\n attrs : { 'href': 'http://google.com', 'class': 'external-link' },\n innerHtml : 'Google' });\n\n tag.toAnchorString(); // Google

```

 Individual accessor methods  

```

tag.getTagName(); // 'a'\n tag.getAttr('href'); // 'http://google.com'\n tag.hasClass('external-link'); // true

```

 Using mutator methods (which may be used in combination with instantiation config properties):  

```

var tag = new Autolinker.HtmlTag();\n tag.setTagName('a');\n tag.setAttr('href', 'http://google.com');\n tag.addClass('external-link');\n tag.setInnerHtml('Google');\n\n tag.getTagName(); // 'a'\n tag.getAttr('href'); // 'http://google.com'\n tag.hasClass('external-link'); // true\n tag.toAnchorString(); // Google

```

 ## Example use within a `{@link Autolinker#replaceFn replaceFn}`  

```

var html = Autolinker.link("Test google.com", {\n replaceFn : function(match) {\n var tag = match.buildTag(); // returns an {@link Autolinker.HtmlTag} instance, configured with the Match's href and anchor text\n tag.setAttr('rel', 'nofollow');\n return tag;\n }\n });\n\n // generated html:\n // Test google.com

```

 ## Example use with a new tag for the replacement  

```

var html = Autolinker.link("Test google.com", {\n replaceFn : function(match) {\n var tag = new Autolinker.HtmlTag({\n tagName : 'button',\n attrs : { 'title': 'Load URL: ' + match.getAnchorHref() },\n innerHtml : 'Load URL: ' + match.getAnchorText()\n });\n return tag;\n }\n });\n\n // generated html:\n // Test <button title="Load URL: http://google.com">Load URL: google.com</button>

```

`HtmlTag = /** @class */ (function () {\n /**\n * @method constructor\n * @param {Object} [cfg] The configuration properties for this class, in an Object (map)\n *\n * function HtmlTag(cfg) {\n * if (cfg === void 0) { cfg = {};\n * }\n *\n * @cfg {String} tagName\n * The tag name. = function () {
 return this.matchedText;
};

/**
 * Sets the {@link #offset} of where the match was
made in the input string.
 * A {@link Autolinker.Matcher} will be fed only HTML text nodes,
 * and will therefore set an original offset that is relative to the HTML
 * text node itself. However, we want this
offset to be relative to the full
 * HTML input string, and thus if using {@link Autolinker#parse} (rather
 * than calling a {@link Autolinker.Matcher} directly), then this
 * offset is corrected after the Matcher
itself has done its job.
 * @param {Number} offset
 * ^ Match.prototype.setOffset = function
(offset) {
 this.offset = offset;
};

/**
 * Returns the offset of where the match was made in the input
string. This
 * is the 0-based index of the match.
 * @return {Number}
 * ^ Match.prototype.getOffset = function () {
 return
this.offset;
};

/**
 * Returns the CSS class suffix(es) for this match.
 * A CSS class suffix is
appended to the {@link Autolinker#className} in
 * the {@link Autolinker.AnchorTagBuilder} when a match
is translated into
 * an anchor tag.
 * For example, if {@link Autolinker#className} was configured
as 'myLink',
 * and this method returns `['url']`, the final class name of the element
 * will become: 'myLink
myLink-url'.
 * The match may provide multiple CSS class suffixes to be appended to the
 * {@link
Autolinker#className} in order to facilitate better styling
 * options for different match criteria. See {@link
Autolinker.match.Mention}
 * for an example.
 * By default, this method returns a single array with
the match's
 * {@link #getType} name, but may be overridden by subclasses.
 * @return
{String[]}
 * ^ Match.prototype.getCssClassSuffixes
= function () {
 return [this.getType()];
};

/**
 * Builds and returns an {@link
Autolinker.HtmlTag} instance based on the
 * Match.
 * This can be used to easily generate anchor
tags from matches, and either
 * return their HTML string, or modify them before doing so.
 * Example Usage:
 * var tag = match.buildTag();
 * tag.addClass('cordova-link');
 * tag.setAttr('target', '_system');
 * tag.toAnchorString(); // <a href="http://google.com"
class="cordova-link" target="_system">Google
 * Example Usage in {@link
Autolinker#replaceFn}:
 * var html = Autolinker.link("Test google.com", {
 * replaceFn :
function(match) {
 * var tag = match.buildTag(); // returns an {@link Autolinker.HtmlTag} instance
 * tag.setAttr('rel', 'nofollow');
 * return tag;
 * }
 * });
 * // generated html:
 * // Test <a href="http://google.com"

 * @protected
 * @property
 {RegExp} matcherRegex
 * The regular expression to match URLs with an optional scheme, port
 * number, path, query string, and hash anchor.
 * Example matches:
 http://google.com
 * www.google.com
 * google.com/path/to/file?q1=1&q2=2#myAnchor
 *
 * This regular expression will have the following capturing groups:
 * 1. Group
 that matches a scheme-prefixed URL (i.e. 'http://google.com').
 * This is used to match scheme URLs with
 just a single word, such as
 * 'http://localhost', where we won't double check that the domain name
 * has at least one dot (.) in it.
 * 2. Group that matches a 'www.' prefixed URL. This is only matched if the
 * 'www.' text was not
 prefixed by a scheme (i.e.: not prefixed by
 * 'http://', 'ftp:', etc.)
 * 3. A protocol-relative (//) match
 for the case of a 'www.' prefixed
 * URL. Will be an empty string if it is not a protocol-relative match.
 * We need to know the character before the '/' in order to determine
 * if it is a valid match or the // was
 in a string we don't want to
 * auto-link.
 * 4. Group that matches a known TLD (top level domain),
 when a scheme
 * or 'www.'-prefixed domain is not matched.
 * 5. A protocol-relative (//) match for
 the case of a known TLD prefixed
 * URL. Will be an empty string if it is not a protocol-relative match.
 * See #3 for more info.

Alternatively, we can set the UglifyJS option `ascii\_only` to true for the build, but that doesn't help others who are pulling in Autolinker into their own build and running UglifyJS themselves.

.source; //

see note in above variable description

**The string form of a regular expression that would match all of the alphanumeric ("letter") chars, emoji, and combining marks in the unicode character set when placed in a RegExp character class ( []). This includes all international alphabetic characters. These would be the characters matched by unicode regex engines `\p{L}\p{M}` escapes and emoji characters.**

**The string form of a regular expression that would match all of the decimal number chars in the unicode character set when placed in a RegExp character class ( []). These would be the characters matched by unicode regex engines `\p{Nd}` escape ("all decimal numbers"). Taken from the XRegExp library: <http://xregexp.com/> (thanks @<https://github.com/slevithan> Specifically: <http://xregexp.com/v/3.2.0/xregexp-all.js>, the 'Decimal\_Number' regex's `bmp` VERY IMPORTANT: This set of characters is defined inside of a Regular Expression literal rather than a string literal to prevent UglifyJS from compressing the unicode escape sequences into their actual unicode characters. If Uglify compresses these into the unicode characters themselves, this results in the error "Range out of order in character class" when these characters are used inside of a Regular Expression character class ( []). See usages of this const. Alternatively, we can set the UglifyJS option**

```

callbacks to notify of tags and text.\n *\n * ## History\n *\n * This file previously used a regular
expression to find html tags in the input\n * text. Unfortunately, we ran into a bunch of catastrophic backtracking
issues\n * with certain input text, causing Autolinker to either hang or just take a\n * really long time to parse the
string.\n *\n * The current code is intended to be a O(n) algorithm that walks through\n * the string in one pass, and
tries to be as cheap as possible. We don't need\n * to implement the full HTML spec, but rather simply determine
where the string\n * looks like an HTML tag, and where it looks like text (so that we can autolink\n * that).\n *\n * This state machine parser is intended just to be a simple but performant\n * parser of HTML for the subset of
requirements we have. We simply need to:\n *\n * 1. Determine where HTML tags are\n * 2. Determine the tag
name (Autolinker specifically only cares about <a>,\n * <script>, and <style> tags, so as not to link any text
within them)\n *\n * We don't need to:\n *\n * 1. Create a parse tree\n * 2. Auto-close
tags with invalid markup\n * 3. etc.\n *\n * The other intention behind this is that we didn't want to add external\n * dependencies on the Autolinker utility which would increase its size. For\n * instance, adding htmlparser2 adds
125kb to the minified output file,\n * increasing its final size from 47kb to 172kb (at the time of writing). It\n * also
doesn't work exactly correctly, treating the string \"<3 blah blah blah\"
as an HTML tag.\n *\n * Reference for
HTML spec:\n *\n * https://www.w3.org/TR/html5/syntax.html#sec-tokenization\n *\n * @param {String} html
The HTML to parse\n * @param {Object} callbacks\n * @param {Function} callbacks.onOpenTag Callback
function to call when an open\n * tag is parsed. Called with the tagName as its argument.\n * @param {Function}
callbacks.onCloseTag Callback function to call when a close\n * tag is parsed. Called with the tagName as its
argument. If a self-closing\n * tag is found, `onCloseTag` is called immediately after
`onOpenTag`.\n * @param {Function} callbacks.onText Callback function to call when text (i.e.\n * not an HTML
tag) is parsed. Called with the text (string) as its first\n * argument, and offset (number) into the string as its
second.\n */\nexport function parseHtml(html, _a) {\n var onOpenTag = _a.onOpenTag, onCloseTag =

/**
 * @class Autolinker
 * @extends Object
 * Utility class used to process a given string of text,
 * and wrap the matches in the appropriate anchor (<a>) tags to turn them into links.
 * Any of the configuration options may be provided in an Object provided to the Autolinker constructor, which will configure
 * how the {@link #link link()} method will process the links.
 * For example:
 * var autolinker = new Autolinker({
 * newWindow : false,
 * truncate : 30
 * });
 * var html = autolinker.link(
 * "Joe went to www.yahoo.com");
 * // produces: 'Joe went to <a
 * href="http://www.yahoo.com">yahoo.com'
 * The {@link #static-link static link()} method may also
 * be used to inline options into a single call, which may be more convenient for one-off uses.
 * For example:
 *
 * var html = Autolinker.link("Joe went to www.yahoo.com", {
 * newWindow : false,
 * truncate : 30
 * });
 * // produces: 'Joe went to yahoo.com'
 * ##
 * Custom Replacements of Links
 * If the configuration options do not provide enough flexibility, a {@link
 * #replaceFn} may be provided to fully customize the output of Autolinker. This function is called once for
 * each URL/Email/Phone#/Hashtag/Mention (Twitter, Instagram, Soundcloud) match that is encountered.
 * For example:
 * var input = "..."; // string with URLs, Email Addresses, Phone #s, Hashtags, and Mentions
 * (Twitter, Instagram, Soundcloud)
 * var linkedText = Autolinker.link(input, {
 * replaceFn : function(
 * match) {
 * console.log("href = ", match.getAnchorHref());
 * console.log("text = ",
 * match.getAnchorText());
 * switch(match.getType())
 * {
 * case 'url' :
 * console.log("url: ", match.getUrl());
 * if(
 * match.getUrl().indexOf('mysite.com') === -1)
 * var tag = match.buildTag(); // returns an
 * `Autolinker.HtmlTag` instance, which provides mutator methods for easy changes
 * tag.setAttr(
 * 'rel', 'nofollow');
 * tag.addClass('external-link');
 * return tag;
 * } else {
 * return true; // let Autolinker perform its normal anchor tag replacement
 * }
 * }
 * case 'email' :
 * var email = match.getEmail();
 * console.log(
 * "email: ", email);
 * if(email === "my@own.address")
 * return false; //
 * don't auto-link this particular email address; leave as-is
 * } else {
 * return; // no return value will have Autolinker perform its normal anchor tag
 * replacement (same as returning `true`)
 * }
 * case 'phone' :
 * var
 * phoneNumber = match.getPhoneNumber();
 * console.log(phoneNumber);
 * return
 * '' + phoneNumber + '';
 * case 'hashtag' :
 * var hashtag = match.getHashtag();
 * console.log(hashtag);
 * return
 * '' + hashtag + '';
 * case 'mention' :
 * var mention = match.getMention();
 * console.log(mention);
 * return '<a
 * href="http://newplace.to.link.mention.to/">' + mention + '';
 * }
 * });
 * The function may return the following values:
 * - `true` (Boolean): Allow Autolinker to replace the match as it normally would.
 * - `false` (Boolean): Do not replace the current match at all - leave as-is.
 * - Any String: If a string is returned from the function, the string will be used directly as the replacement HTML for the match.
 * - An {@link Autolinker.HtmlTag} instance, which can be used to build/modify an HTML tag before writing out its HTML text.
 */
var Autolinker = /** @class */ (function () {
 /**
 * @method constructor
 * @param {Object} [cfg] The configuration options for the Autolinker instance,
 * specified in an Object (map).
 * function Autolinker(cfg) {
 * if (cfg === void 0) {
 * cfg = {};
 * }
 * /**
 * The Autolinker version number exposed on the instance itself.
 * Ex:
 * 0.25.1
 * this.version = Autolinker.version;
 *
 * @cfg {Boolean/Object} [urls]
 * `true` if URLs should be automatically linked,
 * `false` if they should not be. Defaults to `true`.
 * Examples:
 * urls: true
 * // or
 * urls: {
 * schemeMatches : true,
 * wwwMatches : true,
 * tldMatches : true
 * }
 * As shown above, this option also accepts an

```

Object form with 3 properties

- `urls.schemeMatches`: `true` to allow for more customization of what exactly gets linked. All default to `true`:
  - `urls.schemeMatches`: `true` to match URLs found prefixed with a scheme, i.e. `http://google.com`, or `other+scheme://google.com`, `false` to prevent these types of matches.
  - `urls.wwwMatches`: `true` to match urls found prefixed with `'www.'`, i.e. `www.google.com`. `false` to prevent these types of matches. Note that if the URL had a prefixed scheme, and `urls.schemeMatches` is true, it will still be linked.
  - `urls.tldMatches`: `true` to match URLs with known top level domains (.com, .net, etc.) that are not prefixed with a scheme or `'www.'`. This option attempts to match anything that looks like a URL in the given text. Ex: `google.com`, `asdf.org/?page=1`, etc. `false` to prevent these types of matches.
- `email`: `true` if email addresses should be automatically linked, `false` if they should not be.
- `phone`: `true` if Phone numbers (`"(555)555-5555"`) should be automatically linked, `false` if they should not be.
- `hashtag`: `String` for the service name to have hashtags (ex: `"#myHashtag"`) auto-linked to. The currently-supported values are: `'twitter'`, `'facebook'`, `'instagram'`. Pass `false` to skip auto-linking of hashtags.
- `mention`: `String` for the service name to have mentions (ex: `"@myuser"`) auto-linked to. The currently supported values are: `'twitter'`, `'instagram'`, `'soundcloud'`. Defaults to `false` to skip auto-linking of mentions.
- `newWindow`: `true` if the links should open in a new window, `false` otherwise.
- `stripPrefix`: `Boolean/Object` if `'http:/'` (or `'https:/'`) and/or the `'www.'` should be stripped from the beginning of URL links' text, `false` otherwise. Defaults to `true`.

Examples:

- `stripPrefix: true` // or `stripPrefix: { scheme: true, www: true }` As shown above, this option also accepts an Object form with 2 properties to allow for more customization of what exactly is prevented from being displayed. Both default to `true`:
  - `stripPrefix.scheme`: `true` to prevent the scheme part of a URL match from being displayed to the user. Example: `http://google.com` will be displayed as `google.com`. `false` to not strip the scheme. NOTE: Only an `http://` or `https://` scheme will be removed, so as not to remove a potentially dangerous scheme (such as `file://` or `javascript:`)
  - `stripPrefix.www`: `Boolean` `true` to prevent the `'www.'` part of a URL match from being displayed to the user. Ex: `www.google.com` will be displayed as `google.com`. `false` to not strip the `'www.'`

Example when `stripPrefix`: `{ scheme: true, www: true }` // default value just to get the above doc comment in the ES5 output and documentation generator

- `stripTrailingSlash`: `Boolean` `true` to remove the trailing slash from URL matches, `false` to keep the trailing slash.
- `decodePercentEncoding`: `Boolean` `true` to decode percent-encoded characters in URL matches,

```

`false` to keep\n * the percent-encoded characters.\n *\n * Example when `true`:\n`https://en.wikipedia.org/wiki/San_Jos%C3%A9` will\n * be displayed as\n`https://en.wikipedia.org/wiki/San_José`.\n */\n this.decodePercentEncoding = true; // default value just to\n get the above doc comment in the ES5 output and documentation generator\n /**\n * @cfg\n {Number/Object} [truncate=0]\n *\n * ## Number Form\n *\n * A number for how many\n characters matched text should be truncated to\n * inside the text of a link. If the matched text is over this\n number of\n * characters, it will be truncated to this length by adding a two period\n * ellipsis ('..') to the\n end of the string.\n *\n * For example: A url like 'http://www.yahoo.com/some/long/path/to/a/file'\n * truncated to 25 characters might look something like this:\n * 'yahoo.com/some/long/pat..\n *\n * Example Usage:\n *\n * truncate: 25\n *\n * Defaults to `0` for `no\n truncation.`\n *\n * ## Object Form\n *\n * An Object may also be provided with two\n properties: `length` (Number) and\n * `location` (String). `location` may be one of the following: 'end'\n * (default), 'middle', or 'smart'.\n *\n * Example Usage:\n *\n * truncate: { length: 25, location:\n 'middle' }\n *\n * @cfg {Number} [truncate.length=0] How many characters to allow before\n * truncation will occur. Defaults to `0` for `no truncation.`\n * @cfg {"end"|"middle"|"smart"}\n [truncate.location="end"]\n *\n * - 'end' (default): will truncate up to the number of characters, and\n then\n * add an ellipsis at the end. Ex: 'yahoo.com/some/long/pat..' - 'middle': will truncate\n and add the ellipsis in the middle. Ex:\n * 'yahoo.com/s..th/to/a/file' - 'smart': for URLs where the\n algorithm attempts to strip out unnecessary\n * parts first (such as the 'www.', then URL scheme, hash, etc.),\n *\n * attempting to make the URL human-readable before looking for a good\n * point to insert the ellipsis\n if it is still too long. Ex:\n * 'yahoo.com/some..to/a/file'. For more details, see\n * {@link\n Autolinker.truncate.TruncateSmart}.\n *\n * this.truncate = { length: 0, location: 'end' }; // default value just\n to get the above doc comment in the ES5 output and documentation generator\n /**\n * @cfg {String}\n className\n *\n * A CSS class name to add to the generated links. This class will be added\n * to all\n links, as well as this class plus match suffixes for styling\n * url/email/phone/hashtag/mention links\n differently.\n *\n * For example, if this config is provided as `myLink`, then:\n *\n * - URL links will have the CSS\n classes: `myLink myLink-url`\n * - Email links will have the CSS classes: `myLink myLink-email`, and\n *\n * - Phone links will have the CSS classes: `myLink myLink-phone`\n * - Hashtag links will have the CSS\n classes: `myLink myLink-hashtag`\n * - Mention links will have the CSS classes: `myLink myLink-mention\n myLink-[type]`\n * where [type] is either `instagram`, `twitter` or `soundcloud`\n */\n this.className = ""; // default value just to get the above doc comment in the ES5 output and documentation\n generator\n /**\n * @cfg {Function} replaceFn\n *\n * A function to individually process each\n match found in the input string.\n *\n * See the class's description for usage.\n *\n * The\n `replaceFn` can be called with a different context object\n (`this`\n * reference) using the {@link #context} cfg.\n *\n * This function is called with the\n following parameter:\n *\n * @cfg {Autolinker.match.Match} replaceFn.match The Match instance\n which\n * can be used to retrieve information about the match that the `replaceFn`\n * is currently\n processing. See {@link Autolinker.match.Match} subclasses\n * for details.\n *\n * this.replaceFn =\n null; // default value just to get the above doc comment in the ES5 output and documentation generator\n /**\n * @cfg {Object} context\n *\n * The context object (`this` reference) to call the `replaceFn` with.\n *\n * Defaults to this Autolinker instance.\n *\n * this.context = undefined; // default value just to get\n the above doc comment in the ES5 output and documentation generator\n /**\n * @cfg {Boolean}\n [sanitizeHtml=false]\n *\n * `true` to HTML-encode the start and end brackets of existing HTML tags found\n * in the input string.\n This will escape `<` and `>` characters to `<` and\n * `>`, respectively.\n *\n * Setting this to\n `true` will prevent XSS (Cross-site Scripting) attacks,\n * but will remove the significance of existing HTML\n tags in the input string. If\n * you would like to maintain the significance of existing HTML tags while also\n
```

```

* making the output HTML string safe, leave this option as `false` and use a\n * tool like
https://github.com/cure53/DOMPurify (or others) on the input string\n * before running Autolinker.\n *\n this.sanitizeHtml = false; // default value just to get the above doc comment in the ES5 output and documentation

```

```

configuration options for the Autolinker class,
specified in an Object (map). See the class description for an example call.
@return
{Autolinker.match.Match[]} The array of Matches found in the given input `textOrHtml`.
Autolinker.parse = function (textOrHtml, options) {
 var autolinker = new Autolinker(options);
 return autolinker.parse(textOrHtml);
};
/**
 * Normalizes the {@link #urls} config into an Object with 3
properties: `schemeMatches`, `wwwMatches`, and `tldMatches`, all Booleans.
See {@link #urls}
config for details.
@param {Boolean/Object} urls
@return {Object}
Autolinker.prototype.normalizeUrlsCfg = function (urls) {
 if (urls == null)
 urls = true; // default to
`true`
 if (typeof urls === 'boolean') {
 return { schemeMatches: urls, wwwMatches: urls, tldMatches:
urls };
 }
 else { // object form
 return {
 schemeMatches: typeof urls.schemeMatches === 'boolean' ? urls.schemeMatches : true,
 wwwMatches: typeof urls.wwwMatches === 'boolean' ? urls.wwwMatches : true,
 tldMatches: typeof
urls.tldMatches === 'boolean' ? urls.tldMatches : true
 };
 }
};
/**
 * Normalizes the
{@link #stripPrefix} config into an Object with 2
properties: `scheme`, and `www` - both Booleans.
See {@link #stripPrefix}
config for details.
@param {Boolean/Object} stripPrefix
@return {Object}
Autolinker.prototype.normalizeStripPrefixCfg = function (stripPrefix) {
 if
(stripPrefix == null)
 stripPrefix = true; // default to `true`

 if (typeof truncate
=== 'number') {
 return { length: truncate, location: 'end' };
 }
 else { // object, or
undefined/null
 return defaults(truncate || {}, {
 length: Number.POSITIVE_INFINITY,
 location: 'end'
 });
 }
};
/**
 * Parses the input `textOrHtml` looking for URLs, email
addresses, phone
numbers, username handles,
and hashtags (depending on the configuration
of the Autolinker instance), and returns an array of {
Autolinker.match.Match}
objects describing those matches (without making any replacements).
This method is used by the {@link #link} method, but can also be used to
simply do parsing of the input in
order to discover what kinds of links
there are and how many.
Example usage:
var
autolinker = new Autolinker({
 urls: true,
 email: true
});
var matches
= autolinker.parse(`Hello google.com, I am asdf@asdf.com`);
console.log(matches.length);
// 2
console.log(matches[0].getType()); // `url`
console.log(matches[0].getUrl()); //
`google.com`
console.log(matches[1].getType()); // `email`
console.log(matches[1].getEmail()
); // `asdf@asdf.com`
@param {String} textOrHtml The HTML or text to find matches within
(depending on if the
{@link #urls}, {@link #email}, {@link #phone},
{@link #hashtag}, and {@link #mention} options are
enabled).
@return {Autolinker.match.Match[]} The array of Matches found in the
given input
`textOrHtml`.
Autolinker.prototype.parse = function (textOrHtml) {
 var _this = this;
 var
skipTagNames = ['a', 'style', 'script'], skipTagsStackCount = 0, // used to only Autolink text outside of
anchor/script/style tags. We don't want to autolink something that is already linked inside of an <a> tag, for
instance
 matches = []; // Find all matches within the `textOrHtml` (but not matches that are
already nested within <a>, <style> and <script> tags)
 parseHtml(textOrHtml, {
 onOpenTag: function
(tagName) {

handles, and hashtags (depending on the configuration\n * of the Autolinker instance), and returns an array of
{@link Autolinker.match.Match}\n * objects describing those matches.\n *\n * This method processes a
non-HTML string, and is used to parse and\n * match within the text nodes of an HTML string. This method
is used\n * internally by {@link #parse}.\n *\n * @private\n * @param {String} text The text to find
matches within (depending on if the\n * {@link #urls}, {@link #email}, {@link #phone},\n * {@link
#hashtag}, and {@link #mention} options are enabled). This must be a non-HTML string.\n * @param {Number}
[offset=0] The offset of the text node within the\n * original string. This
is used when parsing with the {@link #parse}\n * method to generate correct offsets within the {@link
Autolinker.match.Match}\n * instances, but may be omitted if calling this method publicly.\n * @return
{Autolinker.match.Match[]} The array of Matches found in the\n * given input `text`.\n *\n *\n * Autolinker.prototype.parseText = function (text, offset) {\n * if (offset === void 0) { offset = 0; }\n * offset =
offset || 0;\n * var matchers = this.getMatchers(), matches = [];\n * for (var i = 0, numMatchers =
matchers.length; i < numMatchers; i++) {\n * var textMatches = matchers[i].parseMatches(text);\n * //
Correct the offset of each of the matches. They are originally\n * // the offset of the match within the provided
text node, but we\n * // need to correct them to be relative to the original HTML input\n * // string (i.e. the
one provided to #parse).\n * for (var j = 0, numTextMatches
= textMatches.length; j < numTextMatches; j++) {\n * textMatches[j].setOffset(offset +
textMatches[j].getOffset());\n * }\n * matches.push.apply(matches, textMatches);\n * }\n * return
matches;\n * }\n * /**\n * Automatically links URLs, Email addresses, Phone numbers, Hashtags,\n * and
Mentions (Twitter, Instagram, Soundcloud) found in the given chunk of HTML. Does not link\n * URLs found
within HTML tags.\n *\n * For instance, if given the text: `You should go to http://www.yahoo.com`,\n *
then the result will be `You should go to\n * http://www.yahoo.com`\n *\n * This method finds the text
around any HTML elements in the input\n * `textOrHtml`, which will be the text that is processed. Any original
HTML\n * elements will be left as-is, as well as the text that is already wrapped\n * in anchor (<a>)
tags.\n *\n * @param {String}
textOrHtml The HTML or text to autolink matches within\n * (depending on if the {@link #urls}, {@link
#email}, {@link #phone}, {@link #hashtag}, and {@link #mention} options are enabled).\n * @return {String}
The HTML, with matches automatically linked.\n *\n *\n * Autolinker.prototype.link = function (textOrHtml) {\n * if (!textOrHtml) {\n * return \"\";\n * } // handle `null` and `undefined` (for JavaScript users that don't have
TypeScript support)\n * /* We would want to sanitize the start and end characters of a tag\n * * before
processing the string in order to avoid an XSS scenario.\n * * This behaviour can be changed by toggling the
sanitizeHtml option.\n * *\n * if (this.sanitizeHtml) {\n * textOrHtml = textOrHtml\n *
.replace(</g, '<')\n * .replace(>/g, '>');\n * }\n * var matches = this.parse(textOrHtml), newHtml
= [], lastIndex = 0;\n * for (var i = 0, len
= matches.length; i < len; i++) {\n * var match = matches[i];\n * newHtml.push(textOrHtml.substring(lastIndex, match.getOffset()));\n *
newHtml.push(this.createMatchReturnVal(match));\n * lastIndex = match.getOffset() +
match.getMatchedText().length;\n * }\n * newHtml.push(textOrHtml.substring(lastIndex)); // handle the text
after the last match\n * return newHtml.join("");\n * }\n * /**\n * Creates the return string value for a given
match in the input string.\n *\n * This method handles the {@link #replaceFn}, if one was provided.\n *\n *
@private\n * @param {Autolinker.match.Match} match The Match object that represents\n * the match.\n *
@return {String} The string that the `match` should be replaced with.\n * This is usually the anchor tag string,

```

\* This plugin resolves the JSON pointers.\n \* A major part of this plugin deals with cyclic references via 2 mechanisms.\n \* 1. If a pointer was already resolved before in this path, halt.\n \* 2. If the patch value points to one

of the ancestors in this path, halt.

\* Note that either one of these mechanism is sufficient, both must be in place.

\* For examples:

\* Given the following spec, #1 alone is insufficient because after the 2nd application, there will be a cyclic object reference.

a.b.c: \$ref-d

d.e.f: \$ref-a (per #1, safe to return patch as no immediate cycle)

\* Given the following spec, #2 alone is insufficient because although there will never be any cyclic object reference, the plugin will keep producing patches.

a: \$ref-b

b: \$ref-a

```

The subtree resolver is a higher-level interface that allows you to get the same result that you would from `Swagger.resolve`, but focuses on a subtree of your object. It makes several assumptions that allow you to think less about what resolve, specmap, and normalizeSwagger are doing: if this is not suitable for you, you can emulate `resolveSubtree`'s behavior by talking to the traditional resolver directly. By providing a top-level `obj` and a `path` to resolve within, the subtree will be resolved and normalized in the context of your top-level `obj`. You'll get the resolved subtree you're interested in as a return value (or, you can use `returnEntireTree` to get everything back). This is useful for cases where resolving your entire object is unnecessary and/or non-performant; we use this interface for lazily resolving operations and models in Swagger-UI, which allows us to handle larger definitions. It's

likely that Swagger-Client will rely entirely on lazy resolving in future versions. TODO: move the remarks above into project documentation
