 return joinTo(StringBuilder(), separator, prefix, postfix, limit, truncated, transform).toString()
}

Creates a string from all the elements separated using [separator] and using the given [prefix] and [postfix] if supplied.
If the collection could be huge, you can specify a non-negative value of [limit], in which case only the first [limit] elements will be appended, followed by the [truncated] string (which defaults to "...").
@sample
samples.collections.Collections.Transformations.joinToString

public fun ShortArray.joinToString(separator: CharSequence = "\", prefix: CharSequence = "\\", postfix: CharSequence = "\\", limit: Int = -1, truncated: CharSequence = "...", transform: ((Short) -> CharSequence)? = null): String {
 return joinTo(StringBuilder(), separator, prefix, postfix, limit, truncated, transform).toString()
}

Creates a string from all the elements separated using [separator] and using the given [prefix] and [postfix] if supplied.
If the collection could be huge, you can specify a non-negative value of [limit], in which case only the first [limit] elements will be appended, followed by the [truncated] string (which defaults to "...").
@sample
samples.collections.Collections.Transformations.joinToString

public fun IntArray.joinToString(separator: CharSequence = "\", prefix: CharSequence = "\\", postfix: CharSequence = "\\", limit: Int = -1, truncated: CharSequence = "...", transform: ((Int) -> CharSequence)? = null): String {
 return joinTo(StringBuilder(), separator, prefix, postfix, limit, truncated, transform).toString()
}

Creates a string from all the elements separated using [separator] and using the given [prefix] and [postfix] if supplied.
If the collection could be huge, you can specify a non-negative value of [limit], in which case only the first [limit] elements will be appended, followed by the [truncated] string (which defaults to "...").

Returns `true` if the map contains the specified [key]. Allows to overcome type-safety restriction of `containsKey`
that requires to pass a key of type `K`.
*/
@kotlin.internal.InlineOnly
public inline fun
<@kotlin.internal.OnlyInputTypes K> Map<out K, *>.containsKey(key: K): Boolean =
@Suppress("UNCHECKED_CAST") (this as Map<K, *>).containsKey(key)
Returns `true` if the map
maps one or more keys to the specified [value].
*/
Allows to overcome type-safety restriction of `containsValue` that requires to pass a value of type `V`.
@sample
samples.collections.Maps.Usage.containsValue
*/
@Suppress("EXTENSION_SHADOWED_BY_MEMBER") // false warning, extension takes precedence in
some cases
@kotlin.internal.InlineOnly
public inline fun <K, @kotlin.internal.OnlyInputTypes V> Map<K,
V>.containsValue(value: V): Boolean = this.containsValue(value)
Removes the specified key and its
corresponding value from this map. @return the previous value associated with the key, or `null` if the key

```

was not present in the map.

\* Allows to overcome type-safety restriction of `remove` that requires to pass a key of type `K`.

```

@kotlin.internal.InlineOnly
public inline fun <@kotlin.internal.OnlyInputTypes K, V>
MutableMap<out K, V>.remove(key: K): V? =
 @Suppress("UNCHECKED_CAST") (this as MutableMap<K, V>).remove(key)

```

\* Returns the key component of the map entry.

\* This method allows to use destructuring declarations when working with maps, for example:

```

for ((key, value) in map) {
 // do something with the key and the value
}

```

\* Returns the value component of the map entry.

\* This method allows to use destructuring declarations when working with maps, for example:

```

for ((key, value) in map) {
 // do something with the key and the value
}

```

\* Returns the value component of the map entry.

\* Converts entry to [Pair] with key being first component and value being second.

```

@kotlin.internal.InlineOnly
public inline fun <K, V> Map.Entry<K, V>.toPair(): Pair<K, V> = Pair(key, value)

```

\* Returns the value for the given [key] if the value is present and not `null`. Otherwise, returns the result of the [defaultValue] function.

\* @sample samples.collections.Maps.Usage.getOrNull

```

@kotlin.internal.InlineOnly
public inline fun <K, V> Map<K, V>.getOrNull(key: K, defaultValue: () -> V): V =
 get(key) ?: defaultValue

```

\* Returns the value for the given [key] if the value is present and not `null`. Otherwise, returns the result of the [defaultValue] function.

\* @throws NoSuchElementException when the map doesn't contain a value for the specified key and no implicit default value was provided for that map.

```

@kotlin.internal.InlineOnly
public fun <K, V> Map<K, V>.getValue(key: K): V =
 getOrImplicitDefault(key)

```

\* Returns the value for the given [key] if the value is present and not `null`. Otherwise, calls the [defaultValue] function, puts its result into the map under the given key and returns the call result.

\* Note that the operation is not guaranteed to be atomic if the map is being modified concurrently.

\* @sample samples.collections.Maps.Usage.getOrPut

```

@kotlin.internal.InlineOnly
public inline fun <K, V> MutableMap<K, V>.getOrPut(key: K, defaultValue: () -> V): V {
 val value = get(key)
 return if (value == null) {
 val answer = defaultValue()
 put(key, answer)
 answer
 } else {
 value
 }
}

```

\* Returns an [Iterator] over the entries in the [Map].

\* @sample samples.collections.Maps.Usage.forOverEntries

```

@kotlin.internal.InlineOnly
public inline operator fun <K, V> Map<out K, V>.iterator(): Iterator<Map.Entry<K, V>> = entries.iterator()

```

\* Returns a [MutableIterator] over the mutable entries in the [MutableMap].

```

@kotlin.jvm.JvmName("mutableIterator")
@kotlin.internal.InlineOnly
public inline operator fun <K, V> MutableMap<K, V>.iterator(): MutableIterator<MutableMap.MutableEntry<K, V>> = entries.iterator()

```

\* Populates the given [destination] map with entries having the keys of this map and the values obtained by applying the [transform] function to each entry in this [Map].

```

public inline fun <K, V, R, M : MutableMap<in K, in R>> Map<out K, V>.mapValuesTo(destination: M, transform: (Map.Entry<K, V>) -> R): M {
 return entries.associateByTo(destination, { it.key }, transform)
}

```

\* Populates the given [destination] map with entries having the keys obtained by applying the [transform] function to each entry in this [Map] and the values of this map.

\* In case if any two entries are mapped to the equal keys, the value of the latter one will overwrite the value associated with the former one.

```

public inline fun <K, V, R, M : MutableMap<in R, in V>> Map<out K, V>.mapKeysTo(destination: M, transform: (Map.Entry<K, V>) -> R): M {
 return entries.associateByTo(destination, transform, { it.value })
}

```

\* Puts all the given [pairs] into this [MutableMap] with the first component in the pair being the key and the second the value.

```

public fun <K, V> MutableMap<in K, in V>.putAll(pairs: Array<out Pair<K, V>>): Unit {
 for ((key, value) in pairs) {
 put(key, value)
 }
}

```

\* Puts all the elements of the given collection into

```

* Returns a set containing all elements that are contained by both this collection and the specified collection.
The returned set preserves the element iteration order of the original collection.
To get a set containing all elements that are contained at least in one of these collections use [union].

public infix fun
<T> Iterable<T>.intersect(other: Iterable<T>): Set<T> {
 val set = this.toMutableSet()
 set.retainAll(other)
 return set
}

* Returns a set containing all elements that are contained by this collection and not contained
by the specified collection.
The returned set preserves the element iteration order of the original
collection.

public infix fun <T> Iterable<T>.subtract(other: Iterable<T>): Set<T> {
 val set =
this.toMutableSet()
 set.removeAll(other)
 return set
}

* Returns a new [MutableSet] containing all
distinct elements from the given collection.
The returned set preserves the element iteration order of the
original collection.

public fun <T> Iterable<T>.toMutableSet(): MutableSet<T> {
 return when (this) {
 is Collection<T> -> LinkedHashSet(this)
 else -> toCollection(LinkedHashSet<T>())
 }
}

* Returns a set containing all distinct elements from both collections.
The returned set preserves the element iteration order of the original collection.
Those elements of the [other]
collection that are unique are iterated in the end
in the order of the [other] collection.
To get a set
containing all elements that are contained in both collections use [intersect].

public infix fun <T>
Iterable<T>.union(other: Iterable<T>): Set<T> {
 val set = this.toMutableSet()
 set.addAll(other)
 return set
}

* Returns `true` if all elements match the given [predicate].
Note that if the collection
contains no elements, the function returns `true` because there are no elements in it that _do not_ match the
predicate.
See a more detailed explanation of this logic concept in ["Vacuous
truth"](https://en.wikipedia.org/wiki/Vacuous_truth) article.

`sum`  
`sum` Returns the sum of all values produced by [selector] function applied to each element in the collection.  
`sum`  
`sum` Returns an original collection containing all the non-`null` elements, throwing an [IllegalArgumentException] if there are any `null` elements.  
`sum`  
`sum` Returns an original collection containing all the non-`null` elements, throwing an [IllegalArgumentException] if there are any `null` elements.  
`sum`  
`sum` Splits this collection into a list of lists each not exceeding the given [size].  
`sum`  
`sum` Splits this collection into several lists each not exceeding the given [size] and applies the given [transform] function to an each.  
`sum`  
`sum` Returns a list containing all elements of the original collection without the first occurrence of the given [element].  
`sum`  
`sum` Returns a list containing all elements of the original collection except the elements contained in the given [elements] array.  
`sum`  
`sum` Returns a list containing all elements of the original collection except the elements contained in the given [elements] collection.  
`sum`  
`sum` Returns a list containing all elements of the original collection except the elements contained in the given [elements] sequence.  
`sum`  
`sum` Returns a list containing all elements of the original collection without the first occurrence of the given [element].  
`sum`  
`sum` Splits the original collection into pair of lists, where \*first\* list contains elements for which [predicate] yielded `true`, while \*second\* list contains elements for which [predicate] yielded `false`.  
`sum`

```

```

Returns the numeric value of the decimal digit that this Char represents. Throws an exception if this Char is not a valid decimal digit.  
A Char is considered to represent a decimal digit if [isDigit] is true for the Char.

In this case, the Unicode decimal digit value of the character is returned.  
@sample

```
samples.text.Chars.digitToInt\n
```

```
*\n\n@SinceKotlin("1.5")\n\n@WasExperimental(ExperimentalStdlibApi::class)\n\npublic fun Char.digitToInt(): Int {\n return digitOf(this, 10).also { if (it < 0) throw IllegalArgumentException("Char $this is not a decimal digit") }\n}\n\n/**\n
```

Returns the numeric value of the digit that this Char represents in the specified [radix].  
Throws an exception if the [radix]

is not in the range `2..36` or if this Char is not a valid digit in the specified [radix].  
A Char is considered to represent a digit in the specified [radix] if at least one of the following is true:  
- [isDigit] is `true` for the Char and the Unicode decimal digit value of the character is less than the specified [radix]. In this case the decimal digit value is returned.  
- The Char is one of the uppercase Latin letters 'A' through 'Z' and its [code] is less than `radix + 'A'.code - 10`. In this case, `this.code - 'A'.code + 10` is returned.  
- The Char is one of the lowercase Latin letters 'a' through 'z' and its [code] is less than `radix + 'a'.code - 10`. In this case, `this.code - 'a'.code + 10` is returned.  
- The Char is one of the fullwidth Latin capital letters '\uFF21' through '\uFF3A' and its [code] is less than `radix + 0xFF21 - 10`. In this case, `this.code - 0xFF21 + 10` is returned.  
- The Char is one of the fullwidth Latin small letters '\uFF41'

through '\uFF5A' and its [code] is less than `radix + 0xFF41 - 10`. In this case, `this.code - 0xFF41 + 10` is returned.

```

Returns the numeric value of the digit that this Char represents in the specified [radix], or `null` if this Char is not a valid digit in the specified [radix].  
Throws an exception if the [radix] is not in the range `2..36`.  
A Char is considered to represent a digit in the specified [radix] if at least one of the following is true:  
- [isDigit] is `true` for the Char and the Unicode decimal digit value of the character is less than the specified [radix]. In this case the decimal digit value is returned.  
- The Char is one of the uppercase Latin letters 'A' through 'Z' and its [code] is less than `radix + 'A'.code - 10`. In this case, `this.code - 'A'.code + 10` is returned.  
- The Char is one of the lowercase Latin letters 'a' through 'z' and its [code] is less than `radix + 'a'.code - 10`. In this case, `this.code - 'a'.code + 10` is returned.  
- The Char is one of the fullwidth Latin capital letters '\uFF21' through '\uFF3A' and its [code] is less than `radix + 0xFF21 - 10`.

In this case, `this.code - 0xFF21 + 10` is returned.  
- The Char is one of the fullwidth Latin small letters '\uFF41' through '\uFF5A' and its [code] is less than `radix + 0xFF41 - 10`. In this case, `this.code - 0xFF41 + 10` is returned.  
@sample samples.text.Chars.digitToIntOrNull

```
*\n\n@SinceKotlin("1.5")\n\n@WasExperimental(ExperimentalStdlibApi::class)\n\npublic fun Char.digitToIntOrNull(radix: Int): Int? {\n checkRadix(radix)\n return digitOf(this, radix).takeIf { it >= 0 }\n}\n\n/**\n
```

Returns the Char that represents this decimal digit.  
Throws an exception if this value is not in the range `0..9`.  
If this value is in `0..9`, the decimal digit Char with code `0'.code + this` is returned.  
@sample

```

mapping, thus the length of the returned string can be greater than one.  
 For example, `'\uFB00'.titlecase()` returns `\"'\u0046\u0066\"'`, where `\"'\uFB00\"` is the LATIN SMALL LIGATURE FF character (`\"'\uFB00\"`).  
 If this character has no title case mapping, the result of `[uppercase]` is returned instead.  
 @sample  
`samples.text.Chars.titlecase`  
 @SinceKotlin("1.5")  
`public fun Char.titlecase(): String = titlecaseImpl()`  
 Concatenates this Char and a String.  
 @sample  
`samples.text.Chars.plus`  
 @kotlin.internal.InlineOnly  
`public inline operator fun Char.plus(other: String): String = this.toString() + other`  
 Returns `\"true\"` if this character is equal to the `[other]` character, optionally ignoring character case.  
 Two characters are considered equal ignoring case if `\"Char.uppercaseChar().lowercaseChar()\"` on each character produces the same result.  
 @param `ignoreCase` `\"true\"` to ignore character case when comparing characters. By default `\"false\"`.  
 @sample  
`samples.text.Chars.equals`  
`public fun Char.equals(other: Char, ignoreCase: Boolean = false): Boolean {`  
 if (this == other) return true  
 if (!ignoreCase) return false  
 val thisUpper = this.uppercaseChar()  
 val otherUpper = other.uppercaseChar()  
 return thisUpper == otherUpper || thisUpper.lowercaseChar() == otherUpper.lowercaseChar()  
 }  
 Returns `\"true\"` if this character is a Unicode surrogate code unit.  
`public fun Char.isSurrogate(): Boolean = this in Char.MIN_SURROGATE..Char.MAX_SURROGATE`  
 Returns the Unicode general category of this character.  
 @SinceKotlin("1.5")  
`public expect val Char.category: CharCategory`  
 Returns `\"true\"` if this character (Unicode code point) is defined in Unicode.  
 A character is considered to be defined in Unicode if its `[category]` is not `[CharCategory.UNASSIGNED]`.  
 @SinceKotlin("1.5")  
`public expect fun Char.isDefined(): Boolean`  
 Returns `\"true\"` if this character is a letter.  
 A character is considered to be a letter if its `[category]` is `[CharCategory.UPPERCASE_LETTER]`, `[CharCategory.LOWERCASE_LETTER]`, `[CharCategory.TITLECASE_LETTER]`, `[CharCategory.MODIFIER_LETTER]`, or `[CharCategory.OTHER_LETTER]`.  
 @sample  
`samples.text.Chars.isLetter`  
 @SinceKotlin("1.5")  
`public expect fun Char.isLetter(): Boolean`  
 Returns `\"true\"` if this character is a letter or digit.  
 @see `isLetter`  
 @see `isDigit`  
 @sample  
`samples.text.Chars.isLetterOrDigit`  
 @SinceKotlin("1.5")  
`public expect fun Char.isLetterOrDigit(): Boolean`  
 Returns `\"true\"` if this character is a digit.  
 A character is considered to be a digit if its `[category]` is `[CharCategory.DECIMAL_DIGIT_NUMBER]`.  
 @sample  
`samples.text.Chars.isDigit`  
 @SinceKotlin("1.5")  
`public expect fun Char.isDigit(): Boolean`  
 Returns `\"true\"` if this character is upper case.  
 A character is considered to be an upper case character if its `[category]` is `[CharCategory.UPPERCASE_LETTER]`, or it has contributory property `\"Other_Uppercase\"` as defined by the Unicode Standard.  
 @sample  
`samples.text.Chars.isUpperCase`  
 @SinceKotlin("1.5")  
`public expect fun Char.isUpperCase(): Boolean`  
 Returns `\"true\"` if this character is lower case.  
 A character is considered to be a lower case character if its `[category]` is `[CharCategory.LOWERCASE_LETTER]`, or it has contributory property `\"Other_Lowercase\"` as defined by the Unicode Standard.  
 @sample  
`samples.text.Chars.isLowerCase`  
 @SinceKotlin("1.5")  
`public expect fun Char.isLowerCase(): Boolean`  
 Returns `\"true\"` if this character is a title case letter.  
 A character is considered to be a title case letter if its `[category]` is `[CharCategory.TITLECASE_LETTER]`.  
 @sample  
`samples.text.Chars.isTitleCase`  
 @SinceKotlin("1.5")  
`public expect fun Char.isTitleCase(): Boolean`  
 Returns `\"true\"` if this character is an ISO control character.  
 A character is considered to be an ISO control character if its `[category]` is `[CharCategory.CONTROL]`, meaning the Char is in the range `\"'\u0000'..\"'\u001F\"` or in the range `\"'\u007F'..\"'\u009F\"`.  
 @sample  
`samples.text.Chars.isISOControl`  
 @SinceKotlin("1.5")  
`public expect fun Char.isISOControl(): Boolean`  
 Determines whether a character is whitespace according to the Unicode standard.  
 Returns `\"true\"` if the character is whitespace.  
 @sample  
`samples.text.Chars.isWhitespace`  
 @public  
`expect fun Char.isWhitespace(): Boolean`

```

CharSequence.elementAtOrElse(index: Int, defaultValue: (Int) -> Char): Char {
 return if (index >= 0 && index <= lastIndex) get(index) else defaultValue(index)
}
Returns a character at the given [index] or `null` if the [index] is out of bounds of this char sequence.
@sample
samples.collections.Collections.Elements.elementAtOrNull
Returns the first character matching the given [predicate], or `null` if no such character was found.
@sample
samples.collections.Collections.Elements.find
Returns the last character matching the given [predicate], or `null` if no such character was found.
@sample
samples.collections.Collections.Elements.findLast
Returns the first character.
@throws NoSuchElementException
if the char sequence is empty.
public fun CharSequence.first(): Char {
 if (isEmpty()) throw NoSuchElementException("Char sequence is empty.")
 return this[0]
}
Returns the first character matching the given [predicate].
@throws [NoSuchElementException] if no such character is found.
public inline fun CharSequence.first(predicate: (Char) -> Boolean): Char {
 for (element in this) if (predicate(element)) return element
 throw NoSuchElementException("Char sequence contains no character matching the predicate.")
}
Returns the first non-null value produced by [transform] function being applied to characters of this char sequence in iteration order, or throws [NoSuchElementException] if no non-null value was produced.
@sample
samples.collections.Collections.Transformations.firstNotNullOf
@SinceKotlin("1.5")
@kotlin.internal.InlineOnly
public inline fun <R : Any>
CharSequence.firstNotNullOf(transform: (Char) -> R?): R {
 return firstNotNullOfOrNull(transform) ?: throw NoSuchElementException("No element of the char sequence was transformed to a non-null value.")
}
Returns the first non-null value produced by [transform] function being applied to characters of this char sequence in iteration order, or `null` if no non-null value was produced.
@sample
samples.collections.Collections.Transformations.firstNotNullOfOrNull
@SinceKotlin("1.5")
@kotlin.internal.InlineOnly

CharSequence.firstNotNullOfOrNull(transform: (Char) -> R?): R? {
 for (element in this) {
 val result = transform(element)
 if (result != null) return result
 }
 return null
}
Returns the first character, or `null` if the char sequence is empty.
public fun CharSequence.firstOrNull(): Char? {
 return if (isEmpty()) null else this[0]
}
Returns the first character matching the given [predicate], or `null` if character was not found.
public inline fun CharSequence.firstOrNull(predicate: (Char) -> Boolean): Char? {
 for (element in this) if (predicate(element)) return element
 return null
}
Returns a character at the given [index] or the result of calling the [defaultValue] function if the [index] is out of bounds of this char sequence.
@kotlin.internal.InlineOnly
public inline fun
CharSequence.getOrNull(index: Int, defaultValue: (Int) -> Char): Char? {
 return if (index >= 0 && index <= lastIndex) get(index) else null
}
Returns index of the first character matching the given [predicate], or -1 if the char sequence does not contain such character.
public inline fun
CharSequence.indexOfFirst(predicate: (Char) -> Boolean): Int {
 for (index in indices) if (predicate(this[index])) return index
 return -1
}
Returns index of the last character matching the given [predicate], or -1 if the char sequence does not contain such character.
public inline fun
CharSequence.indexOfLast(predicate: (Char) -> Boolean): Int {
 for (index in indices.reversed()) if (predicate(this[index])) return index
 return -1
}
Returns the last character.
@throws NoSuchElementException if the char sequence is empty.
@sample

public inline fun <V> CharSequence.associateWith(valueSelector: (Char) -> V): Map<Char, V> {
 val result = LinkedHashMap<Char, V>(mapCapacity(length.coerceAtMost(128)).coerceAtLeast(16))
 return result.associateWithTo(this, valueSelector)
}

```

Populates and returns the [destination] mutable map with key-value pairs for each character of the given char sequence, where key is the character itself and value is provided by the [valueSelector] function applied to that key. If any two characters are equal, the last one overwrites the former value in the map.

```

@sample samples.text.Strings.associateWithTo
^@SinceKotlin("1.3")
public inline fun <V, M : MutableMap<in Char, in V>> CharSequence.associateWithTo(destination: M, valueSelector: (Char) -> V): M {
 for (element in this) {
 destination.put(element, valueSelector(element))
 }
 return destination
}

```

Appends all characters to the given [destination] collection.

```

public fun <C : MutableCollection<in Char>> CharSequence.addToCollection(destination: C): C {
 for (item in this) {
 destination.add(item)
 }
 return destination
}

```

Returns a new [HashSet] of all characters.

```

public fun CharSequence.toHashSet(): HashSet<Char> {
 return toCollection(HashSet<Char>(mapCapacity(length.coerceAtMost(128))))
}

```

Returns a [List] containing all characters.

```

public fun CharSequence.toList(): List<Char> {
 return when (length) {
 0 -> emptyList()
 1 -> listOf(this[0])
 else -> this.toMutableList()
 }
}

```

Returns a new [MutableList] filled with all characters of this char sequence.

```

public fun CharSequence.toMutableList(): MutableList<Char> {
 return toCollection(ArrayList<Char>(length))
}

```

Returns a [Set] of all characters. The returned set preserves the element iteration order of the original char sequence.

```

public fun CharSequence.toSet(): Set<Char> {
 return when (length) {
 0 -> emptySet()
 1 -> setOf(this[0])
 else -> toCollection(LinkedHashSet<Char>(mapCapacity(length.coerceAtMost(128))))
 }
}

```

Returns a single list of all elements yielded from results of [transform] function being invoked on each character of original char sequence.

```

@sample samples.collections.Collections.Transformations.flatMap
^@public inline fun <R> CharSequence.flatMap(transform: (Char) -> Iterable<R>): List<R> {
 return flatMapTo(ArrayList<R>(), transform)
}

```

Returns a single list of all elements yielded from results of [transform] function being invoked on each character and its index in the original char sequence.

```

@sample samples.collections.Collections.Transformations.flatMapIndexed

 return if (index == -1) missingDelimiterValue else replaceRange(0, index, replacement)
}

```

Replace part of string before the last occurrence of given delimiter with the [replacement] string. If the string does not contain the delimiter, returns [missingDelimiterValue] which defaults to the original string.

```

public fun String.replaceBeforeLast(delimiter: String, replacement: String, missingDelimiterValue: String = this): String {
 val index = lastIndexOf(delimiter)
 return if (index == -1) missingDelimiterValue else replaceRange(0, index, replacement)
}

```

public fun String.replace(oldChar: Char, newChar: Char, ignoreCase: Boolean): String // JVM- and JS-specific

public fun String.replace(oldValue: String, newValue: String, ignoreCase: Boolean): String // JVM- and JS-specific

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the given [replacement]. The [replacement] can consist of any combination of literal text and \$-substitutions. To treat the replacement string literally escape it with the [kotlin.text.Regex.Companion.escapeReplacement] method.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.replace(regex: Regex, replacement: String): String = regex.replace(this, replacement)

```

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the result of the given function [transform] that takes [MatchResult] and returns a string to be used as a replacement for that match.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.replace(regex: Regex, noinline transform: (MatchResult) -> CharSequence): String =
 regex.replace(this, transform)

```

Replaces the first occurrence of the given regular expression [regex] in this char sequence with specified [replacement] expression.

@param replacement A replacement expression that can include substitutions. See [Regex.replaceFirst] for details.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.replaceFirst(regex: Regex, replacement: String): String = regex.replaceFirst(this, replacement)

```

Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty.

@param transform function that takes the first character and returns the result of the transform applied to the character.

```

@sample samples.text.Strings.replaceFirstChar

```

```

@SinceKotlin("1.5")
@WasExperimental(ExperimentalStdlibApi::class)
@OptIn(kotlin.experimental.ExperimentalTypeInference::class)
@OverloadResolutionByLambdaReturnType
@JvmName("replaceFirstCharWithChar")
@kotlin.internal.InlineOnly
public inline fun String.replaceFirstChar(transform: (Char) -> Char): String {
 return if (isEmpty()) transform(this[0]) + substring(1) else this
}

```

Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty.

@param transform function that takes the first character and returns the result of the transform applied to the character.

```

@sample samples.text.Strings.replaceFirstChar

```

```

@SinceKotlin("1.5")
@WasExperimental(ExperimentalStdlibApi::class)
@OptIn(kotlin.experimental.ExperimentalTypeInference::class)
@OverloadResolutionByLambdaReturnType
@JvmName("replaceFirstCharWithCharSequence")
@kotlin.internal.InlineOnly
public inline fun String.replaceFirstChar(transform: (Char) -> CharSequence): String {
 return if (isEmpty()) transform(this[0]).toString() + substring(1) else this
}

```

Returns true if this char sequence matches the given regular expression.

```

@kotlin.internal.InlineOnly
public infix fun CharSequence.matches(regex: Regex): Boolean = regex.matches(this)

```

Implementation of [regionMatches] for CharSequences.

Invoked when it's already known that arguments are not Strings, so that no additional type checks are performed.

```

internal fun CharSequence.regionMatchesImpl(thisOffset: Int, other: CharSequence, otherOffset: Int, length: Int, ignoreCase: Boolean): Boolean {
 if ((otherOffset < 0) || (thisOffset < 0) || (thisOffset > this.length - length) || (otherOffset > other.length - length))
 return false
 for (index in 0 until length)
 if (!this[thisOffset + index].equals(other[otherOffset + index], ignoreCase))
 return false
 return true
}

```

ambiguous results when strings in [delimiters] have characters in common, this method proceeds from the beginning to the end of this string, and matches at each position the first element in [delimiters] that is equal to a delimiter in this instance at that position.

```

public fun CharSequence.split(vararg delimiters: String, ignoreCase: Boolean = false, limit: Int = 0): List<String> {
 if (delimiters.size == 1) {
 val delimiter = delimiters[0]
 if (!delimiter.isEmpty()) {
 return split(delimiter, ignoreCase, limit)
 }
 }
 return rangesDelimitedBy(delimiters, ignoreCase = ignoreCase, limit = limit).asIterable().map { substring(it) }
}

```

**Splits this char sequence to a sequence of strings around occurrences of the specified [delimiters].** One or more characters to be used as delimiters. `ignoreCase`true`` to ignore character case when matching a delimiter. By default `false``. `limit`` The maximum number of substrings to return.

```

public fun CharSequence.splitToSequence(vararg delimiters: Char, ignoreCase: Boolean = false, limit: Int = 0): Sequence<String> =
 rangesDelimitedBy(delimiters, ignoreCase = ignoreCase, limit = limit).map { substring(it) }

```

**Splits this char sequence to a list of strings around occurrences of the specified [delimiters].** One or more characters to be used as delimiters. `ignoreCase`true`` to ignore character case when matching a delimiter. By default `false``. `limit`` The maximum number of substrings to return.

```

public fun CharSequence.split(vararg delimiters: Char, ignoreCase: Boolean = false, limit: Int = 0): List<String> {
 if (delimiters.size == 1) {
 return split(delimiters[0].toString(), ignoreCase, limit)
 }
 return rangesDelimitedBy(delimiters, ignoreCase = ignoreCase, limit = limit).asIterable().map { substring(it) }
}

```

**Splits this char sequence to a list of strings around occurrences of the specified [delimiter].** This is specialized version of split which receives single non-empty delimiter and offers better performance. `delimiter`` String used as delimiter. `ignoreCase`true`` to ignore character case when matching a delimiter. By default `false``. `limit`` The maximum number of substrings to return.

```

private fun CharSequence.split(delimiter: String, ignoreCase: Boolean, limit: Int): List<String> {
 requireNonNegativeLimit(limit)
 var currentOffset = 0
 var nextIndex = indexOf(delimiter, currentOffset, ignoreCase)
 if (nextIndex == -1 || limit == 1) {
 return listOf(this.toString())
 }
 val isLimited = limit > 0
 val result = ArrayList<String>(if (isLimited) limit.coerceAtMost(10) else 10)
 do {
 result.add(substring(currentOffset, nextIndex))
 currentOffset = nextIndex + delimiter.length
 // Do not search for next occurrence if we're reaching limit
 if (isLimited && result.size == limit - 1) break
 nextIndex = indexOf(delimiter, currentOffset, ignoreCase)
 } while (nextIndex != -1)
 result.add(substring(currentOffset, length))
 return result
}

```

**Splits this char sequence to a list of strings around matches of the given regular expression.** `limit`` Non-negative value specifying the maximum number of substrings to return. Zero by default means no limit is set.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.split(regex: Regex, limit: Int = 0): List<String> = regex.split(this, limit)

```

**Splits this char sequence to a sequence of strings around matches of the given regular expression.** `limit`` Non-negative value specifying the maximum number of substrings to return. Zero by default means no limit is set.

mangling.

- \* This annotation can be applied to either files or top-level declarations.
- \* It is currently prohibited to export the following kinds of declarations:
  - \* `expect` declarations
  - \* inline functions with reified type parameters
  - \* suspend functions
  - \* secondary constructors without `@JsName`
  - \* extension properties
  - \* enum classes
  - \* annotation classes
- \* Signatures of exported declarations must only contain "exportable" types:
  - \* `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`
  - \* `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
  - \* `Array<exportable-type>`
  - \* Function types with exportable parameters and return types
  - \* `external` or `@JsExport` classes and interfaces
  - \* Nullable counterparts of types above
  - \* Unit return type. Must not be nullable
- \* This annotation is experimental, meaning that restrictions mentioned above are subject to change.

```

 value as T
 else ->
 onFailure(exception)
 }
 }

```

`} }` Returns the encapsulated value if this instance represents `[success][Result.isSuccess]` or the `defaultValue` if it is `[failure][Result.isFailure]`.

`.getOrElse { defaultValue }` (see `[getOrElse]`).

`@InlineOnly @SinceKotlin("1.3") public inline fun <R, T : R> Result<T>.getOrElse(defaultValue: R): R` { `if (isFailure) return defaultValue` `return value as T` }

`.onSuccess` Returns the result of `[onSuccess]` for the encapsulated value if this instance represents `[success][Result.isSuccess]` or the result of `[onFailure]` function for the encapsulated `[Throwable]` exception if it is `[failure][Result.isFailure]`.

Note, that this function rethrows any `[Throwable]` exception thrown by `[onSuccess]` or by `[onFailure]` function.

`@InlineOnly @SinceKotlin("1.3") public inline fun <R, T> Result<T>.fold( onSuccess: (value: T) -> R, onFailure: (exception: Throwable) -> R): R` { `contract { callsInPlace(onSuccess, InvocationKind.AT_MOST_ONCE)` `callsInPlace(onFailure, InvocationKind.AT_MOST_ONCE)` } `return when (val exception = exceptionOrNull()) { null -> onSuccess(value as T) else -> onFailure(exception) }` }

`.onFailure` Returns the encapsulated result of the given `[transform]` function applied to the encapsulated value if this instance represents `[success][Result.isSuccess]` or the original encapsulated `[Throwable]` exception if it is `[failure][Result.isFailure]`.

Note, that this function rethrows any `[Throwable]` exception thrown by `[transform]` function.

See `[mapCatching]` for an alternative that encapsulates exceptions.

`@InlineOnly @SinceKotlin("1.3") public inline fun <R, T> Result<T>.map(transform: (value: T) -> R): Result<R>` { `contract { callsInPlace(transform, InvocationKind.AT_MOST_ONCE)` } `return when { isSuccess -> Result.success(transform(value as T)) else -> Result(value) }` }

`.map` Returns the encapsulated result of the given `[transform]` function applied to the encapsulated value if this instance represents `[success][Result.isSuccess]` or the original encapsulated `[Throwable]` exception if it is `[failure][Result.isFailure]`.

This function catches any `[Throwable]` exception thrown by `[transform]` function and encapsulates it as a failure.

See `[map]` for an alternative that rethrows exceptions from ``transform`` function.

`@InlineOnly @SinceKotlin("1.3") public inline fun <R, T> Result<T>.mapCatching(transform: (value: T) -> R): Result<R>` { `return when { isSuccess -> runCatching { transform(value as T) } else -> Result(value) }` }

`.mapCatching` Returns the encapsulated result of the given `[transform]` function applied to the encapsulated `[Throwable]` exception if this instance represents `[failure][Result.isFailure]` or the original encapsulated value if it is `[success][Result.isSuccess]`.

Note, that this function rethrows any `[Throwable]` exception thrown by `[transform]` function.

See `[recoverCatching]` for an alternative that encapsulates exceptions.

`@InlineOnly @SinceKotlin("1.3") public inline fun <R, T : R> Result<T>.recover(transform: (exception: Throwable) -> R): Result<R>` { `contract { callsInPlace(transform, InvocationKind.AT_MOST_ONCE)` } `return when (val exception = exceptionOrNull()) { null -> this else -> Result.success(transform(exception)) }` }

`.recover` Returns the encapsulated result of the given `[transform]` function applied to the encapsulated `[Throwable]` exception if this instance represents `[failure][Result.isFailure]` or the original encapsulated value if it is `[success][Result.isSuccess]`.

This function catches any `[Throwable]` exception thrown by `[transform]` function and encapsulates it as a failure.

See `[recover]` for an alternative that rethrows exceptions.

`@InlineOnly @SinceKotlin("1.3") public inline fun <R, T : R> Result<T>.recoverCatching(transform: (exception: Throwable) -> R): Result<R>` { `return when (val exception = exceptionOrNull()) { null -> this else -> runCatching { transform(exception) } }` }

`.peek` Performs the given `[action]` on the encapsulated `[Throwable]` exception if this instance represents `[failure][Result.isFailure]`.

Returns the original ``Result`` unchanged.

`@InlineOnly @SinceKotlin("1.3") public inline fun <T> Result<T>.onFailure(action: (exception: Throwable) -> Unit): Result<T>` { `contract { callsInPlace(action, InvocationKind.AT_MOST_ONCE)` } `exceptionOrNull()?.let { action(it) }` `return this` }

`.onFailure` Performs the given `[action]` on the encapsulated value if this instance represents `[success][Result.isSuccess]`.

Returns the original ``Result`` unchanged.

```

coroutine immediately in the invoker's call stack without going through the `[ContinuationInterceptor]` that might be present in the completion's `[CoroutineContext]`. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that `[completion]` of this function may get invoked in an arbitrary context. `[Continuation.intercepted]` can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and `[completion]` happens in the invocation context established by `[ContinuationInterceptor]`. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

@SinceKotlin("1.3")
public actual fun <T>
(suspend () -> T).createCoroutineUnintercepted(
 completion: Continuation<T>): Continuation<Unit> =
 // Kotlin/JS suspend lambdas have an extra parameter `suspended`
 if (this.asDynamic().length == 2) {
 // When `suspended` is true the continuation is created, but not executed
 this.asDynamic()(completion, true)
 } else {
 createCoroutineFromSuspendFunction(completion) {
 this.asDynamic()(completion)
 }
 }
}

```

Creates unintercepted coroutine with receiver type `[R]` and result type `[T]`. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned `[Continuation]` instance. The `[completion]` continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the `[ContinuationInterceptor]` that might be present in the completion's `[CoroutineContext]`. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that `[completion]` of this function may get invoked in an arbitrary context.

`[Continuation.intercepted]` can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and `[completion]` happens in the invocation context established by `[ContinuationInterceptor]`. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

@SinceKotlin("1.3")
public actual fun <R, T> (suspend R.() ->
T).createCoroutineUnintercepted(
 receiver: R,
 completion: Continuation<T>): Continuation<Unit> =
 // Kotlin/JS suspend lambdas have an extra parameter `suspended`
 if (this.asDynamic().length == 3) {
 // When `suspended` is true the continuation is created, but not executed
 this.asDynamic()(receiver, completion, true)
 } else {
 createCoroutineFromSuspendFunction(completion) {
 this.asDynamic()(receiver, completion)
 }
 }
}

```

Intercepts this continuation with `[ContinuationInterceptor]`. This function shall be used on the immediate result of `[createCoroutineUnintercepted]` or `[suspendCoroutineUninterceptedOrReturn]`, in which case it checks for `[ContinuationInterceptor]` in the continuation's `[context][Continuation.context]`, invokes `[ContinuationInterceptor.interceptContinuation]`, caches and returns the result. If this function is invoked on other `[Continuation]` instances it returns this continuation unchanged.

```

@SinceKotlin("1.3")
public actual fun <T> Continuation<T>.intercepted(): Continuation<T> =
 (this as? CoroutineImpl)?.intercepted() ?:
 this
private inline fun <T> createCoroutineFromSuspendFunction(
 completion: Continuation<T>,
 crossinline block: () -> Any?): Continuation<Unit> {
 @Suppress("UNCHECKED_CAST")
 return object

marker\n\n/*\n * Gives a declaration (a function, a property
or a class) specific name in JavaScript.\n * This may be useful in the following cases:\n * * There are two
functions for which the compiler gives same name in JavaScript, you can\n * mark one with `@JsName(...)` to
prevent the compiler from reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler
produces mangled names\n * for functions with parameters, which is unnatural for usual JavaScript developer.\n *
You can put `@JsName(...)` on functions you want to be available from JavaScript.\n * * For some reason you
want to rename declaration, e.g. there's common term in JavaScript\n * for a concept provided by the declaration,
which is uncommon in Kotlin.\n * Example:\n * ```\n * kotlin\n * class Person(val name: String) {\n * fun
hello() {\n * println("Hello $name!")\n * }\n * @JsName("helloWithGreeting")\n * fun
hello(greeting: String) {\n * println("$greeting $name!")\n * }\n * }\n * ```\n * @property name the name which compiler uses both for declaration itself and for all references to
the declaration.\n * It's required to denote a valid JavaScript identifier.\n *
*/\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR,
PROPERTY_GETTER, PROPERTY_SETTER)\n\npublic actual annotation class JsName(actual val name:
String)\n\n/*\n * Denotes an `external` declaration that must be imported from native JavaScript library.\n *
The compiler produces the code relevant for the target module system, for example, in case of CommonJS,\n * it
will import the declaration via the `require(...)` function.\n * The annotation can be used on top-level external
declarations (classes, properties, functions) and files.\n * In case of file (which can't be `external`) the following rule
applies: all the declarations in\n * the file must be `external`. By applying `@JsModule(...)` on a file you tell the
compiler to import a
JavaScript object\n * that contain all the declarations from the file.\n * Example:\n * ```\n * kotlin\n *
@JsModule("jquery")\n * external abstract class JQuery() {\n * // some declarations here\n * }\n *
@JsModule("jquery")\n * external fun JQuery(element: Element): JQuery\n * ```\n * @property import name
of a module to import declaration from.\n * It is not interpreted by the Kotlin compiler, it's passed as is
directly to the target module system.\n * @see JsNonModule\n
*/\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\n\npublic
annotation class JsModule(val import: String)\n\n/*\n * Denotes an `external` declaration that can be used without
module system.\n * By default, an `external` declaration is available regardless your target module system.\n *
However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.\n *
Some JavaScript libraries are distributed both as
a standalone downloadable piece of JavaScript and as a module available\n * as an npm package.\n * To tell the
Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.\n *
For example:\n * ```\n * kotlin\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("$")\n * external
abstract class JQuery() {\n * // some declarations here\n * }\n * @JsModule("jquery")\n * @JsNonModule\n

```

```

* @JsName("$")\n * external fun JQuery(element: Element): JQuery\n * ```\n * @see JsModule\n
*\n @Retention(AnnotationRetention.BINARY)\n @Target(CLASS, PROPERTY, FUNCTION, FILE)\n public
annotation class JsNonModule\n\n /**\n * Adds prefix to `external` declarations in a source file.\n * JavaScript
does not have concept of packages (namespaces). They are usually emulated by nested objects.\n * The compiler
turns references to `external` declarations either to plain unprefixed names (in case of *plain* modules)\n * or to
plain imports.\n * However,
if a JavaScript library provides its declarations in packages, you won't be satisfied with this.\n * You can tell the
compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)`\n *
annotation.\n * Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external`
declarations.\n * Example:\n * ```\n * @file:JsQualifier("my.jsPackageName")\n * package
some.kotlinPackage\n * external fun foo(x: Int)\n * external fun bar(): String\n * ```\n * @property value
the qualifier to add to the declarations in the generated code.\n * It must be a sequence of valid JavaScript
identifiers separated by the `.` character.\n * Examples of valid qualifiers are: `foo`, `bar.Baz`, `_$0.f`.\n *
*\n * @see JsModule\n *\n @Retention(AnnotationRetention.BINARY)\n @Target(AnnotationTarget.FILE)\n public

 return (byte1 shl 18) xor
(byte2 shl 12) xor (byte3 shl 6) xor byte4 xor 0x381F80
}

Maximum number of bytes needed to encode
a single char. Code points in `0..0x7F` are encoded in a single byte. Code points in `0x80..0x7FF` are
encoded in two bytes. Code points in `0x800..0xD7FF` or in `0xE000..0xFFFF` are encoded in three bytes.
Surrogate code points in `0xD800..0xDFFF` are not Unicode scalar values, therefore
aren't encoded. Code points in `0x10000..0x10FFFF` are represented by a pair of surrogate `Char`s and are
encoded in four bytes.

`@ExperimentalStdlibApi` must be accepted either by `@OptIn` annotation, e.g. `@OptIn(ExperimentalStdlibApi::class)`, or by using the compiler argument `-opt-in=kotlin.ExperimentalStdlibApi`.

`@RequiresOptIn(level = RequiresOptIn.Level.ERROR)` `@Retention(AnnotationRetention.BINARY)` `@Target(CLASS, ANNOTATION_CLASS, PROPERTY, FIELD, LOCAL_VARIABLE, VALUE_PARAMETER, CONSTRUCTOR, FUNCTION, PROPERTY_GETTER, PROPERTY_SETTER, TYPEALIAS)` `@MustBeDocumented` `@SinceKotlin("1.3")` `public annotation class ExperimentalStdlibApi`

Copyright 2010-2020 JetBrains s.r.o. and Kotlin Programming Language contributors. Use of this source code is governed by the Apache 2.0 license that can be found in the license/LICENSE.txt file.

`@nimport kotlin.annotation.AnnotationTarget` `nimport kotlin.experimental.ExperimentalTypeInference`

`Allows to infer generic type arguments of a function from the calls in the annotated function parameter of that function. When this annotation is placed on a generic function parameter of a function, it enables to infer the type arguments of that generic function from the lambda body passed to that parameter. The calls that affect inference are either members of the receiver type of an annotated function parameter or extensions for that type. The extensions must be themselves annotated with @BuilderInference. Example: we declare fun <T> sequence(@BuilderInference block: suspend SequenceScope<T>().-> Unit): Sequence<T> and use it like val result = sequence { yield("result") } Here the type argument of the resulting sequence is inferred to String from the argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence]. Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.`

`@Target(VALUE_PARAMETER, FUNCTION, PROPERTY)` `@Retention(AnnotationRetention.BINARY)` `@SinceKotlin("1.3")` `@ExperimentalTypeInference` `public annotation class BuilderInference`

`Enables overload selection based on the type of the value returned from lambda argument. When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter. Example: fun create(intProducer: () -> Int): Int fun create(doubleProducer: () -> Double): Double val newValue = create { 3.14 }`

`The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function. This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported. Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.`

`@Target(FUNCTION)` `@Retention(AnnotationRetention.BINARY)` `@SinceKotlin("1.4")` `@ExperimentalTypeInference` `public annotation class OverloadResolutionByLambdaReturnType`

`nimport kotlin.annotation.AnnotationTarget` `nimport kotlin.internal.RequireKotlin` `nimport kotlin.internal.RequireKotlinVersionKind`

`The experimental multiplatform support API marker. Any usage of a declaration annotated with @ExperimentalMultiplatform must be accepted either by @OptIn annotation, e.g. @OptIn(ExperimentalMultiplatform::class), or by using the compiler argument -opt-in=kotlin.ExperimentalMultiplatform. @RequiresOptIn @MustBeDocumented @Target(CLASS, ANNOTATION_CLASS, PROPERTY, FIELD, LOCAL_VARIABLE, VALUE_PARAMETER, CONSTRUCTOR, FUNCTION, PROPERTY_GETTER, PROPERTY_SETTER, TYPEALIAS) @Retention(AnnotationRetention.BINARY) public annotation class ExperimentalMultiplatform. Marks an expected annotation class that it isn't required to have actual counterparts in all platforms. This annotation is only applicable to expect annotation classes in multi-`

platform projects

and marks that class as `optional`. Optional expected class is allowed to have no corresponding actual class on the platform. Optional annotations can only be used to annotate something, not as types in signatures. If an optional annotation has no corresponding actual class on a platform, the annotation entries where it's used are simply erased when compiling code on that platform. Note: this annotation is experimental, see [ExperimentalMultiplatform] on how to opt-in for it.

```
/*\n@Target(ANNOTATION_CLASS)\n@Retention(AnnotationRetention.BINARY)\n@ExperimentalMultiplatform\npublic annotation class OptionalExpectation\n"/*\n * Copyright 2010-2022 JetBrains s.r.o. and Kotlin\nProgramming Language contributors.\n * Use of this source code is governed by the Apache 2.0 license that can be\nfound in the license/LICENSE.txt file.\n *\npackage kotlin\nimport\nkotlin.annotation.AnnotationRetention.*\nimport kotlin.reflect.KClass\n/****\n
```

\* Signals that the annotated annotation class is a marker of an API that requires an explicit opt-in. Call sites of any declaration that is either annotated with such a marker or mentions in its signature any other declaration that requires opt-in should opt in to the API either by using `[OptIn]`, or by being annotated with that marker themselves, effectively causing further propagation of the opt-in requirement. The intended uses of opt-in markers include, but are not limited to the following:

- Experimental API for public preview that might change its semantics or affect binary compatibility.
- Internal declarations that should not be used outside the declaring library, but are `public` for technical reasons.
- Fragile or delicate API that needs a lot of expertise to use and thus require an explicit opt-in.

### Contagiousness

\* When a declaration is marked with an opt-in requirement, it is considered to be contagious,

meaning that all its uses or mentions in other declarations will require an explicit opt-in. A rule of thumb for propagating is the following: if the marked declaration ceases to exist, only the places with explicit opt-in (or the corresponding warning) will break. This rule does not imply transitivity, e.g. the propagation does not propagate opt-in through inlining, making it the responsibility of the `inline` function author to mark it properly.

### Type scopes

\* A type is considered requiring opt-in if it is marked with an opt-in marker, or the outer declaration (class or interface) requires opt-in. Any use of any declaration that mentions such type in its signature will require an explicit opt-in, even if it is not used directly on the call site, and even if such declarations do not require opt-in directly.

\* For example, consider the following declarations that are marked with non-propagating opt-in:

```
Unstable\n * @OptIn(UnstableApi::class)\n * fun foo(): Unstable = Unstable()\n *\n@OptIn(UnstableApi::class)\n * fun bar(arg: Unstable = Unstable()) {\n * }\n *\n@OptIn(UnstableApi::class)\n * fun\nUnstable?.baz() {\n * }\n *\n * and their respective call sites:\n * fun outerFun() {\n * val s = foo()\n * bar()\n * null.baz()\n * }\n *\n * Even though call sites do not mention `Unstable` type directly, the
```

corresponding opt-in warning or error will be triggered in each call site due to propagation contagiousness. Note that the propagation is not transitive, i.e. calls to `outerFun` itself would not trigger any further opt-in requirements.

### Lexical scopes

\* If a type requires an opt-in, such requirement is propagated to its lexical scope and all its nested declarations. For example, for the following scope:

```
Unstable\n * class Unstable {\n * fun memberFun() = ... \n * class NestedClass {\n * fun nestedFun()\n * }\n * }\n *\n * Any use of `Unstable`, `NestedClass`, or their member functions will require an
```

explicit opt-in.

### Overridden declarations

\* Opt-in markers are also propagated through the inheritance and interface implementation. If the base declaration requires an opt-in, overriding it requires either an explicit opt-in or propagating the opt-in requirement. See also [Kotlin language documentation](<https://kotlinlang.org/docs/opt-in-requirements.html>) for more information.

\* @property message message to be reported on usages of API without an explicit opt-in, or empty string for the default message.

The default message is: `"This declaration is experimental and its usage should be marked with 'Marker' or '@OptIn(Marker::class)'"`, where `Marker` is the opt-in requirement marker.

\* @property level specifies how usages of API without an explicit opt-in are reported in code.
