Accumulates value starting with the last element and applying [operation] from right to left to each element with its index in the original array and current accumulator value.
Throws an exception if this array is empty. If the array can be empty in an expected way, please use [reduceRightIndexedOrNull] instead.
It returns `null` when its receiver is empty.

coroutine immediately in the invoker's call stack without going through the `[ContinuationInterceptor]` that might be present in the completion's `[CoroutineContext]`. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that `[completion]` of this function may get invoked in an arbitrary context. `[Continuation.intercepted]` can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and `[completion]` happens in the invocation context established by `[ContinuationInterceptor]`. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

Creates unintercepted coroutine with receiver type `[R]` and result type `[T]`. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned `[Continuation]` instance. The `[completion]` continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the `[ContinuationInterceptor]` that might be present in the completion's `[CoroutineContext]`. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that `[completion]` of this function may get invoked in an arbitrary context.

`[Continuation.intercepted]` can be used to acquire the intercepted continuation. Intercepts this continuation with `[ContinuationInterceptor]`. This function shall be used on the immediate result of `[createCoroutineUnintercepted]` or `[suspendCoroutineUninterceptedOrReturn]`, in which case it checks for `[ContinuationInterceptor]` in the continuation's `[context][Continuation.context]`, invokes `[ContinuationInterceptor.interceptContinuation]`, caches and returns the result. If this function is invoked on other `[Continuation]` instances it returns this continuation unchanged.

prevent the compiler from reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler
produces mangled names\n * for functions with parameters, which is unnatural for usual JavaScript developer.\n *
You can put `@JsName(...)` on functions you want to be available from JavaScript.\n * * For some reason you
want to rename declaration, e.g. there's common term in JavaScript\n * for a concept provided by the declaration,
which is uncommon in Kotlin.\n * Example:\n * ```\n * kotlin\n * class Person(val name: String) {\n *     fun

The compiler produces the code relevant for the target module system, for example, in case of CommonJS,\n * it
will import the declaration via the `require(...)` function.\n * The annotation can be used on top-level external
declarations (classes, properties, functions) and files.\n * In case of file (which can't be `external`) the following rule
applies: all the declarations in\n * the file must be `external`. By applying `@JsModule(...)` on a file you tell the
compiler to import a
JavaScript object\n * that contain all the declarations from the file.\n * Example:\n * ```\n * kotlin\n *
@JsModule("jquery")\n * external abstract class JQuery() {\n *     // some declarations here\n * }\n *
@JsModule("jquery")\n * external fun JQuery(element: Element): JQuery\n * ```\n * @property import name

However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.\n *
Some JavaScript libraries are distributed both as
a standalone downloadable piece of JavaScript and as a module available\n * as an npm package.\n * To tell the
Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.\n *
For example:\n * ```\n * kotlin\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("$")\n * external
abstract class JQuery() {\n *     // some declarations here\n * }\n * @JsModule("jquery")\n * @JsNonModule\n

turns references to `external` declarations either to plain unprefix names (in case of *plain* modules)\n * or to
plain imports.\n * However,
if a JavaScript library provides its declarations in packages, you won't be satisfied with this.\n * You can tell the
compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)`\n *
annotation.\n * Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external`
declarations.\n * Example:\n * ```\n * @file:JsQualifier("my.jsPackageName")\n * package
some.kotlinPackage\n * external fun foo(x: Int)\n * external fun bar(): String\n * ```\n * @property value

Maximum number of bytes needed to encode
a single char. Code points in `0..0x7F` are encoded in a single byte. Code points in `0x80..0x7FF` are
encoded in two bytes. Code points in `0x800..0xD7FF` or in `0xE000..0xFFFF` are encoded in three bytes.
Surrogate code points in `0xD800..0xDFFF` are not Unicode scalar values, therefore
aren't encoded. Code points in `0x10000..0x10FFFF` are represented by a pair of surrogate `Char`s and are
encoded in four bytes.

`*n * Allows to infer generic type arguments of a function from the calls in the annotated function parameter of that function. When this annotation is placed on a generic function parameter of a function, it enables to infer the type arguments of that generic function from the lambda body passed to that parameter. The calls that affect inference are either members of the receiver type of an annotated function parameter or extensions for that type. The extensions must be themselves annotated with @BuilderInference. Example: we declare fun <T> sequence(@BuilderInference block: suspend SequenceScope<T>().-> Unit): Sequence<T> and use it like val result = sequence { yield("result") } Here the type argument of the resulting sequence is inferred to String from the argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence]. Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.`

`@Target(VALUE_PARAMETER, FUNCTION, PROPERTY)` `@Retention(AnnotationRetention.BINARY)` `@SinceKotlin("1.3")` `@ExperimentalTypeInference` `public annotation class BuilderInference`

`*n * Enables overload selection based on the type of the value returned from lambda argument. When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter. Example: fun create(intProducer: () -> Int): Int fun create(doubleProducer: () -> Double): Double`

`*n * val newValue = create { 3.14 }`

`*n * The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function. This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported. Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.`

and marks that class as `optional`. Optional expected class is allowed to have no corresponding actual class on the platform. Optional annotations can only be used to annotate something, not as types in signatures. If an optional annotation has no corresponding actual class on a platform, the annotation entries where it's used are simply erased when compiling code on that platform. Note: this annotation is experimental, see [ExperimentalMultiplatform] on how to opt-in for it.

\* Signals that the annotated annotation class is a marker of an API that requires an explicit opt-in. Call sites of any declaration that is either annotated with such a marker or mentions in its signature any other declaration that requires opt-in should opt in to the API either by using `[OptIn]`, or by being annotated with that marker themselves, effectively causing further propagation of the opt-in requirement. The intended uses of opt-in markers include, but are not limited to the following:

- Experimental API for public preview that might change its semantics or affect binary compatibility.
- Internal declarations that should not be used outside the declaring library, but are `public` for technical reasons.
- Fragile or delicate API that needs a lot of expertise to use and thus require an explicit opt-in.

### Contagiousness

When a declaration is marked with an opt-in requirement, it is considered to be contagious,

meaning that all its uses or mentions in other declarations will require an explicit opt-in. A rule of thumb for propagating is the following: if the marked declaration ceases to exist, only the places with explicit opt-in (or the corresponding warning) will break. This rule does not imply transitivity, e.g. the propagation does not propagate opt-in through inlining, making it the responsibility of `inline` function author to mark it properly.

### Type scopes

A type is considered requiring opt-in if it is marked with an opt-in marker, or the outer declaration (class or interface) requires opt-in. Any use of any declaration that mentions such type in its signature will require an explicit opt-in, even if it is not used directly on the call site, and even if such declarations do not require opt-in directly.

For example, consider the following declarations that are marked with non-propagating opt-in:

```
Unstable\n * @OptIn(UnstableApi::class)\n * fun foo(): Unstable = Unstable()\n *\n@OptIn(UnstableApi::class)\n * fun bar(arg: Unstable = Unstable()) {\n * }\n *\n@OptIn(UnstableApi::class)\n * fun\nUnstable?.baz() {\n * }\n *\n * and their respective call sites:\n * fun outerFun() {\n *     val s = foo()\n *     bar()\n *     null.baz()\n * }\n *\n * Even though call sites do not mention `Unstable` type directly, the
```

corresponding opt-in warning or error will be triggered in each call site due to propagation contagiousness. Note that the propagation is not transitive, i.e. calls to `outerFun` itself would not trigger any further opt-in requirements.

### Lexical scopes

If a type requires an opt-in, such requirement is propagated to its lexical scope and all its nested declarations. For example, for the following scope:

```
class Unstable {\n *     fun memberFun() = ...\n *\n *     class NestedClass {\n *         fun nestedFun()\n *     }\n *\n * }\n *\n * Any use of `Unstable`, `NestedClass`, or their member functions will require an
```

explicit opt-in. Opt-in markers are also propagated through the inheritance and interface implementation. If the base declaration requires an opt-in, overriding it requires either an explicit opt-in or propagating the opt-in requirement. See also [Kotlin language

documentation](<https://kotlinlang.org/docs/opt-in-requirements.html>) for more information.

@property message message to be reported on usages of API without an explicit opt-in, or empty string for the default message.

The default message is: `"This declaration is experimental and its usage should be marked with 'Marker' or '@OptIn(Marker::class)'"`, where `Marker` is the opt-in requirement marker.

@property level specifies how usages of API without an explicit opt-in are reported in code.

\n * When applied, any attempt to subclass the target declaration will trigger an opt-in\n * with the corresponding level
and message.\n *
\n * The intended uses of subclass opt-in markers include, but are not limited to the following
API:\n * - Stable to use, but unstable to implement due to its further evolution.\n * - Stable to use, but closed for
3rd-part implementations due to internal or technical reasons.\n * - Stable to use, but delicate or fragile to
implement.\n * - Stable to use, but with a contract that may be weakened in the future in a backwards-
incompatible\n
* manner for external implementations.\n *
\n * Contrary to regular [RequiresOptIn], there are three ways to opt-in
into the subclassing requirement:\n * - Annotate declaration with the marker annotation, making it propagating.\n * -
Annotate declaration with [OptIn] in order to opt in into the provided guarantees in a non-propagating manner.\n * -
Annotate declaration with [SubclassOptInRequired] with the same marker class, making it further propagating only
for subclassing.\n *
\n * Uses of this annotation are limited to open and abstract classes, and non-`fun` interfaces.\n *
\n * Any other uses allowed by `CLASS` annotation target yield a compilation error.\n *
\n * @property markerClass
specifies marker annotation that require explicit opt-in.\n * @see RequiresOptIn for a detailed description of opt-in
semantics and propagation rules.\n

 A specialized immutable implementation of [List] interface that contains all enum entries of the specified enum type [E].  
 [EnumEntries] contains all enum entries in the order they are declared in the source code, consistently with the corresponding [Enum.ordinal] values.  
 An instance of this interface can only be obtained from `EnumClass.entries` property.

\* Represents a time point notched on a particular [TimeSource]. Remains bound to the time source it was taken from and allows querying for the duration of time elapsed from that point (see the function [elapsedNow]).

\* Returns the amount of time passed from this mark measured with the time source from which this mark was taken. Note that the value returned by this function can change on subsequent invocations.

@throws IllegalArgumentException an implementation may throw if calculating the elapsed time involves adding a positive infinite duration to an infinitely distant past time mark or a negative infinite duration to an infinitely distant future time mark.

public abstract fun elapsedNow(): Duration

Returns a time mark on the same time source that is ahead of this time mark by the specified [duration]. The returned time mark is more `_late_` when the [duration] is positive, and more `_early_` when the [duration] is negative. If the time mark is adjusted too far in the past or in the future, it may saturate to an infinitely distant time mark. In that case, [elapsedNow] will return an infinite duration elapsed from such infinitely distant mark.

@throws IllegalArgumentException an implementation may throw if a positive infinite duration is added to an infinitely distant past time mark or a negative infinite duration is added to an infinitely distant future time mark.

public operator fun plus(duration: Duration): TimeMark = AdjustedTimeMark(this, duration)

Returns a time mark on the same time source that is behind this time mark by the specified [duration]. The returned time mark is more `_early_` when the [duration] is positive, and more `_late_` when the [duration] is negative. If the time mark is adjusted too far in the past or in the future, it may saturate to an infinitely distant time mark. In that case, [elapsedNow] will return an infinite duration elapsed from such infinitely distant mark.

@throws IllegalArgumentException an implementation may throw if a positive infinite duration is subtracted from an infinitely distant future time mark or a negative infinite duration is subtracted from an infinitely distant past time mark.

public open operator fun minus(duration: Duration): TimeMark = plus(-duration)

Returns true if this time mark has passed according to the time source from which this mark was taken. Note that the value returned by this function can change on subsequent invocations. If the time source is monotonic, it can change only from `false` to `true`, namely, when the time mark becomes behind the current point of the time source.

public fun hasPassedNow(): Boolean = !elapsedNow().isNegative()

Returns false if this time mark has not passed according to the time source from which this mark was taken. Note that the value returned by this function can change on subsequent invocations. If the time source is monotonic, it can change only from `true` to `false`, namely, when the time mark becomes behind the current point of the time source.

public fun hasNotPassedNow(): Boolean = elapsedNow().isNegative()

A [TimeMark] that can be compared for difference with other time marks obtained from the same [TimeSource.WithComparableMarks] time source.

null)\n * val deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()\n * ```\n */\n * A regular recursive function can be defined to compute a depth of a tree:\n */\n * ```\n * fun depth(t:
Tree?): Int =\n *     if (t == null) 0 else max(depth(t.left), depth(t.right)) + 1\n * println(depth(deepTree)) //
StackOverflowError\n * ```\n */\n * If this `depth` function is called for a `deepTree` it produces
`StackOverflowError` because of deep recursion.\n * However, the `depth` function can be rewritten using
`DeepRecursiveFunction` in the following way, and then\n * it successfully computes
[depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n */\n * ```\n * val depth =
DeepRecursiveFunction<Tree?, Int> { t ->\n *     if (t == null) 0 else max(callRecursive(t.left),
callRecursive(t.right)) + 1\n * }\n * println(depth(deepTree)) // Ok\n * ```\n */\n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]
extension. For example, the\n * following pair of mutually
recursive functions computes the number of tree nodes at even depth in the tree.\n */\n * ```\n * val mutualRecursion
= object {\n *     val even: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->\n *         if (t ==
null) 0 else odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1\n *     }\n *     val odd:

even.callRecursive(t.left) + even.callRecursive(t.right)\n *     }\n * }\n * ```\n */\n * @param [T] the function
parameter type.\n * @param [R] the function result type.\n * @param block the function body.\n
