state, search, and the owners stack.\n// These values are managed together because changes in one often impact the
others.\n// Combining them enables us to avoid cascading renders.\n// Changes to search state may impact tree
state.\n// For example, updating the selected search result also updates the tree's selected value.\n// Search does not
fundamentally change the tree though.\n// It is also possible to update the selected tree value independently.\n// Changes
to owners state mask search and tree values.\n// When owners stack is not empty, search is temporarily
disabled,\n// and tree values (e.g. num elements, selected element) are masked.\n// Both tree and search values are
restored when the owners stack is cleared.\n// For this reason, changes to the tree context are processed in
sequence: tree -> search -> owners\n// This enables each section to potentially override (or mask) previous
values.\n\nimport * as React from 'react';\nimport {\n  createContext,\n  useCallback,\n  useContext,\n  useEffect,\n  useLayoutEffect,\n  useMemo,\n  useReducer,\n  useRef,\n  startTransition,\n} from 'react';\nimport {createRegExp}

around it, we can conditionally useEffect on the server (no-op) and\n * useLayoutEffect in the browser. We

```

occasionally need `useLayoutEffect` to ensure we don't get a render flash for certain operations, but we may also need affected components to render on the server. One example is when setting a component's descendants to retrieve their index values. Important to note that using this hook as an escape hatch will break the ESLint dependency warnings unless you rename the import to `useLayoutEffect`. Use sparingly only when the effect won't affect the rendered HTML to avoid any server/client mismatch. If a `useLayoutEffect` is needed and the result would create a mismatch, it's likely that the component in question shouldn't be rendered on the server at all, so a better approach would be to lazily render those in a parent component after client-side hydration.

<https://gist.github.com/gaearon/e7d97cdf38a2907924ea12e4ebdf3c85> <https://github.com/reduxjs/react-redux/blob/master/src/utils/useIsomorphicLayoutEffect.js>

```
@param effect
@param deps
function useIsomorphicLayoutEffect = /*#__PURE__*/canUseDOM() ? useLayoutEffect : useEffect;
export { useIsomorphicLayoutEffect };
", "import { useState, useEffect } from 'react';
import { useIsomorphicLayoutEffect } from '@reach/utils/use-isomorphic-layout-effect';
Welcome to @reach/auto-id!
Let's see if we can make sense of why this hook exists and its implementation.
Some background:
1. Accessibility APIs rely heavily on element IDs
2. Requiring developers to put IDs on every element in Reach UI is both cumbersome and error-prone
3. With a component model, we can generate IDs for them!
Solution 1: Generate random IDs. This works great as long as you don't server render your app. When React (in the client) tries to reuse the markup from the server, the IDs won't match and React will then recreate the entire DOM tree.
Solution 2: Increment an integer. This sounds great. Since we're rendering the exact same tree on the server and client, we can increment a counter and get a deterministic result between client and server. Also, JS integers can go up to nine-quadrillion. I'm pretty sure the tab will be closed before an app ever needs 10 quadrillion IDs!
Problem solved, right? Ah, but there's a catch! React's concurrent rendering makes this approach non-deterministic. While the client and server will end up with the same elements in the end, depending on suspense boundaries (and possibly some user input during the initial render) the incrementing integers won't always match up.
Solution 3: Don't use IDs at all on the server; patch after first render. What we've done here is solution 2 with some tricks. With this approach, the ID returned is an empty string on the first render. This way the server and client have the same markup no matter how wild the concurrent rendering may have gotten. After the render, we patch up the components with an incremented ID. This causes a double render on any components with `useId`. Shouldn't be a problem since the components using this hook should be small, and we're only updating the ID attribute on the DOM, nothing big is happening. It doesn't have to be an incremented number, though--we could do generate random strings instead, but incrementing a number is probably the cheapest thing we can do.
Additionally, we only do this patchup on the very first client render ever. Any calls to `useId` that happen dynamically in the client will be populated immediately with a value. So, we only get the double render after server hydration and never again, SO BACK OFF ALRIGHT?
serverHandoffComplete = false;
var id = 0;
var genId = function genId() { return ++id; };
useId
Autogenerate IDs to facilitate WAI-ARIA and server rendering.
Note: The returned ID will initially be `null` and will update after a component mounts. Users may need to supply their own ID if they need consistent values for SSR.
@see Docs https://reach.tech/auto-id
function useId(idFromProps) {
  If this instance isn't part of the initial render, we don't have to do the double render/patch-up dance. We can just generate the ID and return it.
  var initialId = idFromProps || (serverHandoffComplete ? genId() : null);
  var _React$useState = useState(initialId),
      id = _React$useState[0],
      setId = _React$useState[1];
  useIsomorphicLayoutEffect(function () {
    if (id === null) {
      Patch the ID after render. We do this in `useLayoutEffect` to avoid any rendering flicker, though it'll make the first render slower (unlikely to matter, but you're welcome to measure your app and let us know if it's a problem).
      setId(genId());
    } // eslint-disable-next-line react-hooks/exhaustive-deps
  }, []);
  useEffect(function () {
    if (serverHandoffComplete === false) {
      Flag all future uses of `useId` to skip the update dance. This is in `useEffect` because it goes after `useLayoutEffect`, ensuring we don't accidentally bail out of
```

```

hook registers our descendant by passing it into an array. We can then\n * search that array by to find its index when
registering it in the component.\n * We use this for focus management, keyboard navigation, and typeahead\n *
functionality for some components.\n * \n * The hook accepts the element node and (optionally) a key. The key is
useful\n * if multiple descendants have identical text values and we need to\n * differentiate siblings for some
reason.\n * \n * Our main goals with this are:\n * 1) maximum composability,\n * 2) minimal API friction\n * 3)
SSR compatibility*\n * 4) concurrent safe\n * 5) index always up-to-date with the tree despite changes\n * 6)
works with memoization of any component in the tree (hopefully)\n * \n * As for SSR, the good news is that we
don't actually need the index on the\n * server for most use-cases, as we are only using it to determine the order of\n
* composed descendants for keyboard navigation. However, in the few cases where\n * this is not the case, we can

```

```

require an explicit index from the app.\n *\n\nfunction useDescendant(descendant, context, indexProp) {\n  var\n  forceUpdate = useForceUpdate();\n  \n  var _React$useContext = useContext(context),\n      registerDescendant =\n      _React$useContext.registerDescendant,\n      unregisterDescendant = _React$useContext.unregisterDescendant,\n      descendants = _React$useContext.descendants; // This will initially return -1 because we haven't registered the\n  descendant\n  // on the first render.
