We can then search that array by to find its index when registering it in the component. We use this for focus management, keyboard navigation, and typeahead functionality for some components. The hook accepts the element node and (optionally) a key. The key is useful if multiple descendants have identical text values and we need to differentiate siblings for some reason. Our main goals with this are: 1) maximum composability, 2) minimal API friction 3) SSR compatibility 4) concurrent safe 5) index always up-to-date with the tree despite changes 6) works with memoization of any component in the tree (hopefully) As for SSR, the good news is that we don't actually need the index on the server for most use-cases, as we are only using it to determine the order of composed descendants for keyboard navigation. However, in the few cases where this is not the case, we can require an explicit index from the app.*/\n\nfunction useDescendant(descendant, context, indexProp) {\n  var forceUpdate = useForceUpdate();\n  var _React$useContext = useContext(context),\n    registerDescendant = _React$useContext.registerDescendant,\n    unregisterDescendant = _React$useContext.unregisterDescendant,\n    descendants = _React$useContext.descendants; // This will initially return -1 because we haven't registered the descendant\n  // on the first render. element ID to inspected data.\n// We use an LRU for this rather than a WeakMap because of how the "no-change"
optimization works.\n// When the frontend polls the backend for an update on the element that's currently
inspected,\n// the backend will send a "no-change" message if the element hasn't updated (rendered) since the last
time it was asked.\n// In this case, the frontend cache should reuse the previous (cached) value.\n// Using a
WeakMap keyed on Element generally works well for this, since Elements are mutable and stable in the Store.\n//

```

This doesn't work properly though when component filters are changed, because this will cause the Store to dump all roots and re-initialize the tree (recreating the Element objects). So instead we key on Element ID (which is stable in this case) and use an LRU for eviction.

```

```

table/blob/main/src/vendor_upstream/dom/normalizeWheel.js\n\nexport type NormalizedWheelDelta = {\n    deltaX:\n    number,\n    deltaY: number,\n};\n\n// Reasonable defaults\nconst LINE_HEIGHT = 40;\nconst PAGE_HEIGHT =\n800;\n\n * Mouse wheel (and 2-finger trackpad) support on the web sucks. It is\n * complicated, thus this doc\n * is long and (hopefully) detailed enough to answer\n * your questions.\n * If you need to react to the mouse\n * wheel in a predictable way, this code is\n * like your bestest friend. * hugs *\n * In your event callback, use this\n * code to get sane interpretation of the\n * deltas. This code will return an object with properties:\n * - deltaX --\n * normalized distance (to pixels) - x plane\n * - deltaY --\n * - y plane\n * Wheel values are provided by the\n * browser assuming you are using the wheel to\n * scroll a web page by a number of lines or pixels (or pages). Values\n * can vary\n * significantly on different platforms and browsers, forgetting that you can\n * scroll at different speeds.\n * Some devices (like trackpads) emit more events\n * at smaller increments with fine granularity, and some emit\n * massive jumps with\n * linear speed or acceleration.\n * This code does its best to normalize the deltas for\n * you:\n * - delta* is normalizing the desired scroll delta in pixel units.\n * - positive value indicates\n * scrolling DOWN/RIGHT, negative UP/LEFT. This\n * should translate to positive value zooming IN, negative\n * zooming OUT.\n * This matches the 'wheel' event.\n * Implementation info:\n * The basics of the\n * standard 'wheel' event is that it includes a unit,\n * deltaMode (pixels, lines, pages), and deltaX, deltaY and deltaZ.\n
```

* See: <http://www.w3.org/TR/DOM-Level-3-Events/#events-wheel>

* Examples of 'wheel' event if you scroll slowly (down) by one step with an average mouse:

- OS X + Chrome (mouse) - 4 pixel delta (wheelDelta -120)
- OS X + Safari (mouse) - N/A pixel delta (wheelDelta -12)
- OS X + Firefox (mouse) - 0.1 line delta (wheelDelta N/A)
- Win8 + Chrome (mouse) - 100 pixel delta (wheelDelta -120)
- Win8 + Firefox (mouse) - 3 line delta (wheelDelta -120)

* On the trackpad:

- OS X + Chrome (trackpad) - 2 pixel delta (wheelDelta -6)
- OS X + Firefox (trackpad) - 1 pixel delta (wheelDelta N/A)

```

^next function normalizeWheel(event: WheelEvent): NormalizedWheelDelta {
  let deltaX = event.deltaX;
  let deltaY = event.deltaY;
  if ( // $FlowFixMe DOM_DELTA_LINE missing from WheelEvent
    event.deltaMode === WheelEvent.DOM_DELTA_LINE
  ) { // delta in LINE units
    deltaX *= LINE_HEIGHT;
    deltaY *= LINE_HEIGHT;
  } else if ( // $FlowFixMe DOM_DELTA_PAGE missing from WheelEvent
    event.deltaMode === WheelEvent.DOM_DELTA_PAGE
  ) { // delta in PAGE units
    deltaX *= PAGE_HEIGHT;
    deltaY *= PAGE_HEIGHT;
  }
  return {deltaX, deltaY};
}

in Strict Mode\n  // * Disable logging during re-renders to inspect hooks (see inspectHooksOffFiber)\n  //\n  // For
React Native, we intentionally patch early (during injection).\n  // This provides React Native developers with
components stacks even if they don't run DevTools.\n  //\n  // This won't work for DOM though, since this entire
file is eval'ed and inserted as a script tag.\n  // In that case, we'll only patch parts of the console that are
needed during the first render\n  // and patch everything else later (when the frontend attaches).\n  //\n  // Don't
patch in test environments because we don't want to interfere with Jest's own console overrides.\n  //\n  // Note
that because this function is inlined, this conditional check must only use static booleans.\n  // Otherwise the
extension will throw with an undefined error.\n  // (See comments in the try/catch below for more context on inlining.)\n  if
