It differs from BasicSourceMapConsumer in\n * that it takes \"indexed\"\n * source maps (i.e. ones with a \"sections\" field) as\n * input.  

 * The only parameter is a raw source map (either\n * as a JSON string, or already\n * parsed to an object). According to the spec for indexed source maps, they\n * have

```

the following attributes:

- `version`: Which version of the source map spec this map is following.
- `file`: Optional. The generated file this source map is associated with.
- `sections`: A list of section definitions. Each value under the `"sections"` field has two fields:
 - `offset`: The offset into the original specified at which this section begins to apply, defined as an object with a `"line"` and `"column"` field.
 - `map`: A source map definition. This source map could also be indexed, but doesn't have to be.

Instead of the `"map"` field, it's also possible to have a `"url"` field specifying a URL to retrieve a source map from, but that's currently unsupported.

Here's an example source map, taken from the source map spec[0], but modified to omit a section which uses the `"url"` field.

```
{
  version : 3,
  file : "app.js",
  sections : [
    {
      offset : { line:100, column:10 },
      map : {
        version : 3,
        file : "section.js",
        sources : ["foo.js", "bar.js"],
        names : ["src", "maps", "are", "fun"],
        mappings : "AAAA,E;ABCDE;"
      }
    }
  ],
}
```
