source and source maps is done in a Web Worker\\n// because parsing is CPU intensive and should not block the UI
thread.\\n// Fetching source and source map files is intentionally done on the UI thread\\n// so that loaded source
files can reuse the browser's Network cache.\\n// Requests made from within an extension do not share the page's
Network cache,\\n// but messages can be sent from the UI thread to the content script\\n// which can make a request
from the page's context (with caching).\\n// Some overhead may be incurred sharing (serializing) the loaded data
between contexts,\\n// but less than fetching the file to begin with,\\n// and in some cases we can avoid serializing the
source code at all\\n// (e.g. when we are in an environment that supports our custom metadata format).\\n// The
overall flow of this file is such:\\n// 1. Find the Set of source files defining the hooks and load them all.\\n// Then for
each source file, do the following:\\n// a. Search loaded source file to see if a source map is available.\\n// If
so, load that file and pass it to a Worker for parsing.\\n// The source map is used to retrieve the original
source,\\n// which is then also parsed in the Worker to infer hook names.\\n// This is less ideal because parsing
a full source map is slower,\\n// since we need to evaluate the mappings in order to map the runtime code to the
original source,\\n// but at least the eventual source that we parse to an AST is small/fast.\\n// b. If no source
map, pass the full source to a Worker for parsing.\\n// Use the source to infer hook names.\\n// This is the least
optimal route as parsing the full source is very CPU intensive.\\n// In the future, we may add an additional
optimization the above sequence.\\n// This check would come before the source map check:\\n// a. Search loaded
source file to see if a custom React metadata file is available.\\n// If so, load that file and pass it to a Worker
for parsing and extracting.\\n// This is the fastest option since our custom metadata file is much smaller than a full
source map,\\n// and there is no need to convert runtime code to the original source.\\n\\nimport {__DEBUG__}
