- The **aaa authentication** command defines a method list, “default,” to be used on serial interfaces running PPP. The keyword **default** means that PPP authentication is applied by default to all interfaces. The **if-needed** keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword **group tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.
- The **aaa accounting** command configures network accounting via TACACS+. In this example, accounting records describing the session that just terminated will be sent to the TACACS+ daemon whenever a network connection terminates.
- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”
- The **interface** command selects the line, and the **ppp authentication** command applies the default method list to this line.

Example: TACACS Authentication

The following example shows how to configure TACACS+ as the security protocol for PPP authentication:

```
aaa new-model
aaa authentication ppp test group tacacs+ local
tacacs-server host 10.1.2.3
tacacs-server key goaway
```

```
interface serial 0
  ppp authentication chap pap test
```

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.
- The **aaa authentication** command defines a method list, “test,” to be used on serial interfaces running PPP. The keyword **group tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.
- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”
- The **interface** command selects the line, and the **ppp authentication** command applies the test method list to this line.

The following example shows how to configure TACACS+ as the security protocol for PPP authentication, but instead of the “test” method list, the “default” method list is used.

```
aaa new-model
aaa authentication ppp default if-needed group tacacs+ local
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
  ppp authentication chap default
```

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.
- The **aaa authentication** command defines a method list, “default,” to be used on serial interfaces running PPP. The keyword **default** means that PPP authentication is applied by default to all interfaces. The **if-needed** keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword **group tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.
- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”
- The **interface** command selects the line, and the **ppp authentication** command applies the default method list to this line.

The following example shows how to create the same authentication algorithm for PAP, but it calls the method list “MIS-access” instead of “default”:

```
aaa new-model
aaa authentication pap MIS-access if-needed group tacacs+ local
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
  ppp authentication pap MIS-access
```

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.
- The **aaa authentication** command defines a method list, “MIS-access,” to be used on serial interfaces running PPP. The method list, “MIS-access,” means that PPP authentication is applied to all interfaces. The **if-needed** keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword **group tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.
- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”
- The **interface** command selects the line, and the **ppp authentication** command applies the default method list to this line.

The following example shows the configuration for a TACACS+ daemon with an IP address of 10.2.3.4 and an encryption key of “apple”:

```
aaa new-model
aaa authentication login default group tacacs+ local
tacacs-server host 10.2.3.4
tacacs-server key apple
```

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.
- The **aaa authentication** command defines the default method list. Incoming ASCII logins on all interfaces (by default) will use TACACS+ for authentication. If no TACACS+ server responds, then the network access server will use the information contained in the local username database for authentication.
- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.2.3.4. The **tacacs-server key** command defines the shared encryption key to be “apple.”

Example: Configuring Per VRF for TACACS Servers

The following output example shows that the group server **tacacs1** is configured for per VRF AAA services:

```
aaa group server tacacs+ tacacs1
  server-private 10.1.1.1 port 19 key cisco
  ip vrf forwarding cisco
  ip tacacs source-interface Loopback0
ip vrf cisco
  rd 100:1
interface Loopback0
  ip address 10.0.0.2 255.0.0.0
  ip vrf forwarding cisco
```

CHAPTER 51

Configuring RADIUS

The RADIUS security system is a distributed client/server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco devices and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

- [Prerequisites for Configuring RADIUS, on page 1059](#)
- [Restrictions for Configuring RADIUS, on page 1060](#)
- [Information about RADIUS, on page 1060](#)
- [How to Configure RADIUS, on page 1080](#)
- [Configuration Examples for RADIUS, on page 1095](#)
- [Additional References for RADIUS, on page 1098](#)
- [Feature Information for RADIUS, on page 1099](#)

Prerequisites for Configuring RADIUS

This section lists the prerequisites for controlling Device access with RADIUS.

General:

- RADIUS and Authentication, Authorization, and Accounting (AAA) must be enabled to use any of the configuration commands in this chapter.
- RADIUS is facilitated through AAA and can be enabled only through AAA commands.
- Use the **aaa new-model** global configuration command to enable AAA.
- Use the **aaa authentication** global configuration command to define method lists for RADIUS authentication.
- Use **line** and **interface** commands to enable the defined method lists to be used.
- At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.
- You should have access to and should configure a RADIUS server before configuring RADIUS features on your Device.
- The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

- To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

For RADIUS operation:

- Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.

Restrictions for Configuring RADIUS

This topic covers restrictions for controlling Device access with RADIUS.

General:

- To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

- Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.
- Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.
- Networks using a variety of services. RADIUS generally binds a user to one service model.

Information about RADIUS

RADIUS and Switch Access

This section describes how to enable and configure RADIUS. RADIUS provides detailed accounting information and flexible administrative control over the authentication and authorization processes.

RADIUS Overview

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors' access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.

- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a *smart card* access control system. In one case, RADIUS has been used with Enigma's security cards to validate users and to grant access to network resources.
- Networks already using RADIUS. You can add a Cisco Device containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 2: Transitioning from RADIUS to TACACS+ Services below.
- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see Chapter 11, "Configuring IEEE 802.1x Port-Based Authentication."
- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

Figure 86: Transitioning from RADIUS to TACACS+ Services

RADIUS Operation

When a user attempts to log in and authenticate to a Device that is access controlled by a RADIUS server, these events occur:

1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of the following responses from the RADIUS server:
 - ACCEPT—The user is authenticated.
 - REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
 - CHALLENGE—A challenge requires additional data from the user.
 - CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

Default RADIUS Configuration

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

RADIUS Server Host

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port
- Key string
- Timeout period
- Retransmission value

You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS_DEAD message appears, and then the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings.

RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which

they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list. The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one. If the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order in which they are configured.)

AAA Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user's profile, which is in the local user database or on the security server, to configure the user's session. The user is granted access to a requested service only if the information in the user profile allows it.

RADIUS Accounting

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using

the format recommended in the specification. Cisco's vendor-ID is 9, and the supported option has vendor-type 1, which is named *cisco-avpair*. The value is a string with this format:

```
protocol : attribute sep value *
```

Protocol is a value of the Cisco protocol attribute for a particular type of authorization. *Attribute* and *value* are an appropriate attributevalue (AV) pair defined in the Cisco TACACS+ specification, and *sep* is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, the following AV pair causes Cisco's "multiple named IP address pools" feature to be activated during IP authorization (during PPP's Internet Protocol Control Protocol (IPCP) address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

If you insert an "*", the AV pair "ip:addr-pool=first" becomes optional. Note that any AV pair can be made optional:

```
cisco-avpair= "ip:addr-pool*first"
```

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, "Remote Authentication Dial-In User Service (RADIUS)."

Attribute 26 contains the following three elements:

- Type
- Length
- String (also known as data)
 - Vendor-Id
 - Vendor-Type
 - Vendor-Length
 - Vendor-Data

The figure below shows the packet format for a VSA encapsulated "behind" attribute 26.

Figure 87: VSA Encapsulated Behind Attribute 26

51325

Note It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor's definition of that attribute.

The table below describes significant fields listed in the Vendor-Specific RADIUS IETF Attributes table (second table below), which lists supported vendor-specific RADIUS attributes (IETF attribute 26).

Table 110: Vendor-Specific Attributes Table Field Descriptions

Field	Description
Number	All attributes listed in the following table are extensions of IETF attribute 26.
Vendor-Specific Command Codes	A defined code used to identify a particular vendor. Code 9 defines Cisco VSAs, 311 defines Microsoft VSAs, and 529 defines Ascend VSAs.
Sub-Type Number	The attribute ID number. This number is much like the ID numbers of IETF attributes, except it is a "second layer" ID number encapsulated behind attribute 26.
Attribute	The ASCII string name of the attribute.
Description	Description of the attribute.

Table 111: Vendor-Specific RADIUS IETF Attributes

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
MS-CHAP Attributes				
26	311	1	MSCHAP-Response	Contains the response value provided by a PPP MS-CHAP user in response to the challenge. It is only used in Access-Request packets. This attribute is identical to the PPP CHAP Identifier. (RFC 2548)
26	311	11	MSCHAP-Challenge	Contains the challenge sent by a network access server to an MS-CHAP user. It can be used in both Access-Request and Access-Challenge packets. (RFC 2548)
VPDN Attributes				

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	l2tp-cm-local-window-size	Specifies the maximum receive window size for L2TP control messages. This value is advertised to the peer during tunnel establishment.
26	9	1	l2tp-drop-out-of-order	Respects sequence numbers on data packets by dropping those that are received out of order. This does not ensure that sequence numbers will be sent on data packets, just how to handle them if they are received.
26	9	1	l2tp-hello-interval	Specifies the number of seconds for the hello keepalive interval. Hello packets are sent when no data has been sent on a tunnel for the number of seconds configured here.
26	9	1	l2tp-hidden-avp	When enabled, sensitive AVPs in L2TP control messages are scrambled or hidden.
26	9	1	l2tp-nosession-timeout	Specifies the number of seconds that a tunnel will stay active with no sessions before timing out and shutting down.
26	9	1	tunnel-tos-reflect	Copies the IP ToS field from the IP header of each payload packet to the IP header of the tunnel packet for packets entering the tunnel at the LNS.
26	9	1	l2tp-tunnel-authen	If this attribute is set, it performs L2TP tunnel authentication.
26	9	1	l2tp-tunnel-password	Shared secret used for L2TP tunnel authentication and AVP hiding.

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	l2tp-udp-checksum	This is an authorization attribute and defines whether L2TP should perform UDP checksums for data packets. Valid values are “yes” and “no.” The default is no.
Store and Forward Fax Attributes				
26	9	3	Fax-Account-Id-Origin	Indicates the account ID origin as defined by system administrator for the mmoip aaa receive-id or the mmoip aaa send-id commands.
26	9	4	Fax-Msg-Id=	Indicates a unique fax message identification number assigned by Store and Forward Fax.
26	9	5	Fax-Pages	Indicates the number of pages transmitted or received during this fax session. This page count includes cover pages.
26	9	6	Fax-Coverpage-Flag	Indicates whether or not a cover page was generated by the off-ramp gateway for this fax session. True indicates that a cover page was generated; false means that a cover page was not generated.
26	9	7	Fax-Modem-Time	Indicates the amount of time in seconds the modem sent fax data (x) and the amount of time in seconds of the total fax session (y), which includes both fax-mail and PSTN time, in the form x/y. For example, 10/15 means that the transfer time took 10 seconds, and the total fax session took 15 seconds.

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	8	Fax-Connect-Speed	Indicates the modem speed at which this fax-mail was initially transmitted or received. Possible values are 1200, 4800, 9600, and 14400.
26	9	9	Fax-Recipient-Count	Indicates the number of recipients for this fax transmission. Until e-mail servers support Session mode, the number should be 1.
26	9	10	Fax-Process-Abort-Flag	Indicates that the fax session was cancelled or successful. True means that the session was cancelled; false means that the session was successful.
26	9	11	Fax-Dsn-Address	Indicates the address to which DSNs will be sent.
26	9	12	Fax-Dsn-Flag	Indicates whether or not DSN has been enabled. True indicates that DSN has been enabled; false means that DSN has not been enabled.
26	9	13	Fax-Mdn-Address	Indicates the address to which MDNs will be sent.
26	9	14	Fax-Mdn-Flag	Indicates whether or not message delivery notification (MDN) has been enabled. True indicates that MDN had been enabled; false means that MDN had not been enabled.
26	9	15	Fax-Auth-Status	Indicates whether or not authentication for this fax session was successful. Possible values for this field are success, failed, bypassed, or unknown.

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	16	Email-Server-Address	Indicates the IP address of the e-mail server handling the on-ramp fax-mail message.
26	9	17	Email-Server-Ack-Flag	Indicates that the on-ramp gateway has received a positive acknowledgment from the e-mail server accepting the fax-mail message.
26	9	18	Gateway-Id	Indicates the name of the gateway that processed the fax session. The name appears in the following format: hostname.domain-name.
26	9	19	Call-Type	Describes the type of fax activity: fax receive or fax send.
26	9	20	Port-Used	Indicates the slot/port number of the Cisco AS5300 used to either transmit or receive this fax-mail.
26	9	21	Abort-Cause	If the fax session cancels, indicates the system component that signaled the cancel operation. Examples of system components that could trigger a cancel operation are FAP (Fax Application Process), TIFF (the TIFF reader or the TIFF writer), fax-mail client, fax-mail server, ESMTP client, or ESMTP server.
H323 Attributes				
26	9	23	Remote-Gateway-ID (h323-remote-address)	Indicates the IP address of the remote gateway.

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	24	Connection-ID (h323-conf-id)	Identifies the conference ID.
26	9	25	Setup-Time (h323-setup-time)	Indicates the setup time for this connection in Coordinated Universal Time (UTC) formerly known as Greenwich Mean Time (GMT) and Zulu time.
26	9	26	Call-Origin (h323-call-origin)	Indicates the origin of the call relative to the gateway. Possible values are originating and terminating (answer).
26	9	27	Call-Type (h323-call-type)	Indicates call leg type. Possible values are telephony and VoIP .
26	9	28	Connect-Time (h323-connect-time)	Indicates the connection time for this call leg in UTC.
26	9	29	Disconnect-Time (h323-disconnect-time)	Indicates the time this call leg was disconnected in UTC.
26	9	30	Disconnect-Cause (h323-disconnect-cause)	Specifies the reason a connection was taken offline per Q.931 specification.
26	9	31	Voice-Quality (h323-voice-quality)	Specifies the impairment factor (ICPIF) affecting voice quality for a call.
26	9	33	Gateway-ID (h323-gw-id)	Indicates the name of the underlying gateway.
Large Scale Dialout Attributes				
26	9	1	callback-dialstring	Defines a dialing string to be used for callback.
26	9	1	data-service	No description available.
26	9	1	dial-number	Defines the number to dial.

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	force-56	Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available.
26	9	1	map-class	Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out.
26	9	1	send-auth	Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	send-name	<p>PPP name authentication. To apply for PAP, do not configure the ppp pap sent-name password command on the interface. For PAP, “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For CHAP, “preauth:send-name” will be used not only for outbound authentication, but also for inbound authentication. For a CHAP inbound case, the NAS will use the name defined in “preauth:send-name” in the challenge packet to the caller box.</p> <p>Note The send-name attribute has changed over time: Initially, it performed the functions now provided by both the send-name and remote-name attributes. Because the remote-name attribute has been added, the send-name attribute is restricted to its current behavior.</p>

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	send-secret	PPP password authentication. The vendor-specific attributes (VSAs) "preauth:send-name" and "preauth:send-secret" will be used as the PAP username and PAP password for outbound authentication. For a CHAP outbound case, both "preauth:send-name" and "preauth:send-secret" will be used in the response packet.
26	9	1	remote-name	Provides the name of the remote host for use in large-scale dial-out. Dialer checks that the large-scale dial-out remote name matches the authenticated name, to protect against accidental user RADIUS misconfiguration. (For example, dialing a valid phone number but connecting to the wrong device.)
Miscellaneous Attributes				

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	2	Cisco-NAS-Port	<p>Specifies additional vendor specific attribute (VSA) information for NAS-Port accounting. To specify additional NAS-Port information in the form an Attribute-Value Pair (AVPair) string, use the radius-server vsa send global configuration command.</p> <p>Note This VSA is typically used in Accounting, but may also be used in Authentication (Access-Request) packets.</p>
26	9	1	min-links	Sets the minimum number of links for MLP.
26	9	1	proxyacl#<n>	Allows users to configure the downloadable user profiles (dynamic ACLs) by using the authentication proxy feature so that users can have the configured authorization to permit traffic going through the configured interfaces.

Number	Vendor-Specific Company Code	Sub-Type Number	Attribute	Description
26	9	1	spi	Carries the authentication information needed by the home agent to authenticate a mobile node during registration. The information is in the same syntax as the ip mobile secure host <addr> configuration command. Basically it contains the rest of the configuration command that follows that string, verbatim. It provides the Security Parameter Index (SPI), key, authentication algorithm, authentication mode, and replay protection timestamp range.

RADIUS Disconnect-Cause Attribute Values

Disconnect-cause attribute values specify the reason a connection was taken offline. The attribute values are sent in Accounting request packets. These values are sent at the end of a session, even if the session fails to be authenticated. If the session is not authenticated, the attribute can cause stop records to be generated without first generating start records.

The table below lists the cause codes, values, and descriptions for the Disconnect-Cause (195) attribute.

Note The Disconnect-Cause is incremented by 1000 when it is used in RADIUS AVPairs; for example, disc-cause 4 becomes 1004.

Table 112: Disconnect-Cause Attribute Values

Cause Code	Value	Description
0	No-Reason	No reason is given for the disconnect.
1	No-Disconnect	The event was not disconnected.
2	Unknown	Reason unknown.
3	Call-Disconnect	The call has been disconnected.
4	CLID-Authentication-Failure	Failure to authenticate number of the calling-party.

Cause Code	Value	Description
9	No-Modem-Available	A modem is not available to connect the call.
10	No-Carrier	No carrier detected. Note Codes 10, 11, and 12 can be sent if there is a disconnection during initial modem connection.
11	Lost-Carrier	Loss of carrier.
12	No-Detected-Result-Codes	Failure to detect modem result codes.
20	User-Ends-Session	User terminates a session. Note Codes 20, 22, 23, 24, 25, 26, 27, and 28 apply to EXEC sessions.
21	Idle-Timeout	Timeout waiting for user input. Codes 21, 100, 101, 102, and 120 apply to all session types.
22	Exit-Telnet-Session	Disconnect due to exiting Telnet session.
23	No-Remote-IP-Addr	Could not switch to SLIP/PPP; the remote end has no IP address.
24	Exit-Raw-TCP	Disconnect due to exiting raw TCP.
25	Password-Fail	Bad passwords.
26	Raw-TCP-Disabled	Raw TCP disabled.
27	Control-C-Detected	Control-C detected.
28	EXEC-Process-Destroyed	EXEC process destroyed.
29	Close-Virtual-Connection	User closes a virtual connection.
30	End-Virtual-Connection	Virtual connection has ended.
31	Exit-Rlogin	User exits Rlogin.
32	Invalid-Rlogin-Option	Invalid Rlogin option selected.
33	Insufficient-Resources	Insufficient resources.
40	Timeout-PPP-LCP	PPP LCP negotiation timed out. Note Codes 40 through 49 apply to PPP sessions.
41	Failed-PPP-LCP-Negotiation	PPP LCP negotiation failed.
42	Failed-PPP-PAP-Auth-Fail	PPP PAP authentication failed.
43	Failed-PPP-CHAP-Auth	PPP CHAP authentication failed.
44	Failed-PPP-Remote-Auth	PPP remote authentication failed.

Cause Code	Value	Description
45	PPP-Remote-Terminate	PPP received a Terminate Request from remote end.
46	PPP-Closed-Event	Upper layer requested that the session be closed.
47	NCP-Closed-PPP	PPP session closed because there were no NCPs open.
48	MP-Error-PPP	PPP session closed because of an MP error.
49	PPP-Maximum-Channels	PPP session closed because maximum channels were reached.
50	Tables-Full	Disconnect due to full terminal server tables.
51	Resources-Full	Disconnect due to full internal resources.
52	Invalid-IP-Address	IP address is not valid for Telnet host.
53	Bad-Hostname	Hostname cannot be validated.
54	Bad-Port	Port number is invalid or missing.
60	Reset-TCP	TCP connection has been reset. Note Codes 60 through 67 apply to Telnet or raw TCP sessions.
61	TCP-Connection-Refused	TCP connection has been refused by the host.
62	Timeout-TCP	TCP connection has timed out.
63	Foreign-Host-Close-TCP	TCP connection has been closed.
64	TCP-Network-Unreachable	TCP network is unreachable.
65	TCP-Host-Unreachable	TCP host is unreachable.
66	TCP-Network-Admin Unreachable	TCP network is unreachable for administrative reasons.
67	TCP-Port-Unreachable	TCP port in unreachable.
100	Session-Timeout	Session timed out.
101	Session-Failed-Security	Session failed for security reasons.
102	Session-End-Callback	Session terminated due to callback.
120	Invalid-Protocol	Call refused because the detected protocol is disabled.
150	RADIUS-Disconnect	Disconnected by RADIUS request.
151	Local-Admin-Disconnect	Administrative disconnect.
152	SNMP-Disconnect	Disconnected by SNMP request.
160	V110-Retries	Allowed V.110 retries have been exceeded.
170	PPP-Authentication-Timeout	PPP authentication timed out.

Cause Code	Value	Description
180	Local-Hangup	Disconnected by local hangup.
185	Remote-Hangup	Disconnected by remote end hangup.
190	T1-Quiesced	Disconnected because T1 line was quiesced.
195	Call-Duration	Disconnected because the maximum duration of the call was exceeded.
600	VPN-User-Disconnect	Call disconnected by client (through PPP). Code is sent if the LNS receives a PPP terminate request from the client.
601	VPN-Carrier-Loss	Loss of carrier. This can be the result of a physical line going dead. Code is sent when a client is unable to dial out using a dialer.
602	VPN-No-Resources	No resources available to handle the call. Code is sent when the client is unable to allocate memory (running low on memory).
603	VPN-Bad-Control-Packet	Bad L2TP or L2F control packets. This code is sent when an invalid control packet, such as missing mandatory Attribute-Value pairs (AVP), from the peer is received. When using L2TP, the code will be sent after six retransmits; when using L2F, the number of retransmits is user configurable. Note VPN-Tunnel-Shut will be sent if there are active sessions in the tunnel.
604	VPN-Admin-Disconnect	Administrative disconnect. This can be the result of a VPN soft shutdown, which is when a client reaches maximum session limit or exceeds maximum hopcount. Code is sent when a tunnel is brought down by issuing the clear vpdn tunnel command.
605	VPN-Tunnel-Shut	Tunnel teardown or tunnel setup has failed. Code is sent when there are active sessions in a tunnel and the tunnel goes down. Note This code is not sent when tunnel authentication fails.
606	VPN-Local-Disconnect	Call is disconnected by LNS PPP module. Code is sent when the LNS sends a PPP terminate request to the client. It indicates a normal PPP disconnection initiated by the LNS.
607	VPN-Session-Limit	VPN soft shutdown is enabled. Code is sent when a call has been refused due to any of the soft shutdown restrictions previously mentioned.
608	VPN-Call-Redirect	VPN call redirect is enabled.

RADIUS Progress Codes

The RADIUS Progress Codes feature adds additional progress codes to RADIUS attribute 196 (Ascend-Connect-Progress), which indicates a connection state before a call is disconnected through progress codes.

Attribute 196 is sent in network, exec, and resource accounting “start” and “stop” records. This attribute can facilitate call failure debugging because each progress code identifies accounting information relevant to the connection state of a call. The attribute is activated by default; when an accounting “start” or “stop” accounting record is requested, authentication, authorization, and accounting (AAA) adds attribute 196 into the record as part of the standard attribute list. Attribute 196 is valuable because the progress codes, which are sent in accounting “start” and “stop” records, facilitate the debugging of call failures.

Note In accounting “start” records, attribute 196 does not have a value.

Table 113: Newly Supported Progress Codes for Attribute 196

Code	Description
10	Modem allocation and negotiation is complete; the call is up.
30	The modem is up.
33	The modem is waiting for result codes.
41	The max TNT is establishing the TCP connection by setting up a TCP clear call.
60	Link control protocol (LCP) is the open state with PPP and IP Control Protocol (IPCP) negotiation; the LAN session is up.
65	PPP negotiation occurs and, initially, the LCP negotiation occurs; LCP is in the open state.
67	After PPP negotiation with LCP in the open state occurs, IPCP negotiation begins.

Note Progress codes 33, 30, and 67 are generated and seen through debugs on the NAS; all other codes are generated and seen through debugs and the accounting record on the RADIUS server.

Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the **radius server** global configuration commands.

Enhanced Test Command

The Enhanced Test Command feature allows a named user profile to be created with calling line ID (CLID) or dialed number identification service (DNIS) attribute values. The CLID or DNIS attribute values can be associated with the RADIUS record that is sent with the user profile so that the RADIUS server can access CLID or DNIS attribute information for all incoming calls.

How to Configure RADIUS

Identifying the RADIUS Server Host

To apply these settings globally to all RADIUS servers communicating with the Device, use the three unique global configuration commands: **radius-server timeout**, **radius-server retransmit**, and **radius-server key**.

You can configure the Device to use AAA server groups to group existing server hosts for authentication. For more information, see Related Topics below.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the Device and the key string to be shared by both the server and the Device. For more information, see the RADIUS server documentation.

Follow these steps to configure per-server RADIUS server communication.

Before you begin

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the device, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see Related Topics below.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius server** *name*
4. **address** {*ipv4* | *ipv6*} *ip address* {**auth-port** *port number* | **acct-port** *port number*}
5. **key** *string*
6. **retransmit** *value*
7. **timeout** *seconds*
8. **end**
9. **show running-config**
10. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	radius server <i>name</i> Example: Device(config)# radius server ISE	Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode. The device also supports RADIUS for IPv6.
Step 4	address { ipv4 ipv6 } <i>ip address</i> { auth-port <i>port number</i> acct-port <i>port number</i> } Example: Device(config-radius-server)# address ipv4 10.1.1.1 auth-port 1645 acct-port 1646	(Optional) Specifies the RADIUS server parameters. For auth-port <i>port-number</i> , specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536. For acct-port <i>port-number</i> , specify the UDP destination port for authentication requests. The default is 1646.
Step 5	key <i>string</i> Example: Device(config-radius-server)# key cisco123	(Optional) For key <i>string</i> , specify the authentication and encryption key used between the Device and the RADIUS daemon running on the RADIUS server. Note The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the radius server command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.
Step 6	retransmit <i>value</i> Example: Device(config-radius-server)# retransmit 10	(Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the radius-server retransmit global configuration command setting.
Step 7	timeout <i>seconds</i> Example: Device(config-radius-server)# timeout 60	(Optional) Specifies the time interval that the Device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the radius-server timeout global configuration command setting.

	Command or Action	Purpose
Step 8	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 9	show running-config Example: Device# show running-config	Verifies your entries.
Step 10	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

SUMMARY STEPS

1. **configure terminal**
2. **radius-server key *string***
3. **radius-server retransmit *retries***
4. **radius-server timeout *seconds***
5. **radius-server deadtime *minutes***
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	radius-server key <i>string</i> Example:	Specifies the shared secret text string used between the switch and all RADIUS servers.

	Command or Action	Purpose
	<pre>Device(config)# radius-server key your_server_key</pre> <pre>Device(config)# key your_server_key</pre>	<p>Note The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</p>
Step 3	<p>radius-server retransmit <i>retries</i></p> <p>Example:</p> <pre>Device(config)# radius-server retransmit 5</pre>	Specifies the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.
Step 4	<p>radius-server timeout <i>seconds</i></p> <p>Example:</p> <pre>Device(config)# radius-server timeout 3</pre>	Specifies the number of seconds a switch waits for a reply to a RADIUS request before resending the request. The default is 5 seconds; the range is 1 to 1000.
Step 5	<p>radius-server deadtime <i>minutes</i></p> <p>Example:</p> <pre>Device(config)# radius-server deadtime 0</pre>	When a RADIUS server is not responding to authentication requests, this command specifies a time to stop the request on that server. This avoids the wait for the request to timeout before trying the next configured server. The default is 0; the range is 1 to 1440 minutes.
Step 6	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 7	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 8	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring RADIUS Login Authentication

Follow these steps to configure RADIUS login authentication:

Before you begin

To secure the device for HTTP access by using AAA methods, you must configure the device with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the device for HTTP access by using AAA methods.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login {default | list-name} method1 [method2...]**
5. **line [console | tty | vty] line-number [ending-line-number]**
6. **login authentication {default | list-name}**
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Device(config)# aaa new-model	Enables AAA.
Step 4	aaa authentication login {default list-name} method1 [method2...] Example: Device(config)# aaa authentication login default local	Creates a login authentication method list. <ul style="list-style-type: none"> • To create a default list that is used when a named list is <i>not</i> specified in the login authentication command, use the default keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports. • For <i>list-name</i>, specify a character string to name the list you are creating.

	Command or Action	Purpose
		<ul style="list-style-type: none"> For <i>method1...</i>, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails. <p>Select one of these methods:</p> <ul style="list-style-type: none"> <i>enable</i>—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the enable password global configuration command. <i>group radius</i>—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server. <i>line</i>—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the password password line configuration command. <i>local</i>—Use the local username database for authentication. You must enter username information in the database. Use the username name password global configuration command. <i>local-case</i>—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the username password global configuration command. <i>none</i>—Do not use any authentication for login.
Step 5	line [console tty vty] <i>line-number</i> [<i>ending-line-number</i>] Example: <pre>Device(config)# line 1 4</pre>	Enters line configuration mode, and configure the lines to which you want to apply the authentication list.
Step 6	login authentication {default <i>list-name</i> } Example: <pre>Device(config)# login authentication default</pre>	Applies the authentication list to a line or set of lines. <ul style="list-style-type: none"> If you specify default, use the default list created with the aaa authentication login command. For <i>list-name</i>, specify the list created with the aaa authentication login command.
Step 7	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# end	
Step 8	show running-config Example: Device# show running-config	Verifies your entries.
Step 9	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Defining AAA Server Groups

You use the **server** group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional **auth-port** and **acct-port** keywords.

Follow these steps to define AAA server groups:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius server** *name*
4. **address** {**ipv4** | **ipv6**} {*ip-address* | *hostname*} **auth-port** *port-number* **acct-port** *port-number*
5. **key** *string*
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	radius server <i>name</i> Example: Device(config)# <code>radius server ISE</code>	Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode. The device also supports RADIUS for IPv6.
Step 4	address { ipv4 ipv6 } { <i>ip-address</i> <i>hostname</i> } auth-port <i>port-number</i> acct-port <i>port-number</i> Example: Device(config-radius-server)# <code>address ipv4 10.1.1.1 auth-port 1645 acct-port 1646</code>	Configures the IPv4 address for the RADIUS server accounting and authentication parameters.
Step 5	key <i>string</i> Example: Device(config-radius-server)# <code>key cisco123</code>	Specifies the authentication and encryption key for all RADIUS communications between the device and the RADIUS server.
Step 6	end Example: Device(config-radius-server)# <code>end</code>	Exits RADIUS server configuration mode and returns to privileged EXEC mode.
Step 7	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 8	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring RADIUS Authorization for User Privileged Access and Network Services

Note Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to configure RADIUS authorization for user privileged access and network services:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa authorization network radius**
4. **aaa authorization exec radius**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa authorization network radius Example: Device(config)# aaa authorization network radius	Configures the device for user RADIUS authorization for all network-related service requests.
Step 4	aaa authorization exec radius Example: Device(config)# aaa authorization exec radius	Configures the device for user RADIUS authorization if the user has privileged EXEC access. The exec keyword might return user profile information (such as autocommand information).

	Command or Action	Purpose
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 6	show running-config Example: Device# show running-config	Verifies your entries.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

What to do next

You can use the **aaa authorization** global configuration command with the **radius** keyword to set parameters that restrict a user's network access to privileged EXEC mode.

The **aaa authorization exec radius local** command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

Starting RADIUS Accounting

Follow these steps to start RADIUS accounting:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa accounting network start-stop radius**
4. **aaa accounting exec start-stop radius**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Device> <code>enable</code>	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	aaa accounting network start-stop radius Example: Device(config)# <code>aaa accounting network start-stop radius</code>	Enables RADIUS accounting for all network-related service requests.
Step 4	aaa accounting exec start-stop radius Example: Device(config)# <code>aaa accounting exec start-stop radius</code>	Enables RADIUS accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.
Step 5	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 6	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 7	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Verifying Attribute 196

No configuration is required to configure RADIUS Progress Codes. To verify attribute 196 in accounting “start” and “stop” records, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **debug aaa accounting**
3. **show radius statistics**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	debug aaa accounting Example: Device# debug aaa accounting	Displays information on accountable events as they occur.
Step 3	show radius statistics Example: Device# debug aaa authorization	Displays the RADIUS statistics for accounting and authentication packets.

Configuring the Device to Use Vendor-Specific RADIUS Attributes

Follow these steps to configure the device to use vendor-specific RADIUS attributes:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server vsa send [accounting | authentication]**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	radius-server vsa send [accounting authentication] Example: Device(config)# <code>radius-server vsa send accounting</code>	Enables the device to recognize and use VSAs as defined by RADIUS IETF attribute 26. <ul style="list-style-type: none"> • (Optional) Use the accounting keyword to limit the set of recognized vendor-specific attributes to only accounting attributes. • (Optional) Use the authentication keyword to limit the set of recognized vendor-specific attributes to only authentication attributes. If you enter this command without keywords, both accounting and authentication vendor-specific attributes are used.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring the Device for Vendor-Proprietary RADIUS Server Communication

Follow these steps to configure the device to use vendor-proprietary RADIUS server communication:

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `radius-server host {hostname | ip-address} non-standard`
4. `radius-server key string`

5. `end`
6. `show running-config`
7. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p>radius-server host {hostname ip-address} non-standard</p> <p>Example:</p> <pre>Device(config)# radius-server host 172.20.30.15 non-standard</pre>	<p>Specifies the IP address or hostname of the remote RADIUS server host and identifies that it is using a vendor-proprietary implementation of RADIUS.</p>
Step 4	<p>radius-server key string</p> <p>Example:</p> <pre>Device(config)# radius-server key rad124</pre>	<p>Specifies the shared secret text string used between the device and the vendor-proprietary RADIUS server. The device and the RADIUS server use this text string to encrypt passwords and exchange responses.</p> <p>Note The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</p>
Step 5	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 6	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	<p>Verifies your entries.</p>

	Command or Action	Purpose
Step 7	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring a User Profile and Associating it with the RADIUS Record

This section describes how to create a named user profile with CLID or DNIS attribute values and associate it with the RADIUS record.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa user profile** *profile-name*
4. **aaa attribute** {dnis | clid}
5. **exit**
6. **test aaa group** {group-name | radius} username password new-code [profile profile-name]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa user profile <i>profile-name</i> Example: Device(config)# aaa user profile profilename1	Creates a user profile.
Step 4	aaa attribute {dnis clid} Example: Device# configure terminal	Adds DNIS or CLID attribute values to the user profile and enters AAA-user configuration mode.
Step 5	exit	Exit Global Configuration mode.

	Command or Action	Purpose
Step 6	test aaa group {group-name radius} username password new-code [profile profile-name] Example: Device# test aaa group radius secret new-code profile profilename1	Associates a DNIS or CLID named user profile with the record sent to the RADIUS server. Note The <i>profile-name</i> must match the profile-name specified in the aaa user profile command.

Verifying the Enhanced Test Command Configuration

To verify the Enhanced Test Command configuration, use the following commands in privileged EXEC mode:

Command	Purpose
Device# debug radius	Displays information associated with RADIUS.
Device# more system:running-config	Displays the contents of the current running configuration file. (Note that the more system:running-config command has replaced the show running-config command.)

Configuration Examples for RADIUS

Examples: Identifying the RADIUS Server Host

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

```
Device(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1
Device(config)# radius-server host 172.20.36.50 acct-port 1618 key rad2
```

This example shows how to configure *host1* as the RADIUS server and to use the default ports for both authentication and accounting:

```
Device(config)# radius-server host host1
```

Example: Using Two Different RADIUS Group Servers

In this example, the switch is configured to recognize two different RADIUS group servers (*group1* and *group2*). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a fail-over backup to the first entry.

```
Device(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Device(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Device(config)# aaa new-model
```

```

Device(config)# aaa group server radius group1
Device(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Device(config-sg-radius)# exit
Device(config)# aaa group server radius group2
Device(config-sg-radius)# server 172.20.0.1 auth-port 2000 acct-port 2001
Device(config-sg-radius)# exit

```

Examples: AAA Server Groups

The following example shows how to create server group radgroup1 with three different RADIUS server members, each using the default authentication port (1645) and accounting port (1646):

```

aaa group server radius radgroup1
server 172.16.1.11
server 172.17.1.21
server 172.18.1.31

```

The following example shows how to create server group radgroup2 with three RADIUS server members, each with the same IP address but with unique authentication and accounting ports:

```

aaa group server radius radgroup2
server 172.16.1.1 auth-port 1000 acct-port 1001
server 172.16.1.1 auth-port 2000 acct-port 2001
server 172.16.1.1 auth-port 3000 acct-port 3001

```

Troubleshooting Tips for RADIUS Progress Codes

The following example is a sample debug output from the **debug ppp negotiation** command. This debug output is used to verify that accounting “stop” records have been generated and that attribute 196 (Ascend-Connect-Progress) has a value of 65.

```

Tue Aug 7 06:21:03 2001
NAS-IP-Address = 10.0.58.62
NAS-Port = 20018
Vendor-Specific = ""
NAS-Port-Type = ISDN
User-Name = "peer_16a"
Called-Station-Id = "5213124"
Calling-Station-Id = "5212175"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Framed-User
Acct-Session-Id = "00000014"
Framed-Protocol = PPP
Framed-IP-Address = 172.16.0.2
Acct-Input-Octets = 3180
Acct-Output-Octets = 3186
Acct-Input-Packets = 40
Acct-Output-Packets = 40
Ascend-Connect-Pr = 65
Acct-Session-Time = 49
Acct-Delay-Time = 0
Timestamp = 997190463
Request-Authenticator = Unverified

```

Examples: Configuring the Switch to Use Vendor-Specific RADIUS Attributes

For example, this AV pair activates Cisco's *multiple named ip address pools* feature during IP authorization (during PPP IPCP address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

This example shows how to specify an authorized VLAN in the RADIUS server database:

```
cisco-avpair= "tunnel-type (#64)=VLAN(13) "
cisco-avpair= "tunnel-medium-type (#65)=802 media (6) "
cisco-avpair= "tunnel-private-group-id (#81)=vlanid"
```

This example shows how to apply an input ACL in ASCII format to an interface for the duration of this connection:

```
cisco-avpair= "ip:inacl#1=deny ip 10.10.10.10 0.0.255.255 20.20.20.20 255.255.0.0"
cisco-avpair= "ip:inacl#2=deny ip 10.10.10.10 0.0.255.255 any"
cisco-avpair= "mac:inacl#3=deny any any deernet-iv"
```

This example shows how to apply an output ACL in ASCII format to an interface for the duration of this connection:

```
cisco-avpair= "ip:outacl#2=deny ip 10.10.10.10 0.0.255.255 any"
```

Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of *rad124* between the switch and the server:

```
Device(config)# radius-server host 172.20.30.15 nonstandard
Device(config)# radius-server key rad124
```

Example: User Profile Associated With the test aaa group Command

The following example shows how to configure the `dnis = dnisvalue` user profile "prfl1" and associate it with a **test aaa group** command. In this example, the **debug radius** command has been enabled and the output follows the configuration.

```
aaa user profile prfl1
  aaa attribute dnis
```

```

aaa attribute dnis dnisvalue
no aaa attribute clid
! Attribute not found.
aaa attribute clid clidvalue
no aaa attribute clid
exit
!
! Associate the dnis user profile with the test aaa group command.
test aaa group radius user1 pass new-code profile profl1
!
!
! debug radius output, which shows that the dnis value has been passed to the radius !
server.

Feature Information for RADIUS

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.
Cisco IOS 15.2(1)E	The RADIUS Progress Codes feature adds additional progress codes to RADIUS attribute 196 (Ascend-Connect-Progress), which indicates a connection state before a call is disconnected through progress codes.

Release	Feature Information
Cisco IOS 15.2(1)E	<p>The Enhanced Test Command feature allows a named user profile to be created with calling line ID (CLID) or Dialed Number Identification Service (DNIS) attribute values. The CLID or DNIS attribute values can be associated with the RADIUS record that is sent with the user profile so that the RADIUS server can access CLID or DNIS attribute information for all incoming calls.</p> <p>The following commands were introduced or modified: aaa attribute, aaa user profile, and test aaa group</p>

CHAPTER 52

RADIUS Server Load Balancing

The RADIUS Server Load Balancing feature distributes authentication, authorization, and accounting (AAA) authentication and accounting transactions across RADIUS servers in a server group. These servers can share the AAA transaction load and thereby respond faster to incoming requests.

This module describes the RADIUS Server Load Balancing feature.

- [Finding Feature Information, on page 1101](#)
- [Prerequisites for RADIUS Server Load Balancing, on page 1101](#)
- [Restrictions for RADIUS Server Load Balancing, on page 1102](#)
- [Information About RADIUS Server Load Balancing, on page 1102](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for RADIUS Server Load Balancing

- Authentication, authorization, and accounting (AAA) must be configured on the RADIUS server.
- AAA RADIUS server groups must be configured.
- RADIUS must be configured for functions such as authentication, accounting, or static route download.

Restrictions for RADIUS Server Load Balancing

- Incoming RADIUS requests, such as Packet of Disconnect (POD) requests, are not supported.
- Load balancing is not supported on proxy RADIUS servers and for private server groups.

Information About RADIUS Server Load Balancing

RADIUS Server Load Balancing Overview

Load balancing distributes batches of transactions to RADIUS servers within a server group. Load balancing assigns each batch of transactions to the server with the lowest number of outstanding transactions in its queue. The process of assigning a batch of transactions is as follows:

1. The first transaction is received for a new batch.
2. All server transaction queues are checked.
3. The server with the lowest number of outstanding transactions is identified.
4. The identified server is assigned the next batch of transactions.

The batch size is a user-configured parameter. Changes in the batch size may impact CPU load and network throughput. As batch size increases, CPU load decreases and network throughput increases. However, if a large batch size is used, all available server resources may not be fully utilized. As batch size decreases, CPU load increases and network throughput decreases.

Note There is no set number for large or small batch sizes. A batch with more than 50 transactions is considered large and a batch with fewer than 25 transactions is considered small.

Note If a server group contains ten or more servers, we recommend that you set a high batch size to reduce CPU load.

Transaction Load Balancing Across RADIUS Server Groups

You can configure load balancing either per-named RADIUS server group or for the global RADIUS server group. The load balancing server group must be referred to as “radius” in the authentication, authorization, and accounting (AAA) method lists. All public servers that are part of the RADIUS server group are then load balanced.

You can configure authentication and accounting to use the same RADIUS server or different servers. In some cases, the same server can be used for preauthentication, authentication, or accounting transactions for a session. The preferred server, which is an internal setting and is set as the default, informs AAA to use the same server for the start and stop record for a session regardless of the server cost. When using the preferred

server setting, ensure that the server that is used for the initial transaction (for example, authentication), the preferred server, is part of any other server group that is used for a subsequent transaction (for example, accounting).

The preferred server is not used if one of the following criteria is true:

- The **load-balance method least-outstanding ignore-preferred-server** command is used.
- The preferred server is dead.
- The preferred server is in quarantine.
- The want server flag has been set, overriding the preferred server setting.

The want server flag, an internal setting, is used when the same server must be used for all stages of a multistage transaction regardless of the server cost. If the want server is not available, the transaction fails.

You can use the **load-balance method least-outstanding ignore-preferred-server** command if you have either of the following configurations:

- Dedicated authentication server and a separate dedicated accounting server
- Network where you can track all call record statistics and call record details, including start and stop records and records that are stored on separate servers

If you have a configuration where authentication servers are a superset of accounting servers, the preferred server is not used.

RADIUS Server Status and Automated Testing

The RADIUS Server Load Balancing feature considers the server status when assigning batches. Transaction batches are sent only to live servers. We recommend that you test the status of all RADIUS load-balanced servers, including low usage servers (for example, backup servers).

Transactions are not sent to a server that is marked dead. A server is marked dead until its timer expires, at which time it moves to quarantine state. A server is in quarantine until it is verified alive by the RADIUS automated tester functionality.

To determine if a server is alive and available to process transactions, the RADIUS automated tester sends a request periodically to the server for a test user ID. If the server returns an Access-Reject message, the server is alive; otherwise the server is either dead or quarantined.

A transaction sent to an unresponsive server is failed over to the next available server before the unresponsive server is marked dead. We recommend that you use the retry reorder mode for failed transactions.

When using the RADIUS automated tester, verify that the authentication, authorization, and accounting (AAA) servers are responding to the test packets that are sent by the network access server (NAS). If the servers are not configured correctly, packets may be dropped and the server erroneously marked dead.

Caution

We recommend that you use a test user that is not defined on the RADIUS server for the RADIUS server automated testing to protect against security issues that may arise if the test user is not correctly configured.

Note Use the **test aaa group** command to check load-balancing transactions.

How to Configure RADIUS Server Load Balancing

Enabling Load Balancing for a Named RADIUS Server Group

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server host** *{hostname | ip-address}* [**test username name**] [**auth-port number**] [**ignore-auth-port**] [**acct-port number**] [**ignore-acct-port**] [**idle-time seconds**]
4. **aaa group server radius** *group-name*
5. **load-balance method** **least-outstanding** [**batch-size number**] [**ignore-preferred-server**]
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	radius-server host <i>{hostname ip-address}</i> [test username name] [auth-port number] [ignore-auth-port] [acct-port number] [ignore-acct-port] [idle-time seconds] Example: Device(config)# radius-server host 192.0.2.1 test username test1 idle-time 1	Enables RADIUS automated testing.
Step 4	aaa group server radius <i>group-name</i> Example: Device(config)# aaa group server radius rad-sg	Enters server group configuration mode.
Step 5	load-balance method least-outstanding [batch-size number] [ignore-preferred-server] Example:	Enables the least-outstanding load balancing for a named server group.

	Command or Action	Purpose
	Device(config-sg)# load-balance method least-outstanding batch-size 30	
Step 6	end Example: Device(config-sg)# end	Exits server group configuration mode and enters privileged EXEC mode.

Enabling Load Balancing for a Global RADIUS Server Group

The global RADIUS server group is referred to as “radius” in the authentication, authorization, and accounting (AAA) method lists.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server host** *{hostname | ip-address}* [**test username** *name*] [**auth-port** *number*] [**ignore-auth-port**] [**acct-port** *number*] [**ignore-acct-port**] [**idle-time** *seconds*]
4. **radius-server load-balance method** **least-outstanding** [**batch-size** *number*] [**ignore-preferred-server**]
5. **load-balance method** **least-outstanding** [**batch-size** *number*] [**ignore-preferred-server**]
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	radius-server host <i>{hostname ip-address}</i> [test username <i>name</i>] [auth-port <i>number</i>] [ignore-auth-port] [acct-port <i>number</i>] [ignore-acct-port] [idle-time <i>seconds</i>] Example: Device(config)# radius-server host 192.0.2.1 test username test1 idle-time 1	Enables RADIUS automated testing.
Step 4	radius-server load-balance method least-outstanding [batch-size <i>number</i>] [ignore-preferred-server] Example:	Enables the least-outstanding load balancing for the global RADIUS server group and enters server group configuration mode. <ul style="list-style-type: none"> • The default batch size is 25. The batch size range is from 1 to 2147483647.

	Command or Action	Purpose
	Device(config)# radius-server load-balance method least-outstanding	
Step 5	load-balance method least-outstanding [batch-size <i>number</i>] [ignore-preferred-server] Example: Device(config-sg)# load-balance method least-outstanding batch-size 5	Enables least-outstanding load balancing for a global named server group.
Step 6	end Example: Device(config-sg)# end	Exits server group configuration mode and enters privileged EXEC mode.

Troubleshooting RADIUS Server Load Balancing

After configuring the RADIUS Server Load Balancing feature, you can monitor the idle timer, dead timer, and load balancing server selection or verify the server status by using a manual test command.

SUMMARY STEPS

1. Use the **debug aaa test** command to determine when an idle timer or dead timer has expired, when test packets are sent, the status of the server, or to verify the server state.
2. Use the **debug aaa sg-server selection** command to determine the server that is selected for load balancing.
3. Use the **test aaa group** command to manually verify the RADIUS load-balanced server status.

DETAILED STEPS

Step 1 Use the **debug aaa test** command to determine when an idle timer or dead timer has expired, when test packets are sent, the status of the server, or to verify the server state.

The idle timer is used to check the server status and is updated with or without any incoming requests. Monitoring the idle timer helps to determine if there are nonresponsive servers and to keep the RADIUS server status updated to efficiently utilize available resources. For instance, an updated idle timer would help ensure that incoming requests are sent to servers that are alive.

The dead timer is used either to determine that a server is dead or to update a dead server's status appropriately.

Monitoring server selection helps to determine how often the server selection changes. Server selection is effective in analyzing if there are any bottlenecks, a large number of queued requests, or if only specific servers are processing incoming requests.

The following sample output from the **debug aaa test** command shows when the idle timer expired:

Example:

```
Device# debug aaa test
```

```
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) quarantined.
Jul 16 00:07:01: AAA/SG/TEST: Sending test request(s) to server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Sending 1 Access-Requests, 1 Accounting-Requests in current batch.
Jul 16 00:07:01: AAA/SG/TEST(Req#: 1): Sending test AAA Access-Request.
Jul 16 00:07:01: AAA/SG/TEST(Req#: 1): Sending test AAA Accounting-Request.
```

```

Jul 16 00:07:01: AAA/SG/TEST: Obtained Test response from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Obtained Test response from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Necessary responses received from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) marked ALIVE. Idle timer set for 60
sec(s).
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) removed from quarantine.

```

Step 2 Use the **debug aaa sg-server selection** command to determine the server that is selected for load balancing.

The following sample output from the **debug aaa sg-server selection** command shows five access requests being sent to a server group with a batch size of three:

Example:

```

Device# debug aaa sg-server selection

Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: [3] transactions remaining in batch. Reusing server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: [2] transactions remaining in batch. Reusing server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: [1] transactions remaining in batch. Reusing server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: No more transactions in batch. Obtaining a new server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining a new least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Server[0] load: 3
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Server[1] load: 0
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Server[2] load: 0
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Selected Server[1] with load 0
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: [3] transactions remaining in batch.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: [2] transactions remaining in batch. Reusing server.

```

Step 3 Use the **test aaa group** command to manually verify the RADIUS load-balanced server status.

The following sample output shows the response from a load-balanced RADIUS server that is alive when the username “test” does not match a user profile. The server is verified alive when it issues an Access-Reject response to an authentication, authorization, and accounting (AAA) packet generated using the **test aaa group** command.

Example:

```

Device# test aaa group SG1 test lab new-code

00:06:07: RADIUS/ENCODE(00000000):Orig. component type = INVALID
00:06:07: RADIUS/ENCODE(00000000): dropping service type, "radius-server attribute 6 on-for-login-auth"

```

Configuration Examples for RADIUS Server Load Balancing

Example: Enabling Load Balancing for a Named RADIUS Server Group

The following examples show load balancing enabled for a named RADIUS server group. These examples are shown in three parts: the current configuration of the RADIUS command output, debug output, and authentication, authorization, and accounting (AAA) server status information.

The following sample output shows the relevant RADIUS configuration:

```
Device# show running-config
.
.
.
aaa group server radius server-group1
  server 192.0.2.238 auth-port 2095 acct-port 2096
  server 192.0.2.238 auth-port 2015 acct-port 2016
  load-balance method least-outstanding batch-size 5
!
aaa authentication ppp default group server-group1
aaa accounting network default start-stop group server-group1
.
.
.
```

The lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The **aaa group server radius** command shows the configuration of a server group with two member servers.
- The **load-balance** command enables load balancing for global RADIUS server groups with the batch size specified.
- The **aaa authentication ppp** command authenticates all PPP users using RADIUS.
- The **aaa accounting** command enables sending of all accounting requests to the AAA server when the client is authenticated and then disconnected using the **start-stop** keyword.

The show debug sample output below shows the selection of the preferred server and the processing of requests for the preceding configuration:

```
Device# show debug
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT(0000002C):No preferred server available.
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT:Obtaining least loaded server.
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT:No more transactions in batch. Obtaining a new server.
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT:Obtaining a new least loaded server.
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT:Server[0] load:0

```

Example: Enabling Load Balancing for a Global RADIUS Server Group

The following examples show how to enable load balancing for global RADIUS server groups. These examples are shown in three parts: the current configuration of the RADIUS command output, debug output, and authentication, authorization, and accounting (AAA) server status information. You can use delimiting characters to display relevant parts of the configuration.

The following example shows the relevant RADIUS configuration:

```

Device# show running-config | include radius

aaa authentication ppp default group radius
aaa accounting network default start-stop group radius
radius-server host 192.0.2.238 auth-port 2095 acct-port 2096 key cisco
radius-server host 192.0.2.238 auth-port 2015 acct-port 2016 key cisco
radius-server load-balance method least-outstanding batch-size 5

```

Lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The **aaa authentication ppp** command authenticates all PPP users using RADIUS.
- The **aaa accounting** command enables the sending of all accounting requests to an AAA server when the client is authenticated and then disconnected through use of the **start-stop** keyword.
- The **radius-server host** command defines the IP address of the RADIUS server host with the authorization and accounting ports specified and the authentication and encryption keys identified.
- The **radius-server load-balance** command enables load balancing for global RADIUS server groups with the batch size specified.

The **show debug** sample output below shows the selection of the preferred server and the processing of requests for the configuration:

```

Device# show debug

General OS:
  AAA server group server selection debugging is on
#
<sending 10 pppoe requests>

Account:request 5, timeouts 0
      Response:unexpected 0, server error 0, incorrect 0, time 3247ms
      Transaction:success 5, failure 0
Elapsed time since counters last cleared:2m

```

Example: Monitoring Idle Timer

The following example shows idle timer and related server state for load balancing enabled for a named RADIUS server group. The current configuration of the RADIUS command output and debug command output are also displayed.

The following sample output shows the relevant RADIUS configuration:

```

Device# show running-config | include radius

aaa group server radius server-group1
radius-server host 192.0.2.238 auth-port 2095 acct-port 2096 test username junk1 idle-time
 1 key cisco
radius-server host 192.0.2.238 auth-port 2015 acct-port 2016 test username junk1 idle-time
 1 key cisco
radius-server load-balance method least-outstanding batch-size 5

```

The lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The **aaa group server radius** command shows the configuration of a server group.
- The **radius-server host** command defines the IP address of the RADIUS server host with authorization and accounting ports specified and the authentication and encryption key identified.
- The **radius-server load-balance** command enables load balancing for the RADIUS server with the batch size specified.

The **show debug** sample output below shows test requests being sent to servers. The response to the test request sent to the server is received, the server is removed from quarantine as appropriate, the server is marked alive, and then the idle timer is reset.

```

Device# show debug

*Feb 28 13:52:20.835:AAA/SG/TEST:Server (192.0.2.238:2015,2016) quarantined.
*Feb 28 13:52:20.835:AAA/SG/TEST:Sending test request(s) to server (192.0.2.238:2015,2016)
*Feb 28 13:52:20.835:AAA/SG/TEST:Sending 1 Access-Requests, 1 Accounting-Requests in current
  batch.
*Feb 28 13:52:20.835:AAA/SG/TEST(Req#:1):Sending test AAA Access-Request.
*Feb 28 13:52:20.835:AAA/SG/TEST(Req#:1):Sending test AAA Accounting-Request.
*Feb 28 13:52:21.087:AAA/SG/TEST:Obtained Test response from server (192.0.2.238:2015,2016)
*Feb 28 13:52:22.651:AAA/SG/TEST:Obtained Test response from server (192.0.2.238:2015,2016)
*Feb 28 13:52:22.651:AAA/SG/TEST:Necessary responses received from server
(192.0.2.238:2015,2016)
*Feb 28 13:52:22.651:AAA/SG/TEST:Server (192.0.2.238:2015,2016) marked ALIVE. Idle timer
set for 60 secs(s).
*Feb 28 13:52:22.651:AAA/SG/TEST:Server (192.0.2.238:2015,2016) removed from quarantine.
.

```

Example: Configuring the Preferred Server with the Same Authentication and Authorization Server

The following example shows an authentication server group and an authorization server group that use the same servers 209.165.200.225 and 209.165.200.226. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
aaa group server radius accounting-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
```

When a preferred server is selected for a session, all transactions for that session will continue to use the original preferred server. The servers 209.165.200.225 and 209.165.200.226 are load balanced based on sessions rather than transactions.

Example: Configuring the Preferred Server with Different Authentication and Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225 and 209.165.200.226 and an authorization server group that uses servers 209.165.201.1 and 209.165.201.2. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
aaa group server radius accounting-group
  server 209.165.201.1 key radkey3
  server 209.165.201.2 key radkey4
```

The authentication server group and the accounting server group do not share any common servers. A preferred server is never found for accounting transactions; therefore, authentication and accounting servers are load-balanced based on transactions. Start and stop records are sent to the same server for a session.

Example: Configuring the Preferred Server with Overlapping Authentication and Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1 and an accounting server group that uses servers 209.165.201.1 and 209.165.201.2. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
  server 209.165.201.1 key radkey3
aaa group server radius accounting-group
  server 209.165.201.1 key radkey3
  server 209.165.201.2 key radkey4
```

If all servers have equal transaction processing capability, one-third of all authentication transactions are directed toward the server 209.165.201.1. Therefore, one-third of all accounting transactions are also directed

toward the server 209.165.201.1. The remaining two-third of accounting transactions are load balanced equally between servers 209.165.201.1 and 209.165.201.2. The server 209.165.201.1 receives fewer authentication transactions because the server 209.165.201.1 has outstanding accounting transactions.

Example: Configuring the Preferred Server with Authentication Servers As a Subset of Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225 and 209.165.200.226 and an authorization server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
aaa group server radius accounting-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
  server 209.165.201.1 key radkey3
```

One-half of all authentication transactions are sent to the server 209.165.200.225 and the other half to the server 209.165.200.226. Servers 209.165.200.225 and 209.165.200.226 are preferred servers for authentication and accounting transaction. Therefore, there is an equal distribution of authentication and accounting transactions across servers 209.165.200.225 and 209.165.200.226. The server 209.165.201.1 is relatively unused.

Example: Configuring the Preferred Server with Authentication Servers As a Superset of Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1 and an authorization server group that uses servers 209.165.200.225 and 209.165.200.226. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
  server 209.165.201.1 key radkey3
aaa group server radius accounting-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
```

Initially, one-third of authentication transactions are assigned to each server in the authorization server group. As accounting transactions are generated for more sessions, accounting transactions are sent to servers 209.165.200.225 and 209.165.200.226 because the preferred server flag is on. As servers 209.165.200.225 and 209.165.200.226 begin to process more transactions, authentication transactions will start to be sent to server 209.165.201.1. Transaction requests authenticated by server 209.165.201.1 do not have any preferred server setting and are split between servers 209.165.200.225 and 209.165.200.226, which negates the use of the preferred server flag. This configuration should be used cautiously.

Feature Information for RADIUS Server Load Balancing

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 114: Feature Information for RADIUS Server Load Balancing

Feature Name	Releases	Feature Information
RADIUS Server Load Balancing	Cisco IOS 15.2(1)E	<p>The RADIUS Server Load Balancing feature distributes authentication, authorization, and accounting (AAA) authentication and accounting transactions across servers in a server group. These servers can share the AAA transaction load and thereby respond faster to incoming requests.</p> <p>The following commands were introduced or modified: debug aaa sg-server selection, debug aaa test, load-balance (server-group), radius-server host, radius-server load-balance, and test aaa group.</p>

CHAPTER 53

RADIUS Change of Authorization Support

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated

Identity-Based Networking Services supports RADIUS change of authorization (CoA) commands for session query, reauthentication, and termination, port bounce and port shutdown, and service template activation and deactivation.

- [Information About RADIUS Change-of-Authorization, on page 1117](#)
- [How to Configure RADIUS Change-of-Authorization, on page 1128](#)
- [Additional References for RADIUS Change-of-Authorization, on page 1131](#)
- [Feature Information for RADIUS Change-of-Authorization Support, on page 1131](#)

Information About RADIUS Change-of-Authorization

RADIUS Change of Authorization

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated. When a policy changes for a user or user group in AAA, administrators can send RADIUS CoA packets from the AAA server such as a Cisco Secure Access Control Server (ACS) to reinitialize authentication and apply the new policy. This section provides an overview of the RADIUS interface including available primitives and how they are used during a CoA.

- Change-of-Authorization Requests
- CoA Request Response Code
- CoA Request Commands
- Session Reauthentication
- Stacking Guidelines for Session Termination

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Catalyst support the RADIUS CoA extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external AAA or policy servers.

The supports these per-session CoA requests:

- Session reauthentication
- Session termination
- Session termination with port shutdown
- Session termination with port bounce

This feature is integrated with Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Catalyst . However, some basic configuration is required for the following attributes:

- Security and Password—refer to the “Preventing Unauthorized Access to Your Switch” section in this guide.
- Accounting—refer to the “Starting RADIUS Accounting” section in the Configuring Switch-Based Authentication chapter in this guide.

Cisco IOS software supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a push model to allow the dynamic reconfiguring of sessions from external AAA or policy servers. Per-session CoA requests are supported for session identification, session termination, host reauthentication, port shutdown, and port bounce. This model comprises one request (CoA-Request) and two possible response codes:

- CoA acknowledgement (ACK) [CoA-ACK]
- CoA nonacknowledgement (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a AAA or policy server) and directed to the device that acts as a listener.

The table below shows the RADIUS CoA commands and vendor-specific attributes (VSAs) supported by Identity-Based Networking Services. All CoA commands must include the session identifier between the device and the CoA client.

Table 115: RADIUS CoA Commands Supported by Identity-Based Networking Services

CoA Command	Cisco VSA
Activate service	Cisco:Avpair=“subscriber:command=activate-service” Cisco:Avpair=“subscriber:service-name=<service-name>” Cisco:Avpair=“subscriber:precedence=<precedence-number>” Cisco:Avpair=“subscriber:activation-mode=replace-all”
Deactivate service	Cisco:Avpair=“subscriber:command=deactivate-service” Cisco:Avpair=“subscriber:service-name=<service-name>”
Bounce host port	Cisco:Avpair=“subscriber:command=bounce-host-port”
Disable host port	Cisco:Avpair=“subscriber:command=disable-host-port”
Session query	Cisco:Avpair=“subscriber:command=session-query”

CoA Command	Cisco VSA
Session reauthenticate	Cisco:Avpair="subscriber:command=reauthenticate" Cisco:Avpair="subscriber:reauthenticate-type=last" or Cisco:Avpair="subscriber:reauthenticate-type=rerun"
Session terminate	This is a standard disconnect request and does not require a VSA.
Interface template	Cisco:AVpair="interface-template-name=<interfacetemplate>"

Change-of-Authorization Requests

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

- CoA acknowledgment (ACK) [CoA-ACK]
- CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

RFC 5176 Compliance

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.

This table shows the IETF attributes are supported for this feature.

Table 116: Supported IETF Attributes

Attribute Number	Attribute Name
24	State
31	Calling-Station-ID
44	Acct-Session-ID
80	Message-Authenticator
101	Error-Cause

This table shows the possible values for the Error-Cause attribute.

Table 117: Error-Cause Values

Value	Explanation
201	Residual Session Context Removed

Value	Explanation
202	Invalid EAP Packet (Ignored)
401	Unsupported Attribute
402	Missing Attribute
403	NAS Identification Mismatch
404	Invalid Request
405	Unsupported Service
406	Unsupported Extension
407	Invalid Attribute Value
501	Administratively Prohibited
502	Request Not Routable (Proxy)
503	Session Context Not Found
504	Session Context Not Removable
505	Other Proxy Processing Error
506	Resources Unavailable
507	Request Initiated
508	Multiple Session Selection Unsupported

Preconditions

To use the CoA interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

CoA Request Response Code

The CoA Request response code can be used to convey a command to the switch.

The packet format for a CoA Request Response code as defined in RFC 5176 consists of the following fields: Code, Identifier, Length, Authenticator, and Attributes in the Type:Length:Value (TLV) format. The Attributes field is used to carry Cisco vendor-specific attributes (VSAs).

Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

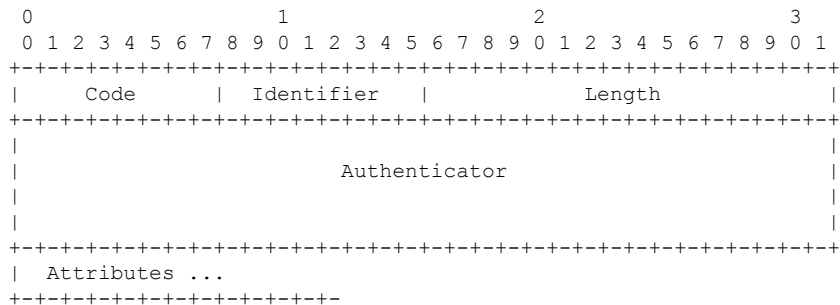

- Acct-Session-Id (IETF attribute #44)

- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
 - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
 - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the “Invalid Attribute Value” error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect- negative acknowledgment (NAK) or CoA-NAK with the error code “Invalid Attribute Value.”

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.

The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

Session Identification

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
 - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
 - Framed-IPv6-Address

- Plain IP Address (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

CoA ACK Response Code

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

CoA NAK Response Code

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use **show** commands to verify a successful CoA.

Session Reauthentication

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: *Cisco:Avpair=“subscriber:command=reauthenticate”* and one or more session identification attributes.

The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -RequestId message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.

If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

Session Reauthentication in a Switch Stack

When a switch stack receives a session reauthentication message:

- It checkpoints the need for a re-authentication before returning an acknowledgment (ACK).
- It initiates reauthentication for the appropriate session.

- If authentication completes with either success or failure, the signal that triggered the reauthentication is removed from the stack's member switch.
- If the stack's active switch fails before authentication completes, reauthentication is initiated after active switch changeover based on the original command (which is subsequently removed).
- If the active switch fails before sending an ACK, the new active switch treats the re-transmitted command as a new command.

Session Termination

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host access to the network.

To restrict a host's access to the network, use a CoA Request with the Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

CoA Activate Service Command

The CoA activate service command can be used to activate a service template on a session. The AAA server sends the request in a standard CoA-Request message using the following VSAs:

```
Cisco:Avpair="subscriber:command=activate-service"
```

```
Cisco:Avpair="subscriber:service-name=<service-name>"
```

```
Cisco:Avpair="subscriber:precedence=<precedence-number>"
```

```
Cisco:Avpair="subscriber:activation-mode=replace-all"
```

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the *Session Identification* section below. If the device cannot locate a session, it returns a CoA-NAK message with the "Session Context Not Found" error-code attribute. If the device locates a session, it initiates an activate template operation for the hosting port and a CoA-ACK is returned. If activating the template fails, a CoA-NAK message is returned with the Error-Code attribute set to the appropriate message.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

Session Identification

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)

- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
 - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
 - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

CoA Deactivate Service Command

The CoA deactivate service command can be used to deactivate a service template on a session. The AAA server sends the request in a standard CoA-Request message using the following VSAs:

```
Cisco:Avpair="subscriber:command=deactivate-service"
```

```
Cisco:Avpair="subscriber:service-name=<service-name>"
```

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the *Session Identification* section below. If the device cannot locate a session, it returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the device locates a session, it initiates a deactivate template operation for the hosting port and a CoA-ACK is returned. If deactivating the template fails, a CoA-NAK message is returned with the Error-Code attribute set to the appropriate message.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

Session Identification

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
 - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
 - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

CoA Request: Disable Host Port

The RADIUS server CoA disable port command administratively shuts down the authentication port that is hosting a session, resulting in session termination. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. To restore network access on the port, reenable it using a non-RADIUS mechanism. This command is carried in a standard CoA-Request message that has this new vendor-specific attribute (VSA):

```
Cisco:Avpair="subscriber:command=disable-host-port"
```

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active switch.

Note A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.

CoA Request: Bounce-Port

A RADIUS server CoA bounce port sent from a RADIUS server can cause a link flap on an authentication port, which triggers DHCP renegotiation from one or more hosts connected to this port. This incident can occur when there is a VLAN change and the endpoint is a device (such as a printer) that does not have a mechanism to detect a change on this authentication port. The CoA bounce port is carried in a standard CoA-Request message that contains the following VSA:

```
Cisco:Avpair="subscriber:command=bounce-host-port"
```

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

CoA Session Query Command

The CoA session query command requests service information about a subscriber session. The AAA server sends the request in a standard CoA-Request message containing the following VSA:

```
Cisco:Avpair="subscriber:command=session-query"
```

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the *Session Identification* section below. If the device cannot locate a session, it returns a CoA-NAK message with the "Session Context Not Found" error-code attribute. If the device locates a session, it performs a session query operation on the session and returns a CoA-ACK message.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

Session Identification

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
 - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
 - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code "Invalid Attribute Value."

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code "Invalid Attribute Value" if any of the above session identification attributes are included in the message.

CoA Session Reauthenticate Command

To initiate session authentication, the AAA server sends a standard CoA-Request message containing the following VSAs:

```
Cisco:Avpair="subscriber:command=reauthenticate"
```

```
Cisco:Avpair="subscriber:reauthenticate-type=<last | rerun>"
```

"reauthenticate-type" defines whether the CoA reauthentication request uses the authentication method that last succeeded on the session or whether the authentication process is completely rerun.

The following rules apply:

- "subscriber:command=reauthenticate" must be present to trigger a reauthentication.

- If “subscriber:reauthenticate-type” is not specified, the default behavior is to rerun the last successful authentication method for the session. If the method reauthenticates successfully, all old authorization data is replaced with the new reauthenticated authorization data.
- “subscriber:reauthenticate-type” is valid only when included with “subscriber:command=reauthenticate.” If it is included in another CoA command, the VSA will be silently ignored.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is resent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

CoA Session Terminate Command

A CoA Disconnect-Request command terminates a session without disabling the host port. This command causes reinitialization of the authenticator state machine for the specified host, but does not restrict the host’s access to the network. If the session cannot be located, the device returns a Disconnect-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the device terminates the session. After the session has been completely removed, the device returns a Disconnect-ACK.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client.

To restrict a host’s access to the network, use a CoA Request with the Cisco:Avpair=“subscriber:command=disable-host-port” VSA. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. When you want to restore network access on the port, reenable it using a non-RADIUS mechanism.

Stacking Guidelines for Session Termination

No special handling is required for CoA Disconnect-Request messages in a switch stack.

Stacking Guidelines for CoA-Request Bounce-Port

Because the **bounce-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the active switch receives a valid **bounce-port** command, it checkpoints the following information before returning a CoA-ACK message:

- the need for a port-bounce
- the port-id (found in the local session context)

The switch initiates a port-bounce (disables the port for 10 seconds, then re-enables it).

If the port-bounce is successful, the signal that triggered the port-bounce is removed from the standby switch.

If the active switch fails before the port-bounce completes, a port-bounce is initiated after an active switch changeover based on the original command (which is subsequently removed).

If the active switch fails before sending a CoA-ACK message, the new active switch treats the re-sent command as a new command.

Stacking Guidelines for CoA-Request Disable-Port

Because the **disable-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the active switch receives a valid **disable-port** command, it verifies this information before returning a CoA-ACK message:

- the need for a port-disable
- the port-id (found in the local session context)

The switch attempts to disable the port.

If the port-disable operation is successful, the signal that triggered the port-disable is removed from the standby switch.

If the active switch fails before the port-disable operation completes, the port is disabled after an active switch changeover based on the original command (which is subsequently removed).

If the active switch fails before sending a CoA-ACK message, the new active switch treats the re-sent command as a new command.

How to Configure RADIUS Change-of-Authorization

Configuring CoA on the Device

Follow these steps to configure CoA on a device. This procedure is required.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa server radius dynamic-author**
5. **client** {*ip-address* | *name*} [**vrf** *vrfname*] [**server-key** *string*]
6. **server-key** [**0** | **7**] *string*
7. **port** *port-number*
8. **auth-type** {*any* | *all* | *session-key*}
9. **ignore session-key**
10. **ignore server-key**
11. **authentication command bounce-port ignore**
12. **authentication command disable-port ignore**
13. **end**
14. **show running-config**
15. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Device(config)# aaa new-model	Enables AAA.
Step 4	aaa server radius dynamic-author Example: Device(config)# aaa server radius dynamic-author	Configures the device as an authentication, authorization, and accounting (AAA) server to facilitate interaction with an external policy server.
Step 5	client {ip-address name} [vrf vrfname] [server-key string]	Enters dynamic authorization local server configuration mode and specifies a RADIUS client from which a device will accept CoA and disconnect requests.
Step 6	server-key [0 7] string Example: Device(config-sg-radius)# server-key your_server_key	Configures the RADIUS key to be shared between a device and RADIUS clients.
Step 7	port port-number Example: Device(config-sg-radius)# port 25	Specifies the port on which a device listens for RADIUS requests from configured RADIUS clients.
Step 8	auth-type {any all session-key} Example: Device(config-sg-radius)# auth-type any	Specifies the type of authorization the device uses for RADIUS clients. The client must match all the configured attributes for authorization.
Step 9	ignore session-key	(Optional) Configures the device to ignore the session-key.

	Command or Action	Purpose
		For more information about the ignore command, see the <i>Cisco IOS Intelligent Services Gateway Command Reference</i> on Cisco.com.
Step 10	ignore server-key Example: Device(config-sg-radius)# ignore server-key	(Optional) Configures the device to ignore the server-key. For more information about the ignore command, see the <i>Cisco IOS Intelligent Services Gateway Command Reference</i> on Cisco.com.
Step 11	authentication command bounce-port ignore Example: Device(config-sg-radius)# authentication command bounce-port ignore	(Optional) Configures the device to ignore a CoA request to temporarily disable the port hosting a session. The purpose of temporarily disabling the port is to trigger a DHCP renegotiation from the host when a VLAN change occurs and there is no supplicant on the endpoint to detect the change.
Step 12	authentication command disable-port ignore Example: Device(config-sg-radius)# authentication command disable-port ignore	(Optional) Configures the device to ignore a nonstandard command requesting that the port hosting a session be administratively shut down. Shutting down the port results in termination of the session. Use standard CLI or SNMP commands to re-enable the port.
Step 13	end Example: Device(config-sg-radius)# end	Returns to privileged EXEC mode.
Step 14	show running-config Example: Device# show running-config	Verifies your entries.
Step 15	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Monitoring and Troubleshooting CoA Functionality

The following Cisco IOS commands can be used to monitor and troubleshoot CoA functionality on the switch:

- **debug radius**
- **debug aaa coa**

- `debug aaa pod`
- `debug aaa subsys`
- `debug cmdhd [detail | error | events]`
- `show aaa attributes protocol radius`

Feature Information for RADIUS Change-of-Authorization Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 118: Feature Information for RADIUS Change-of-Authorization Support

Feature Name	Releases	Feature Information
RADIUS Change-of-Authorization	Cisco IOS Release 15.2(1)E	<p>Supports CoA requests for initiating the following:</p> <ul style="list-style-type: none">• Activating and deactivating service templates on sessions• Port bounce• Port shutdown• Querying a session• Reauthenticating a session• Terminating a session <p>These VSAs are sent in a standard CoA-Request message from a AAA server.</p>

CHAPTER 54

Local AAA Server

The Local AAA Server feature allows you to configure your device so that user authentication and authorization attributes currently available on AAA servers are available locally on the device. The attributes can be added to existing framework, such as the local user database or subscriber profile. The local AAA server provides access to the complete dictionary of Cisco IOS supported attributes.

Prerequisites for Local AAA Server

- Before using this feature, enable the `aaa new-model` command.

Information About Local AAA Server

Local Authorization Attributes Overview

The AAA subsystem (authentication, authorization, and accounting) is responsible for managing all supported attributes that are available to the various services within the Cisco IOS software. As such, it maintains its own local dictionary of all supported attributes.

Local AAA Attribute Support

You can configure your device so that AAA authentication and authorization attributes currently available on AAA servers are made available on existing Cisco IOS devices. The attributes can be added to existing framework, such as the local user database or subscriber profile. For example, an attribute list can now be added to an existing username, providing the ability for the local user database to act as a local AAA server. For situations in which the local username list is relatively small, this flexibility allows you to provide complete user authentication or authorization locally within the Cisco IOS software without having a AAA server. This

ability can allow you to maintain your user database locally or provide a failover local mechanism without having to sacrifice policy options when defining local users.

A subscriber profile allows domain-based clients to have policy applied at the end-user service level. This flexibility allows common policy to be set for all users under a domain in one place and applied there whether or not user authorization is done locally. An attribute list can be added to the subscriber profile, allowing the profile to apply all attributes that can be applied to services using AAA servers. Attributes that are configured under the AAA attribute list are merged with the existing attributes that are generated with the existing subscriber profile and passed to the Subscriber Server Switch (SSS) framework for application.

Note Accounting is still done on a AAA server and is not supported by this feature.

AAA Attribute Lists

AAA attribute lists define user profiles that are local to the router. Every attribute that is known to the AAA subsystem is made available for configuration.

The AAA attributes that are defined in the AAA attribute list are standard RADIUS or TACACS+ attributes. However, they are in the Cisco IOS internal format for that attribute. The attributes must be converted from the RADIUS format (for a RADIUS case) to the Cisco IOS AAA interface format. TACACS+ attributes are generally identical to the Cisco IOS AAA interface format.

Converting from RADIUS Format to Cisco IOS AAA Format

You can use the **show aaa attributes protocol radius** command to get the Cisco IOS AAA format of the Internet Engineering Task Force (IETF) RADIUS attribute. The **show** command output provides a complete list of all the AAA attributes that are supported.

Note The conversion from RADIUS to internal AAA is done internally within the AAA framework. RADIUS vendor-specific attributes (VSAs) are usually accurately reflected during conversion. TACACS+ attributes are also usually identical to the local attributes and do not require the conversion process. However, IETF numbered attributes and some special VSAs often require the conversion process.

Validation of Attributes

Attributes are not validated at configuration. The AAA subsystem “knows” only the format that is expected by the services when the service defines a given attribute inside a definition file. However, it cannot validate the attribute information itself. This validation is done by a service when it first uses the attribute. This validation applies whether the AAA server is RADIUS or TACACS+. Thus, if you are not familiar with configuring a AAA server, it is advisable that you test your attribute list on a test device with the service that will be using the list before configuring and using it in a production environment.

How to Configure a Local AAA Server

Defining a AAA Attribute List

To define an AAA attribute list, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa attribute list** *list-name*
4. **attribute type** *{name}* *{value}* [**service** *service*] [**protocol** *protocol*]
5. **attribute type** *{name}* *{value}* [**service** *service*] [**protocol** *protocol*]
6. **attribute type** *{name}* *{value}* [**service** *service*] [**protocol** *protocol*]
7. **attribute type** *{name}* *{value}*
8. **attribute type** *{name}* *{value}*
9. **attribute type** *{name}* *{value}*
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa attribute list <i>list-name</i> Example: Device(config)# aaa attribute list TEST	Defines a AAA attribute list and enters attribute list configuration mode.
Step 4	attribute type <i>{name}</i> <i>{value}</i> [service <i>service</i>] [protocol <i>protocol</i>] Example: Device(config-attr-list)# attribute type addr-pool poolname service ppp protocol ip	Defines an IP address pool to use.
Step 5	attribute type <i>{name}</i> <i>{value}</i> [service <i>service</i>] [protocol <i>protocol</i>]	Defines the loopback interface to use.

	Command or Action	Purpose
	Example: <pre>Device(config-attr-list)# attribute type ip-unnumbered loopbacknumber service ppp protocol ip</pre>	
Step 6	attribute type <i>{name}</i> <i>{value}</i> [service <i>service</i>] [protocol <i>protocol</i>] Example: <pre>Device(config-attr-list)# attribute type vrf-id vrfname service ppp protocol ip</pre>	Defines the virtual route forwarding (VRF) to use.
Step 7	attribute type <i>{name}</i> <i>{value}</i> Example: <pre>Device(config-attr-list)# attribute type ppp-authen-list aaalistname</pre>	Defines the AAA authentication list to use.
Step 8	attribute type <i>{name}</i> <i>{value}</i> Example: <pre>Device(config-attr-list)# attribute type ppp-author-list aaalistname</pre>	Defines the AAA authorization list to use.
Step 9	attribute type <i>{name}</i> <i>{value}</i> Example: <pre>Device(config-attr-list)# attribute type ppp-acct-list "aaa list name"</pre>	Defines the AAA accounting list to use.
Step 10	end Example: <pre>Device(config-attr-list)# end</pre>	Exits attribute list configuration mode and returns to privileged EXEC mode.

Defining a Subscriber Profile

To define a subscriber profile, perform the following steps.

Note RADIUS users should use the **show aaa attributes** command to map the RADIUS version of the particular attribute to the Cisco IOS AAA version of the string attribute. See the example Mapping from the RADIUS Version of a Particular Attribute to the Cisco IOS AAA Version Example.

SUMMARY STEPS

1. enable

2. **configure terminal**
3. **subscriber authorization enable**
4. **policy-map type service** *domain-name*
5. **service local**
6. **exit**
7. **aaa attribute list** *list-name*
8. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	subscriber authorization enable Example: Device(config)# subscriber authorization enable	Enables subscriber authorization.
Step 4	policy-map type service <i>domain-name</i> Example: Device(config)# policy-map type example.com	Specifies the username domain that has to be matched and enters subscriber profile configuration mode.
Step 5	service local Example: Device(subscriber-profile)# service local	Specifies that local subscriber authorization should be performed.
Step 6	exit Example: Device(subscriber-profile)# exit	Exits subscriber profile configuration mode.
Step 7	aaa attribute list <i>list-name</i> Example: Device(config)# aaa attribute list TEST	Defines the AAA attribute list from which RADIUS attributes are retrieved.
Step 8	end Example:	Exits global configuration mode and returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# end	

Monitoring and Troubleshooting a Local AAA Server

The following debug commands may be helpful in monitoring and troubleshooting, especially to ensure that domain-based service authorization is being triggered and that location authorization is being called on the local AAA server, which triggers the service.

SUMMARY STEPS

1. **enable**
2. **debug aaa authentication**
3. **debug aaa authorization**
4. **debug aaa per-user**
5. **debug ppp authentication**
6. **debug ppp error**
7. **debug ppp forward**
8. **debug ppp negotiation**
9. **debug radius**
10. **debug sss error**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	debug aaa authentication Example: Device# debug aaa authentication	Displays the methods of authentication being used and the results of these methods.
Step 3	debug aaa authorization Example: Device# debug aaa authorization	Displays the methods of authorization being used and the results of these methods.
Step 4	debug aaa per-user Example: Device# debug aaa per-user	Displays information about PPP session per-user activities.

	Command or Action	Purpose
Step 5	debug ppp authentication Example: Device# debug ppp authentication	Indicates whether a client is passing authentication.
Step 6	debug ppp error Example: Device (config)# debug ppp error	Displays protocol errors and error statistics that are associated with PPP connection negotiation and operation.
Step 7	debug ppp forward Example: Device# debug ppp forward	Displays who is taking control of a session.
Step 8	debug ppp negotiation Example: Device# debug ppp negotiation	Displays PPP packets sent during PPP startup, where PPP options are negotiated.
Step 9	debug radius Example: Device# debug radius	Displays information about the RADIUS server.
Step 10	debug sss error Example: Device# debug sss error	Displays diagnostic information about errors that may occur during SSS call setup.

Configuration Examples for Local AAA Server

Example: Local AAA Server

The following example shows a Point-to-Point over Ethernet (PPPoE) group named “bba-group” that is configured for subscriber profile cisco.com (thus, any user with the domain name cisco.com will execute the subscriber profile cisco.com authorization policy). The cisco.com subscriber profile is configured to attach the AAA attribute list “TEST,” which has both **ip vrf forwarding** and **ip unnumbered** commands configured for PPP service under Link Control Protocol (LCP) negotiation. This configuration will essentially cause the named attributes to be applied on the session with the cisco.com domain under the bba-group “pppoe grp1.”

```
aaa authentication ppp template1 local
aaa authorization network template1 local
!
aaa attribute list TEST
```

```

        attribute type interface-config "ip unnumbered FastEthernet0" service ppp protocol lcp
        attribute type interface-config "ip vrf forwarding blue" service ppp protocol lcp
    !
ip vrf blue
description vrf blue template1
rd 1:1
route-target export 1:1
route-target import 1:1
!
subscriber authorization enable
!
policy-map type service example.com
service local
aaa attribute list TEST
!
bba-group pppoe grp1
virtual-template 1
service profile example.com
!
interface Virtual-Template1
no ip address
no snmp trap link-status
no peer default ip address
no keepalive
ppp authentication pap template1
ppp authorization template1
!

```

Note In some versions of Cisco IOS software, it is better to use the explicit attribute instead of interface-config because it provides better scalability (full VAccess interfaces are not required, and subinterfaces could be used to provide the service). In such a case, you can configure **attribute type ip-unnumbered interface service ppp protocol ip** instead of **attribute type interface-config ip unnumbered interface service ppp protocol lcp**.

Example: Mapping from the RADIUS Version of a Particular Attribute to the Cisco IOS AAA Version

The following output example of the **show aaa attributes** command lists RADIUS attributes, which can be used when configuring this feature.

```

Device#
show aaa attributes protocol radius

IETF defined attributes:
  Type=4      Name=acl                      Format=Ulong
  Protocol:RADIUS
  Unknown    Type=11  Name=Filter-Id          Format=Binary
Converts attribute 11 (Filter-Id) of type Binary into an internal attribute
named "acl" of type Ulong. As such, one can configure this attributes locally
by using the attribute type "acl."
Cisco VSA attributes:
  Type=157   Name=interface-config      Format=String
Simply expects a string for the attribute of type "interface-config."

```

Note The **aaa attribute list** command requires the Cisco IOS AAA version of an attribute, which is defined in the “Name” field above.

Feature Information for Local AAA Server

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 119: Feature Information for Local AAA Server

Feature Name	Releases	Feature Information
Local AAA Server	Cisco IOS 15.2(1)E	The Local AAA Server feature allows you to configure your device so that user authentication and authorization attributes currently available on AAA servers are available locally on the device. The attributes can be added to existing framework, such as the local user database or subscriber profile. The local AAA server provides access to the complete dictionary of Cisco IOS supported attributes.

CHAPTER 55

Configuring Kerberos

- [Prerequisites for Controlling Switch Access with Kerberos, on page 1143](#)
- [Restrictions for Controlling Switch Access with Kerberos, on page 1143](#)
- [Information about Kerberos, on page 1144](#)

Prerequisites for Controlling Switch Access with Kerberos

The following are the prerequisites for controlling switch access with Kerberos.

- So that remote users can authenticate to network services, you must configure the hosts and the KDC in the Kerberos realm to communicate and mutually authenticate users and network services. To do this, you must identify them to each other. You add entries for the hosts to the Kerberos database on the KDC and add KEYTAB files generated by the KDC to all hosts in the Kerberos realm. You also create entries for the users in the KDC database.
- A Kerberos server can be a switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

When you add or create entries for the hosts and users, follow these guidelines:

- The Kerberos principal name *must* be in all lowercase characters.
- The Kerberos instance name *must* be in all lowercase characters.
- The Kerberos realm name *must* be in all uppercase characters.

Restrictions for Controlling Switch Access with Kerberos

The following lists any restrictions for controlling switch access with Kerberos.

Information about Kerberos

This section provides Kerberos information.

Kerberos and Switch Access

This section describes how to enable and configure the Kerberos security system, which authenticates requests for network resources by using a trusted third party.

Note In the Kerberos configuration examples, the trusted third party can be any switch that supports Kerberos, that is configured as a network security server, and that can authenticate users by using the Kerberos protocol.

Kerberos Overview

Kerberos is a secret-key network authentication protocol, which was developed at the Massachusetts Institute of Technology (MIT). It uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication and authenticates requests for network resources. Kerberos uses the concept of a trusted third party to perform secure verification of users and services. This trusted third party is called the *key distribution center* (KDC).

Kerberos verifies that users are who they claim to be and the network services that they use are what the services claim to be. To do this, a KDC or trusted Kerberos server issues tickets to users. These tickets, which have a limited life span, are stored in user credential caches. The Kerberos server uses the tickets instead of user names and passwords to authenticate users and network services.

Note A Kerberos server can be any switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

The Kerberos credential scheme uses a process called *single logon*. This process authenticates a user once and then allows secure authentication (without encrypting another password) wherever that user credential is accepted.

This software release supports Kerberos 5, which allows organizations that are already using Kerberos 5 to use the same Kerberos authentication database on the KDC that they are already using on their other network hosts (such as UNIX servers and PCs).

Kerberos supports these network services:

- Telnet
- rlogin
- rsh

This table lists the common Kerberos-related terms and definitions.

Table 120: Kerberos Terms

Term	Definition
Authentication	A process by which a user or service identifies itself to another service. For example, a client can authenticate to a switch or a switch can authenticate to another switch.
Authorization	A means by which the switch identifies what privileges the user has in a network or on the switch and what actions the user can perform.
Credential	A general term that refers to authentication tickets, such as TGTs ⁸ and service credentials. Kerberos credentials verify the identity of a user or service. If a network service decides to trust the Kerberos server that issued a ticket, it can be used in place of re-entering a username and password. Credentials have a default life span of eight hours.
Instance	An authorization level label for Kerberos principals. Most Kerberos principals are of the form <i>user@REALM</i> (for example, <i>smith@EXAMPLE.COM</i>). A Kerberos principal with a Kerberos instance has the form <i>user/instance@REALM</i> (for example, <i>smith/admin@EXAMPLE.COM</i>). The Kerberos instance can be used to specify the authorization level for the user if authentication is successful. The server of each network service might implement and enforce the authorization mappings of Kerberos instances but is not required to do so. Note The Kerberos principal and instance names <i>must</i> be in all lowercase characters. Note The Kerberos realm name <i>must</i> be in all uppercase characters.
KDC ⁹	Key distribution center that consists of a Kerberos server and database program that is running on a network host.
Kerberized	A term that describes applications and services that have been modified to support the Kerberos credential infrastructure.
Kerberos realm	A domain consisting of users, hosts, and network services that are registered to a Kerberos server. The Kerberos server is trusted to verify the identity of a user or network service to another user or network service. Note The Kerberos realm name <i>must</i> be in all uppercase characters.
Kerberos server	A daemon that is running on a network host. Users and network services register their identity with the Kerberos server. Network services query the Kerberos server to authenticate to other network services.
KEYTAB ¹⁰	A password that a network service shares with the KDC. In Kerberos 5 and later Kerberos versions, the network service authenticates an encrypted service credential by using the KEYTAB to decrypt it. In Kerberos versions earlier than Kerberos 5, KEYTAB is referred to as SRVTAB ¹¹ .
Principal	Also known as a Kerberos identity, this is who you are or what a service is according to the Kerberos server. Note The Kerberos principal name <i>must</i> be in all lowercase characters.

Term	Definition
Service credential	A credential for a network service. When issued from the KDC, this credential is encrypted with the password shared by the network service and the KDC. The password is also shared with the user TGT.
SRVTAB	A password that a network service shares with the KDC. In Kerberos 5 or later Kerberos versions, SRVTAB is referred to as KEYTAB.
TGT	Ticket granting ticket that is a credential that the KDC issues to authenticated users. When users receive a TGT, they can authenticate to network services within the Kerberos realm represented by the KDC.

- ⁸ ticket granting ticket
- ⁹ key distribution center
- ¹⁰ key table
- ¹¹ server table

Kerberos Operation

A Kerberos server can be a device that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

To authenticate to network services by using a device as a Kerberos server, remote users must follow these steps:

Authenticating to a Boundary Switch

This section describes the first layer of security through which a remote user must pass. The user must first authenticate to the boundary switch. This process then occurs:

1. The user opens an un-Kerberized Telnet connection to the boundary switch.
2. The switch prompts the user for a username and password.
3. The switch requests a TGT from the KDC for this user.
4. The KDC sends an encrypted TGT that includes the user identity to the switch.
5. The switch attempts to decrypt the TGT by using the password that the user entered.
 - If the decryption is successful, the user is authenticated to the switch.
 - If the decryption is not successful, the user repeats Step 2 either by re-entering the username and password (noting if Caps Lock or Num Lock is on or off) or by entering a different username and password.

A remote user who initiates a un-Kerberized Telnet session and authenticates to a boundary switch is inside the firewall, but the user must still authenticate directly to the KDC before getting access to the network services. The user must authenticate to the KDC because the TGT that the KDC issues is stored on the switch and cannot be used for additional authentication until the user logs on to the switch.

Obtaining a TGT from a KDC

This section describes the second layer of security through which a remote user must pass. The user must now authenticate to a KDC and obtain a TGT from the KDC to access network services.

For instructions about how to authenticate to a KDC, see the “Obtaining a TGT from a KDC” section in the “Security Server Protocols” chapter of the *Cisco IOS Security Configuration Guide, Release 12.4*.

Authenticating to Network Services

This section describes the third layer of security through which a remote user must pass. The user with a TGT must now authenticate to the network services in a Kerberos realm.

For instructions about how to authenticate to a network service, see the “Authenticating to Network Services” section in the “Security Server Protocols” chapter of the *Cisco IOS Security Configuration Guide, Release 12.4*.

How to Configure Kerberos

To set up a Kerberos-authenticated server-client system, follow these steps:

- Configure the KDC by using Kerberos commands.
- Configure the switch to use the Kerberos protocol.

Monitoring the Kerberos Configuration

To display the Kerberos configuration, use the following commands:

- **show running-config**
- **show kerberos creds**: Lists the credentials in a current user’s credentials cache.
- **clear kerberos creds**: Destroys all credentials in a current user’s credentials cache, including those forwarded.

Feature Information for Kerberos

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.

CHAPTER 56

Configuring Accounting

The AAA Accounting feature allows the services that users are accessing and the amount of network resources that users are consuming to be tracked. When AAA Accounting is enabled, the network access server reports user activity to the TACACS+ or RADIUS security server (depending on which security method is implemented) in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, and auditing.

- [Prerequisites for Configuring Accounting, on page 1149](#)
- [Restrictions for Configuring Accounting, on page 1149](#)
- [Information About Configuring Accounting, on page 1150](#)
- [How to Configure Accounting, on page 1163](#)
- [Configuration Examples for Accounting, on page 1172](#)
- [Additional References for Configuring Accounting, on page 1176](#)
- [Feature Information for Configuring Accounting, on page 1176](#)

Prerequisites for Configuring Accounting

The following tasks must be performed before configuring accounting using named method lists:

- Enable AAA on the network access server by using the **aaa new-model** command in global configuration mode.
- Define the characteristics of the RADIUS or TACACS+ security server if RADIUS or TACACS+ authorization is issued. For more information about configuring the Cisco network access server to communicate with the RADIUS security server, see the Configuring RADIUS module. For more information about configuring the Cisco network access server to communicate with the TACACS+ security server, see the Configuring TACACS+ module.

Restrictions for Configuring Accounting

- Accounting information can be sent simultaneously to a maximum of only four AAA servers.
- For Service Selection Gateway (SSG) systems, the **aaa accounting network broadcast** command broadcasts only **start-stop** accounting records. If interim accounting records are configured using the

ssg accounting interval command, the interim accounting records are sent only to the configured default RADIUS server.

Information About Configuring Accounting

Named Method Lists for Accounting

Similar to authentication and authorization method lists, method lists for accounting define the way accounting is performed and the sequence in which these methods are performed.

Named accounting method lists allow particular security protocol to be designated and used on specific lines or interfaces for accounting services. The only exception is the default method list (which is named “default”). The default method list is automatically applied to all interfaces except those that have a named method list explicitly defined. A defined method list overrides the default method list.

A method list is simply a named list describing the accounting methods to be queried (such as RADIUS or TACACS+), in sequence. Method lists allow one or more security protocols to be designated and used for accounting, thus ensuring a backup system for accounting in case the initial method fails. Cisco IOS software uses the first method listed to support accounting; if that method fails to respond, the Cisco IOS software selects the next accounting method listed in the method list. This process continues until there is successful communication with a listed accounting method, or all methods defined are exhausted.

Note The Cisco IOS software attempts accounting with the next listed accounting method only when there is no response from the previous method. If accounting fails at any point in this cycle--meaning that the security server responds by denying the user access--the accounting process stops and no other accounting methods are attempted.

Accounting method lists are specific to the type of accounting being requested. AAA supports seven different types of accounting:

- **Network** --Provides information for all PPP, SLIP, or ARAP sessions, including packet and byte counts.
- **EXEC** --Provides information about user EXEC terminal sessions of the network access server.
- **Commands** --Provides information about the EXEC mode commands that a user issues. Command accounting generates accounting records for all EXEC mode commands, including global configuration commands, associated with a specific privilege level.
- **Connection** --Provides information about all outbound connections made from the network access server, such as Telnet, local-area transport (LAT), TN3270, packet assembler/disassembler (PAD), and rlogin.
- **System** --Provides information about system-level events.
- **Resource** --Provides “start” and “stop” records for calls that have passed user authentication, and provides “stop” records for calls that fail to authenticate.
- **VRRS** --Provides information about Virtual Router Redundancy Service (VRRS).

Note System accounting does not use named accounting lists; only the default list for system accounting can be defined.

Once again, when a named method list is created, a particular list of accounting methods for the indicated accounting type are defined.

Accounting method lists must be applied to specific lines or interfaces before any of the defined methods are performed. The only exception is the default method list (which is named “default”). If the **aaa accounting** command for a particular accounting type is issued without specifying a named method list, the default method list is automatically applied to all interfaces or lines except those that have a named method list explicitly defined (A defined method list overrides the default method list). If no default method list is defined, then no accounting takes place.

This section includes the following subsections:

Method Lists and Server Groups

A server group is a way to group existing LDAP, RADIUS, or TACACS+ server hosts for use in method lists. The figure below shows a typical AAA network configuration that includes four security servers: R1 and R2 are RADIUS servers, and T1 and T2 are TACACS+ servers. R1 and R2 make up the group of RADIUS servers. T1 and T2 make up the group of TACACS+ servers.

Using server groups, a subset of the configured server hosts can be specified and use them for a particular service. For example, server groups allows R1 and R2 to be defined as separate server groups, and T1 and T2 as separate server groups. This allows either R1 and T1 to be specified in the method list or R2 and T2 in the method list, which provides more flexibility in the way that RADIUS and TACACS+ resources are assigned.

Server groups also can include multiple host entries for the same server, as long as each entry has a unique identifier. The combination of an IP address and a UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. In other words, this unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service--for example, authorization--the second host entry configured acts as fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order they are configured.)

AAA Accounting Methods

The Cisco IOS software supports the following two methods for accounting:

- TACACS+--The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.
- RADIUS--The network access server reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

Note With CSCuc32663, passwords and accounting logs are masked before being sent to the TACACS+ or RADIUS security servers. Use the **aaa accounting commands visible-keys** command to send unmasked information to the TACACS+ or RADIUS security servers.

Accounting Record Types

For minimal accounting, use the **stop-only** keyword, which instructs the specified method (**RADIUS** or **TACACS+**) to send a stop record accounting notice at the end of the requested user process. For more accounting information, use the **start-stop** keyword to send a start accounting notice at the beginning of the requested event and a stop accounting notice at the end of the event. To stop all accounting activities on this line or interface, use the **none** keyword.

AAA Accounting Methods

The Cisco IOS software supports the following two methods for accounting:

- **TACACS+**--The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.
- **RADIUS**--The network access server reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

Note With CSCuc32663, passwords and accounting logs are masked before being sent to the TACACS+ or RADIUS security servers. Use the **aaa accounting commands visible-keys** command to send unmasked information to the TACACS+ or RADIUS security servers.

AAA Accounting Types

Network Accounting

Network accounting provides information for all PPP, SLIP, or ARAP sessions, including packet and byte counts.

The following example shows the information contained in a RADIUS network accounting record for a PPP user who comes in through an EXEC session:

```
Wed Jun 27 04:44:45 2001
  NAS-IP-Address = "172.16.25.15"
  NAS-Port = 5
  User-Name = "username1"
  Client-Port-DNIS = "4327528"
  Caller-ID = "562"
  Acct-Status-Type = Start
  Acct-Authentic = RADIUS
  Service-Type = Exec-User
  Acct-Session-Id = "0000000D"
```

```

Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

Wed Jun 27 04:45:00 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 5
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Framed
Acct-Session-Id = "0000000E"
Framed-IP-Address = "10.1.1.2"
Framed-Protocol = PPP
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

Wed Jun 27 04:47:46 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 5
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Framed
Acct-Session-Id = "0000000E"
Framed-IP-Address = "10.1.1.2"
Framed-Protocol = PPP
Acct-Input-Octets = 3075
Acct-Output-Octets = 167
Acct-Input-Packets = 39
Acct-Output-Packets = 9
Acct-Session-Time = 171
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

Wed Jun 27 04:48:45 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 5
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "408"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = "0000000D"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

```

The following example shows the information contained in a TACACS+ network accounting record for a PPP user who first started an EXEC session:

```

Wed Jun 27 04:00:35 2001 172.16.25.15  username1  tty4  562/4327528  starttask_id=28
      service=shell
Wed Jun 27 04:00:46 2001 172.16.25.15  username1  tty4  562/4327528  starttask_id=30
      addr=10.1.1.1  service=ppp
Wed Jun 27 04:00:49 2001 172.16.25.15  username1  tty4  408/4327528  update
task_id=30  addr=10.1.1.1  service=ppp  protocol=ip  addr=10.1.1.1
Wed Jun 27 04:01:31 2001 172.16.25.15  username1  tty4  562/4327528  stoptask_id=30
      addr=10.1.1.1  service=ppp  protocol=ip  addr=10.1.1.1  bytes_in=2844

```

```

bytes_out=1682 paks_in=36 paks_out=24 elapsed_time=51
Wed Jun 27 04:01:32 2001 172.16.25.15 username1 tty4 562/4327528 stoptask_id=28
service=shell elapsed_time=57

```

Note The precise format of accounting packets records may vary depending on the security server daemon.

The following example shows the information contained in a RADIUS network accounting record for a PPP user who comes in through autoselect:

```

Wed Jun 27 04:30:52 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 3
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Framed
Acct-Session-Id = "0000000B"
Framed-Protocol = PPP
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

```

```

Wed Jun 27 04:36:49 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 3
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Framed
Acct-Session-Id = "0000000B"
Framed-Protocol = PPP
Framed-IP-Address = "10.1.1.1"
Acct-Input-Octets = 8630
Acct-Output-Octets = 5722
Acct-Input-Packets = 94
Acct-Output-Packets = 64
Acct-Session-Time = 357
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

```

The following example shows the information contained in a TACACS+ network accounting record for a PPP user who comes in through autoselect:

```

Wed Jun 27 04:02:19 2001 172.16.25.15 username1 Async5 562/4327528 starttask_id=35
service=ppp
Wed Jun 27 04:02:25 2001 172.16.25.15 username1 Async5 562/4327528 update
task_id=35 service=ppp protocol=ip addr=10.1.1.2
Wed Jun 27 04:05:03 2001 172.16.25.15 username1 Async5 562/4327528 stoptask_id=35
service=ppp protocol=ip addr=10.1.1.2 bytes_in=3366 bytes_out=2149
paks_in=42 paks_out=28 elapsed_time=164

```

EXEC Accounting

EXEC accounting provides information about user EXEC terminal sessions (user shells) on the network access server, including username, date, start and stop times, the access server IP address, and (for dial-in users) the telephone number the call originated from.

The following example shows the information contained in a RADIUS EXEC accounting record for a dial-in user:

```

Wed Jun 27 04:26:23 2001
  NAS-IP-Address = "172.16.25.15"
  NAS-Port = 1
  User-Name = "username1"
  Client-Port-DNIS = "4327528"
  Caller-ID = "5622329483"
  Acct-Status-Type = Start
  Acct-Authentic = RADIUS
  Service-Type = Exec-User
  Acct-Session-Id = "00000006"
  Acct-Delay-Time = 0
  User-Id = "username1"
  NAS-Identifier = "172.16.25.15"
Wed Jun 27 04:27:25 2001
  NAS-IP-Address = "172.16.25.15"
  NAS-Port = 1
  User-Name = "username1"
  Client-Port-DNIS = "4327528"
  Caller-ID = "5622329483"
  Acct-Status-Type = Stop
  Acct-Authentic = RADIUS
  Service-Type = Exec-User
  Acct-Session-Id = "00000006"
  Acct-Session-Time = 62
  Acct-Delay-Time = 0
  User-Id = "username1"
  NAS-Identifier = "172.16.25.15"

```

The following example shows the information contained in a TACACS+ EXEC accounting record for a dial-in user:

```

Wed Jun 27 03:46:21 2001      172.16.25.15      username1      tty3      5622329430/4327528
start      task_id=2      service=shell
Wed Jun 27 04:08:55 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=2      service=shell      elapsed_time=1354

```

The following example shows the information contained in a RADIUS EXEC accounting record for a Telnet user:

```

Wed Jun 27 04:48:32 2001
  NAS-IP-Address = "172.16.25.15"
  NAS-Port = 26
  User-Name = "username1"
  Caller-ID = "10.68.202.158"
  Acct-Status-Type = Start
  Acct-Authentic = RADIUS
  Service-Type = Exec-User
  Acct-Session-Id = "00000010"
  Acct-Delay-Time = 0
  User-Id = "username1"
  NAS-Identifier = "172.16.25.15"

```

```

Wed Jun 27 04:48:46 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 26
User-Name = "username1"
Caller-ID = "10.68.202.158"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = "00000010"
Acct-Session-Time = 14
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

```

The following example shows the information contained in a TACACS+ EXEC accounting record for a Telnet user:

```

Wed Jun 27 04:06:53 2001      172.16.25.15      username1      tty26      10.68.202.158
starttask_id=41      service=shell
Wed Jun 27 04:07:02 2001      172.16.25.15      username1      tty26      10.68.202.158
stoptask_id=41      service=shell      elapsed_time=9

```

Command Accounting

Command accounting provides information about the EXEC shell commands for a specified privilege level that are being executed on a network access server. Each command accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the user who executed it.

The following example shows the information contained in a TACACS+ command accounting record for privilege level 1:

```

Wed Jun 27 03:46:47 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=3      service=shell      priv-lvl=1      cmd=show version <cr>
Wed Jun 27 03:46:58 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=4      service=shell      priv-lvl=1      cmd=show interfaces Ethernet 0
<cr>
Wed Jun 27 03:47:03 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=5      service=shell      priv-lvl=1      cmd=show ip route <cr>

```

The following example shows the information contained in a TACACS+ command accounting record for privilege level 15:

```

Wed Jun 27 03:47:17 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=6      service=shell      priv-lvl=15      cmd=configure terminal <cr>
Wed Jun 27 03:47:21 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=7      service=shell      priv-lvl=15      cmd=interface Serial 0 <cr>
Wed Jun 27 03:47:29 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=8      service=shell      priv-lvl=15      cmd=ip address 10.1.1.1 255.255.255.0
<cr>

```

Note The Cisco implementation of RADIUS does not support command accounting.

Connection Accounting

Connection accounting provides information about all outbound connections made from the network access server such as Telnet, LAT, TN3270, PAD, and rlogin.

The following example shows the information contained in a RADIUS connection accounting record for an outbound Telnet connection:

```
Wed Jun 27 04:28:00 2001
  NAS-IP-Address = "172.16.25.15"
  NAS-Port = 2
  User-Name = "username1"
  Client-Port-DNIS = "4327528"
  Caller-ID = "5622329477"
  Acct-Status-Type = Start
  Acct-Authentic = RADIUS
  Service-Type = Login
  Acct-Session-Id = "00000008"
  Login-Service = Telnet
  Login-IP-Host = "10.68.202.158"
  Acct-Delay-Time = 0
  User-Id = "username1"
  NAS-Identifier = "172.16.25.15"
```

```
Wed Jun 27 04:28:39 2001
  NAS-IP-Address = "172.16.25.15"
  NAS-Port = 2
  User-Name = "username1"
  Client-Port-DNIS = "4327528"
  Caller-ID = "5622329477"
  Acct-Status-Type = Stop
  Acct-Authentic = RADIUS
  Service-Type = Login
  Acct-Session-Id = "00000008"
  Login-Service = Telnet
  Login-IP-Host = "10.68.202.158"
  Acct-Input-Octets = 10774
  Acct-Output-Octets = 112
  Acct-Input-Packets = 91
  Acct-Output-Packets = 99
  Acct-Session-Time = 39
  Acct-Delay-Time = 0
  User-Id = "username1"
  NAS-Identifier = "172.16.25.15"
```

The following example shows the information contained in a TACACS+ connection accounting record for an outbound Telnet connection:

```
Wed Jun 27 03:47:43 2001      172.16.25.15      username1  tty3      5622329430/4327528
start  task_id=10      service=connection      protocol=telnet  addr=10.68.202.158  cmd=telnet
      username1-sun
Wed Jun 27 03:48:38 2001      172.16.25.15      username1  tty3      5622329430/4327528
stop   task_id=10      service=connection      protocol=telnet  addr=10.68.202.158  cmd=telnet
      username1-sun      bytes_in=4467  bytes_out=96  paks_in=61      paks_out=72  elapsed_time=55
```

The following example shows the information contained in a RADIUS connection accounting record for an outbound rlogin connection:

```
Wed Jun 27 04:29:48 2001
  NAS-IP-Address = "172.16.25.15"
```

```

NAS-Port = 2
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "5622329477"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = "0000000A"
Login-Service = Rlogin
Login-IP-Host = "10.68.202.158"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

Wed Jun 27 04:30:09 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 2
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "5622329477"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = "0000000A"
Login-Service = Rlogin
Login-IP-Host = "10.68.202.158"
Acct-Input-Octets = 18686
Acct-Output-Octets = 86
Acct-Input-Packets = 90
Acct-Output-Packets = 68
Acct-Session-Time = 22
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

```

The following example shows the information contained in a TACACS+ connection accounting record for an outbound rlogin connection:

```

Wed Jun 27 03:48:46 2001      172.16.25.15      username1      tty3      5622329430/4327528
start      task_id=12      service=connection      protocol=rlogin      addr=10.68.202.158      cmd=rlogin
username1-sun /user username1
Wed Jun 27 03:51:37 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=12      service=connection      protocol=rlogin      addr=10.68.202.158      cmd=rlogin
username1-sun /user username1      bytes_in=659926      bytes_out=138      paks_in=2378      paks_
out=1251      elapsed_time=171

```

The following example shows the information contained in a TACACS+ connection accounting record for an outbound LAT connection:

```

Wed Jun 27 03:53:06 2001      172.16.25.15      username1      tty3      5622329430/4327528
start      task_id=18      service=connection      protocol=lat      addr=VAX      cmd=lat
VAX
Wed Jun 27 03:54:15 2001      172.16.25.15      username1      tty3      5622329430/4327528
stop      task_id=18      service=connection      protocol=lat      addr=VAX      cmd=lat
VAX      bytes_in=0      bytes_out=0      paks_in=0      paks_out=0      elapsed_time=6

```

System Accounting

System accounting provides information about all system-level events (for example, when the system reboots or when accounting is turned on or off).

The following accounting record shows a typical TACACS+ system accounting record server indicating that AAA Accounting has been turned off:

```
Wed Jun 27 03:55:32 2001      172.16.25.15      unknown unknown unknown start   task_id=25
service=system event=sys_acct reason=reconfigure
```

Note The precise format of accounting packets records may vary depending on the TACACS+ daemon.

The following accounting record shows a TACACS+ system accounting record indicating that AAA Accounting has been turned on:

```
Wed Jun 27 03:55:22 2001      172.16.25.15      unknown unknown unknown stop    task_id=23
service=system event=sys_acct reason=reconfigure
```

Additional tasks for measuring system resources are covered in the Cisco IOS software configuration guides. For example, IP accounting tasks are described in the Configuring IP Services chapter in the *CiscoIOS Application Services Configuration Guide*.

Resource Accounting

The Cisco implementation of AAA accounting provides “start” and “stop” record support for calls that have passed user authentication. The additional feature of generating “stop” records for calls that fail to authenticate as part of user authentication is also supported. Such records are necessary for users employing accounting records to manage and monitor their networks.

This section includes the following subsections:

AAA Resource Failure Stop Accounting

Before AAA resource failure stop accounting, there was no method of providing accounting records for calls that failed to reach the user authentication stage of a call setup sequence. Such records are necessary for users employing accounting records to manage and monitor their networks and their wholesale customers.

This functionality generates a “stop” accounting record for any calls that do not reach user authentication; “stop” records are generated from the moment of call setup. All calls that pass user authentication behave as they did before; that is, no additional accounting records are seen.

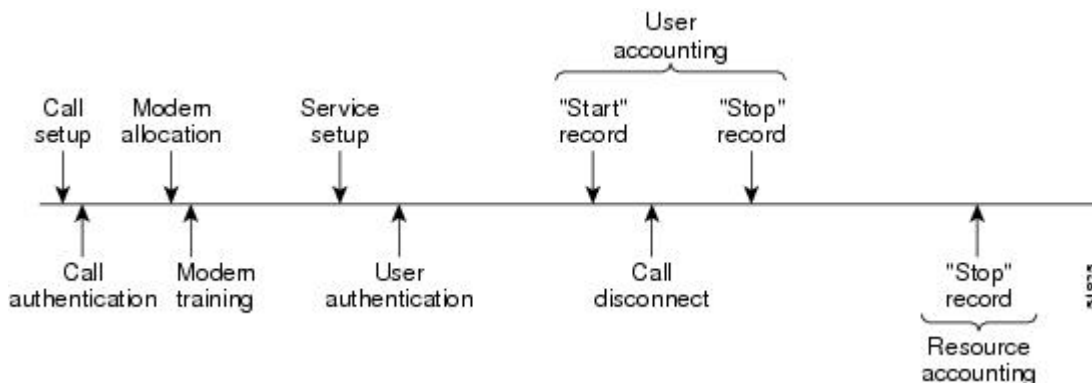

The figure below illustrates a call setup sequence with normal call flow (no disconnect) and without AAA resource failure stop accounting enabled.

Figure 88: Modem Dial-In Call Setup Sequence With Normal Flow and Without Resource Failure Stop Accounting Enabled

The figure below illustrates a call setup sequence with normal call flow (no disconnect) and with AAA resource failure stop accounting enabled.

Figure 89: Modem Dial-In Call Setup Sequence With Normal Flow and With Resource Failure Stop Accounting Enabled

The figure below illustrates a call setup sequence with call disconnect occurring before user authentication and with AAA resource failure stop accounting enabled.

Figure 90: Modem Dial-In Call Setup Sequence With Call Disconnect Occurring Before User Authentication and With Resource Failure Stop Accounting Enabled

The figure below illustrates a call setup sequence with call disconnect occurring before user authentication and without AAA resource failure stop accounting enabled.

Figure 91: Modem Dial-In Call Setup Sequence With Call Disconnect Occurring Before User Authentication and Without Resource Failure Stop Accounting Enabled

AAA Resource Accounting for Start-Stop Records

AAA resource accounting for start-stop records supports the ability to send a “start” record at each call setup, followed by a corresponding “stop” record at the call disconnect. This functionality can be used to manage and monitor wholesale customers from one source of data reporting, such as accounting records.

With this feature, a call setup and call disconnect “start-stop” accounting record tracks the progress of the resource connection to the device. A separate user authentication “start-stop” accounting record tracks the user management progress. These two sets of accounting records are interlinked by using a unique session ID for the call.

The figure below illustrates a call setup sequence with AAA resource start-stop accounting enabled.

Figure 92: Modem Dial-In Call Setup Sequence With Resource Start-Stop Accounting Enabled

VRRS Accounting

Virtual Router Redundancy Service (VRRS) provides a multiclient information abstraction and management service between a First Hop Redundancy Protocol (FHRP) and a registered client. The VRRS multiclient service provides a consistent interface with FHRP protocols by abstracting over several FHRPs and providing an idealized view of their state. VRRS manages data updates, allowing interested clients to register in one place and receive updates for named FHRP groups or all registered FHRP groups.

Virtual Router Redundancy Protocol (VRRP) is an FHRP that acts as a server that pushes FHRP status information out to all registered VRRS clients. Clients obtain status on essential information provided by the FHRP, including current and previous redundancy states, active and inactive L3 and L2 addresses, and, in some cases, information about other redundant gateways in the network. Clients can use this information to provide stateless and stateful redundancy information to clients and protocols.

VRRS Accounting Plug-in

The VRRS Accounting plug-in provides a configurable AAA method list mechanism that provides updates to a RADIUS server when a VRRS group transitions its state. The VRRS accounting plug-in is an extension of existing AAA system accounting messages. The VRRS Accounting plug-in provides accounting-on and accounting-off messages and an additional Vendor-Specific Attribute (VSA) that sends the configured VRRS name in RADIUS accounting messages. The VRRS name is configured using the **vrrp name** command in interface configuration mode.

The VRRS Accounting plug-in provides a configurable AAA method list mechanism that provides updates to a RADIUS server when a VRRS group transitions its state.

The VRRS accounting plug-in is an extension of existing AAA system accounting messages. The VRRS Accounting plug-in provides accounting-on and accounting-off messages and an additional Vendor-Specific Attribute (VSA) that sends the configured VRRS name in RADIUS accounting messages. The VRRS name is configured using the **vrrp name** command in interface configuration mode. The VRRS Accounting plug-in sends an accounting-on message to RADIUS when a VRRS group transitions to the active state, and it sends an accounting-off message when a VRRS group transitions from the active state.

The following RADIUS attributes are included in VRRS accounting messages by default:

- Attribute 4, NAS-IP-Address
- Attribute 26, Cisco VSA Type 1, VRRS Name
- Attribute 40, Acct-Status-Type
- Attribute 41, Acct-Delay-Time
- Attribute 44, Acct-Session-Id

Accounting messages for a VRRS transitioning out of active state are sent after all PPPoE accounting stop messages for sessions that are part of that VRRS.

AAA Accounting Enhancements

AAA Broadcast Accounting

AAA broadcast accounting allows accounting information to be sent to multiple AAA servers at the same time; that is, accounting information can be broadcast to one or more AAA servers simultaneously. This functionality allows service providers to send accounting information to their own private AAA servers and to the AAA servers of their end customers. It also provides redundant billing information for voice applications.

Broadcasting is allowed among groups of RADIUS or TACACS+ servers, and each server group can define its backup servers for failover independently of other groups.

Thus, service providers and their end customers can use different protocols (RADIUS or TACACS+) for the accounting server. Service providers and their end customers can also specify their backup servers independently. As for voice applications, redundant accounting information can be managed independently through a separate group with its own failover sequence.

AAA Session MIB

The AAA session MIB feature allows customers to monitor and terminate their authenticated client connections using Simple Network Management Protocol (SNMP). The data of the client is presented so that it correlates directly to the AAA Accounting information reported by either the RADIUS or the TACACS+ server. AAA session MIB provides the following information:

- Statistics for each AAA function (when used in conjunction with the **show radius statistics** command)
- Status of servers providing AAA functions
- Identities of external AAA servers
- Real-time information (such as idle times), providing additional criteria for use by SNMP networks for assessing whether or not to terminate an active call

Note This command is supported only on Cisco AS5300 and Cisco AS5800 universal access server platforms.

The table below shows the SNMP user-end data objects that can be used to monitor and terminate authenticated client connections with the AAA session MIB feature.

Table 121: SNMP End-User Data Objects

SessionId	The session identification used by the AAA Accounting protocol (same value as reported by RADIUS attribute 44 (Acct-Session-ID)).
UserId	The user login ID or zero-length string if a login is unavailable.
IpAddr	The IP address of the session or 0.0.0.0 if an IP address is not applicable or unavailable.
IdleTime	The elapsed time in seconds that the session has been idle.

Disconnect	The session termination object used to disconnect the given client.
CallId	The entry index corresponding to this accounting session that the Call Tracker record stored.

The table below describes the AAA summary information provided by the AAA session MIB feature using SNMP on a per-system basis.

Table 122: SNMP AAA Session Summary

ActiveTableEntries	Number of sessions currently active.
ActiveTableHighWaterMark	Maximum number of sessions present at once since last system reinstallation.
TotalSessions	Total number of sessions since last system reinstallation.
DisconnectedSessions	Total number of sessions that have been disconnected using since last system reinstallation.

Accounting Attribute-Value Pairs

The network access server monitors the accounting functions defined in either TACACS+ AV pairs or RADIUS attributes, depending on which security method is implemented.

How to Configure Accounting

Configuring AAA Accounting Using Named Method Lists

To configure AAA Accounting using named method lists, perform the following steps:

Note System accounting does not use named method lists. For system accounting, define only the default method list.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa accounting** {system | network | exec | connection | commands *level*} {default | *list-name*} {start-stop | stop-only | none} [*method1* [*method2...*]]
4. Do one of the following:
 - **line** [aux | console | tty | vty] *line-number* [*ending-line-number*]
 - **interface** *interface-type interface-number*
5. Do one of the following:
 - **accounting** {arap | commands *level* | connection | exec} {default | *list-name*}
 - **ppp accounting** {default | *list-name*}

6. Device(config-line)# end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa accounting {system network exec connection commands level} {default list-name} {start-stop stop-only none} [method1 [method2...]] Example: Device(config)# aaa accounting system default start-stop	Creates an accounting method list and enables accounting. The argument <i>list-name</i> is a character string used to name the created list.
Step 4	Do one of the following: <ul style="list-style-type: none"> • line [aux console tty vty] <i>line-number</i> [<i>ending-line-number</i>] • interface <i>interface-type interface-number</i> Example: Device(config)# line aux line1	Enters the line configuration mode for the lines to which the accounting method list is applied. or Enters the interface configuration mode for the interfaces to which the accounting method list is applied.
Step 5	Do one of the following: <ul style="list-style-type: none"> • accounting {arap commands level connection exec} {default list-name} • ppp accounting{default list-name} Example: Device(config-line)# accounting arap default	Applies the accounting method list to a line or set of lines. or Applies the accounting method list to an interface or set of interfaces.
Step 6	Device(config-line)# end Example: Device(config-line)# end	(Optional) Exits line configuration mode and returns to global configuration mode.

Configuring RADIUS System Accounting

Perform this task to configure RADIUS system accounting on the global RADIUS server:

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. radius-server accounting system host-config
5. aaa group server radius *server-name*
6. server-private {*host-name* | *ip-address*} key {[0 *server-key* | 7 *server-key*] *server-key*}
7. accounting system host-config
8. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Device(config)# aaa new-model	Enables AAA network security services.
Step 4	radius-server accounting system host-config Example: Device(config)# radius-server accounting system host-config	Enables the device to send a system accounting record for the addition and deletion of a RADIUS server.
Step 5	aaa group server radius <i>server-name</i> Example: Device(config)# aaa group server radius radgroup1	Adds the RADIUS server and enters server-group configuration mode. <ul style="list-style-type: none"> • The <i>server-name</i> argument specifies the RADIUS server group name.
Step 6	server-private {<i>host-name</i> <i>ip-address</i>} key {[0 <i>server-key</i> 7 <i>server-key</i>] <i>server-key</i>} Example: Device(config-sg-radius)# server-private 172.16.1.11 key cisco	Enters the hostname or IP address of the RADIUS server and hidden server key. <ul style="list-style-type: none"> • (Optional) 0 with the <i>server-key</i> argument specifies that an unencrypted (cleartext) hidden server key follows. • (Optional) 7 with the <i>server-key</i> argument specifies that an encrypted hidden server key follows.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The <i>server-key</i> argument specifies the hidden server key. If the <i>server-key</i> argument is configured without the 0 or 7 preceding it, it is unencrypted. <p>Note Once the server-private command is configured, RADIUS system accounting is enabled.</p>
Step 7	accounting system host-config Example: <pre>Device(config-sg-radius)# accounting system host-config</pre>	Enables the generation of system accounting records for private server hosts when they are added or deleted.
Step 8	end Example: <pre>Device(config-sg-radius)# end</pre>	Exits server-group configuration mode and returns to privileged EXEC mode.

Suppressing Generation of Accounting Records for Null Username Sessions

When AAA Accounting is activated, the Cisco IOS software issues accounting records for all users on the system, including users whose username string, because of protocol translation, is NULL. An example of this is users who come in on lines where the **aaa authentication login *method-list* none** command is applied. To prevent accounting records from being generated for sessions that do not have usernames associated with them, use the following command in global configuration mode:

Command	Purpose
<pre>Device(config)# aaa accounting suppress null-username</pre>	Prevents accounting records from being generated for users whose username string is NULL.

Generating Interim Accounting Records

To enable periodic interim accounting records to be sent to the accounting server, use the following command in global configuration mode:

Command	Purpose
<pre>Device(config)# aaa accounting update [newinfo] [periodic] number</pre>	Enables periodic interim accounting records to be sent to the accounting server.

When the **aaa accounting update** command is activated, the Cisco IOS software issues interim accounting records for all users on the system. If the keyword **newinfo** is used, interim accounting records are sent to the accounting server every time there is new accounting information to report. An example of this would be when IPCP completes IP address negotiation with the remote peer. The interim accounting record includes the negotiated IP address used by the remote peer.

When used with the keyword **periodic**, interim accounting records are sent periodically as defined by the *number* argument. The interim accounting record contains all of the accounting information recorded for that user up to the time the interim accounting record is sent.

Caution Using the **aaa accounting update periodic** command can cause heavy congestion when many users are logged in to the network.

Generating Accounting Records for Failed Login or Session

When AAA Accounting is activated, the Cisco IOS software does not generate accounting records for system users who fail login authentication, or who succeed in login authentication but fail PPP negotiation for some reason.

To specify that accounting stop records be generated for users who fail to authenticate at login or during session negotiation, use the following command in global configuration mode:

Command	Purpose
Device(config)# aaa accounting send stop-record authentication failure	Generates “stop” records for users who fail to authenticate at login or during session negotiation using PPP.
Device(config)# aaa accounting send stop-record always	Sends authentication, authorization, and accounting (AAA) stop records regardless of whether a start record was sent earlier.

Specifying Accounting NETWORK-Stop Records Before EXEC-Stop Records

For PPP users who start EXEC terminal sessions, you can specify the NETWORK records to be generated before EXEC-stop records. In cases such as billing customers for specific services, it can be desirable to keep network start and stop records together, essentially “nesting” them within the framework of the EXEC start and stop messages. For example, a user dialing in using PPP can create the following records: EXEC-start, NETWORK-start, EXEC-stop, NETWORK-stop. By nesting the accounting records, NETWORK-stop records follow NETWORK-start messages: EXEC-start, NETWORK-start, NETWORK-stop, EXEC-stop.

To nest accounting records for user sessions, use the following command in global configuration mode:

Command	Purpose
Device(config)# aaa accounting nested	Nests network accounting records.

Configuring AAA Resource Failure Stop Accounting

To enable resource failure stop accounting, use the following command in global configuration mode:

Command	Purpose
<pre>Device(config)# aaa accounting resource <i>method-list</i> stop-failure group <i>server-group</i></pre>	<p>Generates a “stop” record for any calls that do not reach user authentication.</p> <p>Note Before configuring this feature, the tasks described in the Prerequisites for Configuring Accounting, on page 1149 section must be performed, and SNMP must be enabled on the network access server.</p>

Configuring AAA Resource Accounting for Start-Stop Records

To enable full resource accounting for start-stop records, use the following command in global configuration mode:

Command	Purpose
<pre>Device(config)# aaa accounting resource <i>method-list</i> start-stop group <i>server-group</i></pre>	<p>Supports the ability to send a “start” record at each call setup, followed with a corresponding “stop” record at the call disconnect.</p> <p>Note Before configuring this feature, the tasks described in the Prerequisites for Configuring Accounting, on page 1149 section must be performed, and SNMP must be enabled on the network access server.</p>

Configuring AAA Broadcast Accounting

To configure AAA broadcast accounting, use the **aaa accounting** command in global configuration mode:

Command	Purpose
<pre>Device(config)# aaa accounting {system network exec connection commands <i>level</i>} {default <i>list-name</i>} {start-stop stop-only none} [broadcast] <i>method1</i> [<i>method2...</i>]</pre>	<p>Enables sending accounting records to multiple AAA servers. Simultaneously sends accounting records to the first server in each group. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p>

Configuring Per-DNIS AAA Broadcast Accounting

To configure AAA broadcast accounting per DNIS, use the **aaa dnis map accounting network** command in global configuration mode:

Command	Purpose
<pre>Device(config)# aaa dnis map dnis-number accounting network [start-stop stop-only none] [broadcast] <i>method1</i> [<i>method2...</i>]</pre>	<p>Allows per-DNIS accounting configuration. This command has precedence over the global aaa accounting command.</p> <p>Enables sending accounting records to multiple AAA servers. Simultaneously sends accounting records to the first server in each group. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p>

Configuring AAA Session MIB

The following tasks must be performed before configuring the AAA session MIB feature:

- Configure SNMP.
- Configure AAA.
- Define the RADIUS or TACACS+ server characteristics.

Note Overusing SNMP can affect the overall system performance; therefore, normal network management performance must be considered when this feature is used.

To configure AAA session MIB, use the following command in global configuration mode

SUMMARY STEPS

1. Device (config)# **aaa session-mib disconnect**

DETAILED STEPS

	Command or Action	Purpose
Step 1	Device (config)# aaa session-mib disconnect	Monitors and terminates authenticated client connections using SNMP. To terminate the call, the disconnect keyword must be used.

Configuring VRRS Accounting

Perform the following task to configure Virtual Router Redundancy Service (VRRS) to send AAA Accounting messages to the AAA server:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa accounting vrrs** {**default** | *list-name*} **start-stop** *method1* [*method2...*]
4. **aaa attribute list** *list-name*

5. **attribute type** *name value* [**service** *service*] [**protocol** *protocol*][**mandatory**][**tag** *tag-value*]
6. **exit**
7. **vrrs** *vrrs-group-name*
8. **accounting delay** *seconds*
9. **accounting method** {**default** | *accounting-method-list*}
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa accounting vrrs { default <i>list-name</i> } start-stop <i>method1</i> [<i>method2...</i>] Example: Device(config)# aaa accounting vrrs default start-stop	Enables AAA accounting for VRRS.
Step 4	aaa attribute list <i>list-name</i> Example: Device(config)# aaa attribute list list1	Defines a AAA attribute list locally on a device, and enters attribute list configuration mode.
Step 5	attribute type <i>name value</i> [service <i>service</i>] [protocol <i>protocol</i>][mandatory][tag <i>tag-value</i>] Example: Device(config-attr-list)# attribute type example 1	Defines an attribute type that is to be added to an attribute list locally on a device.
Step 6	exit Example: Device(config-attr-list)# exit	Exits attribute list configuration mode and returns to global configuration mode.
Step 7	vrrs <i>vrrs-group-name</i> Example: Device(config)# vrrs vrrs1	(Optional) Defines a VRRP group and configures parameters for the VRRS group, and enters VRRS configuration mode.

	Command or Action	Purpose
Step 8	accounting delay <i>seconds</i> Example: Device(config-vrrs)# accounting delay 10	(Optional) Specifies the delay time for sending accounting-off messages to the VRRS.
Step 9	accounting method { default <i>accounting-method-list</i> } Example: Device(config-vrrs)# accounting method default	(Optional) Enables VRRS accounting for a VRRP group.
Step 10	end Example: Device(config-vrrs)# end	Exits VRRS configuration mode and returns to privileged EXEC mode.

Establishing a Session with a Device if the AAA Server is Unreachable

To establish a console or telnet session with a device if the AAA server is unreachable, use the following command in global configuration mode:

Command	Purpose
Device(config)# no aaa accounting system guarantee-first	<p>The aaa accounting system guarantee-first command guarantees system accounting as the first record, which is the default condition.</p> <p>In some situations, users may be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than three minutes. To resolve this problem, the no aaa accounting system guarantee-first command can be used.</p>

Note Entering the **no aaa accounting system guarantee-first** command is not the only condition by which the console or telnet session can be started. For example, if the privileged EXEC session is being authenticated by TACACS and the TACACS server is not reachable, then the session cannot start.

Monitoring Accounting

No specific **show** command exists for either RADIUS or TACACS+ accounting. To obtain accounting records displaying information about users currently logged in, use the following command in privileged EXEC mode:

Command	Purpose
Device# show accounting	Allows display of the active accountable events on the network and helps collect information in the event of a data loss on the accounting server.

Troubleshooting Accounting

To troubleshoot accounting information, use the following command in privileged EXEC mode:

Command	Purpose
Device# debug aaa accounting	Displays information on accountable events as they occur.

Configuration Examples for Accounting

Example Configuring Named Method List

The following example shows how to configure a Cisco AS5200 (enabled for AAA and communication with a RADIUS security server) in order for AAA services to be provided by the RADIUS server. If the RADIUS server fails to respond, then the local database is queried for authentication and authorization information, and accounting services are handled by a TACACS+ server.

```

aaa new-model
aaa authentication login admins local
aaa authentication ppp dialins group radius local
aaa authorization network blue1 group radius local
aaa accounting network red1 start-stop group radius group tacacs+
username root password ALongPassword
tacacs-server host 172.31.255.0
tacacs-server key goaway
radius-server host 172.16.2.7
radius-server key myRaDiUSpassWoRd
interface group-async 1
  group-range 1 16
  encapsulation ppp
  ppp authentication chap dialins
  ppp authorization blue1
  ppp accounting red1
line 1 16
  autoselect ppp
  autoselect during-login
  login authentication admins
  modem dialin

```

The lines in this sample RADIUS AAA configuration are defined as follows:

- The **aaa new-model** command enables AAA network security services.
- The **aaa authentication login admins local** command defines a method list “admins”, for login authentication.
- The **aaa authentication ppp dialins group radius local** command defines the authentication method list “dialins”, which specifies that first RADIUS authentication and then (if the RADIUS server does not respond) local authentication is used on serial lines using PPP.
- The **aaa authorization network blue1 group radius local** command defines the network authorization method list named “blue1”, which specifies that RADIUS authorization is used on serial lines using PPP. If the RADIUS server fails to respond, then local network authorization is performed.

- The **aaa accounting network red1 start-stop group radius group tacacs+** command defines the network accounting method list named red1, which specifies that RADIUS accounting services (in this case, start and stop records for specific events) are used on serial lines using PPP. If the RADIUS server fails to respond, accounting services are handled by a TACACS+ server.
- The **username** command defines the username and password to be used for the PPP Password Authentication Protocol (PAP) caller identification.
- The **tacacs-server host** command defines the name of the TACACS+ server host.
- The **tacacs-server key** command defines the shared secret text string between the network access server and the TACACS+ server host.
- The **radius-server host** command defines the name of the RADIUS server host.
- The **radius-server key** command defines the shared secret text string between the network access server and the RADIUS server host.
- The **interface group-async** command selects and defines an asynchronous interface group.
- The **group-range** command defines the member asynchronous interfaces in the interface group.
- The **encapsulation ppp** command sets PPP as the encapsulation method used on the specified interfaces.
- The **ppp authentication chap dialins** command selects Challenge Handshake Authentication Protocol (CHAP) as the method of PPP authentication and applies the “dialins” method list to the specified interfaces.
- The **ppp authorization blue1** command applies the blue1 network authorization method list to the specified interfaces.
- The **ppp accounting red1** command applies the red1 network accounting method list to the specified interfaces.
- The **line** command switches the configuration mode from global configuration to line configuration and identifies the specific lines being configured.
- The **autoselect ppp** command configures the Cisco IOS software to allow a PPP session to start up automatically on these selected lines.
- The **autoselect during-login** command is used to display the username and password prompt without pressing the Return key. After the user logs in, the autoselect function (in this case, PPP) begins.
- The **login authentication admins** command applies the admins method list for login authentication.
- The **modem dialin** command configures modems attached to the selected lines to only accept incoming calls.

The **show accounting** command yields the following output for the preceding configuration:

```
Active Accounted actions on tty1, User username2 Priv 1
Task ID 5, Network Accounting record, 00:00:52 Elapsed
task_id=5 service=ppp protocol=ip address=10.0.0.98
```

The table below describes the fields contained in the preceding output.

Table 123: show accounting Field Descriptions

Field	Description
Active Accounted actions on	Terminal line or interface name user with which the user logged in.
User	User's ID.
Priv	User's privilege level.
Task ID	Unique identifier for each accounting session.
Accounting record	Type of accounting session.
Elapsed	Length of time (hh:mm:ss) for this session type.
attribute=value	AV pairs associated with this accounting session.

Example Configuring AAA Resource Accounting

The following example shows how to configure the resource failure stop accounting and resource accounting for start-stop records functions:

```
!Enable AAA on your network access server.
aaa new-model
!Enable authentication at login and list the AOL string name to use for login authentication.
aaa authentication login AOL group radius local
!Enable authentication for ppp and list the default method to use for PPP authentication.
aaa authentication ppp default group radius local
!Enable authorization for all exec sessions and list the AOL string name to use for
authorization.
aaa authorization exec AOL group radius if-authenticated
!Enable authorization for all network-related service requests and list the default method
to use for all network-related authorizations.
aaa authorization network default group radius if-authenticated
!Enable accounting for all exec sessions and list the default method to use for all start-stop
accounting services.
aaa accounting exec default start-stop group radius
!Enable accounting for all network-related service requests and list the default method to
use for all start-stop accounting services.
aaa accounting network default start-stop group radius
!Enable failure stop accounting.
aaa accounting resource default stop-failure group radius
!Enable resource accounting for start-stop records.
aaa accounting resource default start-stop group radius
```

Example Configuring AAA Broadcast Accounting

The following example shows how to turn on broadcast accounting using the global **aaa accounting** command:

```
aaa group server radius isp
server 10.0.0.1
server 10.0.0.2
aaa group server tacacs+ isp_customer
server 172.0.0.1
aaa accounting network default start-stop broadcast group isp group isp_customer
```

```
radius-server host 10.0.0.1
radius-server host 10.0.0.2
radius-server key key1
tacacs-server host 172.0.0.1 key key2
```

The **broadcast** keyword causes “start” and “stop” accounting records for network connections to be sent simultaneously to server 10.0.0.1 in the group `isp` and to server 172.0.0.1 in the group `isp_customer`. If server 10.0.0.1 is unavailable, failover to server 10.0.0.2 occurs. If server 172.0.0.1 is unavailable, no failover occurs because backup servers are not configured for the group `isp_customer`.

Example Configuring Per-DNIS AAA Broadcast Accounting

The following example shows how to turn on per DNIS broadcast accounting using the global `aaa dnis map accounting network` command:

```
aaa group server radius isp
  server 10.0.0.1
  server 10.0.0.2
aaa group server tacacs+ isp_customer
  server 172.0.0.1
aaa dnis map enable
aaa dnis map 7777 accounting network start-stop broadcast group isp group isp_customer
radius-server host 10.0.0.1
radius-server host 10.0.0.2
radius-server key key_1
tacacs-server host 172.0.0.1 key key_2
```

The **broadcast** keyword causes “start” and “stop” accounting records for network connection calls having DNIS number 7777 to be sent simultaneously to server 10.0.0.1 in the group `isp` and to server 172.0.0.1 in the group `isp_customer`. If server 10.0.0.1 is unavailable, failover to server 10.0.0.2 occurs. If server 172.0.0.1 is unavailable, no failover occurs because backup servers are not configured for the group `isp_customer`.

Example AAA Session MIB

The following example shows how to set up the AAA session MIB feature to disconnect authenticated client connections for PPP users:

```
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius
aaa accounting network default start-stop group radius
aaa session-mib disconnect
```

Example Configuring VRRS Accounting

The following example shows how to configure VRRS to send AAA Accounting messages to the AAA server:

```
Router# configure terminal
Router(config)# aaa accounting vrrs vrrp-mlist-1 start-stop group radius
Router(config)# aaa attribute list vrrp-1-attr
Router(config-attr-list)# attribute type account-delay 10
Router(config-attr-list)# exit
Router(config)# vrrs vrrp-group-1
Router(config-vrrs)# accounting delay 10
```

```
Router(config-vrrs) # accounting method vrrp-mlist-1
Router(config-vrrs) # exit
```

Feature Information for Configuring Accounting

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 124: Feature Information for Configuring Accounting

Feature Name	Releases	Feature Information
AAA Broadcast Accounting	Cisco IOS 15.2(1)E	AAA broadcast accounting allows accounting information to be sent to multiple AAA servers at the same time; that is, accounting information can be broadcast to one or more AAA servers simultaneously.
AAA Resource Accounting for Start-Stop Records	Cisco IOS 15.2(1)E	AAA resource accounting for start-stop records supports the ability to send a “start” record at each call setup, followed by a corresponding “stop” record at the call disconnect. This functionality can be used to manage and monitor wholesale customers from one source of data reporting, such as accounting records.
AAA Session MIB	Cisco IOS 15.2(1)E	The AAA session MIB feature allows customers to monitor and terminate their authenticated client connections using SNMP. The data of the client is presented so that it correlates directly to the AAA Accounting information reported by either the RADIUS or the TACACS+ server.
AAA: IPv6 Accounting Delay Enhancements	Cisco IOS 15.2(1)E	VRRS provides a multi-client information abstraction and management service between a First Hop Redundancy Protocol (FHRP) and a registered client.

How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note To secure the switch for HTTP access by using AAA methods, you must configure the switch with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login default local**
5. **aaa authorization exec default local**
6. **aaa authorization network default local**
7. **username** *name* [**privilege level**] {**password** *encryption-type password*}
8. **end**
9. **show running-config**

10. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Device(config)# aaa new-model	Enables AAA.
Step 4	aaa authentication login default local Example: Device(config)# aaa authentication login default local	Sets the login authentication to use the local username database. The default keyword applies the local user database authentication to all ports.
Step 5	aaa authorization exec default local Example: Device(config)# aaa authorization exec default local	Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell.
Step 6	aaa authorization network default local Example: Device(config)# aaa authorization network default local	Configures user AAA authorization for all network-related service requests.
Step 7	username name [privilege level] {password encryption-type password} Example: Device(config)# username your_user_name privilege 1 password 7 secret567	Enters the local database, and establishes a username-based authentication system. Repeat this command for each user. <ul style="list-style-type: none"> • For <i>name</i>, specify the user ID as one word. Spaces and quotation marks are not allowed.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • (Optional) For <i>level</i>, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access. • For <i>encryption-type</i>, enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows. • For <i>password</i>, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the username command.
Step 8	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 9	show running-config Example: Device# show running-config	Verifies your entries.
Step 10	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Monitoring Local Authentication and Authorization

To display Local Authentication and Authorization configuration, use the **show running-config** privileged EXEC command.

Feature Information for Local Authentication and Authorization

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.

CHAPTER 58

Certification Authority Interoperability

This chapter describes how to configure certification authority (CA) interoperability, which is provided in support of the IPsec protocol. CA interoperability permits Cisco IOS devices and CAs to communicate so that your Cisco IOS device can obtain and use digital certificates from the CA. Although IPsec can be implemented in your network without the use of a CA, using a CA provides manageability and scalability for IPsec.

- [Prerequisites For Certification Authority, on page 1183](#)
- [Restrictions for Certification Authority, on page 1183](#)
- [Information About Certification Authority, on page 1183](#)
- [How to Configure Certification Authority, on page 1186](#)
- [Monitoring and Maintaining Certification Authority, on page 1194](#)

Prerequisites For Certification Authority

You need to have a certification authority (CA) available to your network before you configure this interoperability feature. The CA must support the Public Key Infrastructure (PKI) protocol, and the Simple Certificate Enrollment Protocol (SCEP).

Restrictions for Certification Authority

When configuring your CA, the following restrictions apply:

- This feature should be configured only when you also configure both IPsec and Internet Key Exchange (IKE) in your network.
- The Cisco IOS software does not support CA server public keys greater than 2048 bits.

Information About Certification Authority

CA Supported Standards

Without certification authority (CA) interoperability, Cisco IOS devices could not use CAs when deploying IPsec. CAs provide a manageable, scalable solution for IPsec networks.

Cisco supports the following standards with this feature:

- **IPSec**—IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer; it uses Internet Key Exchange to handle negotiation of protocols and algorithms based on local policy, and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.
- **Internet Key Exchange (IKE)**—A hybrid protocol that implements Oakley and Skeme key exchanges inside the Internet Security Association Key Management Protocol (ISAKMP) framework. Although IKE can be used with other protocols, its initial implementation is with the IPSec protocol. IKE provides authentication of the IPSec peers, negotiates IPSec keys, and negotiates IPSec security associations.
- **Public-Key Cryptography Standard #7 (PKCS #7)**—A standard from RSA Data Security, Inc., used to encrypt and sign certificate enrollment messages.
- **Public-Key Cryptography Standard #10 (PKCS #10)**—A standard syntax from RSA Data Security, Inc. for certificate requests.
- **RSA Keys**—RSA is the public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. RSA keys come in pairs: one public key and one private key.
- **X.509v3 certificates**—Certificate support that allows the IPSec-protected network to scale by providing the equivalent of a digital ID card to each device. When two devices wish to communicate, they exchange digital certificates to prove their identity (thus removing the need to manually exchange public keys with each peer or to manually specify a shared key at each peer). These certificates are obtained from a CA. X.509 is part of the X.500 standard of the ITU.

Purpose of CAs

Certificate authorities (CAs) are responsible for managing certificate requests and issuing certificates to participating IPSec network devices. These services provide centralized key management for the participating devices.

CAs simplify the administration of IPSec network devices. You can use a CA with a network containing multiple IPSec-compliant devices such as routers.

Digital signatures, enabled by public key cryptography, provide a means of digitally authenticating devices and individual users. In public key cryptography, such as the RSA encryption system, each user has a key pair containing both a public and a private key. The keys act as complements, and anything encrypted with one of the keys can be decrypted with the other. In simple terms, a signature is formed when data is encrypted with a user's private key. The receiver verifies the signature by decrypting the message with the sender's public key. The fact that the message could be decrypted using the sender's public key indicates that the holder of the private key, the sender, must have created the message. This process relies on the receiver's having a copy of the sender's public key and knowing with a high degree of certainty that it really does belong to the sender and not to someone pretending to be the sender.

Digital certificates provide the link. A digital certificate contains information to identify a user or device, such as the name, serial number, company, department, or IP address. It also contains a copy of the entity's public key. The certificate is itself signed by a certification authority (CA), a third party that is explicitly trusted by the receiver to validate identities and to create digital certificates.

In order to validate the signature of the CA, the receiver must first know the CA's public key. Normally this process is handled out-of-band or through an operation done at installation. For instance, most web browsers are configured with the public keys of several CAs by default. The Internet Key Exchange (IKE), an essential component of IPSec, can use digital signatures to scalably authenticate peer devices before setting up security associations.

Without digital signatures, one must manually exchange either public keys or secrets between each pair of devices that use IPsec to protect communications between them. Without certificates, every new device added to the network requires a configuration change on every other device with which it communicates securely. With digital certificates, each device is enrolled with a certification authority. When two devices wish to communicate, they exchange certificates and digitally sign data to authenticate each other. When a new device is added to the network, one simply enrolls that device with a CA, and none of the other devices needs modification. When the new device attempts an IPsec connection, certificates are automatically exchanged and the device can be authenticated.

Implementing IPsec Without CAs

Without a CA, if you want to enable IPsec services (such as encryption) between two Cisco devices, you must first ensure that each device has the key of the other device (such as an RSA public key or a shared key). This requirement means that you must manually perform one of the following operations:

- At each device, enter the RSA public key of the other device.
- At each device, specify a shared key to be used by both device.

In the above illustration, each device uses the key of the other device to authenticate the identity of the other device; this authentication always occurs when IPsec traffic is exchanged between the two devices.

If you have multiple Cisco devices in a mesh topology and wish to exchange IPsec traffic passing among all of those devices, you must first configure shared keys or RSA public keys among all of those devices.

Every time a new device is added to the IPsec network, you must configure keys between the new device and each of the existing devices. (In Figure 34, four additional two-part key configurations would be required to add a single encrypting device to the network.)

Consequently, the more devices there are that require IPsec services, the more involved the key administration becomes. This approach does not scale well for larger, more complex encrypting networks.

Implementing IPsec With CAs

With a CA, you do not have to configure keys between all the encrypting devices. Instead, you individually enroll each participating device with the CA, requesting a certificate for the device. When this has been accomplished, each participating device can dynamically authenticate all the other participating devices. This process is illustrated in the illustration.

To add a new IPsec device to the network, you need only configure that new device to request a certificate from the CA, instead of making multiple key configurations with all the other existing IPsec devices.

Implementing IPsec with Multiple Root CAs

With multiple root CAs, you no longer have to enroll a device with the CA that issued a certificate to a peer. Instead, you configure a device with multiple CAs that it trusts. Thus, a device can use a configured CA (a trusted root) to verify certificates offered by a peer that were not issued by the same CA defined in the identity of the device.

Configuring multiple CAs allows two or more devices enrolled under different domains (different CAs) to verify the identity of each other when using IKE to set up IPsec tunnels.

Through Simple Certificate Enrollment Protocol (SCEP), each device is configured with a CA (the enrollment CA). The CA issues a certificate to the device that is signed with the private key of the CA. To verify the

certificates of peers in the same domain, the device is also configured with the root certificate of the enrollment CA.

To verify the certificate of a peer from a different domain, the root certificate of the enrollment CA in the domain of the peer must be configured securely in the device.

During Internet Key Exchange (IKE) phase one signature verification, the initiator will send the responder a list of its CA certificates. The responder should send the certificate issued by one of the CAs in the list. If the certificate is verified, the device saves the public key contained in the certificate on its public key ring.

With multiple root CAs, VPN users can establish trust in one domain and easily and securely distribute it to other domains. Thus, the required private communication channel between entities authenticated under different domains can occur.

How CA Certificates Are Used by IPsec Devices

When two IPsec devices want to exchange IPsec-protected traffic passing between them, they must first authenticate each other—otherwise, IPsec protection cannot occur. The authentication is done with IKE.

Without a CA, a device authenticates itself to the remote device using either RSA-encrypted nonces or preshared keys. Both methods require that keys must have been previously configured between the two devices.

With a CA, a device authenticates itself to the remote device by sending a certificate to the remote device and performing some public key cryptography. Each device must send its own unique certificate that was issued and validated by the CA. This process works because the certificate of each device encapsulates the public key of the device, each certificate is authenticated by the CA, and all participating devices recognize the CA as an authenticating authority. This scheme is called IKE with an RSA signature.

Your device can continue sending its own certificate for multiple IPsec sessions, and to multiple IPsec peers until the certificate expires. When its certificate expires, the device administrator must obtain a new one from the CA.

CAs can also revoke certificates for devices that will no longer participate in IPsec. Revoked certificates are not recognized as valid by other IPsec devices. Revoked certificates are listed in a certificate revocation list (CRL), which each peer may check before accepting a certificate from another peer.

Registration Authorities

Some CAs have a registration authority (RA) as part of their implementation. An RA is essentially a server that acts as a proxy for the CA so that CA functions can continue when the CA is offline.

Some of the configuration tasks described in this document differ slightly, depending on whether your CA supports an RA.

How to Configure Certification Authority

Managing NVRAM Memory Usage

Certificates and certificate revocation lists (CRLs) are used by your device when a CA is used. Normally certain certificates and all CRLs are stored locally in the NVRAM of the device, and each certificate and CRL uses a moderate amount of memory.

The following certificates are normally stored at your device:

- Certificate of your device
- Certificate of the CA
- Root certificates obtained from CA servers (all root certificates are saved in RAM after the device has been initialized)
- Two registration authority (RA) certificates (only if the CA supports an RA)

CRLs are normally stored at your device according to the following conditions:

- If your CA does not support an RA, only one CRL gets stored in the device.
- If your CA supports an RA, multiple CRLs can be stored in the device.

In some cases, storing these certificates and CRLs locally will not present any difficulty. In other cases, memory might become a problem—particularly if the CA supports an RA and a large number of CRLs have to be stored on the device. If the NVRAM is too small to store root certificates, only the fingerprint of the root certificate is saved.

To save NVRAM space, specify that certificates and CRLs should not be stored locally, but should be retrieved from the CA when needed. This alternative will save NVRAM space but could result in a slight performance impact. To specify that certificates and CRLs should not be stored locally on your device, but should be retrieved when required, enable query mode.

If you do not enable query mode now, you can do it later even if certificates and CRLs have already been stored on the device. In this case, when you enable query mode, the stored certificates and CRLs are deleted from the device after you save the configuration. (If you copy the configuration to a TFTP site prior to enabling query mode, you can save any stored certificates and CRLs at the TFTP site.)

Before disabling query mode, perform the **copy system:running-config nvram:startup-config** command to save all current certificates and CRLs to NVRAM. Otherwise they could be lost during a reboot.

To specify that certificates and CRLs should not be stored locally on your device, but should be retrieved when required, enable query mode by using the following command in global configuration mode:

Note Query mode may affect availability if the CA is down.

SUMMARY STEPS

1. **crypto ca certificate query**

DETAILED STEPS

	Command or Action	Purpose
Step 1	crypto ca certificate query Example: Device(config)# <code>crypto ca certificate query</code>	Enables query mode, which causes certificates and CRLs not to be stored locally.

Configuring the Device Host Name and IP Domain Name

You must configure the host name and IP domain name of a device if this has not already been done. This is required because the device assigns a fully qualified domain name (FQDN) to the keys and certificates used by IPsec, and the FQDN is based on the host name and IP domain name assigned to the device. For example, a certificate named "device20.example.com" is based on a device host name of "device20" and a device IP domain name of "example.com".

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **hostname *name***
4. **ip domain-name *name***
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	hostname <i>name</i> Example: Device(config)# hostname device1	Configures the host name of the device.
Step 4	ip domain-name <i>name</i> Example: Device(config)# ip domain-name domain.com	Configures the IP domain name of the device.
Step 5	end Example: Device(config)# end	Exits global configuration and returns to privileged EXEC mode.

Generating an RSA Key Pair

Rivest, Shamir, and Adelman (RSA) key pairs are used to sign and encrypt IKE key management messages and are required before obtaining a certificate for your device.

SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **crypto key generate rsa [usage-keys]**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto key generate rsa [usage-keys] Example: Device(config)# crypto key generate rsa usage-keys	Generates an RSA key pair. <ul style="list-style-type: none"> • Use the usage-keys keyword to specify special-usage keys instead of general-purpose keys.
Step 4	end Example: Device(config)# end	Exits global configuration and returns to privileged EXEC mode.

Declaring a Certification Authority

You should declare one certification authority (CA) to be used by the device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ca trustpoint *name***
4. **enrollment url *url***
5. **enrollment command**
6. **exit**
7. **crypto pki trustpoint *name***
8. **cr1 query ldap://*url*[:*port*]**
9. **enrollment {mode ra | retry count *number* | retry period *minutes* | url *url*}**
10. **enrollment {mode ra | retry count *number* | retry period *minutes* | url *url*}**
11. **revocation-check *method1* [*method2 method3*]**
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto ca trustpoint <i>name</i> Example: Device(config)# crypto ca trustpoint ka	Declares the certification authority (CA) that your device should use and enters the CA profile enroll configuration mode.
Step 4	enrollment url <i>url</i> Example: Device(ca-profile-enroll)# enrollment url http://entrust:81	Specifies the URL of the CA server to which enrollment requests are sent.
Step 5	enrollment command Example: Device(ca-profile-enroll)# enrollment command	Specifies the HTTP command that is sent to the CA for enrollment.
Step 6	exit Example: Device(ca-profile-enroll)# exit	Exit CA profile enroll configuration mode and returns to global configuration mode.
Step 7	crypto pki trustpoint <i>name</i> Example: Device(config)# crypto pki trustpoint ka	Declares the trustpoint that your device should use and enters Ca-trustpoint configuration mode.
Step 8	crl query ldap://<i>url</i>[:<i>port</i>] Example: Device(ca-trustpoint)# crl query ldap://bar.cisco.com:3899	Queries the certificate revocation list (CRL) to ensure that the certificate of the peer is not revoked.
Step 9	enrollment {<i>mode ra</i> <i>retry count number</i> <i>retry period minutes</i> <i>url url</i>} Example: Device(ca-trustpoint)# enrollment retry period 2	Specifies the enrollment wait period between certificate request retries.
Step 10	enrollment {<i>mode ra</i> <i>retry count number</i> <i>retry period minutes</i> <i>url url</i>} Example: Device(ca-trustpoint)# enrollment retry count 8	Specifies the number of times a device will resend a certificate request when it does not receive a response from the previous request.

	Command or Action	Purpose
Step 11	revocation-check <i>method1</i> [<i>method2 method3</i>] Example: Device(ca-trustpoint)# revocation-check crl ocsp	Checks the revocation status of a certificate.
Step 12	end Example: Device(ca-trustpoint)# end	Exit CA trustpoint configuration mode and returns to privileged EXEC mode.

Configuring a Root CA (Trusted Root)

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ca trustpoint** *name*
4. **revocation-check** *method1* [*method2 method3*]
5. **root tftp** *server-hostname filename*
6. **enrollment http-proxy** *hostname port-number*
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto ca trustpoint <i>name</i> Example: Device(config)# crypto ca trustpoint ka	Declares the trustpoint that your device should use and enters CA trustpoint configuration mode.
Step 4	revocation-check <i>method1</i> [<i>method2 method3</i>] Example: Device(ca-trustpoint)# revocation-check ocsp	Checks the revocation status of a certificate.
Step 5	root tftp <i>server-hostname filename</i> Example: Device(ca-trustpoint)# root tftp server1 file1	Obtains the certification authority (CA) certificate via TFTP.

	Command or Action	Purpose
Step 6	enrollment http-proxy <i>hostname port-number</i> Example: Device(ca-trustpoint)# enrollment http-proxy host2 8080	Accesses the certification authority (CA) by HTTP through the proxy server.
Step 7	end Example: Device(ca-trustpoint)# end	Exits CA trustpoint configuration mode and returns to privileged EXEC mode.

Authenticating the CA

The device must authenticate the certification authority (CA). It does this by obtaining the self-signed certificate of the CA, which contains the public key of the CA. Because the certificate of the CA is self-signed (the CA signs its own certificate) the public key of the CA should be manually authenticated by contacting the CA administrator to compare the fingerprint of the CA certificate when you perform this step.

Perform the following task to get the public key of the CA:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki authenticatename**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto pki authenticatename Example: Device(config)# crypto pki authenticate myca	Authenticates the CA by getting the certificate of the CA.
Step 4	end Example: Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

Requesting Signed Certificates

You must obtain a signed certificate from the certification authority (CA) for each of the RSA key pairs on your device. If you generated general-purpose RSA keys, your device has only one RSA key pair and needs only one certificate. If you previously generated special-usage RSA keys, your device has two RSA key pairs and needs two certificates.

Perform the following task to request signed certificates from the CA:

Note If your device reboots after you have issued the **crypto pki enroll** command, but before you have received the certificates, you must reissue the command and notify the CA administrator.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki enroll** *number*
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto pki enroll <i>number</i> Example: Device(config)# crypto pki enroll myca	Obtains certificates for your device from the CA.
Step 4	end Example: Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

What to do next

Saving Your Configuration

Always remember to save your work when you make configuration changes.

Use the **copy system:running-config nvram:startup-config** command to save your configuration. This command includes saving RSA keys to private NVRAM. RSA keys are not saved with your configuration when you use a **copy system:running-config rpc:** or **copy system:running-config tftp:** command.

Monitoring and Maintaining Certification Authority

Requesting a Certificate Revocation List

You can request a certificate revocation list (CRL) only if the certification authority (CA) does not support a registration authority (RA). The following task applies only when the CA does not support an RA.

When a device receives a certificate from a peer, your device will download a CRL from the CA. The device then checks the CRL to make sure the certificate that the peer sent has not been revoked. (If the certificate appears on the CRL, the device will not accept the certificate and will not authenticate the peer.)

A CRL can be reused with subsequent certificates until the CRL expires if query mode is off. If the device receives a peer's certificate after the applicable CRL has expired, the device will download the new CRL.

If the device has a CRL that has not yet expired, but you suspect that the contents of the CRL are out of date, you can request that the latest CRL be downloaded immediately to replace the old CRL.

•

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki crl request *name***
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto pki crl request <i>name</i> Example: Device(config)# crypto pki crl request myca	Requests that a new certificate revocation list (CRL) be obtained immediately from the CA.
Step 4	end Example: Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

Querying a Certification Revocation List

You can query a certificate revocation list (CRL) only when you configure your device with a trusted root. When your device receives a certificate from a peer from another domain (with a different CA), the CRL downloaded from the CA of the device will not include certificate information about the peer. Therefore, you should check the CRL published by the configured root with the LDAP URL to ensure that the certificate of the peer has not been revoked.

If you would like CRL of the root certificate to be queried when the device reboots, you must enter the **cr1 query** command.

Perform the following task to query the CRL published by the configured root with the LDAP URL:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint *name***
4. **cr1 query ldap *://url* : [*port*]**
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto pki trustpoint <i>name</i> Example: Device(ca-trustpoint)# crypto pki trustpoint mytp	Declares the trustpoint that your device should use and enters CA trustpoint configuration mode.
Step 4	cr1 query ldap <i>://url</i> : [<i>port</i>] Example: Device(ca-trustpoint)# cr1 query ldap://url:[port]	Queries the CRL to ensure that the certificate of the peer has not been revoked.
Step 5	end Example: Device(ca-trustpoint)# end	Exits CA trustpoint configuration mode and returns to privileged EXEC mode.

Deleting RSA Keys from a Device

Under certain circumstances you may want to delete RSA keys from your device. For example, if you believe the RSA keys were compromised in some way and should no longer be used, you should delete the keys.

]

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto key zeroize rsa** [*key-pair-label*]
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto key zeroize rsa [<i>key-pair-label</i>] Example: Device(config)# crypto key zeroize rsa	Deletes all Rivest, Shamir, and Adelman (RSA) keys from your device.
Step 4	end Example: Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

What to do next

After you delete RSA keys from the device, you should also complete the following two additional tasks:

- Ask the CA administrator to revoke the device certificates at the CA; you must supply the challenge password that you created when you originally obtained the device certificates with the **crypto pki enroll** command.
- Manually remove the device certificates from the device configuration.

Deleting Public Keys for a Peer

Under certain circumstances you may want to delete RSA public keys of peer devices from your device configuration. For example, if you no longer trust the integrity of the public key of a peer, you should delete the key.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto key pubkey-chain rsa**

4. **no named key** *key-name* [**encryption** | **signature**]
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	crypto key pubkey-chain rsa Example: Device(config)# crypto key pubkey-chain rsa	Enters public key chain configuration mode, so that you can manually specify other devices' RSA public keys.
Step 4	no named key <i>key-name</i> [encryption signature] Example: Device(config-pubkey-c)# no named-key otherpeer.example.com	Deletes the RSA public key of a remote peer and enters public key configuration mode.
Step 5	end Example: Device(config-pubkey)# end	Exits public key configuration mode and returns to privileged EXEC mode.

Deleting Certificates from the Configuration

If the need arises, you can delete certificates that are saved in your device. Your device saves its own certificates, the certificate of the CA, and any RA certificates.

To delete the CA's certificate, you must remove the entire CA identity, which also removes all certificates associated with the CA—your router's certificate, the CA certificate, and any RA certificates.

SUMMARY STEPS

1. **enable**
2. **show crypto pki certificates**
3. **configure terminal**
4. **crypto pki certificate chain** *name*
5. **no certificate** *certificate-serial-number*
6. **exit**
7. **no crypto pki import** *name* **certificate**
8. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show crypto pki certificates Example: Device# show crypto pki certificates	Displays information about your device certificate, the certification authority (CA) certificate, and any registration authority (RA) certificates.
Step 3	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 4	crypto pki certificate chain <i>name</i> Example: Device(config)# crypto pki certificate chain myca	Enters certificate chain configuration mode.
Step 5	no certificate <i>certificate-serial-number</i> Example: Device(config-cert-chain)# no certificate 0123456789ABCDEF0123456789ABCDEF	Deletes the certificate.
Step 6	exit Example: Device(config-cert-chain)# exit	Exits certificate chain configuration mode and returns to global configuration mode.
Step 7	no crypto pki import <i>name</i> certificate Example: Device(config)# no crypto pki import MS certificate	Deletes a certificate manually.
Step 8	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.

Viewing Keys and Certificates

Perform the following task to view keys and certificates:

SUMMARY STEPS

1. enable
2. show crypto key mypubkey rsa [*keyname*]
3. show crypto key pubkey-chain rsa
4. show crypto key pubkey-chain rsa [*name key-name* | *address key-address*]

5. **show crypto pki certificates**
6. **show crypto pki trustpoints**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show crypto key mypubkey rsa [keyname] Example: Device# show crypto key mypubkey rsa [keyname]	Displays the RSA public keys configured on a device.
Step 3	show crypto key pubkey-chain rsa Example: Device# show crypto key pubkey-chain rsa	Displays the RSA public keys of the peer that are stored on a device.
Step 4	show crypto key pubkey-chain rsa [name key-name address key-address] Example: Device# show crypto key pubkey-chain rsa address 209.165.202.129	Displays the address of a specific key.
Step 5	show crypto pki certificates Example: Device# show crypto pki certificates	Displays information about the device certificate, the certification authority (CA) certificate, and any registration authority (RA) certificates
Step 6	show crypto pki trustpoints Example: Device# show crypto pki certificates	Displays trustpoints that are configured on a device.

CHAPTER 59

MAC Authentication Bypass

The MAC Authentication Bypass feature is a MAC-address-based authentication mechanism that allows clients in a network to integrate with the Cisco Identity Based Networking Services (IBNS) and Network Admission Control (NAC) strategy using the client MAC address. The MAC Authentication Bypass feature is applicable to the following network environments:

- Network environments in which a supplicant code is not available for a given client platform.
- Network environments in which the end client configuration is not under administrative control, that is, the IEEE 802.1X requests are not supported on these networks.
- [Prerequisites for Configuring MAC Authentication Bypass, on page 1201](#)
- [Information About MAC Authentication Bypass, on page 1202](#)
- [How to Configure MAC Authentication Bypass, on page 1203](#)
- [Configuration Examples for MAC Authentication Bypass, on page 1208](#)
- [Additional References for MAC Authentication Bypass, on page 1209](#)
- [Feature Information for MAC Authentication Bypass, on page 1210](#)

Prerequisites for Configuring MAC Authentication Bypass

IEEE 802.1x—Port-Based Network Access Control

You should understand the concepts of port-based network access control and have an understanding of how to configure port-based network access control on your Cisco platform.

RADIUS and ACLs

You should understand the concepts of the RADIUS protocol and have an understanding of how to create and apply access control lists (ACLs). For more information, see the documentation for your Cisco platform and the *Securing User Services Configuration Guide Library*.

The device must have a RADIUS configuration and be connected to the Cisco secure access control server (ACS). For more information, see the *User Guide for Secure ACS Appliance 3.2*.

Information About MAC Authentication Bypass

Overview of the Cisco IOS Auth Manager

The capabilities of devices connecting to a given network can be different, thus requiring that the network support different authentication methods and authorization policies. The Cisco IOS Auth Manager handles network authentication requests and enforces authorization policies regardless of authentication method. The Auth Manager maintains operational data for all port-based network connection attempts, authentications, authorizations, and disconnections and, as such, serves as a session manager.

The possible states for Auth Manager sessions are as follows:

- **Idle**—In the idle state, the authentication session has been initialized, but no methods have yet been run. This is an intermediate state.
- **Running**—A method is currently running. This is an intermediate state.
- **Authc Success**—The authentication method has run successfully. This is an intermediate state.
- **Authc Failed**—The authentication method has failed. This is an intermediate state.
- **Authz Success**—All features have been successfully applied for this session. This is a terminal state.
- **Authz Failed**—At least one feature has failed to be applied for this session. This is a terminal state.
- **No methods**—There were no results for this session. This is a terminal state.

Overview of the Configurable MAB Username and Password

A MAC Authentication Bypass (MAB) operation involves authentication using RADIUS Access-Request packets with both the username and password attributes. By default, the username and the password values are the same and contain the MAC address. The Configurable MAB Username and Password feature enables you to configure both the username and the password attributes in the following scenarios:

- To enable MAB for an existing large database that uses formatted username attributes, the username format in the client MAC needs to be configured. Use the **mab request format attribute 1** command to configure the username format.
- Some databases do not accept authentication if the username and password values are the same. In such instances, the password needs to be configured to ensure that the password is different from the username. Use the **mab request format attribute 2** command to configure the password.

The Configurable MAB Username and Password feature allows interoperability between the Cisco IOS Authentication Manager and the existing MAC databases and RADIUS servers. The password is a global password and hence is the same for all MAB authentications and interfaces. This password is also synchronized across all supervisor devices to achieve high availability.

If the password is not provided or configured, the password uses the same value as the username. The table below describes the formatting of the username and the password:

MAC Address	Username Format (Group Size, Separator)	Username	Password Configured	Password Created
08002b8619de	(1, :) (1, -) (1, .)	0:8:0:0:2:b:8:6:1:9:d:e 0-8-0-0-2-b-8-6-1-9-d-e 0.8.0.0.2.b.8.6.1.9.d.e	None	0:8:0:0:2:b:8:6:1:9:d:e 0-8-0-0-2-b-8-6-1-9-d-e 0.8.0.0.2.b.8.6.1.9.d.e

How to Configure MAC Authentication Bypass

Enabling MAC Authentication Bypass

Perform this task to enable the MAC Authentication Bypass feature on an 802.1X port.

SUMMARY STEPS

1. enable
2. configure terminal

3. `interface type slot / port`
4. `mab`
5. `end`
6. `show authentication sessions interface type slot / port details`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface type slot / port Example: Device(config)# interface GigabitEthernet 1/2/1	Enters interface configuration mode.
Step 4	mab Example: Device(config-if)# mab	Enables MAB.
Step 5	end Example: Device(config-if)# end	Returns to privileged EXEC mode.
Step 6	show authentication sessions interface type slot / port details Example: Device# show authentication session interface GigabitEthernet 1/2/1 details	Displays the interface configuration and the authenticator instances on the interface.

Enabling Reauthentication on a Port

By default, ports are not automatically reauthenticated. You can enable automatic reauthentication and specify how often reauthentication attempts are made.

SUMMARY STEPS

1. `enable`

2. **configure terminal**
3. **interface** *type slot / port*
4. **switchport**
5. **switchport mode access**
6. **authentication port-control auto**
7. **mab [eap]**
8. **authentication periodic**
9. **authentication timer reauthenticate** *{seconds | server}*
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>type slot / port</i> Example: Device(config)# interface GigabitEthernet 1/2/1	Enters interface configuration mode.
Step 4	switchport Example: Device(config-if)# switchport	Places interface in Layer 2 switched mode.
Step 5	switchport mode access Example: Device(config-if)# switchport mode access	Sets the interface type as a nontrunking, nontagged single VLAN Layer 2 interface.
Step 6	authentication port-control auto Example: Device(config-if)# authentication port-control auto	Configures the authorization state of the port.
Step 7	mab [eap] Example: Device(config-if)# mab	Enables MAB.

	Command or Action	Purpose
Step 8	authentication periodic Example: Device(config-if)# authentication periodic	Enables reauthentication.
Step 9	authentication timer reauthenticate {seconds server} Example: Device(config-if)# authentication timer reauthenticate 900	Configures the time, in seconds, between reauthentication attempts.
Step 10	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Specifying the Security Violation Mode

When there is a security violation on a port, the port can be shut down or traffic can be restricted. By default, the port is shut down. You can configure the period of time for which the port is shut down.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot / port*
4. **switchport**
5. **switchport mode access**
6. **authentication port-control auto**
7. **mab [eap]**
8. **authentication violation {restrict | shutdown}**
9. **authentication timer restart** *seconds*
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	interface <i>type slot / port</i> Example: Device(config)# interface GigabitEthernet 1/2/1	Enters interface configuration mode.
Step 4	switchport Example: Device(config-if)# switchport	Places interface in Layer 2 switched mode.
Step 5	switchport mode access Example: Device(config-if)# switchport mode access	Sets the interface type as a nontrunking, nontagged single VLAN Layer 2 interface.
Step 6	authentication port-control auto Example: Device(config-if)# authentication port-control auto	Configures the authorization state of the port.
Step 7	mab [eap] Example: Device(config-if)# mab	Enables MAB.
Step 8	authentication violation {restrict shutdown} Example: Device(config-if)# authentication violation shutdown	Configures the action to be taken when a security violation occurs on the port.
Step 9	authentication timer restart <i>seconds</i> Example: Device(config-if)# authentication timer restart 30	Configures the period of time, in seconds, after which an attempt is made to authenticate an unauthorized port.
Step 10	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Enabling Configurable MAB Username and Password

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `mab request format attribute 1 groupsize {1 | 2 | 4 | 12} separator {- | : | .} [lowercase | uppercase]`
4. `mab request format attribute 2 [0 | 7] password`
5. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mab request format attribute 1 groupsize {1 2 4 12} separator {- : .} [lowercase uppercase] Example: Device(config)# mab request format attribute 1 groupsize 2 separator :	Configures the username format for MAB requests.
Step 4	mab request format attribute 2 [0 7] password Example: Device(config)# mab request format attribute 2 password1	Configures a global password for all MAB requests.
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.

Configuration Examples for MAC Authentication Bypass

Example: MAC Authentication Bypass Configuration

In the following example, the **mab** command has been configured to enable the MAC Authorization Bypass (MAB) feature on the specified interface. The optional **show authentication sessions** command has been enabled to display the interface configuration and the authentication instances on the interface.

```

Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet2/1
Device(config-if)# mab
Device(config-if)# end
Device# show authentication sessions interface GigabitEthernet2/1 details

```

Example: Enabling Configurable MAB Username and Password

The following example shows how to configure the username format and password for MAC Authentication Bypass (MAB). In this example, the username format is configured as a group of 12 hexadecimal digits with no separator and the global password as **password1**.

```

Device> enable
Device# configure terminal
Device(config)# mab request format attribute 1 groupsize 2 separator :
Device(config)# mab request format attribute 2 password1
Device(config)# end

```

Feature Information for MAC Authentication Bypass

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 125: Feature Information for MAC Authentication Bypass

Feature Name	Releases	Feature Information
MAC Authentication Bypass (MAB)	Cisco IOS XE 3.2SE Cisco IOS XE 3.3SE Cisco IOS XE 3.5E Cisco IOS 15.2(1)E	The MAC Authentication Bypass feature is a MAC-address-based authentication mechanism that allows clients in a network to integrate with the Cisco IBNS and NAC strategy using the client MAC address. The following commands were introduced or modified: dot1x mac-auth-bypass , show dot1x interface .
Configurable MAB Username and Password	Cisco IOS 15.2(1)E	The Configurable MAB Username and Password feature enables you to configure MAC Authentication Bypass (MAB) username format and password to allow interoperability between the Cisco IOS Authentication Manager and existing MAC databases and RADIUS servers. The following commands were introduced or modified: mab request format attribute 1 , mab request format attribute 2 .

CHAPTER 60

Password Strength and Management for Common Criteria

The Password Strength and Management for Common Criteria feature is used to specify password policies and security mechanisms for storing, retrieving, and providing rules to specify user passwords.

For local users, the user profile and the password information with the key parameters are stored on the Cisco device, and this profile is used for local authentication of users. The user can be an administrator (terminal access) or a network user (for example, PPP users being authenticated for network access).

For remote users, where the user profile information is stored in a remote server, a third-party authentication, authorization, and accounting (AAA) server may be used for providing AAA services, both for administrative and network access.

- [Configuration Examples for Password Strength and Management for Common Criteria, on page 1216](#)
- [Additional References for Password Strength and Management for Common Criteria, on page 1217](#)
- [Feature Information for Password Strength and Management for Common Criteria, on page 1217](#)

Restrictions for Password Strength and Management for Common Criteria

Only four concurrent users can log on to the system by using vty at any moment.

Information About Password Strength and Management for Common Criteria

Password Composition Policy

The password composition policy allows you to create passwords of any combination of upper and lowercase characters, numbers, and special characters that include “!”, “@”, “#”, “\$”, “%”, “^”, “&”, “*”, “(”, and “)”.

Password Length Policy

The administrator has the flexibility to set the password's minimum and maximum length. The recommended minimum password length is 8 characters. The administrator can specify both the minimum (1) and the maximum (64) length for the password.

Password Lifetime Policy

The security administrator can provide a configurable option for a password to have a maximum lifetime. If the lifetime parameter is not configured, the configured password will never expire. The maximum lifetime can be configured by providing the configurable value in years, months, days, hours, minutes, and seconds. The lifetime configuration will survive across reloads as it is a part of the configuration, but every time the system reboots, the password creation time will be updated to the new time. For example, if a password is configured with a lifetime of one month and on the 29th day, the system reboots, then the password will be valid for one month after the system reboots.

Password Expiry Policy

If the user attempts to log on and if the user's password credentials have expired, then the following happens:

1. The user is prompted to set the new password after successfully entering the expired password.
2. When the user enters the new password, the password is validated against the password security policy.
3. If the new password matches the password security policy, then the AAA database is updated, and the user is authenticated with the new password.
4. If the new password does not match the password security policy, then the user is prompted again for the password. From AAA perspective, there is no restriction on the number of retries. The number of retries for password prompt in case of unsuccessful authentication is controlled by the respective terminal access interactive module. For example, for telnet, after three unsuccessful attempts, the session will be terminated.

If the password's lifetime is not configured for a user and the user has already logged on and if the security administrator configures the lifetime for that user, then the lifetime will be set in the database. When the same user is authenticated the next time, the system will check for password expiry. The password expiry is checked only during the authentication phase.

If the user has been already authenticated and logged on to the system and if the password expires, then no action will be taken. The user will be prompted to change the password only during the next authentication for the same user.

Password Change Policy

The new password must contain a minimum of 4 character changes from the previous password. A password change can be triggered by the following scenarios:

- The security administrator wants to change the password.
- The user is trying to get authenticated using a profile, and the password for that profile has expired.

When the security administrator changes the password security policy and the existing profile does not meet the password security policy rules, no action will be taken if the user has already logged on to the system.

The user will be prompted to change the password only when the user tries to get authenticated using the profile that does not meet the password security restriction.

When the user changes the password, the lifetime parameters set by the security administrator for the old profile will be the lifetime parameters for the new password.

For noninteractive clients such as dot1x, when the password expires, appropriate error messages will be sent to the clients, and the clients must contact the security administrator to renew the password.

User Reauthentication Policy

Users are reauthenticated when they change their passwords.

When users change their passwords on expiry, they will be authenticated against the new password. In such cases, the actual authentication happens based on the previous credentials, and the new password is updated in the database.

Note Users can change their passwords only when they are logging on and after the expiry of the old password; however, a security administrator can change the user's password at any time.

Support for Framed (Noninteractive) Session

When a client such as dot1x uses the local database for authentication, the Password Strength and Management for Common Criteria feature will be applicable; however, upon password expiry, clients will not be able to change the password. An appropriate failure message will be sent to such clients, and the user must request the security administrator to change the password.

How to Configure Password Strength and Management for Common Criteria

Configuring the Password Security Policy

Perform this task to create a password security policy and to apply the policy to a specific user profile.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa common-criteria policy *policy-name***
5. **char-changes *number***
6. **max-length *number***
7. **min-length *number***
8. **numeric-count *number***
9. **special-case *number***

10. `exit`
11. `username username common-criteria-policy policy-name password password`
12. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Device(config)# aaa new-model	Enables AAA globally.
Step 4	aaa common-criteria policy <i>policy-name</i> Example: Device(config)# aaa common-criteria policy <i>policyl</i>	Creates the AAA security password policy and enters common criteria configuration policy mode.
Step 5	char-changes <i>number</i> Example: Device(config-cc-policy)# char-changes 4	(Optional) Specifies the number of changed characters between old and new passwords.
Step 6	max-length <i>number</i> Example: Device(config-cc-policy)# max-length 25	(Optional) Specifies the maximum length of the password.
Step 7	min-length <i>number</i> Example: Device(config-cc-policy)# min-length 8	(Optional) Specifies the minimum length of the password.
Step 8	numeric-count <i>number</i> Example: Device(config-cc-policy)# numeric-count 4	(Optional) Specifies the number of numeric characters in the password.

	Command or Action	Purpose
Step 9	special-case <i>number</i> Example: Device(config-cc-policy)# special-case 3	(Optional) Specifies the number of special characters in the password.
Step 10	exit Example: Device(config-cc-policy)# exit	(Optional) Exits common criteria configuration policy mode and returns to global configuration mode.
Step 11	username <i>username</i> common-criteria-policy <i>policy-name</i> password <i>password</i> Example: Device(config)# username user1 common-criteria-policy policy1 password password1	(Optional) Applies a specific policy and password to a user profile.
Step 12	end Example: Device(config)# end	Returns to privileged EXEC mode.

Verifying the Common Criteria Policy

Perform this task to verify all the common criteria security policies.

SUMMARY STEPS

1. **enable**
2. **show aaa common-criteria policy name** *policy-name*
3. **show aaa common-criteria policy all**

DETAILED STEPS

Step 1

enable

Enables privileged EXEC mode.

Example:

```
Device> enable
```

Step 2

show aaa common-criteria policy name *policy-name*

Displays the password security policy information for a specific policy.

Example:

```
Device# show aaa common-criteria policy name policy1

Policy name: policy1
Minimum length: 1
Maximum length: 64
Upper Count: 20
Lower Count: 20
Numeric Count: 5
Special Count: 2
Number of character changes 4
Valid forever. User tied to this policy will not expire.
```

Step 3 show aaa common-criteria policy all

Displays password security policy information for all the configured policies.

Example:

```
Device# show aaa common-criteria policy all
=====
Policy name: policy1
Minimum length: 1
Maximum length: 64
Upper Count: 20
Lower Count: 20
Numeric Count: 5
Special Count: 2
Number of character changes 4
Valid forever. User tied to this policy will not expire.
=====
Policy name: policy2
Minimum length: 1
Maximum length: 34
Upper Count: 10
Lower Count: 5
Numeric Count: 4
Special Count: 2
Number of character changes 2
Valid forever. User tied to this policy will not expire.
=====
```

Configuration Examples for Password Strength and Management for Common Criteria

Example: Password Strength and Management for Common Criteria

The following example shows how to create a common criteria security policy and apply the specific policy to a user profile:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa common-criteria policy policy1
Device(config-cc-policy)# char-changes 4
Device(config-cc-policy)# max-length 20
```

```

Device(config-cc-policy)# min-length 6
Device(config-cc-policy)# numeric-count 2
Device(config-cc-policy)# special-case 2
Device(config-cc-policy)# exit
Device(config)# username user1 common-criteria-policy policy1 password password1
Device(config)# end

```

- [Feature Information for AAA-SERVER-MIB Set Operation, on page 1223](#)

Prerequisites for AAA-SERVER-MIB Set Operation

AAA must have been enabled on the router, that is, the **aaa new-model** command must have been configured. If this configuration has not been accomplished, the set operation fails.

Restrictions for AAA-SERVER-MIB Set Operation

Currently, the CISCO SNMP set operation is supported only for the RADIUS protocol. Therefore, only RADIUS servers in global configuration mode can be added, modified, or deleted.

Information About AAA-SERVER-MIB Set Operation

CISCO-AAA-SERVER-MIB

The CISCO-AAA-SERVER-MIB provides that statistics reflect both the state of the AAA server operation with the server itself and of AAA communications with external servers. The CISCO-AAA-SERVER-MIB provides the following information:

- Statistics for each AAA operation

- Status of servers that are providing AAA functions
- Identities of external AAA servers

CISCO-AAA-SERVER-MIB Set Operation

With the SET operation, you can do the following:

- Create or add a new AAA server.
- Modify the KEY under the CISCO-AAA-SERVER-MIB. This “secret key” is used for secure connectivity to the AAA server, which is present with the network access server (NAS) and the AAA server.
- Delete the AAA server configuration.

How to Configure AAA-SERVER-MIB Set Operation

Configuring AAA-SERVER-MIB Set Operations

No special configuration is required for this feature. The Simple Network Management Protocol (SNMP) framework can be used to manage MIBs. See the Additional References section for a reference to configuring SNMP.

Verifying SNMP Values

SNMP values can be verified by performing the following steps.

SUMMARY STEPS

1. **enable**
2. **show running-config | include radius-server host**
3. **show aaa servers**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show running-config include radius-server host Example: Device# show running-config include radius-server host	Displays all the RADIUS servers that are configured in the global configuration mode.

	Command or Action	Purpose
Step 3	show aaa servers Example: Device# show aaa servers	Displays information about the number of requests sent to and received from authentication, authorization, and accounting (AAA) servers.

Configuration Examples for AAA-SERVER-MIB Set Operation

RADIUS Server Configuration and Server Statistics Example

The following sample output shows the RADIUS server configuration and server statistics before and after the set operation.

Before the Set Operation

```
Device# show running-config | include radius-server host

! The following line is for server 1.
radius-server host 172.19.192.238 auth-port 2095 acct-port 2096 key cisco2
! The following line is for server 2.
radius-server host 172.19.192.238 auth-port 1645 acct-port 1646
```

Server Statistics

```
Device# show aaa servers

RADIUS: id 2, priority 1, host 172.19.192.238, auth-port 2095, acct-port 2096
State: current UP, duration 25s, previous duration 0s
  Dead: total time 0s, count 7
Authen: request 8, timeouts 8
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 2
Author: request 0, timeouts 0
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
Account: request 0, timeouts 0
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
Elapsed time since counters last cleared: 5m
RADIUS: id 3, priority 2, host 172.19.192.238, auth-port 1645, acct-port 1646
State: current UP, duration 5s, previous duration 0s
  Dead: total time 0s, count 2
Authen: request 8, timeouts 8
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 4
Author: request 0, timeouts 0
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
Account: request 0, timeouts 0
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
Elapsed time since counters last cleared: 3m
```

SNMP Get Operation to Check the Configuration and Statistics of the RADIUS Servers

```

aaa-server5:/users/smetri> getmany 10.0.1.42 casConfigTable
casAddress.2.2 = 172.19.192.238
casAddress.2.3 = 172.19.192.238
casAuthenPort.2.2 = 2095
casAuthenPort.2.3 = 1645
casAcctPort.2.2 = 2096
casAcctPort.2.3 = 1646
casKey.2.2 =
casKey.2.3 =
! The following line shows priority for server 1.
casPriority.2.2 = 1
! The following line shows priority for server 2.
casPriority.2.3 = 2
casConfigRowStatus.2.2 = active(1)
casConfigRowStatus.2.3 = active(1)
aaa-server5:/users/smetri>

```

SNMP Set Operation

The key of the existing RADIUS server is being changed. The index “1” is being used. That index acts as a wildcard for addition, deletion, or modification of any entries.

```

Change the key for server 1:=>
aaa-server5:/users/smetri> setany -v2c 10.0.1.42 public casAddress.2.1 -a 172.19.192.238
casAuthenPort.2.1 -i 2095 casAcctPort.2.1 -i 2096 casKey.2.1 -o king
casAddress.2.1 = 172.19.192.238
casAuthenPort.2.1 = 2095
casAcctPort.2.1 = 2096
casKey.2.1 = king
aaa-server5:/users/smetri>

```

After the Set Operation

After the above SNMP set operation, the configurations on the device change. The following output shows the output after the set operation.

```

Device# show running-config | include radius-server host

radius-server host 172.19.192.238 auth-port 1645 acct-port 1646
! The following line shows a change in the key value to "king."
radius-server host 172.19.192.238 auth-port 2095 acct-port 2096 key king

Device# show aaa servers

RADIUS: id 3, priority 1, host 172.19.192.238, auth-port 1645, acct-port 1646
State: current UP, duration 189s, previous duration 0s
  Dead: total time 0s, count 2
Authen: request 8, timeouts 8
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 4
Author: request 0, timeouts 0
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
Account: request 0, timeouts 0
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
Elapsed time since counters last cleared: 6m

```

```

! The following line shows a new server with new statistics.
RADIUS: id 4, priority 2, host 172.19.192.238, auth-port 2095, acct-port 2096
State: current UP, duration 209s, previous duration 0s
    Dead: total time 0s, count 7
Authen: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
Author: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
Account: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms

```

Additional References for AAA-SERVER-MIB Set Operation

The following sections provide references related to the AAA-SERVER-MIB Set Operation feature.

Technical Assistance

Description	Link
<p>The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies.</p> <p>To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds.</p> <p>Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.</p>	<p>http://www.cisco.com/cisco/web/support/index.html</p>

Feature Information for AAA-SERVER-MIB Set Operation

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 127: Feature Information for AAA-SERVER-MIB Set Operation

Feature Name	Releases	Feature Information
AAA-SERVER-MIB Set Operation	Cisco IOS 15.2(1)E	<p>The AAA-SERVER-MIB Set Operation feature allows the authentication, authorization, and accounting (AAA) server configuration to be extended or expanded by using the CISCO-AAA-SERVER-MIB to create and add new AAA servers, modify the “KEY” under the CISCO-AAA-SERVER-MIB, and delete the AAA server configuration.</p> <p>The following commands were introduced or modified: show aaa servers, show running-config, show running-config vrf.</p>

CHAPTER 62

Configuring Secure Shell

The Secure Shell (SSH) feature is an application and a protocol that provides a secure replacement to the Berkeley r-tools. The protocol secures sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. Two versions of SSH are available: SSH Version 1 and SSH Version 2.

- [Prerequisites for Configuring Secure Shell, on page 1225](#)
- [Restrictions for Configuring Secure Shell, on page 1226](#)
- [Information About Configuring Secure Shell , on page 1226](#)
- [How to Configure Secure Shell, on page 1229](#)
- [Configuration Examples for Secure Shell, on page 1240](#)
- [Additional References for Secure Shell, on page 1242](#)
- [Feature Information for Configuring Secure Shell, on page 1242](#)

Prerequisites for Configuring Secure Shell

The following are the prerequisites for configuring the switch for secure shell (SSH):

- For SSH to work, the switch needs an Rivest, Shamir, and Adleman (RSA) public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.
- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.
- SCP relies on SSH for security.
- SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.
- A user must have appropriate authorization to use SCP.
- A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the **copy** command. An authorized administrator can also do this from a workstation.
- The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.)

- Configure a hostname and host domain for your device by using the **hostname** and **ip domain-name** commands in global configuration mode.

Restrictions for Configuring Secure Shell

The following are restrictions for configuring the Device for secure shell.

- The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
- SSH supports only the execution-shell application.
- The SSH server and the SSH client are supported only on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
- The Device supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.
- When using SCP, you cannot enter the password into the **copy** command. You must enter the password when prompted.
- The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.
- The **-l** keyword and **userid** : {number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.

Information About Configuring Secure Shell

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH and Switch Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

SSH Servers, Integrated Clients, and Supported Versions

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH server and SSH integrated client are applications that run on the switch. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

Note The SSH client functionality is available only when the SSH server is enabled.

User authentication is performed like that in the Telnet session to the device. SSH also supports the following user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

RSA Authentication Support

Rivest, Shamir, and Adleman (RSA) authentication available in Secure Shell (SSH) clients is not supported on the SSH server for Cisco software by default.

SSL Configuration Guidelines

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the active switch.

Secure Copy Protocol Overview

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

Note When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

Secure Copy Protocol

Isn't Secure Copy Protocol related closely enough to SSH that it could be used in this book? I have moved all of the item in this topic to prerequisites or restrictions.

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying device configurations or switch image files. The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the device can determine whether the user has the correct privilege level. To configure the Secure Copy feature, you should understand the SCP concepts.

How Secure Copy Works

The behavior of Secure Copy (SCP) is similar to that of remote copy (RCP), which comes from the Berkeley r-tools suite (Berkeley university's own set of networking applications), except that SCP relies on Secure Shell (SSH) for security. In addition, SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so that the device can determine whether the user has the correct privilege level.

SCP allows a user only with a privilege level of 15 to copy any file that exists in the Cisco IOS File System (IFS) to and from a device by using the **copy** command. An authorized administrator may also perform this action from a workstation.

Note Enable the SCP option while using the pscp.exe file with the Cisco software.

Reverse Telnet

Reverse telnet allows you to telnet to a certain port range and connect to terminal or auxiliary lines. Reverse telnet has often been used to connect a Cisco device that has many terminal lines to the consoles of other Cisco devices. Telnet makes it easy to reach the device console from anywhere simply by telnet to the terminal server on a specific line. This telnet approach can be used to configure a device even if all network connectivity to that device is disconnected. Reverse telnet also allows modems that are attached to Cisco devices to be used for dial-out (usually with a rotary device).

Reverse SSH

Reverse telnet can be accomplished using SSH. Unlike reverse telnet, SSH provides for secure connections. The Reverse SSH Enhancements feature provides you with a simplified method of configuring SSH. Using this feature, you no longer have to configure a separate line for every terminal or auxiliary line on which you want to enable SSH. The previous method of configuring reverse SSH limited the number of ports that can be accessed to 100. The Reverse SSH Enhancements feature removes the port number limitation.

How to Configure Secure Shell

Setting Up the Device to Run SSH

Follow these steps to set up your Device to run SSH:

Before you begin

Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `hostname hostname`
4. `ip domain-name domain_name`
5. `crypto key generate rsa`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	hostname hostname Example: Device(config)# <code>hostname your_hostname</code>	Configures a hostname and IP domain name for your Device. Note Follow this procedure only if you are configuring the Device as an SSH server.
Step 4	ip domain-name domain_name Example:	Configures a host domain for your Device.

	Command or Action	Purpose
	Device(config)# <code>ip domain-name your_domain</code>	
Step 5	crypto key generate rsa Example: Device(config)# <code>crypto key generate rsa</code>	Enables the SSH server for local and remote authentication on the Device and generates an RSA key pair. Generating an RSA key pair for the Device automatically enables SSH. We recommend that a minimum modulus size of 1024 bits. When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use. Note Follow this procedure only if you are configuring the Device as an SSH server.
Step 6	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 7	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 8	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring the SSH Server

Follow these steps to configure the SSH server:

Note This procedure is only required if you are configuring the Device as an SSH server.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip ssh version [1 | 2]`
4. `ip ssh {time-out seconds | authentication-retries number}`

5. Use one or both of the following:
 - `line vtyline_number[ending_line_number]`
 - `transport input ssh`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	ip ssh version [1 2] Example: Device(config)# <code>ip ssh version 1</code>	(Optional) Configures the Device to run SSH Version 1 or SSH Version 2. <ul style="list-style-type: none"> • 1—Configure the Device to run SSH Version 1. • 2—Configure the Device to run SSH Version 2. If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.
Step 4	ip ssh {time-out seconds authentication-retries number} Example: Device(config)# <code>ip ssh time-out 90</code> OR Device(config)# <code>ip ssh authentication-retries 2</code>	Configures the SSH control parameters: <ul style="list-style-type: none"> • time-out seconds: Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After the connection is established, the Device uses the default time-out values of the CLI-based sessions. By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • authentication-retries <i>number</i>: Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5. <p>Repeat this step when configuring both parameters.</p>
Step 5	<p>Use one or both of the following:</p> <ul style="list-style-type: none"> • <code>line vtyline_number[ending_line_number]</code> • transport input ssh <p>Example:</p> <pre>Device(config)# line vty 1 10</pre> <p>or</p> <pre>Device(config-line)# transport input ssh</pre>	<p>(Optional) Configures the virtual terminal line settings.</p> <ul style="list-style-type: none"> • Enters line configuration mode to configure the virtual terminal line settings. For <i>line_number</i> and <i>ending_line_number</i>, specify a pair of lines. The range is 0 to 15. • Specifies that the Device prevent non-SSH Telnet connections. This limits the router to only SSH connections.
Step 6	<p>end</p> <p>Example:</p> <pre>Device(config-line)# end</pre>	Returns to privileged EXEC mode.
Step 7	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 8	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Invoking an SSH Client

Perform this task to invoke the Secure Shell (SSH) client. The SSH client runs in user EXEC mode and has no specific configuration tasks.

SUMMARY STEPS

1. **enable**
2. **ssh -l** *username* **-vrf** *vrf-name* *ip-address*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	ssh -l <i>username</i> -vrf <i>vrf-name</i> <i>ip-address</i> Example: Device# ssh -l user1 -vrf vrf1 192.0.2.1	Invokes the SSH client to connect to an IP host or address in the specified virtual routing and forwarding (VRF) instance.

Troubleshooting Tips

- If your Secure Shell (SSH) configuration commands are rejected as illegal commands, you have not successfully generated an Rivest, Shamir, and Adleman (RSA) key pair for your device. Make sure that you have specified a hostname and domain. Then use the **crypto key generate rsa** command to generate an RSA key pair and enable the SSH server.
- When configuring the RSA key pair, you might encounter the following error messages:
 - No hostname specified.
You must configure a hostname for the device using the **hostname** global configuration command.
 - No domain specified.
You must configure a host domain for the device using the **ip domain-name** global configuration command.
- The number of allowable SSH connections is limited to the maximum number of vtys configured for the device. Each SSH connection uses a vty resource.
- SSH uses either local security or the security protocol that is configured through AAA on your device for user authentication. When configuring Authentication, Authorization, and Accounting (AAA), you must ensure that AAA is disabled on the console for user authentication. AAA authorization is disabled on the console by default. If AAA authorization is enabled on the console, disable it by configuring the **no aaa authorization console** command during the AAA configuration stage.

Configuring Reverse SSH for Console Access

To configure reverse SSH console access on the SSH server, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line *line-number* *ending-line-number***
4. **no exec**

5. **login authentication** *listname*
6. **transport input ssh**
7. **exit**
8. **exit**
9. **ssh -l** *userid* : {*number*} {*ip-address*}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	line <i>line-number</i> <i>ending-line-number</i> Example: Device# line 1 3	Identifies a line for configuration and enters line configuration mode.
Step 4	no exec Example: Device(config-line)# no exec	Disables EXEC processing on a line.
Step 5	login authentication <i>listname</i> Example: Device(config-line)# login authentication default	Defines a login authentication mechanism for the lines. Note The authentication method must use a username and password.
Step 6	transport input ssh Example: Device(config-line)# transport input ssh	Defines which protocols to use to connect to a specific line of the device. <ul style="list-style-type: none"> • The ssh keyword must be used for the Reverse SSH Enhancements feature.
Step 7	exit Example: Device(config-line)# exit	Exits line configuration mode.
Step 8	exit Example:	Exits global configuration mode.

	Command or Action	Purpose
	Device(config)# exit	
Step 9	ssh -l <i>userid</i> : {<i>number</i>} {<i>ip-address</i>} Example: Device# ssh -l lab:1 router.example.com	Specifies the user ID to use when logging in on the remote networking device that is running the SSH server. <ul style="list-style-type: none"> • <i>userid</i> --User ID. • : --Signifies that a port number and terminal IP address will follow the <i>userid</i> argument. • <i>number</i> --Terminal or auxiliary line number. • <i>ip-address</i> --Terminal server IP address. Note The <i>userid</i> argument and :rotary { <i>number</i> }{ <i>ip-address</i> } delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.

Configuring Reverse SSH for Modem Access

In this configuration, reverse SSH is being configured on a modem used for dial-out lines. To get any of the dial-out modems, you can use any SSH client and start a SSH session as shown (in Step 10) to get to the next available modem from the rotary device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line *line-number* *ending-line-number***
4. **no exec**
5. **login authentication *listname***
6. **rotary *group***
7. **transport input ssh**
8. **exit**
9. **exit**
10. **ssh -l *userid* :rotary {*number*} {*ip-address*}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	line line-number ending-line-number Example: Device# line 1 200	Identifies a line for configuration and enters line configuration mode.
Step 4	no exec Example: Device(config-line)# no exec	Disables EXEC processing on a line.
Step 5	login authentication listname Example: Device(config-line)# login authentication default	Defines a login authentication mechanism for the lines. Note The authentication method must use a username and password.
Step 6	rotary group Example: Device(config-line)# rotary 1	Defines a group of lines consisting of one or more virtual terminal lines or one auxiliary port line.
Step 7	transport input ssh Example: Device(config-line)# transport input ssh	Defines which protocols to use to connect to a specific line of the device. <ul style="list-style-type: none">• The ssh keyword must be used for the Reverse SSH Enhancements feature.
Step 8	exit Example: Device(config-line)# exit	Exits line configuration mode.
Step 9	exit Example: Device(config)# exit	Exits global configuration mode.
Step 10	ssh -l userid :rotary {number} {ip-address} Example: Device# ssh -l lab:rotary1 router.example.com	Specifies the user ID to use when logging in on the remote networking device that is running the SSH server. <ul style="list-style-type: none">• <i>userid</i> --User ID.• : --Signifies that a port number and terminal IP address will follow the <i>userid</i> argument.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • <i>number</i> --Terminal or auxiliary line number. • <i>ip-address</i> --Terminal server IP address. <p>Note The <i>userid</i> argument and :rotary{<i>number</i>} {<i>ip-address</i>} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.</p>

Troubleshooting Reverse SSH on the Client

To troubleshoot the reverse SSH configuration on the client (remote device), perform the following steps.

SUMMARY STEPS

1. `enable`
2. `debug ip ssh client`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	debug ip ssh client Example: <pre>Device# debug ip ssh client</pre>	Displays debugging messages for the SSH client.

Troubleshooting Reverse SSH on the Server

To troubleshoot the reverse SSH configuration on the terminal server, perform the following steps. The steps may be configured in any order or independent of one another.

SUMMARY STEPS

1. `enable`
2. `debug ip ssh`
3. `show ssh`
4. `show line`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	debug ip ssh Example: Device# debug ip ssh	Displays debugging messages for the SSH server.
Step 3	show ssh Example: Device# show ssh	Displays the status of the SSH server connections.
Step 4	show line Example: Device# show line	Displays parameters of a terminal line.

Monitoring the SSH Configuration and Status

This table displays the SSH server configuration and status.

Table 128: Commands for Displaying the SSH Server Configuration and Status

Command	Purpose
show ip ssh	Shows the version and configuration information for the SSH server.
show ssh	Shows the status of the SSH server.

Configuring Secure Copy

To configure a Cisco device for Secure Copy (SCP) server-side functionality, perform the following steps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login** {default | list-name} method1 [method2...]
5. **aaa authorization** {network | exec | commands level | reverse-access | configuration} {default | list-name} [method1 [method2...]]

6. **username** *name* [**privilege level**] **password** *encryption-type encrypted-password*
7. **ip scp server enable**
8. **exit**
9. **show running-config**
10. **debug ip scp**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	aaa new-model Example: Device(config)# aaa new-model	Sets AAA authentication at login.
Step 4	aaa authentication login { default <i>list-name</i> } <i>method1</i> [<i>method2...</i>] Example: Device(config)# aaa authentication login default group tacacs+	Enables the AAA access control system.
Step 5	aaa authorization { network exec commands level reverse-access configuration } { default <i>list-name</i> } [<i>method1</i> [<i>method2...</i>]] Example: Device(config)# aaa authorization exec default group tacacs+	Sets parameters that restrict user access to a network. Note The exec keyword runs authorization to determine if the user is allowed to run an EXEC shell; therefore, you must use the exec keyword when you configure SCP.
Step 6	username <i>name</i> [privilege level] password <i>encryption-type encrypted-password</i> Example: Device(config)# username superuser privilege 2 password 0 superpassword	Establishes a username-based authentication system. Note You may omit this step if a network-based authentication mechanism, such as TACACS+ or RADIUS, has been configured.
Step 7	ip scp server enable Example:	Enables SCP server-side functionality.

	Command or Action	Purpose
	Device(config)# ip scp server enable	
Step 8	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.
Step 9	show running-config Example: Device# show running-config	(Optional) Displays the SCP server-side functionality.
Step 10	debug ip scp Example: Device# debug ip scp	(Optional) Troubleshoots SCP authentication problems.

Configuration Examples for Secure Shell

Example: Secure Copy Configuration Using Local Authentication

The following example shows how to configure the server-side functionality of Secure Copy (SCP). This example uses a locally defined username and password.

```
! AAA authentication and authorization must be configured properly in order for SCP to work.
aaa new-model
aaa authentication login default local
aaa authorization exec default local
username user1 privilege 15 password 0 lab
! SSH must be configured and functioning properly.
ip scp server enable
```

Example: SCP Server-Side Configuration Using Network-Based Authentication

The following example shows how to configure the server-side functionality of SCP using a network-based authentication mechanism:

```
! AAA authentication and authorization must be configured properly for SCP to work.
aaa new-model
aaa authentication login default group tacacs+
aaa authorization exec default group tacacs+
! SSH must be configured and functioning properly.
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable
```

Example Reverse SSH Console Access

The following configuration example shows that reverse SSH has been configured for console access for terminal lines 1 through 3:

Terminal Server Configuration

```
line 1 3
  no exec
  login authentication default
  transport input ssh
```

Client Configuration

The following commands configured on the SSH client will form the reverse SSH session with lines 1, 2, and 3, respectively:

```
ssh -l lab:1 router.example.com
ssh -l lab:2 router.example.com
ssh -l lab:3 router.example.com
```

Example Reverse SSH Modem Access

The following configuration example shows that dial-out lines 1 through 200 have been grouped under rotary group 1 for modem access:

```
line 1 200
  no exec
  login authentication default
  rotary 1
  transport input ssh
  exit
```

The following command shows that reverse SSH will connect to the first free line in the rotary group:

```
ssh -l lab:rotary1 router.example.com
```

Example: Monitoring the SSH Configuration and Status

To verify that the Secure Shell (SSH) server is enabled and to display the version and configuration data for your SSH connection, use the **show ip ssh** command. The following example shows that SSH is enabled:

```
Device# show ip ssh

SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
```

The following example shows that SSH is disabled:

```
Device# show ip ssh

%SSH has not been enabled
```

To verify the status of your SSH server connections, use the **show ssh** command. The following example shows the SSH server connections on the device when SSH is enabled:

```
Device# show ssh

Connection      Version      Encryption State Username
0 1.5 3DES Session Started guest
```

The following example shows that SSH is disabled:

```
Device# show ssh

%No SSH server connections running.
```

Feature Information for Configuring Secure Shell

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.
Cisco IOS Release 15.2(5)E	Note Starting with Cisco IOS Release 15.2(5)E, Secure Shell Version 1 (SSHv1) is deprecated.

Release	Feature Information
Cisco IOS 15.2(1)E	<p>The Reverse SSH Enhancements feature, which is supported for SSH Version 1 and 2, provides an alternative way to configure reverse Secure Shell (SSH) so that separate lines do not need to be configured for every terminal or auxiliary line on which SSH must be enabled. This feature also eliminates the rotary-group limitation.</p> <p>This feature was supported on CAT4500-X, CAT4500E-SUP6E, CAT4500E-SUP6L-E, CAT4500E-SUP7E, CAT4500E-SUP7L-E.</p> <p>The following command was introduced: ssh.</p>

CHAPTER 63

Secure Shell Version 2 Support

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2. (SSH Version 1 support was implemented in an earlier Cisco software release.) SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. The only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH allows for the secure transfer of files.

Information About Secure Shell Version 2 Support

Secure Shell Version 2

The Secure Shell Version 2 Support feature allows you to configure SSH Version 2.

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The **ip ssh version** command defines the SSH version to be configured. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.

Note SSH Version 1 is a protocol that has never been defined in a standard. If you do not want your device to fall back to the undefined protocol (Version 1), you should use the **ip ssh version** command and specify Version 2.

The **ip ssh rsa keypair-name** command enables an SSH connection using the Rivest, Shamir, and Adleman (RSA) keys that you have configured. Previously, SSH was linked to the first RSA keys that were generated (that is, SSH was enabled when the first RSA key pair was generated). This behavior still exists, but by using the **ip ssh rsa keypair-name** command, you can overcome this behavior. If you configure the **ip ssh rsa keypair-name** command with a key pair name, SSH is enabled if the key pair exists or SSH will be enabled if the key pair is generated later. If you use this command to enable SSH, you are not forced to configure a hostname and a domain name, which was required in SSH Version 1 of the Cisco software.

Note The login banner is supported in SSH Version 2, but it is not supported in Secure Shell Version 1.

Secure Shell Version 2 Enhancements

The SSH Version 2 Enhancements feature includes a number of additional capabilities such as supporting Virtual Routing and Forwarding (VRF)-Aware SSH, SSH debug enhancements, and Diffie-Hellman (DH) group exchange support.

Note The VRF-Aware SSH feature is supported depending on your release.

The Cisco SSH implementation has traditionally used 768-bit modulus, but with an increasing need for higher key sizes to accommodate DH Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications, a message exchange between the client and the server to establish the favored DH group becomes necessary. The **ip ssh dh min size** command configures the modulus size on the SSH server. In addition to this, the **ssh** command was extended to add VRF awareness to the SSH client-side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging was enhanced by modifying SSH debug commands. The **debug ip ssh** command was extended to simplify the debugging process. Before the simplification of the debugging process, this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the **debug ip ssh** command with a keyword, messages are limited to information specified by the keyword.

Secure Shell Version 2 Enhancements for RSA Keys

Cisco SSH Version 2 supports keyboard-interactive and password-based authentication methods. The SSH Version 2 Enhancements for RSA Keys feature also supports RSA-based public key authentication for the client and the server.

User authentication—RSA-based user authentication uses a private/public key pair associated with each user for authentication. The user must generate a private/public key pair on the client and configure a public key on the Cisco SSH server to complete the authentication.

An SSH user trying to establish credentials provides an encrypted signature using the private key. The signature and the user's public key are sent to the SSH server for authentication. The SSH server computes a hash over the public key provided by the user. The hash is used to determine if the server has a matching entry. If a match is found, an RSA-based message verification is performed using the public key. Hence, the user is authenticated or denied access based on the encrypted signature.

Server authentication—While establishing an SSH session, the Cisco SSH client authenticates the SSH server by using the server host keys available during the key exchange phase. SSH server keys are used to identify the SSH server. These keys are created at the time of enabling SSH and must be configured on the client.

For server authentication, the Cisco SSH client must assign a host key for each server. When the client tries to establish an SSH session with a server, the client receives the signature of the server as part of the key exchange message. If the strict host key checking flag is enabled on the client, the client checks if it has the host key entry corresponding to the server. If a match is found, the client tries to validate the signature by

using the server host key. If the server is successfully authenticated, the session establishment continues; otherwise, it is terminated and displays a “Server Authentication Failed” message.

Note Storing public keys on a server uses memory; therefore, the number of public keys configurable on an SSH server is restricted to ten users, with a maximum of two public keys per user.

Note RSA-based user authentication is supported by the Cisco server, but Cisco clients cannot propose public key as an authentication method. If the Cisco server receives a request from an open SSH client for RSA-based authentication, the server accepts the authentication request.

Note For server authentication, configure the RSA public key of the server manually and configure the **ip ssh stricthostkeycheck** command on the Cisco SSH client.

SNMP Trap Generation

Depending on your release, Simple Network Management Protocol (SNMP) traps are generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been enabled. For information about enabling SNMP traps, see the “Configuring SNMP Support” module in the *SNMP Configuration Guide*.

Note When you configure the **snmp-server host** command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server.

You must also enable SNMP debugging using the **debug snmp packet** command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session.

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client.

```
snmp-server
snmp-server host a.b.c.d public tty
```

The following is sample output from the **debug snmp packet** command. The output provides SNMP trap information for an SSH session.

```
Switch# debug snmp packet

SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:

Switch# exit
```

```
[Connection to 10.0.0.2 closed by foreign host]
Device1#

SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically enabled.

The following methods are supported:

- Password
- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)

How to Configure Secure Shell Version 2 Support

Configuring a Device for SSH Version 2 Using a Hostname and Domain Name

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **hostname** *name*
4. **ip domain-name** *name*
5. **crypto key generate rsa**
6. **ip ssh** [**time-out** *seconds* | **authentication-retries** *integer*]
7. **ip ssh version** [**1** | **2**]
8. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Device> enable	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	hostname <i>name</i> Example: Device(config)# hostname cisco7200	Configures a hostname for your device.
Step 4	ip domain-name <i>name</i> Example: cisco7200(config)# ip domain-name example.com	Configures a domain name for your device.
Step 5	crypto key generate rsa Example: cisco7200(config)# crypto key generate rsa	Enables the SSH server for local and remote authentication.
Step 6	ip ssh [time-out <i>seconds</i> authentication-retries <i>integer</i>] Example: cisco7200(config)# ip ssh time-out 120	(Optional) Configures SSH control variables on your device.
Step 7	ip ssh version [1 2] Example: cisco7200(config)# ip ssh version 1	(Optional) Specifies the version of SSH to be run on your device.
Step 8	exit Example: cisco7200(config)# exit	Exits global configuration mode and enters privileged EXEC mode. <ul style="list-style-type: none"> Use no hostname command to return to the default host.

Configuring a Device for SSH Version 2 Using RSA Key Pairs

SUMMARY STEPS

- enable
- configure terminal
- ip ssh rsa keypair-name *keypair-name*

4. **crypto key generate rsa usage-keys label *key-label* modulus *modulus-size***
5. **ip ssh [time-out *seconds* | authentication-retries *integer*]**
6. **ip ssh version 2**
7. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip ssh rsa keypair-name <i>keypair-name</i> Example: Device(config)# ip ssh rsa keypair-name sshkeys	Specifies the RSA key pair to be used for SSH. Note A Cisco device can have many RSA key pairs.
Step 4	crypto key generate rsa usage-keys label <i>key-label</i> modulus <i>modulus-size</i> Example: Device(config)# crypto key generate rsa usage-keys label sshkeys modulus 768	Enables the SSH server for local and remote authentication on the device. <ul style="list-style-type: none"> • For SSH Version 2, the modulus size must be at least 768 bits. Note To delete the RSA key pair, use the crypto key zeroize rsa command. When you delete the RSA key pair, you automatically disable the SSH server.
Step 5	ip ssh [time-out <i>seconds</i> authentication-retries <i>integer</i>] Example: Device(config)# ip ssh time-out 12	Configures SSH control variables on your device.
Step 6	ip ssh version 2 Example: Device(config)# ip ssh version 2	Specifies the version of SSH to be run on the device.
Step 7	exit Example: Device(config)# exit	Exits global configuration mode and enters privileged EXEC mode.

Configuring the Cisco SSH Server to Perform RSA-Based User Authentication

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **hostname** *name*
4. **ip domain-name** *name*
5. **crypto key generate rsa**
6. **ip ssh pubkey-chain**
7. **username** *username*
8. **key-string**
9. **key-hash** *key-type key-name*
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	hostname <i>name</i> Example: Device(config)# hostname host1	Specifies the hostname.
Step 4	ip domain-name <i>name</i> Example: host1(config)# ip domain-name name1	Defines a default domain name that the Cisco software uses to complete unqualified hostnames.
Step 5	crypto key generate rsa Example: host1(config)# crypto key generate rsa	Generates RSA key pairs.
Step 6	ip ssh pubkey-chain Example: host1(config)# ip ssh pubkey-chain	Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The user authentication is successful if the RSA public key stored on the server is verified with the public or the private key pair stored on the client.
Step 7	username <i>username</i> Example: <pre>host1(conf-ssh-pubkey)# username user1</pre>	Configures the SSH username and enters public-key user configuration mode.
Step 8	key-string Example: <pre>host1(conf-ssh-pubkey-user)# key-string</pre>	Specifies the RSA public key of the remote peer and enters public-key data configuration mode. Note You can obtain the public key value from an open SSH client; that is, from the <code>.ssh/id_rsa.pub</code> file.
Step 9	key-hash <i>key-type key-name</i> Example: <pre>host1(conf-ssh-pubkey-data)# key-hash ssh-rsa key1</pre>	(Optional) Specifies the SSH key type and version. <ul style="list-style-type: none"> The key type must be <code>ssh-rsa</code> for the configuration of private public key pairs. This step is optional only if the key-string command is configured. You must configure either the key-string command or the key-hash command. Note You can use a hashing software to compute the hash of the public key string, or you can also copy the hash value from another Cisco device. Entering the public key data using the key-string command is the preferred way to enter the public key data for the first time.
Step 10	end Example: <pre>host1(conf-ssh-pubkey-data)# end</pre>	Exits public-key data configuration mode and returns to privileged EXEC mode. <ul style="list-style-type: none"> Use no hostname command to return to the default host.

Configuring the Cisco IOS SSH Client to Perform RSA-Based Server Authentication

SUMMARY STEPS

- enable**
- configure terminal**
- hostname** *name*

4. **ip domain-name** *name*
5. **crypto key generate rsa**
6. **ip ssh pubkey-chain**
7. **server** *server-name*
8. **key-string**
9. **exit**
10. **key-hash** *key-type key-name*
11. **end**
12. **configure terminal**
13. **ip ssh stricthostkeycheck**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	hostname <i>name</i> Example: Device(config)# hostname host1	Specifies the hostname.
Step 4	ip domain-name <i>name</i> Example: host1(config)# ip domain-name name1	Defines a default domain name that the Cisco software uses to complete unqualified hostnames.
Step 5	crypto key generate rsa Example: host1(config)# crypto key generate rsa	Generates RSA key pairs.
Step 6	ip ssh pubkey-chain Example: host1(config)# ip ssh pubkey-chain	Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.
Step 7	server <i>server-name</i> Example: host1(conf-ssh-pubkey)# server server1	Enables the SSH server for public-key authentication on the device and enters public-key server configuration mode.

	Command or Action	Purpose
Step 8	key-string Example: <pre>host1(conf-ssh-pubkey-server)# key-string</pre>	Specifies the RSA public-key of the remote peer and enters public key data configuration mode. Note You can obtain the public key value from an open SSH client; that is, from the .ssh/id_rsa.pub file.
Step 9	exit Example: <pre>host1(conf-ssh-pubkey-data)# exit</pre>	Exits public-key data configuration mode and enters public-key server configuration mode.
Step 10	key-hash <i>key-type key-name</i> Example: <pre>host1(conf-ssh-pubkey-server)# key-hash ssh-rsa key1</pre>	(Optional) Specifies the SSH key type and version. <ul style="list-style-type: none"> • The key type must be ssh-rsa for the configuration of private/public key pairs. • This step is optional only if the key-string command is configured. • You must configure either the key-string command or the key-hash command. Note You can use a hashing software to compute the hash of the public key string, or you can copy the hash value from another Cisco device. Entering the public key data using the key-string command is the preferred way to enter the public key data for the first time.
Step 11	end Example: <pre>host1(conf-ssh-pubkey-server)# end</pre>	Exits public-key server configuration mode and returns to privileged EXEC mode.
Step 12	configure terminal Example: <pre>host1# configure terminal</pre>	Enters global configuration mode.
Step 13	ip ssh stricthostkeycheck Example: <pre>host1(config)# ip ssh stricthostkeycheck</pre>	Ensures that server authentication takes place. <ul style="list-style-type: none"> • The connection is terminated in case of a failure. • Use no hostname command to return to the default host.

Starting an Encrypted Session with a Remote Device

Note The device with which you want to connect must support a Secure Shell (SSH) server that has an encryption algorithm that is supported in Cisco software. Also, you need not enable your device. SSH can be run in disabled mode.

SUMMARY STEPS

1. `ssh [-v {1 | 2}] [-c {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc | 3des | aes192-cbc | aes256-cbc} | -l user-id | -l user-id:vrf-name number ip-address ip-address | -l user-id:rotary number ip-address | -m {hmac-md5-128 | hmac-md5-96 | hmac-sha1-160 | hmac-sha1-96} | -o numberofpasswordprompts n | -p port-num] {ip-addr | hostname} [command | -vrf]`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<pre>ssh [-v {1 2}] [-c {aes128-ctr aes192-ctr aes256-ctr aes128-cbc 3des aes192-cbc aes256-cbc} -l <i>user-id</i> -l <i>user-id:vrf-name number ip-address ip-address</i> -l <i>user-id:rotary number ip-address</i> -m {hmac-md5-128 hmac-md5-96 hmac-sha1-160 hmac-sha1-96} -o <i>numberofpasswordprompts n</i> -p <i>port-num</i>] {<i>ip-addr</i> <i>hostname</i>} [<i>command</i> -vrf]</pre> <p>Example:</p> <pre>Device# ssh -v 2 -c aes256-ctr -m hmac-sha1-96 -l user2 10.76.82.24</pre>	Starts an encrypted session with a remote networking device.

Enabling Secure Copy Protocol on the SSH Server

Note The following task configures the server-side functionality for SCP. This task shows a typical configuration that allows the device to securely copy files from a remote workstation.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login default local`
5. `aaa authorization exec defaultlocal`
6. `username name privilege privilege-level password password`
7. `ip ssh time-out seconds`
8. `ip ssh authentication-retries integer`

9. `ip scpserverenable`
10. `exit`
11. `debug ip scp`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	aaa new-model Example: <pre>Device(config)# aaa new-model</pre>	Enables the AAA access control model.
Step 4	aaa authentication login default local Example: <pre>Device(config)# aaa authentication login default local</pre>	Sets AAA authentication at login to use the local username database for authentication.
Step 5	aaa authorization exec defaultlocal Example: <pre>Device(config)# aaa authorization exec default local</pre>	Sets the parameters that restrict user access to a network, runs the authorization to determine if the user ID is allowed to run an EXEC shell, and specifies that the system must use the local database for authorization.
Step 6	username name privilege privilege-level password password Example: <pre>Device(config)# username samplename privilege 15 password password1</pre>	Establishes a username-based authentication system, and specifies the username, privilege level, and an unencrypted password. Note The minimum value for the <i>privilege-level</i> argument is 15. A privilege level of less than 15 results in the connection closing.
Step 7	ip ssh time-out seconds Example: <pre>Device(config)# ip ssh time-out 120</pre>	Sets the time interval (in seconds) that the device waits for the SSH client to respond.
Step 8	ip ssh authentication-retries integer Example:	Sets the number of authentication attempts after which the interface is reset.

	Command or Action	Purpose
	Device(config)# ip ssh authentication-retries 3	
Step 9	ip scpserverenable Example: Device(config)# ip scp server enable	Enables the device to securely copy files from a remote workstation.
Step 10	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.
Step 11	debug ip scp Example: Device# debug ip scp	(Optional) Provides diagnostic information about SCP authentication problems.

Verifying the Status of the Secure Shell Connection

SUMMARY STEPS

1. enable
2. show ssh
3. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ssh Example: Device# show ssh	Displays the status of SSH server connections.
Step 3	exit Example: Device# exit	Exits privileged EXEC mode and returns to user EXEC mode.

Examples

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for Version 1 and Version 2 connections:

```
-----
Device# show ssh

Connection      Version Encryption      State                Username
0               1.5      3DES              Session started     lab
Connection Version Mode Encryption Hmac                State
Username
1               2.0      IN   aes128-cbc hmac-md5      Session started     lab
1               2.0      OUT  aes128-cbc hmac-md5      Session started     lab
-----
```

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for a Version 2 connection with no Version 1 connection:

```
-----
Device# show ssh

Connection Version Mode Encryption Hmac                State
Username
1               2.0      IN   aes128-cbc hmac-md5      Session started     lab
1               2.0      OUT  aes128-cbc hmac-md5      Session started     lab
%No SSHv1 server connections running.
-----
```

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for a Version 1 connection with no Version 2 connection:

```
-----
Device# show ssh

Connection      Version Encryption      State                Username
0               1.5      3DES              Session started     lab
%No SSHv2 server connections running.
-----
```

Verifying the Secure Shell Status

SUMMARY STEPS

1. enable
2. show ip ssh
3. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Device> enable	<ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ip ssh Example: Device# show ip ssh	Displays the version and configuration data for SSH.
Step 3	exit Example: Device# exit	Exits privileged EXEC mode and returns to user EXEC mode.

Examples

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for Version 1 and Version 2 connections:

```
-----
Device# show ip ssh

SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3
-----
```

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 2 connection with no Version 1 connection:

```
-----
Device# show ip ssh

SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3
-----
```

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 1 connection with no Version 2 connection:

```
-----
Device# show ip ssh

3d06h: %SYS-5-CONFIG_I: Configured from console by console
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
-----
```

Monitoring and Maintaining Secure Shell Version 2

SUMMARY STEPS

1. enable
2. debug ip ssh
3. debug snmp packet

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	debug ip ssh Example: Device# debug ip ssh	Enables debugging of SSH.
Step 3	debug snmp packet Example: Device# debug snmp packet	Enables debugging of every SNMP packet sent or received by the device.

Example

The following sample output from the **debug ip ssh** command shows the connection is an SSH Version 2 connection:

```
Device# debug ip ssh

00:33:55: SSH1: starting SSH control process

```

Configuration Examples for Secure Shell Version 2 Support

Example: Configuring Secure Shell Version 2

```
Device# configure terminal
Device(config)# ip ssh version 2
```

Example: Starting an Encrypted Session with a Remote Device

```
Device# ssh -v 2 -c aes256-cbc -m hmac-sha1-160 -l shaship 10.76.82.24
```

Example: Configuring Server-Side SCP

The following example shows how to configure the server-side functionality for SCP. This example also configures AAA authentication and authorization on the device. This example uses a locally defined username and password.

```
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authentication login default local
Device(config)# aaa authorization exec default local
Device(config)# username samplename privilege 15 password password1
Device(config)# ip ssh time-out 120
Device(config)# ip ssh authentication-retries 3
Device(config)# ip scp server enable
```

Example: Setting an SNMP Trap

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client.

```
snmp-server
snmp-server host a.b.c.d public tty
```

The following is sample output from the **debug snmp packet** command. The output provides SNMP trap information for an SSH session.

```
Device1# debug snmp packet

SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:

Device2# exit

[Connection to 10.0.0.2 closed by foreign host]
Device1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2
```

```

```

Example: Enabling ChPass with a Blank Password Change

In the following example, the ChPass feature is enabled, and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method. A TACACS+ access control server (ACS) is used as the back-end AAA server.

```
Device1# ssh -l cisco 10.1.1.3

Password:
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]
```

Example: Enabling ChPass and Changing the Password on First Login

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end server. The password is changed on the first login using the SSH keyboard interactive authentication method.

```
Device1# ssh -l cisco 10.1.1.3

Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]

Device1# ssh -l cisco 10.1.1.3

Password:cisco1
Your password has expired.
Enter a new one now.
New Password: cisco
Re-enter New password: cisco12
The New and Re-entered passwords have to be the same.
Try again.
New Password: cisco
Re-enter New password: cisco

Device2>
```

Example: Enabling ChPass and Expiring the Password After Three Logins

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end AAA server. The password expires after three logins using the SSH keyboard interactive authentication method.

```
Device# ssh -l cisco 10.1.1.3

Password: cisco

Device2> exit
```

```

[Connection to 10.1.1.3 closed by foreign host]

Device1# ssh -l cisco 10.1.1.3

Password: cisco

Device2> exit

Device1# ssh -l cisco 10.1.1.3

Password: cisco

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]

Device1# ssh -l cisco 10.1.1.3

Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Device2>

```

Example: SNMP Debugging

The following is sample output from the **debug snmp packet** command. The output provides SNMP trap information for an SSH session.

```

Device1# debug snmp packet

SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:

Device2# exit

Examples: SSH Debugging Enhancements

The following is sample output from the **debug ip ssh detail** command. The output provides debugging information about the SSH protocol and channel requests.

```

Device# debug ip ssh detail

```

```

00:04:22: SSH0: starting SSH control process
00:04:22: SSH0: sent protocol version id SSH-1.99-Cisco-1.25
00:04:22: SSH0: protocol version id is - SSH-1.99-Cisco-1.25
00:04:22: SSH2 0: SSH2_MSG_KEXINIT sent
00:04:22: SSH2 0: SSH2_MSG_KEXINIT received
00:04:22: SSH2:kex: client->server enc:aes128-cbc mac:hmac-shal
00:04:22: SSH2:kex: server->client enc:aes128-cbc mac:hmac-shal
00:04:22: SSH2 0: expecting SSH2_MSG_KEXDH_INIT
00:04:22: SSH2 0: SSH2_MSG_KEXDH_INIT received
00:04:22: SSH2: kex_derive_keys complete
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS sent
00:04:22: SSH2 0: waiting for SSH2_MSG_NEWKEYS
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS received
00:04:24: SSH2 0: authentication successful for lab
00:04:24: SSH2 0: channel open request
00:04:24: SSH2 0: pty-req request
00:04:24: SSH2 0: setting TTY - requested: height 24, width 80; set: height 24, width 80
00:04:24: SSH2 0: shell request
00:04:24: SSH2 0: shell message received
00:04:24: SSH2 0: starting shell for vty
00:04:38: SSH0: Session terminated normally

```

The following is sample output from the **debug ip ssh packet** command. The output provides debugging information about the SSH packet.

```
Device# debug ip ssh packet
```

```

00:05:43: SSH2 0: send:packet of length 280 (length also includes padlen of 4)
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: input: total packet length of 280 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 24 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: input: padlength 4 bytes
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: input: total packet length of 144 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 136 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 136 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 16 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 136 bytes, maclen 0
00:05:43: SSH2 0: input: padlength 6 bytes
00:05:43: SSH2 0: signature length 143
00:05:43: SSH2 0: send:packet of length 448 (length also includes padlen of 7)
00:05:43: SSH2 0: send:packet of length 16 (length also includes padlen of 10)
00:05:43: SSH2 0: newkeys: mode 1
00:05:43: SSH2 0: ssh_receive: 16 bytes received
00:05:43: SSH2 0: input: total packet length of 16 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 8 bytes, maclen 0
00:05:43: SSH2 0: input: padlength 10 bytes
00:05:43: SSH2 0: newkeys: mode 0
00:05:43: SSH2 0: ssh_receive: 52 bytes received
00:05:43: SSH2 0: input: total packet length of 32 bytes
00:05:43: SSH2 0: partial packet length(block size)16 bytes,needed 16 bytes, maclen 20
00:05:43: SSH2 0: MAC compared for #3 :ok

```

Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Secure Shell Version 2 Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 129: Feature Information for Secure Shell Version 2 Support

Feature Name	Releases	Feature Information
Secure Shell Version 2 Client and Server Support	Cisco IOS XE Release 3.4SG	The Cisco image was updated to provide for the automatic generation of SNMP traps when an SSH session terminates. This feature was supported on CAT2960, CAT3560E, CAT3560X, CAT3750, CAT3750E, CAT3750X, CAT4500.

Feature Name	Releases	Feature Information
Secure Shell Version 2 Enhancements	Cisco IOS XE Release 3.4SG	<p>The Secure Shell Version 2 Enhancements feature includes a number of additional capabilities such as support for VRF-Aware SSH, SSH debug enhancements, and DH Group 14 and Group 16 exchange support.</p> <p>This feature was supported on CAT2960, CAT3560E, CAT3560X, CAT3750, CAT3750E, CAT3750X, CAT4500.</p> <p>Note The VRF-Aware SSH feature is supported depending on your release.</p> <p>The following commands were introduced or modified: debug ip ssh, and ip ssh dh min size.</p>
Secure Shell Version 2 Enhancements for RSA Keys	Cisco IOS XE Release 3.4SG	<p>The Secure Shell Version 2 Enhancements for RSA Keys feature includes a number of additional capabilities to support RSA key-based user authentication for SSH and SSH server host key storage and verification.</p> <p>This feature was supported on CAT2960, CAT3560E, CAT3560X, CAT3750, CAT3750E, CAT3750X, CAT4500.</p>
Secure Shell Version 2 Support	Cisco IOS XE Release 3.4SG	<p>The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2 (SSH Version 1 support was implemented in an earlier Cisco software release). SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities.</p> <p>This feature was supported on CAT2960, CAT3560E, CAT3560X, CAT3750, CAT3750E, CAT3750X, CAT4500.</p> <p>The following commands were introduced or modified: debug ip ssh, ip ssh min dh size, ip ssh rsa keypair-name, ip ssh version, and ssh.</p>

Feature Name	Releases	Feature Information
SSH Keyboard Interactive Authentication	Cisco IOS XE Release 3.4SG	<p>The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature.</p> <p>This feature was supported on CAT2960, CAT3560E, CAT3560X, CAT3750, CAT3750E, CAT3750X, CAT4500.</p>

CHAPTER 64

X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for SSH Authentication feature uses public key algorithm (PKI) for server and user authentication, and allows the Secure Shell (SSH) protocol to verify the identity of the owner of a key pair via digital certificates, signed and issued by a Certificate Authority (CA).

This module describes how to configure server and user certificate profiles for a digital certificate.

- [Prerequisites for X.509v3 Certificates for SSH Authentication, on page 1271](#)
- [Restrictions for X.509v3 Certificates for SSH Authentication, on page 1271](#)
- [Information About X.509v3 Certificates for SSH Authentication, on page 1272](#)
- [How to Configure X.509v3 Certificates for SSH Authentication, on page 1273](#)
- [Verifying the Server and User Authentication Using Digital Certificates , on page 1276](#)
- [Configuration Examples for X.509v3 Certificates for SSH Authentication, on page 1280](#)
- [Additional References for X.509v3 Certificates for SSH Authentication, on page 1281](#)
- [Feature Information for X.509v3 Certificates for SSH Authentication, on page 1281](#)

Prerequisites for X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for SSH Authentication feature replaces the **ip ssh server authenticate user** command with the **ip ssh server algorithm authentication** command. Configure the **default ip ssh server authenticate user** command to remove the **ip ssh server authenticate user** command from the configuration. The IOS secure shell (SSH) server will start using the **ip ssh server algorithm authentication** command.

When you configure the **ip ssh server authenticate user** command, the following message is displayed:

Warning

SSH command accepted; but this CLI will be deprecated soon. Please move to new CLI **ip ssh server algorithm authentication**. Please configure the “**default ip ssh server authenticate user**” to make the CLI ineffective.

Restrictions for X.509v3 Certificates for SSH Authentication

- The X.509v3 Certificates for SSH Authentication feature implementation is applicable only on the Cisco IOS Secure Shell (SSH) server side.

- The Cisco IOS SSH server supports only the x509v3-ssh-rsa algorithm-based certificate for server and user authentication.

Information About X.509v3 Certificates for SSH Authentication

X.509v3 Certificates for SSH Authentication Overview

The Secure Shell (SSH) protocol provides a secure remote access connection to network devices. The communication between the client and server is encrypted.

There are two SSH protocols that use public key cryptography for authentication. The Transport Layer Protocol, uses a digital signature algorithm (called the public key algorithm) to authenticate the server to the client. And the User Authentication Protocol uses a digital signature to authenticate (public key authentication) the client to the server.

The validity of the authentication depends upon the strength of the linkage between the public signing key and the identity of the signer. Digital certificates, such as those in X.509 Version 3 (X.509v3), are used to provide identity management. X.509v3 uses a chain of signatures by a trusted root certification authority and intermediate certificate authorities to bind a public signing key to a specific digital identity. This implementation allows the use of a public key algorithm for server and user authentication, and allows SSH to verify the identity of the owner of a key pair via digital certificates, signed and issued by a Certificate Authority (CA).

Server and User Authentication Using X.509v3

For server authentication, the Secure shell (SSH) server sends its own certificate to the SSH client for verification. This server certificate is associated with the trustpoint configured in the server certificate profile (ssh-server-cert-profile-server configuration mode).

For user authentication, the SSH client sends the user's certificate to the IOS SSH server for verification. The SSH server validates the incoming user certificate using public key infrastructure (PKI) trustpoints configured in the server certificate profile (ssh-server-cert-profile-user configuration mode).

By default, certificate-based authentication is enabled for server and user at the IOS SSH server end.

OCSP Response Stapling

The Online Certificate Status Protocol (OCSP) enables applications to determine the (revocation) state of an identified certificate. This protocol specifies the data that needs to be exchanged between an application checking the status of a certificate and the server providing that status. An OCSP client issues a status request to an OCSP responder and suspends acceptance of the certificate until a response is received. An OCSP response at a minimum consists of a responseStatus field that indicates the processing status of the a request.

For the public key algorithms, the key format consists of a sequence of one or more X.509v3 certificates followed by a sequence of zero or more OCSP responses.

The X.509v3 Certificate for SSH Authentication feature uses OCSP Response Stapling. By using OCSP response stapling, a device obtains the revocation information of its own certificate by contacting the OCSP server and then stapling the result along with its certificates and sending the information to the peer rather than having the peer contact the OCSP responder.

How to Configure X.509v3 Certificates for SSH Authentication

Configuring Digital Certificates for Server Authentication

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ssh server algorithm hostkey {x509v3-ssh-rsa [ssh-rsa] | ssh-rsa [x509v3-ssh-rsa]}**
4. **ip ssh server certificate profile**
5. **server**
6. **trustpoint sign *PKI-trustpoint-name***
7. **ocsp-response include**
8. **end**
9. **line vty line_number [ending_line_number]**
10. **transport input ssh**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Switch> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Switch# configure terminal</pre>	Enters global configuration mode.
Step 3	ip ssh server algorithm hostkey {x509v3-ssh-rsa [ssh-rsa] ssh-rsa [x509v3-ssh-rsa]} Example: <pre>Switch(config)# ip ssh server algorithm hostkey x509v3-ssh-rsa</pre>	Defines the order of host key algorithms. Only the configured algorithm is negotiated with the Secure Shell (SSH) client. <p>Note The IOS SSH server must have at least one configured host key algorithm:</p> <ul style="list-style-type: none"> • x509v3-ssh-rsa—certificate-based authentication • ssh-rsa—public key-based authentication
Step 4	ip ssh server certificate profile Example: <pre>Switch(config)# ip ssh server certificate profile</pre>	Configures server and user certificate profiles and enters SSH certificate profile configuration mode.

	Command or Action	Purpose
Step 5	server Example: <pre>Switch(ssh-server-cert-profile)# server</pre>	Configures server certificate profile and enters SSH server certificate profile server configuration mode. <ul style="list-style-type: none"> The server profile is used to send out the certificate of the server to the SSH client during server authentication.
Step 6	trustpoint sign <i>PKI-trustpoint-name</i> Example: <pre>Switch(ssh-server-cert-profile-server)# trustpoint sign trust1</pre>	Attaches the public key infrastructure (PKI) trustpoint to the server certificate profile. <ul style="list-style-type: none"> The SSH server uses the certificate associated with this PKI trustpoint for server authentication.
Step 7	ocsp-response include Example: <pre>Switch(ssh-server-cert-profile-server)# ocsp-response include</pre>	(Optional) Sends the Online Certificate Status Protocol (OCSP) response or OCSP stapling along with the server certificate. <p>Note By default, no OCSP response is sent along with the server certificate.</p>
Step 8	end Example: <pre>Switch(ssh-server-cert-profile-server)# end</pre>	Exits SSH server certificate profile server configuration mode and returns to privileged EXEC mode.
Step 9	line vty line_number [ending_line_number] Example: <pre>Switch(config)# line vty line_number [ending_line_number]</pre>	Enters line configuration mode to configure the virtual terminal line settings. For line_number and ending_line_number, specify a pair of lines. The range is 0 to 15.
Step 10	transport input ssh Example: <pre>Switch(config-line)#transport input ssh</pre>	Specifies that the Switch prevent non-SSH Telnet connections. This limits the router to only SSH connections.

Configuring Digital Certificates for User Authentication

SUMMARY STEPS

- enable
- configure terminal
- ip ssh server algorithm authentication {publickey | keyboard | password}
- ip ssh server algorithm publickey {x509v3-ssh-rsa [ssh-rsa] | ssh-rsa [x509v3-ssh-rsa]}
- ip ssh server certificate profile
- user
- trustpoint verify *PKI-trustpoint-name*
- ocsp-response required

9. **end**
10. **line vty line_number** [*ending_line_number*]
11. **transport input ssh**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Switch> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Switch# configure terminal</pre>	Enters global configuration mode.
Step 3	ip ssh server algorithm authentication {publickey keyboard password} Example: <pre>Switch(config)# ip ssh server algorithm authentication publickey</pre>	Defines the order of user authentication algorithms. Only the configured algorithm is negotiated with the Secure Shell (SSH) client. <p>Note</p> <ul style="list-style-type: none"> • The IOS SSH server must have at least one configured user authentication algorithm. • To use the certificate method for user authentication, the publickey keyword must be configured.
Step 4	ip ssh server algorithm publickey {x509v3-ssh-rsa [ssh-rsa] ssh-rsa [x509v3-ssh-rsa]} Example: <pre>Switch(config)# ip ssh server algorithm publickey x509v3-ssh-rsa</pre>	Defines the order of public key algorithms. Only the configured algorithm is accepted by the SSH client for user authentication. <p>Note</p> The IOS SSH client must have at least one configured public key algorithm: <ul style="list-style-type: none"> • x509v3-ssh-rsa—Certificate-based authentication • ssh-rsa—Public-key-based authentication
Step 5	ip ssh server certificate profile Example: <pre>Switch(config)# ip ssh server certificate profile</pre>	Configures server certificate profile and user certificate profile and enters SSH certificate profile configuration mode.
Step 6	user Example: <pre>Switch(ssh-server-cert-profile)# user</pre>	Configures user certificate profile and enters SSH server certificate profile user configuration mode.
Step 7	trustpoint verify PKI-trustpoint-name Example:	Configures the public key infrastructure (PKI) trustpoint that is used to verify the incoming user certificate.

	Command or Action	Purpose
	Switch(ssh-server-cert-profile-user)# trustpoint verify trust2	Note Configure multiple trustpoints by executing the same command multiple times. A maximum of 10 trustpoints can be configured.
Step 8	ocsp-response required Example: Switch(ssh-server-cert-profile-user)# ocsp-response required	(Optional) Mandates the presence of the Online Certificate Status Protocol (OCSP) response with the incoming user certificate. Note By default, the user certificate is accepted without an OCSP response.
Step 9	end Example: Switch(ssh-server-cert-profile-user)# end	Exits SSH server certificate profile user configuration mode and returns to privileged EXEC mode.
Step 10	line vty line_number [ending_line_number] Example: Switch(config)# line vty line_number [ending_line_number]	Enters line configuration mode to configure the virtual terminal line settings. For line_number and ending_line_number, specify a pair of lines. The range is 0 to 15.
Step 11	transport input ssh Example: Switch(config-line)#transport input ssh	Specifies that the Switch prevent non-SSH Telnet connections. This limits the router to only SSH connections.

Verifying the Server and User Authentication Using Digital Certificates

SUMMARY STEPS

1. enable
2. show ip ssh
3. debug ip ssh detail
4. show log
5. debug ip packet
6. show log

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

- Enter your password if prompted.

Example:

```
Device> enable
```

Step 2 show ip ssh

Displays the currently configured authentication methods. To confirm the use of certificate-based authentication, ensure that the x509v3-ssh-rsa algorithm is the configured host key algorithm.

Example:

```
Device# show ip ssh

SSH Enabled - version 1.99
Authentication methods:publickey,keyboard-interactive,password
Authentication Publickey Algorithms:x509v3-ssh-rsa,ssh-rsa
Hostkey Algorithms:x509v3-ssh-rsa,ssh-rsa
Authentication timeout: 120 secs; Authentication retries: 3
Minimum expected Diffie Hellman key size : 1024 bits
```

Step 3 debug ip ssh detail

Turns on debugging messages for SSH details.

Example:

```
Device# debug ip ssh detail

ssh detail messages debugging is on
```

Step 4 show log

Shows the debug message log.

Example:

```
Device# show log

Syslog logging: enabled (0 messages dropped, 9 messages rate-limited, 0 flushes, 0 overruns, xml
disabled, filtering disabled)

No Active Message Discriminator.

No Inactive Message Discriminator.

Console logging: disabled
Monitor logging: level debugging, 0 messages logged, xml disabled,
filtering disabled
Buffer logging: level debugging, 233 messages logged, xml disabled,
filtering disabled
Exception Logging: size (4096 bytes)
Count and timestamp logging messages: disabled
File logging: disabled
Persistent logging: disabled

No active filter modules.

Trap logging: level informational, 174 message lines logged
Logging Source-Interface: VRF Name:
```

```

Log Buffer (4096 bytes):

```

Step 5 **debug ip packet**

Turns on debugging for IP packet details.

Example:

```
Device# debug ip packet
```

Step 6 **show log**

Shows the debug message log.

Example:

```
Device# show log
```

```
yslog logging: enabled (0 messages dropped, 9 messages rate-limited, 0 flushes, 0 overruns, xml
disabled, filtering disabled)
```

```
No Active Message Discriminator.
```

```
No Inactive Message Discriminator.
```

```
Console logging: disabled
Monitor logging: level debugging, 0 messages logged, xml disabled,
                  filtering disabled
Buffer logging:  level debugging, 1363 messages logged, xml disabled,
                  filtering disabled
Exception Logging: size (4096 bytes)
Count and timestamp logging messages: disabled
File logging: disabled
Persistent logging: disabled
```

```
No active filter modules.
```

```
Trap logging: level informational, 176 message lines logged
Logging Source-Interface:      VRF Name:

Configuration Examples for X.509v3 Certificates for SSH Authentication

Example: Configuring Digital Certificates for Server Authentication

```
Switch> enable
Switch# configure terminal
Switch(config)# ip ssh server algorithm hostkey x509v3-ssh-rsa
Switch(config)# ip ssh server certificate profile
Switch(ssh-server-cert-profile)# server
Switch(ssh-server-cert-profile-server)# trustpoint sign trust1
Switch(ssh-server-cert-profile-server)# exit
```

Example: Configuring Digital Certificate for User Authentication

```
Switch> enable
Switch# configure terminal
```

```
Switch(config)# ip ssh server algorithm authentication publickey
Switch(config)# ip ssh server algorithm publickey x509v3-ssh-rsa
Switch(config)# ip ssh server certificate profile
Switch(ssh-server-cert-profile)# user
Switch(ssh-server-cert-profile-user)# trustpoint verify trust2
Switch(ssh-server-cert-profile-user)# end
```

Feature Information for X.509v3 Certificates for SSH Authentication

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 130: Feature Information for X509v3 Certificates for SSH Authentication

Feature Name	Releases	Feature Information
X.509v3 Certificates for SSH Authentication	Cisco IOS 15.2(4)E1	<p>The X.509v3 Certificates for SSH Authentication feature uses the X5.09v3 digital certificates in server and user authentication at the SSH server side.</p> <p>The following commands were introduced or modified: ip ssh server algorithm hostkey, ip ssh server algorithm authentication, and ip ssh server certificate profile.</p> <p>This feature was implemented on the following platforms:</p> <ul style="list-style-type: none"> • Catalyst 2960C, 2960CX, 2960P, 2960X, and 2960XR Series Switches • Catalyst 3560CX and 3560X Series Switches • Catalyst 3750X Series Switches • Catalyst 4500E Sup7-E, Sup7L-E, Sup8-E, and 4500X Series Switches • Catalyst 4900M, 4900F-E Series Switches

CHAPTER 65

Configuring Secure Socket Layer HTTP

This feature provides Secure Socket Layer (SSL) version 3.0 support for the HTTP 1.1 server and HTTP 1.1 client within Cisco IOS software. SSL provides server authentication, encryption, and message integrity to allow secure HTTP communications. SSL also provides HTTP client authentication. HTTP over SSL is abbreviated as HTTPS.

- [Glossary](#), on page 1295

Information About Secure Socket Layer HTTP

Secure HTTP Servers and Clients Overview

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with `https://` instead of `http://`.

Note SSL evolved into Transport Layer Security (TLS) in 1999, but is still used in this particular context.

The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.

The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

Certificate Authority Trustpoints

Certificate authorities (CAs) manage certificate requests and issue certificates to participating network devices. These services provide centralized security key and certificate management for the participating devices. Specific CA servers are referred to as *trustpoints*.

When a connection attempt is made, the HTTPS server provides a secure connection by issuing a certified X.509v3 certificate, obtained from a specified CA trustpoint, to the client. The client (usually a Web browser), in turn, has a public key that allows it to authenticate the certificate.

For secure HTTP connections, we highly recommend that you configure a CA trustpoint. If a CA trustpoint is not configured for the device running the HTTPS server, the server certifies itself and generates the needed RSA key pair. Because a self-certified (self-signed) certificate does not provide adequate security, the connecting client generates a notification that the certificate is self-certified, and the user has the opportunity to accept or reject the connection. This option is useful for internal network topologies (such as testing).

If you do not configure a CA trustpoint, when you enable a secure HTTP connection, either a temporary or a persistent self-signed certificate for the secure HTTP server (or client) is automatically generated.

- If the switch is not configured with a hostname and a domain name, a temporary self-signed certificate is generated. If the switch reboots, any temporary self-signed certificate is lost, and a new temporary new self-signed certificate is assigned.
- If the switch has been configured with a host and domain name, a persistent self-signed certificate is generated. This certificate remains active if you reboot the switch or if you disable the secure HTTP server so that it will be there the next time you re-enable a secure HTTP connection.

Note The certificate authorities and trustpoints must be configured on each device individually. Copying them from other devices makes them invalid on the switch.

When a new certificate is enrolled, the new configuration change is not applied to the HTTPS server until the server is restarted. You can restart the server using either the CLI or by physical reboot. On restarting the server, the switch starts using the new certificate.

If a self-signed certificate has been generated, this information is included in the output of the **show running-config** privileged EXEC command. This is a partial sample output from that command displaying a self-signed certificate.

```
Device# show running-config
Building configuration...

<output truncated>

crypto pki trustpoint TP-self-signed-3080755072
  enrollment selfsigned

```

<output truncated>

You can remove this self-signed certificate by disabling the secure HTTP server and entering the **no crypto pki trustpoint TP-self-signed-30890755072** global configuration command. If you later re-enable a secure HTTP server, a new self-signed certificate is generated.

Note The values that follow *TP self-signed* depend on the serial number of the device.

You can use an optional command (**ip http secure-client-auth**) to allow the HTTPS server to request an X.509v3 certificate from the client. Authenticating the client provides more security than server authentication by itself.

CipherSuites

A CipherSuite specifies the encryption algorithm and the digest algorithm to use on a SSL connection. When connecting to the HTTPS server, the client Web browser offers a list of supported CipherSuites, and the client and server negotiate the best encryption algorithm to use from those on the list that are supported by both. For example, Netscape Communicator 4.76 supports U.S. security with RSA Public Key Cryptography, MD2, MD5, RC2-CBC, RC4, DES-CBC, and DES-EDE3-CBC.

For the best possible encryption, you should use a client browser that supports 128-bit encryption, such as Microsoft Internet Explorer Version 5.5 (or later) or Netscape Communicator Version 4.76 (or later). The SSL_RSA_WITH_DES_CBC_SHA CipherSuite provides less security than the other CipherSuites, as it does not offer 128-bit encryption.

The more secure and more complex CipherSuites require slightly more processing time. This list defines the CipherSuites supported by the switch and ranks them from fastest to slowest in terms of router processing load (speed):

1. SSL_RSA_WITH_DES_CBC_SHA—RSA key exchange (RSA Public Key Cryptography) with DES-CBC for message encryption and SHA for message digest
2. SSL_RSA_WITH_NULL_SHA key exchange with NULL for message encryption and SHA for message digest (only for SSL 3.0).
3. SSL_RSA_WITH_NULL_MD5 key exchange with NULL for message encryption and MD5 for message digest (only for SSL 3.0).
4. SSL_RSA_WITH_RC4_128_MD5—RSA key exchange with RC4 128-bit encryption and MD5 for message digest
5. SSL_RSA_WITH_RC4_128_SHA—RSA key exchange with RC4 128-bit encryption and SHA for message digest
6. SSL_RSA_WITH_3DES_EDE_CBC_SHA—RSA key exchange with 3DES and DES-EDE3-CBC for message encryption and SHA for message digest
7. SSL_RSA_WITH_AES_128_CBC_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).

8. `SSL_RSA_WITH_AES_256_CBC_SHA`—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).
9. `SSL_RSA_WITH_DHE_AES_128_CBC_SHA`—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).
10. `SSL_RSA_WITH_DHE_AES_256_CBC_SHA`—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

Note The latest versions of Chrome do not support the four original cipher suites, thus disallowing access to both web GUI and guest portals.

RSA (in conjunction with the specified encryption and digest algorithm combinations) is used for both key generation and authentication on SSL connections. This usage is independent of whether or not a CA trustpoint is configured.

Default SSL Configuration

The standard HTTP server is enabled.

SSL is enabled.

No CA trustpoints are configured.

No self-signed certificates are generated.

SSL Configuration Guidelines

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the active switch.

How to Configure Secure Socket Layer HTTP

Configuring the Secure HTTP Server

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP server:

Before you begin

If you are using a certificate authority for certification, you should use the previous procedure to configure the CA trustpoint on the switch before enabling the HTTP server. If you have not configured a CA trustpoint, a self-signed certificate is generated the first time that you enable the secure HTTP server. After you have configured the server, you can configure options (path, access list to apply, maximum number of connections, or timeout policy) that apply to both standard and secure HTTP servers.

To verify the secure HTTP connection by using a Web browser, enter `https://URL`, where the URL is the IP address or hostname of the server switch. If you configure a port other than the default port, you must also specify the port number after the URL. For example:

Note AES256_SHA2 is not supported.

```
https://209.165.129:1026
```

or

```
https://host.domain.com:1026
```

The existing **ip http access-class** *access-list-number* command for specifying the access-list (Only IPv4 ACLs) is going to be deprecated. You can still use this command to specify an access list to allow access to the HTTP server. Two new commands have been introduced to enable support for specifying IPv4 and IPv6 ACLs. These are **ip http access-class ipv4** *access-list-name* | *access-list-number* for specifying IPv4 ACLs and **ip http access-class ipv6** *access-list-name* for specifying IPv6 ACLs. We recommend using the new CLI to avoid receiving warning messages.

Note the following considerations for specifying access-lists:

- If you specify an access-list that does not exist, the configuration takes place but you receive the below warning message:

```
ACL being attached does not exist, please configure it
```

- If you use the **ip http access-class** command for specifying an access-list for the HTTP server, the below warning message appears:

```
This CLI will be deprecated soon, Please use new CLI ip http
access-class ipv4/ipv6 <access-list-name>| <access-list-number>
```

- If you use **ip http access-class ipv4** *access-list-name* | *access-list-number* or **ip http access-class ipv6** *access-list-name*, and an access-list was already configured using **ip http access-class**, the below warning message appears:

```
Removing ip http access-class <access-list-number>
```

ip http access-class *access-list-number* and **ip http access-class ipv4** *access-list-name* | *access-list-number* share the same functionality. Each command overrides the configuration of the previous command. The following combinations between the configuration of the two commands explain the effect on the running configuration:

- If **ip http access-class** *access-list-number* is already configured and you try to configure using **ip http access-class ipv4** *access-list-number* command, the configuration of **ip http access-class** *access-list-number* will be removed and the configuration of **ip http access-class ipv4** *access-list-number* will be added to the running configuration.
- If **ip http access-class** *access-list-number* is already configured and you try to configure using **ip http access-class ipv4** *access-list-name* command, the configuration of **ip http access-class** *access-list-number* will be removed and the configuration of **ip http access-class ipv4** *access-list-name* will be added to the running configuration.

- If **ip http access-class ipv4** *access-list-number* is already configured and you try to configure using **ip http access-class** *access-list-name*, the configuration of **ip http access-class ipv4** *access-list-number* will be removed from configuration and the configuration of **ip http access-class** *access-list-name* will be added to the running configuration.
- If **ip http access-class ipv4** *access-list-name* is already configured and you try to configure using **ip http access-class** *access-list-number*, the configuration of **ip http access-class ipv4** *access-list-name* will be removed from the configuration and the configuration of **ip http access-class** *access-list-number* will be added to the running configuration.

SUMMARY STEPS

1. **show ip http server status**
2. **configure terminal**
3. **ip http secure-server**
4. **ip http secure-port** *port-number*
5. **ip http secure-ciphersuite** {[3des-edc-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}
6. **ip http secure-client-auth**
7. **ip http secure-trustpoint** *name*
8. **ip http path** *path-name*
9. **ip http access-class** *access-list-number*
10. **ip http access-class** { **ipv4** {*access-list-number* | *access-list-name*} | **ipv6** {*access-list-name*} }
11. **ip http max-connections** *value*
12. **ip http timeout-policy** **idle** *seconds* **life** *seconds* **requests** *value*
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	show ip http server status Example: Device# show ip http server status	(Optional) Displays the status of the HTTP server to determine if the secure HTTP server feature is supported in the software. You should see one of these lines in the output: HTTP secure server capability: Present or HTTP secure server capability: Not present
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	ip http secure-server Example: <pre>Device(config)# ip http secure-server</pre>	Enables the HTTPS server if it has been disabled. The HTTPS server is enabled by default.
Step 4	ip http secure-port <i>port-number</i> Example: <pre>Device(config)# ip http secure-port 443</pre>	(Optional) Specifies the port number to be used for the HTTPS server. The default port number is 443. Valid options are 443 or any number in the range 1025 to 65535.
Step 5	ip http secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]} Example: <pre>Device(config)# ip http secure-ciphersuite rc4-128-md5</pre>	(Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS connection. If you do not have a reason to specify a particular CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support. This is the default.
Step 6	ip http secure-client-auth Example: <pre>Device(config)# ip http secure-client-auth</pre>	(Optional) Configures the HTTP server to request an X.509v3 certificate from the client for authentication during the connection process. The default is for the client to request a certificate from the server, but the server does not attempt to authenticate the client.
Step 7	ip http secure-trustpoint <i>name</i> Example: <pre>Device(config)# ip http secure-trustpoint your_trustpoint</pre>	Specifies the CA trustpoint to use to get an X.509v3 security certificate and to authenticate the client certificate connection. Note Use of this command assumes you have already configured a CA trustpoint according to the previous procedure.
Step 8	ip http path <i>path-name</i> Example: <pre>Device(config)# ip http path /your_server:80</pre>	(Optional) Sets a base HTTP path for HTML files. The path specifies the location of the HTTP server files on the local system (usually located in system flash memory).
Step 9	ip http access-class <i>access-list-number</i> Example: <pre>Device(config)# ip http access-class 2</pre>	(Optional) Specifies an access list to use to allow access to the HTTP server.
Step 10	ip http access-class { ipv4 { <i>access-list-number</i> <i>access-list-name</i> } ipv6 { <i>access-list-name</i> } } Example:	(Optional) Specifies an access list to use to allow access to the HTTP server.

	Command or Action	Purpose
	Device(config)# ip http access-class ipv4 4	
Step 11	ip http max-connections <i>value</i> Example: Device(config)# ip http max-connections 4	(Optional) Sets the maximum number of concurrent connections that are allowed to the HTTP server. We recommend that the value be at least 10 and not less. This is required for the UI to function as expected.
Step 12	ip http timeout-policy idle <i>seconds</i> life <i>seconds</i> requests <i>value</i> Example: Device(config)# ip http timeout-policy idle 120 life 240 requests 1	(Optional) Specifies how long a connection to the HTTP server can remain open under the defined circumstances: <ul style="list-style-type: none"> • idle—the maximum time period when no data is received or response data cannot be sent. The range is 1 to 600 seconds. The default is 180 seconds (3 minutes). • life—the maximum time period from the time that the connection is established. The range is 1 to 86400 seconds (24 hours). The default is 180 seconds. • requests—the maximum number of requests processed on a persistent connection. The maximum value is 86400. The default is 1.
Step 13	end Example: Device(config)# end	Returns to privileged EXEC mode.

Configuring the Secure HTTP Client

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP client:

Before you begin

The standard HTTP client and secure HTTP client are always enabled. A certificate authority is required for secure HTTP client certification. This procedure assumes that you have previously configured a CA trustpoint on the switch. If a CA trustpoint is not configured and the remote HTTPS server requires client authentication, connections to the secure HTTP client fail.

SUMMARY STEPS

1. **configure terminal**
2. **ip http client secure-trustpoint** *name*
3. **ip http client secure-ciphersuite** {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ip http client secure-trustpoint <i>name</i> Example: Device(config)# <code>ip http client secure-trustpoint your_trustpoint</code>	(Optional) Specifies the CA trustpoint to be used if the remote HTTP server requests client authentication. Using this command assumes that you have already configured a CA trustpoint by using the previous procedure. The command is optional if client authentication is not needed or if a primary trustpoint has been configured.
Step 3	ip http client secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]} Example: Device(config)# <code>ip http client secure-ciphersuite rc4-128-md5</code>	(Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS connection. If you do not have a reason to specify a particular CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support. This is the default.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.

Configuring a CA Trustpoint

For secure HTTP connections, we recommend that you configure an official CA trustpoint. A CA trustpoint is more secure than a self-signed certificate.

Beginning in privileged EXEC mode, follow these steps to configure a CA Trustpoint:

SUMMARY STEPS

1. **configure terminal**
2. **hostname *hostname***
3. **ip domain-name *domain-name***
4. **crypto key generate rsa**
5. **crypto ca trustpoint *name***
6. **enrollment url *url***
7. **enrollment http-proxy *host-name port-number***
8. **crl query *url***
9. **primary *name***
10. **exit**

11. `crypto ca authentication name`
12. `crypto ca enroll name`
13. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	hostname <i>hostname</i> Example: Device(config)# <code>hostname your_hostname</code>	Specifies the hostname of the switch (required only if you have not previously configured a hostname). The hostname is required for security keys and certificates.
Step 3	ip domain-name <i>domain-name</i> Example: Device(config)# <code>ip domain-name your_domain</code>	Specifies the IP domain name of the switch (required only if you have not previously configured an IP domain name). The domain name is required for security keys and certificates.
Step 4	crypto key generate rsa Example: Device(config)# <code>crypto key generate rsa</code>	(Optional) Generates an RSA key pair. RSA key pairs are required before you can obtain a certificate for the switch. RSA key pairs are generated automatically. You can use this command to regenerate the keys, if needed.
Step 5	crypto ca trustpoint <i>name</i> Example: Device(config)# <code>crypto ca trustpoint your_trustpoint</code>	Specifies a local configuration name for the CA trustpoint and enter CA trustpoint configuration mode.
Step 6	enrollment url <i>url</i> Example: Device(ca-trustpoint)# <code>enrollment url http://your_server:80</code>	Specifies the URL to which the switch should send certificate requests.
Step 7	enrollment http-proxy <i>host-name port-number</i> Example: Device(ca-trustpoint)# <code>enrollment http-proxy</code>	(Optional) Configures the switch to obtain certificates from the CA through an HTTP proxy server. <ul style="list-style-type: none"> • For <i>host-name</i> , specify the proxy server used to get the CA.

	Command or Action	Purpose
	<code>your_host 49</code>	<ul style="list-style-type: none"> For <i>port-number</i>, specify the port number used to access the CA.
Step 8	crl query url Example: <pre>Device(ca-trustpoint)# crl query ldap://your_host:49</pre>	Configures the switch to request a certificate revocation list (CRL) to ensure that the certificate of the peer has not been revoked.
Step 9	primary name Example: <pre>Device(ca-trustpoint)# primary your_trustpoint</pre>	(Optional) Specifies that the trustpoint should be used as the primary (default) trustpoint for CA requests. <ul style="list-style-type: none"> For <i>name</i>, specify the trustpoint that you just configured.
Step 10	exit Example: <pre>Device(ca-trustpoint)# exit</pre>	Exits CA trustpoint configuration mode and return to global configuration mode.
Step 11	crypto ca authentication name Example: <pre>Device(config)# crypto ca authentication your_trustpoint</pre>	Authenticates the CA by getting the public key of the CA. Use the same name used in Step 5.
Step 12	crypto ca enroll name Example: <pre>Device(config)# crypto ca enroll your_trustpoint</pre>	Obtains the certificate from the specified CA trustpoint. This command requests a signed certificate for each RSA key pair.
Step 13	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Monitoring Secure HTTP Server and Client Status

To monitor the SSL secure server and client status, use the privileged EXEC commands in the following table.

Table 131: Commands for Displaying the SSL Secure Server and Client Status

Command	Purpose
<code>show ip http client secure status</code>	Shows the HTTP secure client configuration.

Command	Purpose
show ip http server secure status	Shows the HTTP secure server configuration.
show running-config	Shows the generated self-signed certificate for secure HTTP connections.

Configuration Examples for Secure Socket Layer HTTP

Example: Configuring Secure Socket Layer HTTP

The following example shows a configuration session in which the secure HTTP server is enabled, the port for the secure HTTP server is configured as 1025, and the remote CA trustpoint server “CA-trust-local” is used for certification.

```
Device# show ip http server status

HTTP server status: Disabled
HTTP server port: 80
HTTP server authentication method: enable
HTTP server access class: 0
HTTP server base path:
Maximum number of concurrent server connections allowed: 5
Server idle time-out: 600 seconds
Server life time-out: 600 seconds
Maximum number of requests allowed on a connection: 1
HTTP secure server capability: Present
HTTP secure server status: Disabled
HTTP secure server port: 443
HTTP secure server ciphersuite: 3des-ede-cbc-sha des-cbc-sha rc4-128-md5 rc4-12a
HTTP secure server client authentication: Disabled
HTTP secure server trustpoint:
```

```
Device# configure terminal
Device(config)# ip http secure-server
Device(config)# ip http client secure-trustpoint CA-trust-local
Device(config)# ip http secure-port 1024
Invalid secure port value.
Device(config)# ip http secure-port 1025
Device(config)# ip http secure-ciphersuite rc4-128-sha rc4-128-md5
Device(config)# end
```

```
Device# show ip http serversecure status

HTTP secure server status: Enabled
HTTP secure server port: 1025
HTTP secure server ciphersuite: rc4-128-md5 rc4-128-sha
HTTP secure server client authentication: Disabled
HTTP secure server trustpoint: CA-trust-local
```

In the following example, the CA trustpoint CA-trust-local is specified, and the HTTPS client is configured to use this trustpoint for client authentication requests:

```

Device# config terminal
Device(config)# crypto ca trustpoint CA-trust-local
Device(ca-trustpoint)# enrollment url http://example.com
Device(ca-trustpoint)# crl query ldap://example.com
Device(ca-trustpoint)# primary
Device(ca-trustpoint)# exit
Device(config)# ip http client secure-trustpoint CA-trust-local
Device(config)# end
Device# copy running-config startup-config

```

Feature Information for Secure Socket Layer HTTP

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.

Glossary

RSA—RSA is a widely used Internet encryption and authentication system that uses public and private keys for encryption and decryption. The RSA algorithm was invented in 1978 by Ron Rivest, Adi Shamir, and Leonard Adleman. The abbreviation RSA comes from the first letter of the last names of the three original

developers. The RSA algorithm is included in many applications, such as the web browsers from Microsoft and Netscape. The RSA encryption system is owned by RSA Security.

SHA—The Secure Hash Algorithm. SHA was developed by NIST and is specified in the Secure Hash Standard (SHS, FIPS 180). Often used as an alternative to Digest 5 algorithm.

signatures, digital—In the context of SSL, “signing” means to encrypt with a private key. In digital signing, one-way hash functions are used as input for a signing algorithm. In RSA signing, a 36-byte structure of two hashes (one SHA and one MD5) is signed (encrypted with the private key).

SSL 3.0—Secure Socket Layer version 3.0. SSL is a security protocol that provides communications privacy over the Internet. The protocol allows client and server applications to communicate in a way that is designed to prevent eavesdropping, tampering, or message forgery. SSL uses a program layer located between the Internet’s HTTP and TCP layers. SSL is included as part of most web server products and as part of most Internet browsers. The SSL 3.0 specification can be found at <https://tools.ietf.org/html/rfc6101>.

CHAPTER 66

Access Control List Overview

Access lists filter network traffic by controlling the forwarding or blocking of packets at the interface of a device. A device examines each packet to determine whether to forward or drop that packet, based on the criteria specified in access lists.

The criteria that can be specified in an access list include the source address of the traffic, the destination address of the traffic, and the upper-layer protocol.

Note Some users might successfully evade basic access lists because these lists require no authentication.

- [Information About Access Control Lists, on page 1297](#)

Information About Access Control Lists

Definition of an Access List

An access list is a sequential list consisting of at least one **permit** statement and possibly one or more **deny** statements. In the case of IP access lists, the statements can apply to IP addresses, upper-layer IP protocols, or other fields in IP packets. The access list is identified and referenced by a name or a number. Access list acts as a packet filter, filtering packets based on the criteria defined in the access list.

An access list may be configured, but it does not take effect until the access list is either applied to an interface, a virtual terminal line (vty), or referenced by some command that accepts an access list. Multiple commands can reference the same access list.

The following configuration example shows how to create an IP access list named `branchoffices`. The ACL is applied to serial interface 0 on incoming packets. No sources other than those on the networks specified by each source address and mask pair can access this interface. The destinations for packets coming from sources on network 172.20.7.0 are unrestricted. The destination for packets coming from sources on network 172.29.2.0 must be 172.25.5.4.

```
ip access-list extended branchoffices
 10 permit 172.20.7.0 0.0.0.3 any
 20 permit 172.29.2.0 0.0.0.255 host 172.25.5.4
!
interface serial 0
 ip access-group branchoffices in
```

Functions of an Access Control List

There are many reasons to configure access lists; for example, to restrict contents of routing updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide security for your network, which is the focus of this module.

Use access lists to provide a basic level of security for accessing your network. If you do not configure access lists on your device, all packets passing through the device are allowed access to all parts of your network.

Access lists can allow a host to access a part of your network and prevent another host from accessing the same area. In the figure below, Host A is allowed to access the Human Resources network, but Host B is prevented from accessing the Human Resources network.

You can also use access lists to define the type of traffic that is forwarded or blocked at device interfaces. For example, you can permit e-mail traffic to be routed but at the same time block all Telnet traffic.

Purpose of IP Access Lists

Access lists perform packet filtering to control which packets move through the network and where. Such control can help limit network traffic and restrict the access of users and devices to the network. Access lists have many uses, and therefore many commands accept a reference to an access list in their command syntax. Access lists can be used to do the following:

- Filter incoming packets on an interface.
- Filter outgoing packets on an interface.
- Restrict the contents of routing updates.
- Limit debug output based on an address or protocol.
- Control virtual terminal line access.
- Identify or classify traffic for advanced features, such as congestion avoidance, congestion management, and priority and custom queuing.
- Trigger dial-on-demand routing (DDR) calls.

Reasons to Configure ACLs

There are many reasons to configure access lists; for example, you can use access lists to restrict contents of switching updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide a basic level of security for your network by controlling access to it. If you do not configure access lists on your device, all packets passing through the device could be allowed onto all parts of your network.

An access list can allow one host to access a part of your network and prevent another host from accessing the same area. For example, by applying an appropriate access list to interfaces of a device, Host A is allowed to access the human resources network and Host B is prevented from accessing the human resources network.

You can use access lists on a device that is positioned between two parts of your network, to control traffic entering or exiting a specific part of your internal network.

To provide some security benefits of access lists, you should at least configure access lists on border devices—devices located at the edges of your networks. Such an access list provides a basic buffer from the

outside network or from a less controlled area of your own network into a more sensitive area of your network. On these border devices, you should configure access lists for each network protocol configured on the device interfaces. You can configure access lists so that inbound traffic or outbound traffic or both are filtered on an interface.

Access lists are defined on a per-protocol basis. In other words, you should define access lists for every protocol enabled on an interface if you want to control traffic flow for that protocol.

Software Processing of an Access List

The following general steps describe how the an access list is processed when it is applied to an interface, a vty, or referenced by any command. These steps apply to an access list that has 13 or fewer access list entries.

- The software receives an IP packet and tests parts of each packet being filtered against the conditions in the access list, one condition (**permit** or **deny** statement) at a time. For example, the software tests the source and destination addresses of the packet against the source and destination addresses in a **permit** or **deny** statement.
- If a packet does not match an access list statement, the packet is then tested against the next statement in the list.
- If a packet and an access list statement match, the rest of the statements in the list are skipped and the packet is permitted or denied as specified in the matched statement. The first entry that the packet matches determines whether the software permits or denies the packet. That is, after the first match, no subsequent entries are considered.
- If the access list denies a packet, the software discards the packet and returns an Internet Control Message Protocol (ICMP) Host Unreachable message.
- If no conditions match, the software drops the packet. This is because each access list ends with an unwritten, implicit **deny** statement. That is, if the packet has not been permitted by the time it was tested against each statement, it is denied.

An access list with more than 13 entries is processed using a trie-based lookup algorithm. This process will happen automatically; it does not need to be configured.

Access List Rules

The following rules apply to access control lists (ACLs):

- Only one access list per interface, per protocol, and per direction is allowed.
- An access list must contain at least one **permit** statement or all packets are denied entry into the network.
- The order in which access list conditions or match criteria are configured is important. While deciding whether to forward or block a packet, Cisco software tests the packet against each criteria statement in the order in which these statements are created. After a match is found, no more criteria statements are checked. The same **permit** or **deny** statements specified in a different order can result in a packet being passed under one circumstance and denied in another circumstance.
- If an access list is referenced by a name, but the access list does not exist, all packets pass. An interface or command with an empty access list applied to it permits all traffic into the network.
- Standard access lists and extended access lists cannot have the same name.

- Inbound access lists process packets before packets are sent to an outbound interface. Inbound access lists that have filtering criteria that deny packet access to a network saves the overhead of a route lookup. Packets that are permitted access to a network based on the configured filtering criteria are processed for routing. For inbound access lists, when you configure a **permit** statement, packets are processed after they are received, and when you configure a **deny** statement, packets are discarded.
- Outbound access lists process packets before they leave the device. Incoming packets are routed to the outbound interface and then processed by the outbound access list. For outbound access lists, when you configure a **permit** statement, packets are sent to the output buffer, and when you configure a **deny** statement, packets are discarded.
- An access list can control traffic arriving at a device or leaving a device, but not traffic originating at a device.

Helpful Hints for Creating IP Access Lists

The following tips will help you avoid unintended consequences and help you create more efficient access lists.

- Create the access list before applying it to an interface (or elsewhere), because if you apply a nonexistent access list to an interface and then proceed to configure the access list, the first statement is put into effect, and the implicit **deny** statement that follows could cause you immediate access problems.
- Another reason to configure an access list before applying it is because an interface with an empty access list applied to it permits all traffic.
- All access lists need at least one **permit** statement; otherwise, all packets are denied and no traffic passes.
- Because the software stops testing conditions after it encounters the first match (to either a **permit** or **deny** statement), you will reduce processing time and resources if you put the statements that packets are most likely to match at the beginning of the access list. Place more frequently occurring conditions before less frequent conditions.
- Organize your access list so that more specific references in a network or subnet appear before more general ones.
- Use the statement **permit any any** if you want to allow all other packets not already denied. Using the statement **permit any any** in effect avoids denying all other packets with the implicit deny statement at the end of an access list. Do not make your first access list entry **permit any any** because all traffic will get through; no packets will reach the subsequent testing. In fact, once you specify **permit any any**, all traffic not already denied will get through.
- Although all access lists end with an implicit **deny** statement, we recommend use of an explicit **deny** statement (for example, **deny ip any any**). On most platforms, you can display the count of packets denied by issuing the **show access-list** command, thus finding out more information about who your access list is disallowing. Only packets denied by explicit **deny** statements are counted, which is why the explicit **deny** statement will yield more complete data for you.
- While you are creating an access list or after it is created, you might want to delete an entry.
 - You cannot delete an entry from a numbered access list; trying to do so will delete the entire access list. If you need to delete an entry, you need to delete the entire access list and start over.
 - You can delete an entry from a named access list. Use the **no permit** or **no deny** command to delete the appropriate entry.

- In order to make the purpose of individual statements more scannable and easily understood at a glance, you can write a helpful remark before or after any statement by using the **remark** command.
- If you want to deny access to a particular host or network and find out if someone from that network or host is attempting to gain access, include the **log** keyword with the corresponding **deny** statement so that the packets denied from that source are logged for you.
- This hint applies to the placement of your access list. When trying to save resources, remember that an inbound access list applies the filter conditions before the routing table lookup. An outbound access list applies the filter conditions after the routing table lookup.

IP Packet Fields You Can Filter to Control Access

You can use an extended access list to filter on any of the following fields in an IP packet. Source address and destination address are the two most frequently specified fields on which to base an access list:

- Source address--Specifies a source address to control packets coming from certain networking devices or hosts.
- Destination address--Specifies a destination address to control packets being sent to certain networking devices or hosts.
- Protocol--Specifies an IP protocol indicated by the keyword **eigrp**, **gre**, **icmp**, **igmp**, **ip**, **ipinip**, **nos**, **ospf**, **tcp**, or **udp**, or indicated by an integer in the range from 0 to 255 (representing an Internet protocol). If you specify a transport layer protocol (**icmp**, **igmp**, **tcp**, or **udp**), the command has a specific syntax.
 - Ports and non-contiguous ports--Specifies TCP or UDP ports by a port name or port number. The port numbers can be noncontiguous port numbers. Port numbers can be useful to filter Telnet traffic or HTTP traffic, for example.
 - TCP flags--Specifies that packets match any flag or all flags set in TCP packets. Filtering on specific TCP flags can help prevent false synchronization packets.
- IP options--Specifies IP options; one reason to filter on IP options is to prevent routers from being saturated with spurious packets containing them.

Source and Destination Addresses

Source and destination address fields in an IP packet are two typical fields on which to base an access list. Specify source addresses to control the packets being sent from certain networking devices or hosts. Specify destination addresses to control the packets being sent to certain networking devices or hosts.

Wildcard Mask for Addresses in an Access List

Address filtering uses wildcard masking to indicate to the software whether to check or ignore corresponding IP address bits when comparing the address bits in an access list entry to a packet being submitted to the access list. By carefully setting wildcard masks, you can specify one or more IP addresses for permit or deny tests.

Wildcard masking for IP address bits uses the number 1 and the number 0 to specify how the software treats the corresponding IP address bits. A wildcard mask is sometimes referred to as an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet (network) mask.

- A wildcard mask bit 0 means check the corresponding bit value; they must match.
- A wildcard mask bit 1 means ignore that corresponding bit value; they need not match.

If you do not supply a wildcard mask with a source or destination address in an access list statement, the software assumes an implicit wildcard mask of 0.0.0.0, meaning all values must match.

Unlike subnet masks, which require contiguous bits indicating network and subnet to be ones, wildcard masks allow noncontiguous bits in the mask.

The table below shows examples of IP addresses and masks from an access list, along with the corresponding addresses that are considered a match.

Table 132: Sample IP Addresses, Wildcard Masks, and Match Results

Address	Wildcard Mask	Match Results
0.0.0.0	255.255.255.255	All addresses will match the access list conditions.
172.18.0.0/16	0.0.255.255	Network 172.18.0.0
172.18.5.2/16	0.0.0.0	Only host 172.18.5.2 matches
172.18.8.0	0.0.0.7	Only subnet 172.18.8.0/29 matches
172.18.8.8	0.0.0.7	Only subnet 172.18.8.8/29 matches
172.18.8.15	0.0.0.3	Only subnet 172.18.8.15/30 matches
10.1.2.0	0.0.254.255 (noncontiguous bits in mask)	Matches any even-numbered network in the range of 10.1.2.0 to 10.1.254.0

Access List Sequence Numbers

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within an access list. If you wanted to insert an entry in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When you add a new entry, you specify the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

ACL Supported Types

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

Supported ACLs

The switch supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply port ACLs to a Layer 2 interface in each direction to each access list type — IPv4 and MAC.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).
- VLAN ACLs or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

ACL Precedence

When VLAN maps, Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least for ingress traffic is port ACL, VLAN map, and then router ACL. For egress traffic, the filtering precedence is router ACL, VLAN map, and then port ACL.

The following examples describe simple use cases:

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map
- When an input router ACL and input port ACL exist in a switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
- When a VLAN map, input router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.
- When a VLAN map, output router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

Port ACLs

Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces. Port ACLs can be applied to the interface in outbound and inbound direction. The following access lists are supported:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information

- MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

Figure 94: Using ACLs to Control Traffic in a Network

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the

inbound direction.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

Note You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

Router ACLs

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.

Access Control Entries

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies *permit* or *deny* and a set of conditions the packet must satisfy in order to match the ACE. The meaning of *permit* or *deny* depends on the context in which the ACL is used.

ACEs and Fragmented and Unfragmented Traffic

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.

Note For TCP ACEs with L4 Ops, the fragmented packets will be dropped per RFC 1858.

- Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

ACEs and Fragmented and Unfragmented Traffic Examples

Consider access list 102, configured with these commands, applied to three fragmented packets:

```
Device(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Device(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Device(config)# access-list 102 permit tcp any host 10.1.1.2
Device(config)# access-list 102 deny tcp any any
```

Note In the first and second ACEs in the examples, the *eq* keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

- Packet A is a TCP packet from host 10.2.2.2., port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.
- Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit).

Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

- Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.

CHAPTER 67

Configuring IPv4 Access Control Lists

Access control lists (ACLs) perform packet filtering to control which packets move through the network and where. Such control provides security by helping to limit network traffic, restrict the access of users and devices to the network, and prevent traffic from leaving a network. IP access lists can reduce the chance of spoofing and denial-of-service attacks and allow dynamic, temporary user access through a firewall.

IP access lists can also be used for purposes other than security, such as bandwidth control, restricting the content of routing updates, redistributing routes, triggering dial-on-demand (DDR) calls, limiting debug output, and identifying or classifying traffic for quality of service (QoS) features. This module provides an overview of IP access lists.

Prerequisites for Configuring IPv4 Access Control Lists

This section lists the prerequisites for configuring network security with access control lists (ACLs).

- On switches running the LAN base feature set, VLAN maps are supported.

Restrictions for Configuring IPv4 Access Control Lists

General Network Security

The following are restrictions for configuring network security with ACLs:

- Not all commands that accept a numbered ACL accept a named ACL. ACLs for packet filters and route filters on interfaces can use a name.

- A standard ACL and an extended ACL cannot have the same name.
- Though visible in the command-line help strings, **AppleTalk** is not supported as a matching condition for the **deny** and **permit** MAC access-list configuration mode commands.
- ACL wild card is not supported in downstream client policy.

IPv4 ACL Network Interfaces

The following restrictions apply to IPv4 ACLs to network interfaces:

- When controlling access to an interface, you can use a named or numbered ACL.
- If you apply an ACL to a Layer 3 interface and routing is not enabled on the switch, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic.
- You do not have to enable routing to apply ACLs to Layer 2 interfaces.

MAC ACLs on a Layer 2 Interface

After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:

- You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.
- A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.

Note The **mac access-group** interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

IP Access List Entry Sequence Numbering

- This feature does not support dynamic, reflexive, or firewall access lists.

Information About Configuring IPv4 Access Control Lists

ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch

forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

Standard and Extended IPv4 ACLs

This section describes IP ACLs.

An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

IPv4 ACL Switch Unsupported Features

Configuring IPv4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers.

The following ACL-related features are not supported:

- Non-IP protocol ACLs
- IP accounting
- Reflexive ACLs and dynamic ACLs are not supported.

Access List Numbers

The number you use to denote your ACL shows the type of access list that you are creating.

This lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

Table 133: Access List Numbers

Access List Number	Type	Supported
1–99	IP standard access list	Yes
100–199	IP extended access list	Yes
200–299	Protocol type-code access list	No

Access List Number	Type	Supported
300–399	DECnet access list	No
400–499	XNS standard access list	No
500–599	XNS extended access list	No
600–699	AppleTalk access list	No
700–799	48-bit MAC address access list	No
800–899	IPX standard access list	No
900–999	IPX extended access list	No
1000–1099	IPX SAP access list	No
1100–1199	Extended 48-bit MAC address access list	No
1200–1299	IPX summary address access list	No
1300–1999	IP standard access list (expanded range)	Yes
2000–2699	IP extended access list (expanded range)	Yes

In addition to numbered standard and extended ACLs, you can also create standard and extended named IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Numbered Standard IPv4 ACLs

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.

The switch always rewrites the order of standard access lists so that entries with **host** matches and entries with matches having a *don't care* mask of 0.0.0.0 are moved to the top of the list, above any entries with non-zero *don't care* masks. Therefore, in **show** command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to VLANs, to terminal lines, or to interfaces.

Numbered Extended IPv4 ACLs

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Some protocols also have specific parameters and keywords that apply to that protocol.

You can define an extended TCP, UDP, ICMP, IGMP, or other IP ACL. The switch also supports these IP protocols:

Note ICMP echo-reply cannot be filtered. All other ICMP codes or types can be filtered.

These IP protocols are supported:

- Authentication Header Protocol (**ahp**)
- Encapsulation Security Payload (**esp**)
- Enhanced Interior Gateway Routing Protocol (**eigrp**)
- generic routing encapsulation (**gre**)
- Internet Control Message Protocol (**icmp**)
- Internet Group Management Protocol (**igmp**)
- any Interior Protocol (**ip**)
- IP in IP tunneling (**ipinip**)
- KA9Q NOS-compatible IP over IP tunneling (**nos**)
- Open Shortest Path First routing (**ospf**)
- Payload Compression Protocol (**pcp**)
- Protocol-Independent Multicast (**pim**)
- Transmission Control Protocol (**tcp**)
- User Datagram Protocol (**udp**)

Named IPv4 ACLs

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named access list.

Note The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99 and . The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Consider these guidelines before configuring named ACLs:

- Numbered ACLs are also available.

- A standard ACL and an extended ACL cannot have the same name.
- You can use standard or extended ACLs (named or numbered) in VLAN maps.

Benefits of Using the Named ACL Support for Noncontiguous Ports on an Access Control Entry Feature

The Named ACL Support for Noncontiguous Ports on an Access Control Entry feature allows you to specify noncontiguous ports in a single access control entry, which greatly reduces the number of entries required in an access control list when several entries have the same source address, destination address, and protocol, but differ only in the ports.

This feature greatly reduces the number of access control entries (ACEs) required in an access control list to handle multiple entries for the same source address, destination address, and protocol. If you maintain large numbers of ACEs, use this feature to consolidate existing groups of access list entries wherever it is possible and when you create new access list entries. When you configure access list entries with noncontiguous ports, you will have fewer access list entries to maintain.

Benefits of IP Access List Entry Sequence Numbering

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within an access list. If a user wanted to insert an entry (statement) in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When a user adds a new entry, the user chooses the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

Sequence Numbering Behavior

- For backward compatibility with previous releases, if entries with no sequence numbers are applied, the first entry is assigned a sequence number of 10, and successive entries are incremented by 10. The maximum sequence number is 2147483647. If the generated sequence number exceeds this maximum number, the following message is displayed:

```
Exceeded maximum sequence number.
```

- If the user enters an entry without a sequence number, it is assigned a sequence number that is 10 greater than the last sequence number in that access list and is placed at the end of the list.
- If the user enters an entry that matches an already existing entry (except for the sequence number), then no changes are made.
- If the user enters a sequence number that is already present, the following error message is generated:

```
Duplicate sequence number.
```

- If a new access list is entered from global configuration mode, then sequence numbers for that access list are generated automatically.
- Distributed support is provided so that the sequence numbers of entries in the Route Processor (RP) and line card are in synchronization at all times.

- Sequence numbers are not nvgened. That is, the sequence numbers themselves are not saved. In the event that the system is reloaded, the configured sequence numbers revert to the default sequence starting number and increment. The function is provided for backward compatibility with software releases that do not support sequence numbering.
- This feature works with named and numbered, standard and extended IP access lists.

Including comments in ACLs

You can use the **remark** keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the **access-list** *access-list number* **remark** *remark* global configuration command. To remove the remark, use the **no** form of this command.

The following is an example of a remark that describes function of the subsequent deny statement:

```
ip access-list extended telnetting
  remark Do not allow host1 subnet to telnet out
deny tcp host 172.16.2.88 any eq telnet
```

Hardware and Software Treatment of IP ACLs

ACL processing is performed in hardware. If the hardware reaches its capacity to store ACL configurations, all packets on that interface are dropped.

Note If an ACL configuration cannot be implemented in hardware due to an out-of-resource condition on a switch or stack member, then only the traffic in that VLAN arriving on that switch is affected.

When you enter the **show ip access-lists** privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the **show ip access-lists hardware** privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

Time Ranges for ACLs

You can selectively apply extended ACLs based on the time of day and the week by using the **time-range** global configuration command. First, define a time-range name and set the times and the dates or the days of the week in the time range. Then enter the time-range name when applying an ACL to set restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect, for example, during a specified time period or on specified days of the week. The **time-range** keyword and argument are referenced in the named and numbered extended ACL task tables.

These are some benefits of using time ranges:

- You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address/mask pair and a port number).
- You can control logging messages. ACL entries can be set to log traffic only at certain times of the day. Therefore, you can simply deny access without needing to analyze many logs generated during peak hours.

Time-based access lists trigger CPU activity because the new configuration of the access list must be merged with other features and the combined configuration loaded into the hardware memory. For this reason, you should be careful not to have several access lists configured to take affect in close succession (within a small number of minutes of each other.)

Note The time range relies on the switch system clock; therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock.

IPv4 ACL Interface Considerations

When you apply the **ip access-group** interface configuration command to a Layer 3 interface (an SVI, a Layer 3 EtherChannel, or a routed port), the interface must have been configured with an IP address. Layer 3 access groups filter packets that are routed or are received by Layer 3 processes on the CPU. They do not affect packets bridged within a VLAN.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the switch checks the packet against the ACL. If the ACL permits the packet, the switch sends the packet. If the ACL rejects the packet, the switch discards the packet.

By default, the input interface sends ICMP Unreachable messages whenever a packet is discarded, regardless of whether the packet was discarded because of an ACL on the input interface or because of an ACL on the output interface. ICMP Unreachables are normally limited to no more than one every one-half second per input interface, but this can be changed by using the **ip icmp rate-limit unreachable** global configuration command.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

Apply an Access Control List to an Interface

With some protocols, you can apply up to two access lists to an interface: one inbound access list and one outbound access list. With other protocols, you apply only one access list that checks both inbound and outbound packets.

If the access list is inbound, when a device receives a packet, Cisco software checks the access list's criteria statements for a match. If the packet is permitted, the software continues to process the packet. If the packet is denied, the software discards the packet.

If the access list is outbound, after receiving and routing a packet to the outbound interface, Cisco software checks the access list's criteria statements for a match. If the packet is permitted, the software transmits the packet. If the packet is denied, the software discards the packet.

Note Access lists that are applied to interfaces on a device do not filter traffic that originates from that device.

Figure 95: Topology for Applying Access Control Lists

The figure above shows that Device 2 is a bypass device that is connected to Device 1 and Device 3. An outbound access list is applied to Gigabit Ethernet interface 0/0/0 on Device 1. When you ping Device 3 from Device 1, the access list does not check for packets going outbound because the traffic is locally generated.

The access list check is bypassed for locally generated packets, which are always outbound.

By default, an access list that is applied to an outbound interface for matching locally generated traffic will bypass the outbound access list check; but transit traffic is subjected to the outbound access list check.

Note The behavior described above applies to all single-CPU platforms that run Cisco software.

ACL Logging

The switch software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the **logging console** commands controlling the syslog messages.

Note ACL logging is only supported for RACL.

Note Because routing is done in hardware and logging is done in software, if a large number of packets match a *permit* or *deny* ACE containing a **log** keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.

The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list

number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.

Note The logging facility might drop some logging message packets if there are too many to be handled or if there is more than one logging message to be handled in 1 second. This behavior prevents the router from crashing due to too many logging packets. Therefore, the logging facility should not be used as a billing tool or an accurate source of the number of matches to an access list.

How to Configure ACLs

Configuring IPv4 ACLs

Follow the procedure given below to use IP ACLs on the switch:

SUMMARY STEPS

1. Create an ACL by specifying an access list number or name and the access conditions.
2. Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

DETAILED STEPS

-
- Step 1** Create an ACL by specifying an access list number or name and the access conditions.
- Step 2** Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.
-

Creating a Numbered Standard ACL

Follow these steps to create a numbered standard ACL:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* {deny | permit} *source source-wildcard*]
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	access-list <i>access-list-number</i> { deny permit } <i>source source-wildcard</i>] Example: Device(config)# access-list 2 deny your_host	<p>Defines a standard IPv4 access list by using a source address and wildcard.</p> <p>The <i>access-list-number</i> is a decimal number from 1 to 99 or 1300 to 1999.</p> <p>Enter deny or permit to specify whether to deny or permit access if conditions are matched.</p> <p>The <i>source</i> is the source address of the network or host from which the packet is being sent specified as:</p> <ul style="list-style-type: none"> • The 32-bit quantity in dotted-decimal format. • The keyword any as an abbreviation for <i>source</i> and <i>source-wildcard</i> of 0.0.0.0 255.255.255.255. You do not need to enter a source-wildcard. • The keyword host as an abbreviation for source and <i>source-wildcard</i> of <i>source</i> 0.0.0.0. <p>(Optional) The <i>source-wildcard</i> applies wildcard bits to the source.</p> <p>Note Logging is supported only on ACLs attached to Layer 3 interfaces.</p>
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# show running-config	Verifies your entries.

	Command or Action	Purpose
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Creating a Numbered Extended ACL

Follow these steps to create a numbered extended ACL:

SUMMARY STEPS

- configure terminal**
- access-list** *access-list-number* {deny | permit} *protocol source source-wildcard destination destination-wildcard* [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*]
- access-list** *access-list-number* {deny | permit} **tcp** *source source-wildcard* [*operator port*] *destination destination-wildcard* [*operator port*] [established] [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*] [flag]
- access-list** *access-list-number* {deny | permit} **udp** *source source-wildcard* [*operator port*] *destination destination-wildcard* [*operator port*] [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*]
- access-list** *access-list-number* {deny | permit} **icmp** *source source-wildcard destination destination-wildcard* [*icmp-type* | [[*icmp-type icmp-code*] | [*icmp-message*]]] [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*]
- access-list** *access-list-number* {deny | permit} **igmp** *source source-wildcard destination destination-wildcard* [*igmp-type*] [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*]
- end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	access-list <i>access-list-number</i> {deny permit} <i>protocol source source-wildcard destination destination-wildcard</i> [precedence <i>precedence</i>] [tos <i>tos</i>] [fragments] [log [log-input] [time-range <i>time-range-name</i>] [dscp <i>dscp</i>] Example: Device(config)# <code>access-list 101 permit ip host</code>	Defines an extended IPv4 access list and the access conditions. The <i>access-list-number</i> is a decimal number from 100 to 199 or 2000 to 2699. Enter deny or permit to specify whether to deny or permit the packet if conditions are matched.

	Command or Action	Purpose
	10.1.1.2 any precedence 0 tos 0 log	<p>For <i>protocol</i>, enter the name or number of an P protocol: ahp, eigrp, esp, gre, icmp, igmp, igrp, ip, ipinip, nos, ospf, pcp, pim, tcp, or udp, or an integer in the range 0 to 255 representing an IP protocol number. To match any Internet protocol (including ICMP, TCP, and UDP), use the keyword ip.</p> <p>Note This step includes options for most IP protocols. For additional specific parameters for TCP, UDP, ICMP, and IGMP, see the following steps.</p> <p>The <i>source</i> is the number of the network or host from which the packet is sent.</p> <p>The <i>source-wildcard</i> applies wildcard bits to the source.</p> <p>The <i>destination</i> is the network or host number to which the packet is sent.</p> <p>The <i>destination-wildcard</i> applies wildcard bits to the destination.</p> <p>Source, source-wildcard, destination, and destination-wildcard can be specified as:</p> <ul style="list-style-type: none"> • The 32-bit quantity in dotted-decimal format. • The keyword any for 0.0.0.0 255.255.255.255 (any host). • The keyword host for a single host 0.0.0.0. <p>The other keywords are optional and have these meanings:</p> <ul style="list-style-type: none"> • precedence—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: routine (0), priority (1), immediate (2), flash (3), flash-override (4), critical (5), internet (6), network (7). • fragments—Enter to check non-initial fragments. • tos—Enter to match by type of service level, specified by a number from 0 to 15 or a name: normal (0), max-reliability (2), max-throughput (4), min-delay (8). • log—Enter to create an informational logging message to be sent to the console about the packet that matches the entry or log-input to include the input interface in the log entry. • time-range—Specify the time-range name.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • dscp—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values. <p>Note If you enter a dscp value, you cannot enter tos or precedence. You can enter both a tos and a precedence value with no dscp.</p>
Step 3	<p>access-list <i>access-list-number</i> {deny permit} tcp <i>source source-wildcard</i> [<i>operator port</i>] <i>destination destination-wildcard</i> [<i>operator port</i>] [established] [precedence <i>precedence</i>] [tos <i>tos</i>] [fragments] [log [log-input] [time-range <i>time-range-name</i>] [dscp <i>dscp</i>] [<i>flag</i>]</p> <p>Example:</p> <pre>Device(config)# access-list 101 permit tcp any any eq 500</pre>	<p>Defines an extended TCP access list and the access conditions.</p> <p>The parameters are the same as those described for an extended IPv4 ACL, with these exceptions:</p> <p>(Optional) Enter an <i>operator</i> and <i>port</i> to compare source (if positioned after <i>source source-wildcard</i>) or destination (if positioned after <i>destination destination-wildcard</i>) port. Possible operators include eq (equal), gt (greater than), lt (less than), neq (not equal), and range (inclusive range). Operators require a port number (range requires two port numbers separated by a space).</p> <p>Enter the <i>port</i> number as a decimal number (from 0 to 65535) or the name of a TCP port. Use only TCP port numbers or names when filtering TCP.</p> <p>The other optional keywords have these meanings:</p> <ul style="list-style-type: none"> • established—Enter to match an established connection. This has the same function as matching on the ack or rst flag. • <i>flag</i>—Enter one of these flags to match by the specified TCP header bits: ack (acknowledge), fin (finish), psh (push), rst (reset), syn (synchronize), or urg (urgent).
Step 4	<p>access-list <i>access-list-number</i> {deny permit} udp <i>source source-wildcard</i> [<i>operator port</i>] <i>destination destination-wildcard</i> [<i>operator port</i>] [precedence <i>precedence</i>] [tos <i>tos</i>] [fragments] [log [log-input] [time-range <i>time-range-name</i>] [dscp <i>dscp</i>]</p> <p>Example:</p> <pre>Device(config)# access-list 101 permit udp any any eq 100</pre>	<p>(Optional) Defines an extended UDP access list and the access conditions.</p> <p>The UDP parameters are the same as those described for TCP except that the [<i>operator</i> [<i>port</i>]] port number or name must be a UDP port number or name, and the flag and established keywords are not valid for UDP.</p>
Step 5	<p>access-list <i>access-list-number</i> {deny permit} icmp <i>source source-wildcard</i> <i>destination destination-wildcard</i> [<i>icmp-type</i> [[<i>icmp-type icmp-code</i>] [<i>icmp-message</i>]]] [precedence <i>precedence</i>] [tos <i>tos</i>] [fragments] [log [log-input] [time-range <i>time-range-name</i>] [dscp <i>dscp</i>]</p>	<p>Defines an extended ICMP access list and the access conditions.</p> <p>The ICMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with the</p>

	Command or Action	Purpose
	<p>Example:</p> <pre>Device(config)# access-list 101 permit icmp any any 200</pre>	<p>addition of the ICMP message type and code parameters. These optional keywords have these meanings:</p> <ul style="list-style-type: none"> • <i>icmp-type</i>—Enter to filter by ICMP message type, a number from 0 to 255. • <i>icmp-code</i>—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255. • <i>icmp-message</i>—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name.
Step 6	<p>access-list <i>access-list-number</i> {deny permit} igmp <i>source source-wildcard destination destination-wildcard</i> [<i>igmp-type</i>] [precedence <i>precedence</i>] [tos <i>tos</i>] [fragments] [log [log-input] [time-range <i>time-range-name</i>] [dscp <i>dscp</i>]</p> <p>Example:</p> <pre>Device(config)# access-list 101 permit igmp any any 14</pre>	<p>(Optional) Defines an extended IGMP access list and the access conditions.</p> <p>The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with this optional parameter.</p> <p><i>igmp-type</i>—To match IGMP message type, enter a number from 0 to 15, or enter the message name: dvmrp, host-query, host-report, pim, or trace.</p>
Step 7	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>

Creating Named Standard ACLs

Follow these steps to create a standard ACL using names:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list standard** *name*
4. Use one of the following:
 - **deny** {*source* [*source-wildcard*] | **host** *source* | **any**} [**log**]
 - **permit** {*source* [*source-wildcard*] | **host** *source* | **any**} [**log**]
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ip access-list standard <i>name</i> Example: <pre>Device(config)# ip access-list standard 20</pre>	Defines a standard IPv4 access list using a name, and enter access-list configuration mode. The name can be a number from 1 to 99.
Step 4	Use one of the following: <ul style="list-style-type: none"> • deny {<i>source</i> [<i>source-wildcard</i>] host <i>source</i> any} [log] • permit {<i>source</i> [<i>source-wildcard</i>] host <i>source</i> any} [log] Example: <pre>Device(config-std-nacl)# deny 192.168.0.0 0.0.255.255 255.255.0.0 0.0.255.255</pre> or <pre>Device(config-std-nacl)# permit 10.108.0.0 0.0.0.0 255.255.255.0 0.0.0.0</pre>	In access-list configuration mode, specify one or more conditions denied or permitted to decide if the packet is forwarded or dropped. <ul style="list-style-type: none"> • host <i>source</i>—A source and source wildcard of <i>source</i> 0.0.0.0. • any—A source and source wildcard of 0.0.0.0 255.255.255.255.
Step 5	end Example: <pre>Device(config-std-nacl)# end</pre>	Returns to privileged EXEC mode.
Step 6	show running-config Example: <pre>Device# show running-config</pre>	Verifies your entries.

	Command or Action	Purpose
Step 7	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Creating Extended Named ACLs

Follow the procedure given below to create an extended ACL using names:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended *name***
4. **{deny | permit} protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [precedence precedence] [tos tos] [established] [log] [time-range time-range-name]**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	ip access-list extended <i>name</i> Example: Device(config)# <code>ip access-list extended 150</code>	Defines an extended IPv4 access list using a name, and enter access-list configuration mode. The name can be a number from 100 to 199.
Step 4	{deny permit} protocol {source [source-wildcard] host source any} {destination [destination-wildcard] host destination any} [precedence precedence] [tos tos] [established] [log] [time-range time-range-name]	In access-list configuration mode, specify the conditions allowed or denied. Use the log keyword to get access list logging messages, including violations.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device(config-ext-nacl)# permit 0 any any</pre>	<ul style="list-style-type: none"> • host source—A source and source wildcard of <i>source</i> 0.0.0.0. • host destination—A destination and destination wildcard of <i>destination</i> 0.0.0.0. • any—A source and source wildcard or destination and destination wildcard of 0.0.0.0 255.255.255.255.
Step 5	<p>end</p> <p>Example:</p> <pre>Device(config-ext-nacl)# end</pre>	Returns to privileged EXEC mode.
Step 6	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 7	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

When you are creating extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use **no permit** and **no deny** access-list configuration mode commands to remove entries from a named ACL.

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

What to do next

After creating a named ACL, you can apply it to interfaces or to VLANs.

Configuring an Access Control Entry with Noncontiguous Ports

Perform this task to create access list entries that use noncontiguous TCP or UDP port numbers. Although this task uses TCP ports, you could use the UDP syntax of the **permit** and **deny** commands to filter noncontiguous UDP ports.

Although this task uses a **permit** command first, use the **permit** and **deny** commands in the order that achieves your filtering goals.

Note The ACL—Named ACL Support for Noncontiguous Ports on an Access Control Entry feature can be used only with named, extended ACLs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended** *access-list-name*
4. [*sequence-number*] **permit tcp** *source source-wildcard* [*operator port [port]*] *destination destination-wildcard* [*operator [port]*] [**established** {**match-any** | **match-all**} {+ | -} *flag-name*] [**precedence** *precedence*] [**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
5. [*sequence-number*] **deny tcp** *source source-wildcard* [*operator port [port]*] *destination destination-wildcard* [*operator [port]*] [**established** {**match-any** | **match-all**} {+ | -} *flag-name*] [**precedence** *precedence*] [**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
6. Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the **no** *sequence-number* command to delete an entry.
7. **end**
8. **show ip access-lists** *access-list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip access-list extended <i>access-list-name</i> Example: Device(config)# ip access-list extended acl-extd-1	Specifies the IP access list by name and enters named access list configuration mode.
Step 4	[<i>sequence-number</i>] permit tcp <i>source source-wildcard</i> [<i>operator port [port]</i>] <i>destination destination-wildcard</i> [<i>operator [port]</i>] [established { match-any match-all } {+ -} <i>flag-name</i>] [precedence <i>precedence</i>] [tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] Example: Device(config-ext-nacl)# permit tcp any eq telnet ftp any eq 450 679	Specifies a permit statement in named IP access list configuration mode. <ul style="list-style-type: none"> • Operators include lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range). • If the operator is positioned after the source and source-wildcard arguments, it must match the source port. If the operator is positioned after the destination and destination-wildcard arguments, it must match the destination port.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The range operator requires two port numbers. You can configure up to 10 ports after the eq and neq operators. All other operators require one port number. To filter UDP ports, use the UDP syntax of this command.
Step 5	<p>[<i>sequence-number</i>] deny tcp <i>source source-wildcard</i> [<i>operator port [port]</i>] <i>destination destination-wildcard</i> [<i>operator [port]</i>] [established {match-any match-all} {+ -} <i>flag-name</i>] [precedence <i>precedence</i>] [tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments]</p> <p>Example:</p> <pre>Device(config-ext-nacl)# deny tcp any neq 45 565 632</pre>	<p>(Optional) Specifies a deny statement in named access list configuration mode.</p> <ul style="list-style-type: none"> Operators include lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range). If the <i>operator</i> is positioned after the <i>source</i> and <i>source-wildcard</i> arguments, it must match the source port. If the <i>operator</i> is positioned after the <i>destination</i> and <i>destination-wildcard</i> arguments, it must match the destination port. The range operator requires two port numbers. You can configure up to 10 ports after the eq and neq operators. All other operators require one port number. To filter UDP ports, use the UDP syntax of this command.
Step 6	Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the no <i>sequence-number</i> command to delete an entry.	Allows you to revise the access list.
Step 7	<p>end</p> <p>Example:</p> <pre>Device(config-ext-nacl)# end</pre>	(Optional) Exits named access list configuration mode and returns to privileged EXEC mode.
Step 8	<p>show ip access-lists <i>access-list-name</i></p> <p>Example:</p> <pre>Device# show ip access-lists kmd1</pre>	(Optional) Displays the contents of the access list.

Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry

Perform this task to consolidate a group of access list entries with noncontiguous ports into one access list entry.

Although this task uses TCP ports, you could use the UDP syntax of the **permit** and **deny** commands to filter noncontiguous UDP ports.

Although this task uses a **permit** command first, use the **permit** and **deny** commands in the order that achieves your filtering goals.

SUMMARY STEPS

1. **enable**
2. **show ip access-lists** *access-list-name*
3. **configure terminal**
4. **ip access-list extended** *access-list-name*
5. **no** [*sequence-number*] **permit** *protocol source source-wildcard destination destination-wildcard*[**option** *option-name*] [**precedence** *precedence*][**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
6. [*sequence-number*] **permit** *protocol source source-wildcard*[*operator port*[*port*]] *destination destination-wildcard*[*operator port*[*port*]] [**option** *option-name*] [**precedence** *precedence*][**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
7. Repeat Steps 5 and 6 as necessary, adding **permit** or **deny** statements to consolidate access list entries where possible. Use the **no** *sequence-number* command to delete an entry.
8. **end**
9. **show ip access-lists** *access-list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	show ip access-lists <i>access-list-name</i> Example: Device# show ip access-lists mylist1	(Optional) Displays the contents of the IP access list. <ul style="list-style-type: none">• Review the output to see if you can consolidate any access list entries.
Step 3	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 4	ip access-list extended <i>access-list-name</i> Example: Device(config)# ip access-list extended mylist1	Specifies the IP access list by name and enters named access list configuration mode.
Step 5	no [<i>sequence-number</i>] permit <i>protocol source source-wildcard destination destination-wildcard</i> [option <i>option-name</i>] [precedence <i>precedence</i>][tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] Example: Device(config-ext-nacl)# no 10	Removes the redundant access list entry that can be consolidated. <ul style="list-style-type: none">• Repeat this step to remove entries to be consolidated because only the port numbers differ.• After this step is repeated to remove the access list entries 20, 30, and 40, for example, those entries are removed because they will be consolidated into one permit statement.• If a <i>sequence-number</i> is specified, the rest of the command syntax is optional.

	Command or Action	Purpose
Step 6	<p>[<i>sequence-number</i>] permit <i>protocol source source-wildcard</i>[<i>operator port</i>[<i>port</i>]] <i>destination destination-wildcard</i>[<i>operator port</i>[<i>port</i>]] [option <i>option-name</i>] [precedence <i>precedence</i>][tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments]</p> <p>Example:</p> <pre>Device(config-ext-nacl)# permit tcp any neq 45 565 632 any eq 23 45 34 43</pre>	<p>Specifies a permit statement in named access list configuration mode.</p> <ul style="list-style-type: none"> • In this instance, a group of access list entries with noncontiguous ports was consolidated into one permit statement. • You can configure up to 10 ports after the eq and neq operators.
Step 7	Repeat Steps 5 and 6 as necessary, adding permit or deny statements to consolidate access list entries where possible. Use the no <i>sequence-number</i> command to delete an entry.	Allows you to revise the access list.
Step 8	<p>end</p> <p>Example:</p> <pre>Device(config-std-nacl)# end</pre>	(Optional) Exits named access list configuration mode and returns to privileged EXEC mode.
Step 9	<p>show ip access-lists <i>access-list-name</i></p> <p>Example:</p> <pre>Device# show ip access-lists mylist1</pre>	(Optional) Displays the contents of the access list.

Sequencing Access-List Entries and Revising the Access List

This task shows how to assign sequence numbers to entries in a named IP access list and how to add or delete an entry to or from an access list. When completing this task, keep the following points in mind:

- Resequencing the access list entries is optional. The resequencing step in this task is shown as required because that is one purpose of this feature and this task demonstrates that functionality.
- In the following procedure, the **permit** command is shown in Step 5 and the **deny** command is shown in Step 6. However, that order can be reversed. Use the order that suits the need of your configuration.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list resequence** *access-list-name starting-sequence-number increment*
4. **ip access-list** {**standard**|**extended**} *access-list-name*
5. Do one of the following:
 - *sequence-number* **permit** *source source-wildcard*
 - *sequence-number* **permit** *protocol source source-wildcard destination destination-wildcard* [**precedence** *precedence*][**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
6. Do one of the following:
 - *sequence-number* **deny** *source source-wildcard*

- *sequence-number deny protocol source source-wildcard destination destination-wildcard [precedence precedence][tos tos] [log] [time-range time-range-name] [fragments]*

7. Do one of the following:

- *sequence-number permit source source-wildcard*
- *sequence-number permit protocol source source-wildcard destination destination-wildcard [precedence precedence][tos tos] [log] [time-range time-range-name] [fragments]*

8. Do one of the following:

- *sequence-number deny source source-wildcard*
- *sequence-number deny protocol source source-wildcard destination destination-wildcard [precedence precedence][tos tos] [log] [time-range time-range-name] [fragments]*

9. Repeat Step 5 and/or Step 6 to add sequence number statements, as applicable.

10. **end**

11. **show ip access-lists** *access-list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip access-list resequence <i>access-list-name starting-sequence-number increment</i> Example: Device(config)# ip access-list resequence kmd1 100 15	Resequences the specified IP access list using the starting sequence number and the increment of sequence numbers.
Step 4	ip access-list {standard extended} <i>access-list-name</i> Example: Device(config)# ip access-list standard kmd1	Specifies the IP access list by name and enters named access list configuration mode. <ul style="list-style-type: none"> • If you specify standard, make sure you subsequently specify permit and/or deny statements using the standard access list syntax. • If you specify extended, make sure you subsequently specify permit and/or deny statements using the extended access list syntax.
Step 5	Do one of the following:	Specifies a permit statement in named IP access list mode.

	Command or Action	Purpose
	<ul style="list-style-type: none"> • <i>sequence-number</i> permit <i>source source-wildcard</i> • <i>sequence-number</i> permit <i>protocol source source-wildcard destination destination-wildcard</i> [precedence <i>precedence</i>][tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] <p>Example:</p> <pre>Device(config-std-nacl)# 105 permit 10.5.5.5 0.0.0.0 255</pre>	<ul style="list-style-type: none"> • This access list happens to use a permit statement first, but a deny statement could appear first, depending on the order of statements you need. • As the prompt indicates, this access list was a standard access list. If you had specified extended in Step 4, the prompt for this step would be Device(config-ext-nacl) and you would use the extended permit command syntax.
Step 6	<p>Do one of the following:</p> <ul style="list-style-type: none"> • <i>sequence-number</i> deny <i>source source-wildcard</i> • <i>sequence-number</i> deny <i>protocol source source-wildcard destination destination-wildcard</i> [precedence <i>precedence</i>][tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] <p>Example:</p> <pre>Device(config-std-nacl)# 105 deny 10.6.6.7 0.0.0.0 255</pre>	<p>(Optional) Specifies a deny statement in named IP access list mode.</p> <ul style="list-style-type: none"> • This access list uses a permit statement first, but a deny statement could appear first, depending on the order of statements you need. • As the prompt indicates, this access list was a standard access list. If you had specified extended in Step 4, the prompt for this step would be Device(config-ext-nacl) and you would use the extended deny command syntax.
Step 7	<p>Do one of the following:</p> <ul style="list-style-type: none"> • <i>sequence-number</i> permit <i>source source-wildcard</i> • <i>sequence-number</i> permit <i>protocol source source-wildcard destination destination-wildcard</i> [precedence <i>precedence</i>][tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] <p>Example:</p> <pre>Device(config-ext-nacl)# 150 permit tcp any any log</pre>	<p>Specifies a permit statement in named IP access list mode.</p> <ul style="list-style-type: none"> • This access list happens to use a permit statement first, but a deny statement could appear first, depending on the order of statements you need. • See the permit (IP) command for additional command syntax to permit upper layer protocols (ICMP, IGMP, TCP, and UDP). • Use the no <i>sequence-number</i> command to delete an entry.
Step 8	<p>Do one of the following:</p> <ul style="list-style-type: none"> • <i>sequence-number</i> deny <i>source source-wildcard</i> • <i>sequence-number</i> deny <i>protocol source source-wildcard destination destination-wildcard</i> [precedence <i>precedence</i>][tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] <p>Example:</p> <pre>Device(config-ext-nacl)# 150 deny tcp any any log</pre>	<p>(Optional) Specifies a deny statement in named IP access list mode.</p> <ul style="list-style-type: none"> • This access list happens to use a permit statement first, but a deny statement could appear first, depending on the order of statements you need. • See the deny (IP) command for additional command syntax to permit upper layer protocols (ICMP, IGMP, TCP, and UDP). • Use the no <i>sequence-number</i> command to delete an entry.
Step 9	Repeat Step 5 and/or Step 6 to add sequence number statements, as applicable.	Allows you to revise the access list.

	Command or Action	Purpose
Step 10	end Example: Device(config-std-nacl)# end	(Optional) Exits the configuration mode and returns to privileged EXEC mode.
Step 11	show ip access-lists <i>access-list-name</i> Example: Device# show ip access-lists kmdl	(Optional) Displays the contents of the IP access list.

Examples

Review the output of the **show ip access-lists** command to see that the access list includes the new entries:

```
Device# show ip access-lists kmdl

Standard IP access list kmdl
100 permit 10.4.4.0, wildcard bits 0.0.0.255
105 permit 10.5.5.0, wildcard bits 0.0.0.255
115 permit 10.0.0.0, wildcard bits 0.0.0.255
130 permit 10.5.5.0, wildcard bits 0.0.0.255
145 permit 10.0.0.0, wildcard bits 0.0.0.255
```

Configuring Commented IP ACL Entries

Either use a named or numbered access list configuration. You must apply the access list to an interface or terminal line after the access list is created for the configuration to work.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list** {standard | extended} {name | number}
4. **remark** *remark*
5. **deny protocol host** *host-address* **any eq port**
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip access-list {standard extended} {name number} Example: Device(config)# ip access-list extended telnetting	Identifies the access list by a name or number and enters extended named access list configuration mode.
Step 4	remark remark Example: Device(config-ext-nacl)# remark Do not allow host1 subnet to telnet out	Adds a remark for an entry in a named IP access list. <ul style="list-style-type: none"> The remark indicates the purpose of the permit or deny statement.
Step 5	deny protocol host host-address any eq port Example: Device(config-ext-nacl)# deny tcp host 172.16.2.88 any eq telnet	Sets conditions in a named IP access list that denies packets.
Step 6	end Example: Device(config-ext-nacl)# end	Exits extended named access list configuration mode and enters privileged EXEC mode.

Configuring Time Ranges for ACLs

Follow these steps to configure a time-range parameter for an ACL:

SUMMARY STEPS

- enable**
- configure terminal**
- time-range** *time-range-name*
- Use one of the following:
 - absolute** [start *time date*] [end *time date*]
 - periodic** *day-of-the-week hh:mm to [day-of-the-week] hh:mm*
 - periodic** {weekdays | weekend | daily} *hh:mm to hh:mm*
- end**
- show running-config**
- copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device(config)# enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	time-range <i>time-range-name</i> Example: Device(config)# time-range workhours	Assigns a meaningful name (for example, <i>workhours</i>) to the time range to be created, and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter.
Step 4	Use one of the following: <ul style="list-style-type: none"> • absolute [start <i>time date</i>] [end <i>time date</i>] • periodic <i>day-of-the-week hh:mm to [day-of-the-week] hh:mm</i> • periodic {weekdays weekend daily} <i>hh:mm to hh:mm</i> Example: Device(config-time-range)# absolute start 00:00 1 Jan 2006 end 23:59 1 Jan 2006 OR Device(config-time-range)# periodic weekdays 8:00 to 12:00	Specifies when the function it will be applied to is operational. <ul style="list-style-type: none"> • You can use only one absolute statement in the time range. If you configure more than one absolute statement, only the one configured last is executed. • You can enter multiple periodic statements. For example, you could configure different hours for weekdays and weekends. See the example configurations.
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 6	show running-config Example: Device# show running-config	Verifies your entries.

	Command or Action	Purpose
Step 7	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

What to do next

Repeat the steps if you have multiple items that you want in effect at different times.

Applying an IPv4 ACL to a Terminal Line

You can use numbered ACLs to control access to one or more terminal lines. You cannot apply named ACLs to lines. You must set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.

Follow these steps to restrict incoming and outgoing connections between a virtual terminal line and the addresses in an ACL:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line [console | vty] *line-number***
4. **access-class *access-list-number* {in | out}**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device(config)# <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	line [console vty] <i>line-number</i> Example:	Identifies a specific line to configure, and enter in-line configuration mode.

	Command or Action	Purpose
	Device(config)# line console 0	<ul style="list-style-type: none"> • console—Specifies the console terminal line. The console port is DCE. • vty—Specifies a virtual terminal for remote console access. <p>The <i>line-number</i> is the first line number in a contiguous group that you want to configure when the line type is specified. The range is from 0 to 16.</p>
Step 4	access-class <i>access-list-number</i> { in out } Example: Device(config-line)# access-class 10 in	Restricts incoming and outgoing connections between a particular virtual terminal line (into a device) and the addresses in an access list.
Step 5	end Example: Device(config-line)# end	Returns to privileged EXEC mode.
Step 6	show running-config Example: Device# show running-config	Verifies your entries.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Applying an IPv4 ACL to an Interface (CLI)

This section describes how to apply IPv4 ACLs to network interfaces.

Beginning in privileged EXEC mode, follow the procedure given below to control access to an interface:

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **ip access-group** {*access-list-number* | *name*} {**in** | **out**}
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet1/0/1</code>	Identifies a specific interface for configuration, and enter interface configuration mode. The interface can be a Layer 2 interface (port ACL), or a Layer 3 interface (router ACL).
Step 3	ip access-group {<i>access-list-number</i> <i>name</i>} {in out} Example: Device(config-if)# <code>ip access-group 2 in</code>	Controls access to the specified interface.
Step 4	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# <code>show running-config</code>	Displays the access list configuration.
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Monitoring IPv4 ACLs

You can monitor IPv4 ACLs by displaying the ACLs that are configured on the switch, and displaying the ACLs that have been applied to interfaces and VLANs.

When you use the **ip access-group** interface configuration command to apply ACLs to a Layer 2 or 3 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in this table to display this information.

Table 134: Commands for Displaying Access Lists and Access Groups

Command	Purpose
show access-lists [<i>number</i> <i>name</i>]	Displays the contents of one or all current IP and MAC address access lists or a specific access list (numbered or named).
show ip access-lists [<i>number</i> <i>name</i>]	Displays the contents of all current IP access lists or a specific IP access list (numbered or named).
show ip interface <i>interface-id</i>	Displays detailed configuration and status of an interface. If IP is enabled on the interface and ACLs have been applied by using the ip access-group interface configuration command, the access groups are included in the display.
show running-config [interface <i>interface-id</i>]	Displays the contents of the configuration file for the switch or the specified interface, including all configured MAC and IP access lists and which access groups are applied to an interface.
show mac access-group [interface <i>interface-id</i>]	Displays MAC access lists applied to all Layer 2 interfaces or the specified Layer 2 interface.

Configuration Examples for ACLs

ACLs in a Small Networked Office

Figure 96: Using Router ACLs to Control Traffic

This shows a small networked office environment with routed Port 2 connected to Server A, containing benefits and other information that all employees can access, and routed Port 1 connected to Server B, containing

confidential payroll data. All users can access Server A, but Server B has restricted

access.

Use router ACLs to do this in one of two ways:

- Create a standard ACL, and filter traffic coming to the server from Port 1.
- Create an extended ACL, and filter traffic coming from the server into Port 1.

Example: Numbered ACLs

In this example, network 10.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 10.0.0.0 address specify a particular host. Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the switch accepts addresses on all other network 10.0.0.0 subnets. The ACL is applied to packets entering a port.

```
Device(config)# access-list 2 permit 10.48.0.3
Device(config)# access-list 2 deny 10.48.0.0 0.0.255.255
Device(config)# access-list 2 permit 10.0.0.0 0.255.255.255
Device(config)# interface gigabitEthernet2/0/1
Device(config-if)# ip access-group 2 in
```

Examples: Extended ACLs

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 gt 1023
Device(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
```

```
Device(config)# access-list 102 permit icmp any any
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# ip access-group 102 in
```

In this example, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Outbound packets have the port numbers reversed. Because the secure system of the network always accepts mail connections on port 25, the incoming and outgoing services are separately controlled. The ACL must be configured as an input ACL on the outbound interface and an output ACL on the inbound interface.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 23
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 25
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 102 in
```

In this example, the network is a Class B network with the address 128.88.0.0, and the mail host address is 128.88.1.2. The **established** keyword is used only for the TCP to show an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which show that the packet belongs to an existing connection. Gigabit Ethernet interface 1 on stack member 1 is the interface that connects the router to the Internet.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 established
Device(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 102 in
```

Examples: Named ACLs

Creating named standard and extended ACLs

This example creates a standard ACL named *internet_filter* and an extended ACL named *marketing_group*. The *internet_filter* ACL allows all traffic from the source address 1.2.3.4.

```
Device(config)# ip access-list standard Internet_filter
Device(config-ext-nacl)# permit 1.2.3.4
Device(config-ext-nacl)# exit
```

The *marketing_group* ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.

```
Device(config)# ip access-list extended marketing_group
Device(config-ext-nacl)# permit tcp any 171.69.0.0 0.0.255.255 eq telnet
Device(config-ext-nacl)# deny tcp any any
```

Example: Configuring an Access Control Entry with Noncontiguous Ports

```
Device(config-ext-nacl)# permit icmp any any
Device(config-ext-nacl)# deny udp any 171.69.0.0 0.0.255.255 lt 1024
Device(config-ext-nacl)# deny ip any any log
Device(config-ext-nacl)# exit
```

The *Internet_filter* ACL is applied to outgoing traffic and the *marketing_group* ACL is applied to incoming traffic on a Layer 3 port.

```
Device(config)# interface gigabitethernet3/0/1
Device(config-if)# no switchport
Device(config-if)# ip address 2.0.5.1 255.255.255.0
Device(config-if)# ip access-group Internet_filter out
Device(config-if)# ip access-group marketing_group in
```

Deleting individual ACEs from named ACLs

This example shows how you can delete individual ACEs from the named access list *border-list*:

```
Device(config)# ip access-list extended border-list
Device(config-ext-nacl)# no permit ip host 10.1.1.3 any
```

Example: Configuring an Access Control Entry with Noncontiguous Ports

The following access list entry can be created because up to ten ports can be entered after the **eq** and **neq** operators:

```
ip access-list extended aaa
 permit tcp any eq telnet ftp any eq 23 45 34
end
```

Enter the **show access-lists** command to display the newly created access list entry.

```
Device# show access-lists aaa

Extended IP access list aaa
 10 permit tcp any eq telnet ftp any eq 23 45 34
```

Example: Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry

The **show access-lists** command is used to display a group of access list entries for the access list named abc:

```
Device# show access-lists abc
Extended IP access list abc
 10 permit tcp any eq telnet any eq 450
 20 permit tcp any eq telnet any eq 679
 30 permit tcp any eq ftp any eq 450
 40 permit tcp any eq ftp any eq 679
```

Because the entries are all for the same **permit** statement and simply show different ports, they can be consolidated into one new access list entry. The following example shows the removal of the redundant access list entries and the creation of a new access list entry that consolidates the previously displayed group of access list entries:

```
ip access-list extended abc
```

```
no 10
no 20
no 30
no 40
permit tcp any eq telnet ftp any eq 450 679
end
```

When the **show access-lists** command is reentered, the consolidated access list entry is displayed:

```
Device# show access-lists abc
Extended IP access list abc
 10 permit tcp any eq telnet ftp any eq 450 679
```

Example Resequencing Entries in an Access List

The following example shows an access list before and after resequencing. The starting value is 1, and increment value is 2. The subsequent entries are ordered based on the increment values that users provide, and the range is from 1 to 2147483647.

When an entry with no sequence number is entered, by default it has a sequence number of 10 more than the last entry in the access list.

```
Router# show access-list carls
Extended IP access list carls
 10 permit ip host 10.3.3.3 host 172.16.5.34
 20 permit icmp any any
 30 permit tcp any host 10.3.3.3
 40 permit ip host 10.4.4.4 any
 50 Dynamic test permit ip any any
 60 permit ip host 172.16.2.2 host 10.3.3.12
 70 permit ip host 10.3.3.3 any log
 80 permit tcp host 10.3.3.3 host 10.1.2.2
 90 permit ip host 10.3.3.3 any
100 permit ip any any
Router(config)# ip access-list extended carls
Router(config)# ip access-list resequence carls 1 2
Router(config)# end
Router# show access-list carls
Extended IP access list carls
 1 permit ip host 10.3.3.3 host 172.16.5.34
 3 permit icmp any any
 5 permit tcp any host 10.3.3.3
 7 permit ip host 10.4.4.4 any
 9 Dynamic test permit ip any any
11 permit ip host 172.16.2.2 host 10.3.3.12
13 permit ip host 10.3.3.3 any log
15 permit tcp host 10.3.3.3 host 10.1.2.2
17 permit ip host 10.3.3.3 any
19 permit ip any any
```

Example Adding an Entry with a Sequence Number

In the following example, a new entry (sequence number 15) is added to an access list:

```
Router# show ip access-list
Standard IP access list tryon
 2 permit 10.4.4.2, wildcard bits 0.0.255.255
 5 permit 10.0.0.44, wildcard bits 0.0.0.255
```

```

10 permit 10.0.0.1, wildcard bits 0.0.0.255
20 permit 10.0.0.2, wildcard bits 0.0.0.255
Router(config)# ip access-list standard tryon
Router(config-std-nacl)# 15 permit 10.5.5.5 0.0.0.255
Router# show ip access-list
Standard IP access list tryon
2 permit 10.4.0.0, wildcard bits 0.0.255.255
5 permit 10.0.0.0, wildcard bits 0.0.0.255
10 permit 10.0.0.0, wildcard bits 0.0.0.255
15 permit 10.5.5.0, wildcard bits 0.0.0.255
20 permit 10.0.0.0, wildcard bits 0.0.0.255

```

Example Adding an Entry with No Sequence Number

The following example shows how an entry with no specified sequence number is added to the end of an access list. When an entry is added without a sequence number, it is automatically given a sequence number that puts it at the end of the access list. Because the default increment is 10, the entry will have a sequence number 10 higher than the last entry in the existing access list.

```

Router(config)# ip access-list standard resources
Router(config-std-nacl)# permit 10.1.1.1 0.0.0.255
Router(config-std-nacl)# permit 10.2.2.2 0.0.0.255
Router(config-std-nacl)# permit 10.3.3.3 0.0.0.255
Router# show access-list
Standard IP access list resources
10 permit 10.1.1.1, wildcard bits 0.0.0.255
20 permit 10.2.2.2, wildcard bits 0.0.0.255
30 permit 10.3.3.3, wildcard bits 0.0.0.255
Router(config)# ip access-list standard resources
Router(config-std-nacl)# permit 10.4.4.4 0.0.0.255
Router(config-std-nacl)# end
Router# show access-list
Standard IP access list resources
10 permit 10.1.1.1, wildcard bits 0.0.0.255
20 permit 10.2.2.2, wildcard bits 0.0.0.255
30 permit 10.3.3.3, wildcard bits 0.0.0.255
40 permit 10.4.4.4, wildcard bits 0.0.0.255

```

Examples: Configuring Commented IP ACL Entries

In this example of a numbered ACL, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

```

Device(config)# access-list 1 remark Permit only Jones workstation through
Device(config)# access-list 1 permit 171.69.2.88
Device(config)# access-list 1 remark Do not allow Smith workstation through
Device(config)# access-list 1 deny 171.69.3.13

```

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

```

Device(config)# access-list 100 remark Do not allow Winter to browse the web
Device(config)# access-list 100 deny host 171.69.3.85 any eq www
Device(config)# access-list 100 remark Do not allow Smith to browse the web
Device(config)# access-list 100 deny host 171.69.3.13 any eq www

```

In this example of a named ACL, the Jones subnet is not allowed access:

```
Device(config)# ip access-list standard prevention
Device(config-std-nacl)# remark Do not allow Jones subnet through
Device(config-std-nacl)# deny 171.69.0.0 0.0.255.255
```

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:

```
Device(config)# ip access-list extended telnetting
Device(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Device(config-ext-nacl)# deny tcp 171.69.0.0 0.0.255.255 any eq telnet
```

Examples: Using Time Ranges with ACLs

This example shows how to verify after you configure time ranges for *workhours* and to configure January 1, 2006, as a company holiday.

```
Device# show time-range
time-range entry: new_year_day_2003 (inactive)
    absolute start 00:00 01 January 2006 end 23:59 01 January 2006
time-range entry: workhours (inactive)
    periodic weekdays 8:00 to 12:00
    periodic weekdays 13:00 to 17:00
```

To apply a time range, enter the time-range name in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday times and permits all TCP traffic during work hours.

```
Device(config)# access-list 188 deny tcp any any time-range new_year_day_2006
Device(config)# access-list 188 permit tcp any any time-range workhours
Device(config)# end
Device# show access-lists
Extended IP access list 188
    10 deny tcp any any time-range new_year_day_2006 (inactive)
    20 permit tcp any any time-range workhours (inactive)
```

This example uses named ACLs to permit and deny the same traffic.

```
Device(config)# ip access-list extended deny_access
Device(config-ext-nacl)# deny tcp any any time-range new_year_day_2006
Device(config-ext-nacl)# exit
Device(config)# ip access-list extended may_access
Device(config-ext-nacl)# permit tcp any any time-range workhours
Device(config-ext-nacl)# end
Device# show ip access-lists
Extended IP access list lpip_default
    10 permit ip any any
Extended IP access list deny_access
    10 deny tcp any any time-range new_year_day_2006 (inactive)
Extended IP access list may_access
    10 permit tcp any any time-range workhours (inactive)
```

Examples: Time Range Applied to an IP ACL

This example denies HTTP traffic on IP on Monday through Friday between the hours of 8:00 a.m. and 6:00 p.m (18:00). The example allows UDP traffic only on Saturday and Sunday from noon to 8:00 p.m. (20:00).

```
Device(config)# time-range no-http
Device(config)# periodic weekdays 8:00 to 18:00
!
Device(config)# time-range udp-yes
Device(config)# periodic weekend 12:00 to 20:00
!
Device(config)# ip access-list extended strict
Device(config-ext-nacl)# deny tcp any any eq www time-range no-http
Device(config-ext-nacl)# permit udp any any time-range udp-yes
!
Device(config-ext-nacl)# exit
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# ip access-group strict in
```

Examples: ACL Logging

Two variations of logging are supported on ACLs. The **log** keyword sends an informational logging message to the console about the packet that matches the entry; the **log-input** keyword includes the input interface in the log entry.

In this example, standard named access list *stan1* denies traffic from 10.1.1.0 0.0.0.255, allows traffic from all other sources, and includes the **log** keyword.

```
Device(config)# ip access-list standard stan1
Device(config-std-nacl)# deny 10.1.1.0 0.0.0.255 log
Device(config-std-nacl)# permit any log
Device(config-std-nacl)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group stan1 in
Device(config-if)# end
Device# show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Console logging: level debugging, 37 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 37 messages logged
  File logging: disabled
  Trap logging: level debugging, 39 message lines logged

Log Buffer (4096 bytes):

00:00:48: NTP: authentication delay calculation problems

<output truncated>

00:09:34:%SEC-6-IPACCESSLOGS:list stan1 permitted 0.0.0.0 1 packet
00:09:59:%SEC-6-IPACCESSLOGS:list stan1 denied 10.1.1.15 1 packet
00:10:11:%SEC-6-IPACCESSLOGS:list stan1 permitted 0.0.0.0 1 packet
```

This example is a named extended access list *ext1* that permits ICMP packets from any source to 10.1.1.0 0.0.0.255 and denies all UDP packets.

```

Device(config)# ip access-list extended ext1
Device(config-ext-nacl)# permit icmp any 10.1.1.0 0.0.0.255 log
Device(config-ext-nacl)# deny udp any any log
Device(config-std-nacl)# exit
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip access-group ext1 in

```

This is an example of a log for an extended ACL:

```

01:24:23:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 1
packet
01:25:14:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 7
packets
01:26:12:%SEC-6-IPACCESSLOGP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 1 packet
01:31:33:%SEC-6-IPACCESSLOGP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 8 packets

```

Note that all logging entries for IP ACLs start with %SEC-6-IPACCESSLOG with minor variations in format depending on the kind of ACL and the access entry that has been matched.

This is an example of an output message when the **log-input** keyword is entered:

```

00:04:21:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 (Vlan1 0001.42ef.a400)
->
10.1.1.61 (0/0), 1 packet

```

A log message for the same sort of packet using the **log** keyword does not include the input interface information:

```

00:05:47:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 -> 10.1.1.61 (0/0), 1
packet

```

Examples: Troubleshooting ACLs

If this ACL manager message appears and [chars] is the access-list name,

```

ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]

```

The switch has insufficient resources to create a hardware representation of the ACL. The resources include hardware memory and label space but not CPU memory. A lack of available logical operation units or specialized hardware resources causes this problem. Logical operation units are needed for a TCP flag match or a test other than **eq** (**ne**, **gt**, **lt**, or **range**) on TCP, UDP, or SCTP port numbers.

Use one of these workarounds:

- Modify the ACL configuration to use fewer resources.
- Rename the ACL with a name or number that alphanumerically precedes the ACL names or numbers.

To determine the specialized hardware resources, enter the **show platform layer4 acl** map privileged EXEC command. If the switch does not have available resources, the output shows that index 0 to index 15 are not available.

For more information about configuring ACLs with insufficient resources, see CSCsq63926 in the Bug Toolkit.

For example, if you apply this ACL to an interface:

```
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
permit tcp source source-wildcard destination destination-wildcard
```

And if this message appears:

```
ACL MGR-2-NOVMR: Cannot generate hardware representation of access list [chars]
```

The flag-related operators are not available. To avoid this issue,

- Move the fourth ACE before the first ACE by using **ip access-list resequence** global configuration command:

```
permit tcp source source-wildcard destination destination-wildcard
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
```

or

- Rename the ACL with a name or number that alphanumerically precedes the other ACLs (for example, rename ACL 79 to ACL 1).

You can now apply the first ACE in the ACL to the interface. The switch allocates the ACE to available mapping bits in the Opselect index and then allocates flag-related operators to use the same bits in the hardware memory.

Feature Information for IPv4 Access Control Lists

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	IPv4 Access Control Lists perform packet filtering to control which packets move through the network and where. Such control provides security by helping to limit network traffic, restrict the access of users and devices to the network, and prevent traffic from leaving a network. This feature was introduced.
Cisco IOS 15.2(2)E	The Named ACL Support for Noncontiguous Ports on an Access Control Entry feature allows you to specify noncontiguous ports in a single access control entry, which greatly reduces the number of entries required in an access control list when several entries have the same source address, destination address, and protocol, but differ only in the ports.
Cisco IOS 15.2(2)E	<p>The IP Access List Entry Sequence Numbering feature helps users to apply sequence numbers to permit or deny statements and also reorder, add, or remove such statements from a named IP access list. This feature makes revising IP access lists much easier. Prior to this feature, users could add access list entries to the end of an access list only; therefore needing to add statements anywhere except the end required reconfiguring the access list entirely.</p> <p>The following commands were introduced or modified: deny (IP), ip access-list resequence deny (IP), permit (IP).</p>

CHAPTER 68

IPv6 Access Control Lists

Access lists determine what traffic is blocked and what traffic is forwarded at device interfaces and allow filtering of traffic based on source and destination addresses, and inbound and outbound traffic to a specific interface. Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control. Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control.

This module describes how to configure IPv6 traffic filtering and to control access to virtual terminal lines.

Prerequisites for IPv6 ACLs

The following are the prerequisites for IPv6 ACLs:

To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch. You select the template by entering the **sdm prefer {default }** global configuration command.

Restrictions for IPv6 ACLs

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

- The switch does not support matching on these keywords: **routing header**, and **undetermined-transport**.
- The switch does not support reflexive ACLs (the **reflect** keyword).
-
-

- This release supports port ACLs, router ACLs and VLAN ACLs (VLAN maps) for IPv6.
-
- The switch does not apply MAC-based ACLs on IPv6 frames.
- When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.
- If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

IPv6 ACLs on the switch have these characteristics:

- Fragmented frames (the **fragments** keyword as in IPv4) are supported
- The same statistics supported in IPv4 are supported for IPv6 ACLs.
- If the switch runs out of hardware space, the packets associated with the ACL are dropped on the interface.
- Logging is supported for router ACLs, but not for port ACLs.
- The switch supports IPv6 address-matching for a full range of prefix-lengths.

Information About Configuring IPv6 ACLs

You can filter IP version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic.

Note To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch. You select the template by entering the **sdm prefer {default }** global configuration command.

ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network.

You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

IPv6 ACLs Overview

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similar to how you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running IP base and LAN base feature sets.

A switch supports three types of IPv6 ACLs:

- IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.
- IPv6 port ACLs are supported on outbound and inbound Layer 2 interfaces. IPv6 port ACLs are applied to all IPv6 packets entering the interface.
- VLAN ACLs or VLAN maps access-control all packets in a VLAN. You can use VLAN maps to filter traffic between devices in the same VLAN. ACL VLAN maps are applied on L2 VLANs. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv6. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets entering the VLAN are checked against the VLAN map.

The switch supports VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs.

Understanding IPv6 ACLs

A switch image supports two types of IPv6 ACLs:

- IPv6 router ACLs - Supported on inbound or outbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. Applied to only IPv6 packets that are routed.
- IPv6 port ACLs - Supported on inbound traffic on Layer 2 interfaces only. Applied to all IPv6 packets entering the interface.

Note If you configure unsupported IPv6 ACLs, an error message appears and the configuration does not take effect.

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface.

As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs:

- When an input router ACL and input port ACL exist in an SVI, packets received on ports to which a port ACL is applied are filtered by the port ACL. Routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

- When an output router ACL and input port ACL exist in an SVI, packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv6 packets are filtered by the router ACL. Other packets are not filtered.

Note If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

Interactions with Other Features and Switches

- If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.
- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.
- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.
- If the hardware memory is full, packets are dropped on the interface and an unload error message is logged.

Default Configuration for IPv6 ACLs

The default IPv6 ACL configuration is as follows:

```
Switch# show access-lists preauth_ipv6_acl
IPv6 access list preauth_ipv6_acl (per-user)
permit udp any any eq domain sequence 10
permit tcp any any eq domain sequence 20
permit icmp any any nd-ns sequence 30
permit icmp any any nd-na sequence 40
permit icmp any any router-solicitation sequence 50
permit icmp any any router-advertisement sequence 60
permit icmp any any redirect sequence 70
permit udp any eq 547 any eq 546 sequence 80
permit udp any eq 546 any eq 547 sequence 90
deny ipv6 any any sequence 100
```

Supported ACL Features

IPv6 ACLs on the switch have these characteristics:

- Fragmented frames (the fragments keyword as in IPv4) are supported.
- The same statistics supported in IPv4 are supported for IPv6 ACLs.

- If the switch runs out of TCAM space, packets associated with the ACL label are forwarded to the CPU, and the ACLs are applied in software.
- Routed or bridged packets with hop-by-hop options have IPv6 ACLs applied in software.
- Logging is supported for router ACLs, but not for port ACLs.

IPv6 Port-Based Access Control List Support

The IPv6 PACL feature provides the ability to provide access control (permit or deny) on Layer 2 switch ports for IPv6 traffic. IPv6 PACLs are similar to IPv4 PACLs, which provide access control on Layer 2 switch ports for IPv4 traffic. They are supported only in the ingress direction and in hardware.

A PACL can filter ingress traffic on Layer 2 interfaces based on Layer 3 and Layer 4 header information or non-IP Layer 2 information.

ACLs and Traffic Forwarding

The IPv6 ACL Extensions for Hop by Hop Filtering feature allows you to control IPv6 traffic that might contain hop-by-hop extension headers. You can configure an access control list (ACL) to deny all hop-by-hop traffic or to selectively permit traffic based on protocol.

IPv6 access control lists (ACLs) determine what traffic is blocked and what traffic is forwarded at device interfaces. ACLs allow filtering based on source and destination addresses, inbound and outbound to a specific interface. Use the **ipv6 access-list** command to define an IPv6 ACL, and the **deny** and **permit** commands to configure its conditions.

The IPv6 ACL Extensions for Hop by Hop Filtering feature implements RFC 2460 to support traffic filtering in any upper-layer protocol type.

How to Configure IPv6 ACLs

Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 access-list list-name**
4. **{deny | permit} protocol {source-ipv6-prefix/prefix-length|any} host source-ipv6-address} [operator [port-number]] { destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]][dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]**
5. **{deny | permit} tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neg {port | protocol}] [psh] [range {port | protocol}] [rst] [routing] [sequence value] [syn] [time-range name] [urg]**

6. `{deny | permit} udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [log] [log-input] [neg {port | protocol}] [range {port | protocol}] [routing] [sequence value] [time-range name]`
7. `{deny | permit} icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log] [log-input] [routing] [sequence value] [time-range name]`
8. `end`
9. `show ipv6 access-list`
10. `show running-config`
11. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	{ipv6 access-list list-name} Example: Device(config)# ipv6 access-list example_acl_list	Defines an IPv6 ACL name, and enters IPv6 access list configuration mode.
Step 4	{deny permit} protocol {source-ipv6-prefix/prefix-length any host source-ipv6-address} [operator [port-number]] { destination-ipv6-prefix/ prefix-length any host destination-ipv6-address} [operator [port-number]][dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]	Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions: <ul style="list-style-type: none"> • For protocol, enter the name or number of an Internet protocol: ahp, esp, icmp, ipv6, pcp, stcp, tcp, or udp, or an integer in the range 0 to 255 representing an IPv6 protocol number. • The <i>source-ipv6-prefix/prefix-length</i> or <i>destination-ipv6-prefix/ prefix-length</i> is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373). • Enter any as an abbreviation for the IPv6 prefix <code>::/0</code>.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • For host <i>source-ipv6-address</i> or <i>destination-ipv6-address</i>, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons. • (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range. If the operator follows the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port. If the operator follows the <i>destination-ipv6- prefix/prefix-length</i> argument, it must match the destination port. • (Optional) The port-number is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP. • (Optional) Enter dscp value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63. • (Optional) Enter fragments to check noninitial fragments. This keyword is visible only if the protocol is ipv6. • (Optional) Enter log to cause an logging message to be sent to the console about the packet that matches the entry. Enter log-input to include the input interface in the log entry. Logging is supported only for router ACLs. • (Optional) Enter routing to specify that IPv6 packets be routed. • (Optional) Enter sequence value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4,294,967,295. • (Optional) Enter time-range name to specify the time range that applies to the deny or permit statement.
Step 5	<pre>{deny permit} tcp {source-ipv6-prefix/prefix-length any host source-ipv6-address} [operator [port-number]] {destination-ipv6- prefix/prefix-length </pre>	(Optional) Define a TCP access list and the access conditions.

	Command or Action	Purpose
	any host <i>destination-ipv6-address</i> } [operator [<i>port-number</i>]] [ack] [dscp <i>value</i>] [established] [fin] [log] [log-input] [neq { <i>port</i> protocol}] [psh] [range { <i>port</i> protocol}] [rst] [routing] [sequence <i>value</i>] [syn] [time-range <i>name</i>] [urg]	<p>Enter tcp for Transmission Control Protocol. The parameters are the same as those described in Step 3a, with these additional optional parameters:</p> <ul style="list-style-type: none"> • ack—Acknowledgment bit set. • established—An established connection. A match occurs if the TCP datagram has the ACK or RST bits set. • fin—Finished bit set; no more data from sender. • neq {<i>port</i> protocol}—Matches only packets that are not on a given port number. • psh—Push function bit set. • range {<i>port</i> protocol}—Matches only packets in the port number range. • rst—Reset bit set. • syn—Synchronize bit set. • urg—Urgent pointer bit set.
Step 6	{deny permit} udp { <i>source-ipv6-prefix/prefix-length</i> any host <i>source-ipv6-address</i> } [operator [<i>port-number</i>]] { <i>destination-ipv6-prefix/prefix-length</i> any host <i>destination-ipv6-address</i> } [operator [<i>port-number</i>]] [dscp <i>value</i>] [log] [log-input] [neq { <i>port</i> protocol}] [range { <i>port</i> protocol}] [routing] [sequence <i>value</i>] [time-range <i>name</i>]	<p>(Optional) Define a UDP access list and the access conditions.</p> <p>Enter udp for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the [operator [<i>port</i>]] port number or name must be a UDP port number or name, and the established parameter is not valid for UDP.</p>
Step 7	{deny permit} icmp { <i>source-ipv6-prefix/prefix-length</i> any host <i>source-ipv6-address</i> } [operator [<i>port-number</i>]] { <i>destination-ipv6-prefix/prefix-length</i> any host <i>destination-ipv6-address</i> } [operator [<i>port-number</i>]] [<i>icmp-type</i> [<i>icmp-code</i>] <i>icmp-message</i>] [dscp <i>value</i>] [log] [log-input] [routing] [sequence <i>value</i>] [time-range <i>name</i>]	<p>(Optional) Define an ICMP access list and the access conditions.</p> <p>Enter icmp for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 1, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:</p> <ul style="list-style-type: none"> • <i>icmp-type</i>—Enter to filter by ICMP message type, a number from 0 to 255. • <i>icmp-code</i>—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255. • <i>icmp-message</i>—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type

	Command or Action	Purpose
		names and code names, use the ? key or see command reference for this release.
Step 8	end	Return to privileged EXEC mode.
Step 9	show ipv6 access-list	Verify the access list configuration.
Step 10	show running-config Example: Device# show running-config	Verifies your entries.
Step 11	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

What to do next

Attach the IPv6 ACL to an Interface

Attaching an IPv6 ACL to an Interface

You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces. You can also apply ACLs only to inbound management traffic on Layer 3 interfaces.

Follow these steps to control access to an interface:

SUMMARY STEPS

1. enable
2. configure terminal
3. interface *interface-id*
4. no switchport
5. ipv6 address *ipv6-address*
6. ipv6 traffic-filter *access-list-name* {in | out}
7. end
8. show running-config
9. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i>	Identify a Layer 2 interface (for port ACLs) or Layer 3 interface (for router ACLs) on which to apply an access list, and enter interface configuration mode.
Step 4	no switchport	If applying a router ACL, this changes the interface from Layer 2 mode (the default) to Layer 3 mode.
Step 5	ipv6 address <i>ipv6-address</i>	Configure an IPv6 address on a Layer 3 interface (for router ACLs).
Step 6	ipv6 traffic-filter <i>access-list-name</i> { in out }	Apply the access list to incoming or outgoing traffic on the interface.
Step 7	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 8	show running-config Example: Device# show running-config	Verifies your entries.
Step 9	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Monitoring IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands shown in the table below:

Command	Purpose
show access-lists	Displays all access lists configured on the switch.

Command	Purpose
show ipv6 access-list [<i>access-list-name</i>]	Displays all configured IPv6 access lists or the access list specified by name.
show vlan access-map [<i>map-name</i>]	Displays VLAN access map configuration.
show vlan filter [access-map <i>access-map</i> vlan <i>vlan-id</i>]	Displays the mapping between VACLs and VLANs.

This is an example of the output from the `show access-lists` privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Switch # show access-lists
Extended IP access list hello
    10 permit ip any any
IPv6 access list ipv6
    permit ipv6 any any sequence 10
```

This is an example of the output from the `show ipv6 access-list` privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Switch# show ipv6 access-list
IPv6 access list inbound
    permit tcp any any eq bgp (8 matches) sequence 10
    permit tcp any any eq telnet (15 matches) sequence 20
    permit udp any any sequence 30
IPv6 access list outbound
    deny udp any any sequence 10
    deny tcp any any eq telnet sequence 20
```

This is an example of the output from the `show vlan access-map` privileged EXEC command. The output shows VLAN access map information.

```
Switch# show vlan access-map
Vlan access-map "m1" 10
  Match clauses:
    ipv6 address: ip2
  Action: drop
```

Configuring PACL Mode and Applying IPv6 PACL on an Interface

Before you begin

Before you configure the IPv6 PACL feature, you must configure an IPv6 access list. Once you have configured the IPv6 access list, you must configure the port-based access control list (PACL) mode on the specified IPv6 Layer 2 interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 access-list** *access-list-name*
4. **exit**

5. **interface** *type number*
6. **ipv6 traffic-filter** *access-list-name {in | out}*
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ipv6 access-list <i>access-list-name</i> Example: Device(config)# ipv6 access-list list1	Defines an IPv6 ACL and enters IPv6 access list configuration mode.
Step 4	exit Example: Device(config-ipv6-acl)# exit	Exits IPv6 access list configuration mode and enters global configuration mode.
Step 5	interface <i>type number</i> Example:	Specifies an interface type and number and enters interface configuration mode.
Step 6	ipv6 traffic-filter <i>access-list-name {in out}</i> Example: Device(config-if)# ipv6 traffic-filter list1 in	Filters incoming and outgoing IPv6 traffic on an interface.
Step 7	end Example: Device(config-if)# end	Exits interface configuration mode and enters privileged EXEC mode.

Configuring IPv6 ACL Extensions for Hop by Hop Filtering

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 access-list** *access-list-name*
4. **permit protocol** {*source-ipv6-prefix/prefix-length | any | host source-ipv6-address | auth*} [*operator [port-number]*] {*destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address | auth*} [*operator [port-number]*] [**dest-option-type** [*header-number | header-type*]] [**dscp** *value*] [**flow-label** *value*] [**fragments**] [**hbh**] [**log**] [**log-input**] [**mobility**] [**mobility-type** [*mh-number | mh-type*]] [**reflect** *name*] [**timeout** *value*]] [**routing**] [**routing-type** *routing-number*] [**sequence** *value*] [**time-range** *name*]

5. **deny** *protocol* {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address* | **auth**} [*operator* [*port-number*]] {*destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address* | **auth**} [*operator* [*port-number*]] [**dest-option-type** [*header-number* | *header-type*]] [**dscp** *value*] [**flow-label** *value*] [**fragments**] [**hbh**] [**log**] [**log-input**] [**mobility**] [**mobility-type** [*mh-number* | *mh-type*]] [**routing**] [**routing-type** *routing-number*] [**sequence** *value*] [**time-range** *name*] [**undetermined-transport**]
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ipv6 access-list <i>access-list-name</i> Example: Device(config)# ipv6 access-list hbh-acl	Defines an IPv6 ACL and enters IPv6 access list configuration mode.
Step 4	permit <i>protocol</i> { <i>source-ipv6-prefix/prefix-length</i> any host <i>source-ipv6-address</i> auth } [<i>operator</i> [<i>port-number</i>]] { <i>destination-ipv6-prefix/prefix-length</i> any host <i>destination-ipv6-address</i> auth } [<i>operator</i> [<i>port-number</i>]] [dest-option-type [<i>header-number</i> <i>header-type</i>]] [dscp <i>value</i>] [flow-label <i>value</i>] [fragments] [hbh] [log] [log-input] [mobility] [mobility-type [<i>mh-number</i> <i>mh-type</i>]] [reflect <i>name</i> [<i>timeout</i> <i>value</i>]] [routing] [routing-type <i>routing-number</i>] [sequence <i>value</i>] [time-range <i>name</i>] Example: Device(config-ipv6-acl)# permit icmp any any dest-option-type	Sets permit conditions for the IPv6 ACL.
Step 5	deny <i>protocol</i> { <i>source-ipv6-prefix/prefix-length</i> any host <i>source-ipv6-address</i> auth } [<i>operator</i> [<i>port-number</i>]] { <i>destination-ipv6-prefix/prefix-length</i> any host <i>destination-ipv6-address</i> auth } [<i>operator</i> [<i>port-number</i>]] [dest-option-type [<i>header-number</i> <i>header-type</i>]] [dscp <i>value</i>] [flow-label <i>value</i>] [fragments] [hbh] [log] [log-input] [mobility] [mobility-type [<i>mh-number</i> <i>mh-type</i>]] [routing] [routing-type <i>routing-number</i>] [sequence <i>value</i>] [time-range <i>name</i>] [undetermined-transport] Example:	Sets deny conditions for the IPv6 ACL.

	Command or Action	Purpose
	Device(config-ipv6-acl)# deny icmp any any dest-option-type	
Step 6	end Example: Device (config-ipv6-acl)# end	Returns to privileged EXEC configuration mode.

Configuration Examples for IPv6 ACLs

Example: Configuring IPv6 ACLs

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny -all condition is at the end of each IPv6 access list.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
```

Example: Applying IPv6 ACLs

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface.

```
Device(config-if)# no switchport
Device(config-if)# ipv6 address 2001::/64 eui-64
Device(config-if)# ipv6 traffic-filter CISCO out
```

Example: Configuring PACL Mode and Applying IPv6 PACL on an Interface

```
Device# configure terminal
Device(config)# ipv6 access-list list1
Device(config-ipv6-acl)# exit
Device(config-if)# ipv6 traffic-filter list1 in
```

Example: IPv6 ACL Extensions for Hop by Hop Filtering

```
Device(config)# ipv6 access-list hbh_acl
Device(config-ipv6-acl)# permit tcp any any hbh
Device(config-ipv6-acl)# permit tcp any any
```

```

Device(config-ipv6-acl)# permit udp any any
Device(config-ipv6-acl)# permit udp any any hbh
Device(config-ipv6-acl)# permit hbh any any
Device(config-ipv6-acl)# permit any any
Device(config-ipv6-acl)# hardware statistics
Device(config-ipv6-acl)# exit

! Assign an IP address and add the ACL on the interface.

Device(config)# interface FastEthernet3/1
Device(config-if)# ipv6 address 1001::1/64
Device(config-if)# ipv6 traffic-filter hbh_acl in
Device(config-if)# exit
Device(config)# exit
Device# clear counters
Clear "show interface" counters on all interfaces [confirm]
Device#

! Verify the configurations.

Device# show running-config interface FastEthernet3/1

Building configuration...

Current configuration : 114 bytes
!
interface FastEthernet3/1
no switchport
ipv6 address 1001::1/64
ipv6 traffic-filter hbh_acl
end

```

Feature Information for IPv6 Access Control Lists

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 135: Feature Information for IPv6 Access Control Lists

Feature Name	Releases	Feature Information
IPv6 ACL Extensions for Hop-by-Hop Filtering	15.1(1)SG	<p>Allows you to control IPv6 traffic that might contain hop-by-hop extension headers.</p> <p>This feature was supported on CAT3560C, CAT3560CX, CAT3560X, CAT3750X, CAT4500-X.</p> <p>The following commands were introduced or modified: deny (IPv6), permit (IPv6).</p>

Feature Name	Releases	Feature Information
IPv6 PACL Support		<p>The IPv6 PACL feature permits or denies the movement of traffic between port-based interface, Layer 3 subnets, wireless or wired clients, and VLANs, or within a VLAN.</p> <p>This feature was supported on CAT2960, CAT2960S, CAT3560X, CAT3650, CAT3560CX, CAT4500.</p> <p>The following command was introduced or modified: ipv6 traffic-filter.</p>
IPv6 Services: Extended Access Control Lists	12.2(25)SG	Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control.
IPv6 Services: Standard Access Control Lists	12.2(25)SG	Access lists determine what traffic is blocked and what traffic is forwarded at router interfaces and allow filtering based on source and destination addresses, inbound and outbound to a specific interface.

CHAPTER 69

ACL Support for Filtering IP Options

The ACL Support for Filtering IP Options feature describes how to use an IP access list to filter IP packets that contain IP options to prevent devices from becoming saturated with spurious packets.

This module also describes the ACL TCP Flags Filtering feature and how to use an IP access list to filter IP packets that contain TCP flags. The ACL TCP Flags Filtering feature allows you to select any combination of flags on which to filter. The ability to match on a flag set and on a flag not set gives you a greater degree of control for filtering on TCP flags, thus enhancing security.

- [Configuration Examples for ACL Support for Filtering IP Options, on page 1373](#)
- [Additional References for ACL Support for Filtering IP Options, on page 1374](#)
- [Feature Information for Creating an IP Access List to Filter, on page 1374](#)

Prerequisites for ACL Support for Filtering IP Options

Before you configure the ACL Support for Filtering IP Options feature, you must understand the concepts of the IP access lists.

Information About ACL Support for Filtering IP Options

IP Options

IP uses four key mechanisms in providing its service: Type of Service, Time to Live, Options, and Header Checksum.

The Options, commonly referred to as IP Options, provide for control functions that are required in some situations but unnecessary for the most common communications. IP Options include provisions for time stamps, security, and special routing.

IP Options may or may not appear in datagrams. They must be implemented by all IP modules (host and gateways). What is optional is their transmission in any particular datagram, not their implementation. In some environments the security option may be required in all datagrams.

The option field is variable in length. There may be zero or more options. IP Options can have one of two formats:

- Format 1: A single octet of option-type.
- Format 2: An option-type octet, an option-length octet, and the actual option-data octets.

The option-length octet counts the option-type octet, the option-length octet, and the option-data octets.

The option-type octet is viewed as having three fields: a 1-bit copied flag, a 2-bit option class, and a 5-bit option number. These fields form an 8-bit value for the option type field. IP Options are commonly referred to by their 8-bit value.

For a complete list and description of IP Options, refer to RFC 791, *Internet Protocol* at the following URL: <http://www.faqs.org/rfcs/rfc791.html>

Benefits of Filtering IP Options

- Filtering of packets that contain IP Options from the network relieves downstream devices and hosts of the load from options packets.
- This feature also minimizes load to the Route Processor (RP) for packets with IP Options that require RP processing on distributed systems. Previously, the packets were always routed to or processed by the RP CPU. Filtering the packets prevents them from impacting the RP.

Benefits of Filtering on TCP Flags

The ACL TCP Flags Filtering feature provides a flexible mechanism for filtering on TCP flags. Previously, an incoming packet was matched as long as any TCP flag in the packet matched a flag specified in the access control entry (ACE). This behavior allows for a security loophole, because packets with all flags set could get past the access control list (ACL). The ACL TCP Flags Filtering feature allows you to select any combination of flags on which to filter. The ability to match on a flag set and on a flag not set gives you a greater degree of control for filtering on TCP flags, thus enhancing security.

Because TCP packets can be sent as false synchronization packets that can be accepted by a listening port, it is recommended that administrators of firewall devices set up some filtering rules to drop false TCP packets.

The ACEs that make up an access list can be configured to detect and drop unauthorized TCP packets by allowing only the packets that have a very specific group of TCP flags set or not set. The ACL TCP Flags Filtering feature provides a greater degree of packet-filtering control in the following ways:

- You can select any desired combination of TCP flags on which to filter TCP packets.
- You can configure ACEs to allow matching on a flag that is set, as well as on a flag that is not set.

TCP Flags

The table below lists the TCP flags, which are further described in RFC 793, *Transmission Control Protocol*.

Table 136: TCP Flags

TCP Flag	Purpose
ACK	Acknowledge flag—Indicates that the acknowledgment field of a segment specifies the next sequence number the sender of this segment is expecting to receive.
FIN	Finish flag—Used to clear connections.
PSH	Push flag—Indicates the data in the call should be immediately pushed through to the receiving user.
RST	Reset flag—Indicates that the receiver should delete the connection without further interaction.
SYN	Synchronize flag—Used to establish connections.
URG	Urgent flag—Indicates that the urgent field is meaningful and must be added to the segment sequence number.

How to Configure ACL Support for Filtering IP Options

Filtering Packets That Contain IP Options

Complete these steps to configure an access list to filter packets that contain IP options and to verify that the access list has been configured correctly.

Note

- The ACL Support for Filtering IP Options feature can be used only with named, extended ACLs.
- Resource Reservation Protocol (RSVP) Multiprotocol Label Switching Traffic Engineering (MPLS TE), Internet Group Management Protocol Version 2 (IGMPV2), and other protocols that use IP options packets may not function in drop or ignore mode if this feature is configured.
- On most Cisco devices, a packet with IP options is not switched in hardware, but requires control plane software processing (primarily because there is a need to process the options and rewrite the IP header), so all IP packets with IP options will be filtered and switched in software.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended** *access-list-name*
4. [*sequence-number*] **deny** *protocol source source-wildcard destination destination-wildcard* [**option** *option-value*] [**precedence** *precedence*] [**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
5. [*sequence-number*] **permit** *protocol source source-wildcard destination destination-wildcard* [**option** *option-value*] [**precedence** *precedence*] [**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
6. Repeat Step 4 or Step 5 as necessary.

7. **end**
8. **show ip access-lists** *access-list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip access-list extended <i>access-list-name</i> Example: Device(config)# ip access-list extended mylist1	Specifies the IP access list by name and enters named access list configuration mode.
Step 4	[<i>sequence-number</i>] deny <i>protocol source source-wildcard destination destination-wildcard</i> [option <i>option-value</i>] [precedence <i>precedence</i>] [tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] Example: Device(config-ext-nacl)# deny ip any any option traceroute	(Optional) Specifies a deny statement in named IP access list mode. <ul style="list-style-type: none">• This access list happens to use a deny statement first, but a permit statement could appear first, depending on the order of statements you need.• Use the option keyword and <i>option-value</i> argument to filter packets that contain a particular IP Option.• In this example, any packet that contains the traceroute IP option will be filtered out.• Use the no <i>sequence-number</i> form of this command to delete an entry.
Step 5	[<i>sequence-number</i>] permit <i>protocol source source-wildcard destination destination-wildcard</i> [option <i>option-value</i>] [precedence <i>precedence</i>] [tos <i>tos</i>] [log] [time-range <i>time-range-name</i>] [fragments] Example: Device(config-ext-nacl)# permit ip any any option security	Specifies a permit statement in named IP access list mode. <ul style="list-style-type: none">• In this example, any packet (not already filtered) that contains the security IP option will be permitted.• Use the no <i>sequence-number</i> form of this command to delete an entry.
Step 6	Repeat Step 4 or Step 5 as necessary.	Allows you to revise the access list.
Step 7	end Example: Device(config-ext-nacl)# end	(Optional) Exits named access list configuration mode and returns to privileged EXEC mode.
Step 8	show ip access-lists <i>access-list-name</i> Example:	(Optional) Displays the contents of the IP access list.

	Command or Action	Purpose
	Device# show ip access-lists mylist1	

Filtering Packets That Contain TCP Flags

This task configures an access list to filter packets that contain TCP flags and verifies that the access list has been configured correctly.

Note

- TCP flag filtering can be used only with named, extended ACLs.
- The ACL TCP Flags Filtering feature is supported only for Cisco ACLs.
- Previously, the following command-line interface (CLI) format could be used to configure a TCP flag-checking mechanism:

permit tcp any any rst The following format that represents the same access control entry (ACE) can now be used: **permit tcp any any match-any +rst** Both the CLI formats are accepted; however, if the new keywords **match-all** or **match-any** are chosen, they must be followed by the new flags that are prefixed with “+” or “-”. It is advisable to use only the old format or the new format in a single ACL. You cannot mix and match the old and new CLI formats.

Caution

If a device having ACEs with the new syntax format is reloaded with a previous version of the Cisco software that does not support the ACL TCP Flags Filtering feature, the ACEs will not be applied, leading to possible security loopholes.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended** *access-list-name*
4. [*sequence-number*] **permit tcp** *source source-wildcard* [*operator* [*port*]] *destination destination-wildcard* [*operator* [*port*]] [**established** {**match-any** | **match-all**} {+ | -} *flag-name*] [**precedence** *precedence*] [**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
5. [*sequence-number*] **deny tcp** *source source-wildcard* [*operator* [*port*]] *destination destination-wildcard* [*operator* [*port*]] [**established** {**match-any** | **match-all**} {+ | -} *flag-name*] [**precedence** *precedence*] [**tos** *tos*] [**log**] [**time-range** *time-range-name*] [**fragments**]
6. Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the **no** *sequence-number* command to delete an entry.
7. **end**
8. **show ip access-lists** *access-list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip access-list extended <i>access-list-name</i> Example: Device(config)# ip access-list extended kmd1	Specifies the IP access list by name and enters named access list configuration mode.
Step 4	<i>[sequence-number]</i> permit tcp <i>source source-wildcard</i> <i>[operator [port]] destination destination-wildcard [operator [port]]</i> [established {match-any match-all} {+ -}] <i>flag-name</i> [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments] Example: Device(config-ext-nacl)# permit tcp any any match-any +rst	Specifies a permit statement in named IP access list mode. <ul style="list-style-type: none"> • This access list happens to use a permit statement first, but a deny statement could appear first, depending on the order of statements you need. • Use the TCP command syntax of the permit command. • Any packet with the RST TCP header flag set will be matched and allowed to pass the named access list kmd1 in Step 3.
Step 5	<i>[sequence-number]</i> deny tcp <i>source source-wildcard</i> <i>[operator [port]] destination destination-wildcard [operator [port]]</i> [established {match-any match-all} {+ -}] <i>flag-name</i> [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments] Example: Device(config-ext-nacl)# deny tcp any any match-all -ack -fin	(Optional) Specifies a deny statement in named IP access list mode. <ul style="list-style-type: none"> • This access list happens to use a permit statement first, but a deny statement could appear first, depending on the order of statements you need. • Use the TCP command syntax of the deny command. • Any packet that does not have the ACK flag set, and also does not have the FIN flag set, will not be allowed to pass the named access list kmd1 in Step 3. • See the deny(IP) command for additional command syntax to permit upper-layer protocols (ICMP, IGMP, TCP, and UDP).
Step 6	Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the no sequence-number command to delete an entry.	Allows you to revise the access list.
Step 7	end Example: Device(config-ext-nacl)# end	(Optional) Exits the configuration mode and returns to privileged EXEC mode.
Step 8	show ip access-lists <i>access-list-name</i>	(Optional) Displays the contents of the IP access list.

	Command or Action	Purpose
	Example: Device# show ip access-lists kmdl	<ul style="list-style-type: none"> Review the output to confirm that the access list includes the new entry.

Configuration Examples for ACL Support for Filtering IP Options

Example: Filtering Packets That Contain IP Options

The following example shows an extended access list named mylist2 that contains access list entries (ACEs) that are configured to permit TCP packets only if they contain the IP Options that are specified in the ACEs:

```
ip access-list extended mylist2
 10 permit ip any any option eool
 20 permit ip any any option record-route
 30 permit ip any any option zsu
 40 permit ip any any option mtup
```

The **show access-list** command has been entered to show how many packets were matched and therefore permitted:

```
Device# show ip access-list mylist2
Extended IP access list test
10 permit ip any any option eool (1 match)
20 permit ip any any option record-route (1 match)
30 permit ip any any option zsu (1 match)
40 permit ip any any option mtup (1 match)
```

Example: Filtering Packets That Contain TCP Flags

The following access list allows TCP packets only if the TCP flags ACK and SYN are set and the FIN flag is not set:

```
ip access-list extended aaa
 permit tcp any any match-all +ack +syn -fin
end
```

The **show access-list** command has been entered to display the ACL:

```
Device# show access-list aaa

Extended IP access list aaa
 10 permit tcp any any match-all +ack +syn -fin
```

Feature Information for Creating an IP Access List to Filter

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 137: Feature Information for Creating an IP Access List to Filter

Feature Name	Releases	Feature Configuration Information
ACL Support for Filtering IP Options	Cisco IOS 15.2(2)E	This feature allows you to filter packets having IP Options, in order to prevent routers from becoming saturated with spurious packets.
ACL TCP Flags Filtering	Cisco IOS 15.2(2)E	This feature provides a flexible mechanism for filtering on TCP flags. The ACL TCP Flags Filtering feature allows you to select any combination of flags on which to filter. The ability to match on a flag set and on a flag not set gives you a greater degree of control for filtering on TCP flags, thus enhancing security.

CHAPTER 70

VLAN Access Control Lists

VLAN access control lists (ACLs) or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet access control entries (ACEs). After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

This module provides more information about VLAN ACLs and how to configure them.

- [Information About VLAN Access Control Lists, on page 1377](#)

- [Configuration Examples for Using VLAN Maps in Your Network, on page 1391](#)
- [Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs, on page 1393](#)

Information About VLAN Access Control Lists

VLAN Maps

VLAN ACLs or VLAN maps are used to control network traffic within a VLAN. You can apply VLAN maps to all packets that are bridged within a VLAN in the switch or switch stack. VACLs are strictly for security packet filtering and for redirecting traffic to specific physical interfaces. VACLs are not defined by direction (ingress or egress).

All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map.

Figure 97: Using VLAN Maps to Control Traffic

This shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a VLAN.

VLAN Map Configuration Guidelines

VLAN maps are the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

The following are the VLAN map configuration guidelines:

- If there is no ACL configured to deny traffic on an interface and no VLAN map is configured, all traffic is permitted.
- Each VLAN map consists of a series of entries. The order of entries in an VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.
- If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.
- Logging is not supported for VLAN maps.
- When a switch has an IP access list or MAC access list applied to a Layer 2 interface, and you apply a VLAN map to a VLAN that the port belongs to, the port ACL takes precedence over the VLAN map.
- If a VLAN map configuration cannot be applied in hardware, all packets in that VLAN are dropped.

VLAN Maps with Router ACLs

To access control both bridged and routed traffic, you can use VLAN maps only or a combination of router ACLs and VLAN maps. You can define router ACLs on both input and output routed VLAN interfaces, and you can define a VLAN map to access control the bridged traffic.

If a packet flow matches a VLAN-map deny clause in the ACL, regardless of the router ACL configuration, the packet flow is denied.

Note When you use router ACLs with VLAN maps, packets that require logging on the router ACLs are not logged if they are denied by a VLAN map.

If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action specified, the packet is forwarded if it does not match any VLAN map entry.

VLAN Maps and Router ACL Configuration Guidelines

These guidelines are for configurations where you need to have an router ACL and a VLAN map on the same VLAN. These guidelines do not apply to configurations where you are mapping router ACLs and VLAN maps on different VLANs.

If you must configure a router ACL and a VLAN map on the same VLAN, use these guidelines for both router ACL and VLAN map configuration:

- You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.
- Whenever possible, try to write the ACL with all entries having a single action except for the final, default action of the other type. That is, write the ACL using one of these two forms:

```
permit... permit... permit... deny ip any any
```

or

```
deny... deny... deny... permit ip any any
```
- To define multiple actions in an ACL (permit, deny), group each action type together to reduce the number of entries.
- Avoid including Layer 4 information in an ACL; adding this information complicates the merging process. The best merge results are obtained if the ACLs are filtered based on IP addresses (source and destination) and not on the full flow (source IP address, destination IP address, protocol, and protocol ports). It is also helpful to use *don't care* bits in the IP address, whenever possible.

If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. This gives priority to the filtering of traffic based on IP addresses.

VACL Logging

When you configure VACL logging, syslog messages are generated for denied IP packets under these circumstances:

- When the first matching packet is received.
- For any matching packets received within the last 5 minutes.
- If the threshold is reached before the 5-minute interval.

Log messages are generated on a per-flow basis. A flow is defined as packets with the same IP addresses and Layer 4 (UDP or TCP) port numbers. If a flow does not receive any packets in the 5-minute interval, that flow is removed from the cache. When a syslog message is generated, the timer and packet counter are reset.

VACL logging restrictions:

- Only denied IP packets are logged.
- Packets that require logging on the outbound port ACLs are not logged if they are denied by a VACL.

How to Configure VLAN Access Control Lists

Creating Named MAC Extended ACLs

You can filter non-IPv4 traffic on a VLAN or on a Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs.

Follow these steps to create a named MAC extended ACL:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mac access-list extended *name***
4. **{deny | permit} {any | host *source MAC address* | *source MAC address mask*} {any | host *destination MAC address* | *destination MAC address mask*} [*type mask* | **lsap lsap mask** | **aarp amber** | **dec-spanning** | **decnet-iv** | **diagnostic dsm** | **etype-6000 etype-8042** | **lat** | **lave-sca** | **mop-console** | **mop-dump** | **msdos** | **mumps** | **netbios** | **vines-echo** | **vines-ip** | **xns-idp** | 0-65535] [**cos** *cos*]**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	<p>mac access-list extended <i>name</i></p> <p>Example:</p> <pre>Device(config)# mac access-list extended macl</pre>	Defines an extended MAC access list using a name.
Step 4	<p>{deny permit} {any host <i>source MAC address</i> <i>source MAC address mask</i>} {any host <i>destination MAC address</i> <i>destination MAC address mask</i>} [<i>type mask</i> lsap <i>lsap mask</i> aarp amber dec-spanning decnet-iv diagnostic dsm etype-6000 etype-8042 lat lavr-sca mop-console mop-dump msdos mumps netbios vines-echo vines-ip xns-idp 0-65535] [cos <i>cos</i>]</p> <p>Example:</p> <pre>Device(config-ext-macl)# deny any any decnet-iv</pre> <p>or</p> <pre>Device(config-ext-macl)# permit any any</pre>	<p>In extended MAC access-list configuration mode, specifies to permit or deny any source MAC address, a source MAC address with a mask, or a specific host source MAC address and any destination MAC address, destination MAC address with a mask, or a specific destination MAC address.</p> <p>(Optional) You can also enter these options:</p> <ul style="list-style-type: none"> • type mask—An arbitrary EtherType number of a packet with Ethernet II or SNAP encapsulation in decimal, hexadecimal, or octal with optional mask of <i>don't care</i> bits applied to the EtherType before testing for a match. • lsap lsap mask—An LSAP number of a packet with IEEE 802.2 encapsulation in decimal, hexadecimal, or octal with optional mask of <i>don't care</i> bits. • aarp amber dec-spanning decnet-iv diagnostic dsm etype-6000 etype-8042 lat lavr-sca mop-console mop-dump msdos mumps netbios vines-echo vines-ip xns-idp—A non-IP protocol. • cos cos—An IEEE 802.1Q cost of service number from 0 to 7 used to set priority.
Step 5	<p>end</p> <p>Example:</p> <pre>Device(config-ext-macl)# end</pre>	Returns to privileged EXEC mode.
Step 6	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 7	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Applying a MAC ACL to a Layer 2 Interface

Follow these steps to apply a MAC access list to control access to a Layer 2 interface:

SUMMARY STEPS

1. **configure terminal**
2. **configure terminal**
3. **interface *interface-id***
4. **mac access-group {*name*} {in | out }**
5. **end**
6. **show mac access-group [interface *interface-id*]**
7. **configure terminal**
8. **configure terminal**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/2	Identifies a specific interface, and enter interface configuration mode. The interface must be a physical Layer 2 interface (port ACL).
Step 4	mac access-group {<i>name</i>} {in out } Example: Device(config-if)# mac access-group mac1 in	Controls access to the specified interface by using the MAC access list. Port ACLs are supported in the outbound and inbound directions .
Step 5	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 6	show mac access-group [<i>interface interface-id</i>] Example: Device# show mac access-group interface gigabitethernet1/0/2	Displays the MAC access list applied to the interface or all Layer 2 interfaces.
Step 7	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 8	configure terminal Example: Device# configure terminal	Enters global configuration mode.

After receiving a packet, the switch checks it against the inbound ACL. If the ACL permits it, the switch continues to process the packet. If the ACL rejects the packet, the switch discards it. When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied and permits all packets. Remember this behavior if you use undefined ACLs for network security.

Configuring VLAN Maps

To create a VLAN map and apply it to one or more VLANs, perform these steps:

Before you begin

Create the standard or extended IPv4 ACLs or named MAC extended ACLs that you want to apply to the VLAN.

SUMMARY STEPS

1. **vlan access-map** *name* [**number**]
2. **match** {**ip** | **mac**} **address** {*name* | *number*} [*name* | *number*]
3. Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):

- **action** { **forward** }

```
Device(config-access-map)# action forward
```

- **action** { **drop** }

```
Device(config-access-map)# action drop
```

4. `vlan filter mapname vlan-list list`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><code>vlan access-map name [number]</code></p> <p>Example:</p> <pre>Device(config)# vlan access-map map_1 20</pre>	<p>Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map.</p> <p>When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete.</p> <p>VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match.</p> <p>Entering this command changes to access-map configuration mode.</p>
Step 2	<p><code>match {ip mac} address {name number} [name number]</code></p> <p>Example:</p> <pre>Device(config-access-map)# match ip address ip2</pre>	<p>Match the packet (using either the IP or MAC address) against one or more standard or extended access lists. Note that packets are only matched against access lists of the correct protocol type. IP packets are matched against standard or extended IP access lists. Non-IP packets are only matched against named MAC extended access lists.</p> <p>Note If the VLAN map is configured with a match clause for a type of packet (IP or MAC) and the map action is drop, all packets that match the type are dropped. If the VLAN map has no match clause, and the configured action is drop, all IP and Layer 2 packets are dropped.</p>
Step 3	<p>Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):</p> <ul style="list-style-type: none"> • <code>action { forward }</code> <pre>Device(config-access-map)# action forward</pre> <ul style="list-style-type: none"> • <code>action { drop }</code> <pre>Device(config-access-map)# action drop</pre>	<p>Sets the action for the map entry.</p>
Step 4	<p><code>vlan filter mapname vlan-list list</code></p>	<p>Applies the VLAN map to one or more VLAN IDs.</p>

	Command or Action	Purpose
	Example: Device(config)# vlan filter map 1 vlan-list 20-22	The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around the comma and hyphen are optional.

Creating a VLAN Map

Each VLAN map consists of an ordered series of entries. Beginning in privileged EXEC mode, follow these steps to create, add to, or delete a VLAN map entry:

SUMMARY STEPS

1. **configure terminal**
2. **vlan access-map** *name* [**number**]
3. **match** {**ip** | **mac**} **address** {*name* | *number*} [*name* | *number*]
4. **action** {**drop** | **forward**}
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	vlan access-map <i>name</i> [number] Example: Device(config)# vlan access-map map_1 20	<p>Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map.</p> <p>When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete.</p> <p>VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match.</p> <p>Entering this command changes to access-map configuration mode.</p>
Step 3	match { ip mac } address { <i>name</i> <i>number</i> } [<i>name</i> <i>number</i>]	Match the packet (using either the IP or MAC address) against one or more standard or extended access lists. Note

	Command or Action	Purpose
	Example: Device(config-access-map) # match ip address ip2	that packets are only matched against access lists of the correct protocol type. IP packets are matched against standard or extended IP access lists. Non-IP packets are only matched against named MAC extended access lists.
Step 4	action {drop forward} Example: Device(config-access-map) # action forward	(Optional) Sets the action for the map entry. The default is to forward.
Step 5	end Example: Device(config-access-map) # end	Returns to global configuration mode.
Step 6	show running-config Example: Device# show running-config	Displays the access list configuration.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Applying a VLAN Map to a VLAN

Beginning in privileged EXEC mode, follow these steps to apply a VLAN map to one or more VLANs:

SUMMARY STEPS

- 1.
2. **configure terminal**
3. **vlan filter *mapname* vlan-list *list***
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1		

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	vlan filter <i>mapname</i> vlan-list <i>list</i> Example: Device(config)# <code>vlan filter map 1 vlan-list 20-22</code>	Applies the VLAN map to one or more VLAN IDs. The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around the comma and hyphen are optional.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# <code>show running-config</code>	Displays the access list configuration.
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring VACL Logging

Beginning in privileged EXEC mode:

SUMMARY STEPS

1. `configure terminal`
2. `vlan access-map name [number]`
3. `action drop log`
4. `exit`
5. `vlan access-log {maxflow max_number | threshold pkt_count}`
6. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	vlan access-map name [number] Example: Device(config) # vlan access-map gandymede 10	<p>Creates a VLAN map. Give it a name and optionally a number. The number is the sequence number of the entry within the map.</p> <p>The sequence number range is from 0 to 65535.</p> <p>When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete.</p> <p>Specifying the map name and optionally a number enters the access-map configuration mode.</p>
Step 3	action drop log Example: Device(config-access-map) # action drop log	Sets the VLAN access map to drop and log IP packets.
Step 4	exit Example: Device(config-access-map) # exit	Exits the VLAN access map configuration mode and return to the global configuration mode.
Step 5	vlan access-log {maxflow max_number threshold pkt_count} Example: Device(config) # vlan access-log threshold 4000	<p>Configures the VACL logging parameters.</p> <ul style="list-style-type: none"> • maxflow max_number—Sets the log table size. The content of the log table can be deleted by setting the maxflow to 0. When the log table is full, the software drops logged packets from new flows. The range is from 0 to 2048. The default is 500. • threshold pkt_count—Sets the logging threshold. A logging message is generated if the threshold for a flow is reached before the 5-minute interval. The threshold range is from 0 to 2147483647. The default threshold is 0, which means that a syslog message is generated every 5 minutes.
Step 6	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# end	

Configuration Examples for ACLs and VLAN Maps

Example: Creating an ACL and a VLAN Map to Deny a Packet

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the *ip1* ACL (TCP packets) would be dropped. You first create the *ip1* ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

```
Device(config)# ip access-list extended ip1
Device(config-ext-nacl)# permit tcp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map_1 10
Device(config-access-map)# match ip address ip1
Device(config-access-map)# action drop
```

Example: Creating an ACL and a VLAN Map to Permit a Packet

This example shows how to create a VLAN map to permit a packet. ACL *ip2* permits UDP packets and any packets that match the *ip2* ACL are forwarded. In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

```
Device(config)# ip access-list extended ip2
Device(config-ext-nacl)# permit udp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map_1 20
Device(config-access-map)# match ip address ip2
Device(config-access-map)# action forward
```

Example: Default Action of Dropping IP Packets and Forwarding MAC Packets

In this example, the VLAN map has a default action of drop for IP packets and a default action of forward for MAC packets. Used with standard ACL 101 and extended named access lists **igmp-match** and **tcp-match**, the map will have the following results:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets

```

Device(config)# access-list 101 permit udp any any
Device(config)# ip access-list extended igmp-match
Device(config-ext-nacl)# permit igmp any any

Device(config-ext-nacl)# permit tcp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map drop-ip-default 10
Device(config-access-map)# match ip address 101
Device(config-access-map)# action forward
Device(config-access-map)# exit
Device(config)# vlan access-map drop-ip-default 20
Device(config-access-map)# match ip address igmp-match
Device(config-access-map)# action drop
Device(config-access-map)# exit
Device(config)# vlan access-map drop-ip-default 30
Device(config-access-map)# match ip address tcp-match
Device(config-access-map)# action forward

```

Example: Default Action of Dropping MAC Packets and Forwarding IP Packets

In this example, the VLAN map has a default action of drop for MAC packets and a default action of forward for IP packets. Used with MAC extended access lists **good-hosts** and **good-protocols**, the map will have the following results:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets with decnet-iv or vines-ip protocols
- Drop all other non-IP packets
- Forward all IP packets

Example: Default Action of Dropping All Packets

In this example, the VLAN map has a default action of drop for all packets (IP and non-IP). Used with access lists **tcp-match** and **good-hosts** from Examples 2 and 3, the map will have the following results:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Drop all other IP packets
- Drop all other MAC packets

```

Device(config)# vlan access-map drop-all-default 10
Device(config-access-map)# match ip address tcp-match
Device(config-access-map)# action forward
Device(config-access-map)# exit
Device(config)# vlan access-map drop-all-default 20
Device(config-access-map)# match mac address good-hosts
Device(config-access-map)# action forward

```

Configuration Examples for Using VLAN Maps in Your Network

Example: Wiring Closet Configuration

Figure 98: Wiring Closet Configuration

In a wiring closet configuration, routing might not be enabled on the switch. In this configuration, the switch can still support a VLAN map and a QoS classification ACL. Assume that Host X and Host Y are in different VLANs and are connected to wiring closet switches A and C. Traffic from Host X to Host Y is eventually being routed by Switch B, a Layer 3 switch with routing enabled. Traffic from Host X to Host Y can be access-controlled at the traffic entry point,

If you do not want HTTP traffic switched from Host X to Host Y, you can configure a VLAN map on Switch A to drop all HTTP traffic from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge it to Switch B.

First, define the IP access list *http* that permits (matches) any TCP traffic on the HTTP port.

```
Device(config)# ip access-list extended http
Device(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Device(config-ext-nacl)# exit
```

Next, create VLAN access map *map2* so that traffic that matches the *http* access list is dropped and all other IP traffic is forwarded.

```
Device(config)# vlan access-map map2 10
Device(config-access-map)# match ip address http
Device(config-access-map)# action drop
Device(config-access-map)# exit
Device(config)# ip access-list extended match_all
Device(config-ext-nacl)# permit ip any any
Device(config-ext-nacl)# exit
```

```
Device(config)# vlan access-map map2 20
Device(config-access-map)# match ip address match_all
Device(config-access-map)# action forward
```

Then, apply VLAN access map *map2* to VLAN 1.

```
Device(config)# vlan filter map2 vlan 1
```

Example: Restricting Access to a Server on Another VLAN

Figure 99: Restricting Access to a Server on Another VLAN

You can restrict access to a server on another VLAN. For example, server 10.1.1.100 in VLAN 10 needs to have access denied to these hosts:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

Example: Denying Access to a Server on Another VLAN

This example shows how to deny access to a server on another VLAN by creating the VLAN map SERVER1 that denies access to hosts in subnet 10.1.2.0.8, host 10.1.1.4, and host 10.1.1.8 and permits other IP traffic. The final step is to apply the map SERVER1 to VLAN 10.

Define the IP ACL that will match the correct packets.

```
Device(config)# ip access-list extended SERVER1_ACL
Device(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Device(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Device(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Device(config-ext-nacl)# exit
```

Define a VLAN map using this ACL that will drop IP packets that match SERVER1_ACL and forward IP packets that do not match the ACL.

```

Device(config)# vlan access-map SERVER1_MAP
Device(config-access-map)# match ip address SERVER1_ACL
Device(config-access-map)# action drop
Device(config)# vlan access-map SERVER1_MAP 20
Device(config-access-map)# action forward
Device(config-access-map)# exit

```

Apply the VLAN map to VLAN 10.

```

Device(config)# vlan filter SERVER1_MAP vlan-list 10

```

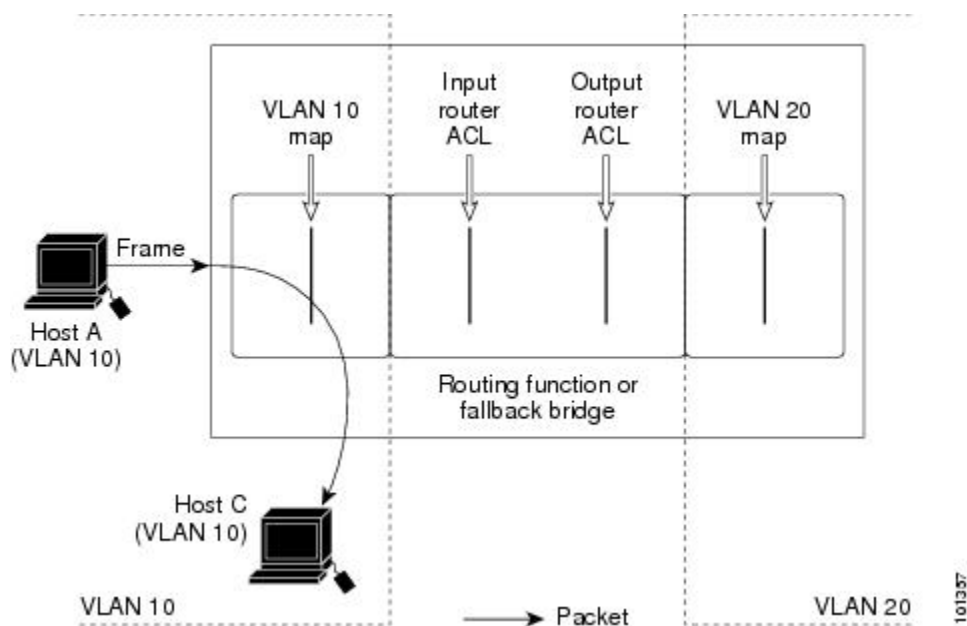

Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs

This section gives examples of applying router ACLs and VLAN maps to a VLAN for switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time the packet's path crosses a line indicating a VLAN map or an ACL, it is also possible that the packet might be dropped, rather than forwarded.

Example: ACLs and Switched Packets

Figure 100: Applying ACLs on Switched Packets

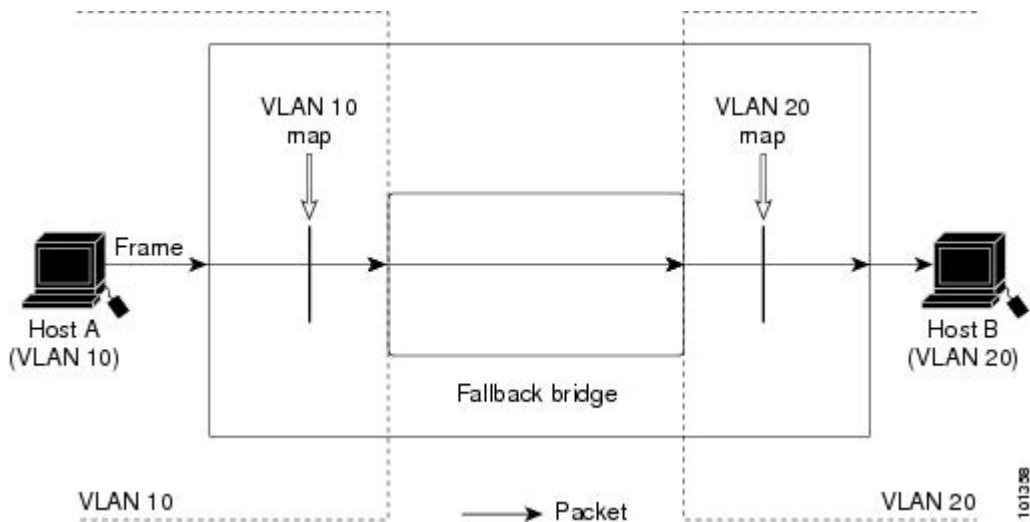

This example shows how an ACL is applied on packets that are switched within a VLAN. Packets switched within the VLAN without being routed or forwarded by fallback bridging are only subject to the VLAN map of the input VLAN.

Example: ACLs and Bridged Packets

Figure 101: Applying ACLs on Bridged Packets

This example shows how an ACL is applied on fallback-bridged packets. For bridged packets, only Layer 2 ACLs are applied to the input VLAN. Only non-IP, non-ARP packets can be fallback-bridged.

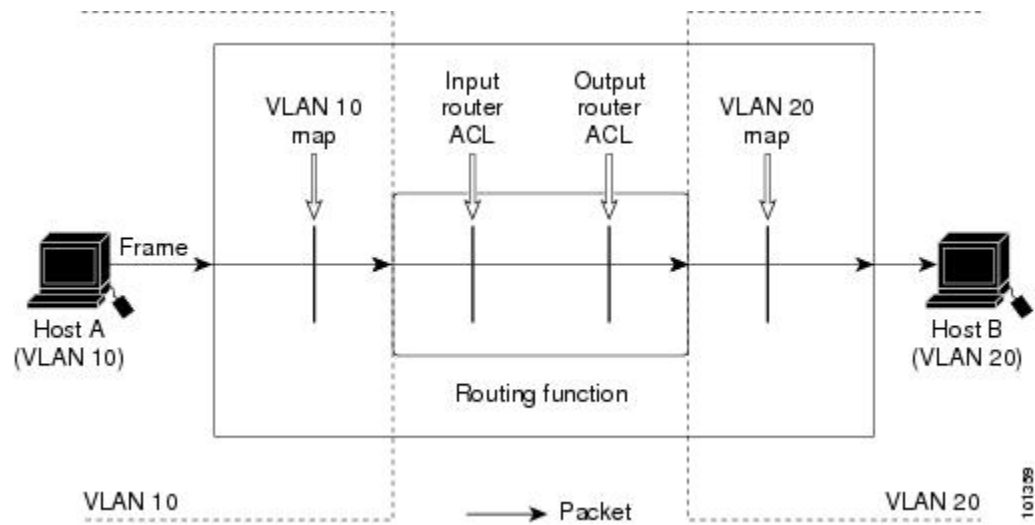

Example: ACLs and Routed Packets

Figure 102: Applying ACLs on Routed Packets

This example shows how ACLs are applied on routed packets. The ACLs are applied in this order:

1. VLAN map for input VLAN
2. Input router ACL
3. Output router ACL
4. VLAN map for output VLAN

Example: ACLs and Multicast Packets

Figure 103: Applying ACLs on Multicast Packets

This example shows how ACLs are applied on packets that are replicated for IP multicasting. A multicast packet being routed has two different kinds of filters applied: one for destinations that are other ports in the input VLAN and another for each of the destinations that are in other VLANs to which the packet has been routed. The packet might be routed to more than one output VLAN, in which case a different router output ACL and VLAN map would apply for each destination VLAN. The final result is that the packet might be permitted in some of the output VLANs and not in others. A copy of the packet is forwarded to those destinations where it is permitted. However, if the input VLAN map drops the packet, no destination receives a copy of the packet.

CHAPTER 71

Configuring DHCP

- [Restrictions for DHCP, on page 1397](#)
- [Information About DHCP, on page 1397](#)
- [How to Configure DHCP Features, on page 1404](#)
- [Configuring DHCP Server Port-Based Address Allocation, on page 1413](#)

Restrictions for DHCP

The following scenario is not supported:

A non-DHCP snooping VLAN, and the SVI of the non-DHCP snooping VLAN is configured on a device. The SVI of the non-DHCP snooping VLAN is configured with the status of *no shutdown*. In this scenario, the DHCP packets in the non-DHCP snooping VLAN are not forwarded to the trusted ports.

If the SVI of the non-DHCP snooping VLAN is not configured or is configured with the *shutdown* status, DHCP packets are forwarded to the trusted ports, and DHCP clients can obtain IP address from the DHCP server.

Information About DHCP

DHCP Server

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it forwards the request to one or more secondary DHCP servers defined by the network administrator. The switch can act as a DHCP server.

DHCP Relay Agent

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on output interfaces.

DHCP Snooping

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, also referred to as a DHCP snooping binding table.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

Note For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

An untrusted DHCP message is a message that is received through an untrusted interface. By default, the switch considers all interfaces untrusted. So, the switch must be configured to trust some interfaces to use DHCP Snooping. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer's switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database has the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not have information regarding hosts interconnected with a trusted interface.

Note When configuring DHCP snooping to block unauthorized IP address using the **ip verify source prot-security** command on an interface, the **switchport port-security** command should also be configured.

In a service-provider network, an example of an interface you might configure as trusted is one connected to a port on a device in the same network. An example of an untrusted interface is one that is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If the addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.

The switch drops a DHCP packet when one of these situations occurs:

- A packet from a DHCP server, such as a DHCP OFFER, DHCP ACK, DHCP NAK, or DHCP REQUEST packet, is received from outside the network or firewall.
- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.
- The switch receives a DHCP RELEASE or DHCP DECLINE broadcast message that has a MAC address in the DHCP snooping binding database, but the interface information in the binding database does not match the interface on which the message was received.
- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.

If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.

When an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the **ip dhcp snooping information option allow-untrusted** global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP inspection or IP source guard, can still be enabled on the aggregation switch while the switch receives packets with option-82 information on untrusted input interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

Normally, it is not desirable to broadcast packets to wireless clients. So, DHCP snooping replaces destination broadcast MAC address (ffff.ffff.ffff) with unicast MAC address for DHCP packets that are going from server to wireless clients. The unicast MAC address is retrieved from CHADDR field in the DHCP payload. This processing is applied for server to client packets such as DHCP OFFER, DHCP ACK, and DHCP NACK messages. The **ip dhcp snooping wireless bootp-broadcast enable** can be used to revert this behavior. When the wireless BOOTP broadcast is enabled, the broadcast DHCP packets from server are forwarded to wireless clients without changing the destination MAC address.

Option-82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

Note The DHCP option-82 feature is supported only when DHCP snooping is globally enabled on the VLANs to which subscriber devices using option-82 are assigned.

The following illustration shows a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.

Figure 104: DHCP Relay Agent in a Metropolitan Ethernet Network

When you enable the DHCP snooping information option 82 on the switch, the following sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, **vlan-mod-port**, from which the packet is received. You can configure the remote ID and circuit ID.
- If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.
- The switch forwards the DHCP request that includes the option-82 field to the DHCP server.
- The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.
- The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields do not change (see the illustration, *Suboption Packet Formats*):

- Circuit-ID suboption fields
 - Suboption type
 - Length of the suboption type
 - Circuit-ID type
 - Length of the circuit-ID type
- Remote-ID suboption fields
 - Suboption type
 - Length of the suboption type
 - Remote-ID type

- Length of the remote-ID type

In the port field of the circuit ID suboption, the port numbers start at 3. For example, on a switch with 24 10/100/1000 ports and four small form-factor pluggable (SFP) module slots, port 3 is the Gigabit Ethernet 1/0/1 port, port 4 is the Gigabit Ethernet 1/0/2 port, and so forth. Port 27 is the SFP module slot Gigabit Ethernet 1/0/25, and so forth.

The illustration, *Suboption Packet Formats*, shows the packet formats for the remote-ID suboption and the circuit-ID suboption when the default suboption configuration is used. For the circuit-ID suboption, the module number corresponds to the switch number in the stack. The switch uses the packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option global` configuration command.

Figure 105: Suboption Packet Formats

Circuit ID Suboption Frame Format

Remote ID Suboption Frame Format

The illustration, *User-Configured Suboption Packet Formats*, shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option format remote-id` global configuration command and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

- Circuit-ID suboption fields
 - The circuit-ID type is 1.
 - The length values are variable, depending on the length of the string that you configure.
- Remote-ID suboption fields
 - The remote-ID type is 1.
 - The length values are variable, depending on the length of the string that you configure.

Figure 106: User-Configured Suboption Packet Formats

Circuit ID Suboption Frame Format (for user-configured string):**Remote ID Suboption Frame Format (for user-configured string):**

Cisco IOS DHCP Server Database

During the DHCP-based autoconfiguration process, the designated DHCP server uses the Cisco IOS DHCP server database. It has IP addresses, address bindings, and configuration parameters, such as the boot file.

An address binding is a mapping between an IP address and a MAC address of a host in the Cisco IOS DHCP server database. You can manually assign the client IP address, or the DHCP server can allocate an IP address from a DHCP address pool. For more information about manual and automatic address bindings, see the “Configuring DHCP” chapter of the *Cisco IOS IP Configuration Guide, Release 12.4*.

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the *Cisco IOS IP Configuration Guide, Release 12.4*.

DHCP Snooping Binding Database

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 64,000 bindings.

Each database entry (binding) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database agent stores the bindings in a file at a configured location. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP inspection or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.

When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch updates the file when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is

updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and cancel-timeout values), the update stops.

This is the format of the file with bindings:

```
<initial-checksum>
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
...
<entry-n> <checksum-1-2-..-n>
END
```

Each entry in the file is tagged with a checksum value that the switch uses to verify the entries when it reads the file. The initial-checksum entry on the first line distinguishes entries associated with the latest file update from entries associated with a previous file update.

This is an example of a binding file:

```
2bb4c2a1
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
192.1.168.1 3 0003.47d8.c91f 2BB6488E Gi1/0/4 21ae5fbb
192.1.168.3 3 0003.44d6.c52f 2BB648EB Gi1/0/4 1bdb223f
192.1.168.2 3 0003.47d9.c8f1 2BB648AB Gi1/0/4 584a38f0
END
```

When the switch starts and the calculated checksum value equals the stored checksum value, the switch reads entries from the binding file and adds the bindings to its DHCP snooping binding database. The switch ignores an entry when one of these situations occurs:

- The switch reads the entry and the calculated checksum value does not equal the stored checksum value. The entry and the ones following it are ignored.
- An entry has an expired lease time (the switch might not remove a binding entry when the lease time expires).
- The interface in the entry no longer exists on the system.
- The interface is a routed interface or a DHCP snooping-trusted interface.

DHCP Snooping and Switch Stacks

DHCP snooping is managed on the active switch. When a new switch joins the stack, the switch receives the DHCP snooping configuration from the active switch. When a member switch leaves the stack, all DHCP snooping address bindings associated with the switch age out.

All snooping statistics are generated on the active switch. If a new active switch is elected, the statistics counters reset.

When a stack merge occurs, all DHCP snooping bindings in the active switch are lost if it is no longer the active switch. With a stack partition, the existing active switch is unchanged, and the bindings belonging to

the partitioned switches age out. The new active switch of the partitioned stack begins processing the new incoming DHCP packets.

How to Configure DHCP Features

Default DHCP Snooping Configuration

Table 138: Default DHCP Configuration

Feature	Default Setting
DHCP server	Enabled in Cisco IOS software, requires configuration ¹²
DHCP relay agent	Enabled ¹³
DHCP packet forwarding address	None configured
Checking the relay agent information	Enabled (invalid messages are dropped)
DHCP relay agent forwarding policy	Replace the existing relay agent information
DHCP snooping enabled globally	Disabled
DHCP snooping information option	Enabled
DHCP snooping option to accept packets on untrusted input interfaces ¹⁴	Disabled
DHCP snooping limit rate	None configured
DHCP snooping trust	Untrusted
DHCP snooping VLAN	Disabled
DHCP snooping MAC address verification	Enabled
Cisco IOS DHCP server binding database	Enabled in Cisco IOS software, requires configuration. Note The switch gets network addresses and configuration parameters only from a device configured as a DHCP server.
DHCP snooping binding database agent	Enabled in Cisco IOS software, requires configuration. This feature is operational only when a destination is configured.

¹² The switch responds to DHCP requests only if it is configured as a DHCP server.

¹³ The switch relays DHCP packets only if the IP address of the DHCP server is configured on the SVI of the DHCP client.

- ¹⁴ Use this feature when the switch is an aggregation switch that receives packets with option-82 information from an edge switch.

DHCP Snooping Configuration Guidelines

- If a switch port is connected to a DHCP server, configure a port as trusted by entering the **ip dhcp snooping trust interface** configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the **no ip dhcp snooping trust** interface configuration command.
- You can display DHCP snooping statistics by entering the **show ip dhcp snooping statistics** user EXEC command, and you can clear the snooping statistics counters by entering the **clear ip dhcp snooping statistics** privileged EXEC command.

Configuring the DHCP Server

The switch can act as a DHCP server.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the *Cisco IOS IP Configuration Guide, Release 12.4*.

DHCP Server and Switch Stacks

The DHCP binding database is managed on the stack's active switch. When a new active switch is assigned, the new active switch downloads the saved binding database from the TFTP server. When a switchover happens, the new active switch stack will use its database file that has been synced from the old active switch stack using the SSO function. The IP addresses associated with the lost bindings are released. You should configure an automatic backup by using the **ip dhcp database url [timeout seconds | write-delay seconds]** global configuration command.

Configuring the DHCP Relay Agent

Follow these steps to enable the DHCP relay agent on the switch:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service dhcp**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Device> enable	<ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	service dhcp Example: Device(config)# service dhcp	Enables the DHCP server and relay agent on your switch. By default, this feature is enabled.
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# show running-config	Verifies your entries.
Step 6	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

What to do next

- Checking (validating) the relay agent information
- Configuring the relay agent forwarding policy

Specifying the Packet Forwarding Address

If the DHCP server and the DHCP clients are on different networks or subnets, you must configure the switch with the **ip helper-address** *address* interface configuration command. The general rule is to configure the command on the Layer 3 interface closest to the client. The address used in the **ip helper-address** command can be a specific DHCP server IP address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables any DHCP server to respond to requests.

Beginning in privileged EXEC mode, follow these steps to specify the packet forwarding address:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface vlan *vlan-id***
4. **ip address *ip-address subnet-mask***
5. **ip helper-address *address***
6. **end**
7. Use one of the following:
 - **interface range *port-range***
 - **interface *interface-id***
8. **switchport mode access**
9. **switchport access vlan *vlan-id***
10. **end**
11. **show running-config**
12. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device(config)# interface vlan 1	Creates a switch virtual interface by entering a VLAN ID, and enter interface configuration mode.
Step 4	ip address <i>ip-address subnet-mask</i> Example: Device(config-if)# ip address 192.108.1.27 255.255.255.0	Configures the interface with an IP address and an IP subnet.
Step 5	ip helper-address <i>address</i> Example: Device(config-if)# ip helper-address 172.16.1.2	Specifies the DHCP packet forwarding address. The helper address can be a specific DHCP server address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables other servers to respond to DHCP requests.

	Command or Action	Purpose
		If you have multiple servers, you can configure one helper address for each server.
Step 6	end Example: Device(config-if)# end	Returns to global configuration mode.
Step 7	Use one of the following: <ul style="list-style-type: none"> • interface range <i>port-range</i> • interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/2	Configures multiple physical ports that are connected to the DHCP clients, and enter interface range configuration mode. or Configures a single physical port that is connected to the DHCP client, and enter interface configuration mode.
Step 8	switchport mode access Example: Device(config-if)# switchport mode access	Defines the VLAN membership mode for the port.
Step 9	switchport access vlan <i>vlan-id</i> Example: Device(config-if)# switchport access vlan 1	Assigns the ports to the same VLAN as configured in Step 2.
Step 10	end Example: Device(config-if)# end	Returns to privileged EXEC mode.
Step 11	show running-config Example: Device# show running-config	Verifies your entries.
Step 12	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Prerequisites for Configuring DHCP Snooping and Option 82

The prerequisites for DHCP Snooping and Option 82 are as follows:

- You must globally enable DHCP snooping on the switch.

- Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.
- If you want the switch to respond to DHCP requests, it must be configured as a DHCP server.
- Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.
- For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces. In a service-provider network, a trusted interface is connected to a port on a device in the same network.
- You must configure the switch to use the Cisco IOS DHCP server binding database to use it for DHCP snooping.
- To use the DHCP snooping option of accepting packets on untrusted inputs, the switch must be an aggregation switch that receives packets with option-82 information from an edge switch.
- The following prerequisites apply to DHCP snooping binding database configuration:
 - You must configure a destination on the DHCP snooping binding database to use the switch for DHCP snooping.
 - Because both NVRAM and the flash memory have limited storage capacity, we recommend that you store the binding file on a TFTP server.
 - For network-based URLs (such as TFTP and FTP), you must create an empty file at the configured URL before the switch can write bindings to the binding file at that URL. See the documentation for your TFTP server to determine whether you must first create an empty file on the server; some TFTP servers cannot be configured this way.
 - To ensure that the lease time in the database is accurate, we recommend that you enable and configure Network Time Protocol (NTP).
 - If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.
- Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, configure DHCP options for devices, or set up the DHCP database agent.
- If you want the switch to relay DHCP packets, the IP address of the DHCP server must be configured on the switch virtual interface (SVI) of the DHCP client.
- If a switch port is connected to a DHCP server, configure a port as trusted by entering the **ip dhcp snooping trust interface** configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the **no ip dhcp snooping trust** interface configuration command.

Enabling DHCP Snooping and Option 82

Follow these steps to enable DHCP snooping on the switch:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp snooping**
4. **ip dhcp snooping vlan *vlan-range***
5. **ip dhcp snooping information option**
6. **ip dhcp snooping information option format remote-id [string *ASCII-string* | hostname]**
7. **ip dhcp snooping information option allow-untrusted**
8. **interface *interface-id***
9. **ip dhcp snooping vlan *vlan* information option format-type circuit-id [override] string *ASCII-string***
10. **ip dhcp snooping trust**
11. **ip dhcp snooping limit rate *rate***
12. **exit**
13. **ip dhcp snooping verify mac-address**
14. **end**
15. **show running-config**
16. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip dhcp snooping Example: Device(config)# ip dhcp snooping	Enables DHCP snooping globally.
Step 4	ip dhcp snooping vlan <i>vlan-range</i> Example: Device(config)# ip dhcp snooping vlan 10	Enables DHCP snooping on a VLAN or range of VLANs. The range is 1 to 4094. You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space. <ul style="list-style-type: none"> • You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens,

	Command or Action	Purpose
		or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space.
Step 5	ip dhcp snooping information option Example: <pre>Device(config)# ip dhcp snooping information option</pre>	Enables the switch to insert and remove DHCP relay information (option-82 field) in forwarded DHCP request messages to the DHCP server. This is the default setting.
Step 6	ip dhcp snooping information option format remote-id [string ASCII-string hostname] Example: <pre>Device(config)# ip dhcp snooping information option format remote-id string acsiistring2</pre>	(Optional) Configures the remote-ID suboption. You can configure the remote ID as: <ul style="list-style-type: none"> • String of up to 63 ASCII characters (no spaces) • Configured hostname for the switch Note If the hostname is longer than 63 characters, it is truncated to 63 characters in the remote-ID configuration. The default remote ID is the switch MAC address.
Step 7	ip dhcp snooping information option allow-untrusted Example: <pre>Device(config)# ip dhcp snooping information option allow-untrusted</pre>	(Optional) If the switch is an aggregation switch connected to an edge switch, this command enables the switch to accept incoming DHCP snooping packets with option-82 information from the edge switch. The default setting is disabled. Note Enter this command only on aggregation switches that are connected to trusted devices.
Step 8	interface interface-id Example: <pre>Device(config)# interface gigabitethernet2/0/1</pre>	Specifies the interface to be configured, and enter interface configuration mode.
Step 9	ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string Example: <pre>Device(config-if)# ip dhcp snooping vlan 1 information option format-type circuit-id override string override2</pre>	(Optional) Configures the circuit-ID suboption for the specified interface. Specify the VLAN and port identifier, using a VLAN ID in the range of 1 to 4094. The default circuit ID is the port identifier, in the format vlan-mod-port . You can configure the circuit ID to be a string of 3 to 63 ASCII characters (no spaces). (Optional) Use the override keyword when you do not want the circuit-ID suboption inserted in TLV format to define subscriber information.
Step 10	ip dhcp snooping trust Example:	(Optional) Configures the interface as trusted or untrusted. Use the no keyword to configure an interface to receive

	Command or Action	Purpose
	Device(config-if)# <code>ip dhcp snooping trust</code>	messages from an untrusted client. The default setting is untrusted.
Step 11	ip dhcp snooping limit rate <i>rate</i> Example: Device(config-if)# <code>ip dhcp snooping limit rate 100</code>	(Optional) Configures the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured. Note We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN with DHCP snooping.
Step 12	exit Example: Device(config-if)# <code>exit</code>	Returns to global configuration mode.
Step 13	ip dhcp snooping verify mac-address Example: Device(config)# <code>ip dhcp snooping verify mac-address</code>	(Optional) Configures the switch to verify that the source MAC address in a DHCP packet received on untrusted ports matches the client hardware address in the packet. The default is to verify that the source MAC address matches the client hardware address in the packet.
Step 14	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 15	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 16	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Enabling the Cisco IOS DHCP Server Database

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4

Monitoring DHCP Snooping Information

Table 139: Commands for Displaying DHCP Information

show ip dhcp snooping	Displays the DHCP snooping configuration for a switch
show ip dhcp snooping binding	Displays only the dynamically configured bindings in the DHCP snooping binding database, also referred to as a binding table.
show ip dhcp snooping database	Displays the DHCP snooping binding database status and statistics.
show ip dhcp snooping statistics	Displays the DHCP snooping statistics in summary or detail form.
show ip source binding	Display the dynamically and statically configured bindings.

Note If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the statically configured bindings.

Configuring DHCP Server Port-Based Address Allocation

Information About Configuring DHCP Server Port-Based Address Allocation

DHCP server port-based address allocation is a feature that enables DHCP to maintain the same IP address on an Ethernet switch port regardless of the attached device client identifier or client hardware address.

When Ethernet switches are deployed in the network, they offer connectivity to the directly connected devices. In some environments, such as on a factory floor, if a device fails, the replacement device must be working immediately in the existing network. With the current DHCP implementation, there is no guarantee that DHCP would offer the same IP address to the replacement device. Control, monitoring, and other software expect a stable IP address associated with each device. If a device is replaced, the address assignment should remain stable even though the DHCP client has changed.

When configured, the DHCP server port-based address allocation feature ensures that the same IP address is always offered to the same connected port even as the client identifier or client hardware address changes in the DHCP messages received on that port. The DHCP protocol recognizes DHCP clients by the client identifier option in the DHCP packet. Clients that do not include the client identifier option are identified by the client hardware address. When you configure this feature, the port name of the interface overrides the client identifier or hardware address and the actual point of connection, the switch port, becomes the client identifier.

In all cases, by connecting the Ethernet cable to the same port, the same IP address is allocated through DHCP to the attached device.

The DHCP server port-based address allocation feature is only supported on a Cisco IOS DHCP server and not a third-party server.

Default Port-Based Address Allocation Configuration

By default, DHCP server port-based address allocation is disabled.

Port-Based Address Allocation Configuration Guidelines

- By default, DHCP server port-based address allocation is disabled.
- To restrict assignments from the DHCP pool to preconfigured reservations (unreserved addresses are not offered to the client and other clients are not served by the pool), you can enter the **reserved-only** DHCP pool configuration command.

Enabling the DHCP Snooping Binding Database Agent

Beginning in privileged EXEC mode, follow these steps to enable and configure the DHCP snooping binding database agent on the switch:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp snooping database** {flash[number]:/filename | ftp://user:password@host/filename | http://[[username:password]@]{hostname | host-ip}[/directory] /image-name.tar | rcp://user@host/filename} | **tftp://host/filename**
4. **ip dhcp snooping database timeout** seconds
5. **ip dhcp snooping database write-delay** seconds
6. **end**
7. **ip dhcp snooping binding** mac-address **vlan** vlan-id **ip-address** **interface** interface-id **expiry** seconds
8. **show ip dhcp snooping database** [detail]
9. **show running-config**
10. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	<p>ip dhcp snooping database {flash[<i>number</i>]:/<i>filename</i> ftp://<i>user</i>:<i>password</i>@<i>host</i>/<i>filename</i> http://[[<i>username</i>:<i>password</i>]@]{<i>hostname</i> / <i>host-ip</i>}[/<i>directory</i>] <i>image-name.tar</i> rcp://<i>user</i>@<i>host</i>/<i>filename</i>} tftp://<i>host</i>/<i>filename</i></p> <p>Example:</p> <pre>Device(config)# ip dhcp snooping database tftp://10.90.90.90/snooping-rp2</pre>	<p>Specifies the URL for the database agent or the binding file by using one of these forms:</p> <ul style="list-style-type: none"> • flash[<i>number</i>]:/<i>filename</i> <p>(Optional) Use the <i>number</i> parameter to specify the stack member number of the active switch. The range for <i>number</i> is 1 to 9.</p> <ul style="list-style-type: none"> • ftp://<i>user</i>:<i>password</i>@<i>host</i>/<i>filename</i> • http://[[<i>username</i>:<i>password</i>]@]{<i>hostname</i> / <i>host-ip</i>}[/<i>directory</i>] <i>image-name.tar</i> • rcp://<i>user</i>@<i>host</i>/<i>filename</i> • tftp://<i>host</i>/<i>filename</i>
Step 4	<p>ip dhcp snooping database timeout <i>seconds</i></p> <p>Example:</p> <pre>Device(config)# ip dhcp snooping database timeout 300</pre>	<p>Specifies (in seconds) how long to wait for the database transfer process to finish before stopping the process.</p> <p>The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely.</p>
Step 5	<p>ip dhcp snooping database write-delay <i>seconds</i></p> <p>Example:</p> <pre>Device(config)# ip dhcp snooping database write-delay 15</pre>	<p>Specifies the duration for which the transfer should be delayed after the binding database changes. The range is from 15 to 86400 seconds. The default is 300 seconds (5 minutes).</p>
Step 6	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 7	<p>ip dhcp snooping binding <i>mac-address</i> vlan <i>vlan-id</i> <i>ip-address</i> interface <i>interface-id</i> expiry <i>seconds</i></p> <p>Example:</p> <pre>Device# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gil/1 expiry 1000</pre>	<p>(Optional) Adds binding entries to the DHCP snooping binding database. The <i>vlan-id</i> range is from 1 to 4904. The <i>seconds</i> range is from 1 to 4294967295.</p> <p>Enter this command for each entry that you add.</p> <p>Use this command when you are testing or debugging the switch.</p>
Step 8	<p>show ip dhcp snooping database [detail]</p> <p>Example:</p> <pre>Device# show ip dhcp snooping database detail</pre>	<p>Displays the status and statistics of the DHCP snooping binding database agent.</p>

	Command or Action	Purpose
Step 9	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 10	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Enabling DHCP Server Port-Based Address Allocation

Follow these steps to globally enable port-based address allocation and to automatically generate a subscriber identifier on an interface.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip dhcp use subscriber-id client-id`
4. `ip dhcp subscriber-id interface-name`
5. `interface interface-id`
6. `ip dhcp server use subscriber-id client-id`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	ip dhcp use subscriber-id client-id Example: Device(config)# ip dhcp use subscriber-id client-id	Configures the DHCP server to globally use the subscriber identifier as the client identifier on all incoming DHCP messages.
Step 4	ip dhcp subscriber-id interface-name Example: Device(config)# ip dhcp subscriber-id interface-name	Automatically generates a subscriber identifier based on the short name of the interface. A subscriber identifier configured on a specific interface takes precedence over this command.
Step 5	interface interface-id Example: Device(config)# interface gigabitethernet1/0/1	Specifies the interface to be configured, and enter interface configuration mode.
Step 6	ip dhcp server use subscriber-id client-id Example: Device(config-if)# ip dhcp server use subscriber-id client-id	Configures the DHCP server to use the subscriber identifier as the client identifier on all incoming DHCP messages on the interface.
Step 7	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 8	show running-config Example: Device# show running-config	Verifies your entries.
Step 9	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

What to do next

After enabling DHCP port-based address allocation on the switch, use the **ip dhcp pool** global configuration command to preassign IP addresses and to associate them to clients.

Monitoring DHCP Server Port-Based Address Allocation

Table 140: Commands for Displaying DHCP Port-Based Address Allocation Information

Command	Purpose
show interface <i>interface id</i>	Displays the status and configuration of a specific interface.
show ip dhcp pool	Displays the DHCP address pools.
show ip dhcp binding	Displays address bindings on the Cisco IOS DHCP server.

Feature Information for DHCP Snooping and Option 82

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.

Release	Feature Information
	<p>Introduced support for the following commands:</p> <ul style="list-style-type: none">• show ip dhcp snooping statistics user EXEC command for displaying DHCP snooping statistics.• clear ip dhcp snooping statistics privileged EXEC command for clearing the snooping statistics counters.

CHAPTER 72

Configuring IP Source Guard

IP Source Guard (IPSG) is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings.

This chapter contains the following topics:

- [Information About IP Source Guard, on page 1421](#)
- [How to Configure IP Source Guard, on page 1423](#)
- [Monitoring IP Source Guard, on page 1426](#)
- [Additional References, on page 1427](#)

Information About IP Source Guard

IP Source Guard

You can use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor and you can enable IP source guard when DHCP snooping is enabled on an untrusted interface.

After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping.

The switch uses a source IP lookup table in hardware to bind IP addresses to ports. For IP and MAC filtering, a combination of source IP and source MAC lookups are used. IP traffic with a source IP address in the binding table is allowed, all other traffic is denied.

The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IPSG is supported only on Layer 2 ports, including access and trunk ports. You can configure IPSG with source IP address filtering or with source IP and MAC address filtering.

IP Source Guard for Static Hosts

Note Do not use IPSG (IP source guard) for static hosts on uplink ports or trunk ports.

IPSG for static hosts extends the IPSG capability to non-DHCP and static environments. The previous IPSG used the entries created by DHCP snooping to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. This security feature restricts IP traffic on nonrouted Layer 2 interfaces. It filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings. The previous version of IPSG required a DHCP environment for IPSG to work.

IPSG for static hosts allows IPSG to work without DHCP. IPSG for static hosts relies on IP device tracking-table entries to install port ACLs. The switch creates static entries based on ARP requests or other IP packets to maintain the list of valid hosts for a given port. You can also specify the number of hosts allowed to send traffic to a given port. This is equivalent to port security at Layer 3.

IPSG for static hosts also supports dynamic hosts. If a dynamic host receives a DHCP-assigned IP address that is available in the IP DHCP snooping table, the same entry is learned by the IP device tracking table. In a stacked environment, when the active switch failover occurs, the IP source guard entries for static hosts attached to member ports are retained. When you enter the **show ip device tracking all EXEC** command, the IP device tracking table displays the entries as ACTIVE.

Note Some IP hosts with multiple network interfaces can inject some invalid packets into a network interface. The invalid packets contain the IP or MAC address for another network interface of the host as the source address. The invalid packets can cause IPSG for static hosts to connect to the host, to learn the invalid IP or MAC address bindings, and to reject the valid bindings. Consult the vendor of the corresponding operating system and the network interface to prevent the host from injecting invalid packets.

IPSG for static hosts initially learns IP or MAC bindings dynamically through an ACL-based snooping mechanism. IP or MAC bindings are learned from static hosts by ARP and IP packets. They are stored in the device tracking database. When the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum, the hardware drops any packet with a new IP address. To resolve hosts that have moved or gone away for any reason, IPSG for static hosts leverages IP device tracking to age out dynamically learned IP address bindings. This feature can be used with DHCP snooping. Multiple bindings are established on a port that is connected to both DHCP and static hosts. For example, bindings are stored in both the device tracking database as well as in the DHCP snooping binding database.

IP Source Guard Configuration Guidelines

- You can configure static IP bindings only on nonrouted ports. If you enter the **ip source binding mac-address vlan vlan-id ip-address interface interface-id** global configuration command on a routed interface, this error message appears:

```
Static IP source binding can only be configured on switch port.
```

- When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled on the access VLAN for that interface.
- If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

Note If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.

- You can enable this feature when 802.1x port-based authentication is enabled.

How to Configure IP Source Guard

Enabling IP Source Guard

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip verify source** [**mac-check**]
5. **exit**
6. **ip source binding** *mac-address* **vlan** *vlan-id* *ip-address* **interface** *interface-id*
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/1	Specifies the interface to be configured, and enters interface configuration mode.
Step 4	ip verify source [mac-check]	Enables IP source guard with source IP address filtering.

	Command or Action	Purpose
	Example: Device(config-if)# ip verify source	(Optional) mac-check —Enables IP Source Guard with source IP address and MAC address filtering.
Step 5	exit Example: Device(config-if)# exit	Returns to global configuration mode.
Step 6	ip source binding mac-address vlan vlan-id ip-address interface interface-id Example: Device(config)# ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface gigabitethernet1/0/1	Adds a static IP source binding. Enter this command for each static binding.
Step 7	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 8	show running-config Example: Device# show running-config	Verifies your entries.
Step 9	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port

You must configure the **ip device tracking maximum limit-number** interface configuration command globally for IPSG for static hosts to work. If you only configure this command on a port without enabling IP device tracking globally or by setting an IP device tracking maximum on that interface, IPSG with static hosts rejects all the IP traffic from that interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip device tracking**

4. **interface** *interface-id*
5. **switchport mode access**
6. **switchport access vlan** *vlan-id*
7. **ip verify source**[tracking] [mac-check]
8. **ip device tracking maximum** *number*
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip device tracking Example: Device(config)# ip device tracking	Turns on the IP host table, and globally enables IP device tracking.
Step 4	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/1	Enters interface configuration mode.
Step 5	switchport mode access Example: Device(config-if)# switchport mode access	Configures a port as access.
Step 6	switchport access vlan <i>vlan-id</i> Example: Device(config-if)# switchport access vlan 10	Configures the VLAN for this port.
Step 7	ip verify source [tracking] [mac-check] Example:	Enables IP source guard with source IP address filtering. (Optional) tracking —Enables IP source guard for static hosts.

	Command or Action	Purpose
	Device(config-if)# ip verify source tracking mac-check	(Optional) mac-check —Enables MAC address filtering. The command ip verify source tracking mac-check enables IP source guard for static hosts with MAC address filtering.
Step 8	ip device tracking maximum <i>number</i> Example: Device(config-if)# ip device tracking maximum 8	Establishes a maximum limit for the number of static IPs that the IP device tracking table allows on the port. The range is 1 to 10. The maximum number is 10. Note You must configure the ip device tracking maximum <i>limit-number</i> interface configuration command.
Step 9	end Example: Device(config)# end	Returns to privileged EXEC mode.

Monitoring IP Source Guard

Table 141: Privileged EXEC show Commands

Command	Purpose
show ip verify source [interface <i>interface-id</i>]	Displays the IP source guard configuration on the switch or on a specific interface.
show ip device tracking { all interface <i>interface-id</i> ip <i>ip-address</i> mac <i>mac-address</i> }	Displays information about the entries in the IP device tracking table.

Table 142: Interface Configuration Commands

Command	Purpose
ip verify source tracking	Verifies the data source.

For detailed information about the fields in these displays, see the command reference for this release.

Restrictions for Dynamic ARP Inspection

This section lists the restrictions and guidelines for configuring Dynamic ARP Inspection on the switch.

- Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.
- Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.
- Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

When DHCP snooping is disabled or in non-DHCP environments, use ARP ACLs to permit or to deny packets.

- Dynamic ARP inspection is supported on access ports, trunk ports, and EtherChannel ports.

Note Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

- A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.

- The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.
- The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.

The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.

If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.

- Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the **ip arp inspection limit none** interface configuration command to make the rate unlimited. A high rate-limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.
- When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.
- In the presence of vlan-bridging & IP device tracking, the cross-stack ARP packet forwarding will not work.

Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous

reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker's computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 26-1 shows an example of ARP cache poisoning.

Figure 107: ARP Cache Poisoning

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic *man-in-the-middle* attack.

Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets

Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the **ip arp inspection vlan *vlan-range*** global configuration command.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with statically configured IP addresses. You define an ARP ACL by using the **arp access-list** *acl-name* global configuration command.

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the **ip arp inspection validate** {[src-mac] [dst-mac] [ip]} global configuration command.

Interface Trust States and Network Security

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the `arp inspection trust interface` configuration command.

Caution Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

In the following figure, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.

Figure 108: ARP Packet Validation on a VLAN Enabled for Dynamic ARP Inspection

Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.

Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches.

Note Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

Rate Limiting of ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the **ip arp inspection limit** interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the **errdisable recovery** global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.

Note The rate limit for an EtherChannel is applied separately to each switch in a stack. For example, if a limit of 20 pps is configured on the EtherChannel, each switch with ports in the EtherChannel can carry up to 20 pps. If any switch exceeds the limit, the entire EtherChannel is placed into the error-disabled state.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the **ip arp inspection filter vlan** global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the **ip arp inspection log-buffer** global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the **ip arp inspection vlan logging** global configuration command.

Default Dynamic ARP Inspection Configuration

Feature	Default Settings
Dynamic ARP inspection	Disabled on all VLANs.
Interface trust state	All interfaces are untrusted.
Rate limit of incoming ARP packets	The rate is 15 pps on untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second. The rate is unlimited on all trusted interfaces. The burst interval is 1 second.
ARP ACLs for non-DHCP environments	No ARP ACLs are defined.
Validation checks	No checks are performed.
Log buffer	When dynamic ARP inspection is enabled, all denied or dropped ARP packets are logged. The number of entries in the log is 32. The number of system messages is limited to 5 per second. The logging-rate interval is 1 second.
Per-VLAN logging	All denied or dropped ARP packets are logged.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the **ip arp inspection filter vlan** global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 2 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

Follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **arp access-list *acl-name***
4. **permit ip host *sender-ip* mac host *sender-mac***
5. **exit**
6. **ip arp inspection filter *arp-acl-name* vlan *vlan-range* [static]**
7. **interface *interface-id***
8. **no ip arp inspection trust**
9. **end**
10. Use the following show commands:
 - **show arp access-list *acl-name***
 - **show ip arp inspection vlan *vlan-range***
 - **show ip arp inspection interfaces**
11. **show running-config**
12. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	arp access-list <i>acl-name</i>	Defines an ARP ACL, and enters ARP access-list configuration mode. By default, no ARP access lists are defined. Note At the end of the ARP access list, there is an implicit deny ip any mac any command.

	Command or Action	Purpose
Step 4	permit ip host <i>sender-ip</i> mac host <i>sender-mac</i>	Permits ARP packets from the specified host (Host 2). <ul style="list-style-type: none"> • For <i>sender-ip</i>, enter the IP address of Host 2. • For <i>sender-mac</i>, enter the MAC address of Host 2.
Step 5	exit	Returns to global configuration mode.
Step 6	ip arp inspection filter <i>arp-acl-name</i> vlan <i>vlan-range</i> [static]	Applies ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN. <ul style="list-style-type: none"> • For <i>arp-acl-name</i>, specify the name of the ACL created in Step 2. • For <i>vlan-range</i>, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. • (Optional) Specify static to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used. <p>If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.</p> <p>ARP packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them.</p>
Step 7	interface <i>interface-id</i>	Specifies Switch A interface that is connected to Switch B, and enters the interface configuration mode.
Step 8	no ip arp inspection trust	Configures Switch A interface that is connected to Switch B as untrusted. <p>By default, all interfaces are untrusted.</p> <p>For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the ip arp inspection vlan logging global configuration command.</p>
Step 9	end	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 10	Use the following show commands: <ul style="list-style-type: none"> • show arp access-list <i>acl-name</i> • show ip arp inspection vlan <i>vlan-range</i> • show ip arp inspection interfaces 	Verifies your entries.
Step 11	show running-config Example: Device# show running-config	Verifies your entries.
Step 12	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Dynamic ARP Inspection in DHCP Environments

Before you begin

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B. Both switches are running dynamic ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

Note Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

Follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

SUMMARY STEPS

1. **enable**
2. **show cdp neighbors**
3. **configure terminal**
4. **ip arp inspection vlan** *vlan-range*
5. **Interface***interface-id*
6. **ip arp inspection trust**
7. **end**
8. **show ip arp inspection interfaces**

9. **show ip arp inspection vlan** *vlan-range*
10. **show ip dhcp snooping binding**
11. **show ip arp inspection statistics vlan** *vlan-range*
12. **configure terminal**
13. **configure terminal**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show cdp neighbors Example: Device (config-if) # show cdp neighbors	Verify the connection between the switches.
Step 3	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 4	ip arp inspection vlan <i>vlan-range</i> Example: Device (config) # ip arp inspection vlan 1	Enable dynamic ARP inspection on a per-VLAN basis. By default, dynamic ARP inspection is disabled on all VLANs. For <i>vlan-range</i> , specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. Specify the same VLAN ID for both switches.
Step 5	Interface <i>interface-id</i> Example: Device (config) # interface gigabitethernet1/0/1	Specifies the interface connected to the other switch, and enter interface configuration mode.
Step 6	ip arp inspection trust Example: Device (config-if) # ip arp inspection trust	Configures the connection between the switches as trusted. By default, all interfaces are untrusted. The switch does not check ARP packets that it receives from the other switch on the trusted interface. It simply forwards the packets. For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the

	Command or Action	Purpose
		logging configuration specified with the ip arp inspection vlan logging global configuration command.
Step 7	end Example: Device(config-if)#end	Returns to privileged EXEC mode.
Step 8	show ip arp inspection interfaces Example:	Verifies the dynamic ARP inspection configuration on interfaces.
Step 9	show ip arp inspection vlan <i>vlan-range</i> Example: Device(config-if)#show ip arp inspection vlan 1	Verifies the dynamic ARP inspection configuration on VLAN.
Step 10	show ip dhcp snooping binding Example: Device(config-if)#show ip dhcp snooping binding	Verifies the DHCP bindings.
Step 11	show ip arp inspection statistics vlan <i>vlan-range</i> Example: Device(config-if)#show ip arp inspection statistics vlan 1	Checks the dynamic ARP inspection statistics on VLAN.
Step 12	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 13	configure terminal Example: Device# configure terminal	Enters global configuration mode.

Limiting the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

Note Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the **no ip arp inspection limit** interface configuration command, the interface reverts to its default rate limit.

Follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip arp inspection limit** {rate pps [burst interval seconds] | none}
5. **exit**
6. Use the following commands:
 - **errdisable detect cause arp-inspection**
 - **errdisable recovery cause arp-inspection**
 - **errdisable recovery interval** *interval*
7. **exit**
8. Use the following show commands:
 - **show ip arp inspection interfaces**
 - **show errdisable recovery**
9. **show running-config**
10. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i>	Specifies the interface to be rate-limited, and enter interface configuration mode.
Step 4	ip arp inspection limit {rate pps [burst interval seconds] none}	Limits the rate of incoming ARP requests and responses on the interface. The default rate is 15 pps on untrusted

	Command or Action	Purpose
		<p>interfaces and unlimited on trusted interfaces. The burst interval is 1 second.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> • For rate<i>pps</i>, specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 pps. • (Optional) For burst interval<i>seconds</i>, specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15. • For rate none, specify no upper limit for the rate of incoming ARP packets that can be processed.
Step 5	exit	Returns to global configuration mode.
Step 6	<p>Use the following commands:</p> <ul style="list-style-type: none"> • errdisable detect cause arp-inspection • errdisable recovery cause arp-inspection • errdisable recovery interval <i>interval</i> 	<p>(Optional) Enables error recovery from the dynamic ARP inspection error-disabled state, and configure the dynamic ARP inspection recover mechanism variables.</p> <p>By default, recovery is disabled, and the recovery interval is 300 seconds.</p> <p>For interval <i>interval</i>, specify the time in seconds to recover from the error-disabled state. The range is 30 to 86400.</p>
Step 7	exit	Returns to privileged EXEC mode.
Step 8	<p>Use the following show commands:</p> <ul style="list-style-type: none"> • show ip arp inspection interfaces • show errdisable recovery 	Verifies your settings.
Step 9	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 10	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Performing Dynamic ARP Inspection Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

Follow these steps to perform specific checks on incoming ARP packets. This procedure is optional.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip arp inspection validate {[src-mac] [dst-mac] [ip]}**
4. **exit**
5. **show ip arp inspection vlan *vlan-range***
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip arp inspection validate {[src-mac] [dst-mac] [ip]}	Performs a specific check on incoming ARP packets. By default, no checks are performed. The keywords have these meanings: <ul style="list-style-type: none"> • For src-mac, check the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped. • For dst-mac, check the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.

	Command or Action	Purpose
		<ul style="list-style-type: none"> For ip, check the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses. <p>You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables src and dst mac validations, and a second command enables IP validation only, the src and dst mac validations are disabled as a result of the second command.</p>
Step 4	exit	Returns to privileged EXEC mode.
Step 5	show ip arp inspection vlan <i>vlan-range</i>	Verifies your settings.
Step 6	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 7	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Monitoring DAI

To monitor DAI, use the following commands:

Command	Description
clear ip arp inspection statistics	Clears dynamic ARP inspection statistics.
show ip arp inspection statistics [vlan <i>vlan-range</i>]	Displays statistics for forwarded, dropped, MAC validation failure, IP validation failure, ACL permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).
clear ip arp inspection log	Clears the dynamic ARP inspection log buffer.
show ip arp inspection log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

For the **show ip arp inspection statistics** command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate.

Verifying the DAI Configuration

To display and verify the DAI configuration, use the following commands:

Command	Description
show arp access-list [<i>acl-name</i>]	Displays detailed information about ARP ACLs.
show ip arp inspection interfaces [<i>interface-id</i>]	Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.
show ip arp inspection vlan <i>vlan-range</i>	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).

CHAPTER 74

Configuring IEEE 802.1x Port-Based Authentication

This chapter describes how to configure IEEE 802.1x port-based authentication. IEEE 802.1x authentication prevents unauthorized devices (clients) from gaining access to the network. Unless otherwise noted, the term *switch* refers to a standalone switch or a switch stack.

- [Information About 802.1x Port-Based Authentication, on page 1447](#)
- [How to Configure 802.1x Port-Based Authentication, on page 1480](#)
- [Monitoring 802.1x Statistics and Status, on page 1536](#)
- [Additional References for IEEE 802.1x Port-Based Authentication, on page 1536](#)
- [Feature Information for 802.1x Port-Based Authentication, on page 1537](#)

Information About 802.1x Port-Based Authentication

The 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Note TACACS is not supported with 802.1x authentication.

Until the client is authenticated, 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

Client session	Maximum sessions supported
Maximum dot1x or MAB client sessions	2000
Maximum web-based authentication sessions	2000
Maximum dot1x sessions with critical-auth VLAN enabled and server re-initialized	2000

Client session	Maximum sessions supported
Maximum MAB sessions with various session features applied	2000
Maximum dot1x sessions with service templates or session features applied	2000

Port-Based Authentication Process

To configure IEEE 802.1X port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

The AAA process begins with authentication. When 802.1x port-based authentication is enabled and the client supports 802.1x-compliant client software, these events occur:

- If the client identity is valid and the 802.1x authentication succeeds, the switch grants the client access to the network.
- If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can use the client MAC address for authorization. If the client MAC address is valid and the authorization succeeds, the switch grants the client access to the network. If the client MAC address is invalid and the authorization fails, the switch assigns the client to a guest VLAN that provides limited services if a guest VLAN is configured.
- If the switch gets an invalid identity from an 802.1x-capable client and a restricted VLAN is specified, the switch can assign the client to a restricted VLAN that provides limited services.
- If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network by putting the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN.

Note Inaccessible authentication bypass is also referred to as critical authentication or the AAA fail policy.

If Multi Domain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization.

Figure 109: Authentication Flowchart

This figure shows the authentication process.

The switch re-authenticates a client when one of these situations occurs:

- Periodic re-authentication is enabled, and the re-authentication timer expires.

You can configure the re-authentication timer to use a switch-specific value or to be based on values from the RADIUS server.

After 802.1x authentication using a RADIUS server is configured, the switch uses timers based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]).

The Session-Timeout RADIUS attribute (Attribute[27]) specifies the time after which re-authentication occurs.

The Termination-Action RADIUS attribute (Attribute [29]) specifies the action to take during re-authentication. The actions are *Initialize* and *ReAuthenticate*. When the *Initialize* action is set (the attribute value is *DEFAULT*), the 802.1x session ends, and connectivity is lost during re-authentication. When the *ReAuthenticate* action is set (the attribute value is *RADIUS-Request*), the session is not affected during re-authentication.

- You manually re-authenticate the client by entering the **dot1x re-authenticate interface interface-id** privileged EXEC command.

Port-Based Authentication Initiation and Message Exchange

During 802.1x authentication, the switch or the client can initiate authentication. If you enable authentication on a port by using the **authentication port-control auto** interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client's identity.

Note If 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted.

The specific exchange of EAP frames depends on the authentication method being used.

Figure 110: Message Exchange

This figure shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS server.

If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can authorize the client when the switch detects an Ethernet packet from the

client. The switch uses the MAC address of the client as its identity and includes this information in the RADIUS-access/request frame that is sent to the RADIUS server. After the server sends the switch the RADIUS-access/accept frame (authorization is successful), the port becomes authorized. If authorization fails and a guest VLAN is specified, the switch assigns the port to the guest VLAN. If the switch detects an EAPOL packet while waiting for an Ethernet packet, the switch stops the MAC authentication bypass process and starts 802.1x authentication.

Figure 111: Message Exchange During MAC Authentication Bypass

This figure shows the message exchange during MAC authentication bypass.

Authentication Manager for Port-Based Authentication

Port-Based Authentication Methods

Table 143: 802.1x Features

Authentication method	Mode			
	Single host	Multiple host	MDA	Multiple Authentication
802.1x	VLAN assignment Per-user ACL Filter-ID attribute Downloadable ACL Redirect URL	VLAN assignment	VLAN assignment Per-user ACL Filter-ID attribute Downloadable ACL Redirect URL	VLAN assignment Per-user ACL Filter-ID attribute Downloadable ACL Redirect URL

Authentication method	Mode			
	Single host	Multiple host	MDA	Multiple Authentication
MAC authentication bypass	VLAN assignment Per-user ACL Filter-ID attribute Downloadable ACL Redirect URL	VLAN assignment	VLAN assignment Per-user ACL Filter-Id attribute Downloadable ACL Redirect URL	VLAN assignment Per-user ACL Filter-Id attribute Downloadable ACL Redirect URL
Standalone web authentication	Proxy ACL, Filter-Id attribute, downloadable ACL

Web authentication as fallback method	Proxy ACL Filter-Id attribute Downloadable ACL	Proxy ACL Filter-Id attribute Downloadable ACL	Proxy ACL Filter-Id attribute Downloadable ACL	Proxy ACL Filter-Id attribute Downloadable ACL

¹⁵ Supported in Cisco IOS Release 12.2(50)SE and later.

¹⁶ For clients that do not support 802.1x authentication.

Per-User ACLs and Filter-Ids

Note You can only set **any** as the source in the ACL.

Note For any ACL configured for multiple-host mode, the source portion of statement must be *any*. (For example, **permit icmp any host 10.10.1.1**.)

You must specify **any** in the source ports of any defined ACL. Otherwise, the ACL cannot be applied and authorization fails. Single host is the only exception to support backward compatibility.

More than one host can be authenticated on MDA-enabled and multiauth ports. The ACL policy applied for one host does not effect the traffic of another host. If only one host is authenticated on a multi-host port, and the other hosts gain network access without authentication, the ACL policy for the first host can be applied to the other connected hosts by specifying any in the source address.

Port-Based Authentication Manager CLI Commands

The authentication-manager interface-configuration commands control all the authentication methods, such as 802.1x, MAC authentication bypass, and web authentication. The authentication manager commands determine the priority and order of authentication methods applied to a connected host.

The authentication manager commands control generic authentication features, such as host-mode, violation mode, and the authentication timer. Generic authentication commands include the **authentication host-mode**, **authentication violation**, and **authentication timer** interface configuration commands.

802.1x-specific commands begin with the **dot1x** keyword. For example, the **authentication port-control auto** interface configuration command enables authentication on an interface.

To disable dot1x on a switch, remove the configuration globally by using the `no dot1x system-auth-control`, and also remove it from all configured interfaces.

Note If 802.1x authentication is globally disabled, other authentication methods are still enabled on that port, such as web authentication.

The **authentication manager** commands provide the same functionality as earlier 802.1x commands.

When filtering out verbose system messages generated by the authentication manager, the filtered content typically relates to authentication success. You can also filter verbose messages for 802.1x authentication and MAB authentication. There is a separate command for each authentication method:

- The **no authentication logging verbose** global configuration command filters verbose messages from the authentication manager.
- The **no dot1x logging verbose** global configuration command filters 802.1x authentication verbose messages.
- The **no mab logging verbose** global configuration command filters MAC authentication bypass (MAB) verbose messages

Table 144: Authentication Manager Commands and Earlier 802.1x Commands

The authentication manager commands in Cisco IOS Release 12.2(50)SE or later	The equivalent 802.1x commands in Cisco IOS Release 12.2(46)SE and earlier	Description
authentication control-direction {both in}	dot1x control-direction {both in}	Enable 802.1x authentication with the wake-on-LAN (WoL) feature, and configure the port control as unidirectional or bidirectional.
authentication event	dot1x auth-fail vlan dot1x critical (interface configuration) dot1x guest-vlan6	Enable the restricted VLAN on a port. Enable the inaccessible-authentication-bypass feature. Specify an active VLAN as an 802.1x guest VLAN.

The authentication manager commands in Cisco IOS Release 12.2(50)SE or later	The equivalent 802.1x commands in Cisco IOS Release 12.2(46)SE and earlier	Description
authentication fallback <i>fallback-profile</i>	dot1x fallback <i>fallback-profile</i>	Configure a port to use web authentication as a fallback method for clients that do not support 802.1x authentication.
authentication host-mode [multi-auth multi-domain multi-host single-host]	dot1x host-mode { single-host multi-host multi-domain }	Allow a single host (client) or multiple hosts on an 802.1x-authorized port.
authentication order	mab	Provides the flexibility to define the order of authentication methods to be used.
authentication periodic	dot1x reauthentication	Enable periodic re-authentication of the client.
authentication port-control { auto force-authorized force-unauthorized }	dot1x port-control { auto force-authorized force-unauthorized }	Enable manual control of the authorization state of the port.
authentication timer	dot1x timeout	Set the 802.1x timers.
authentication violation { protect restrict shutdown }	dot1x violation-mode { shutdown restrict protect }	Configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.

Ports in Authorized and Unauthorized States

During 802.1x authentication, depending on the switch port state, the switch can grant a client access to the network. The port starts in the *unauthorized* state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress and egress traffic except for 802.1x authentication, CDP, and STP packets. When a client is successfully authenticated, the port changes to the *authorized* state, allowing all traffic for the client to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and 802.1x protocol packets before the client is successfully authenticated.

Note CDP bypass is not supported and may cause a port to go into err-disabled state.

If a client that does not support 802.1x authentication connects to an unauthorized 802.1x port, the switch requests the client's identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1x-enabled client connects to a port that is not running the 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the

client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the **authentication port-control** interface configuration command and these keywords:

- **force-authorized**—disables 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without 802.1x-based authentication of the client. This is the default setting.
- **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.
- **auto**—enables 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client MAC address.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

Port-Based Authentication and Switch Stacks

If a switch is added to or removed from a switch stack, 802.1x authentication is not affected as long as the IP connectivity between the RADIUS server and the stack remains intact. This statement also applies if the stack's active switch is removed from the switch stack. Note that if the active switch fails, a stack member becomes the new active switch of the stack by using the election process, and the 802.1x authentication process continues as usual.

If IP connectivity to the RADIUS server is interrupted because the switch that was connected to the server is removed or fails, these events occur:

- Ports that are already authenticated and that do not have periodic re-authentication enabled remain in the authenticated state. Communication with the RADIUS server is not required.
- Ports that are already authenticated and that have periodic re-authentication enabled (with the **dot1x re-authentication** global configuration command) fail the authentication process when the re-authentication occurs. Ports return to the unauthenticated state during the re-authentication process. Communication with the RADIUS server is required.

For an ongoing authentication, the authentication fails immediately because there is no server connectivity.

If the switch that failed comes up and rejoins the switch stack, the authentications might or might not fail depending on the boot-up time and whether the connectivity to the RADIUS server is re-established by the time the authentication is attempted.

To avoid loss of connectivity to the RADIUS server, you should ensure that there is a redundant connection to it. For example, you can have a redundant connection to the stack's active switch and another to a stack member, and if the active switch fails, the switch stack still has connectivity to the RADIUS server.

802.1x Host Mode

You can configure an 802.1x port for single-host or for multiple-hosts mode. In single-host mode, only one client can be connected to the 802.1x-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single 802.1x-enabled port. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients.

In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

Figure 112: Multiple Host Mode Example

Note For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

The switch supports multidomain authentication (MDA), which allows both a data device and a voice device, such as an IP Phone (Cisco or non-Cisco), to connect to the same switch port.

802.1x Multiple Authentication Mode

Multiple-authentication (multiauth) mode allows multiple authenticated clients on the data VLAN and voice VLAN. Each host is individually authenticated. There is no limit to the number of data or voice device that can be authenticated on a multiauthport.

If a hub or access point is connected to an 802.1x-enabled port, each connected client must be authenticated. For non-802.1x devices, you can use MAC authentication bypass or web authentication as the per-host authentication fallback method to authenticate different hosts with different methods on a single port.

Note When a port is in multiple-authentication mode, the authentication-failed VLAN features do not activate.

You can assign a RADIUS-server-supplied VLAN in multi-auth mode, under the following conditions:

- The host is the first host authorized on the port, and the RADIUS server supplies VLAN information
- Subsequent hosts are authorized with a VLAN that matches the operational VLAN.
- A host is authorized on the port with no VLAN assignment, and subsequent hosts either have no VLAN assignment, or their VLAN information matches the operational VLAN.
- The first host authorized on the port has a group VLAN assignment, and subsequent hosts either have no VLAN assignment, or their group VLAN matches the group VLAN on the port. Subsequent hosts must use the same VLAN from the VLAN group as the first host. If a VLAN list is used, all hosts are subject to the conditions specified in the VLAN list.
- After a VLAN is assigned to a host on the port, subsequent hosts must have matching VLAN information or be denied access to the port.
- You cannot configure a guest VLAN or an auth-fail VLAN in multi-auth mode.
- The behavior of the critical-auth VLAN is not changed for multi-auth mode. When a host tries to authenticate and the server is not reachable, all authorized hosts are reinitialized in the configured VLAN.

Multi-auth Per User VLAN assignment

The Multi-auth Per User VLAN assignment feature allows you to create multiple operational access VLANs based on VLANs assigned to the clients on the port that has a single configured access VLAN. The port configured as an access port where the traffic for all the VLANs associated with data domain is not dot1q tagged, and these VLANs are treated as native VLANs.

The number of hosts per multi-auth port is 8, however there can be more hosts.

The following scenarios are associated with the multi-auth Per User VLAN assignments:

Scenario one

When a hub is connected to an access port, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. This behaviour is similar on a single-host or multi-domain-auth port.

When a second host (H2) is connected and gets assigned to VLAN (V2), the port will have two operational VLANs (V1 and V2). If H1 and H2 sends untagged ingress traffic, H1 traffic is mapped to VLAN (V1) and H2 traffic to VLAN (V2), all egress traffic going out of the port on VLAN (V1) and VLAN (V2) are untagged.

If both the hosts, H1 and H2 are logged out or the sessions are removed due to some reason then VLAN (V1) and VLAN (V2) are removed from the port, and the configured VLAN (V0) is restored on the port.

Scenario two

When a hub is connected to an access port, and the port is configured with an access VLAN (V0). The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1.

When a second host (H2) is connected and gets authorized without explicit vlan policy, H2 is expected to use the configured VLAN (V0) that is restored on the port. All egress traffic going out of two operational VLANs, VLAN (V0) and VLAN (V1) are untagged.

If host (H2) is logged out or the session is removed due to some reason then the configured VLAN (V0) is removed from the port, and VLAN (V1) becomes the only operational VLAN on the port.

Scenario three

When a hub is connected to an access port in open mode, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. When a second host (H2) is connected and remains unauthorized, it still has access to operational VLAN (V1) due to open mode.

If host H1 is logged out or the session is removed due to some reason, VLAN (V1) is removed from the port and host (H2) gets assigned to VLAN (V0).

Note The combination of Open mode and VLAN assignment has an adverse affect on host (H2) because it has an IP address in the subnet that corresponds to VLAN (V1).

Limitation in Multi-auth Per User VLAN assignment

In the Multi-auth Per User VLAN assignment feature, egress traffic from multiple vlans are untagged on a port where the hosts receive traffic that is not meant for them. This can be a problem with broadcast and multicast traffic.

- **IPv4 ARPs:** Hosts receive ARP packets from other subnets. This is a problem if two subnets in different Virtual Routing and Forwarding (VRF) tables with overlapping IP address range are active on the port. The host ARP cache may get invalid entries.
- **IPv6 control packets:** In IPv6 deployments, Router Advertisements (RA) are processed by hosts that are not supposed to receive them. When a host from one VLAN receives RA from a different VLAN, the host assign incorrect IPv6 address to itself. Such a host is unable to get access to the network.

The workaround is to enable the IPv6 first hop security so that the broadcast ICMPv6 packets are converted to unicast and sent out from multi-auth enabled ports.. The packet is replicated for each client in multi-auth port belonging to the VLAN and the destination MAC is set to an individual client. Ports having one VLAN, ICMPv6 packets broadcast normally.

- **IP multicast:** Multicast traffic destined to a multicast group gets replicated for different VLANs if the hosts on those VLANs join the multicast group. When two hosts in different VLANs join a multicast group (on the same mutli-auth port), two copies of each multicast packet are sent out from that port.

MAC Move

When a MAC address is authenticated on one switch port, that address is not allowed on another authentication manager-enabled port of the switch. If the switch detects that same MAC address on another authentication manager-enabled port, the address is not allowed.

There are situations where a MAC address might need to move from one port to another on the same switch. For example, when there is another device (for example a hub or an IP phone) between an authenticated host and a switch port, you might want to disconnect the host from the device and connect it directly to another port on the same switch.

You can globally enable MAC move so the device is reauthenticated on the new port. When a host moves to a second port, the session on the first port is deleted, and the host is reauthenticated on the new port. MAC move is supported on all host modes. (The authenticated host can move to any port on the switch, no matter which host mode is enabled on the that port.) When a MAC address moves from one port to another, the

switch terminates the authenticated session on the original port and initiates a new authentication sequence on the new port. The MAC move feature applies to both voice and data hosts.

Note In open authentication mode, a MAC address is immediately moved from the original port to the new port, with no requirement for authorization on the new port.

MAC Replace

The MAC replace feature can be configured to address the violation that occurs when a host attempts to connect to a port where another host was previously authenticated.

Note This feature does not apply to ports in multi-auth mode, because violations are not triggered in that mode. It does not apply to ports in multiple host mode, because in that mode, only the first host requires authentication.

If you configure the **authentication violation** interface configuration command with the **replace** keyword, the authentication process on a port in multi-domain mode is:

- A new MAC address is received on a port with an existing authenticated MAC address.
- The authentication manager replaces the MAC address of the current data host on the port with the new MAC address.
- The authentication manager initiates the authentication process for the new MAC address.
- If the authentication manager determines that the new host is a voice host, the original voice host is removed.

If a port is in open authentication mode, any new MAC address is immediately added to the MAC address table.

802.1x Accounting

The 802.1x standard defines how users are authorized and authenticated for network access but does not keep track of network usage. 802.1x accounting is disabled by default. You can enable 802.1x accounting to monitor this activity on 802.1x-enabled ports:

- User successfully authenticates.
- User logs off.
- Link-down occurs.
- Re-authentication successfully occurs.
- Re-authentication fails.

The switch does not log 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.

802.1x Accounting Attribute-Value Pairs

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.)

AV pairs are automatically sent by a switch that is configured for 802.1x accounting. Three types of RADIUS accounting packets are sent by a switch:

- START—sent when a new user session starts
- INTERIM—sent during an existing session for updates
- STOP—sent when a session terminates

You can view the AV pairs that are being sent by the switch by entering the **debug radius accounting** privileged EXEC command. For more information about this command, see the *Cisco IOS Debug Command Reference, Release 12.4*.

This table lists the AV pairs and when they are sent are sent by the switch.

Table 145: Accounting AV Pairs

Attribute Number	AV Pair Name	START	INTERIM	STOP
Attribute[1]	User-Name	Always	Always	Always
Attribute[4]	NAS-IP-Address	Always	Always	Always
Attribute[5]	NAS-Port	Always	Always	Always
Attribute[8]	Framed-IP-Address	Never	Sometimes ¹⁷	Sometimes
Attribute[25]	Class	Always	Always	Always
Attribute[30]	Called-Station-ID	Always	Always	Always
Attribute[31]	Calling-Station-ID	Always	Always	Always
Attribute[40]	Acct-Status-Type	Always	Always	Always
Attribute[41]	Acct-Delay-Time	Always	Always	Always
Attribute[42]	Acct-Input-Octets	Never	Always	Always
Attribute[43]	Acct-Output-Octets	Never	Always	Always
Attribute[47]	Acct-Input-Packets	Never	Always	Always
Attribute[48]	Acct-Output-Packets	Never	Always	Always
Attribute[44]	Acct-Session-ID	Always	Always	Always
Attribute[45]	Acct-Authentic	Always	Always	Always
Attribute[46]	Acct-Session-Time	Never	Always	Always

Attribute Number	AV Pair Name	START	INTERIM	STOP
Attribute[49]	Acct-Terminate-Cause	Never	Never	Always
Attribute[61]	NAS-Port-Type	Always	Always	Always

¹⁷ The Framed-IP-Address AV pair is sent when a valid static IP address is configured or when a Dynamic Host Control Protocol (DHCP) binding exists for the host in the DHCP snooping bindings table.

802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable. You use an alternate authentication such as MAC authentication bypass or web authentication for the devices that do not support 802.1x functionality.

This feature only works if the supplicant on the client supports a query with the NOTIFY EAP notification packet. The client must respond within the 802.1x timeout value.

Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.

802.1x Authentication with VLAN Assignment

The switch supports 802.1x authentication with VLAN assignment. After successful 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port. You can use this feature to limit network access for certain users.

Voice device authentication is supported with multidomain host mode in Cisco IOS Release 12.2(37)SE. In Cisco IOS Release 12.2(40)SE and later, when a voice device is authorized and the RADIUS server returned an authorized VLAN, the voice VLAN on the port is configured to send and receive packets on the assigned voice VLAN. Voice VLAN assignment behaves the same as data VLAN assignment on multidomain authentication (MDA)-enabled ports.

When configured on the switch and the RADIUS server, 802.1x authentication with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if 802.1x authentication is disabled, the port is configured in its access VLAN after successful authentication. Recall that an access VLAN is a VLAN assigned to an access port. All packets sent from or received on this port belong to this VLAN.
- If 802.1x authentication is enabled but the VLAN information from the RADIUS server is not valid, authorization fails and configured VLAN remains in use. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.

Configuration errors could include specifying a VLAN for a routed port, a malformed VLAN ID, a nonexistent or internal (routed port) VLAN ID, an RSPAN VLAN, a shut down or suspended VLAN. In the case of a multidomain host port, configuration errors can also be due to an attempted assignment of a data VLAN that matches the configured or assigned voice VLAN ID (or the reverse).

- If 802.1x authentication is enabled and all information from the RADIUS server is valid, the authorized device is placed in the specified VLAN after authentication.
- If the multiple-hosts mode is enabled on an 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.
- Enabling port security does not impact the RADIUS server-assigned VLAN behavior.
- If 802.1x authentication is disabled on the port, it is returned to the configured access VLAN and configured voice VLAN.
- If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:
 - If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, then authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.
 - If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to *dot1p* or *untagged* results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization by using the **network** keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication. (The VLAN assignment feature is automatically enabled when you configure 802.1x authentication on an access port).
- Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
 - [64] Tunnel-Type = VLAN
 - [65] Tunnel-Medium-Type = 802
 - [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID
 - [83] Tunnel-Preference

Attribute [64] must contain the value *VLAN* (type 13). Attribute [65] must contain the value *802* (type 6). Attribute [81] specifies the *VLAN name* or *VLAN ID* assigned to the IEEE 802.1x-authenticated user.

802.1x Authentication with Per-User ACLs

You can enable per-user access control lists (ACLs) to provide different levels of network access and service to an 802.1x-authenticated user. When the RADIUS server authenticates a user connected to an 802.1x port, it retrieves the ACL attributes based on the user identity and sends them to the switch. The switch applies the attributes to the 802.1x port for the duration of the user session. The switch removes the per-user ACL configuration when the session is over, if authentication fails, or if a link-down condition occurs. The switch does not save RADIUS-specified ACLs in the running configuration. When the port is unauthorized, the switch removes the ACL from the port.

You can configure router ACLs and input port ACLs on the same switch. However, a port ACL takes precedence over a router ACL. If you apply input port ACL to an interface that belongs to a VLAN, the port ACL takes precedence over an input router ACL applied to the VLAN interface. Incoming packets received on the port, to which a port ACL is applied, are filtered by the port ACL. Incoming routed packets received on other ports are filtered by the router ACL. Outgoing routed packets are filtered by the router ACL. To avoid configuration conflicts, you should carefully plan the user profiles stored on the RADIUS server.

RADIUS supports per-user attributes, including vendor-specific attributes. These vendor-specific attributes (VSAs) are in octet-string format and are passed to the switch during the authentication process. The VSAs used for per-user ACLs are `inac1#<n>` for the ingress direction and `outacl#<n>` for the egress direction. MAC ACLs are supported only in the ingress direction. The switch supports VSAs only in the ingress direction. It does not support port ACLs in the egress direction on Layer 2 ports.

Use only the extended ACL syntax style to define the per-user configuration stored on the RADIUS server. When the definitions are passed from the RADIUS server, they are created by using the extended naming convention. However, if you use the Filter-Id attribute, it can point to a standard ACL.

You can use the Filter-Id attribute to specify an inbound or outbound ACL that is already configured on the switch. The attribute contains the ACL number followed by `.in` for ingress filtering or `.out` for egress filtering. If the RADIUS server does not allow the `.in` or `.out` syntax, the access list is applied to the outbound ACL by default. The user is marked unauthorized if the Filter-Id sent from the RADIUS server is not configured on the device. Because of limited support of Cisco IOS access lists on the switch, the Filter-Id attribute is supported only for IP ACLs numbered in the range of 1 to 199 (IP standard ACLs) and 1300 to 2699 (IP extended ACLs).

The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of RADIUS-server per-user ACLs.

You must meet the following prerequisites to configure per-user ACLs:

- Enable AAA authentication.
- Enable AAA authorization by using the **network** keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication.
- Configure the user profile and VSAs on the RADIUS server.
- Configure the 802.1x port for single-host mode.

Note Per-user ACLs are supported only in single-host mode.

802.1x Authentication with Downloadable ACLs and Redirect URLs

Note IPv6 does not support Redirect URLs.

You can download ACLs and redirect URLs from a RADIUS server to the switch during 802.1x authentication or MAC authentication bypass of the host. You can also download ACLs during web authentication.

Note A downloadable ACL is also referred to as a *dACL*.

If more than one host is authenticated and the host is in single-host, MDA, or multiple-authentication mode, the switch changes the source address of the ACL to the host IP address.

You can apply the ACLs and redirect URLs to all the devices connected to the 802.1x-enabled port.

If no ACLs are downloaded during 802.1x authentication, the switch applies the static default ACL on the port to the host. On a voice VLAN port configured in multi-auth or MDA mode, the switch applies the ACL only to the phone as part of the authorization policies.

Note The limit for dACL with stacking is 64 ACEs per dACL per port. The limit without stacking is the number of available TCAM entries which varies based on the other ACL features that are active.

If there is no static ACL on a port, a dynamic auth-default ACL is created, and policies are enforced before dACLs are downloaded and applied.

Note The auth-default-ACL does not appear in the running configuration.

The auth-default ACL is created when at least one host with an authorization policy is detected on the port. The auth-default ACL is removed from the port when the last authenticated session ends. You can configure the auth-default ACL for IPv4 by using the **ip access-list extended auth-default-acl** command in global configuration mode. For IPv6, use the **ipv6 access-list extended auth-default-acl** command in the global configuration mode.

Note The auth-default-ACL does not support Cisco Discovery Protocol bypass in the single host mode. You must configure a static ACL on the interface to support Cisco Discovery Protocol bypass.

The 802.1x and MAB authentication methods support two authentication modes, *open* and *closed*. If there is no static ACL on a port in *closed* authentication mode:

- An auth-default-ACL is created.
- The auth-default-ACL allows only DHCP traffic until policies are enforced.
- When the first host authenticates, the authorization policy is applied without IP address insertion.

- When a second host is detected, the policies for the first host are refreshed, and policies for the first and subsequent sessions are enforced with IP address insertion.

If there is no static ACL on a port in *open* authentication mode:

- An auth-default-ACL-OPEN is created and allows all traffic.
- Policies are enforced with IP address insertion to prevent security breaches.
- Web authentication is subject to the auth-default-ACL-OPEN.

To control access for hosts with no authorization policy, you can configure a directive. The supported values for the directive are *open* and *default*. When you configure the *open* directive, all traffic is allowed. The *default* directive subjects traffic to the access provided by the port. You can configure the directive either in the user profile on the AAA server or on the switch. To configure the directive on the AAA server, use the **authz-directive =<open/default>** global command. To configure the directive on the switch, use the **epm access-control open** global configuration command.

Note The default value of the directive is *default*.

If a host falls back to web authentication on a port without a configured ACL:

- If the port is in open authentication mode, the auth-default-ACL-OPEN is created.
- If the port is in closed authentication mode, the auth-default-ACL is created.

The access control entries (ACEs) in the fallback ACL are converted to per-user entries. If the configured fallback profile does not include a fallback ACL, the host is subject to the auth-default-ACL associated with the port.

Note If you use a custom logo with web authentication and it is stored on an external server, the port ACL must allow access to the external server before authentication. You must either configure a static port ACL or change the auth-default-ACL to provide appropriate access to the external server.

Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL

The switch uses these *cisco-av-pair* VSAs:

- url-redirect is the HTTP or HTTPS URL.
- url-redirect-acl is the switch ACL name or number.

The switch uses the CiscoSecure-defined-ACL attribute value pair to intercept an HTTP or HTTPS request from the end point. The switch then forwards the client web browser to the specified redirect address. The url-redirect AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The url-redirect-acl attribute value pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to redirect.

**Note**

- Traffic that matches a permit ACE in the ACL is redirected.
- Define the URL redirect ACL and the default port ACL on the switch.

If a redirect URL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs

You can set the CiscoSecure-Defined-ACL Attribute-Value (AV) pair on the Cisco Secure ACS with the RADIUS cisco-av-pair vendor-specific attributes (VSAs). This pair specifies the names of the downloadable ACLs on the Cisco Secure ACS with the #ACL#-IP-name-number attribute for IPv4 and #ACL#-.in.ipv6 attribute for IPv6.

- The *name* is the ACL name.
- The *number* is the version number (for example, 3f783768).

If a downloadable ACL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host-access-policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL that is configured on the switch port. However, if the switch receives an host access policy from the Cisco Secure ACS but the default ACL is not configured, the authorization failure is declared.

VLAN ID-Based MAC Authentication

You can use VLAN ID-based MAC authentication if you wish to authenticate hosts based on a static VLAN ID instead of a downloadable VLAN. When you have a static VLAN policy configured on your switch, VLAN information is sent to an IAS (Microsoft) RADIUS server along with the MAC address of each host for authentication. The VLAN ID configured on the connected port is used for MAC authentication. By using VLAN ID-based MAC authentication with an IAS server, you can have a fixed number of VLANs in the network.

The feature also limits the number of VLANs monitored and handled by STP. The network can be managed as a fixed VLAN.

802.1x Authentication with Guest VLAN

You can configure a guest VLAN for each 802.1x port on the switch to provide limited services to clients, such as downloading the 802.1x client. These clients might be upgrading their system for 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an 802.1x port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

The switch maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

If the switch is trying to authorize an 802.1x-capable voice device and the AAA server is unavailable, the authorization attempt fails, but the detection of the EAPOL packet is saved in the EAPOL history. When the AAA server becomes available, the switch authorizes the voice device. However, the switch no longer allows other devices access to the guest VLAN. To prevent this situation, use one of these command sequences:

- Enter the **authentication event no-response action authorize vlan** *vlan-id* interface configuration command to allow access to the guest VLAN.
- Enter the **shutdown** interface configuration command followed by the **no shutdown** interface configuration command to restart the port.

If devices send EAPOL packets to the switch during the lifetime of the link, the switch no longer allows clients that fail authentication access to the guest VLAN.

Note If an EAPOL packet is detected after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and 802.1x authentication restarts.

Any number of 802.1x-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1x ports in single host, multiple host, multi-auth and multi-domain modes.

You can configure any active VLAN except an RSPAN VLAN, a private VLAN, or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

The switch supports *MAC authentication bypass*. When MAC authentication bypass is enabled on an 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified.

802.1x Authentication with Restricted VLAN

You can configure a restricted VLAN (also referred to as an *authentication failed VLAN*) for each IEEE 802.1x port on a switch stack or a switch to provide limited services to clients that cannot access the guest VLAN. These clients are 802.1x-compliant and cannot access another VLAN because they fail the authentication process. A restricted VLAN allows users without valid credentials in an authentication server (typically, visitors to an enterprise) to access a limited set of services. The administrator can control the services available to the restricted VLAN.

Note You can configure a VLAN to be both the guest VLAN and the restricted VLAN if you want to provide the same services to both types of users.

Without this feature, the client attempts and fails authentication indefinitely, and the switch port remains in the spanning-tree blocking state. With this feature, you can configure the switch port to be in the restricted VLAN after a specified number of authentication attempts (the default value is 3 attempts).

The authenticator counts the failed authentication attempts for the client. When this count exceeds the configured maximum number of authentication attempts, the port moves to the restricted VLAN. The failed attempt count increments when the RADIUS server replies with either an *EAP failure* or an empty response without an EAP packet. When the port moves into the restricted VLAN, the failed attempt counter resets.

Users who fail authentication remain in the restricted VLAN until the next re-authentication attempt. A port in the restricted VLAN tries to re-authenticate at configured intervals (the default is 60 seconds). If re-authentication fails, the port remains in the restricted VLAN. If re-authentication is successful, the port moves either to the configured VLAN or to a VLAN sent by the RADIUS server. You can disable re-authentication. If you do this, the only way to restart the authentication process is for the port to receive a *link down* or *EAP logoff* event. We recommend that you keep re-authentication enabled if a client might connect through a hub. When a client disconnects from the hub, the port might not receive the *link down* or *EAP logoff* event.

After a port moves to the restricted VLAN, a simulated EAP success message is sent to the client. This prevents clients from indefinitely attempting authentication. Some clients (for example, devices running Windows XP) cannot implement DHCP without EAP success.

Restricted VLANs are supported on 802.1x ports in all host modes and on Layer 2 ports.

You can configure any active VLAN except an RSPAN VLAN, a primary private VLAN, or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

Other security port features such as dynamic ARP Inspection, DHCP snooping, and IP source guard can be configured independently on a restricted VLAN.

802.1x Authentication with Inaccessible Authentication Bypass

Use the inaccessible authentication bypass feature, also referred to as *critical authentication* or the *AAA fail policy*, when the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated. You can configure the switch to connect those hosts to *critical ports*.

When a new host tries to connect to the critical port, that host is moved to a user-specified access VLAN, the *critical VLAN*. The administrator gives limited authentication to the hosts.

When the switch tries to authenticate a host connected to a critical port, the switch checks the status of the configured RADIUS server. If a server is available, the switch can authenticate the host. However, if all the RADIUS servers are unavailable, the switch grants network access to the host and puts the port in the *critical-authentication* state, which is a special case of the authentication state.

Note If *critical authentication* is configured on interface, then *vlan* used for critical authorization (*critical vlan*) should be active on the switch. If the *critical vlan* is inactive (or) down, *critical authentication* session will keep trying to enable inactive *vlan* and fail repeatedly. This can lead to large amount of memory holding.

Inaccessible Authentication Bypass Support on Multiple-Authentication Ports

When a port is configured on any host mode and the AAA server is unavailable, the port is then configured to multi-host mode and moved to the critical VLAN. To support this inaccessible bypass on multiple-authentication (multiauth) ports, use the **authentication event server dead action reinitialize vlan *vlan-id*** command. When a new host tries to connect to the critical port, that port is reinitialized and all the connected hosts are moved to the user-specified access VLAN.

This command is supported on all host modes.

Inaccessible Authentication Bypass Authentication Results

The behavior of the inaccessible authentication bypass feature depends on the authorization state of the port:

- If the port is unauthorized when a host connected to a critical port tries to authenticate and all servers are unavailable, the switch puts the port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
- If the port is already authorized and reauthentication occurs, the switch puts the critical port in the critical-authentication state in the current VLAN, which might be the one previously assigned by the RADIUS server.
- If the RADIUS server becomes unavailable during an authentication exchange, the current exchange times out, and the switch puts the critical port in the critical-authentication state during the next authentication attempt.

You can configure the critical port to reinitialize hosts and move them out of the critical VLAN when the RADIUS server is again available. When this is configured, all critical ports in the critical-authentication state are automatically re-authenticated.

Inaccessible Authentication Bypass Feature Interactions

Inaccessible authentication bypass interacts with these features:

- Guest VLAN—Inaccessible authentication bypass is compatible with guest VLAN. When a guest VLAN is enabled on 8021.x port, the features interact as follows:
 - If at least one RADIUS server is available, the switch assigns a client to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.
 - If all the RADIUS servers are not available and the client is connected to a critical port, the switch authenticates the client and puts the critical port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
 - If all the RADIUS servers are not available and the client is not connected to a critical port, the switch might not assign clients to the guest VLAN if one is configured.

- If all the RADIUS servers are not available and if a client is connected to a critical port and was previously assigned to a guest VLAN, the switch keeps the port in the guest VLAN.
- Restricted VLAN—If the port is already authorized in a restricted VLAN and the RADIUS servers are unavailable, the switch puts the critical port in the critical-authentication state in the restricted VLAN.
- 802.1x accounting—Accounting is not affected if the RADIUS servers are unavailable.
- Private VLAN—You can configure inaccessible authentication bypass on a private VLAN host port. The access VLAN must be a secondary private VLAN.
- Voice VLAN—Inaccessible authentication bypass is compatible with voice VLAN, but the RADIUS-configured or user-specified access VLAN and the voice VLAN must be different.
- Remote Switched Port Analyzer (RSPAN)—Do not configure an RSPAN VLAN as the RADIUS-configured or user-specified access VLAN for inaccessible authentication bypass.

In a switch stack:

- The stack's active switch checks the status of the RADIUS servers by sending keepalive packets. When the status of a RADIUS server changes, the stack's active switch sends the information to the stack members. The stack members can then check the status of RADIUS servers when re-authenticating critical ports.
- If the new active switch is elected, the link between the switch stack and RADIUS server might change, and the new stack immediately sends keepalive packets to update the status of the RADIUS servers. If the server status changes from *dead* to *alive*, the switch re-authenticates all switch ports in the critical-authentication state.

When a member is added to the stack, the stack's active switch sends the member the server status.

802.1x Critical Voice VLAN

When an IP phone connected to a port is authenticated by the Cisco Identity Services Engine (ISE), the phone is put into the voice domain. If the ISE is not reachable, the switch cannot determine if the device is a voice device. If the server is unavailable, the phone cannot access the voice network and therefore cannot operate.

For data traffic, you can configure inaccessible authentication bypass, or critical authentication, to allow traffic to pass through on the native VLAN when the server is not available. If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network and puts the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN. When the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated, the switch connects those hosts to critical ports. A new host trying to connect to the critical port is moved to a user-specified access VLAN, the critical VLAN, and granted limited authentication.

You can enter the **authentication event server dead action authorize voice** interface configuration command to configure the critical voice VLAN feature. When the ISE does not respond, the port goes into critical authentication mode. When traffic coming from the host is tagged with the voice VLAN, the connected device (the phone) is put in the configured voice VLAN for the port. The IP phones learn the voice VLAN identification through Cisco Discovery Protocol (Cisco devices) or through LLDP or DHCP.

You can configure the voice VLAN for a port by entering the **switchport voice vlan *vlan-id*** interface configuration command.

This feature is supported in multidomain and multi-auth host modes. Although you can enter the command when the switch is in single-host or multi-host mode, the command has no effect unless the device changes to multidomain or multi-auth host mode.

802.1x User Distribution

You can configure 802.1x user distribution to load-balance users with the same group name across multiple different VLANs.

The VLANs are either supplied by the RADIUS server or configured through the switch CLI under a VLAN group name.

- Configure the RADIUS server to send more than one VLAN name for a user. The multiple VLAN names can be sent as part of the response to the user. The 802.1x user distribution tracks all the users in a particular VLAN and achieves load balancing by moving the authorized user to the least populated VLAN.
- Configure the RADIUS server to send a VLAN group name for a user. The VLAN group name can be sent as part of the response to the user. You can search for the selected VLAN group name among the VLAN group names that you configured by using the switch CLI. If the VLAN group name is found, the corresponding VLANs under this VLAN group name are searched to find the least populated VLAN. Load balancing is achieved by moving the corresponding authorized user to that VLAN.

Note The RADIUS server can send the VLAN information in any combination of VLAN-IDs, VLAN names, or VLAN groups.

802.1x User Distribution Configuration Guidelines

- Confirm that at least one VLAN is mapped to the VLAN group.
- You can map more than one VLAN to a VLAN group.
- You can modify the VLAN group by adding or deleting a VLAN.
- When you clear an existing VLAN from the VLAN group name, none of the authenticated ports in the VLAN are cleared, but the mappings are removed from the existing VLAN group.
- If you clear the last VLAN from the VLAN group name, the VLAN group is cleared.
- You can clear a VLAN group even when the active VLANs are mapped to the group. When you clear a VLAN group, none of the ports or users that are in the authenticated state in any VLAN within the group are cleared, but the VLAN mappings to the VLAN group are cleared.

IEEE 802.1x Authentication with Voice VLAN Ports

A voice VLAN port is a special access port associated with two VLAN identifiers:

- VVID to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.

- PVID to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

The IP phone uses the VVID for its voice traffic, regardless of the authorization state of the port. This allows the phone to work independently of IEEE 802.1x authentication.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multiple-hosts mode, additional clients can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multiple-hosts mode is enabled, the supplicant authentication affects both the PVID and the VVID.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several IP phones are connected in series, the switch recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the switch drops packets from unrecognized IP phones more than one hop away.

When IEEE 802.1x authentication is enabled on a switch port, you can configure an access port VLAN that is also a voice VLAN.

When IP phones are connected to an 802.1x-enabled switch port that is in single host mode, the switch grants the phones network access without authenticating them. We recommend that you use multidomain authentication (MDA) on the port to authenticate both a data device and a voice device, such as an IP phone

Note If you enable IEEE 802.1x authentication on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the Cisco IP phone loses connectivity to the switch for up to 30 seconds.

IEEE 802.1x Authentication with Port Security

In general, Cisco does not recommend enabling port security when IEEE 802.1x is enabled. Since IEEE 802.1x enforces a single MAC address per port (or per VLAN when MDA is configured for IP telephony), port security is redundant and in some cases may interfere with expected IEEE 802.1x operations.

IEEE 802.1x Authentication with Wake-on-LAN

The IEEE 802.1x authentication with wake-on-LAN (WoL) feature allows dormant PCs to be powered when the switch receives a specific Ethernet frame, known as the *magic packet*. You can use this feature in environments where administrators need to connect to systems that have been powered down.

When a host that uses WoL is attached through an IEEE 802.1x port and the host powers off, the IEEE 802.1x port becomes unauthorized. The port can only receive and send EAPOL packets, and WoL magic packets cannot reach the host. When the PC is powered off, it is not authorized, and the switch port is not opened.

When the switch uses IEEE 802.1x authentication with WoL, the switch forwards traffic to unauthorized IEEE 802.1x ports, including magic packets. While the port is unauthorized, the switch continues to block ingress traffic other than EAPOL packets. The host can receive packets but cannot send packets to other devices in the network.

Note If PortFast is not enabled on the port, the port is forced to the bidirectional state.

When you configure a port as unidirectional by using the **authentication control-direction in** interface configuration command, the port changes to the spanning-tree forwarding state. The port can send packets to the host but cannot receive packets from the host.

When you configure a port as bidirectional by using the **authentication control-direction both** interface configuration command, the port is access-controlled in both directions. The port does not receive packets from or send packets to the host.

IEEE 802.1x Authentication with MAC Authentication Bypass

You can configure the switch to authorize clients based on the client MAC address by using the MAC authentication bypass feature. For example, you can enable this feature on IEEE 802.1x ports connected to devices such as printers.

If IEEE 802.1x authentication times out while waiting for an EAPOL response from the client, the switch tries to authorize the client by using MAC authentication bypass.

When the MAC authentication bypass feature is enabled on an IEEE 802.1x port, the switch uses the MAC address as the client identity. The authentication server has a database of client MAC addresses that are allowed network access. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is configured. This process works for most client devices; however, it does not work for clients that use an alternate MAC address format. You can configure how MAB authentication is performed for clients with MAC addresses that deviate from the standard format or where the RADIUS configuration requires the user name and password to differ.

If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an 802.1x-capable supplicant and uses 802.1x authentication (not MAC authentication bypass) to authorize the interface. EAPOL history is cleared if the interface link status goes down.

If the switch already authorized a port by using MAC authentication bypass and detects an IEEE 802.1x supplicant, the switch does not unauthorize the client connected to the port. When re-authentication occurs, the switch uses the authentication or re-authentication methods configured on the port, if the previous session ended because the Termination-Action RADIUS attribute value is `DEFAULT`.

Clients that were authorized with MAC authentication bypass can be re-authenticated. The re-authentication process is the same as that for clients that were authenticated with IEEE 802.1x. During re-authentication, the port remains in the previously assigned VLAN. If re-authentication is successful, the switch keeps the port in the same VLAN. If re-authentication fails, the switch assigns the port to the guest VLAN, if one is configured.

If re-authentication is based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]) and if the Termination-Action RADIUS attribute (Attribute [29]) action is *Initialize* (the attribute value is `DEFAULT`), the MAC authentication bypass session ends, and connectivity is lost during re-authentication. If MAC authentication bypass is enabled and the IEEE 802.1x authentication times out, the switch uses the MAC authentication bypass feature to initiate re-authorization. For more information about these AV pairs, see RFC 3580, "IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines."

MAC authentication bypass interacts with the features:

- IEEE 802.1x authentication—You can enable MAC authentication bypass only if 802.1x authentication is enabled on the port .

- Guest VLAN—If a client has an invalid MAC address identity, the switch assigns the client to a guest VLAN if one is configured.
- Restricted VLAN—This feature is not supported when the client connected to an IEEE 802.1x port is authenticated with MAC authentication bypass.
- Port security
- Voice VLAN
- Private VLAN—You can assign a client to a private VLAN.

Cisco IOS Release 12.2(55)SE and later supports filtering of verbose MAB system messages

Network Admission Control Layer 2 IEEE 802.1x Validation

The switch supports the Network Admission Control (NAC) Layer 2 IEEE 802.1x validation, which checks the antivirus condition or *posture* of endpoint systems or clients before granting the devices network access. With NAC Layer 2 IEEE 802.1x validation, you can do these tasks:

- Download the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) from the authentication server.
- Set the number of seconds between re-authentication attempts as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and get an access policy against the client from the RADIUS server.
- Set the action to be taken when the switch tries to re-authenticate the client by using the Termination-Action RADIUS attribute (Attribute[29]). If the value is the *DEFAULT* or is not set, the session ends. If the value is RADIUS-Request, the re-authentication process starts.
- Set the list of VLAN number or name or VLAN group name as the value of the Tunnel Group Private ID (Attribute[81]) and the preference for the VLAN number or name or VLAN group name as the value of the Tunnel Preference (Attribute[83]). If you do not configure the Tunnel Preference, the first Tunnel Group Private ID (Attribute[81]) attribute is picked up from the list.
- View the NAC posture token, which shows the posture of the client, by using the **show authentication** privileged EXEC command.
- Configure secondary private VLANs as guest VLANs.

Configuring NAC Layer 2 IEEE 802.1x validation is similar to configuring IEEE 802.1x port-based authentication except that you must configure a posture token on the RADIUS server.

Flexible Authentication Ordering

You can use flexible authentication ordering to configure the order of methods that a port uses to authenticate a new host. The IEEE 802.1X Flexible Authentication feature supports three authentication methods:

- dot1X—IEEE 802.1X authentication is a Layer 2 authentication method.
- mab—MAC-Authentication Bypass is a Layer 2 authentication method.
- webauth—Web authentication is a Layer 3 authentication method.

Using this feature, you can control which ports use which authentication methods, and you can control the failover sequencing of methods on those ports. For example, MAC authentication bypass and 802.1x can be the primary or secondary authentication methods, and web authentication can be the fallback method if either or both of those authentication attempts fail.

The IEEE 802.1X Flexible Authentication feature supports the following host modes:

- multi-auth—Multiauthentication allows one authentication on a voice VLAN and multiple authentications on the data VLAN.
- multi-domain—Multidomain authentication allows two authentications: one on the voice VLAN and one on the data VLAN.

Open1x Authentication

Open1x authentication allows a device access to a port before that device is authenticated. When open authentication is configured, a new host can pass traffic according to the access control list (ACL) defined on the port. After the host is authenticated, the policies configured on the RADIUS server are applied to that host.

You can configure open authentication with these scenarios:

- Single-host mode with open authentication—Only one user is allowed network access before and after authentication.
- MDA mode with open authentication—Only one user in the voice domain and one user in the data domain are allowed.
- Multiple-hosts mode with open authentication—Any host can access the network.
- Multiple-authentication mode with open authentication—Similar to MDA, except multiple hosts can be authenticated.

Note If open authentication is configured, it takes precedence over other authentication controls. This means that if you use the **authentication open** interface configuration command, the port will grant access to the host irrespective of the **authentication port-control** interface configuration command.

Multidomain Authentication

The switch supports multidomain authentication (MDA), which allows both a data device and voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port. The port is divided into a data domain and a voice domain.

Note For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

MDA does not enforce the order of device authentication. However, for best results, we recommend that a voice device is authenticated before a data device on an MDA-enabled port.

Note When migrating from Cisco Discovery Protocol bypass to next-generation authentication bypass, if single or multi-host mode is used with an IP phone and one or more data devices, then move to multi-authentication mode with next-generation authentication bypass that provides the session visibility advantage.

Follow these guidelines for configuring MDA:

- You must configure a switch port for MDA.
- You must configure the voice VLAN for the IP phone when the host mode is set to multidomain.
- Voice VLAN assignment on an MDA-enabled port is supported Cisco IOS Release 12.2(40)SE and later.
- To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of *device-traffic-class=voice*. Without this value, the switch treats the voice device as a data device.
- The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.
- If more than one device attempts authorization on either the voice or the data domain of a port, it is error disabled.
- Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked.
- A voice device MAC address that is binding on the data VLAN is not counted towards the port security MAC address limit.
- MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support IEEE 802.1x authentication.
- When a *data* or a *voice* device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.
- If more than five devices are detected on the *data* VLAN or more than one voice device is detected on the *voice* VLAN while a port is unauthorized, the port is error disabled.
- When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that has been allowed on the port voice VLAN is automatically removed and must be reauthenticated on that port.
- Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.
- Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.
- If a data domain is authorized first and placed in the guest VLAN, non-IEEE 802.1x-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.
- We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.

Limiting Login for Users

The Limiting Login feature helps Network administrators to limit the login attempt of users to a network. When a user fails to successfully login to a network within a configurable number of attempts within a configurable time limit, the user can be blocked. This feature is enabled only for local users and not for remote users. You need to configure the **aaa authentication rejected** command in global configuration mode to enable this feature.

802.1x Supplicant and Authenticator Switches with Network Edge Access Topology (NEAT)

The Network Edge Access Topology (NEAT) feature extends identity to areas outside the wiring closet (such as conference rooms). This allows any type of device to authenticate on the port.

- 802.1x switch supplicant: You can configure a switch to act as a supplicant to another switch by using the 802.1x supplicant feature. This configuration is helpful in a scenario, where, for example, a switch is outside a wiring closet and is connected to an upstream switch through a trunk port. A switch configured with the 802.1x switch supplicant feature authenticates with the upstream switch for secure connectivity. Once the supplicant switch authenticates successfully the port mode changes from access to trunk in an authenticator switch. In a supplicant switch you must manually configure trunk when enabling CISP.

Note NEAT configuration is the only supported and qualified method to authenticate switches using 802.1x. Any other method to authenticate a network switch can result in an undefined behavior.

- If the access VLAN is configured on the authenticator switch, it becomes the native VLAN for the trunk port after successful authentication.

In the default state, when you connect a supplicant switch to an authenticator switch that has BPDU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. Beginning with Cisco IOS Release 15.0(1)SE, you can control traffic exiting the supplicant port during the authentication period. Entering the **dot1x supplicant controlled transient** global configuration command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the **no dot1x supplicant controlled transient** global configuration command opens the supplicant port during the authentication period. This is the default behavior.

We strongly recommend using the **dot1x supplicant controlled transient** command on a supplicant switch when BPDU guard is enabled on the authenticator switch port with the **spanning-tree bpduguard enable** interface configuration command.

Note If you globally enable BPDU guard on the authenticator switch by using the **spanning-tree portfast bpduguard default** global configuration command, entering the **dot1x supplicant controlled transient** command does not prevent the BPDU violation.

You can enable MDA or multiauth mode on the authenticator switch interface that connects to one more supplicant switches. Multihost mode is not supported on the authenticator switch interface.

When you reboot an authenticator switch with single-host mode enabled on the interface, the interface may move to err-disabled state before authentication. To recover from err-disabled state, flap the authenticator port to activate the interface again and initiate authentication.

Use the **dot1x supplicant force-multicast** global configuration command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all host modes.

- **Host Authorization:** Ensures that only traffic from authorized hosts (connecting to the switch with supplicant) is allowed on the network. The switches use Client Information Signalling Protocol (CISP) to send the MAC addresses connecting to the supplicant switch to the authenticator switch.
- **Auto enablement:** Automatically enables trunk configuration on the authenticator switch, allowing user traffic from multiple VLANs coming from supplicant switches. Configure the `cisco-av-pair as device-traffic-class=switch` at the ISE. (You can configure this under the *group* or the *user* settings.)

Figure 113: Authenticator and Supplicant Switch using CISP

1	Workstations (clients)	2	Supplicant switch (outside wiring closet)
3	Authenticator switch	4	Cisco ISE
5	Trunk port		

Note The **switchport nonegotiate** command is not supported on supplicant and authenticator switches with NEAT. This command should not be configured at the supplicant side of the topology. If configured on the authenticator side, the internal macros will automatically remove this command from the port.

Voice Aware 802.1x Security

Note To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature to configure the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. In previous releases, when an attempt to authenticate the data client caused a security violation, the entire port shut down, resulting in a complete loss of connectivity.

You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

Common Session ID

Authentication manager uses a single session ID (referred to as a common session ID) for a client no matter which authentication method is used. This ID is used for all reporting purposes, such as the show commands and MIBs. The session ID appears with all per-session syslog messages.

The session ID includes:

- The IP address of the Network Access Device (NAD)
- A monotonically increasing unique 32 bit integer
- The session start time stamp (a 32 bit integer)

This example shows how the session ID appears in the output of the show authentication command. The session ID in this example is 160000050000000B288508E5:

```
Device# show authentication sessions
Interface  MAC Address      Method  Domain  Status      Session ID
Fa4/0/4    0000.0000.0203  mab     DATA   Authz Success 160000050000000B288508E5
```

This is an example of how the session ID appears in the syslog output. The session ID in this example is also 160000050000000B288508E5:

```
1w0d: %AUTHMGR-5-START: Starting 'mab' for client (0000.0000.0203) on Interface Fa4/0/4
AuditSessionID 160000050000000B288508E5
1w0d: %MAB-5-SUCCESS: Authentication successful for client (0000.0000.0203) on Interface
Fa4/0/4 AuditSessionID 160000050000000B288508E5
1w0d: %AUTHMGR-7-RESULT: Authentication result 'success' from 'mab' for client
(0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
```

The session ID is used by the NAD, the AAA server, and other report-analyzing applications to identify the client. The ID appears automatically. No configuration is required.

How to Configure 802.1x Port-Based Authentication

Default 802.1x Authentication Configuration

Table 146: Default 802.1x Authentication Configuration

Feature	Default Setting
Switch 802.1x enable state	Disabled.
Per-port 802.1x enable state	Disabled (force-authorized). The port sends and receives normal traffic without 802.1x-based authentication of the client.
AAA	Disabled.
RADIUS server <ul style="list-style-type: none"> • IP address • UDP authentication port • Default accounting port • Key 	<ul style="list-style-type: none"> • None specified. • 1645. • 1646. • None specified.
Host mode	Single-host mode.
Control direction	Bidirectional control.
Periodic re-authentication	Disabled.
Number of seconds between re-authentication attempts	3600 seconds.
Re-authentication number	2 times (number of times that the switch restarts the authentication process before the port changes to the unauthorized state).
Quiet period	60 seconds (number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client).
Retransmission time	30 seconds (number of seconds that the switch should wait for a response to an EAP request/identity frame from the client before resending the request).
Maximum retransmission number	2 times (number of times that the switch will send an EAP-request/identity frame before restarting the authentication process).

Feature	Default Setting
Client timeout period	30 seconds (when relaying a request from the authentication server to the client, the amount of time the switch waits for a response before resending the request to the client.)
Authentication server timeout period	30 seconds (when relaying a response from the client to the authentication server, the amount of time the switch waits for a reply before resending the response to the server.) You can change this timeout period by using the dot1x timeout server-timeout interface configuration command.
Inactivity timeout	Disabled.
Guest VLAN	None specified.
Inaccessible authentication bypass	Disabled.
Restricted VLAN	None specified.
Authenticator (switch) mode	None specified.
MAC authentication bypass	Disabled.
Voice-aware security	Disabled.

802.1x Authentication Configuration Guidelines

802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.
- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.

If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:
 - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.

- EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
- Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.
- Before globally enabling 802.1x authentication on a switch by entering the **dot1x system-auth-control** global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.
- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass

These are the configuration guidelines for VLAN assignment, guest VLAN, restricted VLAN, and inaccessible authentication bypass:

- When 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.
- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.
- After you configure a guest VLAN for an 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the 802.1x authentication process (**authentication timer inactivity** and **authentication timer reauthentication** interface configuration commands). The amount to decrease the settings depends on the connected 802.1x client type.
- When configuring the inaccessible authentication bypass feature, follow these guidelines:
 - The feature is supported on 802.1x port in single-host mode and multihosts mode.
 - If the client is running Windows XP and the port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.
 - If the Windows XP client is configured for DHCP and has an IP address from the DHCP server, receiving an EAP-Success message on a critical port might not re-initiate the DHCP configuration process.
 - You can configure the inaccessible authentication bypass feature and the restricted VLAN on an 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, switch changes the port state to the critical authentication state and remains in the restricted VLAN.
 - If the CTS links are in Critical Authentication mode and the active switch reloads, the policy where SGT was configured on a device will not be available on the new active switch. This is because the internal bindings will not be synced to the standby switch in a 3750-X switch stack.

- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.
- When wireless guest clients obtains IP from foreign client VLAN instead of anchor client VLAN, you should use the **ip dhcp required** command under the WLAN configuration to force clients to issue a new DHCP request. This prevents the clients from getting an incorrect IP at anchor.
- If the wired guest clients fail to get IP address after a Cisco WLC (foreign) reload, perform a shut/no shut on the ports used by the clients to reconnect them.

MAC Authentication Bypass

These are the MAC authentication bypass configuration guidelines:

- Unless otherwise stated, the MAC authentication bypass guidelines are the same as the 802.1x authentication guidelines.
- If you disable MAC authentication bypass from a port after the port has been authorized with its MAC address, the port state is not affected.
- If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.
- If the port is in the authorized state, the port remains in this state until re-authorization occurs.
- You can configure a timeout period for hosts that are connected by MAC authentication bypass but are inactive. The range is 1 to 65535 seconds.

Maximum Number of Allowed Devices Per Port

This is the maximum number of devices allowed on an 802.1x-enabled port:

- In single-host mode, only one device is allowed on the access VLAN. If the port is also configured with a voice VLAN, an unlimited number of Cisco IP phones can send and receive traffic through the voice VLAN.
- In multidomain authentication (MDA) mode, one device is allowed for the access VLAN, and one IP phone is allowed for the voice VLAN.
- In multihost mode, only one 802.1x supplicant is allowed on the port, but an unlimited number of non-802.1x hosts are allowed on the access VLAN. An unlimited number of devices are allowed on the voice VLAN.

Configuring 802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable.

The 802.1x readiness check is allowed on all ports that can be configured for 802.1x. The readiness check is not available on a port that is configured as **dot1x force-unauthorized**.

Follow these steps to enable the 802.1x readiness check on the switch:

Before you begin

Follow these guidelines to enable the readiness check on the switch:

- The readiness check is typically used before 802.1x is enabled on the switch.
- If you use the **dot1x test eapol-capable** privileged EXEC command without specifying an interface, all the ports on the switch stack are tested.
- When you configure the **dot1x test eapol-capable** command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
- When you configure the **dot1x test eapol-capable** command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
- The readiness check can be sent on a port that handles multiple hosts (for example, a PC that is connected to an IP phone). A syslog message is generated for each of the clients that respond to the readiness check within the timer period.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dot1x test eapol-capable** [interface *interface-id*]
4. **dot1x test timeout** *timeout*
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	dot1x test eapol-capable [interface <i>interface-id</i>] Example: Device# dot1x test eapol-capable interface gigabitethernet1/0/13	Enables the 802.1x readiness check on the switch. (Optional) For <i>interface-id</i> specify the port on which to check for IEEE 802.1x readiness.

	Command or Action	Purpose
	<pre>DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL capable</pre>	Note If you omit the optional interface keyword, all interfaces on the switch are tested.
Step 4	dot1x test timeout <i>timeout</i>	(Optional) Configures the timeout used to wait for EAPOL response. The range is from 1 to 65535 seconds. The default is 10 seconds.
Step 5	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 6	show running-config Example: <pre>Device# show running-config</pre>	Verifies your entries.
Step 7	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring Voice Aware 802.1x Security

Note To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature on the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

Follow these guidelines to configure voice aware 802.1x voice security on the switch:

- You enable voice aware 802.1x security by entering the **errdisable detect cause security-violation shutdown vlan** global configuration command. You disable voice aware 802.1x security by entering the **no** version of this command. This command applies to all 802.1x-configured ports in the switch.

Note If you do not include the **shutdown vlan** keywords, the entire port is shut down when it enters the error-disabled state.

- If you use the **errdisable recovery cause security-violation** global configuration command to configure error-disabled recovery, the port is automatically re-enabled. If error-disabled recovery is not configured for the port, you re-enable it by using the **shutdown** and **no shutdown** interface configuration commands.
- You can re-enable individual VLANs by using the **clear errdisable interface interface-id vlan [vlan-list]** privileged EXEC command. If you do not specify a range, all VLANs on the port are enabled.

Beginning in privileged EXEC mode, follow these steps to enable voice aware 802.1x security:

SUMMARY STEPS

1. **configure terminal**
2. **errdisable detect cause security-violation shutdown vlan**
3. **errdisable recovery cause security-violation**
4. **clear errdisable interface interface-id vlan [vlan-list]**
5. Enter the following:
 - **shutdown**
 - **no shutdown**
6. **end**
7. **show errdisable detect**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal	Enter global configuration mode.
Step 2	errdisable detect cause security-violation shutdown vlan	Shut down any VLAN on which a security violation error occurs. Note If the shutdown vlan keywords are not included, the entire port enters the error-disabled state and shuts down.
Step 3	errdisable recovery cause security-violation	Enter global configuration mode.
Step 4	clear errdisable interface interface-id vlan [vlan-list]	(Optional) Reenable individual VLANs that have been error disabled. <ul style="list-style-type: none"> • For interface-id specify the port on which to reenable individual VLANs. • (Optional) For vlan-list specify a list of VLANs to be re-enabled. If vlan-list is not specified, all VLANs are re-enabled.
Step 5	Enter the following: <ul style="list-style-type: none"> • shutdown • no shutdown 	(Optional) Re-enable an error-disabled VLAN, and clear all error-disable indications.
Step 6	end	Return to privileged EXEC mode.
Step 7	show errdisable detect	Verify your entries.

Example

This example shows how to configure the switch to shut down any VLAN on which a security violation error occurs:

```
Switch(config)# errdisable detect cause security-violation shutdown vlan
```

This example shows how to re-enable all VLANs that were error disabled on port Gigabit Ethernet 40/2.

```
Switch# clear errdisable interface gigabitethernet40/2
vlan
```

You can verify your settings by entering the **show errdisable detect** privileged EXEC command.

Configuring 802.1x Violation Modes

You can configure an 802.1x port so that it shuts down, generates a syslog error, or discards packets from a new device when:

- a device connects to an 802.1x-enabled port
- the maximum number of allowed about devices have been authenticated on the port

Beginning in privileged EXEC mode, follow these steps to configure the security violation actions on the switch:

SUMMARY STEPS

1. **configure terminal**
2. **aaa new-model**
3. **aaa authentication dot1x {default} method1**
4. **interface interface-id**
5. **switchport mode access**
6. **authentication violation {shutdown | restrict | protect | replace}**
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	aaa new-model Example: Device(config)# aaa new-model	Enables AAA.

	Command or Action	Purpose
Step 3	aaa authentication dot1x {default} method1 Example: <pre>Device(config)# aaa authentication dot1x default group radius</pre>	<p>Creates an 802.1x authentication method list.</p> <p>To create a default list that is used when a named list is <i>not</i> specified in the authentication command, use the default keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports.</p> <p>For <i>method1</i>, enter the group radius keywords to use the list of all RADIUS servers for authentication.</p>
Step 4	interface interface-id Example: <pre>Device(config)# interface gigabitethernet1/0/4</pre>	<p>Specifies the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode.</p>
Step 5	switchport mode access Example: <pre>Device(config-if)# switchport mode access</pre>	<p>Sets the port to access mode.</p>
Step 6	authentication violation {shutdown restrict protect replace} Example: <pre>Device(config-if)# authentication violation restrict</pre>	<p>Configures the violation mode. The keywords have these meanings:</p> <ul style="list-style-type: none"> • shutdown—Error disable the port. • restrict—Generate a syslog error. • protect—Drop packets from any new device that sends traffic to the port. • replace—Removes the current session and authenticates with the new host.
Step 7	end Example: <pre>Device(config-if)# end</pre>	<p>Returns to privileged EXEC mode.</p>

Configuring 802.1x Authentication

To allow per-user ACLs or VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

This is the 802.1x AAA process:

Before you begin

To configure 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

SUMMARY STEPS

1. A user connects to a port on the switch.
2. Authentication is performed.
3. VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.
4. The switch sends a start message to an accounting server.
5. Re-authentication is performed, as necessary.
6. The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.
7. The user disconnects from the port.
8. The switch sends a stop message to the accounting server.

DETAILED STEPS

	Command or Action	Purpose
Step 1	A user connects to a port on the switch.	
Step 2	Authentication is performed.	
Step 3	VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.	
Step 4	The switch sends a start message to an accounting server.	
Step 5	Re-authentication is performed, as necessary.	
Step 6	The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.	
Step 7	The user disconnects from the port.	
Step 8	The switch sends a stop message to the accounting server.	

Configuring 802.1x Port-Based Authentication

Beginning in privileged EXEC mode, follow these steps to configure 802.1x port-based authentication:

SUMMARY STEPS

1. **configure terminal**
2. **aaa new-model**
3. **aaa authentication dot1x {default} *method1***
4. **dot1x system-auth-control**
5. **aaa authorization network {default} group radius**
6. **radius-server host *ip-address***

7. `radius-server key string`
8. `interface interface-id`
9. `switchport mode access`
10. `authentication port-control auto`
11. `dot1x pae authenticator`
12. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	aaa new-model Example: Device(config)# <code>aaa new-model</code>	Enables AAA.
Step 3	aaa authentication dot1x {default} method1 Example: Device(config)# <code>aaa authentication dot1x default group radius</code>	<p>Creates an 802.1x authentication method list.</p> <p>To create a default list that is used when a named list is <i>not</i> specified in the authentication command, use the default keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports.</p> <p>For <i>method1</i>, enter the group radius keywords to use the list of all RADIUS servers for authentication.</p> <p>Note Though other keywords are visible in the command-line help string, only the group radius keywords are supported.</p>
Step 4	dot1x system-auth-control Example: Device(config)# <code>dot1x system-auth-control</code>	Enables 802.1x authentication globally on the switch.
Step 5	aaa authorization network {default} group radius Example: Device(config)# <code>aaa authorization network default group radius</code>	(Optional) Configures the switch to use user-RADIUS authorization for all network-related service requests, such as per-user ACLs or VLAN assignment.

	Command or Action	Purpose
Step 6	radius-server host <i>ip-address</i> Example: Device(config)# radius-server host 124.2.2.12	(Optional) Specifies the IP address of the RADIUS server.
Step 7	radius-server key <i>string</i> Example: Device(config)# radius-server key abc1234	(Optional) Specifies the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.
Step 8	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/2	Specifies the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode.
Step 9	switchport mode access Example: Device(config-if)# switchport mode access	(Optional) Sets the port to access mode only if you configured the RADIUS server in Step 6 and Step 7.
Step 10	authentication port-control auto Example: Device(config-if)# authentication port-control auto	Enables 802.1x authentication on the port.
Step 11	dot1x pae authenticator Example: Device(config-if)# dot1x pae authenticator	Sets the interface Port Access Entity to act only as an authenticator and ignore messages meant for a supplicant.
Step 12	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring the Switch-to-RADIUS-Server Communication

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the **radius-server host** global configuration command. If you want to configure these options on a

per-server basis, use the **radius-server timeout**, the **radius-server retransmit**, and the **radius-server key** global configuration commands.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

Follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.

Before you begin

You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server host** *{hostname | ip-address}* **auth-port** *port-number* **key** *string*
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	radius-server host <i>{hostname ip-address}</i> auth-port <i>port-number</i> key <i>string</i> Example: Device(config)# radius-server host 125.5.5.43 auth-port 1645 key rad123	Configures the RADIUS server parameters. For <i>hostname ip-address</i> , specify the server name or IP address of the remote RADIUS server. For auth-port <i>port-number</i> , specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536. For key <i>string</i> , specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.

	Command or Action	Purpose
		<p>Note Always configure the key as the last item in the radius-server host command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.</p> <p>If you want to use multiple RADIUS servers, re-enter this command.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the **authentication port-control** interface configuration command set to **auto**. Use the **multi-domain** keyword to configure and enable multidomain authentication (MDA), which allows both a host and a voice device, such as an IP phone (Cisco or non-Cisco), on the same switch port. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication host-mode** [**multi-auth** | **multi-domain** | **multi-host** | **single-host**]
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Device(config)# interface gigabitethernet2/0/1</pre>	Specifies the port to which multiple hosts are indirectly attached, and enter interface configuration mode.

	Command or Action	Purpose
Step 3	<p>authentication host-mode [multi-auth multi-domain multi-host single-host]</p> <p>Example:</p> <pre>Device(config-if)# authentication host-mode multi-host</pre>	<p>Allows multiple hosts (clients) on an 802.1x-authorized port.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> • multi-auth—Allow multiple authenticated clients on both the voice VLAN and data VLAN. <p>Note The multi-auth keyword is only available with the authentication host-mode command.</p> <ul style="list-style-type: none"> • multi-host—Allow multiple hosts on an 802.1x-authorized port after a single host has been authenticated. • multi-domain—Allow both a host and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port. <p>Note You must configure the voice VLAN for the IP phone when the host mode is set to multi-domain.</p> <p>Make sure that the authentication port-control interface configuration command is set to auto for the specified interface.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config-if)# end</pre>	<p>Returns to privileged EXEC mode.</p>

Configuring Periodic Re-Authentication

You can enable periodic 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between attempts is 3600.

Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication periodic**
4. **authentication timer** {{{[inactivity | reauthenticate | restart | unauthorized]}} {value}}
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	authentication periodic Example: Device(config-if)# <code>authentication periodic</code>	Enables periodic re-authentication of the client, which is disabled by default. Note The default value is 3600 seconds. To change the value of the reauthentication timer or to have the switch use a RADIUS-provided session timeout, enter the authentication timer reauthenticate command.
Step 4	authentication timer {[inactivity reauthenticate restart unauthorized]} {value}} Example: Device(config-if)# <code>authentication timer reauthenticate 180</code>	Sets the number of seconds between re-authentication attempts. The authentication timer keywords have these meanings: <ul style="list-style-type: none"> • inactivity—Interval in seconds after which if there is no activity from the client then it is unauthorized • reauthenticate—Time in seconds after which an automatic re-authentication attempt is initiated • restart <i>value</i>—Interval in seconds after which an attempt is made to authenticate an unauthorized port • unauthorized <i>value</i>—Interval in seconds after which an unauthorized session will get deleted This command affects the behavior of the switch only if periodic re-authentication is enabled.
Step 5	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time and then tries again. The **authentication timer restart** interface configuration command controls the idle period. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication timer restart** *seconds*
4. **end**
5. **show authentication sessions interface** *interface-id*
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet2/0/1	Specifies the port to be configured, and enter interface configuration mode.
Step 3	authentication timer restart <i>seconds</i> Example: Device(config-if)# authentication timer restart 30	Sets the number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. The range is 1 to 65535 seconds; the default is 60.
Step 4	end Example: Device(config-if)# end	Returns to privileged EXEC mode.
Step 5	show authentication sessions interface <i>interface-id</i> Example: Device# show authentication sessions interface	Verifies your entries.

	Command or Action	Purpose
	<code>gigabitethernet2/0/1</code>	
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resends the frame.

Note You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication timer reauthenticate** *seconds*
4. **end**
5. **show authentication sessions interface** *interface-id*
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.

	Command or Action	Purpose
Step 3	authentication timer reauthenticate <i>seconds</i> Example: <pre>Device(config-if)# authentication timer reauthenticate 60</pre>	Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request. The range is 1 to 65535 seconds; the default is 5.
Step 4	end Example: <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 5	show authentication sessions interface <i>interface-id</i> Example: <pre>Device# show authentication sessions interface gigabitethernet2/0/1</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP-request/identity frame (assuming no response is received) to the client before restarting the authentication process.

Note You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **dot1x max-reauth-req** *count*
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	dot1x max-reauth-req <i>count</i> Example: Device(config-if)# <code>dot1x max-reauth-req 5</code>	Sets the number of times that the switch sends an EAP-request/identity frame to the client before restarting the authentication process. The range is 1 to 10; the default is 2.
Step 4	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

Setting the Re-Authentication Number

You can also change the number of times that the switch restarts the authentication process before the port changes to the unauthorized state.

Note You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the re-authentication number. This procedure is optional.

SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `switchport mode access`
4. `dot1x max-req count`
5. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device# <code>interface gigabitethernet2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	switchport mode access Example: Device(config-if)# <code>switchport mode access</code>	Sets the port to access mode only if you previously configured the RADIUS server.
Step 4	dot1x max-req <i>count</i> Example: Device(config-if)# <code>dot1x max-req 4</code>	Sets the number of times that the switch restarts the authentication process before the port changes to the unauthorized state. The range is 0 to 10; the default is 2.
Step 5	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

Enabling MAC Move

MAC move allows an authenticated host to move from one port on the switch to another.

Beginning in privileged EXEC mode, follow these steps to globally enable MAC move on the switch. This procedure is optional.

SUMMARY STEPS

1. `configure terminal`
2. `authentication mac-move permit`
3. `end`
4. `show running-config`
5. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	authentication mac-move permit Example: Device(config)# <code>authentication mac-move permit</code>	Enables MAC move on the switch. Default is deny. In Session Aware Networking mode, the default CLI is access-session mac-move deny . To enable Mac Move in Session Aware Networking, use the no access-session mac-move global configuration command. In legacy mode (IBNS 1.0), default value for mac-move is deny and in C3PL mode (IBNS 2.0) default value is permit .
Step 3	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 4	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 5	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Disabling MAC Move

To disable MAC move from a secure port to an unsecured port on a switch, beginning in privileged EXEC mode, follow these steps. This procedure is optional.

SUMMARY STEPS

1. `configure terminal`
2. `authentication mac-move deny-uncontrolled`
3. `end`
4. `show running-config`
5. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	authentication mac-move deny-uncontrolled Example: Device(config)# <code>authentication mac-move deny-uncontrolled</code>	Disables MAC move on the switch.
Step 3	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 4	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 5	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Enabling MAC Replace

MAC replace allows a host to replace an authenticated host on a port.

Beginning in privileged EXEC mode, follow these steps to enable MAC replace on an interface. This procedure is optional.

SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `authentication violation {protect | replace | restrict | shutdown}`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet2/0/2</code>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	authentication violation {protect replace restrict shutdown} Example: Device(config-if)# <code>authentication violation replace</code>	Use the replace keyword to enable MAC replace on the interface. The port removes the current session and initiates authentication with the new host. The other keywords have these effects: <ul style="list-style-type: none"> • protect: the port drops packets with unexpected MAC addresses without generating a system message. • restrict: violating packets are dropped by the CPU and a system message is generated. • shutdown: the port is error disabled when it receives an unexpected MAC address.
Step 4	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring 802.1x Accounting

Enabling AAA system accounting with 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active 802.1x sessions are closed.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

```
Accounting message %s for session %s failed to receive Accounting Response.
```

When the stop message is not sent successfully, this message appears:

```
00:09:55: %RADIUS-4-RADIUS_DEAD: RADIUS server 172.20.246.201:1645,1646 is not responding.
```

Note You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.

Beginning in privileged EXEC mode, follow these steps to configure 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **aaa accounting dot1x default start-stop group radius**
4. **aaa accounting system default start-stop group radius**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/3	Specifies the port to be configured, and enter interface configuration mode.

	Command or Action	Purpose
Step 3	aaa accounting dot1x default start-stop group radius Example: <pre>Device(config-if)# aaa accounting dot1x default start-stop group radius</pre>	Enables 802.1x accounting using the list of all RADIUS servers.
Step 4	aaa accounting system default start-stop group radius Example: <pre>Device(config-if)# aaa accounting system default start-stop group radius</pre>	(Optional) Enables system accounting (using the list of all RADIUS servers) and generates system accounting reload event messages when the switch reloads.
Step 5	end Example: <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 6	show running-config Example: <pre>Device# show running-config</pre>	Verifies your entries.
Step 7	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring a Guest VLAN

When you configure a guest VLAN, clients that are not 802.1x-capable are put into the guest VLAN when the server does not receive a response to its EAP request/identity frame. Clients that are 802.1x-capable but that fail authentication are not granted network access. The switch supports guest VLANs in single-host or multiple-hosts mode.

Beginning in privileged EXEC mode, follow these steps to configure a guest VLAN. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. Use one of the following:
 - **switchport mode access**
 - **switchport mode private-vlan host**

4. **authentication event no-response action authorize vlan** *vlan-id*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 2/0/2	Specifies the port to be configured, and enter interface configuration mode.
Step 3	Use one of the following: <ul style="list-style-type: none"> • switchport mode access • switchport mode private-vlan host Example: Device(config-if)# switchport mode private-vlan host	<ul style="list-style-type: none"> • Sets the port to access mode. • Configures the Layer 2 port as a private-VLAN host port.
Step 4	authentication event no-response action authorize vlan <i>vlan-id</i> Example: Device(config-if)# authentication event no-response action authorize vlan 2	Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN.
Step 5	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring a Restricted VLAN

When you configure a restricted VLAN on a switch stack or a switch, clients that are IEEE 802.1x-compliant are moved into the restricted VLAN when the authentication server does not receive a valid username and password. The switch supports restricted VLANs only in single-host mode.

Beginning in privileged EXEC mode, follow these steps to configure a restricted VLAN. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. Use one of the following:
 - **switchport mode access**
 - **switchport mode private-vlan host**
4. **authentication port-control auto**
5. **authentication event fail action authorize vlan** *vlan-id*
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 2/0/2	Specifies the port to be configured, and enter interface configuration mode.
Step 3	Use one of the following: <ul style="list-style-type: none"> • switchport mode access • switchport mode private-vlan host Example: Device(config-if)# switchport mode access	<ul style="list-style-type: none"> • Sets the port to access mode. • Configures the Layer 2 port as a private-VLAN host port.
Step 4	authentication port-control auto Example: Device(config-if)# authentication port-control auto	Enables 802.1x authentication on the port.
Step 5	authentication event fail action authorize vlan <i>vlan-id</i> Example: Device(config-if)# authentication event fail action authorize vlan 2	Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.

	Command or Action	Purpose
Step 6	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring Number of Authentication Attempts on a Restricted VLAN

You can configure the maximum number of authentication attempts allowed before a user is assigned to the restricted VLAN by using the **authentication event retry** *retry count* interface configuration command. The range of allowable authentication attempts is 1 to 3. The default is 3 attempts.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of allowed authentication attempts. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. Use one of the following:
 - **switchport mode access**
 - **switchport mode private-vlan host**
4. **authentication port-control auto**
5. **authentication event fail action authorize vlan** *vlan-id*
6. **authentication event retry** *retry count*
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 2/0/3	Specifies the port to be configured, and enter interface configuration mode.
Step 3	Use one of the following: <ul style="list-style-type: none"> • switchport mode access • switchport mode private-vlan host Example:	<ul style="list-style-type: none"> • Sets the port to access mode. • Configures the Layer 2 port as a private-VLAN host port.

	Command or Action	Purpose
	OR Device (config-if) # switchport mode access	
Step 4	authentication port-control auto Example: Device (config-if) # authentication port-control auto	Enables 802.1x authentication on the port.
Step 5	authentication event fail action authorize vlan <i>vlan-id</i> Example: Device (config-if) # authentication event fail action authorize vlan 8	Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.
Step 6	authentication event retry <i>retry count</i> Example: Device (config-if) # authentication event retry 2	Specifies a number of authentication attempts to allow before a port moves to the restricted VLAN. The range is 1 to 3, and the default is 3.
Step 7	end Example: Device (config-if) # end	Returns to privileged EXEC mode.

Configuring 802.1x Inaccessible Authentication Bypass with Critical Voice VLAN

Beginning in privileged EXEC mode, follow these steps to configure critical voice VLAN on a port and enable the inaccessible authentication bypass feature.

SUMMARY STEPS

1. **configure terminal**
2. **aaa new-model**
3. **radius-server dead-criteria {time *seconds* } [*tries number*]**
4. **radius-server deadtime *minutes***
5. **radius-server host ip-address *address* [*acct-port udp-port*] [*auth-port udp-port*] [*testusername name*] [*idle-time time*] [*ignore-acct-port*] [*ignore auth-port*] [*key string*]**
6. **dot1x critical {eapol | recovery delay *milliseconds*}**
7. **interface *interface-id***

8. **authentication event server dead action** {authorize | reinitialize} **vlan** *vlan-id*
9. **switchport voice vlan** *vlan-id*
10. **authentication event server dead action authorize voice**
11. **show authentication interface** *interface-id*
12. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	aaa new-model Example: Device(config)# aaa new-model	Enables AAA.
Step 3	radius-server dead-criteria {time <i>seconds</i> } [<i>tries number</i>] Example: Device(config)# radius-server dead-criteria time 20 tries 10	Sets the conditions that determine when a RADIUS server is considered un-available or down (dead). <ul style="list-style-type: none"> • time— 1 to 120 seconds. The switch dynamically determines a default <i>seconds</i> value between 10 and 60. • number—1 to 100 tries. The switch dynamically determines a default <i>triesnumber</i> between 10 and 100.
Step 4	radius-server deadtime <i>minutes</i> Example: Device(config)# radius-server deadtime 60	(Optional) Sets the number of minutes during which a RADIUS server is not sent requests. The range is from 0 to 1440 minutes (24 hours). The default is 0 minutes.
Step 5	radius-server host ip-address <i>address</i> [<i>acct-port udp-port</i>] [<i>auth-port udp-port</i>] [<i>testusername name</i>] [<i>idle-time time</i>] [<i>ignore-acct-port</i>] [<i>ignore auth-port</i>] [<i>key string</i>] Example: Device(config)# radius-server host 10.0.0.10 acct-port 1550 auth-port 1560 test username user1 idle-time 30 key abc1234	(Optional) Configure the RADIUS server parameters by using these keywords: <ul style="list-style-type: none"> • acct-port <i>udp-port</i>—Specify the UDP port for the RADIUS accounting server. The range for the UDP port number is from 0 to 65536. The default is 1646. • auth-port <i>udp-port</i>—Specify the UDP port for the RADIUS authentication server. The range for the UDP port number is from 0 to 65536. The default is 1645.

	Command or Action	Purpose
		<p>Note You should configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.</p> <ul style="list-style-type: none"> • test username <i>name</i>—Enable automated testing of the RADIUS server status, and specify the username to be used. • idle-time <i>time</i>—Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes. The default is 60 minutes (1 hour). • ignore-acct-port—Disable testing on the RADIUS-server accounting port. • ignore-auth-port—Disable testing on the RADIUS-server authentication port. • For key <i>string</i>, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server. <p>Note Always configure the key as the last item in the radius-server host command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.</p> <p>You can also configure the authentication and encryption key by using the radius-server key {<i>0string</i> <i>7string</i> <i>string</i>} global configuration command.</p>
Step 6	<p>dot1x critical {<i>eapol</i> recovery delay <i>milliseconds</i>}</p> <p>Example:</p> <pre>Device(config)# dot1x critical eapol (config)# dot1x critical recovery delay 2000</pre>	<p>(Optional) Configure the parameters for inaccessible authentication bypass:</p> <ul style="list-style-type: none"> • eapol—Specify that the switch sends an EAPOL-Success message when the switch successfully authenticates the critical port. • recovery delay <i>milliseconds</i>—Set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The range is from 1 to 10000 milliseconds. The default is 1000

	Command or Action	Purpose
		milliseconds (a port can be re-initialized every second).
Step 7	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/1	Specify the port to be configured, and enter interface configuration mode.
Step 8	authentication event server dead action { authorize reinitialize } vlan <i>vlan-id</i>] Example: Device(config-if)# authentication event server dead action reinitialicze vlan 20	Use these keywords to move hosts on the port if the RADIUS server is unreachable: <ul style="list-style-type: none"> • authorize—Move any new hosts trying to authenticate to the user-specified critical VLAN. • reinitialize—Move all authorized hosts on the port to the user-specified critical VLAN.
Step 9	switchport voice vlan <i>vlan-id</i> Example: Device(config-if)# switchport voice vlan	Specifies the voice VLAN for the port. The voice VLAN cannot be the same as the critical data VLAN configured in Step 6.
Step 10	authentication event server dead action authorize voice Example: Device(config-if)# authentication event server dead action authorize voice	Configures critical voice VLAN to move data traffic on the port to the voice VLAN if the RADIUS server is unreachable.
Step 11	show authentication interface <i>interface-id</i> Example: Device(config-if)# do show authentication interface gigabit 1/0/1	(Optional) Verify your entries.
Step 12	copy running-config startup-config Example: Device(config-if)# do copy running-config startup-config	(Optional) Verify your entries.

Example

To return to the RADIUS server default settings, use the **no radius-server dead-criteria**, the **no radius-server deadtime**, and the **no radius-server host** global configuration commands. To disable

inaccessible authentication bypass, use the **no authentication event server dead action** interface configuration command. To disable critical voice VLAN, use the **no authentication event server dead action authorize voice** interface configuration command.

Example of Configuring Inaccessible Authentication Bypass

This example shows how to configure the inaccessible authentication bypass feature:

```
Device(config)# radius-server dead-criteria time 30 tries 20
Device(config)# radius-server deadtime 60
Device(config)# radius-server host 10.0.0.10 acct-port 1550 auth-port 1560 test username
user1 idle-time 30 key abc1234
Device(config)# dot1x critical eapol
Device(config)# dot1x critical recovery delay 2000
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# dot1x critical
Device(config-if)# dot1x critical recovery action reinitialize
Device(config-if)# dot1x critical vlan 20
Device(config-if)# end
```

Configuring 802.1x Authentication with WoL

Beginning in privileged EXEC mode, follow these steps to enable 802.1x authentication with WoL. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication control-direction** {both | in}
4. **end**
5. **show authentication sessions interface** *interface-id*
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet2/0/3	Specifies the port to be configured, and enter interface configuration mode.

	Command or Action	Purpose
Step 3	authentication control-direction {both in} Example: <pre>Device(config-if)# authentication control-direction both</pre>	Enables 802.1x authentication with WoL on the port, and use these keywords to configure the port as bidirectional or unidirectional. <ul style="list-style-type: none"> • both—Sets the port as bidirectional. The port cannot receive packets from or send packets to the host. By default, the port is bidirectional. • in—Sets the port as unidirectional. The port can send packets to the host but cannot receive packets from the host.
Step 4	end Example: <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 5	show authentication sessions interface <i>interface-id</i> Example: <pre>Device# show authentication sessions interface gigabitethernet2/0/3</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring MAC Authentication Bypass

Beginning in privileged EXEC mode, follow these steps to enable MAC authentication bypass. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **authentication port-control auto**
4. **mab [eap]**
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface interface-id Example: Device(config)# <code>interface gigabitethernet 2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	authentication port-control auto Example: Device(config-if)# <code>authentication port-control auto</code>	Enables 802.1x authentication on the port.
Step 4	mab [eap] Example: Device(config-if)# <code>mab</code>	Enables MAC authentication bypass. (Optional) Use the eap keyword to configure the switch to use EAP for authorization.
Step 5	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

Formatting a MAC Authentication Bypass Username and Password

Use the optional **mab request format** command to format the MAB username and password in a style accepted by the authentication server. The username and password are usually the MAC address of the client. Some authentication server configurations require the password to be different from the username.

Beginning in privileged EXEC mode, follow these steps to format MAC authentication bypass username and passwords.

SUMMARY STEPS

1. `configure terminal`
2. `mab request format attribute 1 groupsize {1 | 2 | 4 | 12} [separator {- | : | .}] {lowercase | uppercase}`
3. `mab request format attribute2 {0 | 7} text`
4. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	mab request format attribute 1 groupsize {1 2 4 12} [separator {- : .} {lowercase uppercase}] Example: <pre>Device(config)# mab request format attribute 1 groupsize 12</pre>	<p>Specifies the format of the MAC address in the User-Name attribute of MAB-generated Access-Request packets.</p> <p>1—Sets the username format of the 12 hex digits of the MAC address.</p> <p>group size—The number of hex nibbles to concatenate before insertion of a separator. A valid groupsize must be either 1, 2, 4, or 12.</p> <p>separator—The character that separates the hex nibbles according to group size. A valid separator must be either a hyphen, colon, or period. No separator is used for a group size of 12.</p> <p>{lowercase uppercase}—Specifies if nonnumeric hex nibbles should be in lowercase or uppercase.</p>
Step 3	mab request format attribute2 {0 7} text Example: <pre>Device(config)# mab request format attribute 2 7 A02f44E18B12</pre>	<p>2—Specifies a custom (nondefault) value for the User-Password attribute in MAB-generated Access-Request packets.</p> <p>0—Specifies a cleartext password to follow.</p> <p>7—Specifies an encrypted password to follow.</p> <p>text—Specifies the password to be used in the User-Password attribute.</p> <p>Note When you send configuration information in e-mail, remove type 7 password information. The show tech-support command removes this information from its output by default.</p>
Step 4	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuring 802.1x User Distribution

Beginning in privileged EXEC mode, follow these steps to configure a VLAN group and to map a VLAN to it:

SUMMARY STEPS

1. **configure terminal**
2. **vlan group** *vlan-group-name* **vlan-list** *vlan-list*
3. **end**
4. **no vlan group** *vlan-group-name* **vlan-list** *vlan-list*

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	vlan group <i>vlan-group-name</i> vlan-list <i>vlan-list</i> Example: Device(config)# vlan group eng-dept vlan-list 10	Configures a VLAN group, and maps a single VLAN or a range of VLANs to it.
Step 3	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 4	no vlan group <i>vlan-group-name</i> vlan-list <i>vlan-list</i> Example: Device(config)# no vlan group eng-dept vlan-list 10	Clears the VLAN group configuration or elements of the VLAN group configuration.

Example of Configuring VLAN Groups

This example shows how to configure the VLAN groups, to map the VLANs to the groups, to and verify the VLAN group configurations and mapping to the specified VLANs:

```
Device(config)# vlan group eng-dept vlan-list 10

Device(config)# show vlan group group-name eng-dept
Group Name                Vlans Mapped
-----                -
eng-dept                    10

Device(config)# show dot1x vlan-group all
Group Name                Vlans Mapped
-----                -
eng-dept                    10
```

```
hr-dept                20
```

This example shows how to add a VLAN to an existing VLAN group and to verify that the VLAN was added:

```
Device(config)# vlan group eng-dept vlan-list 30
Device(config)# show vlan group eng-dept
Group Name          Vlans Mapped
-----
eng-dept            10,30
```

This example shows how to remove a VLAN from a VLAN group:

```
Device# no vlan group eng-dept vlan-list 10
```

This example shows that when all the VLANs are cleared from a VLAN group, the VLAN group is cleared:

```
Device(config)# no vlan group eng-dept vlan-list 30
Vlan 30 is successfully cleared from vlan group eng-dept.
Device(config)# show vlan group group-name eng-dept
```

This example shows how to clear all the VLAN groups:

```
Device(config)# no vlan group eng-dept vlan-list all
Device(config)# show vlan-group all
```

For more information about these commands, see the *Cisco IOS Security Command Reference*.

Configuring NAC Layer 2 802.1x Validation

You can configure NAC Layer 2 802.1x validation, which is also referred to as 802.1x authentication with a RADIUS server.

Beginning in privileged EXEC mode, follow these steps to configure NAC Layer 2 802.1x validation. The procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **switchport mode access**
4. **authentication event no-response action authorize vlan** *vlan-id*
5. **authentication periodic**
6. **authentication timer reauthenticate**
7. **end**
8. **show authentication sessions interface** *interface-id*
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet2/0/3</code>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	switchport mode access Example: Device(config-if)# <code>switchport mode access</code>	Sets the port to access mode only if you configured the RADIUS server.
Step 4	authentication event no-response action authorize vlan <i>vlan-id</i> Example: Device(config-if)# <code>authentication event no-response action authorize vlan 8</code>	Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN, or a voice VLAN as an 802.1x guest VLAN.
Step 5	authentication periodic Example: Device(config-if)# <code>authentication periodic</code>	Enables periodic re-authentication of the client, which is disabled by default.
Step 6	authentication timer reauthenticate Example: Device(config-if)# <code>authentication timer reauthenticate</code>	Sets re-authentication attempt for the client (set to one hour). This command affects the behavior of the switch only if periodic re-authentication is enabled.
Step 7	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
Step 8	show authentication sessions interface <i>interface-id</i> Example:	Verifies your entries.

	Command or Action	Purpose
	Device# <code>show authentication sessions interface gigabitethernet2/0/3</code>	
Step 9	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring Limiting Login for Users

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login default local`
5. `aaa authentication rejected n in m ban x`
6. `end`
7. `show aaa local user blocked`
8. `clear aaa local user blocked username username`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	aaa new-model Example: Device(config)# <code>aaa new-model</code>	Enables the authentication, authorization, and accounting (AAA) access control model.
Step 4	aaa authentication login default local Example: Device(config)# <code>aaa authentication login default local</code>	Sets the authentication, authorization, and accounting (AAA) authentication by using the default authentication methods.

	Command or Action	Purpose
Step 5	aaa authentication rejected <i>n</i> in <i>m</i> ban <i>x</i> Example: <pre>Device(config)# aaa authentication rejected 3 in 20 ban 300</pre>	Configures the time period for which an user is blocked, if the user fails to successfully login within the specified time and login attempts. <ul style="list-style-type: none"> • <i>n</i>—Specifies the number of times a user can try to login. • <i>m</i>—Specifies the number of seconds within which an user can try to login. • <i>x</i>—Specifies the time period an user is banned if the user fails to successfully login.
Step 6	end Example: <pre>Device(config)# end</pre>	Exits global configuration mode and returns to privileged EXEC mode.
Step 7	show aaa local user blocked Example: <pre>Device# show aaa local user blocked</pre>	Displays the list of local users who were blocked.
Step 8	clear aaa local user blocked username <i>username</i> Example: <pre>Device# clear aaa local user blocked username user1</pre>	Clears the information about the blocked local user.

Example

The following is sample output from the **show aaa local user blocked** command:

```
Device# show aaa local user blocked

Local-user          State
-----
user1               Watched (till 11:34:42 IST Feb 5 2015)
```

Configuring an Authenticator Switch with NEAT

Configuring this feature requires that one switch outside a wiring closet is configured as a supplicant and is connected to an authenticator switch.

Note

- The authenticator switch interface configuration must be restored to access mode by explicitly flapping it if a line card is removed and inserted in the chassis when CISP or NEAT session is active.
- The *cisco-av-pairs* must be configured as *device-traffic-class=switch* on the ISE, which sets the interface as a trunk after the supplicant is successfully authenticated.

Beginning in privileged EXEC mode, follow these steps to configure a switch as an authenticator:

SUMMARY STEPS

1. **configure terminal**
2. **cisp enable**
3. **interface *interface-id***
4. **switchport mode access**
5. **authentication port-control auto**
6. **dot1x pae authenticator**
7. **spanning-tree portfast**
8. **end**
9. **show running-config interface *interface-id***
10. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	cisp enable Example: Device(config)# cisp enable	Enables CISP.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 2/0/1	Specifies the port to be configured, and enter interface configuration mode.
Step 4	switchport mode access Example: Device(config-if)# switchport mode access	Sets the port mode to access .
Step 5	authentication port-control auto Example: Device(config-if)# authentication port-control auto	Sets the port-authentication mode to auto .

	Command or Action	Purpose
Step 6	dot1x pae authenticator Example: <pre>Device(config-if)# dot1x pae authenticator</pre>	Configures the interface as a port access entity (PAE) authenticator.
Step 7	spanning-tree portfast Example: <pre>Device(config-if)# spanning-tree portfast trunk</pre>	Enables Port Fast on an access port connected to a single workstation or server..
Step 8	end Example: <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 9	show running-config interface <i>interface-id</i> Example: <pre>Device# show running-config interface gigabitethernet 2/0/1</pre>	Verifies your configuration.
Step 10	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file. Note Saving changes to the configuration file will mean that the authenticator interface will continue to be in trunk mode after reload. If you want the authenticator interface to remain as an access port, do not save your changes to the configuration file.

Configuring a Supplicant Switch with NEAT

Beginning in privileged EXEC mode, follow these steps to configure a switch as a supplicant:

SUMMARY STEPS

1. **configure terminal**
2. **cisp enable**
3. **dot1x credentials *profile***
4. **username *suppswitch***
5. **password *password***
6. **dot1x supplicant force-multicast**
7. **interface *interface-id***
8. **switchport trunk encapsulation dot1q**

9. **switchport mode trunk**
10. **dot1x pae supplicant**
11. **dot1x credentials** *profile-name*
12. **end**
13. **show running-config interface** *interface-id*
14. **copy running-config startup-config**
15. Configuring NEAT with Auto Smartports Macros

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	cisp enable Example: Device(config)# cisp enable	Enables CISP.
Step 3	dot1x credentials <i>profile</i> Example: Device(config)# dot1x credentials test	Creates 802.1x credentials profile. This must be attached to the port that is configured as supplicant.
Step 4	username <i>suppswitch</i> Example: Device(config)# username suppswitch	Creates a username.
Step 5	password <i>password</i> Example: Device(config)# password myswitch	Creates a password for the new username.
Step 6	dot1x supplicant force-multicast Example: Device(config)# dot1x supplicant force-multicast	Forces the switch to send only multicast EAPOL packets when it receives either unicast or multicast packets. This also allows NEAT to work on the supplicant switch in all host modes.
Step 7	interface <i>interface-id</i> Example:	Specifies the port to be configured, and enter interface configuration mode.

	Command or Action	Purpose
	Device(config)# <code>interface gigabitethernet1/0/1</code>	
Step 8	switchport trunk encapsulation dot1q Example: Device(config-if)# <code>switchport trunk encapsulation dot1q</code>	Sets the port to trunk mode.
Step 9	switchport mode trunk Example: Device(config-if)# <code>switchport mode trunk</code>	Configures the interface as a VLAN trunk port.
Step 10	dot1x pae supplicant Example: Device(config-if)# <code>dot1x pae supplicant</code>	Configures the interface as a port access entity (PAE) supplicant.
Step 11	dot1x credentials <i>profile-name</i> Example: Device(config-if)# <code>dot1x credentials test</code>	Attaches the 802.1x credentials profile to the interface.
Step 12	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
Step 13	show running-config interface <i>interface-id</i> Example: Device# <code>show running-config interface gigabitethernet1/0/1</code>	Verifies your configuration.
Step 14	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.
Step 15	Configuring NEAT with Auto Smartports Macros	You can also use an Auto Smartports user-defined macro instead of the switch VSA to configure the authenticator

	Command or Action	Purpose
		switch. For more information, see the <i>Auto Smartports Configuration Guide</i> for this release.

Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs

Note You must configure a downloadable ACL on the ACS before downloading it to the switch.

After authentication on the port, you can use the **show ip access-list** privileged EXEC command to display the downloaded ACLs on the port.

Configuring Downloadable ACLs

The policies take effect after client authentication and the client IP address addition to the IP device tracking table. The switch then applies the downloadable ACL to the port.

Beginning in privileged EXEC mode:

SUMMARY STEPS

1. **configure terminal**
2. **ip device tracking**
3. **aaa new-model**
4. **aaa authorization network default local group radius**
5. **radius-server vsa send authentication**
6. **interface *interface-id***
7. **ip access-group *acl-id* in**
8. **show running-config interface *interface-id***
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ip device tracking Example: Device(config)# <code>ip device tracking</code>	Sets the ip device tracking table.

	Command or Action	Purpose
Step 3	aaa new-model Example: <pre>Device(config)# aaa new-model</pre>	Enables AAA.
Step 4	aaa authorization network default local group radius Example: <pre>Device(config)# aaa authorization network default local group radius</pre>	Sets the authorization method to local. To remove the authorization method, use the no aaa authorization network default local group radius command.
Step 5	radius-server vsa send authentication Example: <pre>Device(config)# radius-server vsa send authentication</pre>	Configures the radius vsa send authentication.
Step 6	interface <i>interface-id</i> Example: <pre>Device(config)# interface gigabitethernet2/0/4</pre>	Specifies the port to be configured, and enter interface configuration mode.
Step 7	ip access-group <i>acl-id</i> in Example: <pre>Device(config-if)# ip access-group default_acl in</pre>	Configures the default ACL on the port in the input direction. Note The <i>acl-id</i> is an access list name or number.
Step 8	show running-config interface <i>interface-id</i> Example: <pre>Device(config-if)# show running-config interface gigabitethernet2/0/4</pre>	Verifies your configuration.
Step 9	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring a Downloadable Policy

Beginning in privileged EXEC mode:

SUMMARY STEPS

1. **configure terminal**
2. **access-list** *access-list-number* { **deny** | **permit** } { **hostname** | **any** | **host** } **log**
3. **interface** *interface-id*
4. **ip access-group** *acl-id* **in**
5. **exit**
6. **aaa new-model**
7. **aaa authorization network default group radius**
8. **ip device tracking**
9. **ip device tracking probe** [**count** | **interval** | **use-svi**]
10. **radius-server vsa send authentication**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	access-list <i>access-list-number</i> { deny permit } { hostname any host } log Example: Device(config)# access-list 1 deny any log	Defines the default port ACL. The access-list-number is a decimal number from 1 to 99 or 1300 to 1999. Enter deny or permit to specify whether to deny or permit access if conditions are matched. The source is the source address of the network or host that sends a packet, such as this: <ul style="list-style-type: none"> • hostname: The 32-bit quantity in dotted-decimal format. • any: The keyword any as an abbreviation for source and source-wildcard value of 0.0.0.0 255.255.255.255. You do not need to enter a source-wildcard value. • host: The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0. (Optional) Applies the source-wildcard wildcard bits to the source. (Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.
Step 3	interface <i>interface-id</i> Example:	Enters interface configuration mode.

	Command or Action	Purpose
	Device(config)# <code>interface gigabitethernet2/0/2</code>	
Step 4	<p>ip access-group <i>acl-id</i> in</p> <p>Example:</p> <pre>Device(config-if)# ip access-group default_acl in</pre>	<p>Configures the default ACL on the port in the input direction.</p> <p>Note The <i>acl-id</i> is an access list name or number.</p>
Step 5	<p>exit</p> <p>Example:</p> <pre>Device(config-if)# exit</pre>	Returns to global configuration mode.
Step 6	<p>aaa new-model</p> <p>Example:</p> <pre>Device(config)# aaa new-model</pre>	Enables AAA.
Step 7	<p>aaa authorization network default group radius</p> <p>Example:</p> <pre>Device(config)# aaa authorization network default group radius</pre>	Sets the authorization method to local. To remove the authorization method, use the no aaa authorization network default group radius command.
Step 8	<p>ip device tracking</p> <p>Example:</p> <pre>Device(config)# ip device tracking</pre>	<p>Enables the IP device tracking table.</p> <p>To disable the IP device tracking table, use the no ip device tracking global configuration commands.</p>
Step 9	<p>ip device tracking probe [count interval use-svi]</p> <p>Example:</p> <pre>Device(config)# ip device tracking probe count</pre>	<p>(Optional) Configures the IP device tracking table:</p> <ul style="list-style-type: none"> • count <i>count</i>—Sets the number of times that the switch sends the ARP probe. The range is from 1 to 5. The default is 3. • interval <i>interval</i>—Sets the number of seconds that the switch waits for a response before resending the ARP probe. The range is from 30 to 300 seconds. The default is 30 seconds. • use-svi—Uses the switch virtual interface (SVI) IP address as source of ARP probes.
Step 10	<p>radius-server vsa send authentication</p> <p>Example:</p>	Configures the network access server to recognize and use vendor-specific attributes.

	Command or Action	Purpose
	Device (config) # radius-server vsa send authentication	Note The downloadable ACL must be operational.
Step 11	end Example: Device (config) # end	Returns to privileged EXEC mode.

Configuring VLAN ID-based MAC Authentication

Beginning in privileged EXEC mode, follow these steps:

SUMMARY STEPS

1. **configure terminal**
2. **mab request format attribute 32 vlan access-vlan**
3. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	mab request format attribute 32 vlan access-vlan Example: Device (config) # mab request format attribute 32 vlan access-vlan	Enables VLAN ID-based MAC authentication.
Step 3	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Flexible Authentication Ordering

The examples used in the instructions below changes the order of Flexible Authentication Ordering so that MAB is attempted before IEEE 802.1X authentication (dot1x). MAB is configured as the first authentication method, so MAB will have priority over all other authentication methods.

Beginning in privileged EXEC mode, follow these steps:

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **switchport mode access**
4. **authentication order** [dot1x | mab] | {webauth}
5. **authentication priority** [dot1x | mab] | {webauth}
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/1	Specifies the port to be configured, and enter interface configuration mode.
Step 3	switchport mode access Example: Device(config-if)# switchport mode access	Sets the port to access mode only if you previously configured the RADIUS server.
Step 4	authentication order [dot1x mab] {webauth} Example: Device(config-if)# authentication order mab dot1x	(Optional) Sets the order of authentication methods used on a port.
Step 5	authentication priority [dot1x mab] {webauth} Example: Device(config-if)# authentication priority mab dot1x	(Optional) Adds an authentication method to the port-priority list.

	Command or Action	Purpose
Step 6	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring Open1x

Beginning in privileged EXEC mode, follow these steps to enable manual control of the port authorization state:

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **switchport mode access**
4. **authentication control-direction** {both | in}
5. **authentication fallback** *name*
6. **authentication host-mode** [multi-auth | multi-domain | multi-host | single-host]
7. **authentication open**
8. **authentication order** [dot1x | mab] | {webauth}
9. **authentication periodic**
10. **authentication port-control** {auto | force-authorized | force-un authorized}
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/1	Specifies the port to be configured, and enter interface configuration mode.
Step 3	switchport mode access Example: Device(config-if)# switchport mode access	Sets the port to access mode only if you configured the RADIUS server.

	Command or Action	Purpose
Step 4	authentication control-direction {both in} Example: <pre>Device(config-if) # authentication control-direction both</pre>	(Optional) Configures the port control as unidirectional or bidirectional.
Step 5	authentication fallback <i>name</i> Example: <pre>Device(config-if) # authentication fallback profile1</pre>	(Optional) Configures a port to use web authentication as a fallback method for clients that do not support 802.1x authentication.
Step 6	authentication host-mode [multi-auth multi-domain multi-host single-host] Example: <pre>Device(config-if) # authentication host-mode multi-auth</pre>	(Optional) Sets the authorization manager mode on a port.
Step 7	authentication open Example: <pre>Device(config-if) # authentication open</pre>	(Optional) Enables or disable open access on a port.
Step 8	authentication order [dot1x mab] {webauth} Example: <pre>Device(config-if) # authentication order dot1x webauth</pre>	(Optional) Sets the order of authentication methods used on a port.
Step 9	authentication periodic Example: <pre>Device(config-if) # authentication periodic</pre>	(Optional) Enables or disable reauthentication on a port.
Step 10	authentication port-control {auto force-authorized force-un authorized} Example: <pre>Device(config-if) # authentication port-control auto</pre>	(Optional) Enables manual control of the port authorization state.

	Command or Action	Purpose
Step 11	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Disabling 802.1x Authentication on the Port

You can disable 802.1x authentication on the port by using the **no dot1x pae** interface configuration command.

Beginning in privileged EXEC mode, follow these steps to disable 802.1x authentication on the port. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **switchport mode access**
4. **no dot1x pae authenticator**
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config) # interface gigabitethernet 2/0/1	Specifies the port to be configured, and enter interface configuration mode.
Step 3	switchport mode access Example: Device(config-if) # switchport mode access	(Optional) Sets the port to access mode only if you configured the RADIUS server.
Step 4	no dot1x pae authenticator Example: Device(config-if) # no dot1x pae authenticator	Disables 802.1x authentication on the port.

	Command or Action	Purpose
Step 5	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Resetting the 802.1x Authentication Configuration to the Default Values

Beginning in privileged EXEC mode, follow these steps to reset the 802.1x authentication configuration to the default values. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **dot1x default**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/2	Enters interface configuration mode, and specify the port to be configured.
Step 3	dot1x default Example: Device(config-if) # dot1x default	Resets the 802.1x parameters to the default values.
Step 4	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Monitoring 802.1x Statistics and Status

Table 147: Privileged EXEC show Commands

Command	Purpose
<code>show dot1x all statistics</code>	Displays 802.1x statistics for all ports
<code>show dot1x interface <i>interface-id</i> statistics</code>	Displays 802.1x statistics for a specific port
<code>show dot1x all [count details statistics summary]</code>	Displays the 802.1x administrative and operational status for a switch
<code>show dot1x interface <i>interface-id</i></code>	Displays the 802.1x administrative and operational status for a specific port

Table 148: Global Configuration Commands

Command	Purpose
<code>no dot1x logging verbose</code>	Filters verbose 802.1x authentication messages (beginning with Cisco IOS Release 12.2(55)SE)

For detailed information about the fields in these displays, see the command reference for this release.

Feature Information for 802.1x Port-Based Authentication

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.

Release	Feature Information
	Supports the use of same authorization methods on all the Catalyst switches in a network.
	Supports filtering verbose system messages from the authentication manager.

CHAPTER 75

Configuring Web-Based Authentication

The Web-Based Authentication feature, also known as web authentication proxy, authenticates end users on host systems that do not run the IEEE 802.1x supplicant.

- [Information About Web-Based Authentication, on page 1539](#)

Information About Web-Based Authentication

Web-Based Authentication Overview

Use the web-based authentication feature, known as web authentication proxy, to authenticate end users on host systems that do not run the IEEE 802.1x supplicant.

Note You can configure web-based authentication on Layer 2 and Layer 3 interfaces.

When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the users. The users enter their credentials, which the web-based authentication feature sends to the authentication, authorization, and accounting (AAA) server for authentication.

If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host, and the user is placed on a watch list for a waiting period.

Note HTTPS traffic interception for central web authentication redirect is not supported.

Note You should use global parameter-map (for method-type, custom, and redirect) only for using the same web authentication methods like consent, web consent, and webauth, for all the clients and SSIDs. This ensures that all the clients have the same web-authentication method.

If the requirement is to use Consent for one SSID and Web-authentication for another SSID, then you should use two named parameter-maps. You should configure Consent in first parameter-map and configure webauth in second parameter-map.

Note The traceback that you receive when webauth client tries to do authentication does not have any performance or behavioral impact. It happens rarely when the context for which FFM replied back to EPM for ACL application is already dequeued (possibly due to timer expiry) and the session becomes ‘unauthorized’.

Based on where the web pages are hosted, the local web authentication can be categorized as follows:

- *Internal*—The internal default HTML pages (Login, Success, Fail, and Expire) in the controller are used during the local web authentication.
- *Customized*—The customized web pages (Login, Success, Fail, and Expire) are downloaded onto the controller and used during the local web authentication.
- *External*—The customized web pages are hosted on the external web server instead of using the in-built or custom web pages.

Based on the various web authentication pages, the types of web authentication are as follows:

- *Webauth*—This is a basic web authentication. Herein, the controller presents a policy page with the user name and password. You need to enter the correct credentials to access the network.
- *Consent or web-passthrough*—Herein, the controller presents a policy page with the Accept or Deny buttons. You need to click the Accept button to access the network.
- *Webconsent*—This is a combination of webauth and consent web authentication types. Herein, the controller presents a policy page with Accept or Deny buttons along with user name or password. You need to enter the correct credentials and click the Accept button to access the network.

Device Roles

With web-based authentication, the devices in the network have these specific roles:

- *Client*—The device (workstation) that requests access to the LAN and the services and responds to requests from the switch. The workstation must be running an HTML browser with Java Script enabled.
- *Authentication server*—Authenticates the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and the switch services or that the client is denied.
- *Switch*—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.

Figure 114: Web-Based Authentication Device Roles

This figure shows the roles of these devices in a

Host Detection

The switch maintains an IP device tracking table to store information about detected hosts.

Note By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

For Layer 2 interfaces, web-based authentication detects IP hosts by using these mechanisms:

- ARP based trigger—ARP redirect ACL allows web-based authentication to detect hosts with a static IP address or a dynamic IP address.
- Dynamic ARP inspection
- DHCP snooping—Web-based authentication is notified when the switch creates a DHCP-binding entry for the host.

Session Creation

When web-based authentication detects a new host, it creates a session as follows:

- Reviews the exception list.
If the host IP is included in the exception list, the policy from the exception list entry is applied, and the session is established.
- Reviews for authorization bypass
If the host IP is not on the exception list, web-based authentication sends a nonresponsive-host (NRH) request to the server.
If the server response is access accepted, authorization is bypassed for this host. The session is established.
- Sets up the HTTP intercept ACL
If the server response to the NRH request is access rejected, the HTTP intercept ACL is activated, and the session waits for HTTP traffic from the host.

Authentication Process

When you enable web-based authentication, these events occur:

- The user initiates an HTTP session.
- The HTTP traffic is intercepted, and authorization is initiated. The switch sends the login page to the user. The user enters a username and password, and the switch sends the entries to the authentication server.
- If the authentication succeeds, the switch downloads and activates the user's access policy from the authentication server. The login success page is sent to the user.
- If the authentication fails, the switch sends the login fail page. The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page, and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.
- If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host. The login success page is sent to the user.
- The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or when the host does not send any traffic within the idle timeout on a Layer 3 interface.
- The feature applies the downloaded timeout or the locally configured session timeout.

Note Beginning with Cisco IOS XE Denali 16.1.1 and later, the default session timeout value for web-based authentication on WLC is 1800 seconds. The default session timeout value was infinite seconds, prior to Cisco IOS XE Denali 16.1.1.

- If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server. The terminate action is included in the response from the server.
- If the terminate action is default, the session is dismantled, and the applied policy is removed.

Using Authentication Proxy

The authentication proxy feature requires some user interaction on the client host. The table below describes the interaction of the authentication proxy with the client host.

Table 149: Authentication Proxy Interaction with the Client Host

Authentication Proxy Action with Client	Description
Triggering on HTTP connections	If a user is not currently authenticated at the firewall router, any HTTP connection initiated by the user triggers the authentication proxy. If the user is already authenticated, the authentication proxy is transparent to the user.
Logging in using the login page	Triggering the authentication proxy generates an HTML-based login page. The user must enter a username and password to be authenticated with the AAA server. The Authentication Proxy Login Page figure, in the How the Authentication Proxy Works module, illustrates the authentication proxy login page.

Authentication Proxy Action with Client	Description
Authenticating the user at the client	<p>Following the login attempt, the authentication proxy action can vary depending on whether JavaScript is enabled in the browser. If JavaScript is enabled, and authentication is successful, the authentication proxy displays a message indicating the status of the authentication as shown in the Authentication Proxy Login Status Message figure, in the How the Authentication Proxy Works module. After the authentication status is displayed, the proxy automatically completes the HTTP connection.</p> <p>If JavaScript is disabled, and authentication is successful, the authentication proxy generates a popup window with additional instructions for completing the connection. See the Authentication Proxy Login Status Message with JavaScript Disabled figure, in the Secure Authentication module.</p> <p>If authentication is unsuccessful in any case, the user must log in again from the login page.</p>

When to Use the Authentication Proxy

The following are some situations in which you can use the authentication proxy:

- You want to manage access privileges on an individual (per-user) basis using the services provided by the authentication servers instead of configuring access control based on host IP address or global access policies. Authenticating and authorizing users from any host IP address also allows network administrators to configure host IP addresses using DHCP.
- You want to authenticate and authorize local users before permitting access to intranet or Internet services.
- You want to authenticate and authorize remote users before permitting access to local services.
- You want to control access for specific extranet users. For example, you might want to authenticate and authorize the financial officer of a corporate partner with one set of access privileges while authorizing the technology officer for that same partner to use another set of access privileges.
- You want to use the authentication proxy in conjunction with VPN client software to validate users and to assign specific access privileges.
- You want to use the authentication proxy in conjunction with AAA accounting to generate “start” and “stop” accounting records that can be used for billing, security, or resource allocation purposes, thereby allowing users to track traffic from the authenticated hosts.

Applying Authentication Proxy

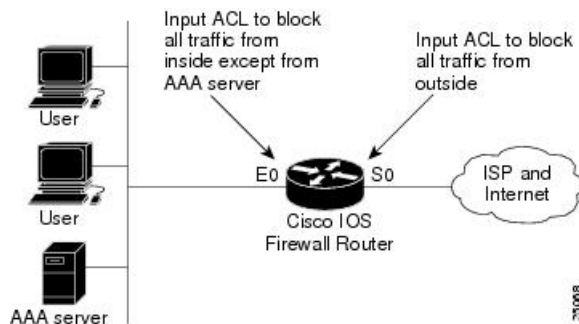

Apply the authentication proxy in the inbound direction at any interface on the router where you want per-user authentication and authorization. Applying the authentication proxy inbound at an interface causes it to intercept the initial connection request from an user, before that request is subjected to any other processing. If the user fails to gain authentication with the AAA server, the connection request is dropped.

How you apply the authentication proxy depends on your security policy. For example, you can block all traffic through an interface and enable the authentication proxy feature to require authentication and authorization for all user-initiated HTTP connections. Users are authorized for services only after successful authentication with the AAA server.

The authentication proxy feature also allows you to use standard access lists to specify a host or group of hosts whose initial HTTP traffic triggers the proxy.

The figure below shows the authentication proxy applied at the LAN interface with all network users required to be authenticated upon the initial connection (all traffic is blocked at each interface).

Figure 115: Applying the Authentication Proxy at the Local Interface

The figure below shows the authentication proxy applied at the dial-in interface with all network traffic blocked at each interface.

Figure 116: Applying the Authentication Proxy at an Outside Interface

Local Web Authentication Banner

With Web Authentication, you can create a default and customized web-browser banners that appears when you log in to a switch.

The banner appears on both the login page and the authentication-result pop-up pages. The default banner messages are as follows:

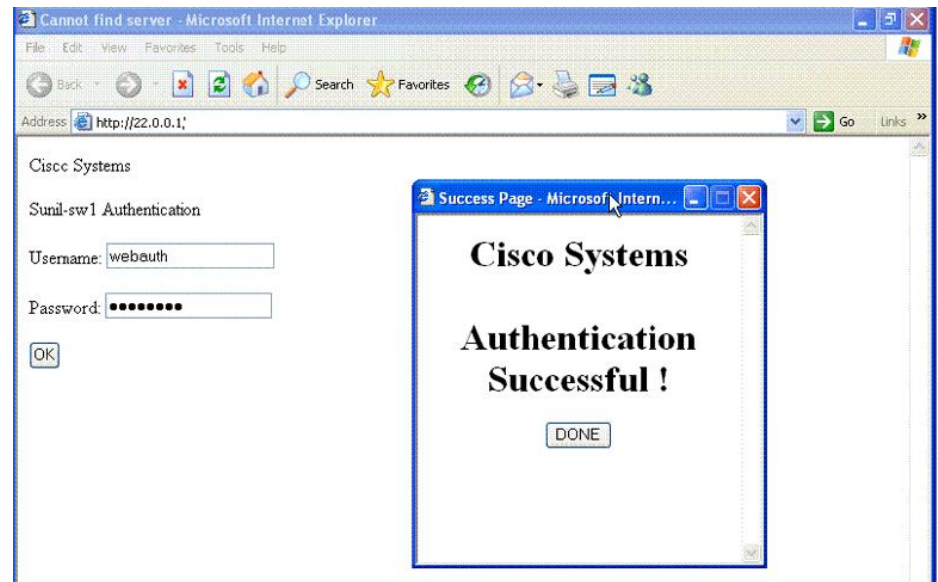

- *Authentication Successful*
- *Authentication Failed*
- *Authentication Expired*

The Local Web Authentication Banner can be configured in legacy and new-style (Session-aware) CLIs as follows:

- Legacy mode—Use the **ip admission auth-proxy-banner http** global configuration command.
- New-style mode—Use the **parameter-map type webauth global banner** global configuration command.

The default banner *Cisco Systems* and *Switch host-name Authentication* appear on the Login Page. *Cisco Systems* appears on the authentication result pop-up page.

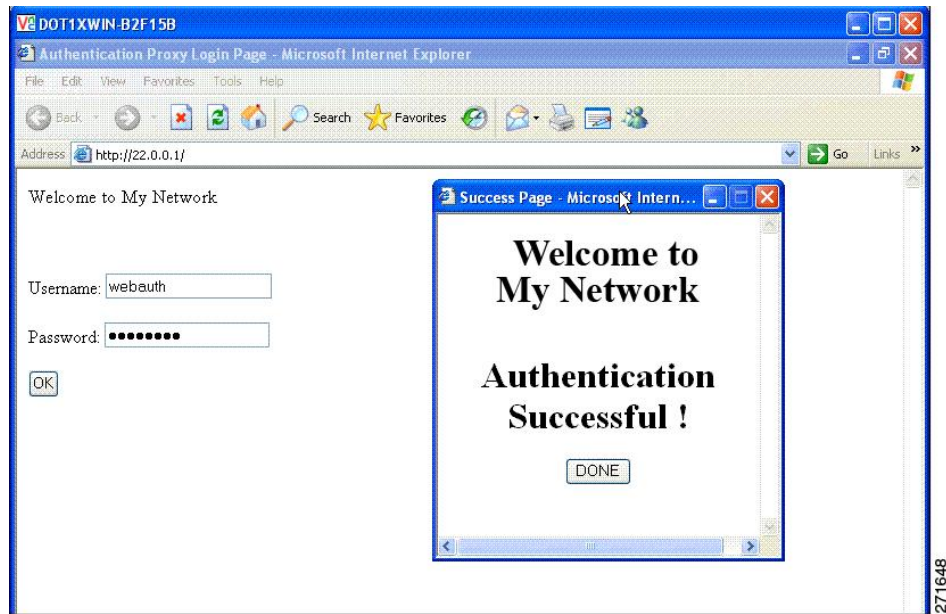

Figure 117: Authentication Successful Banner

The banner can be customized as follows:

- Add a message, such as switch, router, or company name to the banner:
 - Legacy mode—Use the **ip admission auth-proxy-banner http banner-text** global configuration command.
 - New-style mode—Use the **parameter-map type webauth global banner** global configuration command.
- Add a logo or text file to the banner:
 - Legacy mode—Use the **ip admission auth-proxy-banner http file-path** global configuration command.
 - New-style mode—Use the **parameter-map type webauth global banner** global configuration command.

Figure 118: Customized Web Banner

If you do not enable a banner, only the username and password dialog boxes appear in the web authentication login screen, and no banner appears when you log into the switch.

Figure 119: Login Screen With No Banner

Web Authentication Customizable Web Pages

During the web-based authentication process, the switch internal HTTP server hosts four HTML pages to deliver to an authenticating client. The server uses these pages to notify you of these four-authentication process states:

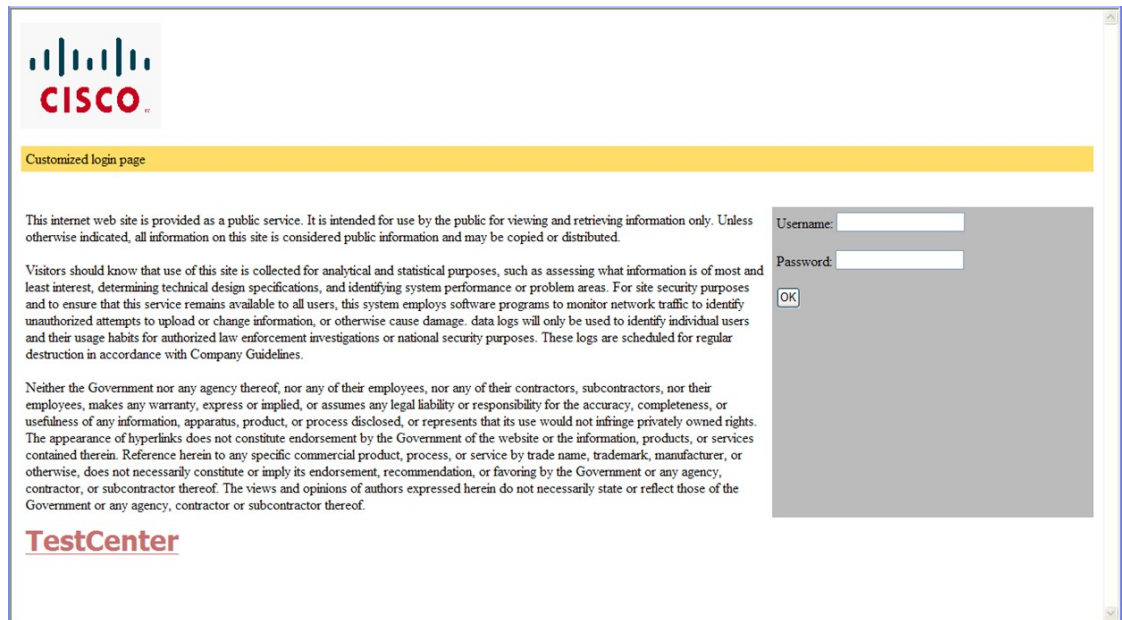

- Login—Your credentials are requested.
- Success—The login was successful.
- Fail—The login failed.
- Expire—The login session has expired because of excessive login failures.

Guidelines

- You can substitute your own HTML pages for the default internal HTML pages.
- You can use a logo or specify text in the *login*, *success*, *failure*, and *expire* web pages.
- On the banner page, you can specify text in the login page.
- The pages are in HTML.
- You must include an HTML redirect command in the success page to access a specific URL.
- The URL string must be a valid URL (for example, <http://www.cisco.com>). An incomplete URL might cause *page not found* or similar errors on a web browser.
- If you configure web pages for HTTP authentication, they must include the appropriate HTML commands (for example, to set the page time out, to set a hidden password, or to confirm that the same page is not submitted twice).
- The CLI command to redirect users to a specific URL is not available when the configured login form is enabled. The administrator should ensure that the redirection is configured in the web page.
- If the CLI command redirecting users to specific URL after authentication occurs is entered and then the command configuring web pages is entered, the CLI command redirecting users to a specific URL does not take effect.
- Configured web pages can be copied to the switch boot flash or flash.
- On stackable switches, configured pages can be accessed from the flash on the stack master or members.
- The login page can be on one flash, and the success and failure pages can be another flash (for example, the flash on the stack master or a member).
- You must configure all four pages.
- The banner page has no effect if it is configured with the web page.
- All of the logo files (image, flash, audio, video, and so on) that are stored in the system directory (for example, flash, disk0, or disk) and that must be displayed on the login page must use *web_auth_<filename>* as the file name.
- The configured authentication proxy feature supports both HTTP and SSL.

You can substitute your HTML pages for the default internal HTML pages. You can also specify a URL to which users are redirected after authentication occurs, which replaces the internal Success page.

Figure 120: Customizable Authentication Page

Authentication Proxy Web Page Guidelines

When configuring customized authentication proxy web pages, follow these guidelines:

- To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.
- The four custom HTML files must be present on the flash memory of the switch. The maximum size of each HTML file is 8 KB.
- Any images on the custom pages must be on an accessible HTTP server. Configure an intercept ACL within the admission rule.
- Any external link from a custom page requires configuration of an intercept ACL within the admission rule.
- To access a valid DNS server, any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule.
- If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.
- If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.
- To remove the specification of a custom file, use the **no** form of the command.

Because the custom login page is a public web form, consider these guidelines for the page:

- The login form must accept user entries for the username and password and must show them as **uname** and **pwd**.
- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.

Redirection URL for Successful Login Guidelines

When configuring a redirection URL for successful login, consider these guidelines:

- If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom-login success page.
- If the redirection URL feature is enabled, a configured auth-proxy-banner is not used
- To remove the specification of a redirection URL, use the **no** form of the command.
- If the redirection URL is required after the web-based authentication client is successfully authenticated, then the URL string must start with a valid URL (for example, http://) followed by the URL information. If only the URL is given without http://, then the redirection URL on successful authentication might cause page not found or similar errors on a web browser.

Web Authentication Redirection to Original URL Overview

The Web Authentication Redirection to Original URL feature enables networks to redirect guest users to the URL that they had originally requested. This feature is enabled by default and requires no configuration.

Guest networks are network connections provided by an enterprise to allow their guests to gain access to the Internet and to their own enterprise networks without compromising the security of the host enterprise. Guest users of an enterprise network can connect to the guest access network through either a wired Ethernet connection or a wireless connection.

Guest access uses a captive portal to gather all web requests made by guests and redirect these requests to one of the guest on-boarding web pages. When guests successfully complete the guest workflow, they are redirected to the page that they had originally requested.

The originally requested URL is passed as metadata along with the Cisco Identity Services Engine (ISE) guest access redirect URL. The Cisco ISE is a security policy management and control platform. It automates and simplifies access control and security compliance for wired, wireless, and VPN connectivity. The requested URL is added at the end of the Cisco ISE guest URL so that the device can send the redirect URL to the guest client. The Cisco ISE parses the URL and redirects the guest to the original URL after completing the on-boarding.

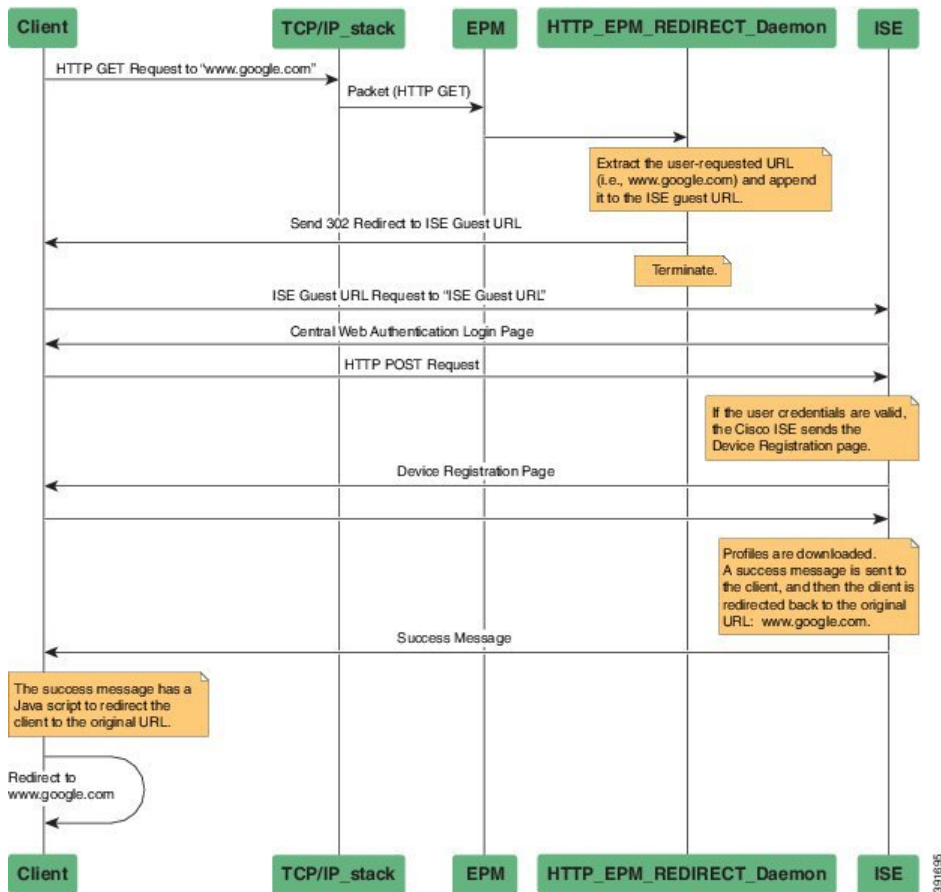

The following is an example of a redirect URL along with the original requested URL:

```
https://10.64.67.92:8443/guestportal/gateway?sessionId=0920269E0000000B0002426B&action=cwa&redirect_url=http://www.cisco.com/
```

In this example, the URL, `https://10.64.67.92:8443/guestportal/gateway?sessionId=0920269E0000000B0002426B&action=cwa` is the URL for the guest portal, “&” tells the browser that what follows is a list of name value pairs, and `redirect_url=http://www.cisco.com` identifies the URL that the user originally requested and to which the user is redirected after completing the guest workflow.

This illustration displays the packet flow that redirects a user to the originally requested URL:

Figure 121: Original URL Redirection Packet Flow

1. A user accesses a network for the first time and sends an HTTP request to access www.google.com. When the user first accesses the network, a MAC authentication bypass (MAB) is triggered and the MAC address is sent to the Cisco ISE.
2. The Cisco ISE returns a RADIUS access-accept message (even if the MAC address is not received) along with the redirect access control list (ACL), the ACL-WEBAUTH-REDIRECT message, and the guest web portal URL to the device.

The RADIUS message instructs the device to open a port that is restricted based on the configured port and the redirect ACLs, for regular network traffic.

3. When the user launches a web browser, the device intercepts the HTTP traffic and redirects the browser to the Cisco ISE central web authentication (CWA) guest web portal URL; the user-requested URL is extracted and appended to the Cisco ISE guest URL.
4. When the user is authenticated, the Cisco ISE sends the Device Registration page to the user. The user enters the required information, and the page is returned to the Cisco ISE. The Cisco ISE downloads user profiles and redirects the user to the originally requested URL: www.google.com.

Web-based Authentication Interactions with Other Features

802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.
- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.

If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:
 - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
 - EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
 - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.
- Before globally enabling 802.1x authentication on a switch by entering the **dot1x system-auth-control** global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.
- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

AAA Accounting with Authentication Proxy

Using the authentication proxy, you can generate “start” and “stop” accounting records with enough information to be used for billing and security auditing purposes. Thus, you can monitor the actions of authenticated hosts that use the authentication proxy service.

When an authentication proxy cache and associated dynamic access control lists (ACLs) are created, the authentication proxy will start to track the traffic from the authenticated host. Accounting saves data about this event in a data structure stored with the data of other users. If the accounting start option is enabled, you can generate an accounting record (a “start” record) at this time. Subsequent traffic from the authenticated host will be recorded when the dynamic ACL created by the authentication proxy receives the packets.

When an authentication proxy cache expires and is deleted, additional data, such as elapsed time, is added to the accounting information and a “stop” record is sent to the server. At this point, the information is deleted from the data structure.

The accounting records for the authentication proxy user session are related to the cache and the dynamic ACL usage.

ACLs

If you configure a VLAN ACL or a Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.

For Layer 2 web-based authentication, it is more secure, though not required, to configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL. The Policy ACL is applied to the session even if there is no ACL configured on the port.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.

Context-Based Access Control

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port VLAN.

EtherChannel

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

Gateway IP

You cannot configure Gateway IP (GWIP) on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

LAN Port IP

You can configure LAN port IP (LPIP) and Layer 2 web-based authentication on the same port. The host is authenticated by using web-based authentication first, followed by LPIP posture validation. The LPIP host policy overrides the web-based authentication host policy.

If the web-based authentication idle timer expires, the NAC policy is removed. The host is authenticated, and posture is validated again.

Port Security

You can configure web-based authentication and port security on the same port. Web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through the port.

Default Web-Based Authentication Configuration

The following table shows the default web-based authentication configuration.

Table 150: Default Web-based Authentication Configuration

Feature	Default Setting
AAA	Disabled
RADIUS server <ul style="list-style-type: none"> • IP address • UDP authentication port • Key 	<ul style="list-style-type: none"> • None specified • 1645 • None specified
Default value of inactivity timeout	3600 seconds
Inactivity timeout	Enabled

Web-Based Authentication Configuration Guidelines and Restrictions

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.
- External web authentication, where the switch redirects a client to a particular host or web server for displaying login message, is not supported.
- You must configure the default ACL on the interface before configuring web-based authentication. Configure a port ACL for a Layer 2 interface or a Cisco IOS ACL for a Layer 3 interface.
- You cannot authenticate hosts on Layer 2 interfaces with static ARP cache assignment. These hosts are not detected by the web-based authentication feature because they do not send ARP messages.
- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
- You must configure at least one IP address to run the switch HTTP server. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.
- Hosts that are more than one hop away might experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. This occurs because the ARP and DHCP updates might not be sent after a Layer 2 (STP) topology change.
- Web-based authentication does not support VLAN assignment as a downloadable-host policy.
- Web-based authentication supports IPv6 in Session-aware policy mode. IPv6 Web-authentication requires at least one IPv6 address configured on the switch and IPv6 Snooping configured on the switchport.
- Web-based authentication and Network Edge Access Topology (NEAT) are mutually exclusive. You cannot use web-based authentication when NEAT is enabled on an interface, and you cannot use NEAT when web-based authentication is running on an interface.

- Web-based authentication NRH (Non-Responsive Host) is not supported for voice devices.
- Only the Password Authentication Protocol (PAP) is supported for web-based RADIUS authentication on controllers. The Challenge Handshake Authentication Protocol (CHAP) is not supported for web-based RADIUS authentication on controllers.
- Identify the following RADIUS security server settings that will be used while configuring switch-to-RADIUS-server communication:
 - Host name
 - Host IP address
 - Host name and specific UDP port numbers
 - IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, that enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

- When you configure the RADIUS server parameters:
 - Specify the **key string** on a separate command line.
 - For **key string**, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
 - When you specify the **key string**, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
 - You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using with the **radius-server host** global configuration command. If you want to configure these options on a per-server basis, use the **radius-server timeout**, **radius-server transmit**, and the **radius-server key** global configuration commands.

Note You need to configure some settings on the RADIUS server, including: the switch IP address, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). For more information, see the RADIUS server documentation.

How to Configure Web-Based Authentication

Configuring the Authentication Rule and Interfaces

Follow these steps to configure the authentication rule and interfaces:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission name *name* proxy http**
4. **interface *type slot/port***
5. **ip access-group *name***
6. **ip admission name**
7. **exit**
8. **ip device tracking**
9. **end**
10. **show ip admission status**
11. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip admission name <i>name</i> proxy http Example: Device(config)# ip admission name webauth1 proxy http	Configures an authentication rule for web-based authorization.
Step 4	interface <i>type slot/port</i> Example: Device(config)# interface gigabitethernet 1/0/1	Enters interface configuration mode and specifies the ingress Layer 2 or Layer 3 interface to be enabled for web-based authentication. <i>type</i> can be fastethernet, gigabit ethernet, or tengigabitethernet.
Step 5	ip access-group <i>name</i> Example: Device(config-if)# ip access-group webauthag	Applies the default ACL.

	Command or Action	Purpose
Step 6	ip admission name Example: Device(config)# ip admission name	Configures an authentication rule for web-based authorization for the interface.
Step 7	exit Example: Device(config-if)# exit	Returns to configuration mode.
Step 8	ip device tracking Example: Device(config)# ip device tracking	Enables the IP device tracking table.
Step 9	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 10	show ip admission status Example: Device# show ip admission status	Displays the configuration.
Step 11	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring AAA Authentication

SUMMARY STEPS

1. **aaa new-model**
2. **aaa authentication login default group {tacacs+ | radius}**
3. **aaa authorization auth-proxy default group {tacacs+ | radius}**
4. **tacacs-server host {hostname | ip_address}**
5. **tacacs-server key {key-data}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	aaa new-model Example: <pre>Device(config)# aaa new-model</pre>	Enables AAA functionality.
Step 2	aaa authentication login default group {tacacs+ radius} Example: <pre>Device(config)# aaa authentication login default group tacacs+</pre>	Defines the list of authentication methods at login. named_authentication_list refers to any name that is not greater than 31 characters. AAA_group_name refers to the server group name. You need to define the server-group server_name at the beginning itself.
Step 3	aaa authorization auth-proxy default group {tacacs+ radius} Example: <pre>Device(config)# aaa authorization auth-proxy default group tacacs+</pre>	Creates an authorization method list for web-based authorization.
Step 4	tacacs-server host {hostname ip_address} Example: <pre>Device(config)# tacacs-server host 10.1.1.1</pre>	Specifies an AAA server.
Step 5	tacacs-server key {key-data} Example: <pre>Device(config)# tacacs-server key</pre>	Configures the authorization and encryption key used between the switch and the TACACS server.

Configuring Switch-to-RADIUS-Server Communication

Follow these steps to configure the RADIUS server parameters:

SUMMARY STEPS

1. enable
2. configure terminal
3. ip radius source-interface vlan *vlan interface number*
4. radius-server host {hostname | ip-address} test username *username*
5. radius-server key *string*
6. radius-server dead-criteria tries *num-tries*

7. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip radius source-interface vlan <i>vlan interface number</i> Example: Device(config)# ip radius source-interface vlan 80	Specifies that the RADIUS packets have the IP address of the indicated interface.
Step 4	radius-server host {<i>hostname</i> <i>ip-address</i>} test username <i>username</i> Example: Device(config)# radius-server host 172.120.39.46 test username user1	Specifies the host name or IP address of the remote RADIUS server. The test username <i>username</i> option enables automated testing of the RADIUS server connection. The specified <i>username</i> does not need to be a valid user name. The key option specifies an authentication and encryption key to use between the switch and the RADIUS server. To use multiple RADIUS servers, reenter this command for each server.
Step 5	radius-server key <i>string</i> Example: Device(config)# radius-server key rad123	Configures the authorization and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.
Step 6	radius-server dead-criteria tries <i>num-tries</i> Example: Device(config)# radius-server dead-criteria tries 30	Specifies the number of unanswered sent messages to a RADIUS server before considering the server to be inactive. The range of <i>num-tries</i> is 1 to 100.
Step 7	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# end	

Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the Device. You can enable the server for either HTTP or HTTPS.

Note The Apple psuedo-browser will not open if you configure only the **ip http secure-server** command. You should also configure the **ip http server** command.

Follow these steps to enable the server for either HTTP or HTTPS:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **ip http secure-server**
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip http server Example: Device(config)# ip http server	Enables the HTTP server. The web-based authentication feature uses the HTTP server to communicate with the hosts for user authentication.
Step 4	ip http secure-server Example:	Enables HTTPS. You can configure custom authentication proxy web pages or specify a redirection URL for successful login.

	Command or Action	Purpose
	Device(config)# ip http secure-server	Note To ensure secure authentication when you enter the ip http secure-server command, the login page is always in HTTPS (secure HTTP) even if the user sends an HTTP request.
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.

Customizing the Authentication Proxy Web Pages

You can configure web authentication to display four substitute HTML pages to the user in place of the Device default HTML pages during web-based authentication.

Follow these steps to specify the use of your custom authentication proxy web pages:

Before you begin

Store your custom HTML files on the Device flash memory.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission proxy http login page file** *device:login-filename*
4. **ip admission proxy http success page file** *device:success-filename*
5. **ip admission proxy http failure page file** *device:fail-filename*
6. **ip admission proxy http login expired page file** *device:expired-filename*
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	ip admission proxy http login page file <i>device:login-filename</i> Example: <pre>Device(config)# ip admission proxy http login page file disk1:login.htm</pre>	Specifies the location in the Device memory file system of the custom HTML file to use in place of the default login page. The <i>device:</i> is flash memory.
Step 4	ip admission proxy http success page file <i>device:success-filename</i> Example: <pre>Device(config)# ip admission proxy http success page file disk1:success.htm</pre>	Specifies the location of the custom HTML file to use in place of the default login success page.
Step 5	ip admission proxy http failure page file <i>device:fail-filename</i> Example: <pre>Device(config)# ip admission proxy http fail page file disk1:fail.htm</pre>	Specifies the location of the custom HTML file to use in place of the default login failure page.
Step 6	ip admission proxy http login expired page file <i>device:expired-filename</i> Example: <pre>Device(config)# ip admission proxy http login expired page file disk1:expired.htm</pre>	Specifies the location of the custom HTML file to use in place of the default login expired page.
Step 7	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Specifying a Redirection URL for Successful Login

Follow these steps to specify a URL to which the user is redirected after authentication, effectively replacing the internal Success HTML page:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission proxy http success redirect *url-string***

4. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip admission proxy http success redirect <i>url-string</i> Example: Device(config)# ip admission proxy http success redirect www.example.com	Specifies a URL for redirection of the user in place of the default login success page.
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.

Configuring the Web-Based Authentication Parameters

Follow these steps to configure the maximum number of failed login attempts before the client is placed in a watch list for a waiting period:

SUMMARY STEPS

1. enable
2. configure terminal
3. ip admission max-login-attempts *number*
4. end
5. show running-config
6. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Device> <code>enable</code>	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	ip admission max-login-attempts <i>number</i> Example: Device(config)# <code>ip admission max-login-attempts 10</code>	Sets the maximum number of failed login attempts. The range is 1 to 2147483647 attempts. The default is 5.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring a Web Authentication Local Banner

For the equivalent Session Aware Networking configuration example for this feature, see the section "Configuring a Parameter Map for Web-Based Authentication" in the chapter, "Configuring Identity Control Policies" of the book, "*Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*."

Beginning in privileged EXEC mode, follow these steps to configure a local banner on a switch that has web authentication configured.

SUMMARY STEPS

1. `configure terminal`

2. **ip auth-proxy auth-proxy-banner http** [*banner-text* | *file-path*]
3. **end**
4. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	ip auth-proxy auth-proxy-banner http [<i>banner-text</i> <i>file-path</i>] Example: Device(config)# aaa ip auth-proxy auth-proxy-banner C My Switch C	Enables the local banner. (Optional) Create a custom banner by entering <i>C banner-text C</i> , where <i>C</i> is a delimiting character or a file-path indicates a file (for example, a logo or text file) that appears in the banner.
Step 3	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 4	copy running-config startup-config Example: Device(config)# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Web-Based Authentication without SVI

You configure the web-based authentication without SVI feature to redirect the HTML login page to the client without creating an IP address in the routing table. These steps are optional.

You configure the web-based authentication without SVI feature to redirect the HTML login page to the client. This is done without creating an IP address in the SVI interface which then would be applied to the WebAuth enabled interface. These steps are optional.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type webauth global**
4. **l2-webauth-enabled**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	parameter-map type webauth global Example: Device (config)# parameter-map type webauth global	Creates a parameter map and enters parameter-map webauth configuration mode. The specific configuration commands supported for a global parameter map defined with the global keyword differ from the commands supported for a named parameter map defined with the parameter-map-name argument.
Step 4	l2-webauth-enabled Example: Device (config-params-parameter-map)# l2-webauth-enabled	Enables the web-based authentication without SVI feature
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 6	show running-config Example: Device# show running-config	Verifies your entries.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Web-Based Authentication with VRF Aware

You configure the web-based authentication with VRF aware to redirect the HTML login page to the client. These steps are optional.

SUMMARY STEPS

1. enable
2. configure terminal
3. parameter-map type webauth global
4. webauth-vrf-aware
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	parameter-map type webauth global Example: Device (config)# parameter-map type webauth global	Creates a parameter map and enters parameter-map webauth configuration mode. The specific configuration commands supported for a global parameter map defined with the global keyword differ from the commands supported for a named parameter map defined with the parameter-map-name argument.
Step 4	webauth-vrf-aware Example: Device (config-params-parameter-map)# webauth-vrf-aware	Enables the web-based authentication VRF aware feature on SVI.
Step 5	end Example: Device (config)# end	Returns to privileged EXEC mode.
Step 6	show running-config Example: Device# show running-config	Verifies your entries.

	Command or Action	Purpose
Step 7	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Removing Web-Based Authentication Cache Entries

Follow these steps to remove web-based authentication cache entries:

SUMMARY STEPS

1. `enable`
2. `clear ip auth-proxy cache {* | host ip address}`
3. `clear ip admission cache {* | host ip address}`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	clear ip auth-proxy cache {* host ip address} Example: Device# <code>clear ip auth-proxy cache 192.168.4.5</code>	Delete authentication proxy entries. Use an asterisk to delete all cache entries. Enter a specific IP address to delete the entry for a single host.
Step 3	clear ip admission cache {* host ip address} Example: Device# <code>clear ip admission cache 192.168.4.5</code>	Delete authentication proxy entries. Use an asterisk to delete all cache entries. Enter a specific IP address to delete the entry for a single host.

Monitoring Web-Based Authentication Status

Use the commands in this topic to display the web-based authentication settings for all interfaces or for specific ports.

Table 151: Privileged EXEC show Commands

Command	Purpose
show authentication sessions method webauth	Displays the web-based authentication settings for all interfaces for fastethernet, gigabitethernet, or tengigabitethernet
show wireless client mac-address <i>a.a.a</i> detail	Displays the session specific wireless information and wireless states.
show authentication sessions interface <i>type slot/port</i>[details]	Displays the web-based authentication settings for the specified interface for fastethernet, gigabitethernet, or tengigabitethernet. In Session Aware Networking mode, use the show access-session interface command.

Displaying Web-Based Authentication Status

Perform this task to display the web-based authentication settings for all interfaces or for specific ports:

SUMMARY STEPS

1. **show authentication sessions {*interfacetype/ slot*}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	show authentication sessions {<i>interfacetype/ slot</i>} Example: This example shows how to view only the global web-based authentication status: <pre>Switch# show authentication sessions</pre> Example: This example shows how to view the web-based authentication settings for gigabit interface 3/27: <pre>Switch# show authentication sessions interface gigabitethernet 3/27</pre>	Displays the web-based authentication settings. type = fastethernet, gigabitethernet, or tengigabitethernet (Optional) Use the interface keyword to display the web-based authentication settings for a specific interface

Monitoring HTTP Authentication Proxy

Perform the following task to troubleshoot your HTTP authentication proxy configuration:

SUMMARY STEPS

1. **enable**
2. **debug ip auth-proxy detailed**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	debug ip auth-proxy detailed Example: Device# debug ip auth-proxy detailed	Displays the authentication proxy configuration information on the device.

Verifying HTTPS Authentication Proxy

To verify your HTTPS authentication proxy configuration, perform the following optional steps:

SUMMARY STEPS

1. enable
2. show ip auth-proxy configuration
3. show ip auth-proxy cache
4. show ip http server secure status

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ip auth-proxy configuration Example: Device# show ip auth-proxy configuration	Displays the current authentication proxy configuration.
Step 3	show ip auth-proxy cache Example: Device# show ip auth-proxy cache	Displays the list of user authentication entries. The authentication proxy cache lists the host IP address, the source port number, the timeout value for the authentication proxy, and the state of the connection. If the authentication proxy state is HTTP_ESTAB, the user authentication was successful.
Step 4	show ip http server secure status Example:	Displays HTTPS status.

Command or Action	Purpose
Device# show ip http server secure status	

Configuration Examples for Web-Based Authentication

Example: Configuring the Authentication Rule and Interfaces

This example shows how to enable web-based authentication on Fast Ethernet port 5/1 :

```
Device(config)# ip admission name webauth1 proxy http
Device(config)# interface fastethernet 5/1
Device(config-if)# ip admission webauth1
Device(config-if)# exit
Device(config)# ip device tracking
```

This example shows how to verify the configuration:

```
Device# show ip admission status
IP admission status:
  Enabled interfaces           0
  Total sessions              0
  Init sessions               0      Max init sessions allowed    100
    Limit reached             0      Hi watermark                 0
  TCP half-open connections   0      Hi watermark                 0
  TCP new connections         0      Hi watermark                 0
  TCP half-open + new         0      Hi watermark                 0
  HTTPD1 Contexts            0      Hi watermark                 0

Parameter Map: Global
  Custom Pages
    Custom pages not configured
  Banner
    Banner not configured
```

Example: AAA Configuration

```
aaa new-model
aaa authentication login default group tacacs group radius
! Set up the aaa new model to use the authentication proxy.
aaa authorization auth-proxy default group tacacs group radius
! Define the AAA servers used by the router.
aaa accounting auth-proxy default start-stop group tacacs+
! Set up authentication proxy with accounting.
tacacs-server host 172.31.54.143
tacacs-server key cisco
radius-server host 172.31.54.143
radius-server key cisco
```

Example: HTTP Server Configuration

```
! Enable the HTTP server on the router.
```

```

ip http server
! Set the HTTP server authentication method to AAA.
ip http authentication aaa
! Define standard access list 61 to deny any host.
access-list 61 deny any
! Use ACL 61 to deny connections from any host to the HTTP server.
ip http access-class 61

```

Example: Customizing the Authentication Proxy Web Pages

This example shows how to configure custom authentication proxy web pages:

```

Device(config)# ip admission proxy http login page file flash:login.htm
Device(config)# ip admission proxy http success page file flash:success.htm
Device(config)# ip admission proxy http fail page file flash:fail.htm
Device(config)# ip admission proxy http login expired page flash:expired.htm

```

This example shows how to verify the configuration of a custom authentication proxy web pages:

```

Device# show ip admission configuration
Authentication proxy webpage
Login page : flash:login.htm
Success page : flash:success.htm
Fail Page : flash:fail.htm
Login expired Page : flash:expired.htm

Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication global init state time is 2 minutes
Authentication Proxy Session ratelimit is 100
Authentication Proxy Watch-list is disabled
Authentication Proxy Auditing is disabled
Max Login attempts per user is 5

```

Example: Specifying a Redirection URL for Successful Login

Configuring redirection URL for successful login

```

Device(config)# ip admission proxy http success redirect www.cisco.com

```

Verifying redirection URL for Successful Login

This example shows how to configure a redirection URL for successful login:

```

Device# show ip admission status
Enabled interfaces          0
Total sessions             0
Init sessions              0   Max init sessions allowed   100
  Limit reached            0   Hi watermark                0
TCP half-open connections  0   Hi watermark                0
TCP new connections        0   Hi watermark                0
TCP half-open + new       0   Hi watermark                0
HTTPD1 Contexts           0   Hi watermark                0

```

```

Parameter Map: Global
  Custom Pages
    Custom pages not configured
  Banner
    Banner not configured

```

Feature Information for Web-Based Authentication

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature is introduced.

CHAPTER 76

Auto Identity

- [Auto Identity, on page 1573](#)

Auto Identity

The Auto Identity feature provides a set of built-in policies at global configuration and interface configuration modes. This feature is available only in Class-Based Policy Language (CPL) control policy-equivalent new-style mode. To convert all the relevant authentication commands to their CPL control policy-equivalents, use the **authentication convert-to new-style** command.

This module describes the feature and explains how to configure it.

Information About Auto Identity

Auto Identity Overview

The Cisco Identity-Based Networking Services (IBNS) solution provides a policy and identity-based framework in which edge devices can deliver flexible and scalable services to subscribers. IBNS allows the concurrent operation of IEEE 802.1x (dot1x), MAC authentication bypass (MAB), and web authentication methods, making it possible to invoke multiple authentication methods in parallel, on a single subscriber session. These authentication methods, dot1x, authentication, authorization, and accounting (AAA), and RADIUS are available in global configuration and interface configuration modes.

The Auto Identity feature uses the Cisco Common Classification Policy Language-based configuration that significantly reduces the number of commands used to configure both authentication methods and interface-level commands. The Auto Identity feature provides a set of built-in policies that are based on policy maps, class maps, parameter maps, and interface templates.

In global configuration mode, the **source template AI_GLOBAL_CONFIG_TEMPLATE** command enables the Auto Identity feature. In interface configuration mode, configure the **AI_MONITOR_MODE**, **AI_LOW_IMPACT_MODE**, or **AI_CLOSED_MODE** interface templates to enable the feature on interfaces.

You can configure multiple templates; however, you must bind multiple templates together using the **merge** command. If you do not bind the templates, the last configured template is used. While binding templates, if the same command is repeated in two templates with different arguments, the last configured command is used.

Note You can also enable user-defined templates that are configured using the **template name** command in global configuration mode .

Use the **show template interface** or **show template global** commands to display information about built-in templates. Built-in templates can be edited. Built-in template information is displayed in the output of the **show running-config** command, if the template is edited. If you delete an edited built-in template, the built-in template reverts to the default and is not deleted from the configuration. However, if you delete a user-defined template, it is deleted from the configuration.

Note Before you delete a template, ensure that it is not attached to a device.

Auto Identity Global Template

To enable the global template, configure the **source template template-name** command.

Note You must configure the RADIUS server commands, because these are not automatically configured when the global template is enabled.

The following example shows how to enable the global template:

```
Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE
Switch(config)# radius server ISE
Switch(config-radius-server)# address ipv4 172.20.254.4 auth-port 1645 acct-port 1646
Switch(config-radius-server)# key cisco
Switch(config-radius-server)# end
```

The AI_GLOBAL_CONFIG_TEMPLATE automatically configures the following commands:

```
dot1x system-auth-control
aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include
```

Auto Identity Interface Templates

The following interface templates are available in the Auto Identity feature:

- AI_MONITOR_MODE—Passively monitors sessions that have authentication in open mode.
- AI_LOW_IMPACT_MODE—Similar to monitor mode, but with a configured static policy such as a port access control list (PACL).

- **AI_CLOSED_MODE**—Secure mode in which data traffic is not allowed into the network, until authentication is complete. This mode is the default.

Note Multi-auth host mode is not supported with the LAN Lite license.

The following commands are inbuilt in the **AI_MONITOR_MODE**:

```
switchport mode access
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

The following commands are inbuilt in the **AI_LOW_IMPACT_MODE**:

```
switchport mode access
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
ip access-group AI_PORT_ACL in
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

The following commands are inbuilt in the **AI_CLOSED_MODE**:

```
switchport mode access
access-session closed
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

Auto Identity Built-in Policies

The following five built-in policies are available in the Auto Identity feature:

- **AI_DOT1X_MAB_AUTH**—Enables flexible authentication with dot1x, and then MAC Address Bypass (MAB).
- **AI_DOT1X_MAB_POLICIES**—Enables flexible authentication with dot1x, and then MAB. Applies critical VLAN in case the Authentication, Authorization, and Accounting (AAA) server is not reachable.
- **AI_DOT1X_MAB_WEBAUTH**—Enables flexible authentication with dot1x, MAB, and then web authentication.
- **AI_NEXTGEN_AUTHBYBASS**—Skips authentication if an IP phone device is detected. Enables the **device classifier** command in global configuration mode and the **voice-vlan** command in interface configuration mode to detect the device. This is a reference policy map, and users can copy the contents of this policy map to other policy maps.
- **AI_STANDALONE_WEBAUTH**—Defines standalone web authentication.

Auto Identity Class Maps Templates

The following built-in class maps are supported by the Auto Identity feature:

- **AI_NRH**—Specifies that the nonresponsive host (NRH) authentication method is enabled.
- **AI_WEBAUTH_METHOD**—Specifies that the web authentication method is enabled.
- **AI_WEBAUTH_FAILED**—Specifies that the web authentication method failed to authenticate.
- **AI_WEBAUTH_NO_RESP**—Specifies that the web authentication client failed to respond.
- **AI_DOT1X_METHOD**—Specifies that the dot1x method is enabled.
- **AI_DOT1X_FAILED**—Specifies that the dot1x method failed to authenticate.
- **AI_DOT1X_NO_RESP**—Specifies that the dot1x client failed to respond.
- **AI_DOT1X_TIMEOUT**—Specifies that the dot1x client stopped responding after the initial acknowledge (ACK) request.
- **AI_MAB_METHOD**—Specifies that the MAC Authentication Bypass (MAB) method is enabled.
- **AI_MAB_FAILED**—Specifies that the MAB method failed to authenticate.
- **AI_AAA_SVR_DOWN_AUTHD_HOST**—Specifies that the Authentication, Authorization, and Accounting (AAA) server is down, and the client is in authorized state.
- **AI_AAA_SVR_DOWN_UNAUTHD_HOST**—Specifies that the AAA server is down, and the client is in authorized state.
- **AI_IN_CRITICAL_AUTH**—Specifies that the critical authentication service template is applied.
- **AI_NOT_IN_CRITICAL_AUTH**—Specifies that the critical authentication service template is not applied.
- **AI_METHOD_DOT1X_DEVICE_PHONE**—Specifies that the method is dot1x and the device type is IP phone.
- **AI_DEVICE_PHONE**—Specifies that the device type is IP phone.

Auto Identity Parameter Maps

The following built-in parameter map templates are supported by the Auto Identity feature:

- **AI_NRH_PMAP**—Starts nonresponsive host (NRH) authentication.
- **AI_WEBAUTH_PMAP**—Starts web authentication.

Auto Identity Service Templates

Service templates are available inside built-in policy maps. The following built-in service templates are supported by the Auto Identity feature:

- **AI_INACTIVE_TIMER**—Template to start the inactivity timer.
- **AI_CRITICAL_ACL**—Dummy template; users can configure this template as per their requirements.

How to Configure Auto Identity

Configuring Auto Identity Globally

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **sourcetemplate** {**AI_GLOBAL_CONFIG_TEMPLATE** | *template-name*}
4. **aaa new-model**
5. **radius server** *name*

6. **address ipv4** {*hostname* | *ipv4-address*}
7. **key ipv4** {**0** *string* | **7** *string*} *string*
8. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 3	sourcetemplate { AI_GLOBAL_CONFIG_TEMPLATE <i>template-name</i> } Example: Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE	Configures an auto identity template. <ul style="list-style-type: none"> • AI_GLOBAL_CONFIG_TEMPLATE is a built-in template. • <i>template-name</i> is a user-defined template.
Step 4	aaa new-model Example: Switch(config)# aaa new-model	Enables the authentication, authorization, and accounting (AAA) access control mode.
Step 5	radius server <i>name</i> Example: Switch(config)# radius server ISE	Specifies the name for the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.
Step 6	address ipv4 { <i>hostname</i> <i>ipv4-address</i> } Example: Switch(config-radius-server)# address ipv4 10.1.1.1	Configures the IPv4 address for the RADIUS server accounting and authentication parameters. <p>Note This command is not a part of the global template, and you must configure it.</p>
Step 7	key ipv4 { 0 <i>string</i> 7 <i>string</i> } <i>string</i> Example: Switch(config-radius-server)# key ipv4 cisco	Specifies the authentication and encryption key for all RADIUS communications between the device and the RADIUS server. <p>Note This command is not a part of the global template, and you must configure it.</p>
Step 8	end Example: Switch(config-radius-server)# end	Exits RADIUS server configuration mode and returns to privileged EXEC mode.

Configuring Auto Identity at an Interface Level

When you configure two interface templates, you must configure the **merge** keyword. If you do not, the last configured template is used.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **source template** {**AI_CLOSED_MODE** | **AI_LOW_IMPACT_MODE** | **AI_MONITOR_MODE** | *template-name*} [**merge**]
5. **source template** {**AI_CLOSED_MODE** | **AI_LOW_IMPACT_MODE** | **AI_MONITOR_MODE** | *template-name*} [**merge**]
6. **switchport access vlan** *vlan-id*
7. **switchport voice vlan** *vlan-id*
8. Repeat Steps 4, 6, and 7 on all interfaces that must have the Auto Identity feature configured.
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: Switch(config)# interface gigabitethernet 1/0/1	Configures an interface and enters interface configuration mode.
Step 4	source template { AI_CLOSED_MODE AI_LOW_IMPACT_MODE AI_MONITOR_MODE <i>template-name</i> } [merge] Example: Switch(config-if)# source template AI_CLOSED_MODE	Configures a source template for the interface.
Step 5	source template { AI_CLOSED_MODE AI_LOW_IMPACT_MODE AI_MONITOR_MODE <i>template-name</i> } [merge] Example: Switch(config-if)# source template AI_MONITOR_MODE merge	(Optional) Configures a source template for the interface and merges this template with the previously configured template <ul style="list-style-type: none">• When you configure two templates, if you do not configure the merge keyword, the last configured template is used.

	Command or Action	Purpose
Step 6	switchport access vlan <i>vlan-id</i> Example: Switch(config-if)# switchport access vlan 100	Sets the VLAN when the interface is in access mode.
Step 7	switchport voice vlan <i>vlan-id</i> Example: Switch(config-if)# switchport voice vlan 101	Configures a voice VLAN on a multiple VLAN access port.
Step 8	Repeat Steps 4, 6, and 7 on all interfaces that must have the Auto Identity feature configured.	—
Step 9	end Example: Switch(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for Auto Identity

Example: Configuring Auto Identity Globally

```
Switch> enable
Switch# configure terminal
Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE
Switch(config)# aaa new-model
Switch(config)# radius server ISE
Switch(config-radius-server)# address ipv4 10.1.1.1
Switch(config-radius-server)# key ipv4 cisco
Switch(config-radius-server)# end
```

Example: Configuring Auto Identity at an Interface Level

```
Switch> enable
Switch# configure terminal
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# source template AI_CLOSED_MODE
Switch(config-if)# source template AI_MONITOR_MODE merge
Switch(config-if)# switchport access vlan 100
Switch(config-if)# switchport voice vlan 101
Switch(config-if)# end
```

Verifying Auto Identity

Step 1 enable
Example:

```
Switch> enable
```

Enables Privileged EXEC mode.

- Enter your password if prompted.

Step 2 show template interface source built-in all

Displays all the configured built-in interface templates.

Example:

```
Switch# show template interface source built-in all

Template Name       : AI_CLOSED_MODE
Modified           : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session closed
access-session port-control auto
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
!
Template Name       : AI_LOW_IMPACT_MODE
Modified           : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session port-control auto
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
ip access-group AI_PORT_ACL in
!
Template Name       : AI_MONITOR_MODE
Modified           : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session port-control auto
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
!
```

Step 3 show template global source built-in all

Displays all the configured global built-in templates.

Example:

```
Switch# show template global source built-in all

Global Template Name       : AI_GLOBAL_CONFIG_TEMPLATE
Modified                   : No
Global Template Definition : global
dot1x system-auth-control
aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
```

```
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include
!
```

Step 4 **show derived-config | include aaa | radius-server**

Displays the composite results of all the configuration commands that apply to an interface, including commands that come from sources such as static templates, dynamic templates, dialer interfaces, and authentication, authorization, and accounting (AAA) per-user attributes.

Example:

```
Switch# show derived-config | inc aaa | radius-server

aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
aaa session-id common
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include
radius-server host 10.25.18.42 key cisco
```

Step 5 **show derived-config | interface type-number**

Displays the composite results of all configuration for an interface.

Example:

```
Switch# show derived-config | interface gigabitethernet2/0/6

Building configuration...

Derived configuration : 267 bytes
!
interface GigabitEthernet2/0/6
 switchport mode access
 switchport voice vlan 100
 access-session closed
 access-session port-control auto
 mab
 dot1x pae authenticator
 spanning-tree portfast edge
 service-policy type control subscriber AI_DOT1X_MAB_POLICIES
end
```

Step 6 **show access-session | interface interface-type-number details**

Displays the policies applied to an interface.

Example:

```
Switch# show access-session interface gigabitethernet2/0/6 details

Interface: GigabitEthernet2/0/6
```

```

MAC Address: c025.5c43.be00
IPv6 Address: Unknown
IPv4 Address: Unknown
  User-Name: CP-9971-SEPC0255C43BE00
  Device-type: Cisco-IP-Phone-9971
    Status: Authorized
    Domain: VOICE
  Oper host mode: multi-auth
  Oper control dir: both
  Session timeout: N/A
Common Session ID: 091A1C5B00000017002003EE
Acct Session ID: 0x00000005
  Handle: 0xBB00000B
  Current Policy: AI_DOT1X_MAB_POLICIES

```

Local Policies:

Server Policies:

```

  Vlan Group: Vlan: 100
Security Policy: Must Not Secure
Security Status: Link Unsecure

```

Method status list:

```

Method      State
dot1x      Authc Success

```

Step 7 **show running-config interface *type-number***

Displays the contents of the current running configuration file or the configuration for an interface.

Example:

```

Switch# show running-config interface gigabitethernet2/0/6

Building configuration...

Current configuration : 214 bytes
!
interface GigabitEthernet2/0/6
 switchport mode access
 switchport voice vlan 100
 access-session port-control auto
 spanning-tree portfast edge
 service-policy type control subscriber AI_NEXTGEN_AUTHBYPASS
end

```

Step 8 **show lldp neighbor**

Displays information about one or all neighboring devices discovered using the Link Layer Discovery Protocol (LLDP).

Example:

```

Switch# show lldp neighbor

Capability codes:
 (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
 (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other

Device ID           Local Intf      Hold-time  Capability  Port ID
SEPC0255C43BE00    Gi2/0/6        180        B,T         C0255C43BE00:P1

```

Total entries displayed: 1

Feature Information for Auto Identity

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 152: Feature Information for Auto Identity

Feature Name	Releases	Feature Information
Auto Identity	Cisco IOS Release 15.2(4)E	<p>The Auto Identity feature provides a set of built-in policies at the global configuration and interface configuration modes. This feature is available only in the Class-Based Policy Language (CPL) control policy-equivalent new-style mode.</p> <p>In Cisco IOS Release 15.2(4)E, this feature was implemented on Cisco Catalyst 2960–X Series Switches, Catalyst 3750–X Series Switches, and Cisco Catalyst 4500E Supervisor Engine 7-E.</p> <p>The following commands was introduced or modified: source-template.</p>

Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported in the Cisco IOS Release for which this guide is written:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Storm Control

Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic

- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

Note When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

Traffic Patterns

Figure 122: Broadcast Storm Control Example

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

Note Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the **storm-control** interface configuration commands to set the threshold value for each traffic type.

How to Configure Storm Control

Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

Note Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Follow these steps to storm control and threshold levels:

Before you begin

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **storm-control** {**broadcast** | **multicast** | **unicast**} **level** {*level* [*level-low*] | **bps** *bps* [*bps-low*] | **pps** *pps* [*pps-low*]}
5. **storm-control action** {**shutdown** | **trap**}
6. **end**
7. **show storm-control** [*interface-id*] [**broadcast** | **multicast** | **unicast**]
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device> enable</pre>	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	<p>interface interface-id</p> <p>Example:</p> <pre>Device(config)# interface gigabitethernet1/0/1</pre>	Specifies the interface to be configured, and enter interface configuration mode.
Step 4	<p>storm-control {broadcast multicast unicast} level {level [level-low] bps bps [bps-low] pps pps [pps-low]}</p> <p>Example:</p> <pre>Device(config-if)# storm-control unicast level 87 65</pre>	<p>Configures broadcast, multicast, or unicast storm control. By default, storm control is disabled.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> For <i>level</i>, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00. (Optional) For <i>level-low</i>, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00. <p>If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.</p> <ul style="list-style-type: none"> For bps bps, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0. (Optional) For <i>bps-low</i>, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.

	Command or Action	Purpose
		<ul style="list-style-type: none"> For pps pps, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0. (Optional) For pps-low, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0. <p>For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.</p>
Step 5	storm-control action {shutdown trap} Example: <pre>Device(config-if)# storm-control action trap</pre>	<p>Specifies the action to be taken when a storm is detected. The default is to filter out the traffic and not to send traps.</p> <ul style="list-style-type: none"> Select the shutdown keyword to error-disable the port during a storm. Select the trap keyword to generate an SNMP trap when a storm is detected.
Step 6	end Example: <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 7	show storm-control [interface-id] [broadcast multicast unicast] Example: <pre>Device# show storm-control gigabitethernet1/0/1 unicast</pre>	Verifies the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, details for all traffic types (broadcast, multicast and unicast) are displayed.
Step 8	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring Small-Frame Arrival Rate

Incoming VLAN-tagged packets smaller than 67 bytes are considered small frames. They are forwarded by the switch, but they do not cause the switch storm-control counters to increment.

You globally enable the small-frame arrival feature on the switch and then configure the small-frame threshold for packets on each interface. Packets smaller than the minimum size and arriving at a specified rate (the threshold) are dropped since the port is error disabled.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **errdisable detect cause small-frame**
4. **errdisable recovery interval *interval***
5. **errdisable recovery cause small-frame**
6. **interface *interface-id***
7. **small-frame violation-rate *pps***
8. **end**
9. **show interfaces *interface-id***
10. **show running-config**
11. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	errdisable detect cause small-frame Example: Device(config)# errdisable detect cause small-frame	Enables the small-frame rate-arrival feature on the switch.
Step 4	errdisable recovery interval <i>interval</i> Example: Device(config)# errdisable recovery interval 60	(Optional) Specifies the time to recover from the specified error-disabled state.
Step 5	errdisable recovery cause small-frame Example: Device(config)# errdisable recovery cause small-frame	(Optional) Configures the recovery time for error-disabled ports to be automatically re-enabled after they are error disabled by the arrival of small frames Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm

	Command or Action	Purpose
		control settings propagate to the EtherChannel physical interfaces.
Step 6	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/2	Enters interface configuration mode, and specify the interface to be configured.
Step 7	small-frame violation-rate <i>pps</i> Example: Device(config-if)# small-frame violation rate 10000	Configures the threshold rate for the interface to drop incoming packets and error disable the port. The range is 1 to 10,000 packets per second (pps)
Step 8	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 9	show interfaces <i>interface-id</i> Example: Device# show interfaces gigabitethernet1/0/2	Verifies the configuration.
Step 10	show running-config Example: Device# show running-config	Verifies your entries.
Step 11	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Protected Ports

Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.
- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

Default Protected Port Configuration

The default is to have no protected ports defined.

Protected Ports Guidelines

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

How to Configure Protected Ports

Configuring a Protected Port

Before you begin

Protected ports are not pre-defined. This is the task to configure one.

SUMMARY STEPS

1. `enable`

2. **configure terminal**
3. **interface *interface-id***
4. **switchport protected**
5. **end**
6. **show interfaces *interface-id* switchport**
7. **show running-config**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/1	Specifies the interface to be configured, and enter interface configuration mode.
Step 4	switchport protected Example: Device(config-if)# switchport protected	Configures the interface to be a protected port.
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 6	show interfaces <i>interface-id</i> switchport Example: Device# show interfaces gigabitethernet 1/0/1 switchport	Verifies your entries.

	Command or Action	Purpose
Step 7	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 8	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Monitoring Protected Ports

Table 153: Commands for Displaying Protected Port Settings

Command	Purpose
<code>show interfaces [interface-id] switchport</code>	Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.

Feature Information

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Port Blocking

Port Blocking

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

Note With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

How to Configure Port Blocking

Blocking Flooded Traffic on an Interface

Before you begin

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport block multicast**
5. **switchport block unicast**
6. **end**
7. **show interfaces** *interface-id* **switchport**
8. **show running-config**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/1	Specifies the interface to be configured, and enter interface configuration mode.
Step 4	switchport block multicast Example:	Blocks unknown multicast forwarding out of the port.

	Command or Action	Purpose
	Device(config-if)# switchport block multicast	
Step 5	switchport block unicast Example: Device(config-if)# switchport block unicast	Blocks unknown unicast forwarding out of the port.
Step 6	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 7	show interfaces interface-id switchport Example: Device# show interfaces gigabitethernet 1/0/1 switchport	Verifies your entries.
Step 8	show running-config Example: Device# show running-config	Verifies your entries.
Step 9	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Monitoring Port Blocking

Table 154: Commands for Displaying Port Blocking Settings

Command	Purpose
show interfaces [interface-id] switchport	Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.

Feature Information

Release	Feature Information
Cisco IOS Release 15.0(2)EX1	This feature was introduced.

Prerequisites for Port Security

Note If you try to set the maximum value to a number less than the number of secure addresses already configured on an interface, the command is rejected.

Restrictions for Port Security

The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

Information About Port Security

Port Security

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses. If you limit the number of secure MAC addresses to one and assign a single secure MAC address, the workstation attached to that port is assured the full bandwidth of the port.

If a port is configured as a secure port and the maximum number of secure MAC addresses is reached, when the MAC address of a station attempting to access the port is different from any of the identified secure MAC addresses, a security violation occurs. Also, if a station with a secure MAC address configured or learned on one secure port attempts to access another secure port, a violation is flagged.

Types of Secure MAC Addresses

The switch supports these types of secure MAC addresses:

- Static secure MAC addresses—These are manually configured by using the **switchport port-security mac-address *mac-address*** interface configuration command, stored in the address table, and added to the switch running configuration.

- Dynamic secure MAC addresses—These are dynamically configured, stored only in the address table, and removed when the switch restarts.
- Sticky secure MAC addresses—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, when the switch restarts, the interface does not need to dynamically reconfigure them.

Sticky Secure MAC Addresses

You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration by enabling sticky learning. The interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses. All sticky secure MAC addresses are added to the running configuration.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

Security Violations

It is a security violation when one of these situations occurs:

- The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.
- An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.
- Running diagnostic tests with port security enabled.

You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

- protect—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

Note We do not recommend configuring the protect violation mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

- restrict—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- **shutdown**—a port security violation causes the interface to become error-disabled and to shut down immediately, and the port LED turns off. When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause psecure-violation** global configuration command, or you can manually re-enable it by entering the **shutdown** and **no shut down** interface configuration commands. This is the default mode.
- **shutdown vlan**—Use to set the security violation mode per-VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs

This table shows the violation mode and the actions taken when you configure an interface for port security.

Table 155: Security Violation Mode Actions

Violation Mode	Traffic is forwarded 18	Sends SNMP trap	Sends syslog message	Displays error message 19	Violation counter increments	Shuts down port
protect	No	No	No	No	No	No
restrict	No	Yes	Yes	No	Yes	No
shutdown	No	No	No	No	Yes	Yes
shutdown vlan	No	No	Yes	No	Yes	No 20

¹⁸ Packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses.

¹⁹ The switch returns an error message if you manually configure an address that would cause a security violation.

²⁰ Shuts down only the VLAN on which the violation occurred.

Port Security Aging

You can use port security aging to set the aging time for all secure addresses on a port. Two types of aging are supported per port:

- **Absolute**—The secure addresses on the port are deleted after the specified aging time.
- **Inactivity**—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

Port Security and Switch Stacks

When a switch joins a stack, the new switch will get the configured secure addresses. All dynamic secure addresses are downloaded by the new stack member from the other stack members.

When a switch (either the active switch or a stack member) leaves the stack, the remaining stack members are notified, and the secure MAC addresses configured or learned by that switch are deleted from the secure MAC address table.

Default Port Security Configuration

Table 156: Default Port Security Configuration

Feature	Default Setting
Port security	Disabled on a port.
Sticky address learning	Disabled.
Maximum number of secure MAC addresses per port	1.
Violation mode	Shutdown. The port shuts down when the maximum number of secure MAC addresses is exceeded.
Port security aging	Disabled. Aging time is 0. Static aging is disabled. Type is absolute.

Port Security Configuration Guidelines

- Port security can only be configured on static access ports or trunk ports. A secure port cannot be a dynamic access port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).

Note Voice VLAN is only supported on access ports and not on trunk ports, even though the configuration is allowed.

- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the phone.
- When a trunk port configured with port security and assigned to an access VLAN for data traffic and to a voice VLAN for voice traffic, entering the **switchport voice** and **switchport priority extend** interface configuration commands has no effect.

When a connected device uses the same MAC address to request an IP address for the access VLAN and then an IP address for the voice VLAN, only the access VLAN is assigned an IP address.
- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.
- The switch does not support port security aging of sticky secure MAC addresses.

This table summarizes port security compatibility with other port-based features.

Table 157: Port Security Compatibility with Other Switch Features

Type of Port or Feature on Port	Compatible with Port Security
DTP ²¹ port ²²	No
Trunk port	Yes
Dynamic-access port ²³	No
Routed port	No
SPAN source port	Yes
SPAN destination port	No
EtherChannel	Yes
Tunneling port	Yes
Protected port	Yes
IEEE 802.1x port	Yes
Voice VLAN port ²⁴	Yes
IP source guard	Yes
Dynamic Address Resolution Protocol (ARP) inspection	Yes
Flex Links	Yes

²¹ DTP=Dynamic Trunking Protocol

²² A port configured with the **switchport mode dynamic** interface configuration command.

²³ A VLAN Query Protocol (VQP) port configured with the **switchport access vlan dynamic** interface configuration command.

²⁴ You must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN.

Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported in the Cisco IOS Release for which this guide is written:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security

- Protocol Storm Protection

How to Configure Port Security

Enabling and Configuring Port Security

Before you begin

This task restricts input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **port-security mac-address forbidden** *mac address*
4. **interface** *interface-id*
5. **switchport mode** {access | trunk}
6. **switchport voice vlan** *vlan-id*
7. **switchport port-security**
8. **switchport port-security** [maximum *value* **vlan** {*vlan-list* | {access | voice}}]]
9. **switchport port-security violation** {protect | restrict | shutdown | shutdown vlan}
10. **switchport port-security** [mac-address *mac-address* [**vlan** {*vlan-id* | {access | voice}}]]
11. **switchport port-security mac-address sticky**
12. **switchport port-security mac-address sticky** [*mac-address* | **vlan** {*vlan-id* | {access | voice}}]]
13. **switchport port-security mac-address forbidden** *mac address*
14. **end**
15. **show port-security**
16. **show running-config**
17. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	<p>port-security mac-address forbidden <i>mac address</i></p> <p>Example:</p> <pre>Device(config)# port-security mac-address forbidden 2.2.2</pre>	Specifies a MAC address that should be forbidden by port-security on all the interfaces.
Step 4	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Device(config)# interface gigabitethernet1/0/1</pre>	Specifies the interface to be configured, and enter interface configuration mode.
Step 5	<p>switchport mode {access trunk}</p> <p>Example:</p> <pre>Device(config-if)# switchport mode access</pre>	Sets the interface switchport mode as access or trunk; an interface in the default mode (dynamic auto) cannot be configured as a secure port.
Step 6	<p>switchport voice vlan <i>vlan-id</i></p> <p>Example:</p> <pre>Device(config-if)# switchport voice vlan 22</pre>	Enables voice VLAN on a port. vlan-id—Specifies the VLAN to be used for voice traffic.
Step 7	<p>switchport port-security</p> <p>Example:</p> <pre>Device(config-if)# switchport port-security</pre>	Enable port security on the interface. Note Under certain conditions, when port security is enabled on the member ports in a switch stack, the DHCP and ARP packets would be dropped. To resolve this, configure a shut and no shut on the interface.
Step 8	<p>switchport port-security [maximum value [vlan {<i>vlan-list</i> {access voice}}]]</p> <p>Example:</p> <pre>Device(config-if)# switchport port-security maximum 20</pre>	<p>(Optional) Sets the maximum number of secure MAC addresses for the interface. The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is set by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.</p> <p>(Optional) vlan—sets a per-VLAN maximum value</p> <p>Enter one of these options after you enter the vlan keyword:</p> <ul style="list-style-type: none"> • <i>vlan-list</i>—On a trunk port, you can set a per-VLAN maximum value on a range of VLANs separated by

	Command or Action	Purpose
		<p>a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.</p> <ul style="list-style-type: none"> • access—On an access port, specifies the VLAN as an access VLAN. • voice—On an access port, specifies the VLAN as a voice VLAN. <p>Note The voice keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.</p>
<p>Step 9</p>	<p>switchport port-security violation {protect restrict shutdown shutdown vlan}</p> <p>Example:</p> <pre>Device(config-if)# switchport port-security violation restrict</pre>	<p>(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:</p> <ul style="list-style-type: none"> • protect—When the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred. <p>Note We do not recommend configuring the protect mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.</p> <ul style="list-style-type: none"> • restrict—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments. • shutdown—The interface is error-disabled when a violation occurs, and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments. • shutdown vlan—Use to set the security violation mode per VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.

	Command or Action	Purpose
		<p>Note When a secure port is in the error-disabled state, you can bring it out of this state by entering the errdisable recovery cause psecure-violation global configuration command. You can manually re-enable it by entering the shutdown and no shutdown interface configuration commands or by using the clear errdisable interface vlan privileged EXEC command.</p>
<p>Step 10</p>	<p>switchport port-security [mac-address <i>mac-address</i> [vlan {<i>vlan-id</i> {access voice}}]]</p> <p>Example:</p> <pre>Device(config-if)# switchport port-security mac-address 00:A0:C7:12:C9:25 vlan 3 voice</pre>	<p>(Optional) Enters a secure MAC address for the interface. You can use this command to enter the maximum number of secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.</p> <p>Note If you enable sticky learning after you enter this command, the secure addresses that were dynamically learned are converted to sticky secure MAC addresses and are added to the running configuration.</p> <p>(Optional) vlan—sets a per-VLAN maximum value.</p> <p>Enter one of these options after you enter the vlan keyword:</p> <ul style="list-style-type: none"> • vlan-id—On a trunk port, you can specify the VLAN ID and the MAC address. If you do not specify a VLAN ID, the native VLAN is used. • access—On an access port, specifies the VLAN as an access VLAN. • voice—On an access port, specifies the VLAN as a voice VLAN. <p>Note The voice keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.</p>
<p>Step 11</p>	<p>switchport port-security mac-address sticky</p> <p>Example:</p> <pre>Device(config-if)# switchport port-security mac-address sticky</pre>	<p>(Optional) Enables sticky learning on the interface.</p>

	Command or Action	Purpose
Step 12	<p>switchport port-security mac-address sticky [<i>mac-address</i> vlan {<i>vlan-id</i> {access voice}}]</p> <p>Example:</p> <pre>Device(config-if)# switchport port-security mac-address sticky 00:A0:C7:12:C9:25 vlan voice</pre>	<p>(Optional) Enters a sticky secure MAC address, repeating the command as many times as necessary. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned, are converted to sticky secure MAC addresses, and are added to the running configuration.</p> <p>Note If you do not enable sticky learning before this command is entered, an error message appears, and you cannot enter a sticky secure MAC address.</p> <p>(Optional) vlan—sets a per-VLAN maximum value.</p> <p>Enter one of these options after you enter the vlan keyword:</p> <ul style="list-style-type: none"> • vlan-id—On a trunk port, you can specify the VLAN ID and the MAC address. If you do not specify a VLAN ID, the native VLAN is used. • access—On an access port, specifies the VLAN as an access VLAN. • voice—On an access port, specifies the VLAN as a voice VLAN. <p>Note The voice keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN.</p>
Step 13	<p>switchport port-security mac-address forbidden <i>mac address</i></p> <p>Example:</p> <pre>Device(config-if)# switchport port-security mac-address forbidden 2.2.2</pre>	<p>Specifies a MAC address that should be forbidden by port-security on the particular interface.</p>
Step 14	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 15	<p>show port-security</p> <p>Example:</p> <pre>Device# show port-security</pre>	<p>Verifies your entries.</p>

	Command or Action	Purpose
Step 16	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 17	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Enabling and Configuring Port Security Aging

Use this feature to remove and add devices on a secure port without manually deleting the existing secure MAC addresses and to still limit the number of secure addresses on a port. You can enable or disable the aging of secure addresses on a per-port basis.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport port-security aging** {static | time *time* | type {absolute | inactivity}}
5. **end**
6. **show port-security** [interface *interface-id*] [address]
7. **show running-config**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example:	Specifies the interface to be configured, and enter interface configuration mode.

	Command or Action	Purpose
	Device(config)# <code>interface gigabitethernet 1/0/1</code>	
Step 4	<p>switchport port-security aging {static time <i>time</i> type {absolute inactivity}}</p> <p>Example:</p> <pre>Device(config-if)# switchport port-security aging time 120</pre>	<p>Enables or disable static aging for the secure port, or set the aging time or type.</p> <p>Note The switch does not support port security aging of sticky secure addresses.</p> <p>Enter static to enable aging for statically configured secure addresses on this port.</p> <p>For <i>time</i>, specifies the aging time for this port. The valid range is from 0 to 1440 minutes.</p> <p>For type, select one of these keywords:</p> <ul style="list-style-type: none"> • absolute—Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified lapses and are removed from the secure address list. • inactivity—Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source addresses for the specified time period.
Step 5	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 6	<p>show port-security [<i>interface interface-id</i>] [<i>address</i>]</p> <p>Example:</p> <pre>Device# show port-security interface gigabitethernet 1/0/1</pre>	Verifies your entries.
Step 7	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 8	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuration Examples for Port Security

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.

```
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# switchport mode access
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 50
Device(config-if)# switchport port-security mac-address sticky
```

This example shows how to configure a static secure MAC address on VLAN 3 on a port:

```
Device(config)# interface gigabitethernet 1/0/2
Device(config-if)# switchport mode trunk
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security mac-address 0000.0200.0004 vlan 3
```

This example shows how to enable sticky port security on a port, to manually configure MAC addresses for data VLAN and voice VLAN, and to set the total maximum number of secure addresses to 20 (10 for data VLAN and 10 for voice VLAN).

```
Device(config)# interface tengigabitethernet 1/0/1
Device(config-if)# switchport access vlan 21
Device(config-if)# switchport mode access
Device(config-if)# switchport voice vlan 22
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 20
Device(config-if)# switchport port-security violation restrict
Device(config-if)# switchport port-security mac-address sticky
Device(config-if)# switchport port-security mac-address sticky 0000.0000.0002
Device(config-if)# switchport port-security mac-address 0000.0000.0003
Device(config-if)# switchport port-security mac-address sticky 0000.0000.0001 vlan voice
Device(config-if)# switchport port-security mac-address 0000.0000.0004 vlan voice
Device(config-if)# switchport port-security maximum 10 vlan access
Device(config-if)# switchport port-security maximum 10 vlan voice
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Protocol Storm Protection

Protocol Storm Protection

When a switch is flooded with Address Resolution Protocol (ARP) or control packets, high CPU utilization can cause the CPU to overload. These issues can occur:

- Routing protocol can flap because the protocol control packets are not received, and neighboring adjacencies are dropped.
- Spanning Tree Protocol (STP) reconverges because the STP bridge protocol data unit (BPDU) cannot be sent or received.
- CLI is slow or unresponsive.

Using protocol storm protection, you can control the rate at which control packets are sent to the switch by specifying the upper threshold for the packet flow rate. The supported protocols are ARP, ARP snooping, Dynamic Host Configuration Protocol (DHCP) v4, DHCP snooping, Internet Group Management Protocol (IGMP), and IGMP snooping.

When the packet rate exceeds the defined threshold, the switch drops all traffic arriving on the specified virtual port for 30 seconds. The packet rate is measured again, and protocol storm protection is again applied if necessary.

For further protection, you can manually error disable the virtual port, blocking all incoming traffic on the virtual port. You can manually enable the virtual port or set a time interval for automatic re-enabling of the virtual port.

Note Excess packets are dropped on no more than two virtual ports.
Virtual port error disabling is not supported for EtherChannel and Flexlink interfaces

Default Protocol Storm Protection Configuration

Protocol storm protection is disabled by default. When it is enabled, auto-recovery of the virtual port is disabled by default.

How to Configure Protocol Storm Protection

Enabling Protocol Storm Protection

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **psp {arp | dhcp | igmp} pps *value***
4. **errdisable detect cause psp**
5. **errdisable recovery interval *time***
6. **end**
7. **show psp config {arp | dhcp | igmp}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	psp {arp dhcp igmp} pps <i>value</i> Example:	Configures protocol storm protection for ARP, IGMP, or DHCP.

	Command or Action	Purpose
	Device(config)# psp dhcp pps 35	For <i>value</i> , specifies the threshold value for the number of packets per second. If the traffic exceeds this value, protocol storm protection is enforced. The range is from 5 to 50 packets per second.
Step 4	errdisable detect cause psp Example: Device(config)# errdisable detect cause psp	(Optional) Enables error-disable detection for protocol storm protection. If this feature is enabled, the virtual port is error disabled. If this feature is disabled, the port drops excess packets without error disabling the port.
Step 5	errdisable recovery interval time Example: Device	(Optional) Configures an auto-recovery time (in seconds) for error-disabled virtual ports. When a virtual port is error-disabled, the switch auto-recovers after this time. The range is from 30 to 86400 seconds.
Step 6	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 7	show psp config {arp dhcp igmp} Example: Device# show psp config dhcp	Verifies your entries.

Monitoring Protocol Storm Protection

Command	Purpose
show psp config {arp dhcp igmp}	Verify your entries.

CHAPTER 78

Configuring Cisco TrustSec

- [Information about Cisco TrustSec, on page 1617](#)
- [Cisco TrustSec Features, on page 1618](#)
- [Feature Information for Cisco TrustSec, on page 1618](#)

Information about Cisco TrustSec

Cisco TrustSec provides security improvements to Cisco network devices based on the capability to strongly identify users, hosts, and network devices within a network. TrustSec provides topology-independent and scalable access controls by uniquely classifying data traffic for a particular role. TrustSec ensures data confidentiality and integrity by establishing trust among authenticated peers and encrypting links with those peers.

The key component of Cisco TrustSec is the Cisco Identity Services Engine (ISE). Cisco ISE can provision switches with TrustSec Identities and Security Group ACLs (SGACLs), though these may be configured manually on the switch.

MTU Guidelines

CTS tagged packets greater than 1518 bytes may get dropped on the Cisco vWLC controller. This is due to a restriction on the size of incoming packets on the UCS server, which is hosting vWLC instances. The UCS server have a default MTU of 1500 thereby allowing packets of 1518 bytes only. Here, the additional 18 bytes includes 4 bytes of 802.1Q and 14 bytes of Ethernet header.

An Ethernet link configured for CTS tagging imposes a 8-byte encapsulation called Cisco metadata. As a result, the total size of the Ethernet packet is increased by 8 bytes to 1526 bytes ($1518+8 = 1526$). Hence, the MTU of the receiving interface has to be increased by 8-bytes to accommodate the additional 8 bytes in the Ethernet.

While CTS interfaces on the routers and switches (for example, Cisco ASR 1000 Series Routers, Cisco 4000 Series Integrated Services Routers, Cisco Catalyst 3000 Series Switches, Cisco Catalyst 9000 Series Switches) auto-adjusts MTU to 1508 bytes to accommodate additional 8-byte. However, other devices like UCS servers requires manual update to increase the MTU to 1508. For information on how to configure jumbo MTU on UCS, see the following link:

<https://www.cisco.com/c/en/us/support/docs/servers-unified-computing/ucs-b-series-blade-servers/117601-configure-UCS-00.html>

Cisco TrustSec Features

The table below lists the Cisco TrustSec features implemented on Cisco TrustSec-enabled Catalyst 2960-X and 2960-XR Series Switches:

Cisco TrustSec Feature	Description
Endpoint Admission Control (EAC)	EAC is an authentication process for an endpoint user or a device connecting to the TrustSec domain. Usually EAC takes place at the access level switch. Successful authentication and authorization in the EAC process results in Security Group Tag assignment for the user or device. Currently EAC can be 802.1X, MAC Authentication Bypass (MAB), and Web Authentication Proxy (WebAuth).
SGT Exchange Protocol (SXP)	Security Group Tag Exchange Protocol (SXP). With SXP, devices that are not TrustSec-hardware-capable can receive SGT attributes for authenticated users and devices from the Cisco Identity Services Engine (ISE) or the Cisco Secure Access Control System (ACS). The devices can then forward a sourceIP-to-SGT binding to a TrustSec-hardware-capable device will tag the source traffic for SGACL enforcement.

Feature Information for Cisco TrustSec

Table 158: Feature Information for Cisco TrustSec

Feature Name	Release	Feature Information
SXPv1 and SXPv2	Cisco IOS XE 15.0(2)EX1	SXP is introduced on the Catalyst 2960-XR switch.

CHAPTER 79

Configuring FIPS

- [Information About FIPS and Common Criteria, on page 1619](#)

Information About FIPS and Common Criteria

The Federal Information Processing Standard (FIPS) certification documents for Cisco Catalyst series switches are posted on the following website:

http://www.cisco.com/web/strategy/government/security_certification/net_business_benefit_seccert_fips140.html

Click the link in the Certification column to view the Consolidated Validation Certificate and the Security Policy document. The Security Policy document describes the FIPS implementation, hardware installation, firmware initialization, and software configuration procedures for FIPS operation.

Common Criteria is an international standard (ISO/IEC 15408) for computer security certification. This standard is a set of requirements, tests, and evaluation methods that ensures that the Target of Evaluation complies with a specific Protection Profile or custom Security Target. For more information, see the security target document for specific Cisco Catalyst switch models and Cisco IOS Releases at: http://www.niap-ccevs.org/CCEVS_Products/pcl.cfm?tech_name=Network+Switch

CHAPTER 80

Configuring Control Plane Policing

- [Restrictions for Control Plane Policing, on page 1621](#)
- [Control Plane Policing, on page 1621](#)
- [Configuring Control Plane Policing, on page 1622](#)
- [Examples: Configuring CoPP, on page 1623](#)

Restrictions for Control Plane Policing

The following restrictions apply while Configuring Control Plane Policing:

- Only six among the following protocols can be configured simultaneously: **rip**, **ospf-v6**, **eigrp-v6**, **rip-v6**, **dhcp-snoop-client-to-server**, **dhcp-snoop-server-to-client**, **ndp-router-solicitation**, **ndp-router-advertisement**, **ndp-redirect**, **dhcpv6-client-to-server**, **dhcpv6-server-to-client**, **igrp**.
- For **ospf**, **eigrp** and **ripv2** protocols, control packets which are destined to multicast Mac of the router are policed along with the "**reserve-multicast-group**" option.

Control Plane Policing

Configure the Control Plane Policing (CoPP) feature on a predefined set of protocols to control the flow of traffic coming to the CPU. The CoPP allows you to set a rate limit on specific protocol packets. These packets are policed, and the packets that conform to the defined rate limit are permitted into the CPU. CoPP protects the packets from being routed to the CPU at an undesired rate that might impact the performance of a switch and the network. In addition, the CoPP protects the CPU from denial of service (DoS) attacks and ensures routing stability, reachability, and packet delivery. You can use Multi-Layer Switching QoS CLI to set the rate limit and policing parameters on a specific protocol.

Note CoPP is supported only on LAN BASE, IP Lite, and IP Service licenses.

Configuring Control Plane Policing

Configure the Control Plane Policing (CoPP) feature on a predefined set of protocols to control the flow of traffic coming into the CPU.

SUMMARY STEPS

1. enable
2. configure terminal
3. mls qos copp protocol { autorp-announce | autorp-discovery | bgp | cdp | cgmp | dai | dhcp-snoop-client-to-server | dhcp-snoop-server-to-client | dhcpv6-client-to-server | dhcpv6-server-to-client | eigrp | eigrp-v6 | energy-wise | igmp-gs-query | igmp-leave | igmp-query | igmp-report | igmp | ipv6-pimv2 | lldp | mld-gs-query | mld-leave | mld-query | mld-report | ndp-redirect | ndp-router-advertisement | ndp-router-solicitation | ospf | ospf-v6 | pimv1 | pxe | rep-hfl | reserve-multicast-group | rip | rip-v6 | rsvp-snoop | stp } police {pps | bps} police rate
4. end
5. show mls qos copp protocols
6. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mls qos copp protocol { autorp-announce autorp-discovery bgp cdp cgmp dai dhcp-snoop-client-to-server dhcp-snoop-server-to-client dhcpv6-client-to-server dhcpv6-server-to-client eigrp eigrp-v6 energy-wise igmp-gs-query igmp-leave igmp-query igmp-report igmp ipv6-pimv2 lldp mld-gs-query mld-leave mld-query mld-report ndp-redirect ndp-router-advertisement ndp-router-solicitation ospf ospf-v6 pimv1 pxe rep-hfl reserve-multicast-group rip rip-v6 rsvp-snoop stp } police {pps bps} police rate Example: Device (config)# mls qos copp protocol cdp police	Configures a packet policer for the specified protocol. For more details about the various parameters, please refer <i>Consolidated Platform Command Reference, Cisco IOS Release 15.2(4)E</i> .

	Command or Action	Purpose
	<pre>bps 10000 Device(config)# mls qos copp protocol cdp police pps 500</pre>	
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	<p>show mls qos copp protocols</p> <p>Example:</p> <pre>Device# show mls qos copp protocols</pre>	Displays the CoPP parameters and counters for all the configured protocol.
Step 6	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

What to do next

To clear the CoPP statistics, use the **clear copp counters** command.

Examples: Configuring CoPP

The following example shows how to enable Control Plane Policing (CoPP) for a specific protocol:

```
Switch (config)# mls qos copp protocol cdp police bps ?
<8000-2000000000> Bits per second (postfix k, m, g optional; decimal point allowed)
Switch (config)# mls qos copp protocol cdp police bps 10000
Switch(config)# mls qos copp protocol cdp police pps ?
<100-100000> Packet per second
Switch(config)# mls qos copp protocol cdp police pps 500
```

The following example shows the CoPP parameters and counters for all the configured protocol:

```
Switch# show running-config | inc copp
Switch#show running-config | inc copp
mls qos copp protocol rep-hfl police pps 5600
mls qos copp protocol lldp police bps 908900
mls qos copp protocol cdp police pps 3434
```

/* Copp detailed output */

```
Switch#show mls qos copp protocols
```

```
-----
Protocol                Mode      PolicerRate      PolicerBurst
InProfilePackets      OutProfilePackets  InProfileBytes    OutProfileBytes
-----
rep-hfl                 pps      5600              5600
0                       0         0                 0
-----
```

lldp		bps	908900	908900
0	0		0	0
cdp		pps	3434	3434
45172	0		2891008	0

PART **XII**

Configuring Cisco IOS IP SLAs

- [Configuring Cisco IP SLAs, on page 1627](#)

CHAPTER 81

Configuring Cisco IP SLAs

- [Restrictions on SLAs, on page 1627](#)
- [Information About SLAs, on page 1627](#)
- [How to Configure IP SLAs Operations, on page 1631](#)
- [Monitoring IP SLA Operations, on page 1632](#)
- [Additional References, on page 1633](#)
- [Feature History and Information for Service Level Agreements, on page 1634](#)

Restrictions on SLAs

This section lists the restrictions on SLAs.

The following are restrictions on IP SLAs network performance measurement:

- The device does not support VoIP service levels using the gatekeeper registration delay operations measurements.
- Only a Cisco IOS device can be a source for a destination IP SLAs responder.
- You cannot configure the IP SLAs responder on non-Cisco devices and Cisco IOS IP SLAs can send operational packets only to services native to those devices.

Information About SLAs

Cisco IOS IP Service Level Agreements (SLAs)

Cisco IOS IP SLAs send data across the network to measure performance between multiple network locations or across multiple network paths. They simulate network data and IP services and collect network performance information in real time. Cisco IOS IP SLAs generate and analyze traffic either between Cisco IOS devices or from a Cisco IOS device to a remote IP device such as a network application server. Measurements provided by the various Cisco IOS IP SLA operations can be used for troubleshooting, for problem analysis, and for designing network topologies.

Depending on the specific Cisco IOS IP SLA operations, various network performance statistics are monitored within the Cisco device and stored in both command-line interface (CLI) and Simple Network Management Protocol (SNMP) MIBs. IP SLA packets have configurable IP and application layer options such as source

and destination IP address, User Datagram Protocol (UDP)/TCP port numbers, a type of service (ToS) byte (including Differentiated Services Code Point [DSCP] and IP Prefix bits), Virtual Private Network (VPN) routing/forwarding instance (VRF), and URL web address.

Because Cisco IP SLAs are Layer 2 transport independent, you can configure end-to-end operations over disparate networks to best reflect the metrics that an end user is likely to experience. IP SLAs collect and analyze the following performance metrics:

- Delay (both round-trip and one-way)
- Jitter (directional)
- Packet loss (directional)
- Packet sequencing (packet ordering)
- Path (per hop)
- Connectivity (directional)
- Server or website download time

Because Cisco IOS IP SLAs is SNMP-accessible, it can also be used by performance-monitoring applications like Cisco Prime Internetwork Performance Monitor (IPM) and other third-party Cisco partner performance management products.

Using IP SLAs can provide the following benefits:

- Service-level agreement monitoring, measurement, and verification.
- Network performance monitoring
 - Measurement of jitter, latency, or packet loss in the network.
 - Continuous, reliable, and predictable measurements.
- IP service network health assessment to verify that the existing QoS is sufficient for new IP services.
- Edge-to-edge network availability monitoring for proactive verification and connectivity testing of network resources (for example, shows the network availability of an NFS server used to store business critical data from a remote site).
- Network operation troubleshooting by providing consistent, reliable measurement that immediately identifies problems and saves troubleshooting time.
- Multiprotocol Label Switching (MPLS) performance monitoring and network verification (if the device supports MPLS).

Network Performance Measurement with Cisco IOS IP SLAs

You can use IP SLAs to monitor the performance between any area in the network—core, distribution, and edge—without deploying a physical probe. It uses generated traffic to measure network performance between two networking devices.

Figure 123: Cisco IOS IP SLAs Operation

The following figure shows how IP SLAs begin when the source device sends a generated packet to the destination device. After the destination device receives the packet, depending on the type of IP SLAs operation,

it responds with time-stamp information for the source to make the calculation on performance metrics. An IP SLAs operation performs a network measurement from the source device to a destination in the network using a specific protocol such as UDP.

IP SLA Responder and IP SLA Control Protocol

The IP SLA responder is a component embedded in the destination Cisco device that allows the system to anticipate and respond to IP SLA request packets. The responder provides accurate measurements without the need for dedicated probes. The responder uses the Cisco IOS IP SLA Control Protocol to provide a mechanism through which it can be notified on which port it should listen and respond.

Note The IP SLA responder can be a Cisco IOS Layer 2, responder-configurable device. The responder does not need to support full IP SLA functionality.

The following figure shows where the Cisco IOS IP SLA responder fits in the IP network. The responder listens on a specific port for control protocol messages sent by an IP SLA operation. Upon receipt of the control message, it enables the specified UDP or TCP port for the specified duration. During this time, the responder accepts the requests and responds to them. It disables the port after it responds to the IP SLA packet, or when the specified time expires. MD5 authentication for control messages is available for added security.

Figure 124: Cisco IOS IP SLAs Operation

You do not need to enable the responder on the destination device for all IP SLA operations. For example, a responder is not required for services that are already provided by the destination router (such as Telnet or HTTP).

Response Time Computation for IP SLAs

Switches, controllers, and routers can take tens of milliseconds to process incoming packets due to other high priority processes. This delay affects the response times because the test-packet reply might be in a queue while waiting to be processed. In this situation, the response times would not accurately represent true network delays. IP SLAs minimize these processing delays on the source device as well as on the target device (if the responder is being used) to determine true round-trip times. IP SLA test packets use time stamping to minimize the processing delays.

When the IP SLA responder is enabled, it allows the target device to take time stamps when the packet arrives on the interface at interrupt level and again just as it is leaving, eliminating the processing time. This time stamping is made with a granularity of sub-milliseconds (ms).

Figure 125: Cisco IOS IP SLA Responder Time Stamping

The following figure demonstrates how the responder works. Four time stamps are taken to make the calculation for round-trip time. At the target router, with the responder functionality enabled, time stamp 2 (TS2) is subtracted from time stamp 3 (TS3) to produce the time spent processing the test packet as represented by delta. This delta value is then subtracted from the overall round-trip time. Notice that the same principle is applied by IP SLAs on the source router where the incoming time stamp 4 (TS4) is also taken at the interrupt

level to allow for greater accuracy. RTT (Round-trip time) = $T4$ (Time stamp 4) - $T1$ (Time stamp 1) - Δ

An additional benefit of the two time stamps at the target device is the ability to track one-way delay, jitter, and directional packet loss. Because much network behavior is asynchronous, it is critical to have these statistics. However, to capture one-way delay measurements, you must configure both the source router and target router with Network Time Protocol (NTP) so that the source and target are synchronized to the same clock source. One-way jitter measurements do not require clock synchronization.

How to Configure IP SLAs Operations

This section does not include configuration information for all available operations as the configuration information details are included in the *Cisco IOS IP SLAs Configuration Guide*. It does include several operations as examples, including configuring the responder, configuring a UDP jitter operation, which requires a responder, and configuring an ICMP echo operation, which does not require a responder. For details about configuring other operations, see the *Cisco IOS IP SLAs Configuration Guide*.

Default Configuration

No IP SLAs operations are configured.

Configuration Guidelines

For information on the IP SLA commands, see the *Cisco IOS IP SLAs Command Reference, Release 12.4T* command reference.

For detailed descriptions and configuration procedures, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4TL*.

Configuring the IP SLA Responder

The IP SLA responder is available only on Cisco IOS software-based devices, including some Layer 2 devices that do not support full IP SLA functionality.

Follow these steps to configure the IP SLA responder on the target device (the operational target):

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip sla responder {tcp-connect | udp-echo} ipaddress ip-address port port-number**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	<p>ip sla responder {tcp-connect udp-echo} ipaddress <i>ip-address</i> port <i>port-number</i></p> <p>Example:</p> <pre>Device(config)# ip sla responder udp-echo 172.29.139.134 5000</pre>	<p>Configures the device as an IP SLA responder.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> • tcp-connect—Enables the responder for TCP connect operations. • udp-echo—Enables the responder for User Datagram Protocol (UDP) echo or jitter operations. • ipaddress <i>ip-address</i>—Enter the destination IP address. • port <i>port-number</i>—Enter the destination port number. <p>Note The IP address and port number must match those configured on the source device for the IP SLA operation.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 6	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Monitoring IP SLA Operations

The following table describes the commands used to display IP SLA operation configurations and results:

Table 159: Monitoring IP SLA Operations

show ip sla authentication	Displays IP SLA authentication information.
show ip sla responder	Displays information about the IP SLA responder.

PART **XIII**

Stacking

- [Managing Switch Stacks, on page 1637](#)
- [FlexStack-Extended, on page 1665](#)

CHAPTER 82

Managing Switch Stacks

- [Prerequisites for Switch Stacks, on page 1637](#)
- [Restrictions for Switch Stacks, on page 1637](#)
- [Information About Switch Stacks, on page 1638](#)
- [How to Configure a Switch Stack, on page 1651](#)
- [Troubleshooting the Switch Stack, on page 1657](#)
- [Monitoring the Device Stack, on page 1659](#)
- [Configuration Examples for Switch Stacks, on page 1660](#)
- [Additional References for Switch Stacks, on page 1662](#)

Prerequisites for Switch Stacks

All stack members must run the same Cisco IOS software image to ensure compatibility among stack members. For switch stack hardware considerations, see the *Catalyst 2960-XR Switch Hardware Installation Guide*.

Restrictions for Switch Stacks

The following are restrictions for your switch stack configuration:

- The switch does not support mixed stacking. Stacking is supported only with other Catalyst 2960-XR switches.
- Auto-upgrade of stack can not be done when one of the switches in stack is with version Cisco IOS 15.2(3)E. This means that whenever any of the switches in the stack goes into a version mismatch, and if either the active stack is running Cisco IOS 15.2(3)E, or if a member is running Cisco 15.2(3)E, the member can not be auto-upgraded to the required version.

Information About Switch Stacks

Switch Stack Overview

A switch stack is a set of up to eight stacking-capable switches connected through their stack ports. You can connect only one switch type in a stack, or you can connect a mix of Catalyst 2960-XR, Catalyst 2960-X and Catalyst 2960-S switches in the stack. The stack can have one of these configurations:

- Homogeneous stack—A Catalyst 2960-XR only stack with only Catalyst 2960-XR switches as stack members. A homogenous stack can have up to 8 stack members.
- Mixed stack—A stack with a mix of Catalyst 2960-XR, Catalyst 2960-X and Catalyst 2960-S switches as stack members. A mixed stack of Catalyst 2960-XR and Catalyst 2960-X switches can have up to 8 stack members. A mixed stack that includes a Catalyst 2960-S switch can have up to 4 stack members.

The active stack controls the operation of the switch stack, and is the single point of stack-wide management. From the active stack, you configure:

- System-level (global) features that apply to all stack members
- Interface-level features for each stack member

The active stack contains the saved and running configuration files for the switch stack. The configuration files include the system-level settings for the switch stack and the interface-level settings for each stack member. Each stack member has a current copy of these files for back-up purposes.

Supported Features in a Switch Stack

The system-level features supported on the active switch are supported on the entire switch stack.

Encryption Features

If the active switch is running the cryptographic universal software image (supports encryption), the encryption features are available on the switch stack.

FlexStack-Plus

The stack members use the Cisco FlexStack-Plus technology to work together as a unified system. Layer 2 protocols support the entire switch stack as a single entity in the network.

Note Switch stacks running the LAN Base image do not support Layer 3 features.

The FlexStack-Plus bandwidth for a single stack port is 20 Gbps. With FlexStack-Plus technology, up to eight members can be joined into a single stack. In a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches, FlexStack-Plus reverts to FlexStack capabilities of 10 Gbps stack port bandwidth and a maximum of four members per stack.

Switch Stack Membership

A switch stack has up to eight stack members connected through their stack ports. A switch stack always has one active switch.

A standalone device is a device stack with one stack member that also operates as the active switch. You can connect one standalone device to another to create a stack containing two stack members, with one of them as the active switch. You can connect standalone devices to an existing device stack to increase the stack membership.

Figure 126: Creating a Switch Stack from Two Standalone Switches

Figure 127: Adding a Standalone Switch to a Switch Stack

Changes to Switch Stack Membership

If you replace a stack member with an identical model, the new switch functions with exactly the same configuration as the replaced switch, assuming that the new switch (referred to as the provisioned switch) is using the same member number as the replaced switch.

The operation of the switch stack continues uninterrupted during membership changes unless you remove the active switch or you add powered-on standalone switches or switch stacks.

- Adding powered-on switches (merging) causes all switches to reload and elect a new active switch from among themselves. The newly elected active switch retains its role and configuration. All other switches retain their stack member numbers and use the stack configuration of the newly elected active switch.

Note In Cisco IOS XE 3.6.4E and later versions, when a new switch is powered-on as a standalone switch before it is added as part of the switch stack, only this switch is reloaded and not the whole switch stack.

Adding powered-on switches (merging) causes the active stack of the merging switch stacks to elect an active stack from among themselves. The reelected active stack retains its role and configuration as do its stack members. All remaining switches, including the former active stacks, reload and join the switch stack as stack members. They change their stack member numbers to the lowest available numbers and use the stack configuration of the reelected active stack.

- Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. This can cause:
 - An IP address conflict in your network. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks.
 - A MAC address conflict between two members in the stack. You can use the **stack-mac update force** command to resolve the conflict.

If a newly created switch stack does not have an active switch or standby switch, the switch stack will reload and elect a new active switch.

Note Make sure that you power off the switches that you add to or remove from the switch stack.

After adding or removing stack members, make sure that the switch stack is operating at full bandwidth (40 Gbps). Press the Mode button on a stack member until the Stack mode LED is on. The last two right port LEDs on all switches in the stack should be green. Depending on the switch model, the last two right ports are 10-Gigabit Ethernet ports or small form-factor pluggable (SFP) module ports (10/100/1000 ports). If one or both of these LEDs are not green on any of the switches, the stack is not operating at full bandwidth.

It may take upto 4 seconds for stack convergence when a new stack member is added to the existing switch stack.

If you remove powered-on members but do not want to partition the stack:

- Power off the switches in the newly created switch stacks.
- Reconnect them to the original switch stack through their stack ports.
- Power on the switches.

For cabling and power considerations that affect switch stacks, see the *Catalyst 2960-XR Switch Hardware Installation Guide*.

Stack Member Numbers

The stack member number (1 to 8) identifies each member in the switch stack. The member number also determines the interface-level configuration that a stack member uses. You can display the stack member number by using the **show switch EXEC** command.

A new, out-of-the-box device (one that has not joined a device stack or has not been manually assigned a stack member number) ships with a default stack member number of 1. When it joins a device stack, its default stack member number changes to the lowest available member number in the stack.

Stack members in the same stack cannot have the same stack member number. Every stack member, including a standalone device, retains its member number until you manually change the number or unless the number is already being used by another member in the stack.

- If you manually change the stack member number by using the **switch current-stack-member-number renumber new-stack-member-number** command, the new number goes into effect after that stack member resets (or after you use the **reload slot stack-member-number** privileged EXEC command) and only if that number is not already assigned to any other members in the stack. Another way to change the stack member number is by changing the device_NUMBER environment variable.

If the number is being used by another member in the stack, the device selects the lowest available number in the stack.

If you manually change the number of a stack member and no interface-level configuration is associated with that new member number, that stack member resets to its default configuration.

You cannot use the **switch current-stack-member-number renumber new-stack-member-number** command on a provisioned device. If you do, the command is rejected.

- If you move a stack member to a different device stack, the stack member retains its number only if the number is not being used by another member in the stack. If it is being used, the device selects the lowest available number in the stack.
- If you merge device stacks, the device that join the device stack of a new active device select the lowest available numbers in the stack.

As described in the hardware installation guide, you can use the device port LEDs in Stack mode to visually determine the stack member number of each stack member.

In the **default** mode Stack LED will blink in green color only on the active switch. However, when we scroll the Mode button to **Stack** option - Stack LED will glow green on all the stack members.

When mode button is scrolled to **Stack** option, the switch number of each stack member will be displayed as LEDs on the first five ports of that switch. The switch number is displayed in binary format for all stack members. On the switch, the amber LED indicates value 0 and green LED indicates value 1.

Example for switch number 5 (Binary - 00101):

First five LEDs glow as follows on stack member with switch number 5.

- Port-1 : Amber
- Port-2 : Amber
- Port-3 : Green
- Port-4 : Amber
- Port-5 : Green

Similarly, the first five LEDs glow amber or green, depending on the switch number on all stack members.

- Note**
- Stack port will not go down but only transmission/reception will be disabled. The log message shown below will be displayed on the console. Once the peer end network port is converted to stack port, transmission/reception on this stack port will be enabled.

```
%STACKMGR-4-HSTACK_LINK_CONFIG: Verify peer stack port setting for hstack
StackPort-1 switch 5 (hostname-switchnumber)
```

Stack Member Priority Values

A higher priority value for a stack member increases the probability of it being elected active switch and retaining its stack member number. The priority value can be 1 to 15. The default priority value is 1. You can display the stack member priority value by using the **show switch EXEC** command.

- Note** We recommend assigning the highest priority value to the device that you prefer to be the active device. This ensures that the device is reelected as the active device if a reelection occurs.

To change the priority value for a stack member, use the **switch stack-member-number priority new priority-value** command. For more information, see the “Setting the Stack Member Priority Value” section.

The new priority value takes effect immediately but does not affect the current active device. The new priority value helps determine which stack member is elected as the new active device when the current active device or the device stack resets.

Switch Stack Bridge ID and MAC Address

The MAC address of the active switch determines the stack MAC address.

When the stack initializes, the MAC address of the active switch determines the bridge ID that identifies the stack in the network.

If the active switch changes, the MAC address of the new active switch determines the new bridge ID and stack MAC address.

If the entire switch stack reloads, the switch stack uses the MAC address of the active switch.

Persistent MAC Address on the Switch Stack

You can use the persistent MAC address feature to set a time delay before the stack MAC address changes to the MAC address of the new active stack. When this feature is enabled, the stack MAC address changes in approximately 4 minutes. During this time, if the previous active stack rejoins the stack, the stack continues to use its MAC address as the stack MAC address, even if the switch is now a stack member and not the active stack. If the previous active stack does not rejoin the stack during this period, the switch stack takes the MAC address of the new active stack as the stack MAC address.

You can also configure stack MAC persistency so that the stack MAC address never changes to the new active switch MAC address.

Active and Standby Switch Election and Reelection

All stack members are eligible to be the active stack. If the active stack becomes unavailable, the remaining members elect a new active stack from among themselves.

The active switch is elected or reelected based on one of these factors and in the order listed:

1. The switch that is currently the active switch.
2. The switch with the highest stack member priority value.

**Note**

We recommend assigning the highest priority value to the switch that you prefer to be the active switch ensures that the switch is reelected as active switch if a reelection occurs.

3. The switch that has the configuration file.
4. The switch with the lowest MAC address.

An active stack retains its role unless one of these events occurs:

- The switch stack is reset.*
- The active stack is removed from the switch stack.
- The active stack is reset or powered off.
- The active stack fails.
- The switch stack membership is increased by adding powered-on standalone switches or switch stacks.*

In the events marked by an asterisk (*), the current active stack *might* be reelected based on the listed factors.

When you power on or reset an entire switch stack, some stack members *might not* participate in the active stack election. Stack members that are powered on within the same 20-second time frame participate in the active stack election and have a chance to become the active stack. Stack members that are powered on after the 20-second time frame do not participate in this initial election and become stack members. All stack members participate in reelections. For all powering considerations that affect active-stack elections, see the “Switch Installation” chapter in the hardware installation guide.

The new active stack becomes available after a few seconds. In the meantime, the switch stack uses the forwarding tables in memory to minimize network disruption. The physical interfaces on the other available stack members are not affected during a new active stack election and reset.

After a new active stack is elected and the previous active stack becomes available, the previous active stack *does not* resume its role as the active stack.

For all powering considerations that affect active-stack elections, see the *Catalyst 2960-XR Switch Hardware Installation Guide*.

Switch Stack Configuration Files

The active switch has the saved and running configuration files for the switch stack. All stack members periodically receive synchronized copies of the configuration files from the active switch. If the active switch becomes unavailable, any stack member assuming the role of active switch has the latest configuration files.

The configuration files record these settings:

- System-level (global) configuration settings such as IP, STP, VLAN, and SNMP settings that apply to all stack members
- Stack member interface-specific configuration settings that are specific for each stack member

Note The interface-specific settings of the active switch are saved if the active switch is replaced without saving the running configuration to the startup configuration.

A new, out-of-box device joining a switch stack uses the system-level settings of that switch stack. If a device is moved to a different switch stack before it is powered on, that device loses its saved configuration file and uses the system-level configuration of the new switch stack. If the device is powered on as a standalone device before it joins the new switch stack, the stack will reload. When the stack reloads, the new device may become the device, retain its configuration and overwrite the configuration files of the other stack members.

The interface-specific configuration of each stack member is associated with the stack member number. Stack members retain their numbers unless they are manually changed or they are already used by another member in the same switch stack. If the stack member number changes, the new number goes into effect after that stack member resets.

- If an interface-specific configuration does not exist for that member number, the stack member uses its default interface-specific configuration.
- If an interface-specific configuration exists for that member number, the stack member uses the interface-specific configuration associated with that member number.

If you replace a failed member with an identical model, the replacement member automatically uses the same interface-specific configuration as the failed device. You do not need to reconfigure the interface settings. The replacement device (referred to as the provisioned device) must have the same stack member number as the failed device.

You back up and restore the stack configuration in the same way as you would for a standalone device configuration.

Offline Configuration to Provision a Stack Member

You can use the offline configuration feature to *provision* (to supply a configuration to) a new switch before it joins the switch stack. You can configure the stack member number, the switch type, and the interfaces associated with a switch that is not currently part of the stack. The configuration that you create on the switch stack is called the *provisioned configuration*. The switch that is added to the switch stack and that receives this configuration is called the *provisioned switch*.

You manually create the provisioned configuration through the **switch stack-member-number provision type** global configuration command. You must change the *stack-member-number* on the provisioned switch before you add it to the stack, and it must match the stack member number that you created for the new switch on the switch stack. The switch type in the provisioned configuration must match the switch type of the newly added switch. The provisioned configuration is automatically created when a switch is added to a switch stack and when no provisioned configuration exists.

When you configure the interfaces associated with a provisioned switch, the switch stack accepts the configuration, and the information appears in the running configuration. However, as the switch is not active,

any configuration on the interface is not operational and the interface associated with the provisioned switch does not appear in the display of the specific feature. For example, VLAN configuration information associated with a provisioned switch does not appear in the **show vlan** user EXEC command output on the switch stack.

The switch stack retains the provisioned configuration in the running configuration whether or not the provisioned switch is part of the stack. You can save the provisioned configuration to the startup configuration file by entering the **copy running-config startup-config** privileged EXEC command. The startup configuration file ensures that the switch stack can reload and can use the saved information whether or not the provisioned switch is part of the switch stack.

Effects of Adding a Provisioned Switch to a Switch Stack

When you add a provisioned Device to the switch stack, the stack applies either the provisioned configuration or the default configuration. This table lists the events that occur when the switch stack compares the provisioned configuration with the provisioned switch.

Table 160: Results of Comparing the Provisioned Configuration with the Provisioned Switch

Scenario		Result
The stack member numbers and the Device types match.	<ol style="list-style-type: none"> 1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, and 2. If the Device type of the provisioned switch matches the Device type in the provisioned configuration on the stack. 	The switch stack applies the provisioned configuration to the provisioned switch and adds it to the stack.
The stack member numbers match but the Device types do not match.	<ol style="list-style-type: none"> 1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, but 2. The Device type of the provisioned switch does not match the Device type in the provisioned configuration on the stack. 	<p>The switch stack applies the default configuration to the provisioned switch and adds it to the stack.</p> <p>The provisioned configuration is changed to reflect the new information.</p>
The stack member number is not found in the provisioned configuration.		<p>The switch stack applies the default configuration to the provisioned switch and adds it to the stack.</p> <p>The provisioned configuration is changed to reflect the new information.</p>
The stack member number of the provisioned switch is not found in the provisioned configuration.		The switch stack applies the default configuration to the provisioned switch and adds it to the stack.

If you add a provisioned switch that is a different type than specified in the provisioned configuration to a powered-down switch stack and then apply power, the switch stack rejects the (now incorrect) **switch stack-member-number provision type** global configuration command in the startup configuration file. However, during stack initialization, the nondefault interface configuration information in the startup configuration file for the provisioned interfaces (potentially of the wrong type) is executed. Depending on the differences between the actual Device type and the previously provisioned switch type, some commands are rejected, and some commands are accepted.

Note If the switch stack does not contain a provisioned configuration for a new Device, the Device joins the stack with the default interface configuration. The switch stack then adds to its running configuration with a **switch stack-member-number provision type** global configuration command that matches the new Device. For configuration information, see the *Provisioning a New Member for a Switch Stack* section.

Effects of Replacing a Provisioned Switch in a Switch Stack

When a provisioned switch in a switch stack fails, it is removed from the stack, and is replaced with another Device, the stack applies either the provisioned configuration or the default configuration to it. The events that occur when the switch stack compares the provisioned configuration with the provisioned switch are the same as those when you add a provisioned switch to a stack.

Effects of Removing a Provisioned Switch from a Switch Stack

If you remove a provisioned switch from the switch stack, the configuration associated with the removed stack member remains in the running configuration as provisioned information. To completely remove the configuration, use the **no switch stack-member-number provision** global configuration command.

Stack Protocol Version

Each software image includes a *stack protocol version*. The stack protocol version has a *major* version number and a *minor* version number (for example 1.4, where 1 is the major version number and 4 is the minor version number). Both version numbers determine the level of compatibility among the stack members. You can display the stack protocol version by using the **show platform stack manager all** privileged EXEC command.

The switches with the same Cisco IOS software version have the same stack protocol version. Such switches are fully compatible, and all features function properly across the switch stack. A device with the same Cisco IOS software version as the active switch can immediately join the switch stack.

If an incompatibility exists, the fully functional stack members generate a system message that describes the cause of the incompatibility on the specific stack members. The active switch sends the message to all stack members.

For more information, see the *Major Version Number Incompatibility Among Switches* procedure and the *Minor Version Number Incompatibility Among Switches* procedure.

Major Stack Protocol Version Number Incompatibility Among Stack-Capable Switches

Device with different major Cisco IOS software versions usually have different stack protocol versions. Device with different major version numbers are incompatible and cannot exist in the same switch stack.

Minor Stack Protocol Version Number Incompatibility Among Stack-Capable Switches

Switches with the same major version number but with a different minor version number are considered partially compatible. When connected to a switch stack, a partially compatible switch enters version-mismatch (VM) mode and cannot join the stack as a fully functioning member. The software detects the mismatched software and tries to upgrade (or downgrade) the switch in VM mode with the switch stack image or with a tar file image from the switch stack flash memory. The software uses the automatic upgrade (auto-upgrade) and the automatic advise (auto-advise) features.

The port LEDs on switches in version-mismatch mode will also remain off. Pressing the Mode button does not change the LED mode.

Auto-Upgrade

The purpose of the auto-upgrade feature is to allow a switch to be upgraded to a compatible software image, so that the switch can join the switch stack.

When a new switch attempts to join a switch stack, each stack member performs compatibility checks with itself and the new switch. Each stack member sends the results of the compatibility checks to the active stack, which uses the results to determine whether the switch can join the switch stack. If the software on the new switch is incompatible with the switch stack, the new switch enters version-mismatch (VM) mode.

If the auto-upgrade feature is enabled on the existing switch stack, the active stack automatically upgrades the new switch with the same software image running on a compatible stack member. Auto-upgrade starts a few minutes after the mismatched software is detected before starting.

By default, auto-upgrade is enabled (the **boot auto-copy-sw** global configuration command is enabled). You can disable auto-upgrade by using the **no boot auto-copy-sw** global configuration command on the active stack. You can check the status of auto-upgrade by using the **show boot** privileged EXEC command and by checking the *Auto upgrade* line in the display.

Auto-upgrade includes an auto-copy process and an auto-extract process.

- Auto-copy automatically copies the software image running on any stack member to the new switch to automatically upgrade it. Auto-copy occurs if auto-upgrade is enabled, if there is enough flash memory in the new switch, and if the software image running on the switch stack is suitable for the new switch.

Note A switch in VM mode might not run all released software. For example, new switch hardware is not recognized in earlier versions of software.

- Automatic extraction (auto-extract) occurs when the auto-upgrade process cannot find the appropriate software in the stack to copy to the new switch. In that case, the auto-extract process searches all switches in the stack for the tar file needed to upgrade the switch stack or the new switch. The tar file can be in any flash file system in the switch stack or in the new switch. If a tar file suitable for the new switch is found on a stack member, the process extracts the file and automatically upgrades the new switch.

The auto-upgrade (auto-copy and auto-extract) processes start a few minutes after the mismatched software is detected.

When the auto-upgrade process is complete, the new switch reloads and joins the stack as a fully functioning member. If you have both stack cables connected during the reload, network downtime does not occur because the switch stack operates on two rings.

Auto-Advise

Automatic advise (auto-advise) occurs when the auto-upgrade process cannot find appropriate stack member software to copy to the new switch. This process tells you the command (**archive copy-sw** or **archive download-sw** privileged EXEC command) and the image name (tar filename) needed to manually upgrade the switch stack or the new switch. The recommended image can be the running switch stack image or a tar file in any flash file system in the switch stack (including the new switch). If an appropriate image is not found in the stack flash file systems, the auto-advise process tells you to install new software on the switch stack. Auto-advise cannot be disabled, and there is no command to check its status.

Examples of Auto-Advise Messages

When you add a switch that has a different minor version number to the switch stack, the software displays messages in sequence (assuming that there are no other system messages generated by the switch).

This example shows that the switch stack detected a new switch that is running a different minor version number than the switch stack. Auto-copy starts, finds suitable software to copy from a stack member to the switch in VM mode, upgrades the switch in VM mode, and then reloads it:

*Mar 11 20:36:15.038:%IMAGEMGR-6-AUTO_COPY_SW:Reloading system(s) 1

```

This example shows that the switch stack detected a new switch that is running a different minor version number than the switch stack. Auto-copy starts but cannot find software in the switch stack to copy to the VM-mode switch to make it compatible with the switch stack. The auto-advise process starts and recommends that you download a tar file from the network to the switch in VM mode:

```

*Mar 1 00:01:11.319:%STACKMGR-6-STACK_LINK_CHANGE:Stack Port 2 Switch 2 has changed to state
UP
*Mar 1 00:01:15.547:%STACKMGR-6-SWITCH_ADDED_VM:Switch 1 has been ADDED to the stack
(VERSION_MISMATCH)

*Mar 1 00:04:22.537:%IMAGEMGR-6-AUTO_ADVISE_SW:command(s) :
*Mar 1 00:04:22.537:%IMAGEMGR-6-AUTO_ADVISE_SW:
*Mar 1 00:04:22.537:%IMAGEMGR-6-AUTO_ADVISE_SW: archive download-sw /force-reload /overwrite
/dest 1 flash1:c2960x-universalk9-mz.150-2.EX1.tar
*Mar 1 00:04:22.537:%IMAGEMGR-6-AUTO_ADVISE_SW:

```

Note Auto-advise and auto-copy identify which images are running by examining the info file and by searching the directory structure on the switch stack. If you download your image by using the **copy tftp:** boot loader command instead of the **archive download-sw** privileged EXEC command, the proper directory structure is not created.

SDM Template Mismatch in Switch Stacks

All stack members use the Switch Database Management (SDM) template configured on the active switch. When a new switch is added to a stack, the SDM configuration that is stored on the active switch overrides the template configured on an individual switch.

You can use the **show switch** privileged EXEC command to see if any stack members are in SDM-mismatch mode.

Version-mismatch (VM) mode has priority over SDM-mismatch mode. If a VM-mode condition and an SDM-mismatch mode exist, the switch stack first attempts to resolve the VM-mode condition.

For more information about SDM templates, see the *Catalyst 2960-XR Switch System Management Configuration Guide*.

Switch Stack Management Connectivity

You manage the switch stack and the stack member interfaces through the active switch. You can use the CLI, SNMP, and any of the supported network management applications. You cannot manage stack members on an individual device basis.

Connectivity to Specific Stack Members

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug a specific stack member, you can access it from the active stack by using the **session stack-member-number** privileged EXEC command. The stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the active stack is Switch. Only the **show** and **debug** commands are available in a CLI session to a specific stack member.

Connectivity to the Switch Stack Through an IP Address

The switch stack is managed through a single IP address. The IP address is a system-level setting and is not specific to the active stack or to any other stack member. You can still manage the stack through the same IP address even if you remove the active stack or any other stack member from the stack, provided there is IP connectivity.

Note Stack members retain their IP addresses when you remove them from a switch stack. To avoid a conflict by having two devices with the same IP address in your network, change the IP addresses of any active stack that you remove from the switch stack.

For related information about switch stack configurations, see the *Switch Stack Configuration Files* section.

Connectivity to the Switch Stack Through Console Ports or Ethernet Management Ports

You can connect to the active switch by using one of these methods:

- You can connect a terminal or a PC to the active switch through the console port of one or more stack members.
- You can connect a PC to the active switch through the Ethernet management ports of one or more stack members. For more information about connecting to the switch stack through Ethernet management ports, see the *Using the Ethernet Management Port* section.

You can connect to the active switch by connecting a terminal or a PC to the active switch through the console port of one or more stack members.

When you use the console port of a stack member, a VTY session is created with the IP address in the 192.168.0.1/24 subnet.

Be careful when using multiple CLI sessions to the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

We recommend using only one CLI session when managing the switch stack.

How to Configure a Switch Stack

Enabling the Persistent MAC Address Feature

Note When you enter the command to configure this feature, a warning message appears with the consequences of your configuration. You should use this feature cautiously. Using the old active switch MAC address elsewhere in the same domain could result in lost traffic.

Follow these steps to enable persistent MAC address:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **stack-mac persistent timer [0 | *time-value*]**
4. **end**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device> enable</pre>	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	<p>stack-mac persistent timer [0 <i>time-value</i>]</p> <p>Example:</p> <pre>Device(config)# stack-mac persistent timer 7</pre>	<p>Enables a time delay after a stack-active switch change before the stack MAC address changes to that of the new ac. If the previous active switch rejoins the stack during this period, the stack uses that MAC address as the stack MAC address.</p> <p>You can configure the time period as 0 to 60 minutes.</p> <ul style="list-style-type: none"> Enter the command with no value to set the default delay of approximately 4 minutes. We recommend that you always enter a value. <p>If the command is entered without a value, the time delay appears in the running-config file with an explicit timer value of 4 minutes.</p> <ul style="list-style-type: none"> Enter 0 to continue using the MAC address of the current active switch indefinitely. <p>The stack MAC address of the previous active switch is used until you enter the no stack-mac persistent timer command, which immediately changes the stack MAC address to that of the current active switch.</p> <ul style="list-style-type: none"> Enter a <i>time-value</i> from 1 to 60 minutes to configure the time period before the stack MAC address changes to the new active switch. <p>The stack MAC address of the previous active switch is used until the configured time period expires or until you enter the no stack-mac persistent timer command.</p> <p>Note If you enter the no stack-mac persistent timer command after a new active switch takes over, before the time expires, the switch stack moves to the current active switch MAC address.</p>
Step 4	<p>end</p> <p>Example:</p>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# end	
Step 5	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

What to do next

Use the **no stack-mac persistent timer** global configuration command to disable the persistent MAC address feature.

Assigning a Stack Member Number

This optional task is available only from the active stack.

Follow these steps to assign a member number to a stack member:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **switch** *current-stack-member-number* **renumber** *new-stack-member-number*
4. **end**
5. **reload slot** *stack-member-number*
6. **show switch**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	switch <i>current-stack-member-number</i> renumber <i>new-stack-member-number</i> Example: Device(config)# switch 3 renumber 4	Specifies the current stack member number and the new stack member number for the stack member. The range is 1 to 8. You can display the current stack member number by using the show switch user EXEC command.
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 5	reload slot <i>stack-member-number</i> Example: Device# reload slot 4	Resets the stack member.
Step 6	show switch Example: showDevice	Verify the stack member number.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Setting the Stack Member Priority Value

This optional task is available only from the active stack.

Follow these steps to assign a priority value to a stack member:

SUMMARY STEPS

1. **enable**
2. **switch** *stack-member-number* **priority** *new-priority-number*
3. **show switch** *stack-member-number*
4. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Device enable	
Step 2	switch <i>stack-member-number</i> priority <i>new-priority-number</i> Example: Device# switch 3 priority 2	Specifies the stack member number and the new priority for the stack member. The stack member number range is 1 to 8. The priority value range is 1 to 15. You can display the current priority value by using the show switch user EXEC command. The new priority value takes effect immediately but does not affect the current active stack. The new priority value helps determine which stack member is elected as the new active stack when the current active stack or switch stack resets.
Step 3	show switch <i>stack-member-number</i> Example: Device# show switch	Verify the stack member priority value.
Step 4	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Provisioning a New Member for a Switch Stack

This optional task is available only from the active switch.

SUMMARY STEPS

1. **show switch**
2. **configure terminal**
3. **switch** *stack-member-number* **provision** *type*
4. **end**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	show switch Example: Device# show switch	Displays summary information about the switch stack.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	switch <i>stack-member-number</i> provision <i>type</i> Example: Device(config)# <code>switch 3 provision WS-xxxx</code>	Specifies the stack member number for the preconfigured switch. By default, no switches are provisioned. For <i>stack-member-number</i> , the range is 1 to 8. Specify a stack member number that is not already used in the switch stack. See Step 1. For <i>type</i> , enter the model number of a supported switch that is listed in the command-line help strings.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 5	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Removing Provisioned Switch Information

Before you begin, you must remove the provisioned switch from the stack. This optional task is available only from the active stack.

SUMMARY STEPS

1. `configure terminal`
2. `no switch stack-member-number provision`
3. `end`
4. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	no switch <i>stack-member-number</i> provision Example: Device(config)# <code>no switch 3 provision</code>	Removes the provisioning information for the specified member.

	Command or Action	Purpose
Step 3	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 4	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Example

If you are removing a provisioned switch in a stack with this configuration:

- The stack has four members
- Stack member 1 is the active stack
- Stack member 3 is a provisioned switch

and want to remove the provisioned information and to avoid receiving an error message, you can remove power from stack member 3, disconnect the stack cables between the stack member 3 and switches to which it is connected, reconnect the cables between the remaining stack members, and enter the **no switch stack-member-number provision** global configuration command.

Troubleshooting the Switch Stack

Accessing the CLI of a Specific Member

This optional task is for debugging purposes, and is available only from the active switch.

You can access all or specific members by using the **remote command** {**all** | *stack-member-number*} privileged EXEC command. The stack member number range is 1 to 8.

You can access specific members by using the **session** *stack-member-number* privileged EXEC command. The member number is appended to the system prompt. For example, the prompt for member 2 is **Switch-2#**, and system prompt for the active switch is **Switch#**. Enter **exit** to return to the CLI session on the active switch. Only the **show** and **debug** commands are available on a specific member.

Temporarily Disabling a Stack Port

If a stack port is flapping and causing instability in the stack ring, to disable the port, enter the **switch stack-member-number stack port port-number disable** privileged EXEC command. To reenble the port, enter the **switch stack-member-number stack port port-number enable** command.

Note Be careful when using the **switch stack-member-number stack port port-number disable** command. When you disable the stack port, the stack operates at half bandwidth.

A stack is in the full-ring state when all members are connected through the stack ports and are in the ready state.

The stack is in the partial-ring state when the following occurs:

- All members are connected through their stack ports but some are not in the ready state.
- Some members are not connected through the stack ports.

SUMMARY STEPS

1. **switch stack-member-number stack port port-number disable**
2. **switch stack-member-number stack port port-number enable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	switch stack-member-number stack port port-number disable Example: Device# switch 2 stack port 1 disable	Disables the specified stack port.
Step 2	switch stack-member-number stack port port-number enable Example: Device# switch 2 stack port 1 enable	Reenables the stack port.

When you disable a stack port and the stack is in the full-ring state, you can disable only one stack port. This message appears:

```
Enabling/disabling a stack port may cause undesired stack changes. Continue?[confirm]
```

When you disable a stack port and the stack is in the partial-ring state, you cannot disable the port. This message appears:

```
Disabling stack port not allowed with current stack configuration.
```

Reenabling a Stack Port While Another Member Starts

Stack Port 1 on Switch 1 is connected to Port 2 on Switch 4. If Port 1 is flapping, you can disable Port 1 with the **switch 1 stack port 1 disable** privileged EXEC command. While Port 1 on Switch 1 is disabled and Switch 1 is still powered on, follow these steps to reenabling a stack port:

-
- Step 1** Disconnect the stack cable between Port 1 on Switch 1 and Port 2 on Switch 4.
- Step 2** Remove Switch 4 from the stack.
- Step 3** Add a switch to replace Switch 4 and assign it switch-number 4.
- Step 4** Reconnect the cable between Port 1 on Switch 1 and Port 2 on Switch 4 (the replacement switch).
- Step 5** Reenable the link between the switches. Enter the **switch 1 stack port 1 enable** privileged EXEC command to enable Port 1 on Switch 1.
- Step 6** Power on Switch 4.
-

Caution Powering on Switch 4 before enabling the Port 1 on Switch 1 might cause one of the switches to reload. If Switch 4 is powered on first, you might need to enter the **switch 1 stack port 1 enable** and the **switch 4 stack port 2 enable** privileged EXEC commands to bring up the link.

Monitoring the Device Stack

Table 161: Commands for Displaying Stack Information

Command	Description
show controller ethernet-controller stack port {1 2}	Displays stack port counters (or per-interface and per-stack port send and receive statistics read from the hardware).
show controller ethernet-controller fastethernet0	Displays information about the Ethernet management port, including the port status and the per-interface send and receive statistics read from the hardware.
show platform stack compatibility	Displays information about HULC feature compatibility.
show platform stack manager all	Displays all stack manager information, such as the stack protocol version.
show platform stack passive-links	Displays information about stack passive links.
show switch	Displays summary information about the stack, including the status of provisioned switches and switches in version-mismatch mode.
show switch <i>stack-member-number</i>	Displays information about a specific member.
show switch detail	Displays detailed information about the stack.
show switch neighbors	Displays the stack neighbors.
show switch stack-ports	Displays port information for the stack.

Configuration Examples for Switch Stacks

Switch Stack Configuration Scenarios

Most of these switch stack configuration scenarios assume that at least two device are connected through their stack ports.

Table 162: Configuration Scenarios

Scenario		Result
Active switch election specifically determined by existing active switches	Connect two powered-on switch stacks through the stack ports.	Only one of the two active switches becomes the new active switch.
Active switch election specifically determined by the stack member priority value	<ol style="list-style-type: none"> 1. Connect two switches through their stack ports. 2. Use the switch stack-member-number priority new-priority-number global configuration command to set one stack member with a higher member priority value. 3. Restart both stack members at the same time. 	The stack member with the higher priority value is elected active switch.
Active switch election specifically determined by the configuration file	<p>Assuming that both stack members have the same priority value:</p> <ol style="list-style-type: none"> 1. Make sure that one stack member has a default configuration and that the other stack member has a saved (nondefault) configuration file. 2. Restart both stack members at the same time. 	The stack member with the saved configuration file is elected active switch.
Active switch election specifically determined by the MAC address	Assuming that both stack members have the same priority value, configuration file, and feature set, restart both stack members at the same time.	The stack member with the lower MAC address is elected active switch.

Scenario		Result
Stack member number conflict	<p>Assuming that one stack member has a higher priority value than the other stack member:</p> <ol style="list-style-type: none"> 1. Ensure that both stack members have the same stack member number. If necessary, use the switch <i>current-stack-member-number</i> renumber <i>new-stack-member-number</i> global configuration command. 2. Restart both stack members at the same time. 	The stack member with the higher priority value retains its stack member number. The other stack member has a new stack member number.
Add a stack member	<ol style="list-style-type: none"> 1. Power off the new switch. 2. Through their stack ports, connect the new switch to a powered-on switch stack. 3. Power on the new switch. 	The active switch is retained. The new switch is added to the switch stack.
Active switch failure	Remove (or power off) the active switch.	One of the remaining stack members becomes the new active switch. All other stack members in the stack remain as stack members and do not reboot.
Add more than eight stack members	<ol style="list-style-type: none"> 1. Through their stack ports, connect nine device. 2. Power on all device. 	<p>Two device become active switches. One active switch has eight stack members. The other active switch remains as a standalone device.</p> <p>Use the Mode button and port LEDs on the device to identify which device are active switches and which device belong to each active switch.</p>

Enabling the Persistent MAC Address Feature: Example

This example shows how to configure the persistent MAC address feature for a 7-minute time delay and to verify the configuration:

```

Device(config)# stack-mac persistent timer 7
WARNING: The stack continues to use the base MAC of the old Master
WARNING: as the stack MAC after a master switchover until the MAC
WARNING: persistency timer expires. During this time the Network
WARNING: Administrators must make sure that the old stack-mac does
WARNING: not appear elsewhere in this network domain. If it does,
WARNING: user traffic may be blackholed.
Device(config)# end
Device# show switch

```

```
Switch/Stack Mac Address : 0016.4727.a900
Mac persistency wait time: 7 mins

Switch#  Role   Mac Address      Priority  H/W   Current
-----  -
*1       Master 0016.4727.a900   1        P2B   Ready
```

Provisioning a New Member for a Switch Stack: Example

This example shows how to provision a switch with a stack member number of 2 for the switch stack. The **show running-config** command output shows the interfaces associated with the provisioned switch:

```
Device(config)# switch 2 provision switch_PID
Device(config)# end
Device# show running-config | include switch 2
switch 2 provision switch_PID
```

CHAPTER 83

FlexStack-Extended

This module describes the FlexStack-Extended feature supported on Catalyst 2960-X Series Switches with LAN Base license and Cisco Catalyst 2960-XR Series Switches.

- [Restrictions for FlexStack-Extended, on page 1665](#)
- [Information About FlexStack-Extended, on page 1665](#)
- [How to Configure FlexStack-Extended, on page 1668](#)
- [Configuration Examples for FlexStack-Extended, on page 1671](#)
- [Feature Information for FlexStack-Extended, on page 1672](#)

Restrictions for FlexStack-Extended

The following restrictions apply to the horizontal stacking of switches.

- For fiber module, both ports must be configured as either network ports or stack ports. Do not configure one port as a network port and the other as a stack port.
- Online Insertion and Removal (OIR) is possible only with the same type of port.
- To connect a switch with a FlexStack module to a switch with a hybrid module, set the speed manually. The stack speed should be set to 10G.
- If the stack module (hybrid or fiber) on a switch is replaced with a FlexStack module, the bandwidth must to be reset manually.

Information About FlexStack-Extended

FlexStack-Extended

Prior to Cisco IOS Release 15.2(6)E, stacking was supported with FlexStack-Plus module, which has two copper stack ports. Copper stack ports support short reach connectivity across local switches. FlexStack-Extended overcomes the problem of short reach connectivity by using 10G SFP+ ports to enable stacking that allows long reach stacking using optics.

The same models that support FlexStack-Plus on Cisco Catalyst 2960-X Series Switches and Cisco Catalyst 2960-XR Series Switches support FlexStack-Extended.

When you convert a network port to a stack port, it continues to work as a network port without any impact to the current running configuration until the next reload of the switch.

When you convert a stack port back to a network port, it continues to work as a stack port until the next reload. After reload, the port comes up as a network port with the default configuration.

Note When uplink ports are working as stack ports, these particular uplink interfaces (for example, TenGigabitEthernet 1/1/1) are not displayed in any show command or are not available under any configuration command, unlike other network ports. These uplink interfaces are made available only after the reload of the switch; once ports are converted back to network ports.

FlexStack-Extended on Catalyst 2960-X and 2960-XR Switches

Cisco Catalyst 2960-X and 2960-XR Series Switches support FlexStack-Extended with hybrid stack and fiber stack modules, and also with 10G SFP+ front panel uplink ports.

The following models support FlexStack-Extended with hybrid stack and fiber stack modules:

- Cisco Catalyst 2960X-24PD-L
- Cisco Catalyst 2960X-24PS-L
- Cisco Catalyst 2960X-24TD-L
- Cisco Catalyst 2960X-24TS-L
- Cisco Catalyst 2960X-48FPD-L
- Cisco Catalyst 2960X-48FPS-L
- Cisco Catalyst 2960X-48LPD-L
- Cisco Catalyst 2960X-48LPS-L
- Cisco Catalyst 2960X-48TD-L
- Cisco Catalyst 2960XR-24PD-I
- Cisco Catalyst 2960XR-24PS-I
- Cisco Catalyst 2960XR-24TD-I
- Cisco Catalyst 2960XR-48FPD-I
- Cisco Catalyst 2960XR-48FPS-I
- Cisco Catalyst 2960XR-48LPD-I
- Cisco Catalyst 2960XR-48LPS-I
- Cisco Catalyst 2960XR-48TD-I

The following models support front-panel stacking:

- Cisco Catalyst 2960X-24TD-L
- Cisco Catalyst 2960X-48FPD-L

- Cisco Catalyst 2960X-48LPD-L
- Cisco Catalyst 2960X-48TD-L
- Cisco Catalyst 2960XR-24PD-I
- Cisco Catalyst 2960XR-24TD-I
- Cisco Catalyst 2960XR-48FPD-I
- Cisco Catalyst 2960XR-48LPD-I
- Cisco Catalyst 2960XR-48TD-I

A hybrid stack module has one copper stack connector and one SFP+ port. The copper port allows short-reach connectivity across the local stack of switches, and the SFP+ allows for long-reach stacking using standard optics. Hybrid-stack module ports can only be used as stack ports. The SFP+ port of the module cannot be changed to a network port.

A fiber stack module has two SFP+ interfaces, which allows for long-reach stacking using standard optics. Fiber stack ports are used either as network ports or stack ports. By default all ports on the fiber stack module are stack port. These ports can be converted to network ports.

Note Stack fast convergence is not supported on hybrid stack and fiber stack modules.

The stack bandwidth for the following stack configuration is 40G:

- Stack using hybrid stack module.
- Stack using fiber stack module.
- Stack using FlexStack-Plus, hybrid, and fiber modules.

For more information on Installing the Switch, see the *Catalyst 2960-X and 2960-XR Switch Hardware Installation Guide* on www.cisco.com.

In Cisco IOS Release 15.2(6)E, FlexStack-Extended is supported on C2960X-HYBRID-STK and C2960X-FIBER-STK modules. By default, all ports are treated as stack ports. Online Insertion and Removal (OIR) of these module (hot swappable) is supported; however, these should be replaced with the same module type. If the module is replaced by a different module type, a reload is required.

The SFP+ port in C2960X-HYBRID-STK module can only be used as a stack port.

Two 10G SFP+ stack ports in the C2960X-FIBER-STK module can be converted to network ports. Using one port as uplink and the other as a stack port is not supported. The SFP+ ports are displayed as Te1/1/1 and Te1/1/2 when converted to network ports.

All SFP+ optics supported by front panel uplink ports are supported by these modules.

Default Port Configurations

The following section lists the default port configurations:

Hybrid Stack

- The default is stack port.

Fiber Stack

- The default is stack port.

FlexStack-Extended LED

The light-emitting diode (LED) behavior is the same for stack ports and network ports. The LED status is as given below:

- OFF—Cable removed/no cable/the switch is off.
- Solid green—Cable inserted and link is up.
- Blinking green—Traffic is running.
- Blinking amber—Cable is connected and the link is coming up.

How to Configure FlexStack-Extended

The 10G SFP+ can be used either as a network port or a stack port.

- All TenGigabitEthernet ports available on the active stack and all stack members that are capable of FlexStack-Extended can be converted to network ports or stack ports.
- If any TenGigabitEthernet port is converted to a horizontal stack port, the stack port number (1 or 2) is displayed corresponding to that port.

Note You cannot choose one stack port from the front panel and another from the back panel. Both stack ports should either be from the front panel or back panel. The following example shows how to configure hstack ports:

```
switch 1 hstack-port 1 Tengigabitethernet 1/0/1
switch 1 hstack-port 2 Tengigabitethernet 1/0/2
```

Configuring a Stack Port as a Network Port

You can configure both 10G stack ports as network ports.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no switch** *switch-number* **hstack-port** *stack-port*
4. **exit**
5. **reload**
6. **show switch hstack-ports**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables Privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	no switch switch-number hstack-port stack-port Example: Device(config)# no switch 1 hstack-port 1	Configures the stack port as a network port. <ul style="list-style-type: none">• The TenGigabitEthernet interface number is automatically added when the command is configured.
Step 4	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.
Step 5	reload Example: Device# reload	Reloads a device. <ul style="list-style-type: none">• Save the configuration by using the copy running-config startup-config command before reloading a device.
Step 6	show switch hstack-ports Example: Device# show switch hstack-ports	Shows the current status and the next reload status for ports. Note For Flexstack-Plus and Hybrid stack modules, port numbers are not displayed.

What to do next

The following is sample output from the **show switch hstack-ports** command:

```
Device# show switch hstack-ports

Horizontal stack port status :
Te Ports  Stack Port  Operational Status  Next Reload Status  Media Type
-----
Tel/0/1   NA           N/W Port           N/W Port           Fiber
Tel/0/2   NA           N/W Port           N/W Port           Fiber
Tel/1/1   NA           N/W port           N/W port           Fiber
Tel/1/2   NA           N/W Port           N/W port           Fiber
```

Configuring a Network Port as a Stack Port

You can configure both 10G Network ports as stack ports.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **switch** *switch-number* **hstack-port** *stack-port* *interface-id* [**tengigabitethernet** *interface-number*]
4. **exit**
5. **reload**
6. **show switch hstack-ports**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables Privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	switch <i>switch-number</i> hstack-port <i>stack-port</i> <i>interface-id</i> [tengigabitethernet <i>interface-number</i>] Example: Device(config)# switch 1 hstack-port 1 Tengigabitethernet 1/1/1	Configures the network port as a stack port.
Step 4	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.
Step 5	reload Example: Device# reload	Reloads a device. <ul style="list-style-type: none">• Save the configuration by using the copy running-config startup-config command before reloading a device.
Step 6	show switch hstack-ports Example: Device# show switch hstack-ports	Shows the current status and the next reload status for the ports. Note For Flexstack-Plus and Hybrid stack modules, the port numbers cannot be seen.

Example

The following is sample output from the **show switch hstack-ports** command:

```
Device# show switch hstack-ports
```

```

Horizontal stack port status :
-----
Te Ports  Stack Port  Operational Status  Next Reload Status  Media Type
-----
Tel/0/1   NA           N/W Port           N/W Port           Fiber
Tel/0/2   NA           N/W Port           N/W Port           Fiber
Tel/1/1   1           Stack Port         Stack Port         Fiber
Tel/1/2   2           Stack Port         Stack Port         Fiber

```

Configuring the Stack Speed

The speed change is configured on the back stack port with a FlexStack-Plus module. Perform this task to configure the stack speed.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **switch stack port-speed *speed***
4. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables Privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	switch stack port-speed <i>speed</i> Example: Device(config)# switch stack port-speed 10	Configures the speed of the switch stack port. Note Use the no form of the command to change the stack speed.
Step 4	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.

Configuration Examples for FlexStack-Extended

Examples: Configuring FlexStack-Extended

The following example shows how to convert a stack port to network port:

```
Device> enable
Device# configure terminal
Device(config)# no switch 1 hstack-port 1

Do you want to continue?[confirm]
New port setting will be effective after next reload
```

The following is sample output from the **show switch hstack-ports** command:

```
Device# show switch hstack-ports

Horizontal stack port status :
-----
Te Ports  Stack Port  Operational Status  Next Reload Status  Media Type
-----
Tel1/0/1  NA              N/W Port            N/W Port            Fiber
Tel1/0/2  NA              N/W Port            N/W Port            Fiber
Tel1/1/1  NA              N/W Port            N/W Port            Fiber
Tel1/1/2  NA              N/W Port            N/W Port            Fiber
```

The following example shows how you can set the speed of the switch stack port:

```
Device> enable
Device# configure terminal
Device(config)# switch stack port-speed 10
Device(config)# end
```

Feature Information for FlexStack-Extended

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 163: Feature Information for FlexStack-Extended

Feature Name	Release	Feature Information
FlexStack-Extended	Cisco IOS Release 15.2(6)E	Switches that support 10G Small Form-Factor Pluggable (SFP+) uplink ports can be part of horizontal stacking. Based on your requirement, create a half-ring or a full-ring stack, and remaining uplink ports can continue to work as network ports. In Cisco IOS Release 15.2(6)E, this feature was implemented on the following platforms: <ul style="list-style-type: none"> • Cisco Catalyst 2960-XR Series Switches

Prerequisites for VTP

The following are prerequisites for VTP:

- Before you create VLANs, you must decide whether to use the VLAN Trunking Protocol (VTP) in your network. Using VTP, you can make configuration changes centrally on one or more switches and have those changes automatically communicated to all the other switches in the network. Without VTP, you cannot send information about VLANs to other switches. VTP is designed to work in an environment where updates are made on a single switch and are sent through VTP to other switches in the domain. It does not work well in a situation where multiple updates to the VLAN database occur simultaneously on switches in the same domain, which would result in an inconsistency in the VLAN database.
- The switch supports 1005 VLANs when running the IP Lite image.
- The switch supports 255 VLANs when running the LAN base feature set.
- However, the number of routed ports, SVIs, and other configured features affects the usage of the switch hardware. If the switch is notified by VTP of a new VLAN and the switch is already using the maximum available hardware resources, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the **show vlan user EXEC** command shows the VLAN in a suspended state.

Information About VTP

VTP

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

VTP version 1 and version 2 support only normal-range VLANs (VLAN IDs 1 to 1005). VTP version 3 supports the entire VLAN range (VLANs 1 to 4094). Extended range VLANs (VLANs 1006 to 4094) are supported only in VTP version 3.

You cannot convert from VTP version 3 to VTP version 2 if extended VLANs are configured in the domain.

VTP Domain

A VTP domain (also called a VLAN management domain) consists of one device or several interconnected devices or device stacks under the same administrative responsibility sharing the same VTP domain name. A device can be in only one VTP domain. You make global VLAN configuration changes for the domain.

By default, the device is in the VTP no-management-domain state until it receives an advertisement for a domain over a trunk link (a link that carries the traffic of multiple VLANs) or until you configure a domain name. Until the management domain name is specified or learned, you cannot create or modify VLANs on a VTP server, and VLAN information is not propagated over the network.

If the device receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The device then ignores advertisements with a different domain name or an earlier configuration revision number.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all devices in the VTP domain. VTP advertisements are sent over all IEEE trunk connections, including IEEE 802.1Q. VTP dynamically maps VLANs with unique names and internal index associates across multiple LAN types. Mapping eliminates excessive device administration required from network administrators.

If you configure a device for VTP transparent mode, you can create and modify VLANs, but the changes are not sent to other devices in the domain, and they affect only the individual device. However, configuration changes made when the device is in this mode are saved in the device running configuration and can be saved to the device startup configuration file.

VTP Modes

Table 164: VTP Modes

VTP Mode	Description
VTP server	<p>In VTP server mode, you can create, modify, and delete VLANs, and specify other configuration parameters (such as the VTP version) for the entire VTP domain. VTP servers advertise their VLAN configurations to other devices in the same VTP domain and synchronize their VLAN configurations with other devices based on advertisements received over trunk links.</p> <p>VTP server is the default mode.</p> <p>In VTP server mode, VLAN configurations are saved in NVRAM. If the device detects a failure while writing a configuration to NVRAM, VTP mode automatically changes from server mode to client mode. If this happens, the device cannot be returned to VTP server mode until the NVRAM is functioning.</p>
VTP client	<p>A VTP client functions like a VTP server and transmits and receives VTP updates on its trunks, but you cannot create, change, or delete VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode.</p> <p>In VTP versions 1 and 2 in VTP client mode, VLAN configurations are not saved in NVRAM. In VTP version 3, VLAN configurations are saved in NVRAM in client mode.</p>

VTP Mode	Description
VTP transparent	<p>VTP transparent devices do not participate in VTP. A VTP transparent device does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2 or version 3, transparent devices do forward VTP advertisements that they receive from other devices through their trunk interfaces. You can create, modify, and delete VLANs on a device in VTP transparent mode.</p> <p>In VTP versions 1 and 2, the device must be in VTP transparent mode when you create private VLANs and when they are configured, you should not change the VTP mode from transparent to client or server mode. VTP version 3 also supports private VLANs in client and server modes. When private VLANs are configured, do not change the VTP mode from transparent to client or server mode.</p> <p>When the device is in VTP transparent mode, the VTP and VLAN configurations are saved in NVRAM, but they are not advertised to other devices. In this mode, VTP mode and domain name are saved in the device running configuration, and you can save this information in the device startup configuration file by using the copy running-config startup-config privileged EXEC command.</p>
VTP off	A device in VTP off mode functions in the same manner as a VTP transparent device, except that it does not forward VTP advertisements on trunks.

VTP Advertisements

Each device in the VTP domain sends periodic global configuration advertisements from each trunk port to a reserved multicast address. Neighboring devices receive these advertisements and update their VTP and VLAN configurations as necessary.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the switch stack and that this trunk port is connected to the trunk port of another switch. Otherwise, the switch cannot receive any VTP advertisements.

VTP advertisements distribute this global domain information:

- VTP domain name
- VTP configuration revision number
- Update identity and update timestamp
- MD5 digest VLAN configuration, including maximum transmission unit (MTU) size for each VLAN

- Frame format

VTP advertisements distribute this VLAN information for each configured VLAN:

- VLAN IDs (including IEEE 802.1Q)
- VLAN name
- VLAN type
- VLAN state
- Additional VLAN configuration information specific to the VLAN type

In VTP version 3, VTP advertisements also include the primary server ID, an instance number, and a start index.

VTP Version 2

If you use VTP in your network, you must decide which version of VTP to use. By default, VTP operates in version 1.

VTP version 2 supports these features that are not supported in version 1:

- Token Ring support—VTP version 2 supports Token Ring Bridge Relay Function (TrBRF) and Token Ring Concentrator Relay Function (TrCRF) VLANs.
- Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM when the device is operating in VTP server mode.
- Version-Dependent Transparent Mode—In VTP version 1, a VTP transparent device inspects VTP messages for the domain name and version and forwards a message only if the version and domain name match. Although VTP version 2 supports only one domain, a VTP version 2 transparent device forwards a message only when the domain name matches.
- Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the MD5 digest on a received VTP message is correct, its information is accepted.

VTP Version 3

VTP version 3 supports these features that are not supported in version 1 or version 2:

- Enhanced authentication—You can configure the authentication as **hidden** or **secret**. When **hidden**, the secret key from the password string is saved in the VLAN database file, but it does not appear in plain text in the configuration. Instead, the key associated with the password is saved in hexadecimal format in the running configuration. You must reenter the password if you enter a takeover command in the domain. When you enter the **secret** keyword, you can directly configure the password secret key.
- Support for extended range VLAN (VLANs 1006 to 4094) database propagation—VTP versions 1 and 2 propagate only VLANs 1 to 1005.

Note VTP pruning still applies only to VLANs 1 to 1005, and VLANs 1002 to 1005 are still reserved and cannot be modified.

- Private VLAN support.
- Support for any database in a domain—In addition to propagating VTP information, version 3 can propagate Multiple Spanning Tree (MST) protocol database information. A separate instance of the VTP protocol runs for each application that uses VTP.
- VTP primary server and VTP secondary servers—A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to its NVRAM.

By default, all devices come up as secondary servers. You can enter the **vtp primary** privileged EXEC command to specify a primary server. Primary server status is only needed for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers. Primary server status is lost if the device reloads or domain parameters change, even when a password is configured on the device.

VTP Pruning

VTP pruning increases network available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to reach the destination devices. Without VTP pruning, a device floods broadcast, multicast, and unknown unicast traffic across all trunk links within a VTP domain even though receiving devices might discard them. VTP pruning is disabled by default.

VTP pruning blocks unneeded flooded traffic to VLANs on trunk ports that are included in the pruning-eligible list. Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible device trunk ports. If the VLANs are configured as pruning-ineligible, the flooding continues. VTP pruning is supported in all VTP versions.

With VTP versions 1 and 2, when you enable pruning on the VTP server, it is enabled for the entire VTP domain. In VTP version 3, you must manually enable pruning on each device in the domain. Making VLANs pruning-eligible or pruning-ineligible affects pruning eligibility for those VLANs on that trunk only (not on all devices in the VTP domain).

VTP pruning takes effect several seconds after you enable it. VTP pruning does not prune traffic from VLANs that are pruning-ineligible. VLAN 1 and VLANs 1002 to 1005 are always pruning-ineligible; traffic from these VLANs cannot be pruned. Extended-range VLANs (VLAN IDs higher than 1005) are also pruning-ineligible.

VTP and Switch Stacks

VTP configuration is the same in all members of a switch stack. When the switch stack is in VTP server or client mode, all switches in the stack carry the same VTP configuration. When VTP mode is transparent, the stack is not taking part in VTP.

- When a switch joins the stack, it inherits the VTP and VLAN properties of the active stack.
- All VTP updates are carried across the stack.

- When VTP mode is changed in a switch in the stack, the other switches in the stack also change VTP mode, and the switch VLAN database remains consistent.

VTP version 3 functions the same on a standalone switch or a stack except when the switch stack is the primary server for the VTP database. In this case, the MAC address of the active stack is used as the primary server ID. If the active stack reloads or is powered off, a new active stack is elected.

- If you do not configure the persistent MAC address feature (by entering the **stack-mac persistent timer** [0 | *time-value*] global configuration command, when the new active stack is elected, it sends a takeover message with the new active stack MAC address as the primary server.
- If persistent MAC address is configured, the new active stack waits for the configured **stack-mac persistent timer** value. If the previous active stack does not rejoin the stack during this time, then the new active stack issues the takeover message.

VTP Configuration Guidelines

Configuration Requirements

When you configure VTP, you must configure a trunk port so that the switch can send and receive VTP advertisements to and from other switches in the domain.

If you are configuring VTP on a cluster member switch to a VLAN, use the **command** privileged EXEC command to log in to the member switch. For more information about the command, see the command reference for this release.

In VTP versions 1 and 2, when you configure extended-range VLANs on the switch, the switch must be in VTP transparent mode. VTP version 3 also supports creating extended-range VLANs in client or server mode.

VTP versions 1 and 2 do not support private VLANs. VTP version 3 does support private VLANs. If you configure private VLANs, the switch must be in VTP transparent mode. When private VLANs are configured on the switch, do not change the VTP mode from transparent to client or server mode.

VTP Settings

The VTP information is saved in the VTP VLAN database. When VTP mode is transparent, the VTP domain name and mode are also saved in the device running configuration file, and you can save it in the device startup configuration file by entering the **copy running-config startup-config** privileged EXEC command. You must use this command if you want to save VTP mode as transparent, even if the device resets.

When you save VTP information in the device startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

Domain Names for Configuring VTP

When configuring VTP for the first time, you must always assign a domain name. You must configure all devices in the VTP domain with the same domain name. Devices in VTP transparent mode do not exchange VTP messages with other devices, and you do not need to configure a VTP domain name for them.

Note If the NVRAM and DRAM storage is sufficient, all devices in a VTP domain should be in VTP server mode.

Caution Do not configure a VTP domain if all devices are operating in VTP client mode. If you configure the domain, it is impossible to make changes to the VLAN configuration of that domain. Make sure that you configure at least one device in the VTP domain for VTP server mode.

Passwords for the VTP Domain

You can configure a password for the VTP domain, but it is not required. If you do configure a domain password, all domain devices must share the same password and you must configure the password on each device in the management domain. Devices without a password or with the wrong password reject VTP advertisements.

If you configure a VTP password for a domain, a device that is booted without a VTP configuration does not accept VTP advertisements until you configure it with the correct password. After the configuration, the device accepts the next VTP advertisement that uses the same password and domain name in the advertisement.

If you are adding a new device to an existing network with VTP capability, the new device learns the domain name only after the applicable password has been configured on it.

Caution When you configure a VTP domain password, the management domain does not function properly if you do not assign a management domain password to each device in the domain.

VTP Version

Follow these guidelines when deciding which VTP version to implement:

- All devices in a VTP domain must have the same domain name, but they do not need to run the same VTP version.
- A VTP version 2-capable device can operate in the same VTP domain as a device running VTP version 1 if version 2 is disabled on the version 2-capable device (version 2 is disabled by default).
- If a device running VTP version 1, but capable of running VTP version 2, receives VTP version 3 advertisements, it automatically moves to VTP version 2.
- If a device running VTP version 3 is connected to a device running VTP version 1, the VTP version 1 device moves to VTP version 2, and the VTP version 3 device sends scaled-down versions of the VTP packets so that the VTP version 2 device can update its database.
- A device running VTP version 3 cannot move to version 1 or 2 if it has extended VLANs.

- Do not enable VTP version 2 on a device unless all of the devices in the same VTP domain are version-2-capable. When you enable version 2 on a device, all of the version-2-capable devices in the domain enable version 2. If there is a version 1-only device, it does not exchange VTP information with devices that have version 2 enabled.
- Cisco recommends placing VTP version 1 and 2 devices at the edge of the network because they do not forward VTP version 3 advertisements.
- If there are TrBRF and TrCRF Token Ring networks in your environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly. To run Token Ring and Token Ring-Net, disable VTP version 2.
- VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must configure these VLANs manually on each device. VTP version 3 supports extended-range VLANs and support for extended range VLAN database propagation.
- When a VTP version 3 device trunk port receives messages from a VTP version 2 device, it sends a scaled-down version of the VLAN database on that particular trunk in VTP version 2 format. A VTP version 3 device does not send VTP version 2-formatted packets on a trunk unless it first receives VTP version 2 packets on that trunk port.
- When a VTP version 3 device detects a VTP version 2 device on a trunk port, it continues to send VTP version 3 packets, in addition to VTP version 2 packets, to allow both kinds of neighbors to coexist on the same trunk.
- A VTP version 3 device does not accept configuration information from a VTP version 2 or version 1 device.
- Two VTP version 3 regions can only communicate in transparent mode over a VTP version 1 or version 2 region.
- Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.
- VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must manually configure these VLANs on each device.
- If you configure the device for VTP client mode, the device does not create the VLAN database file (vlan.dat). If the device is then powered off, it resets the VTP configuration to the default. To keep the VTP configuration with VTP client mode after the device restarts, you must first configure the VTP domain name before the VTP mode.

Caution If all devices are operating in VTP client mode, do not configure a VTP domain name. If you do, it is impossible to make changes to the VLAN configuration of that domain. Therefore, make sure you configure at least one device as a VTP server.

Default VTP Configuration

The following table shows the default VTP configuration.

Table 165: Default VTP Configuration

Feature	Default Setting
VTP domain name	Null
VTP mode (VTP version 1 and version 2)	Server
VTP mode (VTP version 3)	The mode is the same as the mode in VTP version 1 or 2 before conversion to version 3.
VTP version	Version 1
MST database mode	Transparent
VTP version 3 server type	Secondary
VTP password	None
VTP pruning	Disabled

How to Configure VTP

Configuring VTP Mode

You can configure VTP mode as one of these:

- VTP server mode—In VTP server mode, you can change the VLAN configuration and have it propagated throughout the network.
- VTP client mode—In VTP client mode, you cannot change its VLAN configuration. The client device receives VTP updates from a VTP server in the VTP domain and then modifies its configuration accordingly.
- VTP transparent mode—In VTP transparent mode, VTP is disabled on the device. The device does not send VTP updates and does not act on VTP updates received from other device. However, a VTP transparent device running VTP version 2 does forward received VTP advertisements on its trunk links.
- VTP off mode—VTP off mode is the same as VTP transparent mode except that VTP advertisements are not forwarded.

When you configure a domain name, it cannot be removed; you can only reassign a device to a different domain.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vtp domain** *domain-name*
4. **vtp mode** {**client** | **server** | **transparent** | **off**} {**vlan** | **mst** | **unknown**}
5. **vtp password** *password*

6. `end`
7. `show vtp status`
8. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><code>enable</code></p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p><code>configure terminal</code></p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p><code>vtp domain domain-name</code></p> <p>Example:</p> <pre>Device(config)# vtp domain eng_group</pre>	<p>Configures the VTP administrative-domain name. The name can be 1 to 32 characters. All devices operating in VTP server or client mode under the same administrative responsibility must be configured with the same domain name.</p> <p>This command is optional for modes other than server mode. VTP server mode requires a domain name. If the device has a trunk connection to a VTP domain, the device learns the domain name from the VTP server in the domain.</p> <p>You should configure the VTP domain before configuring other VTP parameters.</p>
Step 4	<p><code>vtp mode {client server transparent off} {vlan mst unknown}</code></p> <p>Example:</p> <pre>Device(config)# vtp mode server</pre>	<p>Configures the device for VTP mode (client, server, transparent, or off).</p> <ul style="list-style-type: none"> • vlan—The VLAN database is the default if none are configured. • mst—The multiple spanning tree (MST) database. • unknown—An unknown database type. <p>Note To return a switch in another mode to VTP server mode, use the no vtp mode global configuration command.</p>
Step 5	<p><code>vtp password password</code></p> <p>Example:</p> <pre>Device(config)# vtp password mypassword</pre>	<p>(Optional) Sets the password for the VTP domain. The password can be 8 to 64 characters. If you configure a VTP password, the VTP domain does not function properly if you do not assign the same password to each device in the domain.</p>

	Command or Action	Purpose
		Note To return the switch to a no-password state, use the no vtp password global configuration command.
Step 6	end Example: Device(config) # end	Returns to privileged EXEC mode.
Step 7	show vtp status Example: Device# show vtp status	Verifies your entries in the <i>VTP Operating Mode</i> and the <i>VTP Domain Name</i> fields of the display.
Step 8	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves the configuration in the startup configuration file. Only VTP mode and domain name are saved in the device running configuration and can be copied to the startup configuration file.

Configuring a VTP Version 3 Password

You can configure a VTP version 3 password on the device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vtp version 3**
4. **vtp password *password* [hidden | secret]**
5. **end**
6. **show vtp password**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	vtp version 3 Example: Device(config)# <code>vtp version 3</code>	Enables VTP version 3 on the device. The default is VTP version 1.
Step 4	vtp password <i>password</i> [hidden secret] Example: Device(config)# <code>vtp password mypassword hidden</code>	(Optional) Sets the password for the VTP domain. The password can be 8 to 64 characters. <ul style="list-style-type: none"> • (Optional) hidden—Saves the secret key generated from the password string in the nvram:vlan.dat file. If you configure a takeover by configuring a VTP primary server, you are prompted to reenter the password. • (Optional) secret—Directly configures the password. The secret password must contain 32 hexadecimal characters. <p>Note To clear the password, enter the no vtp password global configuration command.</p>
Step 5	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 6	show vtp password Example: Device# <code>show vtp password</code>	Verifies your entries. The output appears like this: VTP password: 89914640C8D90868B6A0D8103847A733
Step 7	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring a VTP Version 3 Primary Server

When you configure a VTP server as a VTP primary server, the takeover operation starts.

SUMMARY STEPS

1. `vtp version 3`
2. `vtp primary [vlan | mst] [force]`

DETAILED STEPS

	Command or Action	Purpose
Step 1	vtp version 3 Example: Device(config)# <code>vtp version 3</code>	Enables VTP version 3 on the device. The default is VTP version 1.
Step 2	vtp primary [vlan mst] [force] Example: Device# <code>vtp primary vlan force</code>	Changes the operational state of a device from a secondary server (the default) to a primary server and advertises the configuration to the domain. If the device password is configured as hidden , you are prompted to reenter the password. <ul style="list-style-type: none"> • (Optional) vlan—Selects the VLAN database as the takeover feature. This is the default. • (Optional) mst—Selects the multiple spanning tree (MST) database as the takeover feature. • (Optional) force—Overwrites the configuration of any conflicting servers. If you do not enter force, you are prompted for confirmation before the takeover.

Enabling the VTP Version

VTP version 2 and version 3 are disabled by default.

- When you enable VTP version 2 on a device, every VTP version 2-capable device in the VTP domain enables version 2. To enable VTP version 3, you must manually configure it on each device.
- With VTP versions 1 and 2, you can configure the version only on devices in VTP server or transparent mode. If a device is running VTP version 3, you can change to version 2 when the device is in client mode if no extended VLANs exist, no private VLANs exist, and no hidden password was configured.

Caution VTP version 1 and VTP version 2 are not interoperable on devices in the same VTP domain. Do not enable VTP version 2 unless every device in the VTP domain supports version 2.

- In TrCRF and TrBRF Token Ring environments, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly. For Token Ring and Token Ring-Net media, disable VTP version 2.

Caution In VTP version 3, both the primary and secondary servers can exist on an instance in the domain.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vtp version {1 | 2 | 3}**
4. **end**
5. **show vtp status**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vtp version {1 2 3} Example: Device(config)# vtp version 2	Enables the VTP version on the device. The default is VTP version 1. Note To return to the default VTP version 1, use the no vtp version global configuration command.
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 5	show vtp status Example:	Verifies that the configured VTP version is enabled.

	Command or Action	Purpose
	Device# <code>show vtp status</code>	
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Enabling VTP Pruning

Before you begin

VTP pruning is not designed to function in VTP transparent mode. If one or more devices in the network are in VTP transparent mode, you should do one of these actions:

- Turn off VTP pruning in the entire network.
- Turn off VTP pruning by making all VLANs on the trunk of the device upstream to the VTP transparent device pruning ineligible.

To configure VTP pruning on an interface, use the **switchport trunk pruning vlan** interface configuration command. VTP pruning operates when an interface is trunking. You can set VLAN pruning-eligibility, whether or not VTP pruning is enabled for the VTP domain, whether or not any given VLAN exists, and whether or not the interface is currently trunking.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vtp pruning**
4. **end**
5. **show vtp status**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	vtp pruning Example: Device(config)# <code>vtp pruning</code>	Enables pruning in the VTP administrative domain. By default, pruning is disabled. You need to enable pruning on only one device in VTP server mode. Note To disable VTP pruning, use the no vtp pruning global configuration command.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 5	show vtp status Example: Device# <code>show vtp status</code>	Verifies your entries in the <i>VTP Pruning Mode</i> field of the display.

Configuring VTP on a Per-Port Basis

With VTP version 3, you can enable or disable VTP on a per-port basis. You can enable VTP only on ports that are in trunk mode. Incoming and outgoing VTP traffic are blocked, not forwarded.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `vtp`
5. `end`
6. `show running-config interface interface-id`
7. `show vtp status`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet0/1</code>	Identifies an interface, and enters interface configuration mode.
Step 4	vtp Example: Device(config-if)# <code>vtp</code>	Enables VTP on the specified port. Note To disable VTP on the interface, use the no vtp interface configuration command.
Step 5	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 6	show running-config interface <i>interface-id</i> Example: Device# <code>show running-config interface gigabitethernet 1/0/1</code>	Verifies the change to the port.
Step 7	show vtp status Example: Device# <code>show vtp status</code>	Verifies the configuration.

Adding a VTP Client to a VTP Domain

Follow these steps to verify and reset the VTP configuration revision number on a device *before* adding it to a VTP domain.

Before you begin

Before adding a VTP client to a VTP domain, always verify that its VTP configuration revision number is *lower* than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. With VTP versions 1 and 2, adding a device that has a revision number higher than the revision number in

the VTP domain can erase all VLAN information from the VTP server and VTP domain. With VTP version 3, the VLAN information is not erased.

You can use the **vtp mode transparent** global configuration command to disable VTP on the device and then to change its VLAN information without affecting the other devices in the VTP domain.

SUMMARY STEPS

1. **enable**
2. **show vtp status**
3. **configure terminal**
4. **vtp domain *domain-name***
5. **end**
6. **show vtp status**
7. **configure terminal**
8. **vtp domain *domain-name***
9. **end**
10. **show vtp status**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show vtp status Example: Device# show vtp status	Checks the VTP configuration revision number. If the number is 0, add the device to the VTP domain. If the number is greater than 0, follow these substeps: <ul style="list-style-type: none"> • Write down the domain name. • Write down the configuration revision number. • Continue with the next steps to reset the device configuration revision number.
Step 3	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 4	vtp domain <i>domain-name</i> Example: Device(config)# vtp domain domain123	Changes the domain name from the original one displayed in Step 1 to a new name.

	Command or Action	Purpose
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode. The VLAN information on the device is updated and the configuration revision number is reset to 0.
Step 6	show vtp status Example: Device# show vtp status	Verifies that the configuration revision number has been reset to 0.
Step 7	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 8	vtp domain <i>domain-name</i> Example: Device(config)# vtp domain domain012	Enters the original domain name on the device
Step 9	end Example: Device(config)# end	Returns to privileged EXEC mode. The VLAN information on the device is updated.
Step 10	show vtp status Example: Device# show vtp status	(Optional) Verifies that the domain name is the same as in Step 1 and that the configuration revision number is 0.

Monitoring VTP

This section describes commands used to display and monitor the VTP configuration.

You monitor VTP by displaying VTP configuration information: the domain name, the current VTP revision, and the number of VLANs. You can also display statistics about the advertisements sent and received by the device.

Table 166: VTP Monitoring Commands

Command	Purpose
show vtp counters	Displays counters about VTP messages that have been sent and received.
show vtp devices [conflict]	Displays information about all VTP version 3 devices in the domain. Conflicts are VTP version 3 devices with conflicting primary servers. The show vtp devices command does not display information when the device is in transparent or off mode.
show vtp interface [interface-id]	Displays VTP status and configuration for all interfaces or the specified interface.
show vtp password	Displays the VTP password. The form of the password displayed depends on whether or not the hidden keyword was entered and if encryption is enabled on the device.
show vtp status	Displays the VTP device configuration information.

Configuration Examples for VTP

Example: Configuring the Switch as a VTP Server

This example shows how to configure the switch as a VTP server with the domain name *eng_group* and the password *mypassword*:

```
Switch(config)# vtp domain eng_group
Setting VTP domain name to eng_group.

Switch(config)# vtp mode server

Setting device to VTP Server mode for VLANs.
Switch(config)# vtp password mypassword

Setting device VLAN database password to mypassword.

Switch(config)# end
```

Example: Configuring a Hidden Password

This example shows how to configure a hidden password and how it appears.

```
Switch(config)# vtp password mypassword hidden
Generating the secret associated to the password.
Switch(config)# end
Switch# show vtp password
VTP password: 89914640C8D90868B6A0D8103847A733
```

Example: Configuring a VTP Version 3 Primary Server

This example shows how to configure a switch as the primary server for the VLAN database (the default) when a hidden or secret password was configured:

```
Switch# vtp primary vlan

Enter VTP password: mypassword
This switch is becoming Primary server for vlan feature in the VTP domain
VTP Database Conf Switch ID Primary Server Revision System Name
-----
VLANDB Yes 00d0.00b8.1400=00d0.00b8.1400 1 stp7
Do you want to continue (y/n) [n]? y
```

Example: Configuring VTP on a Per-Port Basis

This example shows how to configure VTP on a per-port basis:

```
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# vtp
Switch(config-if)# end
```

Where to Go Next

After configuring VTP, you can configure the following:

- VLANs
- VLAN trunking
- Private VLANs
- VLAN Membership Policy Server (VMPS)
- Tunneling
- Voice VLANs

Prerequisites for VLANs

The following are prerequisites and considerations for configuring VLANs:

- The switch supports 1005 VLANs when running the IP Lite image.
- The switch supports up to 1000 VLANs running the LAN Base image.
- The switch supports 256 SVIs when running the IP Lite image.

Restrictions for VLANs

The following are the restrictions for configuring VLANs:

- The switch supports homogeneous stacking, but does not support mixed stacking.

Information About VLANs

Logical Networks

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can

group end stations even if they are not physically located on the same LAN segment. Any device port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or a device supporting fallback bridging. Because a VLAN is considered a separate logical network, it contains its own bridge Management Information Base (MIB) information and can support its own implementation of spanning tree.

VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the device is assigned manually on an interface-by-interface basis. When you assign device interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

Traffic between VLANs must be routed or fallback bridged.

The device can route traffic between VLANs by using device virtual interfaces (SVIs). An SVI must be explicitly configured and assigned an IP address to route traffic between VLANs.

Supported VLANs

The switch supports VLANs in VTP client, server, and transparent modes. VLANs are identified by a number from 1 to 4094. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs. VTP version 1 and version 2 support only normal-range VLANs (VLAN IDs 1 to 1005). In these versions, the switch must be in VTP transparent mode when you create VLAN IDs from 1006 to 4094. VTP version 3 supports the entire VLAN range (VLANs 1 to 4094). Extended range VLANs (VLANs 1006 to 4094) are supported only in VTP version 3. You cannot convert from VTP version 3 to VTP version 2 if extended VLANs are configured in the domain.

The switch or switch stack supports a total of 1005 (normal range and extended range) VLANs. However, the number of routed ports, SVIs, and other configured features affects the use of the switch hardware.

The switch or switch stack supports a total of 255 VLANs when running the LAN base feature set. However, the number of routed ports, SVIs, and other configured features affects the use of the switch hardware.

The switch supports per-VLAN spanning-tree plus (PVST+) or rapid PVST+ with a maximum of 128 spanning-tree instances. One spanning-tree instance is allowed per VLAN.

The switch supports IEEE 802.1Q trunking methods for sending VLAN traffic over Ethernet ports.

VLAN Port Membership Modes

You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic the port carries and the number of VLANs to which it can belong.

When a port belongs to a VLAN, the device learns and manages the addresses associated with the port on a per-VLAN basis.

Table 167: Port Membership Modes and Characteristics

Membership Mode	VLAN Membership Characteristics	VTP Characteristics
Static-access	A static-access port can belong to one VLAN and is manually assigned to that VLAN.	VTP is not required. If you do not want VTP to globally propagate information, set the VTP mode to transparent. To participate in VTP, there must be at least one trunk port on the device connected to a trunk port of a second device.
Trunk (IEEE 802.1Q) : <ul style="list-style-type: none"> IEEE 802.1Q—Industry-standard trunking encapsulation. 	A trunk port is a member of all VLANs by default, including extended-range VLANs, but membership can be limited by configuring the allowed-VLAN list. You can also modify the pruning-eligible list to block flooded traffic to VLANs on trunk ports that are included in the list.	VTP is recommended but not required. VTP maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP exchanges VLAN configuration messages with other devices over trunk links.
Dynamic access	A dynamic-access port can belong to one VLAN (VLAN ID 1 to 4094) and is dynamically assigned by a VLAN Member Policy Server (VMPS). You can have dynamic-access ports and trunk ports on the same device, but you must connect the dynamic-access port to an end station or hub and not to another device.	VTP is required. Configure the VMPS and the client with the same VTP domain name. To participate in VTP, at least one trunk port on the device must be connected to a trunk port of a second device .
Voice VLAN	A voice VLAN port is an access port attached to a Cisco IP Phone, configured to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.	VTP is not required; it has no effect on a voice VLAN.

VLAN Configuration Files

Configurations for VLAN IDs 1 to 1005 are written to the `vlan.dat` file (VLAN database), and you can display them by entering the **show vlan** privileged EXEC command. The `vlan.dat` file is stored in flash memory. If the VTP mode is transparent, they are also saved in the device running configuration file.

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the **show running-config** privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is

ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.
- In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.
- From image 15.0(02)SE6, on vtp transparent and off modes, vlans get created from startup-config even if they are not applied to the interface.

Note Ensure that you delete the `vlan.dat` file along with the configuration files before you reset the switch configuration using **write erase** command. This ensures that the switch reboots correctly on a reset.

Normal-Range VLAN Overview

Normal-range VLANs are VLANs with VLAN IDs 1 to 1005. If the switch is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)

In VTP versions 1 and 2, the switch must be in VTP transparent mode when you create extended-range VLANs (VLANs with IDs from 1006 to 4094), but these VLANs are not saved in the VLAN database. VTP version 3 supports extended-range VLANs in VTP server and transparent mode.

Configurations for VLAN IDs 1 to 1005 are written to the file `vlan.dat` (VLAN database), and you can display them by entering the **show vlan** privileged EXEC command. The `vlan.dat` file is stored in flash memory. On a switch, the `vlan.dat` file is stored in flash memory on the active stack. Stack members have a `vlan.dat` file that is consistent with the active stack.

Token Ring VLANs

Although the switch does not support Token Ring connections, a remote device such as a Catalyst 5000 series switch with Token Ring connections could be managed from one of the supported switches. Switches running VTP Version 2 advertise information about these Token Ring VLANs:

- Token Ring TrBRF VLANs
- Token Ring TrCRF VLANs

Note For more information on configuring Token Ring VLANs, see the *Catalyst 5000 Series Software Configuration Guide*.

Normal-Range VLANs Configuration Process

You configure VLANs in the **vlan** global configuration command by entering a VLAN ID. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN. You can use the default

VLAN configuration or enter multiple commands to configure the VLAN. For more information about commands available in this mode, see the **vlan** global configuration command description in the command reference for this release. When you have finished the configuration, you must exit VLAN configuration mode for the configuration to take effect. To display the VLAN configuration, enter the **show vlan** privileged EXEC command.

VLAN Configuration Saving Process

The configurations of VLAN IDs 1 to 1005 are always saved in the VLAN database (vlan.dat file). If the VTP mode is transparent, they are also saved in the switch running configuration file. You can enter the **copy running-config startup-config** privileged EXEC command to save the configuration in the startup configuration file. In a switch stack, the whole stack uses the same vlan.dat file and running configuration. To display the VLAN configuration, enter the **show vlan** privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the switch, the switch configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.
- In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.

Normal-Range VLAN Configuration Guidelines

Normal-range VLANs are VLANs with IDs from 1 to 1005.

VTP 1 and 2 only support normal-range VLANs.

Follow these guidelines when creating and modifying normal-range VLANs in your network:

- Normal-range VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.
- VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database. If the VTP mode is transparent, VTP and VLAN configurations are also saved in the device running configuration file.
- If the device is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)
- With VTP versions 1 and 2, the device supports VLAN IDs 1006 through 4094 only in VTP transparent mode (VTP disabled). These are extended-range VLANs and configuration options are limited. Extended-range VLANs created in VTP transparent mode are not saved in the VLAN database and are not propagated. VTP version 3 supports extended range VLAN (VLANs 1006 to 4094) database propagation in VTP server mode. If extended VLANs are configured, you cannot convert from VTP version 3 to version 1 or 2.

- Before you can create a VLAN, the device must be in VTP server mode or VTP transparent mode. If the device is a VTP server, you must define a VTP domain or VTP will not function.
- The device does not support Token Ring or FDDI media. The device does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration through VTP.
- The device supports 128 spanning tree instances. If a device has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 128 VLANs and is disabled on the remaining VLANs.

If you have already used all available spanning-tree instances on a device, adding another VLAN anywhere in the VTP domain creates a VLAN on that device that is not running spanning-tree. If you have the default allowed list on the trunk ports of that device (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there are several adjacent devices that all have run out of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of devices that have used up their allocation of spanning-tree instances.

If the number of VLANs on the device exceeds the number of supported spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your device to map multiple VLANs to a single spanning-tree instance.

Extended-Range VLAN Configuration Guidelines

Extended-range VLANs are VLANs with IDs from 1006 to 4094.

VTP 3 only supports extended-range VLANs.

Follow these guidelines when creating extended-range VLANs:

- VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP unless the device is running VTP version 3.
- You cannot include extended-range VLANs in the pruning eligible range.
- For VTP version 1 or 2, you can set the VTP mode to transparent in global configuration mode. You should save this configuration to the startup configuration so that the device boots up in VTP transparent mode. Otherwise, you lose the extended-range VLAN configuration if the device resets. If you create extended-range VLANs in VTP version 3, you cannot convert to VTP version 1 or 2.
- Each routed port on the device creates an internal VLAN for its use. These internal VLANs use extended-range VLAN numbers, and the internal VLAN ID cannot be used for an extended-range VLAN. If you try to create an extended-range VLAN with a VLAN ID that is already allocated as an internal VLAN, an error message is generated, and the command is rejected.

Note Devices running the LAN Base feature set support only static routing on SVIs.

- Because internal VLAN IDs are in the lower part of the extended range, we recommend that you create extended-range VLANs beginning from the highest number (4094) and moving to the lowest (1006) to reduce the possibility of using an internal VLAN ID.
- Before configuring extended-range VLANs, enter the **show vlan internal usage** privileged EXEC command to see which VLANs have been allocated as internal VLANs.

- If necessary, you can shut down the routed port assigned to the internal VLAN, which frees up the internal VLAN, and then create the extended-range VLAN and re-enable the port, which then uses another VLAN as its internal VLAN.
- Although the device or device stack supports a total of 1005 (normal-range and extended-range) VLANs, the number of routed ports, SVIs, and other configured features affects the use of the device hardware. If you try to create an extended-range VLAN and there are not enough hardware resources available, an error message is generated, and the extended-range VLAN is rejected.

Default Ethernet VLAN Configuration

The following table displays the default configuration for Ethernet VLANs.

Note The switch supports Ethernet interfaces exclusively. Because FDDI and Token Ring VLANs are not locally supported, you only configure FDDI and Token Ring media-specific characteristics for VTP global advertisements to other switches.

Table 168: Ethernet VLAN Defaults and Range

Parameter	Default	Range
VLAN ID	1	1 to 4094. Note Extended-range VLANs (VLAN IDs 1006 to 4094) are only saved in the VLAN database in VTP version 3.
VLAN name	VLANxxxx, where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number	No range
IEEE 802.10 SAID	100001 (100000 plus the VLAN ID)	1 to 4294967294
IEEE 802.10 SAID	1500	576-18190
Private VLANs	none configured	2 to 1001, 1006 to 4094

Default VLAN Configuration

You can change only the MTU size, private VLAN, and the remote SPAN configuration state on extended-range VLANs; all other characteristics must remain at the default state.

How to Configure VLANs

How to Configure Normal-Range VLANs

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:

- VLAN ID
- VLAN name
- VLAN type
 - Ethernet
 - Fiber Distributed Data Interface [FDDI]
 - FDDI network entity title [NET]
 - TrBRF or TrCRF
 - Token Ring
 - Token Ring-Net
- VLAN state (active or suspended)
- Security Association Identifier (SAID)
- Bridge identification number for TrBRF VLANs
- Ring number for FDDI and TrCRF VLANs
- Parent VLAN number for TrCRF VLANs
- Spanning Tree Protocol (STP) type for TrCRF VLANs
- VLAN number to use when translating from one VLAN type to another

You can cause inconsistency in the VLAN database if you attempt to manually delete the `vlan.dat` file. If you want to modify the VLAN configuration, follow the procedures in this section.

Creating or Modifying an Ethernet VLAN

Each Ethernet VLAN in the VLAN database has a unique, 4-digit ID that can be a number from 1 to 1001. VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs. To create a normal-range VLAN to be added to the VLAN database, assign a number and name to the VLAN.

Note With VTP version 1 and 2, if the device is in VTP transparent mode, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vlan *vlan-id***
4. **name *vlan-name***
5. **mtu *mtu-size***
6. **remote-span**
7. **end**
8. **show vlan {name *vlan-name* | id *vlan-id*}**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vlan <i>vlan-id</i> Example: Device(config)# vlan 20	Enters a VLAN ID, and enters VLAN configuration mode. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN. Note The available VLAN ID range for this command is 1 to 4094.
Step 4	name <i>vlan-name</i> Example: Device(config-vlan)# name test20	(Optional) Enters a name for the VLAN. If no name is entered for the VLAN, the default is to append the <i>vlan-id</i> value with leading zeros to the word VLAN. For example, VLAN0004 is a default VLAN name for VLAN 4.
Step 5	mtu <i>mtu-size</i> Example: Device(config-vlan)# mtu 256	(Optional) Changes the MTU size (or other VLAN characteristic).
Step 6	remote-span Example:	(Optional) Configures the VLAN as the RSPAN VLAN for a remote SPAN session.

	Command or Action	Purpose
	Device(config-vlan) # remote-span	Note To return the VLAN name to the default settings, use the no name , no mtu , or no remote-span commands.
Step 7	end Example: Device(config) # end	Returns to privileged EXEC mode.
Step 8	show vlan {name vlan-name id vlan-id} Example: Device# show vlan name test20 id 20	Verifies your entries.
Step 9	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Deleting a VLAN

When you delete a VLAN from a device that is in VTP server mode, the VLAN is removed from the VLAN database for all devices in the VTP domain. When you delete a VLAN from a device that is in VTP transparent mode, the VLAN is deleted only on that specific device .

You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.

Caution When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no vlan vlan-id**
4. **end**
5. **show vlan brief**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	no vlan <i>vlan-id</i> Example: Device(config)# no vlan 4	Removes the VLAN by entering the VLAN ID.
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 5	show vlan brief Example: Device# show vlan brief	Verifies the VLAN removal.
Step 6	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Assigning Static-Access Ports to a VLAN

You can assign a static-access port to a VLAN without having VTP globally propagate VLAN configuration information by disabling VTP (VTP transparent mode).

If you are assigning a port on a cluster member switch to a VLAN, first use the **rcommand** privileged EXEC command to log in to the cluster member switch.

If you assign an interface to a VLAN that does not exist, the new VLAN is created.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **switchport mode access**
4. **switchport access vlan** *vlan-id*
5. **end**
6. **show running-config interface** *interface-id*
7. **show interfaces** *interface-id* **switchport**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet2/0/1	Enters the interface to be added to the VLAN.
Step 3	switchport mode access Example: Device(config-if)# switchport mode access	Defines the VLAN membership mode for the port (Layer 2 access port).
Step 4	switchport access vlan <i>vlan-id</i> Example: Device(config-if)# switchport access vlan 2	Assigns the port to a VLAN. Valid VLAN IDs are 1 to 4094. Note To return an interface to its default configuration, use the default interface interface-id interface configuration command.
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 6	show running-config interface <i>interface-id</i> Example: Device# show running-config interface gigabitethernet2/0/1	Verifies the VLAN membership mode of the interface.

	Command or Action	Purpose
Step 7	<p>show interfaces <i>interface-id</i> switchport</p> <p>Example:</p> <pre>Device# show interfaces gigabitethernet2/0/1 switchport</pre>	Verifies your entries in the <i>Administrative Mode</i> and the <i>Access Mode VLAN</i> fields of the display.

How to Configure Extended-Range VLANs

Extended-range VLANs enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any **switchport** commands that allow VLAN IDs.

With VTP version 1 or 2, extended-range VLAN configurations are not stored in the VLAN database, but because VTP mode is transparent, they are stored in the device running configuration file, and you can save the configuration in the startup configuration file. Extended-range VLANs created in VTP version 3 are stored in the VLAN database.

You can change only the MTU size, private VLAN, and the remote SPAN configuration state on extended-range VLANs; all other characteristics must remain at the default state.

Creating an Extended-Range VLAN

You create an extended-range VLAN in global configuration mode by entering the **vlan** global configuration command with a VLAN ID from 1006 to 4094. The extended-range VLAN has the default Ethernet VLAN characteristics and the MTU size, and RSPAN configuration are the only parameters you can change. See the description of the **vlan** global configuration command in the command reference for the default settings of all parameters. In VTP version 1 or 2, if you enter an extended-range VLAN ID when the switch is not in VTP transparent mode, an error message is generated when you exit VLAN configuration mode, and the extended-range VLAN is not created.

In VTP version 1 and 2, extended-range VLANs are not saved in the VLAN database; they are saved in the switch running configuration file. You can save the extended-range VLAN configuration in the switch startup configuration file by using the **copy running-config startup-config** privileged EXEC command. VTP version 3 saves extended-range VLANs in the VLAN database.

Note Before you create an extended-range VLAN, you can verify that the VLAN ID is not used internally by entering the **show vlan internal usage** privileged EXEC command. If the VLAN ID is used internally and you want to free it up, go to the *Creating an Extended-Range VLAN with an Internal VLAN ID* before creating the extended-range VLAN.

SUMMARY STEPS

1. **configure terminal**
2. **vtp mode transparent**
3. **vlan** *vlan-id*
4. **mtu** *mtu size*
5. **remote-span**

6. **end**
7. **show vlan id *vlan-id***
8. **copy running-config startup config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	vtp mode transparent Example: Device(config)# vtp mode transparent	Configures the device for VTP transparent mode, disabling VTP. Note This step is not required for VTP version 3.
Step 3	vlan <i>vlan-id</i> Example: Device(config)# vlan 2000 Device(config-vlan)#	Enters an extended-range VLAN ID and enters VLAN configuration mode. The range is 1006 to 4094. Note To delete an extended-range VLAN, use the no vlan <i>vlan-id</i> global configuration command.
Step 4	mtu <i>mtu size</i> Example: Device(config-vlan)# mtu 1024	Modifies the VLAN by changing the MTU size.
Step 5	remote-span Example: Device(config-vlan)# remote-span	(Optional) Configures the VLAN as the RSPAN VLAN.
Step 6	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 7	show vlan id <i>vlan-id</i> Example: Device# show vlan id 2000	Verifies that the VLAN has been created.
Step 8	copy running-config startup config	Saves your entries in the device startup configuration file.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device# copy running-config startup-config</pre>	<p>To save an extended-range VLAN configuration, you need to save the VTP transparent mode configuration and the extended-range VLAN configuration in the device startup configuration file. Otherwise, if the device resets, it will default to VTP server mode, and the extended-range VLAN IDs will not be saved.</p> <p>Note This step is not required for VTP version 3 because VLANs are saved in the VLAN database.</p> <p>The procedure for assigning static-access ports to an extended-range VLAN is the same as for normal-range VLANs.</p>

Creating an Extended-Range VLAN with an Internal VLAN ID

If you enter an extended-range VLAN ID that is already assigned to an internal VLAN, an error message is generated, and the extended-range VLAN is rejected. To manually free an internal VLAN ID, you must temporarily shut down the routed port that is using the internal VLAN ID.

Note Devices running the LAN Base images support only static routing on SVIs.

SUMMARY STEPS

1. **enable**
2. **show vlan internal usage**
3. **configure terminal**
4. **interface *interface-id***
5. **shutdown**
6. **exit**
7. **vtp mode transparent**
8. **vlan *vlan-id***
9. **exit**
10. **interface *interface-id***
11. **no shutdown**
12. **end**
13. **copy running-config startup config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	show vlan internal usage Example: Device# show vlan internal usage	Displays the VLAN IDs being used internally by the device. If the VLAN ID that you want to use is an internal VLAN, the display shows the routed port that is using the VLAN ID. Enter that port number in Step 3.
Step 3	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 4	interface interface-id Example: Device(config)# interface gigabitethernet1/0/3	Specifies the interface ID for the routed port that is using the VLAN ID, and enters interface configuration mode.
Step 5	shutdown Example: Device(config-if)# shutdown	Shuts down the port to free the internal VLAN ID.
Step 6	exit Example: Device(config-if)# exit	Returns to global configuration mode.
Step 7	vtp mode transparent Example: Device(config)# vtp mode transparent	Sets the VTP mode to transparent for creating extended-range VLANs. Note This step is not required for VTP version 3.
Step 8	vlan vlan-id Example: Device(config-vlan)# vlan 2000	Enters the new extended-range VLAN ID, and enters VLAN configuration mode.
Step 9	exit Example:	Exits from VLAN configuration mode, and returns to global configuration mode.

	Command or Action	Purpose
	Device(config-vlan)# exit	
Step 10	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/3	Specifies the interface ID for the routed port that you shut down in Step 4, and enters interface configuration mode.
Step 11	no shutdown Example: Device(config)# no shutdown	Reenables the routed port. It will be assigned a new internal VLAN ID.
Step 12	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 13	copy running-config startup config Example: Device# copy running-config startup-config	Saves your entries in the device startup configuration file. To save an extended-range VLAN configuration, you need to save the VTP transparent mode configuration and the extended-range VLAN configuration in the device startup configuration file. Otherwise, if the device resets, it will default to VTP server mode, and the extended-range VLAN IDs will not be saved. Note This step is not required for VTP version 3 because VLANs are saved in the VLAN database.

Monitoring VLANs

Table 169: Privileged EXEC show Commands

Command	Purpose
show interfaces [vlan <i>vlan-id</i>]	Displays characteristics for all interfaces or for the specified VLAN configured on the device.

Configuration Examples

Example: Creating a VLAN Name

This example shows how to create Ethernet VLAN 20, name it test20, and add it to the VLAN database:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# name test20
Switch(config-vlan)# end
```

Example: Configuring a Port as Access Port

This example shows how to configure a port as an access port in VLAN 2:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 2
Switch(config-if)# end
```

Example: Creating an Extended-Range VLAN

This example shows how to create a new extended-range VLAN with all default characteristics, enter VLAN configuration mode, and save the new VLAN in the switch startup configuration file:

```
Switch(config)# vtp mode transparent
Switch(config)# vlan 2000
Switch(config-vlan)# end
Switch# copy running-config startup config
```

Where to Go Next

After configuring VLANs, you can configure the following:

- VLAN Trunking Protocol (VTP)
- VLAN trunks
- Private VLANs
- Tunneling

Prerequisites for VLAN Trunks

The IEEE 802.1Q trunks impose these limitations on the trunking strategy for a network:

- In a network of Cisco devices connected through IEEE 802.1Q trunks, the devices maintain one spanning-tree instance for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANs.

When you connect a Cisco device to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco device combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q device. However, spanning-tree information for each VLAN is maintained by Cisco devices separated by a cloud of non-Cisco IEEE 802.1Q devices. The non-Cisco IEEE 802.1Q cloud separating the Cisco devices is treated as a single trunk link between the devices.

- Make sure the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.
- Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure your network is loop-free before disabling spanning tree.

Restrictions for VLAN Trunks

The following are restrictions for VLAN trunks:

- A trunk port cannot be a secure port.
- A trunk port cannot be a tunnel port.
- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the device propagates the setting that you entered to all ports in the group:
 - Allowed-VLAN list.
 - STP port priority for each VLAN.
 - STP Port Fast setting.
 - Trunk status:
 - If one port in a port group ceases to be a trunk, all ports cease to be trunks.
- We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.
- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.
- Dynamic Trunking Protocol (DTP) is not supported on tunnel ports.
- The device does not support Layer 3 trunks; you cannot configure subinterfaces or use the **encapsulation** keyword on Layer 3 interfaces. The device does support Layer 2 trunks and Layer 3 VLAN interfaces, which provide equivalent capabilities.

Information About VLAN Trunks

Trunking Overview

A trunk is a point-to-point link between one or more Ethernet device interfaces and another networking device such as a router or a device. Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network.

The following trunking encapsulations are available on all Ethernet interfaces:

- IEEE 802.1Q— Industry-standard trunking encapsulation.

Trunking Modes

Ethernet trunk interfaces support different trunking modes. You can set an interface as trunking or nontrunking or to negotiate trunking with the neighboring interface. To autonegotiate trunking, the interfaces must be in the same VTP domain.

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a Point-to-Point Protocol (PPP). However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations.

To avoid this, you should configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.

Layer 2 Interface Modes

Table 170: Layer 2 Interface Modes

Mode	Function
switchport mode access	Puts the interface (access port) into permanent nontrunking mode and negotiates to convert the link into a nontrunk link. The interface becomes a nontrunk interface regardless of whether or not the neighboring interface is a trunk interface.
switchport mode dynamic auto	Makes the interface able to convert the link to a trunk link. The interface becomes a trunk interface if the neighboring interface is set to trunk or desirable mode. The default switchport mode for all Ethernet interfaces is dynamic auto .
switchport mode dynamic desirable	Makes the interface actively attempt to convert the link to a trunk link. The interface becomes a trunk interface if the neighboring interface is set to trunk , desirable , or auto mode.
switchport mode trunk	Puts the interface into permanent trunking mode and negotiates to convert the neighboring link into a trunk link. The interface becomes a trunk interface even if the neighboring interface is not a trunk interface.
switchport nonegotiate	Prevents the interface from generating DTP frames. You can use this command only when the interface switchport mode is access or trunk . You must manually configure the neighboring interface as a trunk interface to establish a trunk link.
switchport mode dot1q-tunnel	Configures the interface as a tunnel (nontrunking) port to be connected in an asymmetric link with an IEEE 802.1Q trunk port. The IEEE 802.1Q tunneling is used to maintain customer VLAN integrity across a service provider network.

Mode	Function
switchport mode private-vlan	Configures the private VLAN mode. Note The switchport mode private-vlan command option is not supported.

Allowed VLANs on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs, 1 to 4094, are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), DTP, and VTP in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port will be added to VLAN 1, regardless of the **switchport trunk allowed** setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled, if VTP knows of the VLAN, and if the VLAN is in the allowed list for the port. When VTP detects a newly enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of the enabled VLAN. When VTP detects a new VLAN and the VLAN is not in the allowed list for a trunk port, the trunk port does not become a member of the new VLAN.

Load Sharing on Trunk Ports

Load sharing divides the bandwidth supplied by parallel trunks connecting devices. To avoid loops, STP normally blocks all but one parallel link between devices. Using load sharing, you divide the traffic between the links according to which VLAN the traffic belongs.

You configure load sharing on trunk ports by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same device. For load sharing using STP path costs, each load-sharing link can be connected to the same device or to two different devices.

Network Load Sharing Using STP Priorities

When two ports on the same device form a loop, the device uses the STP port priority to decide which port is enabled and which port is in a blocking state. You can set the priorities on a parallel trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.

Network Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs, blocking different ports for different VLANs. The VLANs keep the traffic separate and maintain redundancy in the event of a lost link.

Feature Interactions

Trunking interacts with other features in these ways:

- A trunk port cannot be a secure port.
- A trunk port cannot be a tunnel port.
- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the device propagates the setting that you entered to all ports in the group:
 - Allowed-VLAN list.
 - STP port priority for each VLAN.
 - STP Port Fast setting.
 - Trunk status:

If one port in a port group ceases to be a trunk, all ports cease to be trunks.

- We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.
- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.

Default Layer 2 Ethernet Interface VLAN Configuration

The following table shows the default Layer 2 Ethernet interface VLAN configuration.

Table 171: Default Layer 2 Ethernet Interface VLAN Configuration

Feature	Default Setting
Interface mode	switchport mode dynamic auto
Trunk encapsulation	switchport trunk encapsulation negotiate
Allowed VLAN range	VLANs 1 to 4094
VLAN range eligible for pruning	VLANs 2 to 1001
Default VLAN (for access ports)	VLAN 1
Native VLAN (for IEEE 802.1Q trunks)	VLAN 1

How to Configure VLAN Trunks

To avoid trunking misconfigurations, configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.
- To enable trunking to a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

Configuring an Ethernet Interface as a Trunk Port

Configuring a Trunk Port

Because trunk ports send and receive VTP advertisements, to use VTP you must ensure that at least one trunk port is configured on the device and that this trunk port is connected to the trunk port of a second device. Otherwise, the device cannot receive any VTP advertisements.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport mode {dynamic {auto | desirable} | trunk}**
5. **switchport access vlan *vlan-id***
6. **switchport trunk native vlan *vlan-id***
7. **end**
8. **show interfaces *interface-id* switchport**
9. **show interfaces *interface-id* trunk**
10. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/2	Specifies the port to be configured for trunking, and enters interface configuration mode.
Step 4	switchport mode {dynamic {auto desirable} trunk} Example: Device(config-if)# switchport mode dynamic desirable	Configures the interface as a Layer 2 trunk (required only if the interface is a Layer 2 access port or tunnel port or to specify the trunking mode). <ul style="list-style-type: none"> • dynamic auto—Sets the interface to a trunk link if the neighboring interface is set to trunk or desirable mode. This is the default. • dynamic desirable—Sets the interface to a trunk link if the neighboring interface is set to trunk, desirable, or auto mode. • trunk—Sets the interface in permanent trunking mode and negotiate to convert the link to a trunk link even if the neighboring interface is not a trunk interface.
Step 5	switchport access vlan <i>vlan-id</i> Example: Device(config-if)# switchport access vlan 200	(Optional) Specifies the default VLAN, which is used if the interface stops trunking.
Step 6	switchport trunk native vlan <i>vlan-id</i> Example: Device(config-if)# switchport trunk native vlan 200	Specifies the native VLAN for IEEE 802.1Q trunks.
Step 7	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 8	show interfaces <i>interface-id</i> switchport Example: Device# show interfaces gigabitethernet 1/0/2 switchport	Displays the switch port configuration of the interface in the <i>Administrative Mode</i> and the <i>Administrative Trunking Encapsulation</i> fields of the display.

	Command or Action	Purpose
Step 9	show interfaces <i>interface-id</i> trunk Example: <pre>Device# show interfaces gigabitethernet 1/0/2 trunk</pre>	Displays the trunk configuration of the interface.
Step 10	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file. Note To return an interface to its default configuration, use the default interface <i>interface-id</i> interface configuration command. To reset all trunking characteristics of a trunking interface to the defaults, use the no switchport trunk interface configuration command. To disable trunking, use the switchport mode access interface configuration command to configure the port as a static-access port.

Defining the Allowed VLANs on a Trunk

VLAN 1 is the default VLAN on all trunk ports in all Cisco devices, and it has previously been a requirement that VLAN 1 always be enabled on every trunk link. You can use the VLAN 1 minimization feature to disable VLAN 1 on any individual VLAN trunk link so that no user traffic (including spanning-tree advertisements) is sent or received on VLAN 1.

SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **switchport mode trunk**
4. **switchport trunk allowed vlan {add | all | except | none | remove} *vlan-list***
5. **end**
6. **show interfaces *interface-id* switchport**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
Step 2	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/1	Specifies the port to be configured, and enters interface configuration mode.
Step 3	switchport mode trunk Example: Device(config-if)# switchport mode trunk	Configures the interface as a VLAN trunk port.
Step 4	switchport trunk allowed vlan {add all except none remove} <i>vlan-list</i> Example: Device(config-if)# switchport trunk allowed vlan remove 2	(Optional) Configures the list of VLANs allowed on the trunk. The <i>vlan-list</i> parameter is either a single VLAN number from 1 to 4094 or a range of VLANs described by two VLAN numbers, the lower one first, separated by a hyphen. Do not enter any spaces between comma-separated VLAN parameters or in hyphen-specified ranges. All VLANs are allowed by default.
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 6	show interfaces <i>interface-id</i> switchport Example: Device# show interfaces gigabitethernet1/0/1 switchport	Verifies your entries in the <i>Trunking VLANs Enabled</i> field of the display.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file. Note To return to the default allowed VLAN list of all VLANs, use the no switchport trunk allowed vlan interface configuration command.

Changing the Pruning-Eligible List

The pruning-eligible list applies only to trunk ports. Each trunk port has its own eligibility list. VTP pruning must be enabled for this procedure to take effect.

SUMMARY STEPS

1. enable

2. **configure terminal**
3. **interface** *interface-id*
4. **switchport trunk pruning vlan** {**add** | **except** | **none** | **remove**} *vlan-list* [,*vlan* [,*vlan* [,...]]]
5. **end**
6. **show interfaces** *interface-id* **switchport**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet0/1	Selects the trunk port for which VLANs should be pruned, and enters interface configuration mode.
Step 4	switchport trunk pruning vlan { add except none remove } <i>vlan-list</i> [, <i>vlan</i> [, <i>vlan</i> [,...]]]	Configures the list of VLANs allowed to be pruned from the trunk. For explanations about using the add , except , none , and remove keywords, see the command reference for this release. Separate non-consecutive VLAN IDs with a comma and no spaces; use a hyphen to designate a range of IDs. Valid IDs are 2 to 1001. Extended-range VLANs (VLAN IDs 1006 to 4094) cannot be pruned. VLANs that are pruning-ineligible receive flooded traffic. The default list of VLANs allowed to be pruned contains VLANs 2 to 1001. Note To return to the default pruning-eligible list of all VLANs, use the no switchport trunk pruning vlan interface configuration command.
Step 5	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# end	
Step 6	show interfaces <i>interface-id</i> switchport Example: Device# show interfaces gigabitethernet 1/0/1 switchport	Verifies your entries in the <i>Pruning VLANs Enabled</i> field of the display.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring the Native VLAN for Untagged Traffic

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the device forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

The native VLAN can be assigned any VLAN ID.

If a packet has a VLAN ID that is the same as the outgoing port native VLAN ID, the packet is sent untagged; otherwise, the device sends the packet with a tag.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport trunk native vlan *vlan-id***
5. **end**
6. **show interfaces *interface-id* switchport**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet 1/0/2</code>	Defines the interface that is configured as the IEEE 802.1Q trunk, and enters interface configuration mode.
Step 4	switchport trunk native vlan <i>vlan-id</i> Example: Device(config-if)# <code>switchport trunk native vlan 12</code>	Configures the VLAN that is sending and receiving untagged traffic on the trunk port. For <i>vlan-id</i> , the range is 1 to 4094. Note To return to the default native VLAN, VLAN 1, use the no switchport trunk native vlan interface configuration command.
Step 5	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
Step 6	show interfaces <i>interface-id</i> switchport Example: Device# <code>show interfaces gigabitethernet 1/0/2 switchport</code>	Verifies your entries in the <i>Trunking Native Mode VLAN</i> field.
Step 7	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring Trunk Ports for Load Sharing

Configuring Load Sharing Using STP Port Priorities

These steps describe how to configure a network with load sharing using STP port priorities.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `vtp domain domain-name`

4. **vtp mode server**
5. **end**
6. **show vtp status**
7. **show vlan**
8. **configure terminal**
9. **interface *interface-id***
10. **switchport mode trunk**
11. **end**
12. **show interfaces *interface-id* switchport**
13. Repeat the above steps on Device A for a second port in the device.
14. Repeat the above steps on Device B to configure the trunk ports that connect to the trunk ports configured on Device A.
15. **show vlan**
16. **configure terminal**
17. **interface *interface-id***
18. **spanning-tree vlan *vlan-range* port-priority *priority-value***
19. **exit**
20. **interface *interface-id***
21. **spanning-tree vlan *vlan-range* port-priority *priority-value***
22. **end**
23. **show running-config**
24. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode on Device A.
Step 3	vtp domain <i>domain-name</i> Example: Device(config)# vtp domain workdomain	Configures a VTP administrative domain. The domain name can be 1 to 32 characters.
Step 4	vtp mode server Example:	Configures Device A as the VTP server.

	Command or Action	Purpose
	Device(config)# vtp mode server	
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 6	show vtp status Example: Device# show vtp status	Verifies the VTP configuration on both Device A and Device B. In the display, check the <i>VTP Operating Mode</i> and the <i>VTP Domain Name</i> fields.
Step 7	show vlan Example: Device# show vlan	Verifies that the VLANs exist in the database on Device A.
Step 8	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 9	interface interface-id Example: Device(config)# interface gigabitethernet1/0/1	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 10	switchport mode trunk Example: Device(config-if)# switchport mode trunk	Configures the port as a trunk port.
Step 11	end Example: Device(config-if)# end	Returns to privileged EXEC mode.
Step 12	show interfaces interface-id switchport Example: Device# show interfaces gigabitethernet 1/0/1	Verifies the VLAN configuration.

	Command or Action	Purpose
	<code>switchport</code>	
Step 13	Repeat the above steps on Device A for a second port in the device.	
Step 14	Repeat the above steps on Device B to configure the trunk ports that connect to the trunk ports configured on Device A.	
Step 15	show vlan Example: Device# <code>show vlan</code>	When the trunk links come up, VTP passes the VTP and VLAN information to Device B. This command verifies that Device B has learned the VLAN configuration.
Step 16	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode on Device A.
Step 17	interface interface-id Example: Device(config)# <code>interface gigabitethernet 1/0/1</code>	Defines the interface to set the STP port priority, and enters interface configuration mode.
Step 18	spanning-tree vlan vlan-range port-priority priority-value Example: Device(config-if)# <code>spanning-tree vlan 8-10 port-priority 16</code>	Assigns the port priority for the VLAN range specified. Enter a port priority value from 0 to 240. Port priority values increment by 16.
Step 19	exit Example: Device(config-if)# <code>exit</code>	Returns to global configuration mode.
Step 20	interface interface-id Example: Device(config)# <code>interface gigabitethernet 1/0/2</code>	Defines the interface to set the STP port priority, and enters interface configuration mode.
Step 21	spanning-tree vlan vlan-range port-priority priority-value Example:	Assigns the port priority for the VLAN range specified. Enter a port priority value from 0 to 240. Port priority values increment by 16.

	Command or Action	Purpose
	Device (config-if) # spanning-tree vlan 3-6 port-priority 16	
Step 22	end Example: Device (config-if) # end	Returns to privileged EXEC mode.
Step 23	show running-config Example: Device# show running-config	Verifies your entries.
Step 24	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Load Sharing Using STP Path Cost

These steps describe how to configure a network with load sharing using STP path costs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport mode trunk**
5. **exit**
6. Repeat Steps 2 through 4 on a second interface in Device A .
7. **end**
8. **show running-config**
9. **show vlan**
10. **configure terminal**
11. **interface** *interface-id*
12. **spanning-tree vlan** *vlan-range* **cost** *cost-value*
13. **end**
14. Repeat Steps 9 through 13 on the other configured trunk interface on Device A, and set the spanning-tree path cost to 30 for VLANs 8, 9, and 10.
15. **exit**
16. **show running-config**
17. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode on Device A.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/1	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	switchport mode trunk Example: Device(config-if)# switchport mode trunk	Configures the port as a trunk port.
Step 5	exit Example: Device(config-if)# exit	Returns to global configuration mode.
Step 6	Repeat Steps 2 through 4 on a second interface in Device A .	
Step 7	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 8	show running-config Example: Device# show running-config	Verifies your entries. In the display, make sure that the interfaces are configured as trunk ports.

	Command or Action	Purpose
Step 9	show vlan Example: Device# <code>show vlan</code>	When the trunk links come up, Device A receives the VTP information from the other devices. This command verifies that Device A has learned the VLAN configuration.
Step 10	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 11	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet 1/0/1</code>	Defines the interface on which to set the STP cost, and enters interface configuration mode.
Step 12	spanning-tree vlan <i>vlan-range</i> cost <i>cost-value</i> Example: Device(config-if)# <code>spanning-tree vlan 2-4 cost 30</code>	Sets the spanning-tree path cost to 30 for VLANs 2 through 4.
Step 13	end Example: Device(config-if)# <code>end</code>	Returns to global configuration mode.
Step 14	Repeat Steps 9 through 13 on the other configured trunk interface on Device A, and set the spanning-tree path cost to 30 for VLANs 8, 9, and 10.	
Step 15	exit Example: Device(config)# <code>exit</code>	Returns to privileged EXEC mode.
Step 16	show running-config Example: Device# <code>show running-config</code>	Verifies your entries. In the display, verify that the path costs are set correctly for both trunk interfaces.
Step 17	copy running-config startup-config Example:	(Optional) Saves your entries in the configuration file.

	Command or Action	Purpose
	Device# <code>copy running-config startup-config</code>	

Configuration Examples for VLAN Trunking

Example: Configuring an IEEE 802.1Q Trunk

This example shows how to configure a port as an IEEE 802.1Q trunk. The example assumes that the neighbor interface is configured to support IEEE 802.1Q trunking.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# end
```

Example: Removing a VLAN

This example shows how to remove VLAN 2 from the allowed VLAN list on a port:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport trunk allowed vlan remove 2
Switch(config-if)# end
```

Where to Go Next

After configuring VLAN trunks, you can configure the following:

- VTP
- VLANs
- Private VLANs
- VLAN Membership Policy Server (VMPS)
- Tunneling
- Voice VLANs

Feature History and Information for VLAN Trunks

Release	Modification
Cisco IOS Release 15.0(2)EX1	This feature was introduced.

CHAPTER 87

Configuring Private VLANs

- [Prerequisites for Private VLANs, on page 1739](#)
- [Restrictions for Private VLANs, on page 1742](#)
- [Information About Private VLANs, on page 1743](#)
- [How to Configure Private VLANs, on page 1748](#)

- [Configuration Examples for Private VLANs, on page 1757](#)
- [Where to Go Next, on page 1759](#)
- [Additional References, on page 1760](#)
- [Feature History and Information for Private VLANs, on page 1760](#)

Prerequisites for Private VLANs

The following are prerequisites for configuring private VLANs:

- When you configure private VLANs on switches running VTP, the switch must be in VTP transparent mode.
- When configuring private VLANs on the switch, always use the default Switch Database Management (SDM) template to balance system resources between unicast routes and Layer 2 entries. If another SDM template is configured, use the **sdm prefer default** global configuration command to set the default template.

Secondary and Primary VLAN Configuration

Follow these guidelines when configuring private VLANs:

- Private VLANs are supported in transparent mode for VTP 1, 2 and 3. If the device is running VTP version 1 or 2, you must set VTP to transparent mode. After you configure a private VLAN, you should not change the VTP mode to client or server. VTP version 3 supports private VLANs in all modes.
- With VTP version 1 or 2, after you have configured private VLANs, use the **copy running-config startup config** privileged EXEC command to save the VTP transparent mode configuration and private-VLAN configuration in the device startup configuration file. Otherwise, if the device resets, it defaults to VTP server mode, which does not support private VLANs. VTP version 3 does support private VLANs.

- VTP version 1 and 2 do not propagate private-VLAN configuration. You must configure private VLANs on each device where you want private-VLAN ports unless the devices are running VTP version 3, as VTP3 propagate private vlans.
- You cannot configure VLAN 1 or VLANs 1002 to 1005 as primary or secondary VLANs. Extended VLANs (VLAN IDs 1006 to 4094) can belong to private VLANs.
- A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it. An isolated or community VLAN can have only one primary VLAN associated with it.
- Although a private VLAN contains more than one VLAN, only one Spanning Tree Protocol (STP) instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.
- When copying a PVLAN configuration from a tftp server and applying it on a running-config, the PVLAN association will not be formed. You will need to check and ensure that the primary VLAN is associated to all the secondary VLANs.

You can also use **configure replace flash:config_file force** instead of **copy flash:config_file running-config**.

- You can enable DHCP snooping on private VLANs. When you enable DHCP snooping on the primary VLAN, it is propagated to the secondary VLANs. If you configure DHCP on a secondary VLAN, the configuration does not take effect if the primary VLAN is already configured.
- When you enable IP source guard on private-VLAN ports, you must enable DHCP snooping on the primary VLAN.
- We recommend that you prune the private VLANs from the trunks on devices that carry no traffic in the private VLANs.
- You can apply different quality of service (QoS) configurations to primary, isolated, and community VLANs.
- Note the following considerations for sticky ARP:
 - Sticky ARP entries are those learned on SVIs and Layer 3 interfaces. These entries do not age out.
 - The **ip sticky-arp** global configuration command is supported only on SVIs belonging to private VLANs.
 - The **ip sticky-arp** interface configuration command is only supported on:
 - Layer 3 interfaces
 - SVIs belonging to normal VLANs
 - SVIs belonging to private VLANs

For more information about using the **ip sticky-arp global** configuration and the **ip sticky-arp interface** configuration commands, see the command reference for this release.

- You can configure VLAN maps on primary and secondary VLANs. However, we recommend that you configure the same VLAN maps on private-VLAN primary and secondary VLANs.
- PVLANS are bidirectional. They can be applied at both the ingress and egress sides.

When a frame in Layer-2 is forwarded within a private VLAN, the VLAN map is applied at the ingress side and at the egress side. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the ingress side. Similarly, when the frame is routed from an external port to a Private VLAN, the private-VLAN is applied at the egress side.

Bridging

- For upstream traffic from secondary VLAN to primary VLAN, the MAP of the secondary VLAN is applied on the ingress side and the MAP of the primary VLAN is applied on the egress side.
- For downstream traffic from primary VLAN to secondary VLAN, the MAP of the primary VLAN is applied in the ingress direction and the MAP of the secondary VLAN is applied in the egress direction.

Routing

If we have two private VLAN domains - PV1 (sec1, prim1) and PV2 (sec2, prim2). For frames routed from PV1 to PV2:

- The MAP of sec1 and L3 ACL of prim1 is applied in the ingress port .
- The MAP of sec1 and L3 ACL of prim2 is applied in the egress port.
- For packets going upstream or downstream from isolated host port to promiscuous port, the isolated VLAN's VACL is applied in the ingress direction and primary VLAN'S VACL is applied in the egress direction. This allows user to configure different VACL for different secondary VLAN in a same primary VLAN domain.

To filter out specific IP traffic for a private VLAN, you should apply the VLAN map to both the primary and secondary VLANs.

- You can apply router ACLs only on the primary-VLAN SVIs. The ACL is applied to both primary and secondary VLAN Layer 3 traffic.
- Although private VLANs provide host isolation at Layer 2, hosts can communicate with each other at Layer 3.
- Private VLANs support these Switched Port Analyzer (SPAN) features:
 - You can configure a private-VLAN port as a SPAN source port.
 - You can use VLAN-based SPAN (VSPAN) on primary, isolated, and community VLANs or use SPAN on only one VLAN to separately monitor egress or ingress traffic.

Private VLAN Port Configuration

Follow these guidelines when configuring private VLAN ports:

- Use only the private VLAN configuration commands to assign ports to primary, isolated, or community VLANs. Layer 2 access ports assigned to the VLANs that you configure as primary, isolated, or community VLANs are inactive while the VLAN is part of the private VLAN configuration. Layer 2 trunk interfaces remain in the STP forwarding state.
- Do not configure ports that belong to a PAgP or LACP EtherChannel as private VLAN ports. While a port is part of the private VLAN configuration, any EtherChannel configuration for it is inactive.

- Enable Port Fast and BPDU guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence. When enabled, STP applies the BPDU guard feature to all Port Fast-configured Layer 2 LAN ports. Do not enable Port Fast and BPDU guard on promiscuous ports.
- If you delete a VLAN used in the private VLAN configuration, the private VLAN ports associated with the VLAN become inactive.
- Private VLAN ports can be on different network devices if the devices are trunk-connected and the primary and secondary VLANs have not been removed from the trunk.

Restrictions for Private VLANs

The following are restrictions for configuring private VLANs:

- Private VLANs are only supported on switches running the IP Lite image.

Limitations with Other Features

When configuring private VLANs, remember these limitations with other features:

Note In some cases, the configuration is accepted with no error messages, but the commands have no effect.

- Do not configure fallback bridging on switches with private VLANs.
- When IGMP snooping is enabled on the switch (the default), the switch or switch stack supports no more than 20 private VLAN domains.
- Do not configure a remote SPAN (RSPAN) VLAN as a private VLAN primary or secondary VLAN.
- Do not configure private VLAN ports on interfaces configured for these other features:
 - Dynamic-access port VLAN membership
 - Dynamic Trunking Protocol (DTP)
 - Port Aggregation Protocol (PAgP)
 - Link Aggregation Control Protocol (LACP)
 - Multicast VLAN Registration (MVR)
 - Voice VLAN
 - Web Cache Communication Protocol (WCCP)
- You can configure IEEE 802.1x port-based authentication on a private VLAN port, but do not configure 802.1x with port security, voice VLAN, or per-user ACL on private VLAN ports.
- A private VLAN host or promiscuous port cannot be a SPAN destination port. If you configure a SPAN destination port as a private VLAN port, the port becomes inactive.

- If you configure a static MAC address on a promiscuous port in the primary VLAN, you must add the same static address to all associated secondary VLANs. If you configure a static MAC address on a host port in a secondary VLAN, you must add the same static MAC address to the associated primary VLAN. When you delete a static MAC address from a private VLAN port, you must remove all instances of the configured MAC address from the private VLAN.

Note Dynamic MAC addresses learned in one VLAN of a private VLAN are replicated in the associated VLANs. For example, a MAC address learned in a secondary VLAN is replicated in the primary VLAN. When the original dynamic MAC address is deleted or aged out, the replicated addresses are removed from the MAC address table.

- Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs.

Information About Private VLANs

Private VLAN Domains

The private VLAN feature addresses two problems that service providers face when using VLANs:

- To enable IP routing, each VLAN is assigned a subnet address space or a block of addresses, which can result in wasting the unused IP addresses, and cause IP address management problems.

Figure 128: Private VLAN Domain

Using private VLANs addresses the scalability problem and provides IP address management benefits for service providers and Layer 2 security for customers. Private VLANs partition a regular VLAN domain into subdomains. A subdomain is represented by a pair of VLANs: a *primary* VLAN and a *secondary* VLAN. A private VLAN can have multiple VLAN pairs, one pair for each subdomain. All VLAN pairs in a private VLAN share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another.

Secondary VLANs

There are two types of secondary VLANs:

- Isolated VLANs—Ports within an isolated VLAN cannot communicate with each other at the Layer 2 level.
- Community VLANs—Ports within a community VLAN can communicate with each other but cannot communicate with ports in other communities at the Layer 2 level.

Private VLANs Ports

Private VLANs provide Layer 2 isolation between ports within the same private VLAN. Private VLAN ports are access ports that are one of these types:

- Promiscuous—A promiscuous port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports that belong to the secondary VLANs associated with the primary VLAN.
- Isolated—An isolated port is a host port that belongs to an isolated secondary VLAN. It has complete Layer 2 separation from other ports within the same private VLAN, except for the promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports.
- Community—A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with promiscuous ports. These interfaces are isolated at Layer 2 from all other interfaces in other communities and from isolated ports within their private VLAN.

Note Trunk ports carry traffic from regular VLANs and also from primary, isolated, and community VLANs.

Primary and secondary VLANs have these characteristics:

- **Primary VLAN**—A private VLAN has only one primary VLAN. Every port in a private VLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the (isolated and community) host ports and to other promiscuous ports.
- **Isolated VLAN**—A private VLAN has only one isolated VLAN. An isolated VLAN is a secondary VLAN that carries unidirectional traffic upstream from the hosts toward the promiscuous ports and the gateway.
- **Community VLAN**—A community VLAN is a secondary VLAN that carries upstream traffic from the community ports to the promiscuous port gateways and to other host ports in the same community. You can configure multiple community VLANs in a private VLAN.

A promiscuous port can serve only one primary VLAN, one isolated VLAN, and multiple community VLANs. Layer 3 gateways are typically connected to the device through a promiscuous port. With a promiscuous port, you can connect a wide range of devices as access points to a private VLAN. For example, you can use a promiscuous port to monitor or back up all the private VLAN servers from an administration workstation.

Private VLANs in Networks

In a switched environment, you can assign an individual private VLAN and associated IP subnet to each individual or common group of end stations. The end stations need to communicate only with a default gateway to communicate outside the private VLAN.

You can use private VLANs to control access to end stations in these ways:

- Configure selected interfaces connected to end stations as isolated ports to prevent any communication at Layer 2. For example, if the end stations are servers, this configuration prevents Layer 2 communication between the servers.
- Configure interfaces connected to default gateways and selected end stations (for example, backup servers) as promiscuous ports to allow all end stations access to a default gateway.

You can extend private VLANs across multiple devices by trunking the primary, isolated, and community VLANs to other devices that support private VLANs. To maintain the security of your private VLAN configuration and to avoid other use of the VLANs configured as private VLANs, configure private VLANs on all intermediate devices, including devices that have no private VLAN ports.

IP Addressing Scheme with Private VLANs

Assigning a separate VLAN to each customer creates an inefficient IP addressing scheme:

- Assigning a block of addresses to a customer VLAN can result in unused IP addresses.
- If the number of devices in the VLAN increases, the number of assigned address might not be large enough to accommodate them.

These problems are reduced by using private VLANs, where all members in the private VLAN share a common address space, which is allocated to the primary VLAN. Hosts are connected to secondary VLANs, and the DHCP server assigns them IP addresses from the block of addresses allocated to the primary VLAN. Subsequent IP addresses can be assigned to customer devices in different secondary VLANs, but in the same primary VLAN. When new devices are added, the DHCP server assigns them the next available address from a large pool of subnet addresses.

Private VLANs Across Multiple Devices

Figure 129: Private VLANs Across Switches

As with regular VLANs, private VLANs can span multiple devices. A trunk port carries the primary VLAN and secondary VLANs to a neighboring device. The trunk port treats the private VLAN as any other VLAN. A feature of private VLANs across multiple devices is that traffic from an isolated port in Device A does not reach an isolated port on Device B.

Private VLANs are supported in transparent mode for VTP 1, 2 and 3. Private vlan is also supported on server mode for VTP 3. If we have a server client setup using VTP 3, private vlans configured on the server should be reflected on the client.

Private VLAN Interaction with Other Features

Private VLANs and Unicast, Broadcast, and Multicast Traffic

In regular VLANs, devices in the same VLAN can communicate with each other at the Layer 2 level, but devices connected to interfaces in different VLANs must communicate at the Layer 3 level. In private VLANs, the promiscuous ports are members of the primary VLAN, while the host ports belong to secondary VLANs. Because the secondary VLAN is associated to the primary VLAN, members of these VLANs can communicate with each other at the Layer 2 level.

In a regular VLAN, broadcasts are forwarded to all ports in that VLAN. Private VLAN broadcast forwarding depends on the port sending the broadcast:

- An isolated port sends a broadcast only to the promiscuous ports or trunk ports.
- A community port sends a broadcast to all promiscuous ports, trunk ports, and ports in the same community VLAN.
- A promiscuous port sends a broadcast to all ports in the private VLAN (other promiscuous ports, trunk ports, isolated ports, and community ports).

Multicast traffic is routed or bridged across private VLAN boundaries and within a single community VLAN. Multicast traffic is not forwarded between ports in the same isolated VLAN or between ports in different secondary VLANs.

Private VLAN multicast forwarding supports the following:

- Sender can be outside the VLAN and the Receivers can be inside the VLAN domain.
- Sender can be inside the VLAN and the Receivers can be outside the VLAN domain.
- Sender and Receiver can both be in the same community vlan.

Private VLANs and SVIs

In a Layer 3 device, a device virtual interface (SVI) represents the Layer 3 interface of a VLAN. Layer 3 devices communicate with a private VLAN only through the primary VLAN and not through secondary VLANs. Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

- If you try to configure a VLAN with an active SVI as a secondary VLAN, the configuration is not allowed until you disable the SVI.
- If you try to create an SVI on a VLAN that is configured as a secondary VLAN and the secondary VLAN is already mapped at Layer 3, the SVI is not created, and an error is returned. If the SVI is not mapped at Layer 3, the SVI is created, but it is automatically shut down.

When the primary VLAN is associated with and mapped to the secondary VLAN, any configuration on the primary VLAN is propagated to the secondary VLAN SVIs. For example, if you assign an IP subnet to the primary VLAN SVI, this subnet is the IP subnet address of the entire private VLAN.

Private VLANs and Device Stacks

Private VLANs can operate within the device stack, and private-VLAN ports can reside on different stack members. However, the following changes to the stack can impact private-VLAN operation:

- If a stack contains only one private-VLAN promiscuous port and the stack member that contains that port is removed from the stack, host ports in that private VLAN lose connectivity outside the private VLAN.
- If a stack's active switch that contains the only private-VLAN promiscuous port in the stack fails or leaves the stack and a new active switch is elected, host ports in a private VLAN that had its promiscuous port on the old active switch lose connectivity outside of the private VLAN.
- If two stacks merge, private VLANs on the winning stack are not affected, but private-VLAN configuration on the losing device is lost when that device reboots.

Private VLAN Configuration Tasks

To configure a private VLAN, perform these steps:

1. Set VTP mode to transparent.
2. Create the primary and secondary VLANs and associate them.

Note If the VLAN is not created already, the private VLAN configuration process creates it.

3. Configure interfaces to be isolated or community host ports, and assign VLAN membership to the host port.
4. Configure interfaces as promiscuous ports, and map the promiscuous ports to the primary-secondary VLAN pair.
5. If inter-VLAN routing will be used, configure the primary SVI, and map the secondary VLANs to the primary.
6. Verify the private VLAN configuration.

Default Private VLAN Configuration

No private VLANs are configured.

How to Configure Private VLANs

Configuring and Associating VLANs in a Private VLAN

The **private-vlan** commands do not take effect until you exit VLAN configuration mode.

To configure and associate VLANs in a Private VLAN, perform these steps:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vtp mode transparent**
4. **vlan *vlan-id***
5. **private-vlan primary**
6. **exit**
7. **vlan *vlan-id***
8. **private-vlan isolated**
9. **exit**
10. **vlan *vlan-id***
11. **private-vlan community**
12. **exit**
13. **vlan *vlan-id***
14. **private-vlan community**
15. **exit**
16. **vlan *vlan-id***
17. **private-vlan association [add | remove] *secondary_vlan_list***

18. `end`
19. `show vlan private-vlan [type]` or `show interfaces status`
20. `copy running-config startup config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	vtp mode transparent Example: Device(config)# <code>vtp mode transparent</code>	Sets VTP mode to transparent (disable VTP). Note For VTP3, you can set mode to either server or transparent mode
Step 4	vlan <i>vlan-id</i> Example: Device(config)# <code>vlan 20</code>	Enters VLAN configuration mode and designates or creates a VLAN that will be the primary VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.
Step 5	private-vlan primary Example: Device(config-vlan)# <code>private-vlan primary</code>	Designates the VLAN as the primary VLAN.
Step 6	exit Example: Device(config-vlan)# <code>exit</code>	Returns to global configuration mode.
Step 7	vlan <i>vlan-id</i> Example: Device(config)# <code>vlan 501</code>	(Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be an isolated VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.

	Command or Action	Purpose
Step 8	private-vlan isolated Example: Device(config-vlan)# private-vlan isolated	Designates the VLAN as an isolated VLAN.
Step 9	exit Example: Device(config-vlan)# exit	Returns to global configuration mode.
Step 10	vlan <i>vlan-id</i> Example: Device(config)# vlan 502	(Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be a community VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.
Step 11	private-vlan community Example: Device(config-vlan)# private-vlan community	Designates the VLAN as a community VLAN.
Step 12	exit Example: Device(config-vlan)# exit	Returns to global configuration mode.
Step 13	vlan <i>vlan-id</i> Example: Device(config)# vlan 503	(Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be a community VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.
Step 14	private-vlan community Example: Device(config-vlan)# private-vlan community	Designates the VLAN as a community VLAN.
Step 15	exit Example: Device(config-vlan)# exit	Returns to global configuration mode.

	Command or Action	Purpose
Step 16	<p>vlan <i>vlan-id</i></p> <p>Example:</p> <pre>Device(config)# vlan 20</pre>	Enters VLAN configuration mode for the primary VLAN designated in Step 4.
Step 17	<p>private-vlan association [add remove] <i>secondary_vlan_list</i></p> <p>Example:</p> <pre>Device(config-vlan)# private-vlan association 501-503</pre>	<p>Associates the secondary VLANs with the primary VLAN. It can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.</p> <ul style="list-style-type: none"> • The <i>secondary_vlan_list</i> parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. • The <i>secondary_vlan_list</i> parameter can contain multiple community VLAN IDs but only one isolated VLAN ID. • Enter a <i>secondary_vlan_list</i>, or use the add keyword with a <i>secondary_vlan_list</i> to associate secondary VLANs with a primary VLAN. • Use the remove keyword with a <i>secondary_vlan_list</i> to clear the association between secondary VLANs and a primary VLAN. • The command does not take effect until you exit VLAN configuration mode.
Step 18	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 19	<p>show vlan private-vlan [type] or show interfaces status</p> <p>Example:</p> <pre>Device# show vlan private-vlan</pre>	Verifies the configuration.
Step 20	<p>copy running-config startup config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	Saves your entries in the device startup configuration file.

Configuring a Layer 2 Interface as a Private VLAN Host Port

Follow these steps to configure a Layer 2 interface as a private-VLAN host port and to associate it with primary and secondary VLANs:

Note Isolated and community VLANs are both secondary VLANs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport mode private-vlan host**
5. **switchport private-vlan host-association** *primary_vlan_id secondary_vlan_id*
6. **end**
7. **show interfaces** [*interface-id*] **switchport**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/22	Enters interface configuration mode for the Layer 2 interface to be configured.
Step 4	switchport mode private-vlan host Example: Device(config-if)# switchport mode private-vlan host	Configures the Layer 2 port as a private-VLAN host port.

	Command or Action	Purpose
Step 5	<p>switchport private-vlan host-association <i>primary_vlan_id</i> <i>secondary_vlan_id</i></p> <p>Example:</p> <pre>Device(config-if)# switchport private-vlan host-association 20 501</pre>	<p>Associates the Layer 2 port with a private VLAN.</p> <p>Note This is a required step to associate the PVLAN to a Layer 2 interface.</p>
Step 6	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 7	<p>show interfaces [<i>interface-id</i>] switchport</p> <p>Example:</p> <pre>Device# show interfaces gigabitethernet1/0/22 switchport</pre>	Verifies the configuration.
Step 8	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port

Follow these steps to configure a Layer 2 interface as a private VLAN promiscuous port and map it to primary and secondary VLANs:

Note Isolated and community VLANs are both secondary VLANs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport mode private-vlan promiscuous**
5. **switchport private-vlan mapping** *primary_vlan_id* {**add** | **remove**} *secondary_vlan_list*
6. **end**
7. **show interfaces** [*interface-id*] **switchport**
8. **copy running-config startup config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/2	Enters interface configuration mode for the Layer 2 interface to be configured.
Step 4	switchport mode private-vlan promiscuous Example: Device(config-if)# switchport mode private-vlan promiscuous	Configures the Layer 2 port as a private VLAN promiscuous port.
Step 5	switchport private-vlan mapping <i>primary_vlan_id</i> { add remove } <i>secondary_vlan_list</i> Example: Device(config-if)# switchport private-vlan mapping 20 add 501-503	Maps the private VLAN promiscuous port to a primary VLAN and to selected secondary VLANs. <ul style="list-style-type: none"> • The <i>secondary_vlan_list</i> parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs. • Enter a <i>secondary_vlan_list</i>, or use the add keyword with a <i>secondary_vlan_list</i> to map the secondary VLANs to the private VLAN promiscuous port. • Use the remove keyword with a <i>secondary_vlan_list</i> to clear the mapping between secondary VLANs and the private VLAN promiscuous port.
Step 6	end Example: Device(config)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 7	show interfaces [<i>interface-id</i>] switchport Example: <pre>Device# show interfaces gigabitethernet1/0/2 switchport</pre>	Verifies the configuration.
Step 8	copy running-config startup config Example: <pre>Device# copy running-config startup-config</pre>	Saves your entries in the device startup configuration file.

Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface

If the private VLAN will be used for inter-VLAN routing, you configure an SVI for the primary VLAN and map secondary VLANs to the SVI.

Note Isolated and community VLANs are both secondary VLANs.

Follow these steps to map secondary VLANs to the SVI of a primary VLAN to allow Layer 3 switching of private VLAN traffic:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface vlan** *primary_vlan_id*
4. **private-vlan mapping** [**add** | **remove**] *secondary_vlan_list*
5. **end**
6. **show interface private-vlan mapping**
7. **copy running-config startup config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	interface vlan <i>primary_vlan_id</i> Example: Device(config)# <code>interface vlan 20</code>	Enters interface configuration mode for the primary VLAN, and configures the VLAN as an SVI. The VLAN ID range is 2 to 1001 and 1006 to 4094.
Step 4	private-vlan mapping [add remove] <i>secondary_vlan_list</i> Example: Device(config-if)# <code>private-vlan mapping 501-503</code>	Maps the secondary VLANs to the Layer 3 VLAN interface of a primary VLAN to allow Layer 3 switching of private VLAN ingress traffic. Note The private-vlan mapping interface configuration command only affects private VLAN traffic that is Layer 3 switched. <ul style="list-style-type: none"> • The <i>secondary_vlan_list</i> parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. • Enter a <i>secondary_vlan_list</i>, or use the add keyword with a <i>secondary_vlan_list</i> to map the secondary VLANs to a primary VLAN. • Use the remove keyword with a <i>secondary_vlan_list</i> to clear the mapping between secondary VLANs and a primary VLAN.
Step 5	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 6	show interface private-vlan mapping Example: Device# <code>show interfaces private-vlan mapping</code>	Verifies the configuration.
Step 7	copy running-config startup config Example: Device# <code>copy running-config startup-config</code>	Saves your entries in the device startup configuration file.

Monitoring Private VLANs

The following table displays the commands used to monitor private VLANs.

Table 172: Private VLAN Monitoring Commands

Command	Purpose
show interfaces status	Displays the status of interfaces, including the VLANs to which they belongs.
show vlan private-vlan [type]	Displays the private VLAN information for the Device.
show interface switchport	Displays private VLAN configuration on interfaces.
show interface private-vlan mapping	Displays information about the private VLAN mapping for VLAN SVIs.

Configuration Examples for Private VLANs

Example: Configuring a Primary VLAN, Isolated VLAN, and a Community of VLANs

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, to associate them in a private VLAN, and to verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# exit
Switch(config)# vlan 501
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 502
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config)# vlan 503
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config)# vlan 20
Switch(config-vlan)# private-vlan association 501-503
Switch(config-vlan)# end
Switch(config)# show vlan private vlan
```

```
Primary Secondary Type Ports
-----
```

```
20 501 isolated
20 502 community
20 503 community
```

```
20 504 non-operational
```

Example: Configuring an Interface as a Host Port

This example shows how to configure an interface as a private VLAN host port, associate it with a private VLAN pair, and verify the configuration:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/22
Device(config-if)# switchport mode private-vlan host
Device(config-if)# switchport private-vlan host-association 20 501
Device(config-if)# end
Device# show interfaces gigabitethernet1/0/22 switchport
Name: Gi1/0/22
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: 20 501
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan:
20 501

<output truncated>
```

Example: Configuring an Interface as a Private VLAN Promiscuous Port

This example shows how to configure an interface as a private VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport mode private-vlan promiscuous
Device(config-if)# switchport private-vlan mapping 20 add 501-503
Device(config-if)# end
```

Use the **show vlan private-vlan** or the **show interface status** privileged EXEC command to display primary and secondary VLANs and private-VLAN ports on the Device.

Example: Mapping Secondary VLANs to a Primary VLAN Interface

This example shows how to map the interfaces for VLANs 501 and 502 to primary VLAN 10, which permits routing of secondary VLAN ingress traffic from private VLANs 501 and 502:

```
Device# configure terminal
Device(config)# interface vlan 20
Device(config-if)# private-vlan mapping 501-503
Device(config-if)# end
Device# show interfaces private-vlan mapping
Interface Secondary VLAN Type
-----
vlan20      501          isolated
vlan20      502          community
vlan20      503          community
```

Example: Monitoring Private VLANs

This example shows output from the `show vlan private-vlan` command:

```
Device# show vlan private-vlan
Primary Secondary Type Ports
-----
20      501      isolated  Gi1/0/22, Gi1/0/2
20      502      community Gi1/0/2
20      503      community Gi1/0/2
```

Where to Go Next

You can configure the following:

- VTP
- VLANs
- VLAN trunking
- VLAN Membership Policy Server (VMPS)
- Tunneling
- Voice VLANs

Cisco IOS Release 15.0(2)EX1	This feature was introduced.

CHAPTER 88

Configuring VMPS

- [Prerequisites for VMPS, on page 1761](#)
- [Restrictions for VMPS, on page 1761](#)
- [Information About VMPS, on page 1762](#)
- [How to Configure VMPS, on page 1764](#)
- [Monitoring the VMPS, on page 1770](#)
- [Configuration Example for VMPS, on page 1771](#)
- [Where to Go Next, on page 1772](#)
- [Additional References, on page 1773](#)
- [Feature History and Information for VMPS, on page 1774](#)

Prerequisites for VMPS

- You should configure the VMPS before you configure ports as dynamic-access ports.
- When you configure a port as a dynamic-access port, the spanning-tree Port Fast feature is automatically enabled for that port. The Port Fast mode accelerates the process of bringing the port into the forwarding state.

Restrictions for VMPS

- IEEE 802.1x ports cannot be configured as dynamic-access ports. If you try to enable IEEE 802.1x on a dynamic-access (VQP) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
- Trunk ports cannot be dynamic-access ports, but you can enter the **switchport access vlan dynamic** interface configuration command for a trunk port. In this case, the switch retains the setting and applies it if the port is later configured as an access port.
You must turn off trunking on the port before the dynamic-access setting takes effect.
- Dynamic-access ports cannot be monitor ports.
- Secure ports cannot be dynamic-access ports. You must disable port security on a port before it becomes dynamic.

- Private VLAN ports cannot be dynamic-access ports.
- Dynamic-access ports cannot be members of an EtherChannel group.
- Port channels cannot be configured as dynamic-access ports.
- A dynamic-access port can participate in fallback bridging.
- The VTP management domain of the VMPS client and the VMPS server must be the same.
- The VLAN configured on the VMPS server should not be a voice VLAN.

Information About VMPS

Dynamic VLAN Assignments

The VLAN Query Protocol (VQP) is used to support dynamic-access ports, which are not permanently assigned to a VLAN, but give VLAN assignments based on the MAC source addresses seen on the port. Each time an unknown MAC address is seen, the device sends a VQP query to a remote VLAN Membership Policy Server (VMPS); the query includes the newly seen MAC address and the port on which it was seen. The VMPS responds with a VLAN assignment for the port. The device cannot be a VMPS server but can act as a client to the VMPS and communicate with it through VQP.

Each time the client device receives the MAC address of a new host, it sends a VQP query to the VMPS. When the VMPS receives this query, it searches its database for a MAC-address-to-VLAN mapping. The server response is based on this mapping and whether or not the server is in open or secure mode. In secure mode, the server shuts down the port when an illegal host is detected. In open mode, the server denies the host access to the port.

If the port is currently unassigned (that is, it does not yet have a VLAN assignment), the VMPS provides one of these responses:

- If the host is allowed on the port, the VMPS sends the client a vlan-assignment response containing the assigned VLAN name and allowing access to the host.
- If the host is not allowed on the port and the VMPS is in open mode, the VMPS sends an access-denied response.
- If the VLAN is not allowed on the port and the VMPS is in secure mode, the VMPS sends a port-shutdown response.

If the port already has a VLAN assignment, the VMPS provides one of these responses:

- If the VLAN in the database matches the current VLAN on the port, the VMPS sends a success response, allowing access to the host.
- If the VLAN in the database does not match the current VLAN on the port and active hosts exist on the port, the VMPS sends an access-denied or a port-shutdown response, depending on the secure mode of the VMPS.

If the device receives an access-denied response from the VMPS, it continues to block traffic to and from the host MAC address. The device continues to monitor the packets directed to the port and sends a query to the

VMPS when it identifies a new host address. If the device receives a port-shutdown response from the VMPS, it disables the port. The port must be manually reenabled by using Network Assistant, the CLI, or SNMP.

Dynamic-Access Port VLAN Membership

A dynamic-access port can belong to only one VLAN with an ID from 1 to 4094. When the link comes up, the device does not forward traffic to or from this port until the VMPS provides the VLAN assignment. The VMPS receives the source MAC address from the first packet of a new host connected to the dynamic-access port and attempts to match the MAC address to a VLAN in the VMPS database.

If there is a match, the VMPS sends the VLAN number for that port. If the client device was not previously configured, it uses the domain name from the first VTP packet it receives on its trunk port from the VMPS. If the client device was previously configured, it includes its domain name in the query packet to the VMPS to obtain its VLAN number. The VMPS verifies that the domain name in the packet matches its own domain name before accepting the request and responds to the client with the assigned VLAN number for the client. If there is no match, the VMPS either denies the request or shuts down the port (depending on the VMPS secure mode setting).

Multiple hosts (MAC addresses) can be active on a dynamic-access port if they are all in the same VLAN; however, the VMPS shuts down a dynamic-access port if more than 20 hosts are active on the port.

If the link goes down on a dynamic-access port, the port returns to an isolated state and does not belong to a VLAN. Any hosts that come online through the port are checked again through the VQP with the VMPS before the port is assigned to a VLAN.

Dynamic-access ports can be used for direct host connections, or they can connect to a network. A maximum of 20 MAC addresses are allowed per port on the device. A dynamic-access port can belong to only one VLAN at a time, but the VLAN can change over time, depending on the MAC addresses seen.

[Example: VMPS Configuration](#), on page 1771

Default VMPS Client Configuration

The following table shows the default VMPS and dynamic-access port configuration on client switches.

Table 173: Default VMPS Client and Dynamic-Access Port Configuration

Feature	Default Setting
VMPS domain server	None
VMPS reconfirm interval	60 minutes
VMPS server retry count	3
Dynamic-access ports	None configured

How to Configure VMPS

Entering the IP Address of the VMPS

Note If the VMPS is being defined for a cluster of switches, enter the address on the command switch.

Before you begin

You must first enter the IP address of the server to configure the switch as a client.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vmpls server *ipaddress* primary**
4. **vmpls server *ipaddress***
5. **end**
6. **show vmpls**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vmpls server <i>ipaddress</i> primary Example: Device(config)# vmpls server 10.1.2.3 primary	Enters the IP address of the device acting as the primary VMPS server.
Step 4	vmpls server <i>ipaddress</i> Example:	(Optional) Enters the IP address of the device acting as a secondary VMPS server. You can enter up to three secondary server addresses.

	Command or Action	Purpose
	Device(config)# vmpls server 10.3.4.5	
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 6	show vmpls Example: Device# show vmpls	Verifies your entries in the <i>VMPS Domain Server</i> field of the display.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Dynamic-Access Ports on VMPS Clients

Caution Dynamic-access port VLAN membership is for end stations or hubs connected to end stations. Connecting dynamic-access ports to other switches can cause a loss of connectivity.

If you are configuring a port on a cluster member device as a dynamic-access port, first use the **recommand** privileged EXEC command to log in to the cluster member device.

Before you begin

You must have IP connectivity to the VMPS for dynamic-access ports to work. You can test for IP connectivity by pinging the IP address of the VMPS and verifying that you get a response.

Note To return an interface to its default configuration, use the **default interface** *interface-id* interface configuration command. To return an interface to its default switchport mode (dynamic auto), use the **no switchport mode** interface configuration command. To reset the access mode to the default VLAN for the device, use the **no switchport access vlan** interface configuration command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*

4. `switchport mode access`
5. `switchport access vlan dynamic`
6. `end`
7. `show interfaces interface-id switchport`
8. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	interface interface-id Example: Device(config)# <code>interface gigabitethernet 0/1</code>	Specifies the device port that is connected to the end station, and enters interface configuration mode.
Step 4	switchport mode access Example: Device(config-if)# <code>switchport mode access</code>	Sets the port to access mode.
Step 5	switchport access vlan dynamic Example: Device(config-if)# <code>switchport access vlan dynamic</code>	Configures the port as eligible for dynamic VLAN membership. The dynamic-access port must be connected to an end station.
Step 6	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 7	show interfaces interface-id switchport Example: Device# <code>show interfaces gigabitethernet 0/1</code>	Verifies your entries in the <i>Operational Mode</i> field of the display.

	Command or Action	Purpose
	<code>switchport</code>	
Step 8	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Reconfirming VLAN Memberships

This task confirms the dynamic-access port VLAN membership assignments that the device has received from the VMPS.

SUMMARY STEPS

1. `enable`
2. `vmpls reconfirm`
3. `show vmpls`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	vmpls reconfirm Example: Device# <code>vmpls reconfirm</code>	Reconfirms dynamic-access port VLAN membership.
Step 3	show vmpls Example: Device# <code>show vmpls</code>	Verifies the dynamic VLAN reconfirmation status.

Changing the Reconfirmation Interval

VMPS clients periodically reconfirm the VLAN membership information received from the VMPS. You can set the number of minutes after which reconfirmation occurs.

Note If you are configuring a member device in a cluster, this parameter must be equal to or greater than the reconfirmation setting on the command device. You also must first use the **command** privileged EXEC command to log in to the member device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vmpls reconfirm** *minutes*
4. **end**
5. **show vmpls**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vmpls reconfirm <i>minutes</i> Example: Device(config)# vmpls reconfirm 90	Sets the number of minutes between reconfirmations of the dynamic VLAN membership. The range is 1 to 120. The default is 60 minutes. Note To return the switch to its default setting, use the no vmpls reconfirm global configuration command.
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 5	show vmps Example: Device# <code>show vmps</code>	Verifies the dynamic VLAN reconfirmation status in the <i>Reconfirm Interval</i> field of the display.
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Changing the Retry Count

Follow these steps to change the number of times that the device attempts to contact the VMPS before querying the next server.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `vmps retry count`
4. `end`
5. `show vmps`
6. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	vmps retry count Example: Device(config)# <code>vmps retry 5</code>	Changes the retry count. The retry range is 1 to 10; the default is 3. Note To return the device to its default setting, use the no vmps retry global configuration command.

	Command or Action	Purpose
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 5	show vmmps Example: Device# show vmmps	Verifies your entry in the <i>Server Retry Count</i> field of the display.
Step 6	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Troubleshooting Dynamic-Access Port VLAN Membership

Problem The VMPS shuts down a dynamic-access port under these conditions:

- **Problem** The VMPS is in secure mode, and it does not allow the host to connect to the port. The VMPS shuts down the port to prevent the host from connecting to the network.
- **Problem** More than 20 active hosts reside on a dynamic-access port.

Solution To reenab a disabled dynamic-access port, enter the **shutdown** interface configuration command followed by the **no shutdown** interface configuration command.

Monitoring the VMPS

You can display information about the VMPS by using the **show vmmps** privileged EXEC command. The device displays this information about the VMPS:

- **VMPS VQP Version**—The version of VQP used to communicate with the VMPS. The device queries the VMPS that is using VQP Version 1.
- **Reconfirm Interval**—The number of minutes the device waits before reconfirming the VLAN-to-MAC-address assignments.
- **Server Retry Count**—The number of times VQP resends a query to the VMPS. If no response is received after this many tries, the device starts to query the secondary VMPS.
- **VMPS domain server**—The IP address of the configured VLAN membership policy servers. The device sends queries to the one marked *current*. The one marked *primary* is the primary server.

- **VMPS Action**—The result of the most recent reconfirmation attempt. A reconfirmation attempt can occur automatically when the reconfirmation interval expires, or you can force it by entering the **vmmps reconfirm** privileged EXEC command or its Network Assistant or SNMP equivalent.

This is an example of output for the **show vmmps** privileged EXEC command:

```
Device# show vmmps
VQP Client Status:
-----
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.128.86 (primary, current)
                   172.20.128.87

Reconfirmation status
-----
VMPS Action:          other
```

Configuration Example for VMPS

Example: VMPS Configuration

Figure 130: Dynamic Port VLAN Membership Configuration

This network has a VMPS server switch and VMPS client switches with dynamic-access ports with this configuration:

- The VMPS server and the VMPS client are separate switches.
- The Catalyst 6500 series Switch A is the primary VMPS server.
- The Catalyst 6500 series Switch C and Switch J are secondary VMPS servers.
- End stations are connected to the clients, Switch B and Switch I.
- The database configuration file is stored on the TFTP server with the IP address 172.20.22.7.

Configuring IEEE 802.1Q and Layer 2 Protocol Tunneling

Prerequisites for Configuring Tunneling

The following sections list prerequisites and considerations for configuring IEEE 802.1Q and Layer 2 protocol tunneling.

IEEE 802.1Q Tunneling

Although IEEE 802.1Q tunneling works well for Layer 2 packet switching, there are incompatibilities between some Layer 2 features and Layer 3 switching.

- A tunnel port cannot be a routed port.
- IP routing is not supported on a VLAN that includes IEEE 802.1Q tunnel ports. Packets received from a tunnel port are forwarded based only on Layer 2 information. If routing is enabled on a device virtual interface (SVI) that includes tunnel ports, untagged IP packets received from the tunnel port are recognized and routed by the device. Customers can access the Internet through its native VLAN. If this access is not needed, you should not configure SVIs on VLANs that include tunnel ports.
- Fallback bridging is not supported on tunnel ports. Because all IEEE 802.1Q-tagged packets received from a tunnel port are treated as non-IP packets, if fallback bridging is enabled on VLANs that have tunnel ports configured, IP packets would be improperly bridged across VLANs. Therefore, you must not enable fallback bridging on VLANs with tunnel ports.
- Tunnel ports do not support IP access control lists (ACLs).

- Layer 3 quality of service (QoS) ACLs and other QoS features related to Layer 3 information are not supported on tunnel ports. MAC-based QoS is supported on tunnel ports.
- EtherChannel port groups are compatible with tunnel ports as long as the IEEE 802.1Q configuration is consistent within an EtherChannel port group.
- Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), and UniDirectional Link Detection (UDLD) are supported on IEEE 802.1Q tunnel ports.
- Dynamic Trunking Protocol (DTP) is not compatible with IEEE 802.1Q tunneling because you must manually configure asymmetric links with tunnel ports and trunk ports.
- VLAN Trunking Protocol (VTP) does not work between devices that are connected by an asymmetrical link or devices that communicate through a tunnel.
- Loopback detection is supported on IEEE 802.1Q tunnel ports.
- When a port is configured as an IEEE 802.1Q tunnel port, spanning-tree bridge protocol data unit (BPDU) filtering is automatically enabled on the interface. Cisco Discovery Protocol (CDP) and the Layer Link Discovery Protocol (LLDP) are automatically disabled on the interface.

Layer 2 Protocol Tunneling

- The device supports tunneling of CDP, STP, including multiple STP (MSTP), and VTP. Protocol tunneling is disabled by default but can be enabled for the individual protocols on IEEE 802.1Q tunnel ports or access ports.
- The device does not support Layer 2 protocol tunneling on ports with switchport mode dynamic auto or dynamic desirable.
- DTP is not compatible with layer 2 protocol tunneling.
- The edge devices on the outbound side of the service-provider network restore the proper Layer 2 protocol and MAC address information and forward the packets to all tunnel and access ports in the same metro VLAN.
- For interoperability with third-party vendor devices, the device supports a Layer 2 protocol-tunnel bypass feature. Bypass mode transparently forwards control PDUs to vendor devices that have different ways of controlling protocol tunneling. When Layer 2 protocol tunneling is enabled on ingress ports on a device, egress trunk ports forward the tunneled packets with a special encapsulation. If you also enable Layer 2 protocol tunneling on the egress trunk port, this behavior is bypassed, and the device forwards control PDUs without any processing or modification.
- The device supports PAgP, LACP, and UDLD tunneling for emulated point-to-point network topologies. Protocol tunneling is disabled by default but can be enabled for the individual protocols on IEEE 802.1Q tunnel ports or on access ports.
- If you enable PAgP or LACP tunneling, we recommend that you also enable UDLD on the interface for faster link-failure detection.
- Loopback detection is not supported on Layer 2 protocol tunneling of PAgP, LACP, or UDLD packets.
- EtherChannel port groups are compatible with tunnel ports when the IEEE 802.1Q configuration is consistent within an EtherChannel port group.

- If an encapsulated PDU (with the proprietary destination MAC address) is received from a tunnel port or an access port with Layer 2 tunneling enabled, the tunnel port is shut down to prevent loops. The port also shuts down when a configured shutdown threshold for the protocol is reached. You can manually reenab the port (by entering a **shutdown** and a **no shutdown** command sequence). If errdisable recovery is enabled, the operation is retried after a specified time interval.
- Only decapsulated PDUs are forwarded to the customer network. The spanning-tree instance running on the service-provider network does not forward BPDUs to tunnel ports. CDP packets are not forwarded from tunnel ports.
- When protocol tunneling is enabled on an interface, you can set a per-protocol, per-port, shutdown threshold for the PDUs generated by the customer network. If the limit is exceeded, the port shuts down. You can also limit BPDU rate by using QoS ACLs and policy maps on a tunnel port.
- When protocol tunneling is enabled on an interface, you can set a per-protocol, per-port, drop threshold for the PDUs generated by the customer network. If the limit is exceeded, the port drops PDUs until the rate at which it receives them is below the drop threshold.
- Because tunneled PDUs (especially STP BPDUs) must be delivered to all remote sites so that the customer virtual network operates properly, you can give PDUs higher priority within the service-provider network than data packets received from the same tunnel port. By default, the PDUs use the same CoS value as data packets.

Layer 2 Tunneling for EtherChannels

To configure Layer 2 point-to-point tunneling to facilitate the automatic creation of EtherChannels, you need to configure both the SP (service-provider) edge switch and the customer device.

Information about Tunneling

IEEE 802.1Q and Layer 2 Protocol Overview

Virtual private networks (VPNs) provide enterprise-scale connectivity on a shared infrastructure, often Ethernet-based, with the same security, prioritization, reliability, and manageability requirements of private networks. Tunneling is a feature designed for service providers who carry traffic of multiple customers across their networks and are required to maintain the VLAN and Layer 2 protocol configurations of each customer without impacting the traffic of other customers.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

IEEE 802.1Q Tunneling

Business customers of service providers often have specific requirements for VLAN IDs and the number of VLANs to be supported. The VLAN ranges required by different customers in the same service-provider network might overlap, and traffic of customers through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations and could easily exceed the VLAN limit (4096) of the IEEE 802.1Q specification.

Using the IEEE 802.1Q tunneling feature, service providers can use a single VLAN to support customers who have multiple VLANs. Customer VLAN IDs are preserved, and traffic from different customers is segregated within the service-provider network, even when they appear to be in the same VLAN. Using IEEE 802.1Q tunneling expands VLAN space by using a VLAN-in-VLAN hierarchy and retagging the tagged packets. A port configured to support IEEE 802.1Q tunneling is called a tunnel port. When you configure tunneling, you assign a tunnel port to a VLAN ID that is dedicated to tunneling. Each customer requires a separate service-provider VLAN ID, but that VLAN ID supports all of the customer's VLANs.

Customer traffic tagged in the normal way with appropriate VLAN IDs comes from an IEEE 802.1Q trunk port on the customer device and into a tunnel port on the service-provider edge device. The link between the customer device and the edge device is asymmetric because one end is configured as an IEEE 802.1Q trunk port, and the other end is configured as a tunnel port. You assign the tunnel port interface to an access VLAN ID that is unique to each customer.

Figure 131: IEEE 802.1Q Tunnel Ports in a Service-Provider Network

Packets coming from the customer trunk port into the tunnel port on the service-provider edge device are normally IEEE 802.1Q-tagged with the appropriate VLAN ID. The tagged packets remain intact inside the device and when they exit the trunk port into the service-provider network, they are encapsulated with another layer of an IEEE 802.1Q tag (called the metro tag) that contains the VLAN ID that is unique to the customer. The original customer IEEE 802.1Q tag is preserved in the encapsulated packet. Therefore, packets entering the service-provider network are double-tagged, with the outer (metro) tag containing the customer's access VLAN ID, and the inner VLAN ID being that of the incoming traffic.

When the double-tagged packet enters another trunk port in a service-provider core device, the outer tag is stripped as the device processes the packet. When the packet exits another trunk port on the same core device, the same metro tag is again added to the packet.

Figure 132: Original (Normal), IEEE 802.1Q, and Double-Tagged Ethernet Packet Formats

This figure shows the tag structures of the double-tagged packets.

When the packet enters the trunk port of the service-provider egress device, the outer tag is again stripped as the device internally processes the packet. However, the metro tag is not added when the packet is sent out the tunnel port on the edge device into the customer network. The packet is sent as a normal IEEE 802.1Q-tagged frame to preserve the original VLAN numbers in the customer network.

In the above network figure, Customer A was assigned VLAN 30, and Customer B was assigned VLAN 40. Packets entering the edge device tunnel ports with IEEE 802.1Q tags are double-tagged when they enter the service-provider network, with the outer tag containing VLAN ID 30 or 40, appropriately, and the inner tag containing the original VLAN number, for example, VLAN 100. Even if both Customers A and B have VLAN 100 in their networks, the traffic remains segregated within the service-provider network because the outer tag is different. Each customer controls its own VLAN numbering space, which is independent of the VLAN numbering space used by other customers and the VLAN numbering space used by the service-provider network.

At the outbound tunnel port, the original VLAN numbers on the customer's network are recovered. It is possible to have multiple levels of tunneling and tagging, but the device supports only one level in this release.

If traffic coming from a customer network is not tagged (native VLAN frames), these packets are bridged or routed as normal packets. All packets entering the service-provider network through a tunnel port on an edge device are treated as untagged packets, whether they are untagged or already tagged with IEEE 802.1Q headers. The packets are encapsulated with the metro tag VLAN ID (set to the access VLAN of the tunnel port) when they are sent through the service-provider network on an IEEE 802.1Q trunk port. The priority field on the metro tag is set to the interface class of service (CoS) priority configured on the tunnel port. (The default is zero if none is configured.)

On device, because 802.1Q tunneling is configured on a per-port basis, it does not matter whether the device is a standalone device or a stack member. All configuration is done on the active stack.

IEEE 802.1Q Tunneling Configuration Guidelines

When you configure IEEE 802.1Q tunneling, you should always use an asymmetrical link between the customer device and the edge device, with the customer device port configured as an IEEE 802.1Q trunk port and the edge device port configured as a tunnel port.

Assign tunnel ports only to VLANs that are used for tunneling.

Configuration requirements for native VLANs and for and maximum transmission units (MTUs) are explained in these next sections.

Native VLANs

When configuring IEEE 802.1Q tunneling on an edge device, you must use IEEE 802.1Q trunk ports for sending packets into the service-provider network. However, packets going through the core of the service-provider network can be carried through IEEE 802.1Q trunks, ISL trunks, or nontrunking links. When IEEE 802.1Q trunks are used in these core devices, the native VLANs of the IEEE 802.1Q trunks must not match any native VLAN of the nontrunking (tunneling) port on the same device because traffic on the native VLAN would not be tagged on the IEEE 802.1Q sending trunk port.

In the following network figure, VLAN 40 is configured as the native VLAN for the IEEE 802.1Q trunk port from Customer X at the ingress edge device in the service-provider network (Device B). Device A of Customer X sends a tagged packet on VLAN 30 to the ingress tunnel port of Device B in the service-provider network, which belongs to access VLAN 40. Because the access VLAN of the tunnel port (VLAN 40) is the same as the native VLAN of the edge device trunk port (VLAN 40), the metro tag is not added to tagged packets received from the tunnel port. The packet carries only the VLAN 30 tag through the service-provider network to the trunk port of the egress-edgedevice (Device C) and is misdirected through the egress device tunnel port to Customer Y.

Figure 133: Potential Problems with IEEE 802.1Q Tunneling and Native VLANs

These are some ways to solve this problem:

- Use the **vlan dot1q tag native** global configuration command to configure the edge devices so that all packets going out an IEEE 802.1Q trunk, including the native VLAN, are tagged. If the device is configured to tag native VLAN packets on all IEEE 802.1Q trunks, the device accepts untagged packets, but sends only tagged packets.

- Ensure that the native VLAN ID on the edge devices trunk port is not within the customer VLAN range. For example, if the trunk port carries traffic of VLANs 100 to 200, assign the native VLAN a number outside that range.

System MTU

The default system MTU for traffic on the device is 1500 bytes. You can configure Fast Ethernet ports on the device members in the mixed hardware device stack to support frames larger than 1500 bytes by using the **system mtu** global configuration command.

You can configure 10-Gigabit and Gigabit Ethernet ports to support frames larger than 1500 bytes by using the **system mtu jumbo** global configuration command.

The system MTU and system jumbo MTU values do not include the IEEE 802.1Q header. Because the IEEE 802.1Q tunneling feature increases the frame size by 4 bytes when the metro tag is added, you must configure all devices in the service-provider network to be able to process maximum frames by adding 4 bytes to the system MTU and system jumbo MTU sizes.

For example, the device supports a maximum frame size of 1496 bytes with one of these configurations:

- The device has a system jumbo MTU value of 1500 bytes, and the **switchport mode dot1q tunnel** interface configuration command is configured on a 10-Gigabit or Gigabit Ethernet device port.
- The device member has a system MTU value of 1500 bytes, and the **switchport mode dot1q tunnel** interface configuration command is configured on a Fast Ethernet port of the member.

Default IEEE 802.1Q Tunneling Configuration

By default, IEEE 802.1Q tunneling is disabled because the default switchport mode is dynamic auto. Tagging of IEEE 802.1Q native VLAN packets on all IEEE 802.1Q trunk ports is also disabled.

Layer 2 Protocol Tunneling Overview

Customers at different sites connected across a service-provider network need to use various Layer 2 protocols to scale their topologies to include all remote sites, as well as the local sites. STP must run properly, and every VLAN should build a proper spanning tree that includes the local site and all remote sites across the service-provider network. Cisco Discovery Protocol (CDP) must discover neighboring Cisco devices from local and remote sites. VLAN Trunking Protocol (VTP) must provide consistent VLAN configuration throughout all sites in the customer network.

When protocol tunneling is enabled, edge devices on the inbound side of the service-provider network encapsulate Layer 2 protocol packets with a special MAC address and send them across the service-provider network. Core devices in the network do not process these packets but forward them as normal packets. Layer 2 protocol data units (PDUs) for CDP, STP, or VTP cross the service-provider network and are delivered to customer devices on the outbound side of the service-provider network. Identical packets are received by all customer ports on the same VLANs with these results:

- Users on each of a customer's sites can properly run STP, and every VLAN can build a correct spanning tree based on parameters from all sites and not just from the local site.
- CDP discovers and shows information about the other Cisco devices connected through the service-provider network.

- VTP provides consistent VLAN configuration throughout the customer network, propagating to all devices through the service provider.

Note To provide interoperability with third-party vendors, you can use the Layer 2 protocol-tunnel bypass feature. Bypass mode transparently forwards control PDUs to vendor devices that have different ways of controlling protocol tunneling. You implement bypass mode by enabling Layer 2 protocol tunneling on the egress trunk port. When Layer 2 protocol tunneling is enabled on the trunk port, the encapsulated tunnel MAC address is removed and the protocol packets have their normal MAC address.

Layer 2 protocol tunneling can be used independently or can enhance IEEE 802.1Q tunneling. If protocol tunneling is not enabled on IEEE 802.1Q tunneling ports, remote devices at the receiving end of the service-provider network do not receive the PDUs and cannot properly run STP, CDP, and VTP. When protocol tunneling is enabled, Layer 2 protocols within each customer's network are totally separate from those running within the service-provider network. Customer devices on different sites that send traffic through the service-provider network with IEEE 802.1Q tunneling achieve complete knowledge of the customer's VLAN. If IEEE 802.1Q tunneling is not used, you can still enable Layer 2 protocol tunneling by connecting to the customer device through access ports and by enabling tunneling on the service-provider access port.

For example, in the following figure (Layer 2 Protocol Tunneling), Customer X has four devices in the same VLAN, that are connected through the service-provider network. If the network does not tunnel PDUs, devices on the far ends of the network cannot properly run STP, CDP, and VTP. For example, STP for a VLAN on a device in Customer X, Site 1, will build a spanning tree on the devices at that site without considering convergence parameters based on Customer X's device in Site 2. This could result in the topology shown in the Layer 2 Network Topology without Proper Convergence figure.

Figure 134: Layer 2 Protocol Tunneling

Figure 135: Layer 2 Network Topology Without Proper Convergence

In an SP network, you can use Layer 2 protocol tunneling to enhance the creation of EtherChannels by emulating a point-to-point network topology. When you enable protocol tunneling (PAGP or LACP) on the SP device, remote customer devices receive the PDUs and can negotiate the automatic creation of EtherChannels.

For example, in the following figure (Layer 2 Protocol Tunneling for EtherChannels), Customer A has two devices in the same VLAN that are connected through the SP network. When the network tunnels PDUs, devices on the far ends of the network can negotiate the automatic creation of EtherChannels without needing dedicated lines.

Figure 136: Layer 2 Protocol Tunneling for EtherChannels

Layer 2 Protocol Tunneling on Ports

You can enable Layer 2 protocol tunneling (by protocol) on the ports that are connected to the customer in the edge devices of the service-provider network. The service-provider edge devices connected to the customer device perform the tunneling process. Edge device tunnel ports are connected to customer IEEE 802.1Q trunk ports. Edge device access ports are connected to customer access ports. The edge devices connected to the customer device perform the tunneling process.

You can enable Layer 2 protocol tunneling on ports that are configured as access ports or tunnel ports. You cannot enable Layer 2 protocol tunneling on ports configured in either **switchport mode dynamic auto** mode (the default mode) or **switchport mode dynamic desirable** mode.

The device supports Layer 2 protocol tunneling for CDP, STP, and VTP. For emulated point-to-point network topologies, it also supports PAGP, LACP, and UDLD protocols. The device does not support Layer 2 protocol tunneling for LLDP.

Note PAgP, LACP, and UDLD protocol tunneling is only intended to emulate a point-to-point topology. An erroneous configuration that sends tunneled packets to many ports could lead to a network failure.

When the Layer 2 PDUs that entered the service-provider inbound edge device through a Layer 2 protocol-enabled port exit through the trunk port into the service-provider network, the device overwrites the customer PDU-destination MAC address with a well-known Cisco proprietary multicast address (01-00-0c-cd-cd-d0). If IEEE 802.1Q tunneling is enabled, packets are also double-tagged; the outer tag is the customer metro tag, and the inner tag is the customer's VLAN tag. The core devices ignore the inner tags and forward the packet to all trunk ports in the same metro VLAN. The edge devices on the outbound side restore the proper Layer 2 protocol and MAC address information and forward the packets to all tunnel or access ports in the same metro VLAN. Therefore, the Layer 2 PDUs remain intact and are delivered across the service-provider infrastructure to the other side of the customer network.

See the Layer 2 Protocol Tunneling figure in [Layer 2 Protocol Tunneling Overview, on page 1781](#), with Customer X and Customer Y in access VLANs 30 and 40, respectively. Asymmetric links connect the customers in Site 1 to edge devices in the service-provider network. The Layer 2 PDUs (for example, BPDUs) coming into Device B from Customer Y in Site 1 are forwarded to the infrastructure as double-tagged packets with the well-known MAC address as the destination MAC address. These double-tagged packets have the metro VLAN tag of 40, as well as an inner VLAN tag (for example, VLAN 100). When the double-tagged packets enter Device D, the outer VLAN tag 40 is removed, the well-known MAC address is replaced with the respective Layer 2 protocol MAC address, and the packet is sent to Customer Y on Site 2 as a single-tagged frame in VLAN 100.

You can also enable Layer 2 protocol tunneling on access ports on the edge device connected to access or trunk ports on the customer device. In this case, the encapsulation and decapsulation process is the same as described in the previous paragraph, except that the packets are not double-tagged in the service-provider network. The single tag is the customer-specific access VLAN tag.

In device stacks, Layer 2 protocol tunneling configuration is distributed among all stack members. Each stack member that receives an ingress packet on a local port encapsulates or decapsulates the packet and forwards it to the appropriate destination port. On a single device, ingress Layer 2 protocol-tunneled traffic is sent across all local ports in the same VLAN on which Layer 2 protocol tunneling is enabled. In a stack, packets received by a Layer 2 protocol-tunneled port are distributed to all ports in the stack that are configured for Layer 2 protocol tunneling and are in the same VLAN. All Layer 2 protocol tunneling configuration is handled by the active stack and distributed to all stack members.

Default Layer 2 Protocol Tunneling Configuration

The following table shows the default Layer 2 protocol tunneling configuration.

Table 174: Default Layer 2 Ethernet Interface VLAN Configuration

Feature	Default Setting
Layer 2 protocol tunneling	Disabled.
Shutdown threshold	None set.
Drop threshold	None set.

Feature	Default Setting
CoS Value	If a CoS value is configured on the interface, that value is used to set the BPDU CoS value for Layer 2 protocol tunneling. If no CoS value is configured at the interface level, the default value for CoS marking of L2 protocol tunneling BPDUs is 5. This does not apply to data traffic.

How to Configure Tunneling

Configuring an IEEE 802.1Q Tunneling Port

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport access vlan *vlan-id***
5. **switchport mode dot1q-tunnel**
6. **exit**
7. **vlan dot1q tag native**
8. **end**
9. Use one of the following:
 - **show dot1q-tunnel**
 - **show running-config interface**
10. **show vlan dot1q tag native**
11. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface <i>interface-id</i> Example: Device (config) # interface gigabitethernet2/0/1	Enters interface configuration mode for the interface to be configured as a tunnel port. This should be the edge port in the service-provider network that connects to the customer device. Valid interfaces include physical interfaces and port-channel logical interfaces (port channels 1 to 48).
Step 4	switchport access vlan <i>vlan-id</i> Example: Device (config-if) # switchport access vlan 2	Specifies the default VLAN, which is used if the interface stops trunking. This VLAN ID is specific to the particular customer.
Step 5	switchport mode dot1q-tunnel Example: Device (config-if) # switchport mode dot1q-tunnel	Sets the interface as an IEEE 802.1Q tunnel port. Note Use the no switchport mode dot1q-tunnel interface configuration command to return the port to the default state of dynamic desirable.
Step 6	exit Example: Device (config-if) # exit	Returns to privileged EXEC mode.
Step 7	vlan dot1q tag native Example: Device (config) # vlan dot1q tag native	(Optional) Sets the device to enable tagging of native VLAN packets on all IEEE 802.1Q trunk ports. When not set, and a customer VLAN ID is the same as the native VLAN, the trunk port does not apply a metro tag, and packets could be sent to the wrong destination. Note Use the no vlan dot1q tag native global configuration command to disable tagging of native VLAN packets.
Step 8	end Example: Device (config) # end	Returns to privileged EXEC mode.
Step 9	Use one of the following: <ul style="list-style-type: none"> • show dot1q-tunnel • show running-config interface Example: Device# show dot1q-tunnel	Displays the ports configured for IEEE 802.1Q tunneling. Displays the ports that are in tunnel mode.

	Command or Action	Purpose
	OR Device# <code>show running-config interface</code>	
Step 10	show vlan dot1q tag native Example: Device# <code>show vlan dot1q native</code>	Displays IEEE 802.1Q native VLAN tagging status.
Step 11	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring Layer 2 Protocol Tunneling

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. Use one of the following:
 - `switchport mode access`
 - `switchport mode dot1q-tunnel`
5. `l2protocol-tunnel [cdp | lldp | point-to-point | stp | vtp]`
6. `l2protocol-tunnel shutdown-threshold [packet_second_rate_value | cdp | lldp point-to-point | stp | vtp]`
7. `l2protocol-tunnel drop-threshold [packet_second_rate_value | cdp | lldp | point-to-point | stp | vtp]`
8. `exit`
9. `errdisable recovery cause l2ptguard`
10. `l2protocol-tunnel cos value`
11. `end`
12. `show l2protocol`
13. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>enable</code> Example:	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
	Device> <code>enable</code>	
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# <code>interface gigabitethernet1/0/1</code>	Specifies the interface connected to the phone, and enters interface configuration mode.
Step 4	Use one of the following: <ul style="list-style-type: none"> • <code>switchport mode access</code> • <code>switchport mode dot1q-tunnel</code> Example: Device# <code>switchport mode access</code> OR Device# <code>switchport mode dot1q-tunnel</code>	Configures the interface as an access port or an IEEE 802.1Q tunnel port.
Step 5	l2protocol-tunnel [cdp lldp point-to-point stp vtp] Example: Device# <code>l2protocol-tunnel cdp</code>	Enables protocol tunneling for the desired protocol. If no keyword is entered, tunneling is enabled for all three Layer 2 protocols. Note Use the <code>no l2protocol-tunnel [cdp lldp point-to-point stp vtp]</code> interface configuration command to disable protocol tunneling for one of the Layer 2 protocols or for all three.
Step 6	l2protocol-tunnel shutdown-threshold [<i>packet_second_rate_value</i> cdp lldp point-to-point stp vtp] Example: Device# <code>l2protocol-tunnel shutdown-threshold 100 cdp</code>	(Optional) Configures the threshold for packets-per-second accepted for encapsulation. The interface is disabled if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured. Note If you also set a drop threshold on this interface, the <code>shutdown-threshold</code> value must be greater than or equal to the <code>drop-threshold</code> value.

	Command or Action	Purpose
		<p>Note Use the no l2protocol-tunnel shutdown-threshold [<i>packet_second_rate_value</i> cdp lldp point-to-point stp vtp] and the no l2protocol-tunnel drop-threshold [<i>packet_second_rate_value</i> cdp lldp point-to-point stp vtp] commands to return the shutdown and drop thresholds to the default settings.</p>
Step 7	<p>l2protocol-tunnel drop-threshold [<i>packet_second_rate_value</i> cdp lldp point-to-point stp vtp]</p> <p>Example:</p> <pre>Device# l2protocol-tunnel drop-threshold 100 cdp</pre>	<p>(Optional) Configures the threshold for packets-per-second accepted for encapsulation. The interface drops packets if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured.</p> <p>Note If you also set a shutdown threshold on this interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.</p> <p>Note Use the no l2protocol-tunnel shutdown-threshold [cdp lldp point-to-point stp vtp] and the no l2protocol-tunnel drop-threshold [cdp stp vtp] commands to return the shutdown and drop thresholds to the default settings.</p>
Step 8	<p>exit</p> <p>Example:</p> <pre>Device# exit</pre>	Returns to global configuration mode.
Step 9	<p>errdisable recovery cause l2ptguard</p> <p>Example:</p> <pre>Device(config)# errdisable recovery cause l2ptguard</pre>	(Optional) Configures the recovery mechanism from a Layer 2 maximum-rate error so that the interface is reenabled and can try again. Errdisable recovery is disabled by default; when enabled, the default time interval is 300 seconds.
Step 10	<p>l2protocol-tunnel cos value</p> <p>Example:</p> <pre>Device(config)# l2protocol-tunnel cos value 7</pre>	(Optional) Configures the CoS value for all tunneled Layer 2 PDUs. The range is 0 to 7; the default is the default CoS value for the interface. If none is configured, the default is 5.

	Command or Action	Purpose
Step 11	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 12	show l2protocol Example: Device# show l2protocol	Displays the Layer 2 tunnel ports on the device, including the protocols configured, the thresholds, and the counters.
Step 13	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring the SP Edge Switch

Before you begin

For EtherChannels, you need to configure both the SP (service-provider) edge devices and the customer devices for Layer 2 protocol tunneling.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport mode dot1q-tunnel**
5. **l2protocol-tunnel point-to-point** [**pagp** | **lACP** | **udld**]
6. **l2protocol-tunnel shutdown-threshold** [**point-to-point** [**pagp** | **lACP** | **udld**]] *value*
7. **l2protocol-tunnel drop-threshold** [**point-to-point** [**pagp** | **lACP** | **udld**]] *value*
8. **no cdp enable**
9. **spanning-tree bpdu filter enable**
10. **exit**
11. **errdisable recovery cause l2ptguard**
12. **l2protocol-tunnel cos** *value*
13. **end**
14. **show l2protocol**
15. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface interface-id Example: Device(config)# interface gigabitethernet1/0/1	Specifies the interface connected to the phone, and enters interface configuration mode.
Step 4	switchport mode dot1q-tunnel Example: Device(config-if)# switchport mode dot1q-tunnel	Configures the interface as an IEEE 802.1Q tunnel port.
Step 5	l2protocol-tunnel point-to-point [pagp lacp udld] Example: Device(config-if)# l2protocol-tunnel point-to-point pagp	(Optional) Enables point-to-point protocol tunneling for the desired protocol. If no keyword is entered, tunneling is enabled for all three protocols. <p>Note To avoid a network failure, make sure that the network is a point-to-point topology before you enable tunneling for PAGP, LACP, or UDLD packets.</p> <p>Note Use the no l2protocol-tunnel [point-to-point [pagp lacp udld]] interface configuration command to disable point-to-point protocol tunneling for one of the Layer 2 protocols or for all three.</p>
Step 6	l2protocol-tunnel shutdown-threshold [point-to-point [pagp lacp udld]] value Example: Device(config-if)# l2protocol-tunnel shutdown-threshold point-to-point pagp 100	(Optional) Configures the threshold for packets-per-second accepted for encapsulation. The interface is disabled if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured.

	Command or Action	Purpose
		<p>Note If you also set a drop threshold on this interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.</p> <p>Note Use the no l2protocol-tunnel shutdown-threshold [point-to-point [pagp lacp udld]] and the no l2protocol-tunnel drop-threshold [[point-to-point [pagp lacp udld]] commands to return the shutdown and drop thresholds to the default settings.</p>
Step 7	<p>l2protocol-tunnel drop-threshold [point-to-point [pagp lacp udld]] value</p> <p>Example:</p> <pre>Device(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 500</pre>	<p>(Optional) Configures the threshold for packets-per-second accepted for encapsulation. The interface drops packets if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured.</p> <p>Note If you also set a shutdown threshold on this interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.</p>
Step 8	<p>no cdp enable</p> <p>Example:</p> <pre>Device(config-if)# no cdp enable</pre>	Disables CDP on the interface.
Step 9	<p>spanning-tree bpdu filter enable</p> <p>Example:</p> <pre>Device(config-if)# spanning-tree bpdu filter enable</pre>	Enables BPDU filtering on the interface.
Step 10	<p>exit</p> <p>Example:</p> <pre>Device(config-if)# exit</pre>	Returns to global configuration mode.
Step 11	<p>errdisable recovery cause l2ptguard</p> <p>Example:</p> <pre>Device(config)# errdisable recovery cause l2ptguard</pre>	(Optional) Configures the recovery mechanism from a Layer 2 maximum-rate error so that the interface is reenabled and can try again. Errdisable recovery is disabled by default; when enabled, the default time interval is 300 seconds.

	Command or Action	Purpose
Step 12	l2protocol-tunnel cos <i>value</i> Example: Device(config)# l2protocol-tunnel cos 2	(Optional) Configures the CoS value for all tunneled Layer 2 PDUs. The range is 0 to 7; the default is the default CoS value for the interface. If none is configured, the default is 5.
Step 13	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 14	show l2protocol Example: Device)# show l2protocol	Displays the Layer 2 tunnel ports on the device, including the protocols configured, the thresholds, and the counters.
Step 15	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring the Customer Device

Before you begin

For EtherChannels, you need to configure both the SP edge device and the customer devices for Layer 2 protocol tunneling.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport trunk encapsulation dot1q**
5. **switchport mode trunk**
6. **udld port**
7. **channel-group *channel-group-number* mode desirable**
8. **exit**
9. **interface port-channel *port-channel number***
10. **shutdown**
11. **no shutdown**
12. **end**
13. **show l2protocol**

14. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet1/0/1	Specifies the interface connected to the phone, and enters interface configuration mode.
Step 4	switchport trunk encapsulation dot1q Example: Device(config)# switchport trunk encapsulation dot1q	Sets the trunking encapsulation format to IEEE 802.1Q.
Step 5	switchport mode trunk Example: Device(config-if)# switchport mode trunk	Enables trunking on the interface.
Step 6	udld port Example: Device(config-if)# udld port	Enables UDLD in normal mode on the interface.
Step 7	channel-group <i>channel-group-number</i> mode desirable Example: Device(config-if)# channel-group 25 mode desirable	Assigns the interface to a channel group, and specifies desirable for the PAgP mode.
Step 8	exit	Returns to global configuration mode.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device(config-if)# exit</pre>	
Step 9	<p>interface port-channel port-channel <i>number</i></p> <p>Example:</p> <pre>Device(config)# interface port-channel port-channel 25</pre>	Enters port-channel interface mode.
Step 10	<p>shutdown</p> <p>Example:</p> <pre>Device(config)# shutdown</pre>	Shuts down the interface.
Step 11	<p>no shutdown</p> <p>Example:</p> <pre>Device(config)# no shutdown</pre>	Enables the interface.
Step 12	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 13	<p>show l2protocol</p> <p>Example:</p> <pre>Device# show l2protocol</pre>	Displays the Layer 2 tunnel ports on the device, including the protocols configured, the thresholds, and the counters.
Step 14	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p> <p>Note Use the no switchport mode trunk, the no udd enable, and the no channel group channel-group-number mode desirable interface configuration commands to return the interface to the default settings.</p>

Configuration Examples for IEEE 802.1Q and Layer 2 Protocol Tunneling

Example: Configuring an IEEE 802.1Q Tunneling Port

The following example shows how to configure an interface as a tunnel port, enable tagging of native VLAN packets, and verify the configuration. In this configuration, the VLAN ID for the customer connected to Gigabit Ethernet interface 7 on stack member 1 is VLAN 22.

```
Switch(config)# interface gigabitethernet1/0/7
Switch(config-if)# switchport access vlan 22
% Access VLAN does not exist. Creating vlan 22
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# exit
Switch(config)# vlan dot1q tag native
Switch(config)# end
Switch# show dot1q-tunnel interface gigabitethernet1/0/7
Port
-----
Gi1/0/1Port
-----
Switch# show vlan dot1q tag native
dot1q native vlan tagging is enabled
```

Example: Configuring Layer 2 Protocol Tunneling

The following example shows how to configure Layer 2 protocol tunneling for CDP, STP, and VTP and to verify the configuration.

```
Switch(config)# interface gigabitethernet1/0/11
Switch(config-if)# l2protocol-tunnel cdp
Switch(config-if)# l2protocol-tunnel stp
Switch(config-if)# l2protocol-tunnel vtp
Switch(config-if)# l2protocol-tunnel shutdown-threshold 1500
Switch(config-if)# l2protocol-tunnel drop-threshold 1000
Switch(config-if)# exit
Switch(config)# l2protocol-tunnel cos 7
Switch(config)# end
Switch# show l2protocol
```

```
COS for Encapsulated Packets: 7
Port Protocol Shutdown Drop Encapsulation Decapsulation Drop
Threshold Threshold Counter Counter Counter
-----
Gi0/11 cdp 1500 1000 2288 2282 0
stp 1500 1000 116 13 0
vtp 1500 1000 3 67 0
pagp ---- ---- 0 0 0
lacp ---- ---- 0 0 0
udld ---- ---- 0 0 0
```

Examples: Configuring the SP Edge and Customer Switches

This example shows how to configure the SP edge switch 1 and edge switch 2. VLANs 17, 18, 19, and 20 are the access VLANs, Fast Ethernet interfaces 1 and 2 are point-to-point tunnel ports with PAgP and UDLD enabled, the drop threshold is 1000, and Fast Ethernet interface 3 is a trunk port.

SP edge switch 1 configuration:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport access vlan 17
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport access vlan 18
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# switchport trunk encapsulation isl
Switch(config-if)# switchport mode trunk
```

SP edge switch 2 configuration:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport access vlan 19
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport access vlan 20
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# switchport trunk encapsulation isl
Switch(config-if)# switchport mode trunk
```

This example shows how to configure the customer switch at Site 1. Fast Ethernet interfaces 1, 2, 3, and 4 are set for IEEE 802.1Q trunking, UDLD is enabled, EtherChannel group 1 is enabled, and the port channel is shut down and then enabled to activate the EtherChannel configuration.

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/2
```

```

Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# uddld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# uddld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/4
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# uddld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface port-channel 1
Switch(config-if)# shutdown
Switch(config-if)# no shutdown
Switch(config-if)# exit

```

Monitoring Tunneling Status

The following table describes the commands used to monitor tunneling status.

Table 175: Commands for Monitoring Tunneling

Command	Purpose
clear l2protocol-tunnel counters	Clears the protocol counters on Layer 2 protocol tunneling ports.
show dot1q-tunnel	Displays IEEE 802.1Q tunnel ports on the device.
show dot1q-tunnel interface <i>interface-id</i>	Verifies if a specific interface is a tunnel port.
show l2protocol-tunnel	Displays information about Layer 2 protocol tunneling ports.
show errdisable recovery	Verifies if the recovery timer from a Layer 2 protocol-tunnel error disable state is enabled.
show l2protocol-tunnel interface <i>interface-id</i>	Displays information about a specific Layer 2 protocol tunneling port.
show l2protocol-tunnel summary	Displays only Layer 2 protocol summary information.
show vlan dot1q tag native	Displays the status of native VLAN tagging on the device.

Where to Go Next

You can configure the following:

- VTP
- VLANs
- VLAN Trunking
- Private VLANs
- VLAN Membership Policy Server (VMPS)
- Voice VLANs

- [Where to Go Next, on page 1809](#)
- [Additional References, on page 1809](#)
- [Feature History and Information for Voice VLAN, on page 1810](#)

Prerequisites for Voice VLANs

The following are the prerequisites for voice VLANs:

- Voice VLAN configuration is only supported on switch access ports; voice VLAN configuration is not supported on trunk ports.

Note Trunk ports can carry any number of voice VLANs, similar to regular VLANs. The configuration of voice VLANs is not supported on trunk ports.

- Before you enable voice VLAN, we recommend that you enable QoS on the switch by entering the **mls qos** global configuration command and configure the port trust state to trust by entering the **mls qos trust cos** interface configuration command. If you use the auto-QoS feature, these settings are automatically configured.
- You must enable CDP on the switch port connected to the Cisco IP Phone to send the configuration to the phone. (CDP is globally enabled by default on all switch interfaces.)

Restrictions for Voice VLANs

The following are the restrictions for voice VLANs:

- Do not configure voice VLAN on private VLAN ports.

- You cannot configure static secure MAC addresses in the voice VLAN.

Information About Voice VLAN

Voice VLANs

The voice VLAN feature enables access ports to carry IP voice traffic from an IP phone. When the device is connected to a Cisco 7960 IP Phone, the phone sends voice traffic with Layer 3 IP precedence and Layer 2 class of service (CoS) values, which are both set to 5 by default. Because the sound quality of an IP phone call can deteriorate if the data is unevenly sent, the device supports quality of service (QoS) based on IEEE 802.1p CoS. QoS uses classification and scheduling to send network traffic from the device in a predictable manner.

The Cisco 7960 IP Phone is a configurable device, and you can configure it to forward traffic with an IEEE 802.1p priority. You can configure the device to trust or override the traffic priority assigned by a Cisco IP Phone.

Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the device to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the device in any of these ways:

- In the voice VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN, untagged (no Layer 2 CoS priority value)

Note In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

Cisco IP Phone Data Traffic

The device can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP Phone. You can configure Layer 2 access ports on the device to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

- In trusted mode, all traffic received through the access port on the Cisco IP Phone passes through the phone unchanged.
- In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received through the access port on the Cisco IP Phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.

Note Untagged traffic from the device attached to the Cisco IP Phone passes through the phone unchanged, regardless of the trust state of the access port on the phone.

Voice VLAN Configuration Guidelines

- Because a Cisco 7960 IP Phone also supports a connection to a PC or other device, a port connecting the device to a Cisco IP Phone can carry mixed traffic. You can configure a port to decide how the Cisco IP Phone carries voice traffic and data traffic.
- The voice VLAN should be present and active on the device for the IP phone to correctly communicate on the voice VLAN. Use the **show vlan** privileged EXEC command to see if the VLAN is present (listed in the display). If the VLAN is not listed, create the voice VLAN.
- The Power over Ethernet (PoE) devices are capable of automatically providing power to Cisco pre-standard and IEEE 802.3af-compliant powered devices if they are not being powered by an AC power source.
- The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.
- If the Cisco IP Phone and a device attached to the phone are in the same VLAN, they must be in the same IP subnet. These conditions indicate that they are in the same VLAN:
 - They both use IEEE 802.1p or untagged frames.
 - The Cisco IP Phone uses IEEE 802.1p frames, and the device uses untagged frames.
 - The Cisco IP Phone uses untagged frames, and the device uses IEEE 802.1p frames.
 - The Cisco IP Phone uses IEEE 802.1Q frames, and the voice VLAN is the same as the access VLAN.
- The Cisco IP Phone and a device attached to the phone cannot communicate if they are in the same VLAN and subnet but use different frame types because traffic in the same subnet is not routed (routing would eliminate the frame type difference).
- Voice VLAN ports can also be these port types:
 - Dynamic access port.
 - IEEE 802.1x authenticated port.

Note If you enable IEEE 802.1x on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the phone loses connectivity to the device for up to 30 seconds.

- Protected port.
- A source or destination port for a SPAN or RSPAN session.
- Secure port.

Note When you enable port security on an interface that is also configured with a voice VLAN, you must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN. When the port is connected to a Cisco IP Phone, the phone requires up to two MAC addresses. The phone address is learned on the voice VLAN and might also be learned on the access VLAN. Connecting a PC to the phone requires additional MAC addresses.

Default Voice VLAN Configuration

The voice VLAN feature is disabled by default.

When the voice VLAN feature is enabled, all untagged traffic is sent according to the default CoS priority of the port.

The CoS value is not trusted for IEEE 802.1p or IEEE 802.1Q tagged traffic.

How to Configure Voice VLAN

Configuring Cisco IP Phone Voice Traffic

You can configure a port connected to the Cisco IP Phone to send CDP packets to the phone to configure the way in which the phone sends voice traffic. The phone can carry voice traffic in IEEE 802.1Q frames for a specified voice VLAN with a Layer 2 CoS value. It can use IEEE 802.1p priority tagging to give voice traffic a higher priority and forward all voice traffic through the native (access) VLAN. The Cisco IP Phone can also send untagged voice traffic or use its own configuration to send voice traffic in the access VLAN. In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5).

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **mls qos trust cos**
4. **switchport voice vlan** {*vlan-id* | **dot1p** | **none** | **untagged** }
5. **end**
6. Use one of the following:
 - **show interfaces** *interface-id* **switchport**
 - **show running-config interface** *interface-id*
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface interface-id Example: Device(config)# interface gigabitethernet1/0/1	Specifies the interface connected to the phone, and enters interface configuration mode.
Step 3	mls qos trust cos Example: Device(config-if)# mls qos trust cos	Configures the interface to classify incoming traffic packets by using the packet CoS value. For untagged packets, the port default CoS value is used. Note Before configuring the port trust state, you must first globally enable QoS by using the mls qos global configuration command.
Step 4	switchport voice vlan {vlan-id dot1p none untagged } Example: Device(config-if)# switchport voice vlan 125	Configures how the Cisco IP Phone carries voice traffic: <ul style="list-style-type: none"> • vlan-id—Configures the phone to forward all voice traffic through the specified VLAN. By default, the Cisco IP Phone forwards the voice traffic with an IEEE 802.1Q priority of 5. Valid VLAN IDs are 1 to 4094. • dot1p—Configures the switch to accept voice and data IEEE 802.1p priority frames tagged with VLAN ID 0 (the native VLAN). By default, the switch drops all voice and data traffic tagged with VLAN 0. If configured for 802.1p the Cisco IP Phone forwards the traffic with an IEEE 802.1p priority of 5. • none—Allows the phone to use its own configuration to send untagged voice traffic. • untagged—Configures the phone to send untagged voice traffic. Note Before configuring the switch port to detect and recognize a Cisco IP phone, confirm that the phone is powered by PoE. The configuration fails when power is provided by an AC source.
Step 5	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config-if)# end	
Step 6	Use one of the following: <ul style="list-style-type: none"> • show interfaces <i>interface-id</i> switchport • show running-config interface <i>interface-id</i> Example: Device# show interfaces gigabitethernet1/0/1 switchport or Device# show running-config interface gigabitethernet1/0/1	Verifies your voice VLAN entries or your QoS and voice VLAN entries.
Step 7	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring the Priority of Incoming Data Frames

You can connect a PC or other data device to a Cisco IP Phone port. To process tagged data traffic (in IEEE 802.1Q or IEEE 802.1p frames), you can configure the device to send CDP packets to instruct the phone how to send data packets from the device attached to the access port on the Cisco IP Phone. The PC can generate packets with an assigned CoS value. You can configure the phone to not change (trust) or to override (not trust) the priority of frames arriving on the phone port from connected devices.

Follow these steps to set the priority of data traffic received from the non-voice port on the Cisco IP Phone:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport priority extend** {*cos value* | **trust**}
5. **end**
6. **show interfaces** *interface-id* **switchport**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Device> enable	<ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface interface-id Example: Device(config)# interface gigabitethernet1/0/1	Specifies the interface connected to the Cisco IP Phone, and enters interface configuration mode.
Step 4	switchport priority extend {cos value trust} Example: Device(config-if)# switchport priority extend trust	Sets the priority of data traffic received from the Cisco IP Phone access port: <ul style="list-style-type: none"> • cos value—Configures the phone to override the priority received from the PC or the attached device with the specified CoS value. The value is a number from 0 to 7, with 7 as the highest priority. The default priority is cos 0. • trust—Configures the phone access port to trust the priority received from the PC or the attached device. <p>Note To return the port to its default setting, use the no switchport priority extend interface configuration command.</p>
Step 5	end Example: Device(config-if)# end	Returns to privileged EXEC mode.
Step 6	show interfaces interface-id switchport Example: Device# show interfaces gigabitethernet1/0/1 switchport	Verifies your entries.
Step 7	copy running-config startup-config Example:	(Optional) Saves your entries in the configuration file.

	Command or Action	Purpose
	Device# <code>copy running-config startup-config</code>	

Monitoring Voice VLAN

To display voice VLAN configuration for an interface, use the **show interfaces *interface-id* switchport** privileged EXEC command.

Configuration Examples for Voice VLANs

Example: Configuring Cisco IP Phone Voice Traffic

This example shows how to configure a port connected to a Cisco IP Phone to use the CoS value to classify incoming traffic and to accept voice and data priority traffic tagged with VLAN ID 0:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mls qos trust cos
Switch(config-if)# switchport voice vlan dot1p
Switch(config-if)# end
```

To return the port to its default setting, use the **no switchport voice vlan** interface configuration command.

This example shows how to enable switch port voice detect on a Cisco IP Phone:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# switchport voice?
detect detection enhancement keyword
vlan VLAN for voice traffic

Switch(config-if)# switchport voice detect?
cisco-phone Cisco IP Phone

Switch(config-if)# switchport voice detect cisco-phone?
full-duplex Cisco IP Phone

Switch(config-if)# switchport voice detect cisco-phone full-duplex
full-duplex full duplex keyword

Switch(config-if)# end
```

This example shows how to disable switchport voice detect on a Cisco IP Phone:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/0/1
```

```
Switch(config-if)# no switchport voice detect cisco-phone
Switch(config-if)# no switchport voice detect cisco-phone full-duplex
```

Example: Configuring a Port Connected to an IP Phone Not to Change Frame Priority

This example shows how to configure a port connected to a Cisco IP Phone to not change the priority of frames received from the PC or the attached device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport priority extend trust
Switch(config-if)# end
```

Where to Go Next

After configuring voice VLANs, you can configure the following:

- VTP
- VLANs
- VLAN trunking
- Private VLANs
- VLAN Membership Policy Server (VMPS)
- Tunneling

Information About Administering the Device

System Time and Date Management

You can manage the system time and date on your device using automatic configuration methods (RTC and NTP), or manual configuration methods.

Note For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference* on Cisco.com.

System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- RTC
- NTP
- Manual configuration

The system clock can provide time to these services:

- User **show** commands

- Logging and debugging messages

The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is *authoritative* or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.

Real Time Clock

A real-time clock (RTC) keeps track of the current time on the switch. The switch is shipped to you with RTC set to GMT time until you reconfigure clocking parameters.

The benefits of an RTC are:

- RTC is battery-powered.
- System time is retained during power outage and at system reboot.

The RTC and NTP clocks are integrated on the switch. When NTP is enabled, the RTC time is periodically synchronized to the NTP clock to maintain accuracy.

Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

Cisco's implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The figure below shows a typical network example using NTP. Device A is the NTP primary (formerly known as NTP primary), with the **Device B, C, and D** configured in NTP server mode, in server association with Device A. Device E is configured as an NTP peer to the upstream and downstream Device, Device B and Device F, respectively.

Figure 137: Typical NTP Network Configuration

If the network is isolated from the Internet, Cisco's implementation of NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

NTP Stratum

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

NTP Associations

The communications between devices running NTP (known as *associations*) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

NTP Security

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

NTP Implementation

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

Figure 138: Typical NTP Network Configuration

The following figure shows a typical network example using NTP. Switch A is the NTP primary, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F,

If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

NTP Version 4

NTP version 4 is implemented on the device. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.

NTPv4 provides these capabilities:

- Support for IPv6.
- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

For details about configuring NTPv4, see the *Implementing NTPv4 in IPv6* chapter of the *Cisco IOS IPv6 Configuration Guide, Release 12.4T*.

System Name and Prompt

You configure the system name on the Device to identify it. By default, the system name and prompt are *Switch*.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [`>`] is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.4* and the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4*.

Stack System Name and Prompt

If you are accessing a stack member through the active stack, you must use the **session** *stack-member-number* privileged EXEC command. The stack member number range is from 1 through 8. When you use this command, the stack member number is appended to the system prompt. For example, *Switch-2#* is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the switch stack is *Switch*.

Default System Name and Prompt Configuration

The default switch system name and prompt is *Switch*.

DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your device, you can substitute the hostname for the IP address with all IP commands, such as **ping**, **telnet**, **connect**, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a *com* domain name, so its domain name is *cisco.com*. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as *ftp.cisco.com*.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

Default DNS Settings

Table 176: Default DNS Settings

Feature	Default Setting
DNS enable state	Enabled.
DNS default domain name	None configured.
DNS servers	No name server addresses are configured.

Login Banners

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

Note For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.4*.

Default Banner Configuration

The MOTD and login banners are not configured.

MAC Address Table

The MAC address table contains address information that the device uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the device learns and then ages when it is not in use.

- Static address—A manually entered unicast address that does not age and that is not lost when the device resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

Note For complete syntax and usage information for the commands used in this section, see the command reference for this release.

MAC Address Table Creation

With multiple MAC addresses supported on all ports, you can connect any port on the device to other network devices. The device provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the device updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the device maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The device sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the device forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The device always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

When private VLANs are configured, address learning depends on the type of MAC address:

- Dynamic MAC addresses learned in one VLAN of a private VLAN are replicated in the associated VLANs. For example, a MAC address learned in a private-VLAN secondary VLAN is replicated in the primary VLAN.
- Static MAC addresses configured in a primary or secondary VLAN are not replicated in the associated VLANs. When you configure a static MAC address in a private VLAN primary or secondary VLAN, you should also configure the same static MAC address in all associated VLANs.

MAC Addresses and Device Stacks

The MAC address tables on all stack members are synchronized. At any given time, each stack member has the same copy of the address tables for each VLAN. When an address ages out, the address is removed from the address tables on all stack members. When a Device joins a switch stack, that Device receives the addresses for each VLAN learned on the other stack members. When a stack member leaves the switch stack, the remaining stack members age out or remove all addresses learned by the former stack member.

Default MAC Address Table Settings

The following table shows the default settings for the MAC address table.

Table 177: Default Settings for the MAC Address

Feature	Default Setting
Aging time	300 seconds
Dynamic addresses	Automatically learned
Static addresses	None configured

ARP Table Management

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called *address resolution*.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the **arpa** keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.4 documentation on *Cisco.com*.

How to Administer the Device

Configuring the Time and Date Manually

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the device can synchronize, you do not need to manually set the system clock.

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

Follow these steps to set the system clock:

SUMMARY STEPS

1. **enable**
2. Use one of the following:
 - **clock set** *hh:mm:ss day month year*
 - **clock set** *hh:mm:ss month day year*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	Use one of the following: <ul style="list-style-type: none"> • clock set <i>hh:mm:ss day month year</i> • clock set <i>hh:mm:ss month day year</i> Example: Device# clock set 13:32:00 23 March 2013	Manually set the system clock using one of these formats: <ul style="list-style-type: none"> • <i>hh:mm:ss</i>—Specifies the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone. • <i>day</i>—Specifies the day by date in the month. • <i>month</i>—Specifies the month by name. • <i>year</i>—Specifies the year (no abbreviation).

Configuring the Time Zone

Follow these steps to manually configure the time zone:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **clock timezone** *zone hours-offset [minutes-offset]*
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	clock timezone zone hours-offset [minutes-offset] Example: Device(config)# <code>clock timezone AST -3 30</code>	Sets the time zone. Internal time is kept in Coordinated Universal Time (UTC), so this command is used only for display purposes and when the time is manually set. <ul style="list-style-type: none"> • <i>zone</i>—Enters the name of the time zone to be displayed when standard time is in effect. The default is UTC. • <i>hours-offset</i>—Enters the hours offset from UTC. • (Optional) <i>minutes-offset</i>—Enters the minutes offset from UTC. This available where the local time zone is a percentage of an hour different from UTC.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **clock summer-time zone date date month year hh:mm date month year hh:mm [offset]**
4. **clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]**

5. `end`
6. `show running-config`
7. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p>clock summer-time <i>zone</i> date <i>date month year hh:mm</i> <i>date month year hh:mm [offset]</i></p> <p>Example:</p> <pre>Device(config)# clock summer-time PDT date 10 March 2013 2:00 3 November 2013 2:00</pre>	<p>Configures summer time to start and end on specified days every year.</p>
Step 4	<p>clock summer-time <i>zone</i> recurring [<i>week day month</i> <i>hh:mm week day month hh:mm [offset]</i>]</p> <p>Example:</p> <pre>Device(config)# clock summer-time PDT recurring 10 March 2013 2:00 3 November 2013 2:00</pre>	<p>Configures summer time to start and end on the specified days every year. All times are relative to the local time zone. The start time is relative to standard time.</p> <p>The end time is relative to summer time. Summer time is disabled by default. If you specify clock summer-time <i>zone</i> recurring without parameters, the summer time rules default to the United States rules.</p> <p>If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.</p> <ul style="list-style-type: none"> • <i>zone</i>—Specifies the name of the time zone (for example, PDT) to be displayed when summer time is in effect. • (Optional) <i>week</i>— Specifies the week of the month (1 to 4, first, or last). • (Optional) <i>day</i>—Specifies the day of the week (Sunday, Monday...). • (Optional) <i>month</i>—Specifies the month (January, February...).

	Command or Action	Purpose
		<ul style="list-style-type: none"> • (Optional) <i>hh:mm</i>—Specifies the time (24-hour format) in hours and minutes. • (Optional) <i>offset</i>—Specifies the number of minutes to add during summer time. The default is 60.
Step 5	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 6	show running-config Example: <pre>Device# show running-config</pre>	Verifies your entries.
Step 7	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Follow these steps if summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events):

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **clock summer-time zone date** [*month date year hh:mm month date year hh:mm [offset]*] **or** **clock summer-time zone date** [*date month year hh:mm date month year hh:mm [offset]*]
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	<p>clock summer-time zone date [<i>month date year hh:mm month date year hh:mm [offset]</i>] or clock summer-time zone date [<i>date month year hh:mm date month year hh:mm [offset]</i>]</p>	<p>Configures summer time to start on the first date and end on the second date.</p> <p>Summer time is disabled by default.</p> <ul style="list-style-type: none"> • For <i>zone</i>, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect. • (Optional) For <i>week</i>, specify the week of the month (1 to 5 or last). • (Optional) For <i>day</i>, specify the day of the week (Sunday, Monday...). • (Optional) For <i>month</i>, specify the month (January, February...). • (Optional) For <i>hh:mm</i>, specify the time (24-hour format) in hours and minutes. • (Optional) For <i>offset</i>, specify the number of minutes to add during summer time. The default is 60.
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 6	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring a System Name

Follow these steps to manually configure a system name:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **hostname *name***
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	hostname <i>name</i> Example: Device(config)# hostname remote-users	Configures a system name. When you set the system name, it is also used as the system prompt. The default setting is Switch. The name must follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names can be up to 63 characters.
Step 4	end Example: remote-users(config)# end remote-users#	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# show running-config	Verifies your entries.

	Command or Action	Purpose
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Setting Up DNS

If you use the device IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the **ip domain-name** global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

Follow these steps to set up your switch to use the DNS:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip domain-name** *name*
4. **ip name-server** *server-address1* [*server-address2* ... *server-address6*]
5. **ip domain-lookup** [*nsap* | *source-interface interface*]
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	ip domain-name <i>name</i> Example: Device(config)# <code>ip domain-name Cisco.com</code>	Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name).

	Command or Action	Purpose
		<p>Do not include the initial period that separates an unqualified name from the domain name.</p> <p>At boot time, no domain name is configured; however, if the device configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</p>
Step 4	<p>ip name-server <i>server-address1</i> [<i>server-address2</i> ... <i>server-address6</i>]</p> <p>Example:</p> <pre>Device(config)# ip name-server 192.168.1.100 192.168.1.200 192.168.1.300</pre>	<p>Specifies the address of one or more name servers to use for name and address resolution.</p> <p>You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The device sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</p>
Step 5	<p>ip domain-lookup [<i>nsap</i> <i>source-interface interface</i>]</p> <p>Example:</p> <pre>Device(config)# ip domain-lookup</pre>	<p>(Optional) Enables DNS-based hostname-to-address translation on your device. This feature is enabled by default.</p> <p>If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).</p>
Step 6	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 7	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	<p>Verifies your entries.</p>
Step 8	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p>

Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the device

Follow these steps to configure a MOTD login banner:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **banner motd *c message c***
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	banner motd <i>c message c</i> Example: Device(config)# banner motd # This is a secure site. Only authorized users are allowed. For access, contact technical support. #	Specifies the message of the day. <i>c</i> —Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. <i>message</i> —Enters a banner message up to 255 characters. You cannot use the delimiting character in the message.
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Device# show running-config	Verifies your entries.

	Command or Action	Purpose
Step 6	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

Follow these steps to configure a login banner:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **banner login *c message c***
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	banner login <i>c message c</i> Example: <pre>Device(config)# banner login \$ Access for authorized users only. Please enter your username and password. \$</pre>	Specifies the login message. <p><i>c</i>— Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.</p> <p><i>message</i>—Enters a login message up to 255 characters. You cannot use the delimiting character in the message.</p>

	Command or Action	Purpose
Step 4	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	show running-config Example: <pre>Device# show running-config</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Managing the MAC Address Table

Changing the Address Aging Time

Follow these steps to configure the dynamic address table aging time:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mac address-table aging-time** [0 | 10-1000000] [**routed-mac** | **vlan** *vlan-id*]
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	<p><code>mac address-table aging-time [0 10-1000000]</code> <code>[routed-mac vlan <i>vlan-id</i>]</code></p> <p>Example:</p> <pre>Device(config)# mac address-table aging-time 500 vlan 2</pre>	<p>Sets the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated.</p> <p>The range is 10 to 1000000 seconds. The default is 300. You can also enter 0, which disables aging. Static address entries are never aged or removed from the table.</p> <p><i>vlan-id</i>—Valid IDs are 1 to 4094.</p>
Step 4	<p><code>end</code></p> <p>Example:</p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	<p><code>show running-config</code></p> <p>Example:</p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 6	<p><code>copy running-config startup-config</code></p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring MAC Address Change Notification Traps

Follow these steps to configure the switch to send MAC address change notification traps to an NMS host:

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `snmp-server host host-addr community-string notification-type { informs | traps } { version { 1 | 2c | 3 } } { vrf vrf instance name }`
4. `snmp-server enable traps mac-notification change`
5. `mac address-table notification change`
6. `mac address-table notification change [interval value] [history-size value]`
7. `interface interface-id`
8. `snmp trap mac-notification change { added | removed }`
9. `end`
10. `show running-config`
11. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p>snmp-server host <i>host-addr</i> <i>community-string</i> <i>notification-type</i> { informs traps } { version { 1 2c 3 } } { vrf <i>vrf instance name</i> }</p> <p>Example:</p> <pre>Device(config)# snmp-server host 172.20.10.10 traps private mac-notification</pre>	<p>Specifies the recipient of the trap message.</p> <ul style="list-style-type: none"> • <i>host-addr</i>—Specifies the name or address of the NMS. • traps (the default)—Sends SNMP traps to the host. • informs—Sends SNMP informs to the host. • version—Specifies the SNMP version to support. Version 1, the default, is not available with informs. • <i>community-string</i>—Specifies the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. • <i>notification-type</i>—Uses the mac-notification keyword. • vrf <i>vrf instance name</i>—Specifies the VPN routing/forwarding instance for this host.
Step 4	<p>snmp-server enable traps mac-notification change</p> <p>Example:</p> <pre>Device(config)# snmp-server enable traps mac-notification change</pre>	<p>Enables the device to send MAC address change notification traps to the NMS.</p>
Step 5	<p>mac address-table notification change</p> <p>Example:</p> <pre>Device(config)# mac address-table notification change</pre>	<p>Enables the MAC address change notification feature.</p>

	Command or Action	Purpose
Step 6	<p>mac address-table notification change [<i>interval value</i>] [<i>history-size value</i>]</p> <p>Example:</p> <pre>Device(config)# mac address-table notification change interval 123 Device(config)# mac address-table notification change history-size 100</pre>	<p>Enters the trap interval time and the history table size.</p> <ul style="list-style-type: none"> • (Optional) interval value—Specifies the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second. • (Optional) history-size value—Specifies the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1.
Step 7	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Device(config)# interface gigabitethernet 1/0/2</pre>	<p>Enters interface configuration mode, and specifies the Layer 2 interface on which to enable the SNMP MAC address notification trap.</p>
Step 8	<p>snmp trap mac-notification change {added removed}</p> <p>Example:</p> <pre>Device(config-if)# snmp trap mac-notification change added</pre>	<p>Enables the MAC address change notification trap on the interface.</p> <ul style="list-style-type: none"> • Enables the trap when a MAC address is added on this interface. • Enables the trap when a MAC address is removed from this interface.
Step 9	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 10	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	<p>Verifies your entries.</p>
Step 11	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p>

Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.

Follow these steps to configure the device to send MAC address-move notification traps to an NMS host:

SUMMARY STEPS

1. enable
2. configure terminal
3. snmp-server host *host-addr* {traps | informs} {version {1 | 2c | 3}} *community-string notification-type*
4. snmp-server enable traps mac-notification move
5. mac address-table notification mac-move
6. end
7. show running-config
8. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p>snmp-server host <i>host-addr</i> {traps informs} {version {1 2c 3}} <i>community-string notification-type</i></p> <p>Example:</p> <pre>Device(config)# snmp-server host 172.20.10.10 traps private mac-notification</pre>	<p>Specifies the recipient of the trap message.</p> <ul style="list-style-type: none"> • <i>host-addr</i>—Specifies the name or address of the NMS. • traps (the default)—Sends SNMP traps to the host. • informs—Sends SNMP informs to the host. • version—Specifies the SNMP version to support. Version 1, the default, is not available with informs. • <i>community-string</i>—Specifies the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. • <i>notification-type</i>—Uses the mac-notification keyword.
Step 4	<p>snmp-server enable traps mac-notification move</p> <p>Example:</p> <pre>Device(config)# snmp-server enable traps mac-notification move</pre>	<p>Enables the device to send MAC address move notification traps to the NMS.</p>

	Command or Action	Purpose
Step 5	mac address-table notification mac-move Example: <pre>Device(config)# mac address-table notification mac-move</pre>	Enables the MAC address move notification feature.
Step 6	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 7	show running-config Example: <pre>Device# show running-config</pre>	Verifies your entries.
Step 8	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

What to do next

To disable MAC address-move notification traps, use the **no snmp-server enable traps mac-notification move** global configuration command. To disable the MAC address-move notification feature, use the **no mac address-table notification mac-move** global configuration command.

You can verify your settings by entering the **show mac address-table notification mac-move** privileged EXEC commands.

Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

Follow these steps to configure the switch to send MAC address table threshold notification traps to an NMS host:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server host *host-addr* {traps / informs} {version {1 | 2c | 3}} *community-string notification-type***
4. **snmp-server enable traps mac-notification threshold**
5. **mac address-table notification threshold**
6. **mac address-table notification threshold [*limit percentage*] | [*interval time*]**

7. `end`
8. `show running-config`
9. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p>snmp-server host <i>host-addr</i> {traps / informs} {version {1 2c 3}} <i>community-string notification-type</i></p> <p>Example:</p> <pre>Device(config)# snmp-server host 172.20.10.10 traps private mac-notification</pre>	<p>Specifies the recipient of the trap message.</p> <ul style="list-style-type: none"> • <i>host-addr</i>—Specifies the name or address of the NMS. • traps (the default)—Sends SNMP traps to the host. • informs—Sends SNMP informs to the host. • version—Specifies the SNMP version to support. Version 1, the default, is not available with informs. • <i>community-string</i>—Specifies the string to send with the notification operation. You can set this string by using the snmp-server host command, but we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. • <i>notification-type</i>—Uses the mac-notification keyword.
Step 4	<p>snmp-server enable traps mac-notification threshold</p> <p>Example:</p> <pre>Device(config)# snmp-server enable traps mac-notification threshold</pre>	<p>Enables MAC threshold notification traps to the NMS.</p>
Step 5	<p>mac address-table notification threshold</p> <p>Example:</p> <pre>Device(config)# mac address-table notification threshold</pre>	<p>Enables the MAC address threshold notification feature.</p>

	Command or Action	Purpose
Step 6	<p>mac address-table notification threshold [<i>limit percentage</i>] [<i>interval time</i>]</p> <p>Example:</p> <pre>Device(config)# mac address-table notification threshold interval 123 Device(config)# mac address-table notification threshold limit 78</pre>	<p>Enters the threshold value for the MAC address threshold usage monitoring.</p> <ul style="list-style-type: none"> • (Optional) limit percentage—Specifies the percentage of the MAC address table use; valid values are from 1 to 100 percent. The default is 50 percent. • (Optional) interval time—Specifies the time between notifications; valid values are greater than or equal to 120 seconds. The default is 120 seconds.
Step 7	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 8	<p>show running-config</p> <p>Example:</p> <pre>Device# show running-config</pre>	<p>Verifies your entries.</p>
Step 9	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Device# copy running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p>

Adding and Removing Static Address Entries

Follow these steps to add a static address:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mac address-table static mac-addr vlan vlan-id interface interface-id**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
	Device> <code>enable</code>	
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface <i>interface-id</i> Example: Device(config)# <code>mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/0/1</code>	Adds a static address to the MAC address table. <ul style="list-style-type: none"> • <i>mac-addr</i>—Specifies the destination MAC unicast address to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface. • <i>vlan-id</i>—Specifies the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094. • <i>interface-id</i>—Specifies the interface to which the received packet is forwarded. Valid interfaces include physical ports or port channels. For static multicast addresses, you can enter multiple interface IDs. For static unicast addresses, you can enter only one interface at a time, but you can enter the command multiple times with the same MAC address and VLAN ID.
Step 4	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Step 5	show running-config Example: Device# <code>show running-config</code>	Verifies your entries.
Step 6	copy running-config startup-config Example: Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring Unicast MAC Address Filtering

Follow these steps to configure the Device to drop a source or destination unicast static address:

SUMMARY STEPS

1. enable
2. configure terminal
3. mac address-table static *mac-addr* vlan *vlan-id* drop
4. end
5. show running-config
6. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> drop Example: <pre>Device(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop</pre>	Enables unicast MAC address filtering and configure the device to drop a packet with the specified source or destination unicast static address. <ul style="list-style-type: none"> • <i>mac-addr</i>—Specifies a source or destination unicast MAC address (48-bit). Packets with this MAC address are dropped. • <i>vlan-id</i>—Specifies the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.
Step 4	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	show running-config Example: <pre>Device# show running-config</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example:	(Optional) Saves your entries in the configuration file.

Command or Action	Purpose
Device# <code>copy running-config startup-config</code>	

Monitoring and Maintaining Administration of the Device

Command	Purpose
<code>clear mac address-table dynamic</code>	Removes all dynamic entries.
<code>clear mac address-table dynamic address <i>mac-address</i></code>	Removes a specific MAC address.
<code>clear mac address-table dynamic interface <i>interface-id</i></code>	Removes all addresses on the specified physical port or port channel.
<code>clear mac address-table dynamic vlan <i>vlan-id</i></code>	Removes all addresses on a specified VLAN.
<code>show clock [<i>detail</i>]</code>	Displays the time and date configuration.
<code>show ip igmp snooping groups</code>	Displays the Layer 2 multicast entries for all VLANs or the specified VLAN.
<code>show mac address-table address <i>mac-address</i></code>	Displays MAC address table information for the specified MAC address.
<code>show mac address-table aging-time</code>	Displays the aging time in all VLANs or the specified VLAN.
<code>show mac address-table count</code>	Displays the number of addresses present in all VLANs or the specified VLAN.
<code>show mac address-table dynamic</code>	Displays only dynamic MAC address table entries.
<code>show mac address-table interface <i>interface-name</i></code>	Displays the MAC address table information for the specified interface.
<code>show mac address-table move update</code>	Displays the MAC address table move update information.
<code>show mac address-table multicast</code>	Displays a list of multicast MAC addresses.
<code>show mac address-table notification {change mac-move threshold}</code>	Displays the MAC notification parameters and history table.
<code>show mac address-table secure</code>	Displays the secure MAC addresses.
<code>show mac address-table static</code>	Displays only static MAC address table entries.
<code>show mac address-table vlan <i>vlan-id</i></code>	Displays the MAC address table information for the specified VLAN.

Configuration Examples for Device Administration

Example: Setting the System Clock

This example shows how to manually set the system clock:

```
Device# clock set 13:32:00 23 July 2013
```

Examples: Configuring Summer Time

This example (for daylight savings time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

```
Device(config)# clock summer-time PDT recurring PST date  
10 March 2013 2:00 3 November 2013 2:00
```

This example shows how to set summer time start and end dates:

```
Device(config)#clock summer-time PST date  
20 March 2013 2:00 20 November 2013 2:00
```

Example: Configuring a MOTD Banner

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

```
Device(config)# banner motd #
```

```
This is a secure site. Only authorized users are allowed.  
For access, contact technical support.
```

```
#
```

```
Device(config)#
```

This example shows the banner that appears from the previous configuration:

```
Unix> telnet 192.0.2.15
```

```
Trying 192.0.2.15...
```

```
Connected to 192.0.2.15.
```

```
Escape character is '^]'.  
#
```

```
This is a secure site. Only authorized users are allowed.
```

```
For access, contact technical support.
```

```
User Access Verification
Password:
```

Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign (\$) symbol as the beginning and ending delimiter:

```
Device(config)# banner login $
Access for authorized users only. Please enter your username and password.
$
Device(config)#
```

Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

```
Device(config)# snmp-server host 172.20.10.10 traps private mac-notification
Device(config)# snmp-server enable traps mac-notification change
Device(config)# mac address-table notification change
Device(config)# mac address-table notification change interval 123
Device(config)# mac address-table notification change history-size 100
Device(config)# interface gigabitethernet 1/2/1
Device(config-if)# snmp trap mac-notification change added
```

Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 per cent:

```
Device(config)# snmp-server host 172.20.10.10 traps private mac-notification
Device(config)# snmp-server enable traps mac-notification threshold
Device(config)# mac address-table notification threshold
Device(config)# mac address-table notification threshold interval 123
Device(config)# mac address-table notification threshold limit 78
```

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

Note You cannot associate the same static MAC address to multiple interfaces. If the command is executed again with a different interface, the static MAC address is overwritten on the new interface.

```
Device(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet
1/1/1
```

Example: Configuring Unicast MAC Address Filtering

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Device(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

Information About Performing Device Setup Configuration

Review the sections in this module before performing your initial device configuration tasks that include IP address assignments and DHCP autoconfiguration.

Boot Process

To start your device, you need to follow the procedures in the getting started guide or the hardware installation guide for installing and powering on the device and setting up the initial device configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The boot loader software performs the normal boot process and includes these activities:

- Locates the bootable (base) package in the bundle or installed package set.
- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
- Initializes the file systems on the system board.
- Loads a default operating system software image into memory and boots up the device.

The boot loader provides access to the flash file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door operation provides enough access to the system so that if it is

necessary, you can format the flash file system, reinstall the operating system software image by using the Xmodem Protocol, recover from a lost or forgotten password, and finally restart the operating system.

Before you can assign device information, make sure that you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match that of the device console port settings:

- Baud rate default is 9600.
- Data bits default is 8.

Note If the data bits option is set to 8, set the parity option to none.

- Stop bits default is 2 (minor).
- Parity settings default is none.

Devices Information Assignment

You can assign IP information through the device setup program, through a DHCP server, or manually.

Use the device setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

Note If you are using DHCP, do not respond to any of the questions in the setup program until the device receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the device configuration steps, manually configure the device. Otherwise, use the setup program described in the *Boot Process* section.

Default Switch Information

Table 178: Default Switch Information

Feature	Default Setting
IP address and subnet mask	No IP address or subnet mask are defined.
Default gateway	No default gateway is defined.
Enable secret password	No password is defined.
Hostname	The factory-assigned default hostname is Device.

Feature	Default Setting
Telnet password	No password is defined.
Cluster command switch functionality	Disabled.
Cluster name	No cluster name is defined.

DHCP-Based Autoconfiguration Overview

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The device can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your device (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your device. However, you need to configure the DHCP server for various lease options associated with IP addresses.

If you want to use DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

Note We recommend a redundant connection between a switch stack and the DHCP, DNS, and TFTP servers. This is to help ensure that these servers remain accessible in case one of the connected stack members is removed from the switch stack.

The DHCP server for your device can be on the same LAN or on a different LAN than the device. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your device and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your device.

DHCP Client Request Process

When you boot up your device, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the device. If the configuration file is present and the configuration includes the **ip address dhcp** interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.

This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

Figure 139: DHCP Client and Server Message Exchange

The client, Device A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the device receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the device accepts replies from a BOOTP server and configures itself, the device broadcasts, instead of unicasts, TFTP requests to obtain the device configuration file.

The DHCP hostname option allows a group of devices to obtain hostnames and a standard configuration from the central management DHCP server. A client (device) includes in its DHCPDISCOVER message an option 12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the **hostname name** global configuration command is not configured or the **no hostname** global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the **ip address dhcp** interface configuration command. In this case, if the client receives the DHCP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.

DHCP-based Autoconfiguration and Image Update

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more devices in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new device added to a network receives the same image and configuration.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

Restrictions for DHCP-based Autoconfiguration

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
- The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.
- The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the **write memory** or **copy running-configuration startup-configuration** privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

DHCP Autoconfiguration

DHCP autoconfiguration downloads a configuration file to one or more devices in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the device. It does not overwrite the bootup configuration saved in the flash, until you reload the device.

DHCP Auto-Image Update

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more devices in your network. The device (or devices) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

To enable a DHCP auto-image update on the device, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname) option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the device in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the device, and the new image is downloaded and installed on the device. When you reboot the device, the configuration is stored in the saved configuration on the device.

DHCP Server Configuration Guidelines

Follow these guidelines if you are configuring a device as a DHCP server:

- You should configure the DHCP server with reserved leases that are bound to each device by the device hardware address.
- If you want the device to receive IP address information, you must configure the DHCP server with these lease options:
 - IP address of the client (required)

- Subnet mask of the client (required)
- DNS server IP address (optional)
- Router IP address (default gateway address to be used by the device) (required)
- If you want the device to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
 - TFTP server name (required)
 - Boot filename (the name of the configuration file that the client needs) (recommended)
 - Hostname (optional)
- Depending on the settings of the DHCP server, the device can receive IP address information, the configuration file, or both.
- If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the device is not configured. If the router IP address or the TFTP server name are not found, the device might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.
- The device can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your device but are not configured. (These features are not operational.)

Purpose of the TFTP Server

Based on the DHCP server configuration, the device attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the device with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the device attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the device attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: `network-config`, `cisconet.cfg`, `hostname.config`, or `hostname.cfg`, where *hostname* is the device's current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the device to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual device configuration file).
- The `network-config` or the `cisconet.cfg` file (known as the default configuration files).
- The `router-config` or the `ciscottr.cfg` file (These files contain commands common to all devices. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the device, or if it is to be accessed by the device through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. The preferred solution is to configure the DHCP server with all the required information.

Purpose of the DNS Server

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the device.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same LAN or on a different LAN from the device. If it is on a different LAN, the device must be able to access it through a router.

How to Obtain Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the device obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the device and provided in the DHCP reply (one-file read method).

The device receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The device sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.

- The IP address and the configuration filename is reserved for the device, but the TFTP server address is not provided in the DHCP reply (one-file read method).

The device receives its IP address, subnet mask, and the configuration filename from the DHCP server. The device sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- Only the IP address is reserved for the device and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

The device receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The device sends a unicast message to the TFTP server to retrieve the `network-config` or `cisconet.cfg` default configuration file. (If the `network-config` file cannot be read, the device reads the `cisconet.cfg` file.)

The default configuration file contains the hostnames-to-IP-address mapping for the device. The device fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the device uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the device uses the default *Switch* as its hostname.

After obtaining its hostname from the default configuration file or the DHCP reply, the device reads the configuration file that has the same name as its hostname (`hostname-config` or `hostname.cfg`, depending on whether `network-config` or `cisconet.cfg` was read earlier) from the TFTP server. If the `cisconet.cfg` file is read, the filename of the host is truncated to eight characters.

If the device cannot read the `network-config`, `cisconet.cfg`, or the hostname file, it reads the `router-config` file. If the device cannot read the `router-config` file, it reads the `ciscortr.cfg` file.

Note The device broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

How to Control Environment Variables

With a normally operating device, you enter the boot loader mode only through the console connection. Unplug the switch power cord, then reconnect the power cord. Hold down the **MODE** button until you see the boot loader switch prompt

The device boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader or any other software running on the system, functions. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value. Many environment variables are predefined and have default values.

Environment variables store two kinds of data:

- Data that controls code, which does not read the Cisco IOS configuration file. For example, the name of a boot loader helper file, which extends or patches the functionality of the boot loader can be stored as an environment variable.
- Data that controls code, which is responsible for reading the Cisco IOS configuration file. For example, the name of the Cisco IOS configuration file can be stored as an environment variable.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.

Common Environment Variables

This table describes the function of the most common environment variables.

Table 179: Common Environment Variables

Variable	Boot Loader Command	Cisco IOS Global Configuration Command
BOOT	<p>set BOOT <i>filesystem</i> <i>:/file-url ...</i></p> <p>A semicolon-separated list of executable files to try to load and execute when automatically booting. If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash file system.</p>	<p>boot system <i>{filesystem : /file-url ...</i></p> <p>Specifies the Cisco IOS image to load during the next boot cycle and the stack members on which the image is loaded. This command changes the setting of the BOOT environment variable.</p>
MANUAL_BOOT	<p>set MANUAL_BOOT yes</p> <p>Decides whether the switch automatically or manually boots.</p> <p>Valid values are 1, yes, 0, and no. If it is set to no or 0, the boot loader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the boot loader mode.</p>	<p>boot manual</p> <p>Enables manually booting the switch during the next boot cycle and changes the setting of the MANUAL_BOOT environment variable.</p> <p>The next time you reboot the system, the switch is in boot loader mode. To boot up the system, use the boot flash: <i>filesystem :/file-url</i> boot loader command, and specify the name of the bootable image.</p>

Variable	Boot Loader Command	Cisco IOS Global Configuration Command
CONFIG_FILE	<p>set CONFIG_FILE flash:/ file-url</p> <p>Changes the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.</p>	<p>boot config-file flash:/ file-url</p> <p>Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration. This command changes the CONFIG_FILE environment variable.</p>
SWITCH_NUMBER	<p>set SWITCH_NUMBER stack-member-number</p> <p>Changes the member number of a stack member.</p>	<p>switch current-stack-member-number renumber new-stack-member-number</p> <p>Changes the member number of a stack member.</p>
SWITCH_PRIORITY	<p>set SWITCH_PRIORITY stack-member-number</p> <p>Changes the priority value of a stack member.</p>	<p>switch stack-member-number priority priority-number</p> <p>Changes the priority value of a stack member.</p>
BAUD	<p>set BAUD baud-rate</p>	<p>line console 0 speed speed-value</p> <p>Configures the baud rate.</p>
ENABLE_BREAK	<p>set ENABLE_BREAK yes/no</p>	<p>boot enable-break switch yes/no</p> <p>This command can be issued when the flash filesystem is initialized when ENABLE_BREAK is set to yes.</p>

Environment Variables for TFTP

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.

Table 180: Environment Variables for TFTP

Variable	Description
MAC_ADDR	Specifies the MAC address of the switch. Note We recommend that you do not modify this variable. However, if you modify this variable after the boot loader is up or the value is different from the saved value, enter this command before using TFTP. A reset is required for the new value to take effect.
IP_ADDRESS	Specifies the IP address and the subnet mask for the associated IP subnet of the switch.
DEFAULT_ROUTER	Specifies the IP address and subnet mask of the default gateway.

Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the device at a later time (for example, late at night or during the weekend when the device is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all devices in the network).

Note A scheduled reload must take place within approximately 24 days.

You have these reload options:

- Reload of the software to take effect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.
- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The **reload** command halts the system. If the system is not set to manually boot up, it reboots itself.

If your device is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the device from entering the boot loader mode and then taking it from the remote user's control.

If you modify your configuration file, the device prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the CONFIG_FILE environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

To cancel a previously scheduled reload, use the **reload cancel** privileged EXEC command.

How to Perform Device Setup Configuration

Using DHCP to download a new image and a new configuration to a device requires that you configure at least two devices. One device acts as a DHCP and TFTP server and the second device (client) is configured to download either a new configuration file or a new configuration file and a new image file.

Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing device in the network so that it can support the autoconfiguration of a new device.

SUMMARY STEPS

1. **configure terminal**
2. **ip dhcp pool** *poolname*
3. **boot** *filename*
4. **network** *network-number mask prefix-length*
5. **default-router** *address*
6. **option 150** *address*
7. **exit**
8. **tftp-server flash:***filename.text*
9. **interface** *interface-id*
10. **no switchport**
11. **ip address** *address mask*
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	ip dhcp pool <i>poolname</i> Example: Device(config)# ip dhcp pool pool	Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode.
Step 3	boot <i>filename</i> Example:	Specifies the name of the configuration file that is used as a boot image.

	Command or Action	Purpose
	Device (dhcp-config) # <code>boot config-boot.text</code>	
Step 4	<p>network <i>network-number mask prefix-length</i></p> <p>Example:</p> <pre>Device (dhcp-config) # network 10.10.10.0 255.255.255.0</pre>	<p>Specifies the subnet network number and mask of the DHCP address pool.</p> <p>Note The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).</p>
Step 5	<p>default-router <i>address</i></p> <p>Example:</p> <pre>Device (dhcp-config) # default-router 10.10.10.1</pre>	Specifies the IP address of the default router for a DHCP client.
Step 6	<p>option 150 <i>address</i></p> <p>Example:</p> <pre>Device (dhcp-config) # option 150 10.10.10.1</pre>	Specifies the IP address of the TFTP server.
Step 7	<p>exit</p> <p>Example:</p> <pre>Device (dhcp-config) # exit</pre>	Returns to global configuration mode.
Step 8	<p>tftp-server flash:<i>filename.text</i></p> <p>Example:</p> <pre>Device (config) # tftp-server flash:config-boot.text</pre>	Specifies the configuration file on the TFTP server.
Step 9	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Device (config) # interface gigabitethernet 1/0/4</pre>	Specifies the address of the client that will receive the configuration file.
Step 10	<p>no switchport</p> <p>Example:</p> <pre>Device (config-if) # no switchport</pre>	Puts the interface into Layer 3 mode.

	Command or Action	Purpose
Step 11	ip address <i>address mask</i> Example: <pre>Device(config-if)# ip address 10.10.10.1 255.255.255.0</pre>	Specifies the IP address and mask for the interface.
Step 12	end Example: <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.

Configuring DHCP Auto-Image Update (Configuration File and Image)

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing device to support the installation of a new switch.

Before you begin

You must first create a text file (for example, `autoinstall_dhcp`) that will be uploaded to the device. In the text file, put the name of the image that you want to download (forexample, `c3750e-ipservices-mz.122-44.3.SE.tarc3750x-ipservices-mz.122-53.3.SE2.tar`). This image must be a tar and not a bin file.

SUMMARY STEPS

1. **configure terminal**
2. **ip dhcp pool** *poolname*
3. **boot** *filename*
4. **network** *network-number mask prefix-length*
5. **default-router** *address*
6. **option 150** *address*
7. **option 125** *hex*
8. **copy tftp flash** *filename.txt*
9. **copy tftp flash** *imagename.bin*
10. **exit**
11. **tftp-server flash:** *config.text*
12. **tftp-server flash:** *imagename.bin*
13. **tftp-server flash:** *filename.txt*
14. **interface** *interface-id*
15. **no switchport**
16. **ip address** *address mask*
17. **end**
18. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	ip dhcp pool <i>poolname</i> Example: Device(config)# ip dhcp pool pool1	Creates a name for the DHCP server address pool and enter DHCP pool configuration mode.
Step 3	boot <i>filename</i> Example: Device(dhcp-config)# boot config-boot.text	Specifies the name of the file that is used as a boot image.
Step 4	network <i>network-number mask prefix-length</i> Example: Device(dhcp-config)# network 10.10.10.0 255.255.255.0	Specifies the subnet network number and mask of the DHCP address pool. Note The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).
Step 5	default-router <i>address</i> Example: Device(dhcp-config)# default-router 10.10.10.1	Specifies the IP address of the default router for a DHCP client.
Step 6	option 150 <i>address</i> Example: Device(dhcp-config)# option 150 10.10.10.1	Specifies the IP address of the TFTP server.
Step 7	option 125 <i>hex</i> Example: Device(dhcp-config)# option 125 hex 0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f64.686370	Specifies the path to the text file that describes the path to the image file.

	Command or Action	Purpose
Step 8	copy tftp flash <i>filename.txt</i> Example: Device(config)# copy tftp flash image.bin	Uploads the text file to the device.
Step 9	copy tftp flash <i>imagename.bin</i> Example: Device(config)# copy tftp flash image.bin	Uploads the tar file for the new image to the device.
Step 10	exit Example: Device(dhcp-config)# exit	Returns to global configuration mode.
Step 11	tftp-server flash: <i>config.text</i> Example: Device(config)# tftp-server flash:config-boot.text	Specifies the Cisco IOS configuration file on the TFTP server.
Step 12	tftp-server flash: <i>imagename.bin</i> Example: Device(config)# tftp-server flash:image.bin	Specifies the image name on the TFTP server.
Step 13	tftp-server flash: <i>filename.txt</i> Example: Device(config)# tftp-server flash:boot-config.text	Specifies the text file that contains the name of the image file to download
Step 14	interface <i>interface-id</i> Example: Device(config)# interface gigabitethernet 1/0/4	Specifies the address of the client that will receive the configuration file.
Step 15	no switchport Example: Device(config-if)# no switchport	Puts the interface into Layer 3 mode.

	Command or Action	Purpose
Step 16	ip address <i>address mask</i> Example: <pre>Device(config-if)# ip address 10.10.10.1 255.255.255.0</pre>	Specifies the IP address and mask for the interface.
Step 17	end Example: <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 18	copy running-config startup-config Example: <pre>Device(config-if)# end</pre>	(Optional) Saves your entries in the configuration file.

Configuring the Client to Download Files from DHCP Server

Note You should only configure and enable the Layer 3 interface. Do not assign an IP address or DHCP-based autoconfiguration with a saved configuration.

SUMMARY STEPS

1. **configure terminal**
2. **boot host dhcp**
3. **boot host retry timeout** *timeout-value*
4. **banner config-save** ^C *warning-message* ^C
5. **end**
6. **show boot**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	boot host dhcp Example:	Enables autoconfiguration with a saved configuration.

	Command or Action	Purpose
	<code>Device(conf)# boot host dhcp</code>	
Step 3	<p>boot host retry timeout <i>timeout-value</i></p> <p>Example:</p> <pre>Device(conf)# boot host retry timeout 300</pre>	<p>(Optional) Sets the amount of time the system tries to download a configuration file.</p> <p>Note If you do not set a timeout, the system will try indefinitely to obtain an IP address from the DHCP server.</p>
Step 4	<p>banner config-save ^C <i>warning-message</i> ^C</p> <p>Example:</p> <pre>Device(conf)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot^C</pre>	(Optional) Creates warning messages to be displayed when you try to save the configuration file to NVRAM.
Step 5	<p>end</p> <p>Example:</p> <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 6	<p>show boot</p> <p>Example:</p> <pre>Device# show boot</pre>	Verifies the configuration.

Manually Assigning IP Information to Multiple SVIs

This task describes how to manually assign IP information to multiple switched virtual interfaces (SVIs):

Note If the switch is running the IP Lite image, you can also manually assign IP information to a port if you first put the port into Layer 3 mode by using the **no switchport** interface configuration command.

SUMMARY STEPS

1. **configure terminal**
2. **interface vlan** *vlan-id*
3. **ip address** *ip-address subnet-mask*
4. **exit**
5. **ip default-gateway** *ip-address*
6. **end**

7. `show interfaces vlan vlan-id`
8. `show ip redirects`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface vlan <i>vlan-id</i> Example: Device(config)# <code>interface vlan 99</code>	Enters interface configuration mode, and enter the VLAN to which the IP information is assigned. The range is 1 to 4094.
Step 3	ip address <i>ip-address subnet-mask</i> Example: Device(config-vlan)# <code>ip address 10.10.10.2 255.255.255.0</code>	Enters the IP address and subnet mask.
Step 4	exit Example: Device(config-vlan)# <code>exit</code>	Returns to global configuration mode.
Step 5	ip default-gateway <i>ip-address</i> Example: Device(config)# <code>ip default-gateway 10.10.10.1</code>	<p>Enters the IP address of the next-hop router interface that is directly connected to the device where a default gateway is being configured. The default gateway receives IP packets with unresolved destination IP addresses from the device.</p> <p>Once the default gateway is configured, the device has connectivity to the remote networks with which a host needs to communicate.</p> <p>Note When your device is configured to route with IP, it does not need to have a default gateway set.</p>
Step 6	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 7	show interfaces vlan <i>vlan-id</i> Example: Device# show interfaces vlan 99	Verifies the configured IP address.
Step 8	show ip redirects Example: Device# show ip redirects	Verifies the configured default gateway.

Configuring the NVRAM Buffer Size

The default NVRAM buffer size is 512 KB. In some cases, the configuration file might be too large to save to NVRAM. Typically, this occurs when you have many switches in a switch stack. You can configure the size of the NVRAM buffer to support larger configuration files. The new NVRAM buffer size is synced to all current and new member switches.

Note After you configure the NVRAM buffer size, reload the switch or switch stack.

When you add a switch to a stack and the NVRAM size differs, the new switch syncs with the stack and reloads automatically.

SUMMARY STEPS

1. **configure terminal**
2. **boot buffersize** *size*
3. **end**
4. **show boot**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	boot buffersize <i>size</i> Example: Device(config)# boot buffersize 524288	Configures the NVRAM buffersize in KB. The valid range for <i>size</i> is from 4096 to 1048576.

	Command or Action	Purpose
Step 3	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	show boot Example: <pre>Device# show boot</pre>	Verifies the configuration.

Modifying the Device Startup Configuration

Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the `config.text` file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

Before you begin

Use a standalone device for this task.

SUMMARY STEPS

1. **configure terminal**
2. **boot flash:/file-url**
3. **end**
4. **show boot**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>Switch# configure terminal</pre>	Enters global configuration mode.
Step 2	boot flash:/file-url Example: <pre>Switch(config)# boot flash:config.text</pre>	Specifies the configuration file to load during the next boot cycle. <i>file-url</i> —The path (directory) and the configuration filename. Filenames and directory names are case-sensitive.

	Command or Action	Purpose
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 4	show boot Example: Switch# show boot	Verifies your entries. The boot global configuration command changes the setting of the CONFIG_FILE environment variable.
Step 5	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Manually Booting the Switch

By default, the switch automatically boots up; however, you can configure it to manually boot up.

Before you begin

Use a standalone switch for this task.

SUMMARY STEPS

1. **configure terminal**
2. **boot manual**
3. **end**
4. **show boot**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	boot manual Example: Device(config)# boot manual	Enables the switch to manually boot up during the next boot cycle.

	Command or Action	Purpose
Step 3	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	show boot Example: <pre>Device# show boot</pre>	<p>Verifies your entries.</p> <p>The boot manual global command changes the setting of the MANUAL_BOOT environment variable.</p> <p>The next time you reboot the system, the switch is in boot loader mode, shown by the <i>switch:</i> prompt. To boot up the system, use the boot filesystem:/file-url boot loader command.</p> <ul style="list-style-type: none"> • <i>filesystem:</i>—Uses flash: for the system board flash device. <pre>Switch: boot flash:</pre> • For <i>file-url</i>—Specifies the path (directory) and the name of the bootable image. <p>Filenames and directory names are case-sensitive.</p>
Step 5	copy running-config startup-config Example: <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring a Scheduled Software Image Reload

This task describes how to configure your device to reload the software image at a later time.

SUMMARY STEPS

1. **configure terminal**
2. **copy running-config startup-config**
3. **reload in [hh:]mm [text]**
4. **reload at hh: mm [month day | day month] [text]**
5. **reload cancel**
6. **show reload**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 2	copy running-config startup-config Example: <code>copy running-config startup-config</code>	Saves your device configuration information to the startup configuration before you use the reload command.
Step 3	reload in [hh:]mm [text] Example: Device(config)# <code>reload in 12</code> System configuration has been modified. Save? [yes/no]: <code>y</code>	Schedules a reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 days. You can specify the reason for the reload in a string up to 255 characters in length.
Step 4	reload at hh: mm [month day day month] [text] Example: Device(config)# <code>reload at 14:00</code>	Specifies the time in hours and minutes for the reload to occur. Note Use the at keyword only if the device system clock has been set (through Network Time Protocol (NTP), the hardware calendar, or manually). The time is relative to the configured time zone on the device. To schedule reloads across several devices to occur simultaneously, the time on each device must be synchronized with NTP.
Step 5	reload cancel Example: Device(config)# <code>reload cancel</code>	Cancels a previously scheduled reload.
Step 6	show reload Example: <code>show reload</code>	Displays information about a previously scheduled reload or identifies if a reload has been scheduled on the device.

Monitoring Device Setup Configuration

Example: Verifying the Device Running Configuration

```
Device# show running-config
Building configuration...

Current configuration: 1363 bytes
!
```

```

version 12.4
no service pad
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname Stack1
!
enable secret 5 $1$ej9.$DMUvAUnZOAmvmgqBEzIxEO
!
.
<output truncated>
.
interface gigabitethernet6/0/2
mvr type source

<output truncated>

...!
interface VLAN1
 ip address 172.20.137.50 255.255.255.0
 no ip directed-broadcast
!
ip default-gateway 172.20.137.1 !
!
snmp-server community private RW
snmp-server community public RO
snmp-server community private@es0 RW
snmp-server community public@es0 RO
snmp-server chassis-id 0x12
!
end

```

Examples: Displaying Software Install

This example displays software bootup in install mode:

```
switch# boot flash:/c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin
```

Configuration Examples for Performing Device Setup

Example: Configuring a Device as a DHCP Server

```

Device# configure terminal
Device(config)# ip dhcp pool pool1
Device(dhcp-config)# network 10.10.10.0 255.255.255.0
Device(dhcp-config)# boot config-boot.text
Device(dhcp-config)# default-router 10.10.10.1
Device(dhcp-config)# option 150 10.10.10.1
Device(dhcp-config)# exit
Device(config)# tftp-server flash:config-boot.text
Device(config)# interface gigabitethernet 1/0/4
Device(config-if)# no switchport
Device(config-if)# ip address 10.10.10.1 255.255.255.0

```

```
Device(config-if)# end
```

Example: Configuring DHCP Auto-Image Update

```
Device# configure terminal
Device(config)# ip dhcp pool pool1
Device(dhcp-config)# network 10.10.10.0 255.255.255.0
Device(dhcp-config)# boot config-boot.text
Device(dhcp-config)# default-router 10.10.10.1
Device(dhcp-config)# option 150 10.10.10.1
Device(dhcp-config)# option 125 hex 0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f64.686370

Device(dhcp-config)# exit
Device(config)# tftp-server flash:config-boot.text
Device(config)# tftp-server flash:image_name
Device(config)# tftp-server flash:boot-config.text
Device(config)# tftp-server flash:autoinstall_dhcp
Device(config)# interface gigabitethernet 1/0/4
Device(config-if)# no switchport
Device(config-if)# ip address 10.10.10.1 255.255.255.0
Device(config-if)# end
```

Example: Configuring a Device to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

```
Device# configure terminal
Device(config)# boot host dhcp
Device(config)# boot host retry timeout 300
Device(config)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause
  You to No longer Automatically Download Configuration Files at Reboot^C
Device(config)# vlan 99
Device(config-vlan)# interface vlan 99
Device(config-if)# no shutdown
Device(config-if)# end
Device# show boot
BOOT path-list:
Config file:          flash:/config.text
Private Config file: flash:/private-config.text
Enable Break:        no
Manual Boot:         no
HELPER path-list:
NVRAM/Config file
  buffer size:       32768
Timeout for Config
  Download:          300 seconds
Config Download
  via DHCP:         enabled (next boot: enabled)
Device#
```

Example: Configuring NVRAM Buffer Size

```

Device# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Device(config)# boot buffersize 600000
Device(config)# end
Device# show boot
BOOT path-list      :
Config file         : flash:/config.text
Private Config file : flash:/private-config.text
Enable Break       : no
Manual Boot        : no
HELPER path-list   :
Auto upgrade       : yes
Auto upgrade path  :
NVRAM/Config file
  buffer size:     600000
Timeout for Config
  Download:        300 seconds
Config Download
  via DHCP:        enabled (next boot: enabled)
Device#

```

CHAPTER 93

Configuring AVC with DNS-AS

- [Prerequisites for AVC with DNS-AS, on page 1875](#)
- [Restrictions and Guidelines for AVC with DNS-AS, on page 1875](#)
- [Information About AVC with DNS-AS, on page 1876](#)
- [How to Configure AVC with DNS-AS, on page 1880](#)
- [Monitoring AVC with DNS-AS, on page 1893](#)
- [Troubleshooting AVC with DNS-AS, on page 1896](#)
- [Feature History and Information for AVC with DNS-AS, on page 1897](#)

Prerequisites for AVC with DNS-AS

- You have the [Cisco ONE for Access](#) license to use AVC with DNS-AS.
- You have enabled Multilayer Switch (MLS) Quality of Service (QoS).
- You have maintained metadata in the authoritative DNS server and reachability exists - before you enable AVC with DNS-AS
- The DNS-AS client can snoop forward look-up requests originating from hosts.
- To ensure DNS packet logging or snooping, you have attached the policy map to the interface, by using the **service-policy input** command.

Restrictions and Guidelines for AVC with DNS-AS

- Only a forward look-up is supported.
- Two DNS servers are supported (in case of a failover). One is considered the primary DNS server and other, the secondary DNS server.
- IPv6 is not supported—AAAA requests, and IPv6 DNS servers are not supported.
- AVC with DNS-AS is supported only on physical interfaces, in the ingress direction.
- Virtual Routing and Forwarding (VRF) is not supported.

- We recommend a maximum of 300 AVC with DNS-AS applications (domain names) in the binding table, because of its effect on the ternary content addressable memory (TCAM). To know how the addition of applications affects the TCAM see the [Troubleshooting AVC with DNS-AS](#) section of this chapter.

Information About AVC with DNS-AS

The Application Visibility Control (AVC) with Domain Name System as an Authoritative Source (DNS-AS) feature (AVC with DNS-AS) provides a centralized means of controlling the identification and classification of trusted network traffic in an organization. It accomplishes this by using network metadata stored in a DNS server that is authoritative to the domain in question, to identify applications, Quality of Service (QoS) to classify the corresponding traffic and apply suitable policies, and Flexible NetFlow (FNF), to monitor and export application information to an external collector.

The feature provides:

- **Application Visibility**—Ensuring unambiguous visibility of applications.

The DNS-AS mechanism snoops requests and does not require a CPU-intensive, deep packet inspection (DPI). Since traffic classification is by means of a DNS request and not DPI, this feature is compatible in scenarios where network traffic is encrypted.

- **Metadata Driven**—Using information about applications.

You can program the network holistically so it behaves like a self-driving car. You now have information about all the required applications in your network, irrespective of whether traffic is encrypted or not.

- **Centralized Control**—Using a cross-domain application intent policy controller.

The feature leverages an existing, universally available query-response mechanism to enable local DNS servers within an organization to act as authoritative servers and propagate application classification information to DNS-AS clients (switches) in an enterprise network.

- **Control without Administrative Access**—Providing alternatives to controller-based approaches.

The feature supports scenarios where your network may be in the cloud and you may not own it. You can still control network devices across the Internet, even though you may not have administrative control of these devices.

Overview of AVC with DNS-AS

The process starts with an organization's requirements relating to management and control of network traffic. You begin by assessing the software applications that run on the various hosts (phones, PCs etc.) in your network, the domains (websites) and applications accessed by these devices, and the business-relevance of these domains and applications in your organization.

The assessment helps you arrive at a list of domains and applications that are "trusted" by your organization, designating all remaining domains and applications as untrusted.

With DNS-AS enabled on your network and the list of trusted domains at hand, the networking devices or DNS-AS clients in your network identify which applications the network traffic belongs to or which domains are being requested. As long as the traffic is part of the trusted list, the switch requests the DNS server for metadata and IP address information. This request is sent in the form of a DNS-query. The response, once

received, is cached locally until the Time-to-Live (TTL) for that resource record expires. The response is bound to the traffic and allows the DNS-AS client to now identify, classify, and forward traffic accordingly.

Key Concepts for AVC with DNS-AS

Concept	Meaning or Definition
Metadata (RFC6759)	<p>In the context of the AVC with DNS-AS feature, this includes traffic classification information, application identification information, and business relevance information.</p> <p>Metadata is maintained in the form of TXT records. The following is a sample metadata record in the prescribed format:</p> <pre>CISCO-CLS=app-name:example app-class:TD business:YES app-id:CU/28202</pre>
Forward look-up	<p>A request for an IP address or a request for an “A” record, originating from a host.</p> <p>Being able to snoop these forward lookups in the network traffic is fundamental to the AVC with DNS-AS feature.</p>
Host	<p>A PC or mobile where users run software applications, access websites and so on.</p> <p>Forward look-up requests originate from hosts.</p>
Client or DNS-AS client	<p>Networking devices throughout your network. Host traffic is always routed through such a client.</p> <p>Note This chapter deals with the configuration of the AVC with DNS-AS on Cisco Catalyst Switches that are deployed as access switches only. Throughout this document, the term client, DNS-AS client, refers to the switch where AVC with DNS-AS is enabled.</p> <p>DNS-AS clients receive metadata from an authoritative DNS server and maintain a database of this information in the form of records. How long the record remains in the client’s database, is determined by the record’s TTL.</p>
Binding table	<p>A table that resides in the DNS-AS client and serves as a database of parsed DNS server responses [TXT records and “A” records].</p> <p>Every DNS-AS client has a binding table of its own.</p> <p>This table not to be confused with the trusted domain list which is only a list of the trusted domains.</p>
"A" record	<p>A record containing the domain name and IP address information [Only IPv4 address]. This is one of the DNS-Server responses (the other being the TXT record) and has a predefined lifespan.</p> <p>A forward lookup request from a host is a request for an “A” record.</p>

Concept	Meaning or Definition
TXT DNS-AS resource record or TXT record	<p>A record containing metadata. This is one of the DNS-Server responses (the other being the “A” record) and has a predefined lifespan.</p> <p>A TXT record is limited to 255 characters.</p> <p>For AVC with DNS-AS, the TXT attribute is always CISCO-CLS. Any TXT record that starts with CISCO-CLS= can be recognized as an AVC with DNS-AS message. The message format is as follows:</p> <pre>CISCO-CLS=<option>:<val>{ <option>:<val>}*</pre>
Time-to-Live (TTL)	<p>The lifespan of an “A” record and TXT record in the binding table.</p> <p>TTL values are configured on the DNS server.</p> <p>While a TTL accompanies both TXT and “A” record responses, the DNS client only goes by the “A” record response from the DNS server.</p>
Authoritative DNS server	<p>The go-to DNS server for all client metadata and “A” record requests.</p> <p>Every DNS domain has only one authoritative DNS server.</p> <p>Such a server maintains records of application metadata in the form of a TXT record, and only returns responses to queries about domain names that have been maintained in the required format.</p> <p>The following is a sample metadata record in the prescribed format:</p> <pre>CISCO-CLS=app-name:example app-class:TD business:YES app-id:CU/28202</pre>

AVC with DNS-AS Process Flow

The working of AVC with DNS-AS involves the DNS snooping process and the DNS-AS client process—both of which are loosely coupled, but independent processes.

DNS Snooping Process

-
- Step 1** The host initiates an “A” record request.
- A user from your organization is in a meeting room in an office building. The associated DNS-AS client here is a switch (Network traffic from this meeting room is routed through this switch). The user looks up a website `www.example.com`, which initiates the request for an “A” record.
- Step 2** The authoritative DNS-server responds with an “A” record response.
-

DNS-AS Client Process

-
- Step 1** The DNS-AS client sends a DNS query (TXT request) to the authoritative DNS server.

The DNS-AS client, which is constantly snooping for requests (that correspond with entries in the trusted domain list), finds the host's forward look-up request. Based on the snooped result, the DNS-AS client sends a TXT request to the authoritative DNS server.

Note The DNS-AS client receives a copy of the host's "A" record request, and does not alter the host's original request in any manner.

- Step 2** The authoritative DNS-server responds with a TXT record response.
- Step 3** A successful TXT response is followed by an "A" record request.
- Step 4** The authoritative DNS-server responds with an "A" record response.
- Step 5** The DNS-AS client parses and saves the response in its binding table.

The DNS-AS client saves the TXT record and "A" record in its binding table. The response will remain saved in the binding table for the duration specified by the TTL of the "A" record. The system automatically checks and prevents duplicate entries for a fully qualified domain name in the binding table.

The DNS-AS client uses the metadata it receives (from the DNS Server), to determine if a QoS policy should be applied.

The DNS-AS client forwards information about identified applications, to FNF, enabling you to export this information.

Figure: AVC with DNS-AS Process Flow

1	Host	2	DNS-As Client	3	Authoritative DNS Server
Part I: DNS Snooping Process					
	An "A" record request from the host to the DNS server		An "A" record response from the DNS server to the host		
Part II: DNS-As Client Process					
	A copy of the host's "A" record request that the DNS-AS client saves	-	-		
	TXT record and "A" record request from the DNS-AS client to the DNS server		TXT record and "A" record response from the DNS server to the DNS-AS client		

Stacking and AVC with DNS-AS

AVC with DNS-AS supports stacking. To ensure successful stack management, the binding table database of the active stack (also a DNS-AS client) is synchronized with the stack member (also a DNS-AS client). As long as AVC with DNS-AS is enabled, no additional user configuration is required. The binding table entries are synchronized at these times:

- The stack member comes up (bulk synchronization).
- New entries are added to the binding table database.
- One or more entries are cleared from the database.

Default Configuration for AVC with DNS-AS

DNS-AS is disabled.

How to Configure AVC with DNS-AS

Generating Metadata Streams

Application metadata is configured and saved on the local, authoritative DNS server. You configure application classification information, for each trusted domain, in a prescribed format (a metadata stream). This is the information that the server propagates to switches when queried for application metadata. When the switch sends a TXT query regarding an application, the DNS server sends the relevant metadata in the TXT response.

To generate metadata streams, perform the following task:

SUMMARY STEPS

1. Go to the: [AVC Resource Record Generator](#).
2. Click one of the options to generate the metadata stream.
 - Generate predefined
 - Generate custom
3. Copy metadata into the corresponding TXT Resource Record of the DNS server in charge of the DNS domain that you have marked as a trusted domain.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Go to the: AVC Resource Record Generator . Example: <code>CISCO-CLS=app-name:example app-class:TD business:YES app-id:CU/28202</code>	Helps you generate a metadata stream for an application or domain, in a TXT record format. You can specify the following metadata fields: <ul style="list-style-type: none"> • (Optional) Domain Name

	Command or Action	Purpose
		<ul style="list-style-type: none"> • (Mandatory) Application Name—A value is mandatory. This can be an existing application name or custom application name. <ul style="list-style-type: none"> • Existing Application Name (app-name:)—Select from the list of standard applications. • (Optional) Custom Application Name(app-name:)—If you enter a custom application name, you must also maintain the Traffic Class and Business Relevance information in the metadata stream. • (Optional) Selector ID (app-id:)—Consists of a classification engine ID (first eight bits) and a selector ID (the next twenty-four bits). <ul style="list-style-type: none"> • Engine ID or Classification Engine ID—Defines the context for the selector ID. Only these engine IDs are allowed: <ul style="list-style-type: none"> L3—IANA layer 3 protocol number L4—IANA layer 4 well-known port number L7—Cisco global application ID CU—Custom protocol. Use this engine ID for custom application names. • Selector ID—An application identifier, for a given classification engine ID. Enter a numeric value between 1 and 65535 <p>Note When you enter the engine ID and selector ID for existing application names, be sure to align with the Network Based Application Recognition (NBAR) standard. Only then will the FNF exporters report with a common ID and in a consistent manner.</p> • (Optional) Port Range (server-port:) • (Optional) Traffic Class (app-class:) • (Optional) Business Relevance (business:)—If you do not select yes or no, the business relevance value is set based on the app-class or app-name, in that order of priority.

	Command or Action	Purpose
		For information about how traffic class and business relevance fields here map to QoS traffic classification, see App-Class and QoS Traffic Mapping
Step 2	<p>Click one of the options to generate the metadata stream.</p> <ul style="list-style-type: none"> • Generate predefined • Generate custom <p>Example: Generate predefined</p>	<p>Generate predefined—Generate a predefined metadata stream for well known applications, using best practice defaults.</p> <p>Generate custom—Generate a custom metadata stream for your own applications using custom values.</p>
Step 3	Copy metadata into the corresponding TXT Resource Record of the DNS server in charge of the DNS domain that you have marked as a trusted domain.	Copy and paste the metadata stream from the website, to the authoritative DNS server you are using.

Configuring a DNS Server as the Authoritative Server

All DNS-AS clients in the network should be configured to send all DNS queries to one authoritative DNS server. On a Cisco Catalyst switch, perform the following task:

SUMMARY STEPS

1. **configure terminal**
2. **ip name-server***server-address*

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	<p>ip name-server<i>server-address</i></p> <p>Example:</p> <pre>Device(config)# ip name-server server-address 192.0.2.1 192.0.2.2</pre>	<p>Specifies the address of the authoritative DNS server. The port number is always 53.</p> <p>You can configure up to two DNS Servers, in case of a failover.</p>

	Command or Action	Purpose
		<p>Note The command allows you configure up to six name servers (IPv4 and IPv6). Ensure that at least the first two IP addresses in the sequence are IPv4 addresses, because the AVC with DNS-AS feature will use only these. See the example below, here the first two addresses are IPv4 (192.0.2.1 and 192.0.2.2), the third one (2001:DB8::1) is an IPv6 address. AVC with DNS-AS will use the first two.</p> <pre>Device(config)# ip name-server 192.0.2.1 192.0.2.2 2001:DB8::1</pre>

Enabling AVC with DNS-AS

DNS-AS is disabled by default. To enable the feature on a Cisco Catalyst switch, perform the following task:

SUMMARY STEPS

1. **configure terminal**
2. **[no] avc dns-as client enable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	[no] avc dns-as client enable Example: <pre>Device(config)# avc dns-as client enable</pre>	Enables AVC with DNS-AS on the switch (DNS-AS client). The system then creates a binding table where parsed DNS server responses are stored till the TTL expires. <p>Note To ensure DNS packet logging or snooping, you must attach the policy map (containing the relevant class maps that will determine traffic class) to the interface by using the service-policy input command. For more information, see Configuring QoS for AVC with DNS-AS, on page 1884</p>

Maintaining the List of Trusted Domains

Trusted domains are saved in every DNS-AS client where AVC with DNS-AS is enabled. When the feature is first enabled on the DNS-AS client, the list is empty. You must enter the domains that the switch should

trust. The switch snoops only for network traffic that is maintained in this list. To make entries in the trusted domain list, perform the following task:

SUMMARY STEPS

1. **configure terminal**
2. **[no] avc dns-as client trusted-domains**
3. **[no] domain domain-name**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	[no] avc dns-as client trusted-domains Example: Device(config)# avc dns-as client trusted-domains	Enters the trusted domain configuration mode.
Step 3	[no] domain domain-name Example: Device(config-trusted-domains)# domain www.example.com OR Device(config-trusted-domains)# domain *example.com	Enter the domain name you would like to add to the trusted domain list. This forms part of the list of trusted domains for the DNS-AS client. All remaining domains are ignored and will follow default forwarding behavior. You can enter up to 50 domains. You can use regular expressions to match the domain name. For example, to represent all the domains for an organization, if you enter:Switch(config-trusted-domains)# domain *.example.*, the DNS-AS client matches www.example.com, ftp.example.org and any other domain that pertains to the organization “example”. But use such an entry at your discretion, because it could increase the size of the binding table considerably.

Configuring QoS for AVC with DNS-AS

In order to isolate and classify trusted traffic as defined in the metadata stream, you must create class maps (one for each traffic class) > define traffic-class match criteria and business-relevance match criteria > create a policy map > add the class map > set action > attach the policy map to the interface. For more information, see the [Classification Overview](#) section of the *Configuring QoS* chapter in this guide.

Class Map Configuration in the Easy QoS Model

In order to determine the number of traffic classes that should be provisioned, you can use the 12-class Easy QoS Model. This model provides a uniform, standards-based recommendations to help ensure

that QoS designs and deployments are unified and consistent across an organization. The following sample output displays class map configuration for traffic class and business relevance, according to the 12-class Easy QoS Model:

Note Only in the context of the DNS-AS feature, you can specify up to two match attributes for each class.

```
class-map match-all VOICE
match protocol attribute traffic-class voip-telephony
match protocol attribute business-relevance business-relevant
class-map match-all BROADCAST-VIDEO
match protocol attribute traffic-class broadcast-video
match protocol attribute business-relevance business-relevant
class-map match-all REAL-TIME-INTERACTIVE
match protocol attribute traffic-class real-time-interactive
match protocol attribute business-relevance business-relevant
class-map match-all MULTIMEDIA-CONFERENCING
match protocol attribute traffic-class multimedia-conferencing
match protocol attribute business-relevance business-relevant
class-map match-all MULTIMEDIA-STREAMING
match protocol attribute traffic-class multimedia-streaming
match protocol attribute business-relevance business-relevant
class-map match-all SIGNALING
match protocol attribute traffic-class signaling
match protocol attribute business-relevance business-relevant
class-map match-all NETWORK-CONTROL
match protocol attribute traffic-class network-control
match protocol attribute business-relevance business-relevant
class-map match-all NETWORK-MANAGEMENT
match protocol attribute traffic-class ops-admin-mgmt
match protocol attribute business-relevance business-relevant
class-map match-all TRANSACTIONAL-DATA
match protocol attribute traffic-class transactional-data
match protocol attribute business-relevance business-relevant
class-map match-all BULK-DATA
match protocol attribute traffic-class bulk-data
match protocol attribute business-relevance business-relevant
class-map match-all SCAVENGER
match protocol attribute business-relevance business-irrelevant
```

Policy Map Definitions in the Easy QoS Model

The following sample output displays the policy map definitions, with traffic attribute marking for all the traffic classes in the 12-class Easy QoS Model:

```
policy-map MARKING
class VOICE
set dscp ef
class BROADCAST-VIDEO
set dscp cs5
class REAL-TIME-INTERACTIVE
set dscp cs4
class MULTIMEDIA-CONFERENCING
set dscp af41
class MULTIMEDIA-STREAMING
set dscp af31
```

```

class SIGNALING
set dscp cs3
class NETWORK-CONTROL
set dscp cs6
class NETWORK-MANAGEMENT
set dscp cs2
class TRANSACTIONAL-DATA
set dscp af21
class BULK-DATA
set dscp af11
class SCAVENGER
set dscp cs1
class class-default
set dscp default

```

App-Class and QoS Traffic Mapping

The following table shows how the `app-class` field in the metadata stream maps to the 12-class Easy QoS Model of traffic classification.

App-Class and QoS Traffic Mapping

Application Class Long Text	Application Class Short Text	Corresponding QoS Traffic Class Name and Business Relevance
VOIP-TELEPHONY	VO	Traffic-class = voip-telephony Business-relevance = YES
BROADCAST-VIDEO	BV	Traffic-class = broadcast-video Business-relevance = YES
REALTIME-INTERACTIVE	RTI	Traffic-class = real-time-interactive Business-relevance = YES
MULTIMEDIA-CONFERENCING	MMC	Traffic-class = multimedia-conferencing Business-relevance = YES
MULTIMEDIA-STREAMING	MMS	Traffic-class = multimedia-streaming Business-relevance = YES
NETWORK-CONTROL	NC	Traffic-class = network-control Business-relevance = YES
SIGNALING	CS	Traffic-class = Signaling Business-relevance = YES
OPS-ADMIN-MGMT	OAM	Traffic-class = ops-admin-mgmt Business-relevance = YES

Application Class Long Text	Application Class Short Text	Corresponding QoS Traffic Class Name and Business Relevance
TRANSACTIONAL-DATA	TD	Traffic-class = Transactional-Data Business-relevance = YES
BULK-DATA	BD	Traffic-class = bulk-data Business-relevance = YES
BEST-EFFORT	BE	Traffic-class = <no change> Business-relevance = default
SCAVENGER	SCV	Traffic-Class = <no change> Business-relevance = NO

Classifying Network Control Traffic

The following example shows how to classify network control traffic. The corresponding metadata that should be maintained is: CISCO-CLS=app-name:example|app-class:NC|business:YES

1. Create class maps and match attributes:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map NETWORK-CONTROL
Device(config-cmap)# match protocol attribute traffic-class network-control
Device(config-cmap)# match protocol attribute business-relevance business-relevant
Device(config-cmap)# end
```

2. Create the policy map, attach the class map to it and specify priority:

```
Device# configure terminal
Device configuration commands, one per line. End with CNTL/Z.
Device(config)# policy-map MARKING
Device(config-pmap)# class NETWORK-CONTROL
Device(config-pmap-c)# set dscp ef
Device(config-pmap-c)# end
```

3. Attach the policy map to an interface:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface tengigabitethernet 1/0/1
Device(config-if)# service-policy input MARKING
Device(config-if)# end
```

Configuring FNF for AVC with DNS-AS

With FNF you can gain visibility into the applications running on your network, and use FNF option templates to export application ID, description, and attribute information. You must configure these FNF settings on the DNS-AS client:

- Configure a flow record to collect nonkey field **application-name**, and the key fields **ipv4 source address** and **ipv4 destination address**

- Configure a flow exporter and the two option templates. Option templates fetch application information.

Option template **application-table**, exports only applications resolved by the DNS-AS client, that is, the application ID and name from the binding table. The corresponding application descriptions are from Network Based Application Recognition (NBAR) definition for standard applications. A constructed help string is used for custom applications..

Option template **application-attributes** fetches attribute information by mapping it to the application name. Where standard application names are used, the option template uses standard Network Based Application Recognition (NBAR) attribute definitions; where custom application names are used, user-defined application names and only certain attribute fields are guaranteed to carry values.

- Configure a flow monitor and apply it to an interface to enable network traffic monitoring.

FNF Interaction with DNS-AS—With every flow that is created in the flow table, the DNS-AS client resolves the application name for the flow (if the entry exists in the binding table), by using the destination IP address (and if not available), the source IP address.

At periodic, configured intervals (600 seconds, by default), FNF exports option template data, that is mapped to the corresponding application name, to an external collector.

Option Templates

The **application-table** and **application-attributes** option templates are supported. Option templates determine the information that is exported to an external collector.

option application-table

This template exports the application name, application tag, and description to the external collector.

On a device where AVC with DNS-AS is enabled, only applications resolved by the DNS-AS client are exported. But as a permanent feature, the application-table template exports applications **unclassified** and **unknown**, irrespective of whether the feature is enabled or not.

- Application Name—For custom and standard applications, this information is derived from the TXT response (**app-name:**) that is saved in the binding table.
- Application Tag—The same as the application ID in the context of the AVC with DNS-AS feature. It consists of the engine ID and selector ID.
 - Engine ID or Classification Engine ID—Defines the context for the selector ID. Only these values are supported:
 - L3—IANA layer 3 protocol number (IANA_L3_STANDARD, ID: 1)
 - L4—IANA layer 4 well-known port number (IANA_L4_STANDARD, ID: 3)
 - L7—Cisco global application ID (CISCO_L7_GLOBAL, ID: 13)
 - CU—Custom protocol, (NBAR_CUSTOM, ID: 6)
 - Selector ID—Uniquely identifies the application or classification.

For standard applications, the application tag information is derived from these sources, in the given order of precedence:

1. TXT response (**app-id:**)

2. The NBAR definition for standard applications (if the TXT response does not carry a value).

For custom applications, the following applies to application tag information:

- It is derived only from the TXT response (**app-id:**)
 - For the engine ID, the DNS-AS client automatically uses CU—Custom protocol, (NBAR_CUSTOM, ID: 6).
 - For the selector ID, the DNS-AS client allots a custom selector ID. A maximum of 120 custom applications are supported - out of which 110 are available to the DNS-AS client. Starting with selector ID value 243, IDs are assigned in descending order. When there are no remaining IDs to assign, the entry is not saved in the binding table.
- Description—This information is derived from the NBAR definition for standard applications. For custom applications, the DNS-AS client uses: User Defined Protocol <app-name>.

option application-attributes

This template enables the collector to map the application names (from the option application-table), to attributes. Attributes are statically assigned to each protocol or application, and are not dependent on traffic. The template supports the following attributes:

For standard applications—

- Application Tag—See the Application Tag info in the [option application-table](#) section above. The same applies here.
- Category—Groups applications based on the first level of categorization for each protocol as the match criteria. Similar applications are grouped together under one category. For example, the email category contains all email applications such as, Internet Mail Access Protocol (IMAP), Simple Mail Transfer Protocol (SMTP), Lotus Notes, and so on.
- Sub-category—Groups applications based on the second level of categorization for each protocol as the match criteria. For example, clearcase, dbase, rda, mysql and other database applications are grouped under the database group.
- Application Group—Groups the same networking applications together. For instance, Example-Messenger, Example-VoIP-messenger, and Example-VoIP-over-SIP are grouped together under the example-messenger-group
- Peer-to-peer (p2p)—Groups protocols based on whether or not they use p2p technology.
- Tunnel—Groups protocols based on whether or not a protocol tunnels the traffic of other protocols. Protocols for which the NBAR does not provide any value are categorized under the unassigned tunnel group. For example, Layer 2 Tunneling Protocols (L2TP).
- Encryption—Groups applications based on the encrypted and nonencrypted status of the applications. Protocols for which the NBAR does not provide any value are categorized under the unassigned encrypted group.
- Traffic class—Groups applications and protocols based on the traffic class they belong to. For example, all applications that have traffic class TD. Traffic class information is derived from these sources, in the given order of precedence:

1. TXT response (**app-class:**)

2. The NBAR definition for standard applications (if the TXT response does not carry a value)
- Business relevance—Groups applications based on whether or not they have been marked as business-relevant. For example, all applications that have business relevance as YES. Business relevance information is derived from these sources, in the given order of precedence:
 1. TXT response (**business:**)
 2. The NBAR definition for standard applications (if the TXT response does not carry a value)

For custom applications—

Only these attributes of the application-attributes options template are guaranteed to carry a value:

- Application Tag—See the Application Tag info in the [option application-table](#) section above. The same applies here.
- Traffic class—This information is derived from the TXT response (**app-class:**)
- Business relevance—This information is derived from the TXT response (**business:**)

Sample FNF Configuration for AVC with DNS-AS

The following example shows how you can configure FNF for AVC with DNS-AS:

Part 1: Create a flow record. As in the example, you must configure:

- The source and destination IP addresses as key fields, in order to resolve application names.
- The use of the application name as a monkey field in flow record.

Additionally (not mandatory), you can also configure the number of bytes or packets in a flow as a monkey field, to display the number of applications sent to the collector

```
Device# configure terminal
Device(config)# flow record example-record1
Device(config-flow-record)# match ipv4 source address
Device(config-flow-record)# match ipv4 destination address
Device(config-flow-record)# collect application name
Device(config-flow-record)# collect counter packets
Device(config-flow-record)# exit
```

```
Device# show flow record example-record1
flow record example-record1
  match ipv4 source address
  match ipv4 destination address
  collect application name
  collect counter packets
```

Part 2: Create a flow exporter.

Also configure the **application-table** and **application-attributes** option templates in the exporter. Without option templates, the collector cannot retrieve meaningful application information. At a minimum we recommend that you configure the application-table option. For attribute information, also configure the application-attribute option.

You can also change the frequency of template export in seconds (the allowed range is 1 to 86400 seconds; the default is 600 seconds).

```

Device(config)# flow exporter example-exporter1
Device(config-flow-exporter)# option application-table
Device(config-flow-exporter)# option application-attributes
Device(config-flow-exporter)# template data timeout 500
Device(config-flow-exporter)# exit

Device# show flow exporter example-exporter1
Flow Exporter example-exporter1:
  Description:                User defined
  Export protocol:            NetFlow Version 9
  Transport Configuration:
    Destination IP address: 192.0.1.254
    Source IP address:      192.51.100.2
    Transport Protocol:    UDP
    Destination Port:      9995
    Source Port:           54964
    DSCP:                   0x0
    TTL:                    255
    Output Features:       Not Used
  Options Configuration:
    application-table (timeout 500 seconds)
    application-attributes (timeout 500 seconds)

Device# show flow exporter example-exporter1 statistics
Flow Exporter example-exporter1:
  Packet send statistics (last cleared 00:00:48 ago):
    Successfully sent:      2                (924 bytes)

  Client send statistics:
    Client: Option options application-name
      Records added:        4
      - sent:               4
      Bytes added:         332
      - sent:               332

    Client: Option options application-attributes
      Records added:        2
      - sent:               2
      Bytes added:         388
      - sent:               388

```

Part 3: Create a flow monitor

Apply the flow monitor to an interface, to perform network traffic monitoring.

You can also apply a QoS policy to the same interface. This example applies the QoS policy created as part of the sample QoS configuration ([Classifying Network Control Traffic, on page 1887](#))

```

Device# configure terminal
Device(config)# flow monitor example-monitor1
Device(config-flow-monitor)# record example-record1
Device(config-flow-monitor)# exporter exporter-exporter1
Device(config-flow-monitor)# exit
Device(config)# interface tengigabitethernet 1/0/1
Device(config-if)# switchport access vlan 100
Device(config-if)# switchport mode access
Device(config-if)# ip flow monitor example-monitor1 input
Device(config-if)# service-policy input MARKING
Device(config-if)# end

Device# show flow monitor
flow monitor example-monitor1
  record example-record1

```

```

exporter example-exporter1
!
Device# show interface tengigabitethernet1/0/1
interface tengigabitethernet1/0/1
  switchport access vlan 100
  switchport mode access
ip flow monitor example-monitor1 input

Device# show flow monitor example-monitor1 cache

Monitoring AVC with DNS-AS

To display the various AVC with DNS-AS settings you have configured, use these commands in the privileged EXEC mode:

Table 181: AVC with DNS-AS Monitoring Commands

Command	Purpose	Sample Output
show avc dns-as client status	Displays current status of the DNS-AS client. Use this command to know whether AVC with DNS-AS is enabled or not.	Example: show avc dns-as client status
show avc dns-as client trusted-domains	Displays list of trusted domains maintained in the binding table.	Example: show avc dns-as client trusted-domains

Command	Purpose	Sample Output
show avc dns-as client binding-table and show avc dns-as client binding-table detail	Displays AVC with DNS-AS metadata for the list of trusted domains and resolved entries. You can filter the output by application name, domain name, and so on. Both commands display the same information, in different formats.	Example: show avc dns-as client binding-table
show avc dns-as client statistics	Displays packet logging information—the number of DNS queries sent and the number of responses received.	Example: show avc dns-as client statistics
show avc dns-as client name-server brief	Displays information about the DNS server to which the metadata request was sent.	Example: show avc dns-as client name-server brief
show ip name-server	Displays all the name server IP addresses that have been maintained.	Example: show ip name-server
show platform tcam utilization	Displays information about TCAM availability	Example: show platform tcam utilization

Example: show avc dns-as client status

```
Device# show avc dns-as client status
DNS-AS client is enabled
```

Back to [Table 181: AVC with DNS-AS Monitoring Commands](#)

Example: show avc dns-as client trusted-domains

```
Device# show avc dns-as client trusted-domains
Id | Trusted domain
-----
1| example.com
2| www.example.com
3| example.net
4| www.example.net
5| example.org
6| www.example.org
```

Back to [Table 181: AVC with DNS-AS Monitoring Commands](#)

Example: show avc dns-as client binding-table

```
Device# show avc dns-as client binding-table
Switch# show avc dns-as client binding-table detailed
DNS-AS generated protocols:
Max number of protocols :50
Customization interval [min] :N/A

Age : The amount of time that the entry is active
TTL : Time to live which was learned from DNS-AS server
Time To Expire : Entry expiration time in case device does not see DNS traffic for the entry
```

```

Traffic Class : voip-telephony
Business Relevance : business relevant
IP : 192.0.2.121
   : 192.0.2.254
   : 198.51.100.1
   : 198.51.100.254
   : 192.51.100.12
   : 203.0.113.125
<output truncated>

```

Back to [Table 181: AVC with DNS-AS Monitoring Commands](#)

Example: show avc dns-as client statistics

Note Two DNS servers are configured in this example.

```

Device# show avc dns-as client statistics
Server details: vrf-id = 0 vrf-name = <default> ip = 192.0.2.1
AAAA Query Error packets 0
AAAA Query TX packets 0
AAAA Response RX packets 0
TXT Query Error packets 0
TXT Query TX packets 8
TXT Response RX packets 0
A Query Error packets 0
A Query TX packets 6
A Response RX packets 0
Server details: vrf-id = 0 vrf-name = <default> ip = 192.0.2.2
AAAA Query Error packets 0
AAAA Query TX packets 0
AAAA Response RX packets 0
TXT Query Error packets 0
TXT Query TX packets 2
TXT Response RX packets 2
A Query Error packets 0
A Query TX packets 4
A Response RX packets 2
Total Drop packets 0

avc_dns_as_pkts_logged = 2
avc_dns_as_q_pkts_processed = 2

```

Back to [Table 181: AVC with DNS-AS Monitoring Commands](#)

Example: show avc dns-as client name-server brief

```

Device# show avc dns-as client name-server brief

Server-IP | Vrf-name
-----

```

```
192.0.2.1 | <default>
192.0.2.2 | <default>
```

Back to [Table 181: AVC with DNS-AS Monitoring Commands](#)

Example: show ip name-server

```
Device# show ip name-server
192.0.2.1
192.0.2.2
2001:DB8::1
```

Back to [Table 181: AVC with DNS-AS Monitoring Commands](#)

Example: show platform tcam utilization

Note The relevant TCAM entry is IPv4 qos aces:

```
Device# show platform tcam utilization
CAM Utilization for ASIC# 0 Max Used
Masks/Values Masks/values

Unicast mac addresses: 16604/16604 24/24
IPv4 IGMP groups + multicast routes: 1072/1072 3/3
IPv4 unicast directly-connected routes: 4096/4096 4/4
IPv4 unicast indirectly-connected routes: 1280/1280 40/40
IPv6 Multicast groups: 1072/1072 18/18
IPv6 unicast directly-connected routes: 4096/4096 1/1
IPv6 unicast indirectly-connected routes: 1280/1280 32/32
IPv4 policy based routing aces: 512/512 14/14
IPv4 qos aces: 512/512 51/51
IPv4 security aces: 1024/1024 78/78
IPv6 policy based routing aces: 256/256 8/8
IPv6 qos aces: 256/256 44/44
IPv6 security aces: 512/512 18/18
```

Note: Allocation of TCAM entries per feature uses a complex algorithm. The above information is meant to provide an abstract view of the current TCAM utilization

Back to [Table 181: AVC with DNS-AS Monitoring Commands](#)

Troubleshooting AVC with DNS-AS

Problem	Possible Causes and Solutions
There are no entries in the binding table.	<p>The binding table may be empty because of either one or both of these reasons:</p> <ul style="list-style-type: none"> • Metadata is not maintained in DNS server—complete task Generating Metadata Streams, on page 1880 • The entry is not maintained in the trusted domain list—complete task Maintaining the List of Trusted Domains, on page 1883

Problem	Possible Causes and Solutions
Unsuccessful DNS snooping or packet logging.	To ensure DNS snooping and packet logging, you must attach the policy map (containing the relevant class maps that will determine traffic class) to the interface—See the example in the Configuring QoS for AVC with DNS-AS, on page 1884
The DNS server does not return correct values.	<p>Verify that the correct DNS-AS metadata is maintained in the DNS system.</p> <ul style="list-style-type: none"> Using Linux dig: <pre>dig TXT +short www.example.org [dns-server-ip] "CISCO-CLS=app-name:example app-class:TD business:YES app-id:CU/28202"</pre> Using Windows nslookup: <pre>C:\Windows\system32>NSLookup.exe -q=TXT www.example.org [dns-server-ip] www.example.org text = "CISCO-CLS=app-name:example app-class:TD business:YES app-id:CU/28202"</pre>
The QoS policy you applied is removed from the port.	<p>When the DNS-AS client recognises an application, along with saving the "A" record response in the binding table, the system utilises the TCAM to save the IP address of the application. A single application can in effect have multiple IP addresses, each utilising additional space in the TCAM. When the TCAM is exhausted, QoS policies cease to be applied.</p> <p>To avoid the problem, monitor TCAM utilisation on a regular basis. Enter the show platform tcam utilisation command in privilege EXEC mode, to display information about TCAM availability.</p>
The DNS-AS client ignores the QoS mapping you've defined and applies default forwarding behavior.	<p>The DNS-AS client ignores QoS mapping and applies default forwarding behavior in these cases:</p> <ul style="list-style-type: none"> If the match attributes that you specify for the traffic class and business relevance do not match what you have defined in the metadata stream—Check and correct as required. If the binding table entry is no longer active. This refers to the age of the entry—Use the show avc dns-as client binding-table command to display the age of an entry.

Feature History and Information for AVC with DNS-AS

The following table provides release information about the feature or features described in this chapter. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Release	Modification
Cisco IOS Release 15.2(5)E1	This feature was introduced.

Release	Modification
Cisco IOS Release 15.2(5)E2	Flexible NetFlow (FNF) for AVC with DNS-AS was introduced - Provides the ability to export application information using FNF.

CHAPTER 94

Configuring SDM Templates

- [Information About Configuring SDM Templates, on page 1899](#)
- [How to Configure SDM Templates, on page 1901](#)
- [Configuration Examples for SDM Templates, on page 1903](#)
- [Additional References for SDM Templates, on page 1904](#)
- [Feature History and Information for Configuring SDM Templates, on page 1905](#)

Information About Configuring SDM Templates

Restrictions for SDM Templates

The following are restrictions when using SDM templates:

The switch supports homogeneous stacking, but does not support mixed stacking.

SDM Templates

You can use Switch Database Management (SDM) templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions: for example, use the default template to balance resources, and use the access template to obtain maximum ACL usage. The switch SDM templates allocate system hardware resources for different uses.

You can select SDM templates for IP Version 4 (IPv4) to optimize these features on switches running the IP Lite feature set:

Note When the switch is running the LAN Base feature set, you must use the default template.

- IPv4—The IPv4 template provides maximum support for IPv4. No IPv6 support is available on this template.
- VLAN—The VLAN template provides Layer 2 functionality and the maximum number of unicast MAC addresses.

- Default—The default template gives balance to all functions providing support for Layer 2, IPv4 and IPv6 functionality.

Note Use the default template when configuring IPv4 static routing on SVIs on switches running the LAN Base feature set. You can configure up to 16 static routes.

For information about homogeneous stacks, see the *Catalyst 2960-XR Switch Stacking Configuration Guide*.

After you change the template and the system reboots, you can use the **show sdm prefer** privileged EXEC command to verify the new template configuration. If you enter the **show sdm prefer** command before you enter the **reload** privileged EXEC command, the **show sdm prefer** command shows the template currently in use and the template that becomes active after a reload.

Note

- The SDM templates contain only those commands that are defined as part of the templates. If a template enables another related command that is not defined in the template, then this other command will be visible when the **show running config** command is entered. For example, if the SDM template enables the **switchport voice vlan** command, then the **spanning-tree portfast edge** command may also be enabled (although it is not defined on the SDM template).

If the SDM template is removed, then other such related commands are also removed and have to be reconfigured explicitly.

- SDM templates do not create VLANs. You must create the VLANs before adding commands to the SDM templates.

SDM Template Resources

You can use SDM templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

To allocate ternary content addressable memory (TCAM) resources for different usages, the switch SDM templates prioritize system resources to optimize support for certain features. These templates are supported on your device:

Table 182: Approximate Number of Feature Resources Allowed by Templates

Resource	Default	IPv4	VLAN
Unicast MAC addresses	16 K	16 K	32 K
Active VLANs/VLAN IDs	1K/4096	1K/4096	1K/4096
IPv4 IGMP groups	1 K	1 K	1 K
IPv4 unicast routes	5.25 K	24 K	0.5 K

Resource	Default	IPv4	VLAN
• Directly connected hosts	4 K	16 K	0.25 K
• Indirect routes	1.25 K	8 K	0.25 K
IPv4 policy-based routing ACEs	0.5 K	0.375 k	0.5 K
IPv6 multicast groups:	1 K	0	1 K
• Directly connected IPv6 addresses	4 K	0	0.25 K
• Indirect IPv6 unicast routes	1.25 K	0	0.25 K
IPv4 MAC QoS ACEs	0.5 K	0.5 K	0.5 K
IPv4 MAC security ACEs	1 K	0.875 k	1 K
IPv6 policy-based routing ACEs	0.25 K	0	0
IPv6 QoS ACEs	0.25 K	0	0.5 K
IPv6 security ACEs	0.5 K	60	0.5 K

SDM Templates and Switch Stacks

All stack members use the same SDM template that is stored on the active stack. When a new switch is added to a stack, as with the switch configuration and VLAN database files, the SDM configuration that is stored on the active stack overrides the template configured on an individual switch.

Version-mismatch (VM) mode has priority over SDM-mismatch mode. If a VM mode condition and an SDM-mismatch mode exist, the switch stack first attempts to resolve the VM-mode condition. You can use the **show switch** privileged EXEC command to see if any stack members are in SDM-mismatch mode.

How to Configure SDM Templates

Setting the SDM Template

Follow these steps to use the SDM template to maximize feature usage:

SUMMARY STEPS

1. enable
2. configure terminal
3. sdm prefer { default | ipv4 | vlan }
4. end
5. reload

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
Step 3	<p>sdm prefer { default ipv4 vlan }</p> <p>Example:</p> <pre>Device(config)# sdm prefer default</pre>	<p>Specifies the SDM template to be used on the switch. The keywords have these meanings:</p> <ul style="list-style-type: none"> • default —The default template provides balance for all Layer 2, IPv4 and IPv6 functionality. • IPv4 —The IPv4 template provides maximum support for IPv4. No IPv6 support is available on this template. • VLAN —The VLAN template provides Layer 2 functionality and the maximum number of unicast MAC addresses. <p>Use the no sdm prefer command to set the switch to the default template. The default template balances the use of system resources.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 5	<p>reload</p> <p>Example:</p> <pre>Device# reload</pre>	<p>Reloads the operating system.</p>

Configuration Examples for SDM Templates

Examples: Displaying SDM Templates

This is an example output showing the default template information:

```
Device# show sdm prefer default

"default" template:
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.

number of unicast mac addresses:          16K
number of IPv4 IGMP groups + multicast routes: 1K
number of IPv4 unicast routes:           5.25K
  number of directly-connected IPv4 hosts: 4K
  number of indirect IPv4 routes:         1.25K
number of IPv6 multicast groups:          1K
number of directly-connected IPv6 addresses: 4K
number of indirect IPv6 unicast routes:    1.25K
number of IPv4 policy based routing aces: 0.5K
number of IPv4/MAC qos aces:              0.5K
number of IPv4/MAC security aces:         1K
number of IPv6 policy based routing aces: 0.25K
number of IPv6 qos aces:                  0.25K
number of IPv6 security aces:             0.5K

Device#
```

This is an example output showing the IPv4 template information:

```
Device# show sdm prefer ipv4

"ipv4" template:
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.

number of unicast mac addresses:          16K
number of IPv4 IGMP groups + multicast routes: 1K
number of IPv4 unicast routes:           24K
  number of directly-connected IPv4 hosts: 16K
  number of indirect IPv4 routes:         8K
number of IPv6 multicast groups:          0
number of directly-connected IPv6 addresses: 0
number of indirect IPv6 unicast routes:    0
number of IPv4 policy based routing aces: 0.375k
number of IPv4/MAC qos aces:              0.5K
number of IPv4/MAC security aces:         0.875k
number of IPv6 policy based routing aces: 0
number of IPv6 qos aces:                  0
number of IPv6 security aces:             60

Device#
```

This is an example output showing the VLAN template information:

```

Device# show sdm prefer vlan

"vlan" template:
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.

number of unicast mac addresses:          32K
number of IPv4 IGMP groups + multicast routes: 1K
number of IPv4 unicast routes:           0.5K
  number of directly-connected IPv4 hosts: 0.25K
  number of indirect IPv4 routes:         0.25K
number of IPv6 multicast groups:          1K
number of directly-connected IPv6 addresses: 0.25K
number of indirect IPv6 unicast routes:    0.25K
number of IPv4 policy based routing aces: 0.5K
number of IPv4/MAC qos aces:              0.5K
number of IPv4/MAC security aces:         1K
number of IPv6 policy based routing aces:  0
number of IPv6 qos aces:                  0.5K
number of IPv6 security aces:             0.5K

```

Examples: Configuring SDM Templates

This example shows how to configure the VLAN template:

```

Device(config)# sdm prefer vlan
Device(config)# exit
Device# reload
  Proceed with reload? [confirm]

```

Information About Configuring System Message Logs and Smart Logs

System Message Logging

By default, a switch sends the output from system messages and **debug** privileged EXEC commands to a logging process. . The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch. If a standalone switch , the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port.

Note The syslog format is compatible with 4.3 BSD UNIX.

System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- *seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)*
- *seq no:timestamp: %facility-severity-MNEMONIC:description*

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- **service sequence-numbers**
- **service timestamps log datetime**
- **service timestamps log datetime [localtime] [msec] [show-timezone]**
- **service timestamps log uptime**

Table 183: System Log Message Elements

Element	Description
<i>seq no:</i>	Stamps log messages with a sequence number only if the service sequence-numbers global configuration command is configured.
<i>timestamp</i> formats: <i>mm/dd h h:mm:ss</i> or <i>hh:mm:ss</i> (short uptime) or <i>d h</i> (long uptime)	Date and time of the message or event. This information appears only if the service timestamps log [datetime log] global configuration command is configured.
<i>facility</i>	The facility to which the message refers (for example, SNMP, SYS, and so forth).
<i>severity</i>	Single-digit code from 0 to 7 that is the severity of the message.
<i>MNEMONIC</i>	Text string that uniquely describes the message.
<i>description</i>	Text string containing detailed information about the event being reported.

Default System Message Logging Settings

Table 184: Default System Message Logging Settings

Feature	Default Setting
System message logging to the console	Enabled.
Console severity	Debugging.
Logging file configuration	No filename specified.
Logging buffer size	4096 bytes.
Logging history size	1 message.
Time stamps	Disabled.
Synchronous logging	Disabled.
Logging server	Disabled.
Syslog server IP address	None configured.
Server facility	Local7
Server severity	Informational.

Syslog Message Limits

If you enabled syslog message traps to be sent to an SNMP network management station by using the **snmp-server enable trap** global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level **warning** and numerically lower levels are stored in the history table even if syslog traps are not enabled.

When the history table is full (it contains the maximum number of message entries specified with the **logging history size** global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

The history table lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, *emergencies* equal 1, not 0, and *critical* equals 3, not 2.

Smart Logging

Smart logging provides a mechanism to capture and export packet flows based on predefined or user-configured triggers. The switch supports smart logging for these events:

- DHCP snooping violations

- Dynamic ARP inspection violations
- IP source guard denied traffic
- ACL permitted or denied traffic

To use smart logging, you must first configure a NetFlow exporter that you identify when you enable smart logging. For information on configuring the NetFlow feature, see the *Catalyst 2960-XR Switch NetFlow Lite Configuration Guide*.

Smart logging processing creates a NetFlow packet for the configured event and sends the packet to the external NetFlow collector. Smart logging counters reflect the number of packets that are logged. This number is the same as the number of packets sent to the collector if no packets are dropped between the switch and the NetFlow collector. You enable smart logging globally on the switch, and you can then configure specific events to be smart logged.

Smart Logging for Port ACL Deny or Permit Actions

The switch supports port ACLs, router ACLs, and VLAN ACLs.

- Port ACLs are IP or MAC ACLs applied to a Layer 2 port. Logging is not supported on port ACLs, but smart logging is supported on IP ACLs applied to Layer 2 ports.
- Router ACLs are ACLs applied to Layer 3 ports. Router ACLs support logging but not smart logging.
- VLAN ACLs or VLAN maps are ACLs applied to VLANs. You can configure logging on VLAN maps, but not smart logging.

When you configure any permit or deny ACL, you can configure logging or smart logging as part of the access list, to take place on all traffic that the ACL permits or denies. The type of port that you attach the ACL to determines the type of logging. If you attach an ACL with smart log configured to a router or a VLAN, the ACL is attached, but smart logging does not take affect. If you configure logging on an ACL attached to a Layer 2 port, the logging keyword is ignored.

How to Configure System Message Logs and Smart Logs

Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **logging buffered** *[size]*
3. **logging host**
4. **logging file flash:** *filename* *[max-file-size [min-file-size]]* *[severity-level-number | type]*
5. **end**
6. **terminal monitor**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	<p>logging buffered <i>[size]</i></p> <p>Example:</p> <pre>Device(config)# logging buffered 8192</pre>	<p>Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the active switch. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes.</p> <p>If a standalone switch or the active switch fails, the log file is lost unless you previously saved it to flash memory. See Step 4.</p> <p>Note Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should <i>not</i> be set to this amount.</p>
Step 3	<p>logging <i>host</i></p> <p>Example:</p> <pre>Device(config)# logging 125.1.1.100</pre>	<p>Logs messages to a UNIX syslog server host.</p> <p><i>host</i> specifies the name or IP address of the host to be used as the syslog server.</p> <p>To build a list of syslog servers that receive logging messages, enter this command more than once.</p>
Step 4	<p>logging file flash: <i>filename</i> [<i>max-file-size</i> [<i>min-file-size</i>]] [<i>severity-level-number</i> <i>type</i>]</p> <p>Example:</p> <pre>Device(config)# logging file flash:log_msg.txt 40960 4096 3</pre>	<p>Stores log messages in a file in flash memory on a standalone switch or, in the case of a switch stack, on the active switch.</p> <ul style="list-style-type: none"> • <i>filename</i>—Enters the log message filename. • (Optional) max-file-size —Specifies the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes. • (Optional) <i>min-file-size</i>—Specifies the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes. • (Optional) <i>severity-level-number</i> <i>type</i>—Specifies either the logging severity level or the logging type. The severity range is 0 to 7.
Step 5	<p>end</p> <p>Example:</p>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# end	
Step 6	terminal monitor Example: Device# terminal monitor	Logs messages to a nonconsole terminal during the current session. Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.

Synchronizing Log Messages

You can synchronize unsolicited messages and **debug** privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and **debug** command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **line** [**console** | **vty**] *line-number* [*ending-line-number*]
3. **logging synchronous** [**level** [*severity-level* | **all**] | **limit** *number-of-buffers*]
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	line [console vty] <i>line-number</i> [<i>ending-line-number</i>] Example: Device(config)# line console	Specifies the line to be configured for synchronous logging of messages. <ul style="list-style-type: none"> • console —Specifies configurations that occur through the switch console port or the Ethernet management port.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • line vty <i>line-number</i>—Specifies which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15. <p>You can change the setting of all 16 vty lines at once by entering:</p> <pre>line vty 0 15</pre> <p>You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:</p> <pre>line vty 2</pre> <p>When you enter this command, the mode changes to line configuration.</p>
Step 3	<p>logging synchronous [level [<i>severity-level</i> all] limit <i>number-of-buffers</i>]</p> <p>Example:</p> <pre>Device(config)# logging synchronous level 3 limit 1000</pre>	<p>Enables synchronous logging of messages.</p> <ul style="list-style-type: none"> • (Optional) level <i>severity-level</i>—Specifies the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2. • (Optional) level all—Specifies that all messages are printed asynchronously regardless of the severity level. • (Optional) limit <i>number-of-buffers</i>—Specifies the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>

Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The **logging synchronous** global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press **Return**.

To reenable message logging after it has been disabled, use the **logging on** global configuration command.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **no logging console**
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	no logging console Example: Device(config)# no logging console	Disables message logging.
Step 3	end Example: Device(config)# end	Returns to privileged EXEC mode.

Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. Use one of these commands:
 - **service timestamps log uptime**
 - **service timestamps log datetime[msec | localtime | show-timezone]**
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	Use one of these commands: <ul style="list-style-type: none"> • service timestamps log uptime • service timestamps log datetime[msec localtime show-timezone] Example: Device(config)# <code>service timestamps log uptime</code> or Device(config)# <code>service timestamps log datetime</code>	Enables log time stamps. <ul style="list-style-type: none"> • log uptime—Enables time stamps on log messages, showing the time since the system was rebooted. • log datetime—Enables time stamps on log messages. Depending on the options selected, the time stamp can include the date, time in milliseconds relative to the local time zone, and the time zone name.
Step 3	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.

Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed.

This task is optional.

SUMMARY STEPS

1. `configure terminal`
2. `service sequence-numbers`
3. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 2	service sequence-numbers Example: Device(config) # service sequence-numbers	Enables sequence numbers.
Step 3	end Example: Device(config) # end	Returns to privileged EXEC mode.

Defining the Message Severity Level

Limit messages displayed to the selected device by specifying the severity level of the message.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **logging console** *level*
3. **logging monitor** *level*
4. **logging trap** *level*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	logging console <i>level</i> Example: Device(config) # logging console 3	Limits messages logged to the console. By default, the console receives debugging messages and numerically lower levels.
Step 3	logging monitor <i>level</i> Example: Device(config) # logging monitor 3	Limits messages logged to the terminal lines. By default, the terminal receives debugging messages and numerically lower levels.

	Command or Action	Purpose
Step 4	logging trap <i>level</i> Example: Device(config)# logging trap 3	Limits messages logged to the syslog servers. By default, syslog servers receive informational messages and numerically lower levels.
Step 5	end Example: Device(config)# end	Returns to privileged EXEC mode.

Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **logging history *level***
3. **logging history size *number***
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	logging history <i>level</i> Example: Device(config)# logging history 3	Changes the default level of syslog messages stored in the history file and sent to the SNMP server. By default, warnings , errors , critical , alerts , and emergencies messages are sent.
Step 3	logging history size <i>number</i> Example: Device(config)# logging history size 200	Specifies the number of syslog messages that can be stored in the history table. The default is to store one message. The range is 0 to 500 messages.

	Command or Action	Purpose
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.

Logging Messages to a UNIX Syslog Daemon

This task is optional.

Note Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX **man syslogd** command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

Before you begin

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

SUMMARY STEPS

1. Add a line to the file `/etc/syslog.conf`.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Add a line to the file <code>/etc/syslog.conf</code> . Example: <pre>local7.debug /usr/adm/logs/cisco.log</pre>	<ul style="list-style-type: none"> • local7—Specifies the logging facility. • debug—Specifies the syslog level. The file must already exist, and the syslog daemon must have permission to write to it.
Step 2	Enter these commands at the UNIX shell prompt. Example: <pre>\$ touch /var/log/cisco.log \$ chmod 666 /var/log/cisco.log</pre>	Creates the log file. The syslog daemon sends messages at this level or at a more severe level to this file.
Step 3	Make sure the syslog daemon reads the new changes. Example:	For more information, see the man syslog.conf and man syslogd commands on your UNIX system.

	Command or Action	Purpose
	<code>\$ kill -HUP `cat /etc/syslog.pid`</code>	

Enabling Smart Logging

SUMMARY STEPS

1. configure terminal
2. logging smartlog
3. logging smartlog exporter *exporter_name*
4. logging packet capture size *packet_size*
5. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	logging smartlog Example: Device(config)# <code>logging smartlog</code>	Turns on the smart logging feature.
Step 3	logging smartlog exporter <i>exporter_name</i> Example: Device(config)# <code>logging smartlog exporter export-file</code>	Identifies the smart log exporter. You must have already configured the exporter by using the NetFlow CLI. If the exporter name does not exist, you receive an error message. By default, the switch sends data to the collector every 60 seconds.
Step 4	logging packet capture size <i>packet_size</i> Example: Device(config)# <code>logging packet capture size 128</code>	(Optional) Configures the size of the packet to be sent to the exporter. The range is from 64 to 1024 bytes in 4-byte increments. The default size is 64 bytes. Note Increasing the packet capture size reduces the number of flow records per packet.
Step 5	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.

Enabling Smart Logging for DHCP Snooping Violations

DHCP snooping intercepts and inspects DHCP packets entering untrusted ports and either forwards or drops the packets. You can enable DHCP snooping smart logging to send the contents of dropped packets to the NetFlow collector.

SUMMARY STEPS

1. **configure terminal**
2. **ip dhcp snooping vlan** {*vlan-id* | *vlan-range*} **smartlog**
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	ip dhcp snooping vlan { <i>vlan-id</i> <i>vlan-range</i> } smartlog Example: Device(config)# ip dhcp snooping vlan 5-8 smartlog	Specifies a VLAN ID or a range of VLANs on which to enable DHCP snooping smart logging.
Step 3	end Example: Device(config)# end	Returns to privileged EXEC mode.

Enabling Smart Logging for Dynamic ARP Inspection Violations

Dynamic ARP inspection intercepts ARP packets on untrusted ports and validates them before forwarding. The functionality is similar to DHCP snooping but for ARP packets. You can configure dynamic ARP inspection logging by using the **ip arp inspection log-buffer** global configuration command. By default, all dropped packets are logged. You can also configure the switch to apply smart logging to the same packets that are being logged, sending the packet contents packet to the Cisco NetFlow collector.

SUMMARY STEPS

1. **configure terminal**
2. **ip arp inspection smartlog**
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	ip arp inspection smartlog Example: Device(config)# <code>ip arp inspection smartlog</code>	Specifies that whatever packets are currently being logged (the default is all dropped packets) are also smart-logged.
Step 3	end Example: Device(config)# <code>end</code>	Returns to privileged EXEC mode.

Enabling Smart Logging for IP Source Guard Violations

IP source guard is a security feature related to DHCP snooping. You can use IP source guard to filter traffic based on the IP source address or the MAC address. All IP packets with a source address other than the specified address or addresses learned through DHCP snooping are denied. You can enable IP source guard smart logging to send the contents of the denied packets to the NetFlow collector.

SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `ip verify source smartlog`
4. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface interface-id Example: Device(config)# <code>interface GigabitEthernet1/0/1</code>	Specifies an interface and enters interface configuration mode.

	Command or Action	Purpose
Step 3	ip verify source smartlog Example: <pre>Device(config-if)# ip verify source smartlog</pre>	Enables IP source guard smart logging for all packets that are denied by IP source guard.
Step 4	end Example: <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.

Monitoring and Maintaining System Message Logs and Smart Logs

Monitoring Configuration Archive Logs

Command	Purpose
show archive log config { all number [<i>end-number</i>] user <i>username</i> [session number] <i>number</i> [<i>end-number</i>] statistics } [provisioning]	Displays the entire configuration log or the log for specified parameters.

Monitoring Smart Logging

Command	Purpose
show logging smartlog	Displays smart logging entries.
show ip arp inspection	Displays the IP ARP smart logging entries.
show ip verify source	Displays IP source guard smart logging entries. The output shows whether or not smart logging is enabled on the interface.

Configuration Examples for System Message Logs and Smart Logs

Example: Stacking System Message

This example shows a partial switch system message for active stack and a stack member (hostname *Switch-2*):

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channell, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet1/0/1, changed
state to down 2
*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar  1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

00:00:46: %LINK-3-UPDOWN: Interface Port-channell, changed state to up (Switch-2)
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet2/0/1, changed state to up (Switch-2)
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet2/0/2, changed state to up (Switch-2)
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
(Switch-2)
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet2/0/1, changed
state to down 2 (Switch-2)
```

Example: Switch System Message

This example shows a partial switch system message on a switch:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channell, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state
to down 2
*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar  1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

Example: Enabling Smart Logging

You add the smart log configuration option when you create the permit and deny conditions for an ACL.

This example shows how to enable smart logging on a numbered access list:

```
Device(config)# access-list 199 permit ip any any smartlog
```

This example shows how to enable smart logging on a named access list:

```
Device(config)# ip access-list extended test1
Device(config-ext-nacl)# deny ip host 10.1.1.3 any smartlog
```

Examples: Displaying Service Timestamps Log

This example shows part of a logging display with the **service timestamps log datetime** global configuration command enabled:

```
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
(Switch-2)
```

This example shows part of a logging display with the **service timestamps log uptime** global configuration command enabled:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up (Switch-2)
```

This example shows part of a logging display with the sequence numbers enabled.

```
000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)
```

CHAPTER 96

Configuring Online Diagnostics

- [Information About Configuring Online Diagnostics, on page 1927](#)
- [How to Configure Online Diagnostics, on page 1928](#)
- [Monitoring and Maintaining Online Diagnostics, on page 1932](#)
- [Configuration Examples for Online Diagnostic Tests, on page 1933](#)
- [Additional References for Online Diagnostics, on page 1936](#)
- [Feature History and Information for Configuring Online Diagnostics, on page 1937](#)

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the Device while the Device is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints

Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the Device is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the Device or switch stack and the diagnostic tests that have already run.

How to Configure Online Diagnostics

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the **diagnostic start** privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

SUMMARY STEPS

1. **diagnostic start switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all** | **basic** | **non-disruptive** }

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>diagnostic start switch <i>number</i> test {<i>name</i> <i>test-id</i> <i>test-id-range</i> all basic non-disruptive }</p> <p>Example:</p> <pre>Device# diagnostic start switch 2 test basic</pre>	<p>Starts the diagnostic tests.</p> <p>The switch <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 8.</p> <p>You can specify the tests by using one of these options:</p> <ul style="list-style-type: none"> • <i>name</i>—Enters the name of the test. • <i>test-id</i>—Enters the ID number of the test. • <i>test-id-range</i>—Enters the range of test IDs by using integers separated by a comma and a hyphen. • all—Starts all of the tests. • basic— Starts the basic test suite. • non-disruptive—Starts the non-disruptive test suite.

Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a switch. Use the **no** form of this command to remove the scheduling.

SUMMARY STEPS

1. **configure terminal**

2. **diagnostic schedule switch** *number test* {*name* | *test-id* | *test-id-range* | **all** | **basic** | **non-disruptive** } {**daily** | **on** *mm dd yyyy hh:mm* | **weekly** *day-of-week hh:mm*}

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	<p>diagnostic schedule switch <i>number test</i> {<i>name</i> <i>test-id</i> <i>test-id-range</i> all basic non-disruptive } {daily on <i>mm dd yyyy hh:mm</i> weekly <i>day-of-week hh:mm</i>}</p> <p>Example:</p> <pre>Device(config)# diagnostic schedule switch 1 test 1-5 on July 3 2013 23:10</pre>	<p>Schedules on-demand diagnostic tests for a specific day and time.</p> <p>The switch <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 8.</p> <p>When specifying the tests to be scheduled, use these options:</p> <ul style="list-style-type: none"> • <i>name</i>—Name of the test that appears in the show diagnostic content command output. • <i>test-id</i>—ID number of the test that appears in the show diagnostic content command output. • <i>test-id-range</i>—ID numbers of the tests that appear in the show diagnostic content command output. • all—All test IDs. • basic—Starts the basic on-demand diagnostic tests. • non-disruptive—Starts the non-disruptive test suite. <p>You can schedule the tests as follows:</p> <ul style="list-style-type: none"> • Daily—Use the daily <i>hh:mm</i> parameter. • Specific day and time—Use the on <i>mm dd yyyy hh:mm</i> parameter. • Weekly—Use the weekly <i>day-of-week hh:mm</i> parameter.

Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a Device while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the Device to generate a syslog message because of a test failure, and enable a specific test.

Use the **no** form of this command to disable testing.

By default, health monitoring is disabled, but the Device generates a syslog message when a test fails.

Follow these steps to configure and enable the health-monitoring diagnostic tests:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **diagnostic monitor interval switch** *number test* {*name* | *test-id* | *test-id-range* | **all**} *hh:mm:ss milliseconds day*
4. **diagnostic monitor syslog**
5. **diagnostic monitor threshold switch** *number number test* {*name* | *test-id* | *test-id-range* | **all**} **failure count** *count*
6. **diagnostic monitor switch** *number test* {*name* | *test-id* | *test-id-range* | **all**}
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	diagnostic monitor interval switch <i>number test</i> { <i>name</i> <i>test-id</i> <i>test-id-range</i> all } <i>hh:mm:ss milliseconds day</i> Example: Device(config)# diagnostic monitor interval switch 2 test 1 12:30:00 750 5	Configures the health-monitoring interval of the specified tests. The switch <i>number</i> keyword is supported only on stacking switches. When specifying the tests, use one of these parameters: <ul style="list-style-type: none"> • <i>name</i>—Name of the test that appears in the show diagnostic content command output. • <i>test-id</i>—ID number of the test that appears in the show diagnostic content command output. • <i>test-id-range</i>—ID numbers of the tests that appear in the show diagnostic content command output. • all—All of the diagnostic tests. When specifying the interval, set these parameters:

	Command or Action	Purpose
		<ul style="list-style-type: none"> • <i>hh:mm:ss</i>—Monitoring interval in hours, minutes, and seconds. The range for <i>hh</i> is 0 to 24, and the range for <i>mm</i> and <i>ss</i> is 0 to 60. • <i>milliseconds</i>—Monitoring interval in milliseconds (ms). The range is from 0 to 999. • <i>day</i>—Monitoring interval in the number of days. The range is from 0 to 20.
Step 4	diagnostic monitor syslog Example: <pre>Device(config)# diagnostic monitor syslog</pre>	(Optional) Configures the switch to generate a syslog message when a health-monitoring test fails.
Step 5	diagnostic monitor threshold switch <i>number number test {name test-id test-id-range all} failure count count</i> Example: <pre>Device(config)# diagnostic monitor threshold switch 2 test 1 failure count 20</pre>	(Optional) Sets the failure threshold for the health-monitoring tests. The switch <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 8. When specifying the tests, use one of these parameters: <ul style="list-style-type: none"> • <i>name</i>—Name of the test that appears in the show diagnostic content command output. • <i>test-id</i>—ID number of the test that appears in the show diagnostic content command output. • <i>test-id-range</i>—ID numbers of the tests that appear in the show diagnostic content command output. • all—All of the diagnostic tests. The range for the failure threshold <i>count</i> is 0 to 99.
Step 6	diagnostic monitor switch <i>number test {name test-id test-id-range all}</i> Example: <pre>Device(config)# diagnostic monitor switch 2 test 1</pre>	Enables the specified health-monitoring tests. The switch <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 8. When specifying the tests, use one of these parameters: <ul style="list-style-type: none"> • <i>name</i>—Name of the test that appears in the show diagnostic content command output. • <i>test-id</i>—ID number of the test that appears in the show diagnostic content command output. • <i>test-id-range</i>—ID numbers of the tests that appear in the show diagnostic content command output. • all—All of the diagnostic tests.

	Command or Action	Purpose
Step 7	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 8	show running-config Example: Device# show running-config	Verifies your entries.
Step 9	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

What to do next

Use the **no diagnostic monitor interval test***test-id | test-id-range* } global configuration command to change the interval to the default value or to zero. Use the **no diagnostic monitor syslog** command to disable generation of syslog messages when a health-monitoring test fails. Use the **diagnostic monitor threshold test***test-id | test-id-range* }**failure count** command to remove the failure threshold.

Monitoring and Maintaining Online Diagnostics

Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the Device or Device stack and check the test results by using the privileged EXEC **show** commands in this table:

Table 185: Commands for Diagnostic Test Configuration and Results

Command	Purpose
show diagnostic content switch [<i>number</i> all]	Displays the online diagnostics configured for a switch.
show diagnostic status	Displays the currently running diagnostic tests.
show diagnostic result switch [<i>number</i> all] [detail test { <i>name</i> <i>test-id</i> <i>test-id-range</i> all } [detail]]	Displays the online diagnostics test results.
show diagnostic switch [<i>number</i> all] [detail]	Displays the online diagnostics test results.
show diagnostic schedule switch [<i>number</i> all]	Displays the online diagnostics test schedule.

Command	Purpose
<code>show diagnostic post</code>	Displays the POST results. (The output is the same as the <code>show post</code> command output.)

Configuration Examples for Online Diagnostic Tests

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

SUMMARY STEPS

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | non-disruptive }`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><code>diagnostic start switch number test {name test-id test-id-range all basic non-disruptive }</code></p> <p>Example:</p> <pre>Device# diagnostic start switch 2 test basic</pre>	<p>Starts the diagnostic tests.</p> <p>The <code>switch number</code> keyword is supported only on stacking switches. The range is from 1 to 8.</p> <p>You can specify the tests by using one of these options:</p> <ul style="list-style-type: none"> • <code>name</code>—Enters the name of the test. • <code>test-id</code>—Enters the ID number of the test. • <code>test-id-range</code>—Enters the range of test IDs by using integers separated by a comma and a hyphen. • <code>all</code>—Starts all of the tests. • <code>basic</code>— Starts the basic test suite. • <code>non-disruptive</code>—Starts the non-disruptive test suite.

Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

```
Device(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
Device(config)# diagnostic monitor interval switch 1 test TestPortAsicStackPortLoopback
```

Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:

```
Device(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25
```

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

```
Device(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30
```

Displaying Online Diagnostics: Examples

This example shows how to display the online diagnostic detailed information on a specific switch:

```
Device# show diagnostic switch 1 detail
```

```
Switch 1: SerialNo :
```

```
Overall Diagnostic Result for Switch 1 : UNTESTED
```

```
Test results: (. = Pass, F = Fail, U = Untested)
```

```
1) TestPortAsicStackPortLoopback ---> U
```

```
Error code -----> 3 (DIAG_SKIPPED)
Total run count -----> 0
Last test testing type -----> n/a
Last test execution time ----> n/a
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> n/a
Total failure count -----> 0
Consecutive failure count ---> 0
```

```
2) TestPortAsicLoopback -----> U
```

```
Error code -----> 3 (DIAG_SKIPPED)
Total run count -----> 0
Last test testing type -----> n/a
Last test execution time ----> n/a
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> n/a
Total failure count -----> 0
Consecutive failure count ---> 0
```

```
3) TestPortAsicCam -----> U
```

```
Error code -----> 3 (DIAG_SKIPPED)
Total run count -----> 0
Last test testing type -----> n/a
Last test execution time ----> n/a
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> n/a
```

```

Total failure count -----> 0
Consecutive failure count ---> 0

-----

4) TestPortAsicMem -----> U

Error code -----> 3 (DIAG_SKIPPED)
Total run count -----> 0
Last test testing type -----> n/a
Last test execution time ----> n/a
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> n/a
Total failure count -----> 0
Consecutive failure count ---> 0

-----

5) TestInlinePwrCtrlr -----> U

Error code -----> 3 (DIAG_SKIPPED)
Total run count -----> 0
Last test testing type -----> n/a
Last test execution time ----> n/a
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> n/a
Total failure count -----> 0
Consecutive failure count ---> 0

```

This example shows how to display the online diagnostics that are configured on a specific switch:

```
Device# show diagnostic content switch 3
```

```

Switch 1:
Diagnostics test suite attributes:
  B/* - Basic ondemand test / NA
  P/V/* - Per port test / Per device test / NA
  D/N/* - Disruptive test / Non-disruptive test / NA
  S/* - Only applicable to standby unit / NA
  X/* - Not a health monitoring test / NA
  F/* - Fixed monitoring interval test / NA
  E/* - Always enabled monitoring test / NA
  A/I - Monitoring is active / Monitoring is inactive
  R/* - Switch will reload after test list completion / NA
  P/* - will partition stack / NA

```

ID	Test Name	Attributes	Test Interval day hh:mm:ss.ms	Thre- shold
1)	TestPortAsicStackPortLoopback	---> B*N***I**	not configured	n/a
2)	TestPortAsicLoopback	-----> B*D*X**IR*	not configured	n/a
3)	TestPortAsicCam	-----> B*D*X**IR*	not configured	n/a
4)	TestPortAsicRingLoopback	-----> B*D*X**IR*	not configured	n/a
5)	TestMicRingLoopback	-----> B*D*X**IR*	not configured	n/a
6)	TestPortAsicMem	-----> B*D*X**IR*	not configured	n/a

This example shows how to display the online diagnostic results for a switch:

```

Device# show diagnostic result

Switch 1: SerialNo :
Overall diagnostic result: PASS
Test results: (. = Pass, F = Fail, U = Untested)
1) TestPortAsicStackPortLoopback ---> .
2) TestPortAsicLoopback -----> .
3) TestPortAsicCam -----> .
4) TestPortAsicRingLoopback -----> .
5) TestMicRingLoopback -----> .
6) TestPortAsicMem -----> .

```

This example shows how to display the online diagnostic test status:

```

Device# show diagnostic status

<BU> - Bootup Diagnostics, <HM> - Health Monitoring Diagnostics,
<OD> - OnDemand Diagnostics, <SCH> - Scheduled Diagnostics
=====
Card   Description                               Current Running Test           Run by
-----
1      N/A                                          N/A                             N/A

Cisco IOS Release 15.0(2)EX1	This feature was introduced.

CHAPTER 97

Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Lost or Forgotten Password on a Device

The default configuration for the device allows an end user with physical access to the device to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the device.

Note On these devices, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.

Note You cannot recover encryption password key, when Cisco WLC configuration is copied from one Cisco WLC to another (in case of an RMA).

Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the *Catalyst 2960-XR Switch Interface and Hardware Component Configuration Guide*.

Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE Device port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the **shutdown** interface configuration command, and then enter the **no shutdown** interface command. You can also configure automatic recovery on the Device to recover from the error-disabled state.

On a Device, the **errdisable recovery cause loopback** and the **errdisable recovery interval seconds** global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.

Monitoring PoE Port Status

- **show controllers power inline** privileged EXEC command
- **show power inline** EXEC command
- **debug ilpower** privileged EXEC command

Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the **power inline never** interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the **shutdown** and the **no shutdown** interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the **power inline never** command.

Ping

The Device supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- Normal response—The normal response (*hostname is alive*) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a *no-answer* message is returned.
- Unknown host—If the host does not exist, an *unknown host* message is returned.
- Destination unreachable—If the default gateway cannot reach the specified network, a *destination-unreachable* message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a *network or host unreachable* message is returned.

Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the Device in the path. When the Device detects a device in the path that does not support Layer 2 traceroute, the Device continues to send Layer 2 trace queries and lets them time out.

The Device can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

Layer 2 Traceroute Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.
If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.
- A Device is reachable from another Device when you can test connectivity by using the **ping** privileged EXEC command. All Device in the physical path must be reachable from each other.
- The maximum number of hops identified in the path is ten.
- You can enter the **traceroute mac** or the **traceroute mac ip** privileged EXEC command on a Device that is not in the physical path from the source device to the destination device. All Device in the path must be reachable from this switch.
- The **traceroute mac** command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.
- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.
- The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the Device uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.
 - If an ARP entry exists for the specified IP address, the Device uses the associated MAC address and identifies the physical path.
 - If an ARP entry does not exist, the Device sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.
- When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.
- This feature is not supported in Token Ring VLANs.

IP Traceroute

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your Device can participate as the source or destination of the **traceroute** privileged EXEC command and might or might not appear as a hop in the **traceroute** command output. If the Device is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate Device do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate Device is a multilayer Device that is routing a particular packet, this Device shows up as a hop in the traceroute output.

The **traceroute** privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP *port-unreachable*

error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

Time Domain Reflector Guidelines

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported only on 10/100/1000 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.
- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a Device
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Device reports accurate information in these situations:

- The cable for the gigabit link is a solid-core cable.
- The open-ended cable is not terminated.

When you run TDR, the Device does not report accurate information in these situations:

- The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
- The link is a 10-megabit or a 100-megabit link.
- The cable is a stranded cable.
- The link partner is a Cisco IP Phone.
- The link partner is not IEEE 802.3 compliant.

Debug Commands

Caution Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

All **debug** commands are entered in privileged EXEC mode, and most **debug** commands take no arguments.

Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the Device. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot Device problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the Device and small form-factor pluggable (SFP) modules. The Device stores this information in the flash memory:

- CLI commands—Record of the OBFL CLI commands that are entered on a standalone Device or a switch stack member.
- Environment data—Unique device identifier (UDI) information for a standalone Device or a switch stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
- Message—Record of the hardware-related system messages generated by a standalone Device or a switch stack member.
- Power over Ethernet (PoE)—Record of the power consumption of PoE ports on a standalone Device or a switch stack member.
- Temperature—Temperature of a standalone Device or a switch stack member.
- Uptime data—Time when a standalone Device or a switch stack member starts, the reason the Device restarts, and the length of time the Device has been running since it last restarted.
- Voltage—System voltages of a standalone Device or a switch stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP).

When the Device is running, you can retrieve the OBFL data by using the **show logging onboard** privileged EXEC commands. If the Device fails, contact your Cisco technical support representative to find out how to retrieve the data.

When an OBFL-enabled Device is restarted, there is a 10-minute delay before logging of new data begins.

Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:

Note You may see increased system memory usage when Cisco Catalyst 4500E Supervisor Engine 8-E is used in wireless mode.

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
- DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

Layer 3 switches:

- Dropped packets or increased latency for packets routed in software
- BGP or OSPF routing topology changes
- HSRP flapping

How to Troubleshoot the Software Configuration

Recovering from a Software Failure

Switch software can be corrupted during an upgrade by downloading the wrong file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

This procedure uses the Xmodem Protocol to recover from a corrupt or wrong image file. There are many software packages that support the Xmodem Protocol, and this procedure is largely dependent on the emulation software that you are using.

This recovery procedure requires that you have physical access to the switch.

Step 1 From your PC, download the software image tar file (*image_filename.tar*) from Cisco.com. The Cisco IOS image is stored as a bin file in a directory in the tar file. For information about locating the software image files on Cisco.com, see the release notes.

Step 2 Extract the bin file from the tar file. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using UNIX, follow these steps:

- a) Display the contents of the tar file by using the **tar -tvf <image_filename.tar>** UNIX command.

Example:

```
unix-1% tar -tvf image_filename.tar
```

- b) Locate the bin file, and extract it by using the `tar -xvf <image_filename.tar> <image_filename.bin>` UNIX command.

Example:

```
unix-1% tar -xvf image_filename.tar image_filename.bin
x c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin, 2928176 bytes, 5720
tape blocks
```

- c) Verify that the bin file was extracted by using the `ls -l <image_filename.bin>` UNIX command.

Example:

```
unix-1% ls -l image_filename.bin
-rw-r--r--  1 boba      2928176 Apr 21 12:01
c2960x-universalk9-mz.150-2.0.66.UCP/c2960x-universalk9-mz.150-2.0.66.UCP.bin
```

- Step 3** Connect your PC with terminal-emulation software supporting the Xmodem Protocol to the switch console port.
- Step 4** Set the line speed on the emulation software to 9600 baud.
- Step 5** Unplug the switch power cord.
- Step 6** Press the **Mode** button, and at the same time reconnect the power cord to the switch. You can release the Mode button a second or two after the LED above port 1 goes off. Several lines of information about the software appear along with instructions.

Example:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system

```
software#
```

```
flash_init
load_helper
boot
```

- Step 7** Initialize the flash file system.

Example:

```
switch: flash_init
```

- Step 8** If you had set the console port speed to any speed other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

- Step 9** Load any helper files.

Example:

```
switch: load_helper
```

- Step 10** Start the file transfer by using the Xmodem Protocol.

Example:

```
switch: copy xmodem: flash:image_filename.bin
```

- Step 11** After the Xmodem request appears, use the appropriate command on the terminal-emulation software to start the transfer and to copy the software image into flash memory.
- Step 12** Boot the newly downloaded Cisco IOS image.
- Example:**
- ```
switch: boot flash:image_filename.bin
```
- Step 13** Use the **archive download-sw** privileged EXEC command to download the software image to the switch or to the switch stack.
- Step 14** Use the **reload** privileged EXEC command to restart the switch and to verify that the new software image is operating properly.
- Step 15** Delete the **flash:image\_filename.bin** file from the switch.
- 

## Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

**Note** On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

---

You enable or disable password recovery by using the **service password-recovery** global configuration command.

The switch supports homogeneous stacking, but does not support mixed stacking.

---

- Step 1** Connect a terminal or PC to the switch.
- Connect a terminal or a PC with terminal-emulation software to the switch console port.
- Or
- Connect a PC to the Ethernet management port.
- Step 2** Set the line speed on the emulation software to 9600 baud.
- Step 3** On a switch, power off the switch.
- Step 4** Reconnect the power cord to the switch. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid, then release the **Mode** button.

Several lines of information about the software appear with instructions, informing you if the password recovery procedure has been disabled or not.

- If you see a message that begins with this statement:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system

proceed to the "Procedure with Password Recovery Enabled" section, and follow the steps.

- If you see a message that begins with this statement:

The password-recovery mechanism has been triggered, but is currently disabled.

proceed to the "Procedure with Password Recovery Disabled" section, and follow the steps.

**Step 5** After recovering the password, reload the switch.

On a switch:

```
Switch> reload
Proceed with reload? [confirm] y
```

---

## Procedure with Password Recovery Enabled

If the password-recovery operation is enabled, this message appears:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software:

```
flash_init
load_helper
boot
```

---

**Step 1** Initialize the flash file system.

Device: **flash\_init**

**Step 2** If you had set the console port speed to any number other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

**Step 3** Load any helper files.

Device: **load\_helper**

**Step 4** Display the contents of flash memory.

```
Device: dir: flash:
Directory of flash:
 13 drwx 192 Mar 01 2013 22:30:48
c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin
 11 -rwx 5825 Mar 01 2013 22:31:59 config.text

16128000 bytes total (10003456 bytes free)
```

**Step 5** Rename the configuration file to config.text.old

This file contains the password definition.

```
Device: rename flash: config.text flash: config.text.old
```

**Step 6** Boot up the system.

```
Device: boot
```

You are prompted to start the setup program. Enter **N** at the prompt.

```
Continue with the configuration dialog?? [yes/no]: No
```

**Step 7** At the switch prompt, enter privileged EXEC mode.

```
Device> enable
Switch#
```

**Step 8** Rename the configuration file to its original name.

```
Device# rename flash: config.text.old flash: config.text
```

**Note** Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized. Failure to follow this step can result in a lost configuration depending on how your device is set up.

**Step 9** Copy the configuration file into memory

```
Device# copy flash: config.text system: running-config
Source filename [config.text]?
Destination filename [running-config]?
```

Press **Return** in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

**Step 10** Enter global configuration mode.

```
Device# configure terminal
```

**Step 11** Change the password.

```
Device(config)# enable secret password
```

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

**Step 12** Return to privileged EXEC mode.

```
Device(config)# exit
Switch#
```

**Step 13** Write the running configuration to the startup configuration file.

```
Device# copy running-config startup-config
```

The new password is now in the startup configuration.

**Note** This procedure is likely to leave your switch virtual interface in a shutdown state. You can see which interface is in this state by entering the **show running-config** privileged EXEC command. To reenabte the interface, enter the **interface vlan *vlan-id*** global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the **no shutdown** command.

**Step 14** Boot the device with the *packages.conf* file from flash.

```
Device: boot flash:packages.conf
```

**Step 15** Reload the switch stack.

```
Device# reload
```

---

## Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

```
The password-recovery mechanism has been triggered, but
is currently disabled. Access to the boot loader prompt
through the password-recovery mechanism is disallowed at
this point. However, if you agree to let the system be
reset back to the default system configuration, access
to the boot loader prompt can still be allowed.
```

```
Would you like to reset the system back to the default configuration (y/n)?
```

---

**Caution** Returning the Device to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup Device and VLAN configuration files.

---

- If you enter **n** (no), the normal boot process continues as if the **Mode** button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

```
Press Enter to continue.....
```

- If you enter **y** (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.
- 

**Step 1** Choose to continue with password recovery and delete the existing configuration:

```
Would you like to reset the system back to the default configuration (y/n)? y
```

**Step 2** Display the contents of flash memory:

```
Device: dir flash:
```

The Device file system appears.

**Step 3** Boot up the system:

```
Device: boot
```

You are prompted to start the setup program. To continue with password recovery, enter **N** at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

**Step 4** At the Device prompt, enter privileged EXEC mode:

```
Device> enable
```

**Step 5** Enter global configuration mode:

```
Device# configure terminal
```

**Step 6** Change the password:

```
Device(config)# enable secret password
```

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

**Step 7** Return to privileged EXEC mode:

```
Device(config)# exit
Device#
```

**Note** Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized.

**Step 8** Write the running configuration to the startup configuration file:

```
Device# copy running-config startup-config
```

The new password is now in the startup configuration.

**Step 9** You must now reconfigure the Device. If the system administrator has the backup Device and VLAN configuration files available, you should use those.

---

## Recovering from a Command Switch Failure

This section describes how to recover from a failed command switch. You can configure a redundant command switch group by using the Hot Standby Router Protocol (HSRP).

---

**Note** HSRP is the preferred method for supplying redundancy to a cluster.

---

---

**Note** This feature is introduced from Cisco IOS Release 15.2(5)E2.

---

If you have not configured a standby command switch, and your command switch loses power or fails in some other way, management contact with the member switches is lost, and you must install a new command switch. However, connectivity between switches that are still connected is not affected, and the member switches forward packets as usual. You can manage the members as standalone switches through the console port, or, if they have IP addresses, through the other management interfaces.

You can prepare for a command switch failure by assigning an IP address to a member switch or another switch that is command-capable, making a note of the command-switch password, and cabling your cluster to provide redundant connectivity between the member switches and the replacement command switch. These sections describe two solutions for replacing a failed command switch:

- Replacing a Failed Command Switch with a Cluster Member
- Replacing a Failed Command Switch with Another Switch

These recovery procedures require that you have physical access to the switch. For information on command-capable switches, see the release notes.

## Replacing a Failed Command Switch with a Cluster Member

To replace a failed command switch with a command-capable member in the same cluster, follow these steps

- 
- Step 1** Disconnect the command switch from the member switches, and physically remove it from the cluster.
- Step 2** Insert the member switch in place of the failed command switch, and duplicate its connections to the cluster members.
- Step 3** Start a CLI session on the new command switch.
- You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see *Catalyst 2960-X Switch Hardware Installation Guide*.
- Step 4** At the switch prompt, enter privileged EXEC mode.
- Example:**
- ```
Switch> enable
Switch#
```
- Step 5** Enter the password of the *failed command switch*.
- Step 6** Enter global configuration mode.
- Example:**
- ```
Switch# configure terminal
```
- Enter configuration commands, one per line. End with CNTL/Z.
- Step 7** Remove the member switch from the cluster.

**Example:**

```
Switch(config)# no cluster commander-address
```

**Step 8** Return to privileged EXEC mode.

**Example:**

```
Switch(config)# end
Switch#
```

**Step 9** Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter **setup**, and press **Return**.

**Example:**

```
Switch# setup

--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '['].
Basic management setup configures only enough connectivity
for management of the system, extended setup will ask you
to configure each interface on the system
Would you like to enter basic management setup? [yes/no]:
```

**Step 10** Enter **Y** at the first prompt.

**Example:**

The prompts in the setup program vary depending on the member switch that you selected to be the command switch:

```
Continue with configuration dialog? [yes/no]: y
```

or

```
Configuring global parameters:
```

If this prompt does not appear, enter **enable**, and press **Return**. Enter **setup**, and press **Return** to start the setup program.

**Step 11** Respond to the questions in the setup program.

When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use *-n*, where *n* is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

**Step 12** When prompted for the **enable secret** and **enable** passwords, enter the passwords of the *failed command switch* again.

**Step 13** When prompted, make sure to enable the switch as the cluster command switch, and press **Return**.

**Step 14** When prompted, assign a name to the cluster, and press **Return**.

The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

**Step 15** After the initial configuration displays, verify that the addresses are correct.

**Step 16** If the displayed information is correct, enter **Y**, and press **Return**.

If this information is not correct, enter **N**, press **Return**, and begin again at Step 9.

- Step 17** Start your browser, and enter the IP address of the new command switch.
- Step 18** From the Cluster menu, select **Add to Cluster** to display a list of candidate switches to add to the cluster.

## Replacing a Failed Command Switch with Another Switch

To replace a failed command switch with a switch that is command-capable but not part of the cluster, follow these steps:

- Step 1** Insert the new switch in place of the failed command switch, and duplicate its connections to the cluster members.
- Step 2** You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see the switch hardware installation guide.
- Step 3** At the switch prompt, enter privileged EXEC mode.

**Example:**

```
Switch> enable
Switch#
```

- Step 4** Enter the password of the *failed command switch*.
- Step 5** Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter **setup**, and press **Return**.

**Example:**

```
Switch# setup

--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.
Basic management setup configures only enough connectivity
for management of the system, extended setup will ask you
to configure each interface on the system
Would you like to enter basic management setup? [yes/no]:
```

- Step 6** Enter **Y** at the first prompt.

**Example:**

The prompts in the setup program vary depending on the member switch that you selected to be the command switch:

```
Continue with configuration dialog? [yes/no]: y
```

or

```
Configuring global parameters:
```

If this prompt does not appear, enter **enable**, and press **Return**. Enter **setup**, and press **Return** to start the setup program.

- Step 7** Respond to the questions in the setup program.

When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use *-n*, where *n* is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

**Step 8** When prompted for the **enable secret** and **enable** passwords, enter the passwords of the *failed command switch* again.

**Step 9** When prompted, make sure to enable the switch as the cluster command switch, and press **Return**.

**Step 10** When prompted, assign a name to the cluster, and press **Return**.

The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

**Step 11** After the initial configuration displays, verify that the addresses are correct.

**Step 12** If the displayed information is correct, enter **Y**, and press **Return**.

If this information is not correct, enter **N**, press **Return**, and begin again at Step 9.

**Step 13** Start your browser, and enter the IP address of the new command switch.

**Step 14** From the Cluster menu, select **Add to Cluster** to display a list of candidate switches to add to the cluster.

---

## Preventing Switch Stack Problems

To prevent switch stack problems, you should do the following:

- Make sure that the Device that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the “Switch Installation” chapter in the hardware installation guide.
- Press the **Mode** button on a stack member until the Stack mode LED is on. The last two port LEDs on the Device should be green. Depending on the Device model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.
- We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the active stack. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.
- Manually assigning stack member numbers according to the placement of the Device in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the Device have manually assigned numbers if you add, remove, or rearrange Device later. Use the **switch** *current-stack-member-number* **renumber** *new-stack-member-number* global configuration command to manually assign a stack member number.

If you replace a stack member with an identical model, the new Device functions with the exact same configuration as the replaced Device. This is also assuming the new Device is using the same member number as the replaced Device.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

1. Power off the newly created switch stacks.
2. Reconnect them to the original switch stack through their StackWise Plus ports.

### 3. Power on the Device.

For the commands that you can use to monitor the switch stack and its members, see the *Displaying Switch Stack Information* section.

## Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the Device settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize Device performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

---

**Note** If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

---

## Troubleshooting SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the Device, the Device software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

---

**Note** The security error message references the GBIC\_SECURITY facility. The Device supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

---

If you are using a non-Cisco SFP module, remove the SFP module from the Device, and replace it with a Cisco module. After inserting a Cisco SFP module, use the **errdisable recovery cause gbic-invalid** global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the Device brings the interface out of the error-disabled state and retries the operation. For more information about the **errdisable recovery** command, see the command reference for this release.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.

## Monitoring SFP Module Status

You can check the physical or operational status of an SFP module by using the **show interfaces transceiver** privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module. For more information, see the **show interfaces transceiver** command in the command reference for this release.

## Executing Ping

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all Device.

**Note** Though other protocol keywords are available with the **ping** command, they are not supported in this release.

Use this command to ping another device on the network from the Device:

| Command                                                                                | Purpose                                                                         |
|----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <p><b>ping ip</b> <i>host</i>   <i>address</i></p> <pre>Device# ping 172.20.52.3</pre> | Pings a remote host through IP or by supplying the hostname or network address. |

## Monitoring Temperature

The Device monitors the temperature conditions and uses the temperature information to control the fans.

Use the **show env temperature status** privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the Device (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the **system env temperature threshold yellow** *value* global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds. For more information, see the command reference for this release.

## Monitoring the Physical Path

You can monitor the physical path that a packet takes from a source device to a destination device by using one of these privileged EXEC commands:

Table 186: Monitoring the Physical Path

| Command                                                                                                                                               | Purpose                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>tracetroute mac [interface interface-id] {source-mac-address} [interface interface-id] {destination-mac-address} [vlan vlan-id] [detail]</code> | Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.                       |
| <code>tracetroute mac ip {source-ip-address   source-hostname} {destination-ip-address   destination-hostname} [detail]</code>                        | Displays the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname. |

## Executing IP Traceroute

**Note** Though other protocol keywords are available with the `tracetroute` privileged EXEC command, they are not supported in this release.

| Command                                                                              | Purpose                                                |
|--------------------------------------------------------------------------------------|--------------------------------------------------------|
| <code>tracetroute ip host</code><br>Device# <code>tracetroute ip 192.51.100.1</code> | Traces the path that packets take through the network. |

## Running TDR and Displaying the Results

To run TDR, enter the `test cable-diagnostics tdr interface interface-id` privileged EXEC command.

To display the results, enter the `show cable-diagnostics tdr interface interface-id` privileged EXEC command.

## Redirecting Debug and Error Message Output

By default, the network server sends the output from `debug` commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

**Note** Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see *Configuring System Message Logging*.

## Using the show platform forward Command

The output from the **show platform forward** privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the Device application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

## Configuring OBFL

**Caution** We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.

- To enable OBFL, use the **hw-switch switch [switch-number] logging onboard [message level level]** global configuration command. On switches, the range for *switch-number* is from 1 to 9. Use the **message level level** parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.
- To copy the OBFL data to the local network or a specific file system, use the **copy onboard switch switch-number url url-destination** privileged EXEC command.
- To disable OBFL, use the **no hw-switch switch [switch-number] logging onboard [message level]** global configuration command.
- To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the **clear onboard switch switch-number** privileged EXEC command.
- In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the **hw-switch switch [switch-number] logging onboard [message level level]** global configuration command.
- You can enable or disable OBFL on a member switch from the active stack.

For more information about the commands in this section, see the command reference for this release.

## Verifying Troubleshooting of the Software Configuration

### Displaying OBFL Information

*Table 187: Commands for Displaying OBFL Information*

| Command                                                                                             | Purpose                                                                                                 |
|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>show logging onboard [module[switch-number ]]clilog</b><br>Device# show logging onboard 1 clilog | Displays the OBFL CLI commands that were entered on a standalone switch or the specified stack members. |

| Command                                                                                                                     | Purpose                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show logging onboard [module[switch-number ]] environment</b><br>Device# show logging onboard 1 environment              | Displays the UDI information for a standalone switch or the specified stack members and for all the connected FRU devices: the PID, the VID, and the serial number.                                                                                                                 |
| <b>show logging onboard [module[switch-number ]] message</b><br>Device# show logging onboard 1 message                      | Displays the hardware-related messages generated by a standalone switch or the specified stack members.                                                                                                                                                                             |
| <b>show logging onboard [module[switch-number ]] poe</b><br>Device# show logging onboard 1 poe                              | Displays the power consumption of PoE ports on a standalone switch or the specified stack members.                                                                                                                                                                                  |
| <b>show logging onboard [module[switch-number ]] temperature</b><br>Device# show logging onboard 1 temperature              | Displays the temperature of a standalone switch or the specified stack members.                                                                                                                                                                                                     |
| <b>show logging onboard [module[switch-number ]] uptime</b><br>Device# show logging onboard 1 uptime                        | Displays the time when a standalone switch or the specified stack members start, the reason the standalone switch or specified stack members restart, and the length of time that the standalone switch or the specified stack members have been running since they last restarted. |
| <b>show logging onboard [module[switch-number ]] voltage</b><br>Device# show logging onboard 1 voltage                      | Displays the system voltages of a standalone switch or the specified stack members.                                                                                                                                                                                                 |
| <b>show logging onboard [module[switch-number ]] continuous</b><br>Device# show logging onboard 1 continuous                | Displays the data in the continuous file.                                                                                                                                                                                                                                           |
| <b>show logging onboard [module[switch-number ]] detail</b><br>Device# show logging onboard 1 detail                        | Displays both the continuous and summary data .                                                                                                                                                                                                                                     |
| <b>show logging onboard [module[switch-number ]] endhh:mm:ss</b><br>Device# show logging onboard 1<br>end 13:00:15 jul 2013 | Displays end time and date on a standalone switch or the specified stack members.                                                                                                                                                                                                   |

| Command                                                                                                                     | Purpose                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>show logging onboard [module[switch-number ]]</b><br><br>Device# show logging<br>onboard 1                               | Displays OBFL information about the specified switches in the system.                   |
| <b>show logging onboard [module[switch-number ]] raw</b><br><br>Device# show logging<br>onboard 1 raw                       | Displays the raw information on a standalone switch or the specified stack members.     |
| <b>show logging onboard [module[switch-number ]] start</b><br><br>Device# show logging<br>onboard 1 start 13:00:10 jul 2013 | Displays the start time and date on a standalone switch or the specified stack members. |
| <b>show logging onboard [module[switch-number ]] status</b><br><br>Device# show logging onboard 1 status                    | Displays status information on a standalone switch or the specified stack members.      |
| <b>show logging onboard [module[switch-number ]] summary</b><br><br>Device# show logging onboard 1 summary                  | Displays both the data in the summary file                                              |

For more information, see the *Catalyst 2960-X Switch System Management Command Reference*.

## Example: Verifying the Problem and Cause for High CPU Utilization

To determine if high CPU utilization is a problem, enter the **show processes cpu sorted** privileged EXEC command. Note the underlined information in the first line of the output example.

```
Device# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...
<output truncated>
```

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.

**Table 188: Troubleshooting CPU Utilization Problems**

| <b>Type of Problem</b>                                                           | <b>Cause</b>                                                                                                                    | <b>Corrective Action</b>                                                                                                                       |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Interrupt percentage value is almost as high as total CPU utilization value.     | The CPU is receiving too many packets from the network.                                                                         | Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on “Analyzing Network Traffic.” |
| Total CPU utilization is greater than 50% with minimal time spent on interrupts. | One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process. | Identify the unusual event, and troubleshoot the root cause. See the section on “Debugging Active Processes.”                                  |

# Scenarios for Troubleshooting the Software Configuration

## Scenarios to Troubleshoot Power over Ethernet (PoE)

Table 189: Power over Ethernet Troubleshooting Scenarios

| Symptom or Problem                                                                                                                                          | Possible Cause and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Only one port does not have PoE.</p> <p>Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports.</p> | <p>Verify that the powered device works on another PoE port.</p> <p>Use the <b>show run</b>, or <b>show interface status</b> user EXEC commands to verify that the port is not shut down or error-disabled.</p> <p><b>Note</b> Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional.</p> <p>Verify that <b>power inline never</b> is not configured on that interface or port.</p> <p>Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host.</p> <p><b>Note</b> Cisco powered device works only with straight cable and not with crossover one.</p> <p>Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters.</p> <p>Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on.</p> <p>If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the <b>show power inline</b> command to verify the amount of available power.</p> |

| Symptom or Problem                                                                                                                                                                                        | Possible Cause and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>No PoE on all ports or a group of ports.</p> <p>Trouble is on all switch ports.</p> <p>Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.</p> | <p>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch.</p> <p>If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch.</p> <p>Use the <b>show log</b> privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes.</p> <p>If there are no alarms, use the <b>show interface status</b> command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the <b>shut</b> and <b>no shut</b> interface configuration commands to reenables the ports.</p> <p>Use the <b>show env power</b> and <b>show power inline</b> privileged EXEC commands to review the PoE status and power budget (available PoE).</p> <p>Review the running configuration to verify that <b>power inline never</b> is not configured on the ports.</p> <p>Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the <b>shut</b> and <b>no shut</b> interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected.</p> <p>Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port.</p> <p>Use the <b>show power inline</b> privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on.</p> <p>If a powered device can power on when only one powered device is connected to the switch, enter the <b>shut</b> and <b>no shut</b> interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the <b>show interface status</b> and <b>show power inline</b> privileged EXEC commands to monitor inline power statistics and port status.</p> <p>If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</p> |

| Symptom or Problem                                                                                                                                                                                                                                                          | Possible Cause and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Cisco pre-standard powered device disconnects or resets.</p> <p>After working normally, a Cisco phone intermittently reloads or disconnects from PoE.</p>                                                                                                                | <p>Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloads.</p> <p>Verify that the cable length is not more than 100 meters from the switch port to the powered device.</p> <p>Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs.</p> <p>Notice whether any error messages appear at the same time a disconnect occurs. Use the <b>show log</b> privileged EXEC command to review error messages.</p> <p>Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.)</p> <p>Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.</p> |
| <p>IEEE 802.3af-compliant or IEEE 802.3at-compliant powered devices do not work on Cisco PoE switch.</p> <p>A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.</p> | <p>Use the <b>show power inline</b> command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it.</p> <p>Use the <b>show interface status</b> command to verify that the switch detects the connected powered device.</p> <p>Use the <b>show log</b> command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or <i>inrush</i>) current that exceeds a current-limit threshold for the port.</p>                                                                                                                                                                                                                                                                                                                                                                    |

## Configuration Examples for Troubleshooting Software

### Example: Pinging an IP Host

This example shows how to ping an IP host:

```
Device# ping 172.20.52.3
```

```
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds:
!!!!
```

```
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
Device#
```

**Table 190: Ping Output Display Characters**

| Character | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| !         | Each exclamation point means receipt of a reply.                          |
| .         | Each period means the network server timed out while waiting for a reply. |
| U         | A destination unreachable error PDU was received.                         |
| C         | A congestion experienced packet was received.                             |
| I         | User interrupted test.                                                    |
| ?         | Unknown packet type.                                                      |
| &         | Packet lifetime exceeded.                                                 |

To end a ping session, enter the escape sequence (**Ctrl-^ X** by default). Simultaneously press and release the **Ctrl**, **Shift**, and **6** keys and then press the **X** key.

## Example: Performing a Traceroute to an IP Host

This example shows how to perform a **traceroute** to an IP host:

```
Device# traceroute ip 192.0.2.10

Type escape sequence to abort.
Tracing the route to 192.0.2.10

 0 192.0.2.1 0 msec 0 msec 4 msec
 1 192.0.2.203 12 msec 8 msec 0 msec
 2 192.0.2.100 4 msec 0 msec 0 msec
 3 192.0.2.10 0 msec 4 msec 0 msec
```

The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

**Table 191: Traceroute Output Display Characters**

| Character | Description                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------|
| *         | The probe timed out.                                                                              |
| ?         | Unknown packet type.                                                                              |
| A         | Administratively unreachable. Usually, this output means that an access list is blocking traffic. |
| H         | Host unreachable.                                                                                 |
| N         | Network unreachable.                                                                              |

| Character | Description           |
|-----------|-----------------------|
| P         | Protocol unreachable. |
| Q         | Source quench.        |
| U         | Port unreachable.     |

To end a trace in progress, enter the escape sequence (**Ctrl-^ X** by default). Simultaneously press and release the **Ctrl**, **Shift**, and **6** keys and then press the **X** key.

## Example: Enabling All System Diagnostics

**Caution** Because debugging output takes priority over other network traffic, and because the **debug all** privileged EXEC command generates more output than any other **debug** command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific **debug** commands.

This command disables all-system diagnostics:

```
Device# debug all
```

The **no debug all** privileged EXEC command disables all diagnostic output. Using the **no debug all** command is a convenient way to ensure that you have not accidentally left any **debug** commands enabled.

## CHAPTER 98

# Information About Licensing

---

- [Restrictions for Configuring Licenses, on page 1969](#)
- [Information About Licensing, on page 1969](#)
- [How to Configure Add-On License Levels, on page 1972](#)
- [Configuration Examples for License Levels, on page 1974](#)
- [Feature History for Information About Licensing, on page 1976](#)

## Restrictions for Configuring Licenses

- Members of a switch stack must run the same license level (base license level and add-on). If the license level is different with a mismatched base license, the switch will not join the stack until it is changed and rebooted from the active stack. Mismatched add-on licenses are automatically synced by the active stack.
- A permanent license can be moved from one device to another. To activate a license, you must reboot your switch.
- An expired evaluation license cannot be reactivated after reboot.

## Information About Licensing

### Overview of License Levels

Software features on the switch are available with base (also known as feature sets) and add-on license levels. Their validity duration determines the license type.

- **Base license levels** for a switch are indicated by the switch model number. They are always permanent licenses, without an expiration date.
- **Add-on license levels** provide Cisco innovations on the switch, as well as on the Cisco Digital Network Architecture Center (Cisco DNA Center). Add-on licenses may be ordered only with a term license type, for a three, five, or seven year period.

## Base Licenses

The switch is shipped with an IP Lite base license. The model number is an indicator of the license level. See the last suffix in the model number. -I indicates an IP Lite model. For example, WS-C2960XR-48FPS-I has an IP Lite Image.

---

**Note** The base license level is tied to the hardware model and cannot be changed.

---

## Add-On Licenses

The DNA essentials add-on license is available.

The following guidelines apply to Add-on Licenses:

- A Reboot is not required when you configure an add-on license.
- Add-on licenses may be ordered for a three, five, or seven year period.
- You must set up Cisco SSM to receive daily e-mail alerts, to be notified of expiring add-on licenses that you want to renew.
- Only the DNA Essentials add-on license is available. (Although visible on the CLI, the DNA Advantage license level is not available).

## License States

You can also access the license information by using the **show license** command in the privileged EXEC mode.

*Table 192: Right-to-use license states*

| License State      | Description                                                                   |
|--------------------|-------------------------------------------------------------------------------|
| Active, In Use     | EULA was accepted and the license is in use after device reboot.              |
| Active, Not In Use | EULA was accepted and the switch is ready to use when the license is enabled. |
| Not Activated      | EULA was not accepted.                                                        |

The following example shows how to display the license level of the switch. The example shows LAN Base as the active license and as the one that is in use.

```
Switch# show license

Index 1
License Name : lanlite
Period left : 0 minute 0 second
License Type: Permanent
License State: Inactive
Index 2
```

```
License Name : lanbase
Period left : 0 minute 0 second
License Type : Permanent
License State : Active, In use
```

```
Index 3
License Name : dna-essentials
Period left : CSSM Managed
License Type : Subscription
License State : Active, In use
```

```
Index 4
License Name : dna-advantage
Period left : CSSM Managed
License Type : Subscription
License State : Not Activated
```

Guidelines to follow when monitoring your image based license state:

- A purchased permanent license is set to Active, In Use state only after a switch reboot.
- If more than one license was purchased, a reboot will activate the license with the highest feature set. For instance, the LAN Base license is activated and not the LAN Lite license.
- The remaining licenses purchased after switch reboot, stay in Active, Not In Use state.

## Guidelines for License Types

Licenses may be of the permanent or term type only.

- Permanent: For a license level, and without an expiration date. The basic license type for the switch is determined by the model and is always permanent.
- Term: For a license level, and for a three, five, or seven year period. Add-on licenses (DNA Essentials and DNA Advantage) may be ordered only with a term license type.

## Ordering with Smart Accounts

We recommend that you use Smart Accounts to order devices as well as licenses. Smart Accounts enable you to manage all of your software licenses for switches, routers, firewalls, access-points or tools from one centralized website. To create Smart Accounts, use the Cisco Smart Software Manager (Cisco SSM).

---

**Note** This is especially relevant to the term licenses that you order, because information about the expiry of term licenses is available only through the Cisco SSM website.

---

For more information about Cisco SSM, see: <http://www.cisco.com/c/en/us/buy/smart-accounts/software-licensing.html>

## License Activation for Switch Stacks

LAN Base models can stack with LAN Base models only.

The active stack is activated with a license from its active console. The license level for members in the stack can be activated at the same time.

To change the license level, do not disconnect a newly added stack member if the stack cables are connected. Instead, use the active console to set the new member's license level at the same license level as an active stack and reboot the new member to join the stack.

Reboot is required only for the base license; not when you configure an add-on license

## How to Configure Add-On License Levels

The following sections provide information on how to configure Add-on License Levels.

### Activating an Image Based Add-on License

The following steps can be used to activate an image based license.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `license boot level addon addon-license`
4. `license accept end user agreement force`
5. `show license right-to-use usage`

#### DETAILED STEPS

|        | Command or Action                                                                                                                               | Purpose                                                                                                                                     |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                                                 | Enables privileged EXEC mode. Enter your password if prompted.                                                                              |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                         | Enters global configuration mode.                                                                                                           |
| Step 3 | <b>license boot level addon <i>addon-license</i></b><br><b>Example:</b><br>Device(config)# <code>license boot level addon dna-essentials</code> | Specifies the add-on license level. The following options are available: <ul style="list-style-type: none"> <li>• DNA Essentials</li> </ul> |
| Step 4 | <b>license accept end user agreement force</b><br><b>Example:</b>                                                                               | Enables acceptance of the end-user license agreement (EULA).                                                                                |

|               | Command or Action                                                                                                | Purpose                                                                                                                                                                   |
|---------------|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device(config)# license accept end user agreement<br>force                                                       | <b>Note</b> To configure an add-on license EULA acceptance is not mandatory, but you will not be able to use or configure the DNAC features until you complete this step. |
| <b>Step 5</b> | <b>show license right-to-use usage</b><br><br><b>Example:</b><br>Device(config)# show license right-to-use usage | Displays detailed usage information.<br><br>Other options are available with the <b>show license right-to-use command</b> .                                               |

## Rehosting a License

To rehost a license, you have to deactivate the license from one device and then activate the same license on another device. The following steps can be used to rehost a license.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **license right-to-use deactivate [license-level] slotslot-num**
4. **license right-to-use activate [license-level]slot-num [acceptEULA]**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                          | Purpose                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Device> enable                                                                                                                     | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# configure terminal                                                                                             | Enters global configuration mode.                                       |
| <b>Step 3</b> | <b>license right-to-use deactivate [license-level] slotslot-num</b><br><br><b>Example:</b><br>Device(config)# license right-to-use deactivate<br>dna-essentials slot 1     | Deactivates the license on one device.                                  |
| <b>Step 4</b> | <b>license right-to-use activate [license-level]slot-num [acceptEULA]</b><br><br><b>Example:</b><br>Device(config)# license right-to-use activate<br>dna-essentials slot 2 | Activates the license on another device.                                |

## Monitoring Licenses

Use the following commands in the privilege EXEC mode to monitor license information:

| Command                                                     | Purpose                                                                         |
|-------------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>show license right-to-use default</b>                    | Displays the default license information.                                       |
| <b>show license right-to-use detail</b>                     | Displays detailed information of all the licenses in the switch stack.          |
| <b>show license right-to-use eula</b>                       | Displays the end user license agreement.                                        |
| <b>show license right-to-use slot slot-number</b>           | Displays the license information for a specific slot in a switch stack.         |
| <b>show license right-to-use summary</b>                    | Displays a summary of the license information on the entire switch stack.       |
| <b>show license right-to-use usage [ slot slot-number ]</b> | Displays detailed information about usage for all licenses in the switch stack. |

## Configuration Examples for License Levels

The following sections provide examples for configuring license levels.

### Reference

.

### Example: Displaying the detailed license information

The following examples shows how to display the detailed information of all the licenses in a stack using the **show license right-to-use detail** command.

```
Device# show license right-to-use detail
Index 1
 License Name : Advanced Enterprise Services
 Period left : Lifetime
 License Type : permanent
 License State : Active, In use
Index 2
 License Name : dna-essentials
 Period left : CSSM Managed
 License Type : Subscription
 License State : Not Activated
Index 3
 License Name : dna-advantage
 Period left : CSSM Managed
 License Type : Subscription
 License State : Active, In use
```

## Example: Displaying a summary of the license information

The following examples shows how to display a summary of the license information using the **show license right-to-use summary** command.

```
Device# show license right-to-use summary
License Name Type Period left

lanlite Permanent 0 minute 0 second
lanbase Permanent 0 minute 0 second
dna-essentials Subscription CSSM Managed

```

```
License Level In Use: lanbase addon: dna-essentials
License Level on Reboot: lanbase addon: dna-essentials
```

Example: show license right-to-use usage

```
FEX-0#show license right-to-use usage
slot License Name Type In-use EULA

0 lanlite Permanent yes yes
0 lanbase Permanent yes yes
 dna-essentials Subscription yes yes
 dna-advantage Subscription no yes
```

## Example: Displaying the end user license agreement

The following example shows how to display the end user license agreement.

```
Device# show license right-to-use eula subscription
Feature name EULA Accepted

dna-essentials yes
dna-advantage no
```

```
PLEASE READ THE FOLLOWING TERMS CAREFULLY. INSTALLING THE LICENSE OR
LICENSE KEY PROVIDED FOR ANY CISCO SOFTWARE PRODUCT, PRODUCT FEATURE,
AND OR SUBSEQUENTLY PROVIDED SOFTWARE FEATURES (COLLECTIVELY, THE ?SOFTWARE?),
USING SUCH SOFTWARE, AND/OR ACTIVATION OF THE SOFTWARE COMMAND LINE INTERFACE
CONSTITUTES YOUR FULL ACCEPTANCE OF THE FOLLOWING TERMS.YOU MUST NOT PROCEED
FURTHER IF YOU ARE NOT WILLING TO BE BOUND BY ALL THE TERMS SET FORTH HEREIN.
```

## CHAPTER 99

# Embedded Event Manager Overview

Embedded Event Manager (EEM) is a distributed and customized approach to event detection and recovery offered directly in a Cisco IOS device. EEM offers the ability to monitor events and take informational, corrective, or any desired EEM action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs.

This module contains a technical overview of EEM. EEM can be used alone, or with other network management technologies to help monitor and maintain your network. Before you begin to implement EEM, it is important that you understand the information presented in this module.

- [Information About Embedded Event Manager, on page 1979](#)
- [Where to Go Next, on page 1997](#)
- [Feature Information for Embedded Event Manager 4.0 Overview, on page 1997](#)
- [Additional References, on page 1997](#)

## Information About Embedded Event Manager

### Embedded Event Manager

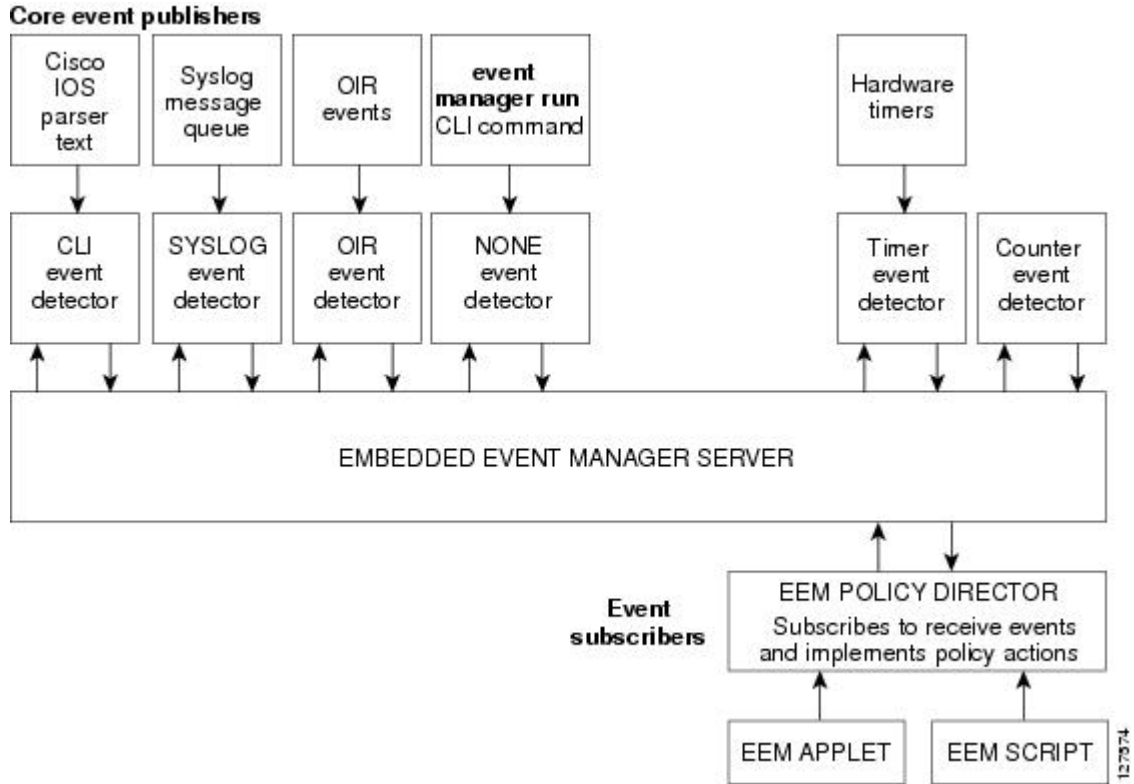

Event tracking and management has traditionally been performed by devices external to the networking device. Embedded Event Manager (EEM) has been designed to offer event management capability directly in Cisco IOS devices. The on-device, proactive event management capabilities of EEM are useful because not all event management can be done off device because some problems compromise communication between the device and the external network management device. Capturing the state of the device during such situations can be invaluable in taking immediate recovery actions and gathering information to perform root-cause analysis. Network availability is also improved if automatic recovery actions are performed without the need to fully reboot the routing device.

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs. The EEM policies that are configured using the Cisco command-line interface (CLI) then implement recovery on the basis of the current state of the system and the actions specified in the policy for the given event.

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions

to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

Figure 140: Embedded Event Manager Core Event Detectors

**Note** If your network has a higher version of EEM, that version would include the previous releases of EEM version as well.

## Embedded Event Manager 1.0

EEM 1.0 introduced the following event detectors:

- **SNMP**—The Simple Network Management Protocol (SNMP) event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.
- **Syslog**—The syslog event detector allows for screening syslog messages for a regular expression pattern match.

EEM 1.0 introduced the following actions:

- Generating prioritized syslog messages.
- Generating a Cisco Networking Services (CNS) event for upstream processing by CNS devices.

- Reloading the Cisco software.
- Switching to a secondary processor in a fully redundant hardware configuration.

## Embedded Event Manager 2.0

EEM 2.0 introduced some new features. EEM 2.0 introduced the following event detectors:

- **Application-Specific**—The application-specific event detector allows any Embedded Event Manager policy to publish an event.
- **Counter**—The counter event detector publishes an event when a named counter crosses a specified threshold.
- **Interface Counter**—The interface counter event detector publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold.
- **Timer**—The timer event detector publishes events for the following four different types of timers: absolute-time-of-day, countdown, watchdog, and CRON.
- **Watchdog System Monitor (IOSWDSysMon)**—The Cisco IOS watchdog system monitor event detector publishes an event when CPU or memory utilization for a Cisco IOS process crosses a threshold.

EEM 2.0 introduced the following actions:

- Setting or modifying a named counter.
- Publishing an application-specific event
- Generating an SNMP trap.

The ability to run a Cisco defined sample policy written using Tool Command Language (Tcl) was introduced. A sample policy was provided that could be stored in the system policy directory.

## Embedded Event Manager 2.1

EEM 2.1 introduced the following new event detectors:

- **CLI**—The CLI event detector screens command-line interface (CLI) commands for a regular expression match.
- **None**—The none event detector publishes an event when the Cisco IOS **event manager run** command executes an EEM policy.
- **OIR**—The online insertion and removal (OIR) event detector publishes an event when a particular hardware insertion or removal event occurs.

EEM 2.1 introduced the following actions:

- Executing a Cisco CLI command.
- Requesting system information when an event occurs.
- Sending a short e-mail.
- Manually running an EEM policy.

EEM 2.1 also permits multiple concurrent policies to be run using the new **event manager scheduler script** command. Support for SNMP event detector rate-based events is provided as is the ability to create policies using Tool Command Language (Tcl).

## Embedded Event Manager 2.1 (Software Modularity)

EEM 2.1 (Software Modularity) is supported on Cisco Software Modularity images. EEM 2.1 (Software Modularity) introduced the following event detectors:

- **GOLD**—The Generic Online Diagnostic (GOLD) event detector publishes an event when a GOLD failure event is detected on a specified card and subcard.
- **System Manager**—The system manager event detector generates events for Cisco IOS Software Modularity process start, normal or abnormal stop, and restart events. The events generated by the system manager allows policies to change the default behavior of the process restart.
- **Watchdog System Monitor (WDSysMon)**—The Cisco Software Modularity watchdog system monitor event detector detects infinite loops, deadlocks, and memory leaks in Cisco IOS Software Modularity processes.

EEM 2.1 for Software Modularity introduced the ability to display EEM reliability metric data for processes.

---

**Note** EEM 2.1 for Software Modularity images also supports the resource and RF event detectors introduced in EEM 2.2, but it does not support the enhanced object tracking event detector or the actions to read and set tracked objects.

---

## Embedded Event Manager 2.2

EEM 2.2 introduced some new features. EEM 2.2 introduced the following event detectors:

- **Enhanced Object Tracking**—The enhanced object tracking event detector publishes an event when the tracked object changes. Enhanced object tracking provides complete separation between the objects to be tracked and the action to be taken by a client when a tracked object changes.
- **Resource**—The resource event detector publishes an event when the Embedded Resource Manager (ERM) reports an event for the specified policy.
- **RF**—The redundancy framework (RF) event detector publishes an event when one or more RF events occur during synchronization in a dual Route Processor (RP) system. The RF event detector can also detect an event when a dual RP system continuously switches from one RP to another RP (referred to as a ping-pong situation).

EEM 2.2 introduced the following actions:

- Reading the state of a tracked object.
- Setting the state of a tracked object.

## Embedded Event Manager 2.3

EEM 2.3 is supported on the Cisco Catalyst 6500 Series switches and introduces enhancements to the Generic Online Diagnostics (GOLD) Event Detector on that product.

- The **event gold** command was enhanced with the addition of the **action-notify**, **testing-type**, **test-name**, **test-id**, **consecutive-failure**, **platform-action**, and **maxrun** keywords for improved reaction to GOLD test failures and conditions.
- The following platform-wide GOLD Event Detector information can be accessed through new read-only EEM built-in environment variables:
  - Boot-up diagnostic level
  - Card index, name, serial number
  - Port counts
  - Test counts
- The following test-specific GOLD Event Detector information can be accessed through new read-only EEM built-in environment variables (available to EEM applets only):
  - Test name, attribute, total run count
  - Test result per test, port, or device
  - Total failure count, last fail time
  - Error code
  - Occurrence of consecutive failures

These enhancements result in reduced mean time to recovery (MTTR) and higher availability through improved automation and fault detection.

## Embedded Event Manager 2.4

EEM 2.4 introduced the following event detectors:

- **SNMP Notification**—The SNMP notification event detector provides the ability to intercept SNMP trap and inform messages coming into the device. An SNMP notification event is generated when an incoming SNMP trap or inform message matches specified values or crosses specified thresholds.
- **RPC**—The remote procedure call (RPC) event detector provides the ability to invoke EEM policies from outside the device over an encrypted connection using Secure Shell (SSH). The RPC event detector uses Simple Object Access Protocol (SOAP) data encoding for exchanging XML-based messages. This event detector can be used to run EEM policies and then receive output in a SOAP XML-formatted reply.

EEM 2.4 added enhancements to the following event detectors:

- **Interface counter rate-based trigger**—This feature adds the ability for an interface event to be triggered based on a rate of change over a period of time. A rate can be specified both for the entry value and the exit value. This feature copies the rate-based functionality that currently exists for the SNMP event detector.
- **SNMP delta value**—The difference between the monitored Object Identifier (OID) value at the beginning of the monitored period and the actual OID value when the event is published will be provided in the **event reqinfo** data for both the SNMP event detector and the Interface Counter event detector.

EEM 2.4 introduced the following actions:

- Multiple event support—The ability to run multiple events was introduced, and **show event manager** commands were enhanced to show multiple events.
- Support for parameters—The *parameter* argument has been added to the **event manager run** command. A maximum of 15 parameters can be used.
- Display of Job IDs and completion status--Some of the **show event manager** commands were enhanced to display Job IDs and completion status.
- Bytecode support—Tcl 8 defines a specialized bytecode language (BCL) and includes a just-in-time compiler that translates Tcl scripts to BCL. Byte sequence is executed by a “virtual machine,” Tcl\_ExecuteByteCode(), or TEBC for short, as often as needed. Currently EEM accepts file extensions, such as \*.tcl for user policies and \*.tm for system policies. Tcl standard extension for bytecode scripts are \*.tbc. Now EEM will accept \*.tbc as valid EEM policies.
- Registration substitution enhancement—Supports replacing multiple parameters in the event registration statement lines with a single environment variable.
- Tcl package support

## Embedded Event Manager 3.0

EEM 3.0 introduced the following new event detectors:

- Custom CLI--The custom CLI event detector publishes an event to add and enhance existing CLI command syntax.
- Routing--The Routing event detector publishes an event when route entries change in the Routing Information Base (RIB).
- NetFlow-- The NetFlow event detector publishes an event when a NetFlow event is triggered.
- IP SLA--The IP SLA event detector publishes an event when an IP SLA reaction is triggered.

EEM 3.0 introduced the following features:

- Class-based scheduling--The EEM policies will be assigned a class using the **class** keyword when they are registered. EEM policies registered without a class will be assigned to the default class.
- High performance Tcl policies--Three new Tcl commands are introduced **event\_completion**, **event\_wait**, and **event\_completion\_with\_wait**.
- Interactive cli support--The synchronous applets are enhanced to support interaction with the local console (TTY). Two new IOS commands, **action gets** and **action puts**, are introduced to allow users to enter and display input directly on the console.
- Variable logic for applets--The Variable Logic for EEM Applets feature adds the ability to apply conditional logic within EEM applets. Conditional logic introduces a control structure that can change the flow of actions within applets depending on conditional expressions.
- Digital signature support--A new API performs digital signature verification for a Tcl script to check it the script is signed by Cisco before execution.
- Support authenticating e-mail servers--The **action mail** command is modified to include an optional username and password.

- SMTP IPv6 support--The keyword **sourceaddr** is added in Tcl e-mail templates to specify either an IPv6 or IPv4 address.
- SNMP library extensions--The EEM applet **action info** and Tcl **sys\_reqinfo\_snmp** commands are enhanced to include functionality for SNMP getid, inform, trap, and set-type operations.
- SNMP Notification IPv6 support--IPv6 address is supported for the source and destination IP addresses.
- CLI Library XML-PI support--Provides a programmable interface which encapsulates IOS command-line interface (CLI) show commands in XML format in a consistent way across different Cisco products. Customers using XML-PI will be able to parse IOS show command output from within Tcl scripts using well-known keywords instead of having to depend on the use of regular expression support.

## Embedded Event Manager 3.1

EEM 3.1 introduced one new event detector:

- SNMP Object--The Simple Network Management Protocol (SNMP) object trap event detector provides an extension to replace the value when an SNMP trap with the specified SNMP object ID (OID) is encountered on a specific interface or address.

EEM 3.1 added an enhancement to the following event detector:

- SNMP Notification--The SNMP notification event detector now can wait and intercept the outgoing SNMP traps and informs.

EEM 3.1 added enhancement to the following action:

- Specify facility--The **action syslog** command has been enhanced to specify syslog facility.

EEM 3.1 introduces the following features:

- Provides the ability to create a short description for the registered policy--A new **description** command has been introduced to register policies with a brief description in Cisco IOS CLI and Tcl policies. The **show event manager policy available** command and the **show event manager policy registered** command have been enhanced to add the **description** keyword to display the description of the registered applet.
- Enables EEM policies to bypass AAA authorization--The **event manager application** command has been enhanced to provide authorization and bypass keywords to disable AAA.
- Introduces CLI Library enhancements--Provides two new commands in the CLI library: **cli\_run** and **cli\_run\_interactive**.

## Embedded Event Manager 3.2

EEM 3.2 introduced the following new event detectors:

- Neighbor Discovery--Neighbor Discovery event detector provides the ability to publish a policy to respond to automatic neighbor detection when:
  - a Cisco Discovery Protocol (CDP) cache entry is added, deleted or updated.
  - a Link Layer Discovery Protocol (LLDP) cache entry is added, deleted, or updated.
  - an interface link status changes.

- an interface line status changes.
- Identity--Identity event detector generates an event when AAA authorization and authentication is successful, when failure occurs, or after normal user traffic on the port is allowed to flow.
- Mac-Address-Table--Mac-Address-Table event detector generates an event when a MAC address is learned in the MAC address table.

**Note** The Mac-Address-Table event detector is supported only on switch platforms and can be used only on Layer 2 interfaces where MAC addresses are learned. Layer 3 interfaces do not learn addresses and devices do not usually support the mac-address-table infrastructure needed to notify EEM of a learned MAC address.

EEM 3.2 also introduces new CLI commands to support the applets to work with the new event detectors.

## Embedded Event Manager 4.0

EEM 4.0 introduces the following new features:

- EEM Email Action Enhancements
  - TLS support for SMTP mail actions—The new optional **secure** keyword is added to the **action mail** CLI with **tls** and **none** keyword options. There are no updates to the corresponding Tcl Policy.
  - Custom port for SMTP mail actions—The new optional **port** keyword is added to the **action mail** CLI. In the Tcl policy, the port number can be specified by adding a line to the e-mail template.
- EEM Security Enhancements
  - Checksum-based script integrity—Where digital signature is not supported or unavailable, users can still enforce some basic integrity check on the TCL policy by using the Unix command **openssl sha1**. The new optional **checksum**, **md5**, and **sha-1** keywords have been added to the **event manager policy** command.
  - Third-party digital signature support—Requires Tcl secure mode and a trustpoint to associate with the TCL scripts in order to verify the signature.
  - Script owner identification—If a policy is successfully registered with a digital signature, the owner (or signer) of the policy can be identified by using the **show event manager policy registered** command and checking the **Dsig** keyword in the show output.
  - Registration of remote Tcl policies—The new optional **remote** keyword has been added to the **event manager policy** command.
- EEM Resource Management
  - Resource consumption throttling—The new optional **resource-limit** keyword has been added to the **event manager scheduler** command.
  - Rate limiting of triggered policies per event—The new optional **rate-limit** keyword has been added to the **event syslog** command.
- EEM Usability Enhancements
  - File operations in EEM applet actions—The new CLI **action file** has been added to allow file selection.
  - New fields are added in EEM to track statistics of queue size, dropped events, and run-time using the **show event manager statistics EXEC** command. A set of new clear commands—**clear event**

**manager detector counters** and **clear event manager server counters** —are introduced to clear the event manager queue counters.

- EEM Event Detector Enhancements
  - CLI event detector enhancement—Provides the ability to detect the session where the user enters the event cli command. Four new keywords and built-in environmental variables—**username**, **host**, **privilege**, and **tty**— are added to the **event cli** applet and event\_reqinfo array names to the **event\_register\_cli** event detector. The **show event manager detector EXEC** command has also been modified to reflect the enhancement.
  - Syslog event detector performance enhancement—Provides the option to perform string matching on specific log message fields. The four new keywords—**facility**, **mnemonic**, **sequence**, and **timestamp** keywords— are added to the **action syslog** command, **event syslog** command, and to the **event\_register\_syslog** event detector. The **show event manager detector EXEC** command has also been modified to reflect the enhancement.

## EEM Event Detectors Available by Cisco IOS Release

EEM uses software programs known as event detectors to determine when an EEM event occurs. Some event detectors are available on every Cisco IOS release, but most event detectors have been introduced in a specific release. Use the table below to determine which event detectors are available in your specific Cisco IOS release. A blank entry (--) indicates that the event detector is not available; the text “Yes” indicates that the event detector is available. The event detectors shown in the table are supported in later releases of the same Cisco IOS release train. For more details on each event detector, see the Event Detectors concept in the “Embedded Event Manager Overview” module.

**Table 193: Availability of Event Detectors by Cisco IOS Release**

| Event Detector           | 12.2(25)S | 12.3(14)T<br>12.2(18)SXF5<br>12.2(28)SB<br>12.2(33)SRA | 12.4(2)T<br>12.2(31)SB3<br>12.2(33)SRB | 12.2(18)SXF4<br>Cisco IOS Software Modularity | 12.2(33)SXH | 12.4(20)T<br>12.2(33)SXI | 12.4(22)T<br>12.2(33)SRE | 15.0(1)M<br>15.1(3)T | 15.2(3)S<br>15.2(3)SY | 15 E<br>XE 3E |

## Event Detectors

Embedded Event Manager (EEM) uses software programs known as *event detectors* to determine when an EEM event occurs. Event detectors are separate systems that provide an interface between the agent being monitored, for example Simple Network Management Protocol (SNMP), and the EEM policies where an action can be implemented. Some event detectors are available on every Cisco IOS release, but most event detectors have been introduced in a specific release. For details of which event detector is supported in each Cisco IOS release, see the EEM Event Detectors Available by Cisco IOS Release concept in the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” or the “Writing Embedded Event Manager Policies Using Tcl” modules. EEM contains the following event detectors.

### Application-Specific Event Detector

The application-specific event detector allows any Embedded Event Manager policy to publish an event. When an EEM policy publishes an event it must use an EEM subsystem number of 798 with any event type. If an existing policy is registered for subsystem 798 and a specified event type, a second policy of the same event type will trigger the first policy to run when the specified event is published.

### CLI Event Detector

The CLI event detector screens command-line interface (CLI) commands for a regular expression match. When a match is found, an event is published. The match logic is performed on the fully expanded CLI command after the command is successfully parsed and before it is executed. The CLI event detector supports three publish modes:

- Synchronous publishing of CLI events--The CLI command is not executed until the EEM policy exits, and the EEM policy can control whether the command is executed. The read/write variable, `_exit_status`, allows you to set the exit status at policy exit for policies triggered from synchronous events. If `_exit_status` is 0, the command is skipped, if `_exit_status` is 1, the command is run.
- Asynchronous publishing of CLI events--The CLI event is published, and then the CLI command is executed.
- Asynchronous publishing of CLI events with command skipping--The CLI event is published, but the CLI command is not executed.

### Counter Event Detector

The counter event detector publishes an event when a named counter crosses a specified threshold. There are two or more participants that affect counter processing. The counter event detector can modify the counter, and one or more subscribers define the criteria that cause the event to be published. After a counter event has been published, the counter monitoring logic can be reset to start monitoring the counter immediately or it can be reset when a second threshold--called an exit value--is crossed.

### Custom CLI Event Detector

The custom CLI event detector publishes an event to add and enhance existing CLI command syntax. When the special parser characters Tab, ? (question mark), and Enter are entered, the parser sends the input to the custom CLI event detector for processing. The custom CLI event detector then compares this input against registered strings to determine if this is a new or enhanced CLI command. Upon a match the custom CLI event detector takes appropriate actions, such as displaying help for the command if ? is entered, displaying the entire command if Tab is entered, or executing the command if Enter was entered. If a match does not occur, the parser regains control and processes the information as usual.

### Enhanced Object Tracking Event Detector

The enhanced object tracking (EOT) event detector publishes an event when the status of a tracked object changes. Object tracking was first introduced into the Hot Standby Router Protocol (HSRP) as a simple tracking mechanism that allowed you to track the interface line-protocol state only. If the line-protocol state of the interface went down, the HSRP priority of the device was reduced, allowing another HSRP device with a higher priority to become active.

Object tracking was enhanced to provide complete separation between the objects to be tracked and the action to be taken by a client when a tracked object changes. Thus, several clients such as HSRP, VRRP, or GLBP can register their interest with the tracking process, track the same object, and each take different action when the object changes. Each tracked object is identified by a unique number that is specified on the tracking command-line interface (CLI). Client processes use this number to track a specific object. The tracking process periodically polls the tracked objects and notes any change of value. The changes in the tracked object are communicated to interested client processes, either immediately or after a specified delay. The object values are reported as either up or down.

Enhanced object tracking is now integrated with EEM to allow EEM to report on a status change of a tracked object and to allow enhanced object tracking to track EEM objects. A new type of tracking object--a stub object--is created. The stub object can be manipulated using the existing CLI commands that already allow tracked objects to be manipulated.

### GOLD Event Detector

The GOLD event detector publishes an event when a GOLD failure event is detected on a specified card and subcard.

### Interface Counter Event Detector

The interface counter event detector publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold. A threshold can be specified as an absolute value or an incremental value. If the incremental value is set to 50, for example, an event would be published when the interface counter increases by 50.

After an interface counter event has been published, the interface counter monitoring logic is reset using two methods. The interface counter is reset either when a second threshold--called an exit value--is crossed or when an elapsed period of time occurs.

### IP SLA Event Detector

The IP SLA event detector publishes an event when an IP SLA reaction is triggered.

### NetFlow Event Detector

The NetFlow event detector publishes an event when a NetFlow event is triggered.

### None Event Detector

The none event detector publishes an event when the Cisco IOS **event manager run** CLI command executes an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. An EEM policy must be identified and registered to be permitted to run manually before the **event manager run** command will execute.

### OIR Event Detector

The online insertion and removal (OIR) event detector publishes an event when one of the following hardware insertion or removal event occurs:

- A card is removed.
- A card is inserted.

Route Processors (RPs), line cards, or feature cards can be monitored for OIR events.

### Resource Event Detector

The resource event detector publishes an event when the Embedded Resource Manager (ERM) reports an event for the specified policy. The ERM infrastructure tracks resource depletion and resource dependencies across processes and within a system to handle various error conditions. The error conditions are handled by providing an equitable sharing of resources between various applications. The ERM framework provides a communication mechanism for resource entities and allows communication between these resource entities from numerous locations. The ERM framework also helps in debugging CPU and memory-related issues. The ERM monitors system resource usage to better understand scalability needs by allowing you to configure threshold values for resources such as the CPU, buffers, and memory. The ERM event detector is the preferred method for monitoring resources in Cisco software but the ERM event detector is not supported in Software Modularity images. For more details about ERM, go to “Embedded Resource Manager” module.

### RF Event Detector

The redundancy framework (RF) event detector publishes an event when one or more RF events occur during synchronization in a dual Route Processor (RP) system. The RF event detector can also detect an event when a dual RP system continuously switches from one RP to another RP (referred to as a ping-pong situation).

### RPC Event Detector

The remote procedure call (RPC) event detector provides the ability to invoke EEM policies from outside the device over an encrypted connection using Secure Shell (SSH). The RPC event detector uses Simple Object Access Protocol (SOAP) data encoding for exchanging XML-based messages. This event detector can be used to run EEM policies and then receive output in a SOAP XML-formatted reply.

### Routing Event Detector

The routing event detector publishes an event when a route entry changes in the Routing Information Base (RIB).

### SNMP Event Detector

The SNMP event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.

### SNMP Notification Event Detector

The SNMP notification event detector provides the ability to intercept SNMP trap and inform messages coming into or going out of the device. An SNMP notification event is generated when an incoming or outgoing SNMP trap or inform message matches specified values or crosses specified thresholds. The SNMP event detector can wait and intercept the outgoing SNMP traps and informs.

### SNMP Object Event Detector

The Simple Network Management Protocol (SNMP) object trap event detector provides an extension to replace the value when an SNMP trap with the specified SNMP object ID (OID) is encountered on a specific interface or address.

### Syslog Event Detector

The syslog event detector allows for screening syslog messages for a regular expression pattern match. The selected messages can be further qualified, requiring that a specific number of occurrences be logged within a specified time. A match on a specified event criteria triggers a configured policy action.

### System Manager Event Detector

The system manager event detector generates events for Cisco IOS Software Modularity process start, normal or abnormal stop, and restart events. The events generated by the system manager allows policies to change the default behavior of the process restart.

### Timer Event Detector

The timer event detector publishes events for the following four different types of timers:

- An absolute-time-of-day timer publishes an event when a specified absolute date and time occurs.
- A countdown timer publishes an event when a timer counts down to zero.
- A watchdog timer publishes an event when a timer counts down to zero and then the timer automatically resets itself to its initial value and starts to count down again.
- A CRON timer publishes an event using a UNIX standard CRON specification to indicate when the event is to be published. A CRON timer never publishes events more than once per minute.

### Watchdog System Monitor (IOSWDSysMon) Event Detector for Cisco IOS

The Cisco IOS watchdog system monitor event detector publishes an event when one of the following occurs:

- CPU utilization for a Cisco IOS task crosses a threshold.
- Memory utilization for a Cisco IOS task crosses a threshold.

---

**Note** Cisco IOS processes are now referred to as tasks to distinguish them from Cisco IOS Software Modularity processes.

---

Two events may be monitored at the same time, and the event publishing criteria can be specified to require one event or both events to cross their specified thresholds.

### Watchdog System Monitor (WDSysMon) Event Detector for Cisco IOS Software Modularity

The Cisco IOS Software Modularity watchdog system monitor event detector detects infinite loops, deadlocks, and memory leaks in Cisco IOS Software Modularity processes.

## EEM Actions Available by Cisco IOS Release

The CLI-based corrective actions that are taken when event detectors report events enable a powerful on-device event management mechanism. Some actions are available in every Cisco IOS release, but most actions have been introduced in a specific release. Use the table below to determine which actions are available in your specific Cisco IOS release. A blank entry (--) indicates that the action is not available; the text “Yes” indicates that the action is available. The actions shown in the table are supported in later releases of the same Cisco IOS release train. For more details on each action, see the Embedded Event Manager Actions concept in the “Embedded Event Manager Overview” module.

**Table 194: Availability of Actions by Cisco IOS Release**

| Action                                | 12.2(25)S | 12.3(14)T<br>12.2(18)SXF5<br>12.2(28)SB<br>12.2(33)SRA | 12.4(2)T<br>12.2(31)SB3<br>12.2(33)SRB | 12.2(18)SXF4<br>Cisco IOS<br>Software<br>Modularity | 12.2(33)SXH | 12.4(20)T | 12.4(22)T | 15.0(1)M | 15E<br>XE 3E |
|---------------------------------------|-----------|--------------------------------------------------------|----------------------------------------|-----------------------------------------------------|-------------|-----------|-----------|----------|--------------|
| Execute a CLI command                 | --        | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Generate a CNS event                  | Yes       | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Generate a prioritized syslog message | Yes       | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Generate an SNMP trap                 | Yes       | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Manually run an EEM policy            | --        | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Publish an application-specific event | Yes       | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Read the state of a tracked object    | --        | --                                                     | Yes                                    | --                                                  |             | Yes       | Yes       | Yes      | Yes          |
| Reload the Cisco software             | Yes       | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Request system information            | --        | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Send a short e-mail                   | --        | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Set or modify a named counter         | Yes       | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |
| Set the state of a tracked object     | --        | --                                                     | Yes                                    | --                                                  |             | Yes       | Yes       | Yes      | Yes          |
| Switch to a secondary RP              | Yes       | Yes                                                    | Yes                                    | Yes                                                 | Yes         | Yes       | Yes       | Yes      | Yes          |

## Embedded Event Manager Actions

The CLI-based corrective actions that are taken when event detectors report events enable a powerful on-device event management mechanism. Some EEM actions are available on every Cisco IOS release, but most EEM actions have been introduced in a specific release. For details of which EEM action is supported in each Cisco IOS release, see the EEM Actions Available by Cisco IOS Release concept in the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” or the “Writing Embedded Event Manager Policies Using Tcl” modules. EEM supports the following actions:

- Executing a Cisco IOS command-line interface (CLI) command.
- Generating a CNS event for upstream processing by Cisco CNS devices.
- Setting or modifying a named counter.
- Switching to a secondary processor in a fully redundant hardware configuration.
- Requesting system information when an event occurs.
- Sending a short e-mail.
- Manually running an EEM policy.
- Publishing an application-specific event.
- Reloading the Cisco software.
- Generating an SNMP trap.
- Generating prioritized syslog messages.
- Reading the state of a tracked object.
- Setting the state of a tracked object.

EEM action CLI commands contain an EEM action label that is a unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric (lexicographical) key sequence using the label as the sort key. If you are using numbers as labels be aware that alphabetical sorting will sort 10.0 after 1.0, but before 2.0, and in this situation we recommend that you use numbers such as 01.0, 02.0, and so on, or use an initial letter followed by numbers.

## Embedded Event Manager Environment Variables

EEM allows environment variables to be used in EEM policies. Tool Command Language (Tcl) allows global variables to be defined that are known to all procedures within a Tcl script. EEM allows environment variables to be defined using a CLI command, the **event manager environment** command, for use within an EEM policy. All EEM environment variables are automatically assigned to Tcl global variables before a Tcl script is run. There are three different types of environment variables associated with Embedded Event Manager:

- User-defined--Defined by you if you create an environment variable in a policy that you have written.
- Cisco-defined--Defined by Cisco for a specific sample policy.
- Cisco built-in (available in EEM applets)--Defined by Cisco and can be read only or read/write. The read only variables are set by the system before an applet starts to execute. The single read/write variable, `_exit_status`, allows you to set the exit status at policy exit for policies triggered from synchronous events.

Cisco-defined environment variables (see the table below) and Cisco system-defined environment variables may apply to one specific event detector or to all event detectors. Environment variables that are user-defined or defined by Cisco in a sample policy are set using the **event manager environment** command. Variables that are used in the EEM policy must be defined before you register the policy. A Tcl policy contains a section called “Environment Must Define” that can be defined to check that any required environment variables are defined before the policy runs.

Cisco built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write, and these variables may apply to one specific event detector or to all event detectors. For more details and a table listing the Cisco system-defined variables, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

**Note** Cisco-defined environment variables begin with an underscore character (\_). We strongly recommend that customers avoid the same naming convention to prevent naming conflicts.

The table below describes the Cisco-defined variables used in the sample EEM policies. Some of the environment variables do not have to be specified for the corresponding sample policy to run and these are marked as optional.

**Table 195: Cisco-Defined Environmental Variables and Examples**

| Environment Variable  | Description                                                                                                                                                                               | Example                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| _config_cmd1          | The first configuration command that is executed.                                                                                                                                         | <b>interface Ethernet1/0</b>                  |
| _config_cmd2          | (Optional) The second configuration command that is executed.                                                                                                                             | <b>no shutdown</b>                            |
| _crash_reporter_debug | (Optional) A value that identifies whether debug information for tm_crash_reporter.tcl will be enabled.                                                                                   | 1                                             |
| _crash_reporter_url   | The URL location to which the crash report is sent.                                                                                                                                       | http://www.yourdomain.com/fm/interface_tm.cgi |
| _cron_entry           | A CRON specification that determines when the policy will run. See the “Writing Embedded Event Manager Policies Using Tcl” module for more information about how to specify a cron entry. | 0-59/1 0-23/1 * * 0-7                         |
| _email_server         | A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail.                                                                                                                   | mailserver.yourdomain.com                     |
| _email_to             | The address to which e-mail is sent.                                                                                                                                                      | engineer@yourdomain.com                       |
| _email_from           | The address from which e-mail is sent.                                                                                                                                                    | devtest@yourdomain.com                        |
| _email_cc             | The address to which the e-mail is be copied.                                                                                                                                             | manager@yourdomain.com                        |

| Environment Variable     | Description                                                                                                                                                                                                                                 | Example                                                |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| _email_ipaddr            | The source IP address of the recipient.                                                                                                                                                                                                     | 209.165.201.1 or (IPv6 address)<br>2001:0DB8::1        |
| _info_snmp_oid           | The SNMP object ID.                                                                                                                                                                                                                         | 1.3.6.1.2.1.2 or<br>iso.internet.mgmt.mib-2.interfaces |
| _info_snmp_value         | The value string of the associated SNMP data element.                                                                                                                                                                                       |                                                        |
| _show_cmd                | The CLI <b>show</b> command to be executed when the policy is run.                                                                                                                                                                          | <b>show version</b>                                    |
| _syslog_pattern          | A regular expression pattern match string that is used to compare syslog messages to determine when the policy runs.                                                                                                                        | .*UPDOWN.*FastEthernet 0/0.*                           |
| _tm_fsys_usage_cron      | (Optional) A CRON specification that is used in the <b>event_register</b> keyword extension. If unspecified, the <code>_tm_fsys_usage.tcl</code> policy is triggered once per minute.                                                       | 0-59/1 0-23/1 * * 0-7                                  |
| _tm_fsys_usage_debug     | (Optional) When this variable is set to a value of 1, disk usage information is displayed for all entries in the system.                                                                                                                    | 1                                                      |
| _tm_fsys_usage_freebytes | (Optional) Free byte threshold for systems or specific prefixes. If free space falls below a given value, a warning is displayed.                                                                                                           | disk2:98000000                                         |
| _tm_fsys_usage_percent   | (Optional) Disk usage percentage thresholds for systems or specific prefixes. If disk usage percentage exceeds a given percentage, a warning is displayed. If unspecified, the default disk usage percentage is 80 percent for all systems. | nvrnram:25 disk2:5                                     |

## Embedded Event Manager Policy Creation

EEM is a policy driven process in which the EEM policy engine receives notifications when faults and other events occur in the Cisco software system. Embedded Event Manager policies implement recovery based on the current state of the system and the actions specified in the policy for a given event. Recovery actions are triggered when the policy is run.

Although there are some EEM CLI configuration and **show** commands, EEM is implemented through the creation of policies. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tcl.

The creation of an EEM policy involves:

- Selecting the event for which the policy is run.

- Defining the event detector options associated with logging and responding to the event.
- Defining the environment variables, if required.
- Choosing the actions to be performed when the event occurs.

There are two ways to create an EEM policy. The first method is to write applets using CLI commands, and the second method is to write Tcl scripts. Cisco provides enhancements to Tcl in the form of Tcl command extensions that facilitate the development of EEM policies. Scripts are defined off the networking device using an ASCII editor. The script is then copied to the networking device and registered with EEM. When a policy is registered with the Embedded Event Manager, the software examines the policy and registers it to be run when the specified event occurs. Policies can be unregistered or suspended. Both types of policies can be used to implement EEM in your network.

For details on writing EEM policies using the Cisco IOS CLI, go to “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

For details on writing EEM policies using Tcl, go to “Writing Embedded Event Manager Policies Using Tcl” module.

## Where to Go Next

- If you want to write EEM policies using the Cisco IOS CLI, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.
- If you want to write EEM policies using Tcl, see the “Writing Embedded Event Manager Policies Using Tcl” module.

## Feature Information for Embedded Event Manager 4.0 Overview

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 196: Feature Information for Embedded Event Manager 4.0 Overview**

| Feature Name               | Releases      | Feature Information                                           |
|----------------------------|---------------|---------------------------------------------------------------|
| Embedded Event Manager 4.0 | IOS 15.2(5)E1 | This feature was introduced and is supported only on c2960cx. |

## Additional References

The following sections provide references related to EEM.

## CHAPTER 100

# Information About Writing EEM Policies Using the Cisco IOS CLI

---

- [Prerequisites for Writing EEM Policies Using the Cisco IOS CLI, on page 2001](#)
- [Information About Writing EEM Policies Using the Cisco IOS CLI, on page 2001](#)
- [How to Write EEM Policies Using the Cisco IOS CLI, on page 2013](#)
- [Configuration Examples for Writing Embedded Event Manager Policies Using Tcl, on page 2056](#)
- [Additional References, on page 2072](#)
- [Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI, on page 2074](#)

## Prerequisites for Writing EEM Policies Using the Cisco IOS CLI

- Before writing EEM policies, you should be familiar with the concepts explained in the “Embedded Event Manager Overview” module.
- If the **action cns-event** command is used, access to a Cisco Networking Services (CNS) Event gateway must be configured.
- If the **action force-switchover** command is used, a secondary processor must be configured on the device.
- If the **action snmp-trap** command is used, the **snmp-server enable traps event-manager** command must be enabled to permit SNMP traps to be sent from the Cisco IOS device to the SNMP server. Other relevant **snmp-server** commands must also be configured; for details see the **action snmp-trap** command page.

## Information About Writing EEM Policies Using the Cisco IOS CLI

### Embedded Event Manager Policies

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or a threshold is reached. An EEM policy is an entity that defines an event and the actions to be

taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

## EEM Applet

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs. In applet configuration mode, three types of configuration statements are supported. The **event** commands are used to specify the event criteria to trigger the applet to run, the **action** commands are used to specify an action to perform when the EEM applet is triggered, and the **set** command is used to set the value of an EEM applet variable. Currently only the `_exit_status` variable is supported for the **set** command.

Only one **event** configuration command is allowed within an applet configuration. When applet configuration mode is exited and no **event** command is present, a warning is displayed stating that no event is associated with this applet. If no event is specified, this applet is not considered registered. When no action is associated with this applet, events are still triggered but no actions are performed. Multiple **action** configuration commands are allowed within an applet configuration. Use the **show event manager policy registered** command to display a list of registered applets.

Before modifying an EEM applet, be aware that the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. It is safe to modify the applet without unregistering it. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

The action configuration commands are uniquely identified using the *label* argument, which can be any string value. Actions are sorted in ascending alphanumeric key sequence using the *label* argument as the sort key, and they are run using this sequence.

The Embedded Event Manager schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the **event** and **action** commands that are entered and registers the applet to be run when a specified event occurs.

## EEM Script

Scripts are defined off the networking device using an ASCII editor. The script is then copied to the networking device and registered with EEM. Tcl scripts are supported by EEM.

EEM allows you to write and implement your own policies using Tcl. Writing an EEM policy involves:

- Selecting the event for which the policy is run.
- Defining the event detector options associated with logging and responding to the event.
- Choosing the actions to be followed when the event occurs.

Cisco provides enhancements to Tcl in the form of keyword extensions that facilitate the development of EEM policies. The main categories of keywords identify the detected event, the subsequent action, utility information, counter values, and system information. For more details about writing EEM policies using Tcl, see the “Writing Embedded Event Manager Policies Using Tcl” module.

## Embedded Event Manager Built-In Environment Variables Used in EEM Applets

EEM built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write

and these variables may apply to one specific event detector or to all event detectors. The table below lists the Cisco built-in environment variables that are read-only alphabetically by event detector and subevent.

**Table 197: EEM Built-In Environment Variables (Read Only)**

| <b>Environment Variable</b>                  | <b>Description</b>                                                                                                                                           |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| All Events                                   |                                                                                                                                                              |
| <b>_event_id</b>                             | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.  |
| <b>_event_type</b>                           | Type of event.                                                                                                                                               |
| <b>_event_type_string</b>                    | An ASCII string identifier of the event type that triggered the event.                                                                                       |
| <b>_event_pub_sec</b> <b>_event_pub_msec</b> | The time, in seconds and milliseconds, at which the event was published to the EEM.                                                                          |
| <b>_event_severity</b>                       | The severity of the event.                                                                                                                                   |
| Application-Specific Event Detector          |                                                                                                                                                              |
| <b>_application_component_id</b>             | The event application component identifier.                                                                                                                  |
| <b>_application_data1</b>                    | The value of an environment variable, character text, or a combination of the two to be passed to an application-specific event when the event is published. |
| <b>_application_data2</b>                    | The value of an environment variable, character text, or a combination of the two to be passed to an application-specific event when the event is published. |
| <b>_application_data3</b>                    | The value of an environment variable, character text, or a combination of the two to be passed to an application-specific event when the event is published. |
| <b>_application_data4</b>                    | The value of an environment variable, character text, or a combination of the two to be passed to an application-specific event when the event is published. |
| <b>_application_sub_system</b>               | The event application subsystem number.                                                                                                                      |
| <b>_application_type</b>                     | The type of application.                                                                                                                                     |
| CLI Event Detector                           |                                                                                                                                                              |
| <b>_cli_msg</b>                              | The fully expanded message that triggered the CLI event.                                                                                                     |
| <b>_cli_msg_count</b>                        | The number of times that a message match occurred before the event was published.                                                                            |
| Counter Event Detector                       |                                                                                                                                                              |

| Environment Variable                    | Description                                                                                                                                                                                                                                            |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>_counter_name</b>                    | The name of the counter.                                                                                                                                                                                                                               |
| <b>_counter_value</b>                   | The value of the counter.                                                                                                                                                                                                                              |
| Enhanced Object Tracking Event Detector |                                                                                                                                                                                                                                                        |
| <b>_track_number</b>                    | The number of the tracked object.                                                                                                                                                                                                                      |
| <b>_track_state</b>                     | The state of the tracked object; down or up.                                                                                                                                                                                                           |
| GOLD Event Detector                     |                                                                                                                                                                                                                                                        |
| <b>_action_notify</b>                   | The action notify information in a GOLD event flag; either false or true.                                                                                                                                                                              |
| <b>_event_severity</b>                  | The event severity which can be one of the following; normal, minor, or major.                                                                                                                                                                         |
| <b>_gold_bl</b>                         | The boot diagnostic level, which can be one of the following values: <ul style="list-style-type: none"> <li>• 0: complete diagnostic</li> <li>• 1: minimal diagnostic</li> <li>• 2: bypass diagnostic</li> </ul>                                       |
| <b>_gold_card</b>                       | The card on which a GOLD failure event was detected.                                                                                                                                                                                                   |
| <b>_gold_cf</b> <i>testnum</i>          | Consecutive failure, where <i>testnum</i> is the test number. For example, <b>_gold_cf3</b> is the EEM built-in environment variable for consecutive failure of test 3.                                                                                |
| <b>_gold_ci</b>                         | Card index.                                                                                                                                                                                                                                            |
| <b>_gold_cn</b>                         | Card name.                                                                                                                                                                                                                                             |
| <b>_gold_ec</b> <i>testnum</i>          | Test error code, where <i>testnum</i> is the test number. For example, <b>_gold_ec3</b> is the EEM built-in environment variable for the error code of test 3.                                                                                         |
| <b>_gold_lf</b> <i>testnum</i>          | Last fail time, where <i>testnum</i> is the test number. For example, <b>_gold_lf3</b> is the EEM built-in variable for the last fail time of test 3.<br><br>The time-stamp format is <i>mmm dd yyyy hh:mm:ss</i> . For example, Mar 11 2005 08:47:00. |
| <b>_gold_new_failure</b>                | The new test failure information in a GOLD event flag; either true or false.                                                                                                                                                                           |

| Environment Variable           | Description                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>_gold_overall_result</b>    | The overall diagnostic result, which can be one of the following values: <ul style="list-style-type: none"> <li>• 0: OK</li> <li>• 3: minor error</li> <li>• 4: major error</li> <li>• 14: unknown result</li> </ul>                                                                                                                                                                                          |
| <b>_gold_pc</b>                | Port counts.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>_gold_rc</b> <i>testnum</i> | Test total run count, where <i>testnum</i> is the test number. For example, <b>_gold_rc3</b> is the EEM built-in variable for the total run count of test 3.                                                                                                                                                                                                                                                  |
| <b>_gold_sn</b>                | Card serial number.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>_gold_sub_card</b>          | The subcard on which a GOLD failure event was detected.                                                                                                                                                                                                                                                                                                                                                       |
| <b>_gold_ta</b> <i>testnum</i> | Test attribute, where <i>testnum</i> is the test number. For example, <b>_gold_ta3</b> is the EEM built-in variable for the test attribute of test 3.                                                                                                                                                                                                                                                         |
| <b>_gold_tc</b>                | Test counts.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>_gold_tf</b> <i>testnum</i> | Total failure count, where <i>testnum</i> is the test number. For example, <b>_gold_tf3</b> is the EEM built-in variable for the total failure count of test 3.                                                                                                                                                                                                                                               |
| <b>_gold_tn</b> <i>testnum</i> | Test name, where <i>testnum</i> is the test number. For example, <b>_gold_tn3</b> is the EEM built-in variable for the name of test 3.                                                                                                                                                                                                                                                                        |
| <b>_gold_tr</b> <i>testnum</i> | Test result, where <i>testnum</i> is the test number. For example, <b>_gold_tr6</b> is the EEM built-in variable for test 6, where test 6 is not a per-port test and not a per-device test.<br><br>The test result is one of the following values: <ul style="list-style-type: none"> <li>• P: diagnostic result Pass</li> <li>• F: diagnostic result Fail</li> <li>• U: diagnostic result Unknown</li> </ul> |

| Environment Variable                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>_gold_tr</b> <i>testnum d devnum</i>  | Per-device test result, where <i>testnum</i> is the test number and <i>devnum</i> is the device number. For example, <b>_gold_tr3d20</b> is the EEM built-in variable for the test result for test 3, device 20.<br><br>The test result is one of the following values: <ul style="list-style-type: none"> <li>• P: diagnostic result Pass</li> <li>• F: diagnostic result Fail</li> <li>• U: diagnostic result Unknown</li> </ul> |
| <b>_gold_tr</b> <i>testnum p portnum</i> | Per-port test result, where <i>testnum</i> is the test number and <i>portnum</i> is the port number. For example, <b>_gold_tr5p20</b> is the EEM built-in variable for the test result for test 5, port 20.<br><br>The test result is one of the following values: <ul style="list-style-type: none"> <li>• P: diagnostic result Pass</li> <li>• F: diagnostic result Fail</li> <li>• U: diagnostic result Unknown</li> </ul>      |
| <b>_gold_tt</b>                          | The testing type, which can be one of the following: <ul style="list-style-type: none"> <li>• 1: a boot diagnostic</li> <li>• 2: an on-demand diagnostic</li> <li>• 3: a schedule diagnostic</li> <li>• 4: a monitoring diagnostic</li> </ul>                                                                                                                                                                                      |
| Interface Counter Event Detector         |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>_interface_is_increment</b>           | A value to indicate whether the current interface counter value is an absolute value (0) or an increment value (1).                                                                                                                                                                                                                                                                                                                |
| <b>_interface_name</b>                   | The name of the interface to be monitored.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>_interface_parameter</b>              | The name of the interface counter to be monitored.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>_interface_value</b>                  | A value with which the current interface counter value is compared.                                                                                                                                                                                                                                                                                                                                                                |
| None Event Detector                      |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>_event_id</b>                         | A value of 1 indicates an insertion event; a value of 2 indicates a removal event.                                                                                                                                                                                                                                                                                                                                                 |

| <b>_snmp_notif_dest_ip_addr</b>         | The destination IP address of the SNMP PDU.                                                                                |
| <b>_x_x_x_x_x_x_x(varbinds)</b>         | The SNMP PDU varbind information.                                                                                          |
| <b>_snmp_notif_trunc_vb_buf</b>         | Indicates whether the varbind information has been truncated due to the lack of space in the buffer.                       |
| Syslog Event Detector                   |                                                                                                                            |
| <b>_syslog_msg</b>                      | The syslog message that caused the event to be published.                                                                  |
| System Manager (Process) Event Detector |                                                                                                                            |
| <b>_process_dump_count</b>              | The number of times that a Posix process was dumped.                                                                       |
| <b>_process_exit_status</b>             | The status of the Posix process at exit.                                                                                   |
| <b>_process_fail_count</b>              | The number of times that a Posix process failed.                                                                           |
| <b>_process_instance</b>                | The instance number of the Posix process.                                                                                  |
| <b>_process_last_respawn</b>            | The Posix process that was last respawned.                                                                                 |
| <b>_process_node_name</b>               | The node name of the Posix process.                                                                                        |
| <b>_process_path</b>                    | The path of the Posix process.                                                                                             |
| <b>_process_process_name</b>            | The name of the Posix process.                                                                                             |
| <b>_process_respawn_count</b>           | The number of times that a Posix process was respawned.                                                                    |
| Timer Event Detector                    |                                                                                                                            |
| <b>_timer_remain</b>                    | The time available before the timer expires.<br><b>Note</b> This environment variable is not available for the CRON timer. |
| <b>_timer_time</b>                      | The time at which the last event was triggered.                                                                            |
| <b>_timer_type</b>                      | The type of timer.                                                                                                         |

| Environment Variable                                                     | Description                                                                                                                                                                                                         |

| <code>_wd_sub1_is_percent</code><br><code>_wd_sub2_is_percent</code> | A number that identifies whether the value is a percentage. A value of 0 means that the value is not a percentage; a value of 1 means that the value is a percentage.                                                 |
| <code>_wd_sub1_node</code> <code>_wd_sub2_node</code>                | The slot number for the subevent RP reporting node.                                                                                                                                                                   |
| <code>_wd_sub1_period</code> <code>_wd_sub2_period</code>            | The time period, in seconds and optional milliseconds, used for measurement in subevents.                                                                                                                             |
| <code>_wd_sub1_value</code> <code>_wd_sub2_value</code>              | The CPU utilization of subevents measured as a percentage.                                                                                                                                                            |
| <code>_wd_sub1_used</code> <code>_wd_sub2_used</code>                | The memory used by subevents.                                                                                                                                                                                         |

## How to Write EEM Policies Using the Cisco IOS CLI

### Registering and Defining an Embedded Event Manager Applet

Perform this task to register an applet with Embedded Event Manager and to define the EEM applet using the Cisco IOS CLI **event** and **action** commands. Only one **event** command is allowed in an EEM applet. Multiple **action** commands are permitted. If no **event** and no **action** commands are specified, the applet is removed when you exit configuration mode.

The SNMP event detector and the syslog **action** commands used in this task are just representing any event detector and **action** commands. For examples using other event detectors and **action** commands, see the [Embedded Event Manager Applet Configuration Examples, on page 2056](#).

### EEM Environment Variables

EEM environment variables for EEM policies are defined using the EEM **event manager environment** configuration command. By convention, all Cisco EEM environment variables begin with “\_”. In order to avoid future conflict, customers are urged not to define new variables that start with “\_”.

You can display the EEM environment variables set on your system by using the **show event manager environment** privileged EXEC command.

For example, you can create EEM policies that can send e-mails when an event occurs. The table below describes the e-mail-specific environment variables that can be used in EEM policies.

Table 198: EEM E-mail-Specific Environmental Variables

| Environment Variable       | Description                                                             | Example                                                                                                                                                                                                                                                  |
|----------------------------|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>_email_server</code> | A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail. | The e-mail server name--Mailservername-- can be in any one of the following template formats: <ul style="list-style-type: none"> <li>• <code>username:password@host</code></li> <li>• <code>username@host</code></li> <li>• <code>host</code></li> </ul> |
| <code>_email_to</code>     | The address to which e-mail is sent.                                    | <code>engineering@example.com</code>                                                                                                                                                                                                                     |
| <code>_email_from</code>   | The address from which e-mail is sent.                                  | <code>devtest@example.com</code>                                                                                                                                                                                                                         |
| <code>_email_cc</code>     | The address to which the e-mail is copied.                              | <code>manager@example.com</code>                                                                                                                                                                                                                         |

## Alphabetical Order of EEM Action Labels

An EEM action label is a unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric (lexicographical) key sequence using the label as the sort key. If you are using numbers as labels be aware that alphanumerical sorting will sort 10.0 after 1.0, but before 2.0, and in this situation we recommend that you use numbers such as 01.0, 02.0, and so on, or use an initial letter followed by numbers.

### SUMMARY STEPS

1. **enable**
2. **show event manager environment** [**all**] *variable-name*
3. **configure terminal**
4. **event manager environment** *variable-name string*
5. Repeat [Alphabetical Order of EEM Action Labels](#) for all the required environment variables.
6. **event manager applet** *applet-name*
7. Do one of the following:
  - **event snmp oid** *oid-value* **get-type** {**exact**|**next**} **entry-op** *operator* **entry-val** *entry-value* [**exit-comb** | **and**] [**exit-op** *operator*] [**exit-val** *exit-value*] [**exit-time** *exit-time-value*] **poll-interval** *poll-int-value*
8. **action** *label* **cli command** *cli-string* [**pattern** *pattern-string*]
9. **action** *label* **syslog** [**priority** *priority-level*] **msg** *msg-text* **facility** *string*
10. **action** *label* **mail server** *server-address* **to** *to-address* **from** *from-address* [**cc** *cc-address*] **subject** *subject* **body** *body-text*
11. Add more action commands as required.
12. **end**

DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                        |
| Step 2 | <p><b>show event manager environment</b> [<b>all</b>] <i>variable-name</i></p> <p><b>Example:</b></p> <pre>Device# show event manager environment all</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>(Optional) Displays the name and value of EEM environment variables.</p> <ul style="list-style-type: none"> <li>• The optional <b>all</b> keyword displays all the EEM environment variables.</li> <li>• The optional <i>variable-name</i> argument displays information about the specified environment variable.</li> </ul> |
| Step 3 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Enters global configuration mode.</p>                                                                                                                                                                                                                                                                                         |
| Step 4 | <p><b>event manager environment</b> <i>variable-name string</i></p> <p><b>Example:</b></p> <pre>Device(config)# event manager environment _email_to engineering@example.com</pre>                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Configures the value of the specified EEM environment variable.</p> <ul style="list-style-type: none"> <li>• In this example, the environment variable that holds the e-mail address to which e-mail is sent is set to <code>engineering@example.com</code>.</li> </ul>                                                       |
| Step 5 | <p>Repeat <a href="#">Alphabetical Order of EEM Action Labels</a> for all the required environment variables.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Repeat <a href="#">Alphabetical Order of EEM Action Labels</a> to configure all the environment variables required by the policy to be registered in <a href="#">Alphabetical Order of EEM Action Labels</a>.</p>                                                                                                             |
| Step 6 | <p><b>event manager applet</b> <i>applet-name</i></p> <p><b>Example:</b></p> <pre>Device(config)# event manager applet memory-fail</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</p>                                                                                                                                                                                                                          |
| Step 7 | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• <b>event snmp oid</b> <i>oid-value</i> <b>get-type</b> {<b>exact</b> <b>next</b>} <b>entry-op</b> <i>operator</i> <b>entry-val</b> <i>entry-value</i> [<b>exit-comb</b>   <b>and</b>] [<b>exit-op</b> <i>operator</i>] [<b>exit-val</b> <i>exit-value</i>] [<b>exit-time</b> <i>exit-time-value</i>] <b>poll-interval</b> <i>poll-int-value</i></li> </ul> <p><b>Example:</b></p> <pre>Device(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000 poll-interval 90</pre> | <p>Specifies the event criteria that cause the EEM applet to run.</p> <ul style="list-style-type: none"> <li>• In this example, an EEM event is triggered when free memory falls below the value of 5120000.</li> <li>• Exit criteria are optional, and if not specified, event monitoring is reenabled immediately.</li> </ul>  |

|                | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <p><b>action</b> <i>label</i> <b>cli command</b> <i>cli-string</i> [<b>pattern</b> <i>pattern-string</i>]</p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 1.0 cli command "enable"</pre> <p><b>Example:</b></p> <pre>Device(config-applet)# action 2.0 cli command "clear counters Ethernet0/1" pattern "confirm"</pre> <p><b>Example:</b></p> <pre>Device(config-applet)# action 3.0 cli command "y"</pre>                                                            | <p>Specifies the action of executing a Cisco IOS CLI command when an EEM applet is triggered.</p> <p>The <b>pattern</b> keyword is optional and is used only when the command string solicits input. The <b>action cli</b> command ends when the solicited prompt as specified in the optional <b>pattern</b> keyword is received. You are required to specify a regular expression pattern that will match the next solicited prompt. Specification of an incorrect pattern will cause the <b>action cli</b> command to wait forever until the applet execution times out due to the maxrun timer expiration.</p> <ul style="list-style-type: none"> <li>The action taken is to specify an EEM applet to run when the <b>pattern</b> keyword specifies the <i>confirm</i> argument for the <b>clear counters Ethernet0/1</b> command. In this case the command string solicits input, such as “confirm,” which has to be completed with a “yes” or a “no” input.</li> </ul> |
| <b>Step 9</b>  | <p><b>action</b> <i>label</i> <b>syslog</b> [<b>priority</b> <i>priority-level</i>] <b>msg</b> <i>msg-text</i> <b>facility</b> <i>string</i></p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 1.0 syslog priority critical msg "Memory exhausted; current available memory is \$_snmp_oid_val bytes"</pre> <p><b>Example:</b></p> <pre>Device(config-applet)# action 1.0 syslog priority errors facility EEM-FAC message "TEST MSG"</pre>                               | <p>Specifies the action to be taken when an EEM applet is triggered.</p> <p>In this example, the action taken is to write a message to syslog.</p> <ul style="list-style-type: none"> <li>The optional <b>priority</b> keyword specifies the priority level of the syslog messages. If selected, the <i>priority-level</i> argument must be defined.</li> <li>The <i>msg-text</i> argument can be character text, an environment variable, or a combination of the two.</li> <li>The <b>facility</b> keyword specifies the location of generated message</li> <li>The <i>string</i> argument can be character text, an environment variable, or a combination of the two.</li> </ul>                                                                                                                                                                                                                                                                                         |
| <b>Step 10</b> | <p><b>action</b> <i>label</i> <b>mail server</b> <i>server-address</i> <b>to</b> <i>to-address</i> <b>from</b> <i>from-address</i> [<b>cc</b> <i>cc-address</i>] <b>subject</b> <i>subject</i> <b>body</b> <i>body-text</i></p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 2.0 mail server 192.168.1.10 to engineering@example.com from devtest@example.com subject "Memory failure" body "Memory exhausted; current available memory is \$_snmp_oid_val bytes"</pre> | <p>Specifies the action of sending a short e-mail when an EEM applet is triggered.</p> <ul style="list-style-type: none"> <li>The <i>server-address</i> argument specifies the fully qualified domain name of the e-mail server to be used to forward the e-mail.</li> <li>The <i>to-address</i> argument specifies the e-mail address where the e-mail is to be sent.</li> <li>The <i>from-address</i> argument specifies the e-mail address from which the e-mail is sent.</li> <li>The <i>subject</i> argument specifies the subject line content of the e-mail as an alphanumeric string.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                     |

|                | Command or Action                                                      | Purpose                                                                                                                                             |
|----------------|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                        | <ul style="list-style-type: none"> <li>The <i>body-text</i> argument specifies the text content of the e-mail as an alphanumeric string.</li> </ul> |
| <b>Step 11</b> | Add more action commands as required.                                  | --                                                                                                                                                  |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config-applet)# end</pre> | Exits applet configuration mode and returns to privileged EXEC mode.                                                                                |

## Troubleshooting Tips

Use the **debug event manager** command in privileged EXEC mode to troubleshoot EEM command operations. Use any debugging command with caution as the volume of generated output can slow or stop the device operations. We recommend that this command be used only under the supervision of a Cisco engineer.

## Registering and Defining an EEM Tcl Script

Perform this task to configure environment variables and register an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When an EEM policy is registered, the software examines the policy and registers it to be run when the specified event occurs.

### Before you begin

You must have a policy available that is written in the Tcl scripting language. Sample policies are provided--see the details in the [Sample EEM Policies, on page 2093](#) to see which policies are available for the Cisco IOS release image that you are using--and these sample policies are stored in the system policy directory.

### SUMMARY STEPS

- enable**
- show event manager environment** [**all**| *variable-name*]
- configure terminal**
- event manager environment** *variable-name string*
- Repeat [Registering and Defining an EEM Tcl Script](#) to configure all the environment variables required by the policy to be registered in [Registering and Defining an EEM Tcl Script](#).
- event manager policy** *policy-filename* [**type** {**system**| **user**}] [**trap**]
- exit**

### DETAILED STEPS

|               | Command or Action                                                | Purpose                                                                                                          |
|---------------|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Step 2</b> | <p><b>show event manager environment</b> [<b>all</b>  <i>variable-name</i>]</p> <p><b>Example:</b></p> <pre>Device# show event manager environment all</pre>                                                         | <p>(Optional) Displays the name and value of EEM environment variables.</p> <ul style="list-style-type: none"> <li>• The optional <b>all</b> keyword displays all the EEM environment variables.</li> <li>• The optional <i>variable-name</i> argument displays information about the specified environment variable.</li> </ul>                                                                                                                                                                                                       |
| <b>Step 3</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 4</b> | <p><b>event manager environment</b> <i>variable-name string</i></p> <p><b>Example:</b></p> <pre>Device(config)# event manager environment _cron_entry 0-59/2 0-23/1 * * 0-6</pre>                                    | <p>Configures the value of the specified EEM environment variable.</p> <ul style="list-style-type: none"> <li>• In this example, the software assigns a CRON timer environment variable to be set to the second minute of every hour of every day.</li> </ul>                                                                                                                                                                                                                                                                          |
| <b>Step 5</b> | Repeat <a href="#">Registering and Defining an EEM Tcl Script</a> to configure all the environment variables required by the policy to be registered in <a href="#">Registering and Defining an EEM Tcl Script</a> . | --                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <p><b>event manager policy</b> <i>policy-filename</i> [<b>type</b> {<b>system</b> <b>user</b>}] [<b>trap</b>]</p> <p><b>Example:</b></p> <pre>Device(config)# event manager policy tm_cli_cmd.tcl type system</pre>  | <p>Registers the EEM policy to be run when the specified event defined within the policy occurs.</p> <ul style="list-style-type: none"> <li>• Use the <b>system</b> keyword to register a Cisco-defined system policy.</li> <li>• Use the <b>user</b> keyword to register a user-defined system policy.</li> <li>• Use the <b>trap</b> keyword to generate an SNMP trap when the policy is triggered.</li> <li>• In this example, the sample EEM policy named <code>tm_cli_cmd.tcl</code> is registered as a system policy.</li> </ul> |
| <b>Step 7</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config)# exit</pre>                                                                                                                                            | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Examples

In the following example, the **show event manager environment** privileged EXEC command is used to display the name and value of all EEM environment variables.

```

Device# show event manager environment all
No. Name Value
1 _cron_entry 0-59/2 0-23/1 * * 0-6
2 _show_cmd show ver
3 _syslog_pattern .*UPDOWN.*Ethernet1/0.*
4 _config_cmd1 interface Ethernet1/0
5 _config_cmd2 no shut

```

## Unregistering Embedded Event Manager Policies

Perform this task to remove an EEM policy from the running configuration file. Execution of the policy is canceled.

### SUMMARY STEPS

1. **enable**
2. **show event manager policy registered** [description [*policy-name*] | detailed *policy-filename* [system | user] | [event-type *event-name*] [system | user] [time-ordered | name-ordered]]
3. **configure terminal**
4. **no event manager policy** *policy-filename*
5. **exit**
6. Repeat Step 2 to ensure that the policy has been removed.

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                             |
| Step 2 | <b>show event manager policy registered</b> [description [ <i>policy-name</i> ]   detailed <i>policy-filename</i> [system   user]   [event-type <i>event-name</i> ] [system   user] [time-ordered   name-ordered]]<br><b>Example:</b><br>Device# show event manager policy registered | (Optional) Displays the EEM policies that are currently registered. <ul style="list-style-type: none"> <li>• The optional <b>system</b> and <b>user</b> keywords display the registered system and user policies.</li> <li>• If no keywords are specified, EEM registered policies for all event types are displayed in time order.</li> </ul> |
| Step 3 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                              |
| Step 4 | <b>no event manager policy</b> <i>policy-filename</i><br><b>Example:</b><br>Device(config)# no event manager policy IPSLAping1                                                                                                                                                        | Removes the EEM policy from the configuration, causing the policy to be unregistered.                                                                                                                                                                                                                                                          |

|               | Command or Action                                                                                                            | Purpose                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                       | Exits global configuration mode and returns to privileged EXEC mode. |
| <b>Step 6</b> | Repeat Step 2 to ensure that the policy has been removed.<br><b>Example:</b><br>Device# show event manager policy registered | --                                                                   |

### Examples

In the following example, the **show event manager policy registered** privileged EXEC command is used to display the two EEM applets that are currently registered:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system snmp Off Fri Aug 12 17:42:52 2005 IPSLAping1
oid {1.3.6.1.4.1.9.9.42.1.2.9.1.6.4} get-type exact entry-op eq entry-val {1}
exit-op eq exit-val {2} poll-interval 90.000
action 1.0 syslog priority critical msg "Server IPEcho Failed: OID=$_snmp_oid_val"
action 1.1 snmp-trap strdata "EEM detected server reachability failure to 10.1.88.9"
action 1.2 publish-event sub-system 88000101 type 1 arg1 "10.1.88.9" arg2 "IPSLAEcho"
arg3 "fail"
action 1.3 counter name _IPSLA1F op inc value 1
2 applet system snmp Off Thu Sep 15 05:57:16 2005 memory-fail
oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val {5120000}
poll-interval 90
action 1.0 syslog priority critical msg Memory exhausted; current available memory is
$_snmp_oid_val bytes
action 2.0 force-switchover
```

In the following example, the **show event manager policy registered** privileged EXEC command is used to show that applet IPSLAping1 has been removed after entering the **no event manager policy** command:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system snmp Off Thu Sep 15 05:57:16 2005 memory-fail
oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val {5120000}
poll-interval 90
action 1.0 syslog priority critical msg Memory exhausted; current available memory is
$_snmp_oid_val bytes
action 2.0 force-switchover
```

## Suspending All Embedded Event Manager Policy Execution

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them might be necessary for reasons of temporary performance or security.

## SUMMARY STEPS

1. **enable**
2. **show event manager policy registered** [description [*policy-name*] | **detailed** *policy-filename* [system | user] | [event-type *event-name*] [system | user] [time-ordered | name-ordered]]
3. **configure terminal**
4. **event manager scheduler suspend**
5. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                        |

| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                             |
| Step 2 | <b>show event manager policy registered</b> [description [ <i>policy-name</i> ]   <b>detailed</b> <i>policy-filename</i> [system   user]   [event-type <i>event-name</i> ] [system   user] [time-ordered   name-ordered]]<br><b>Example:</b><br>Device# show event manager policy registered | (Optional) Displays the EEM policies that are currently registered. <ul style="list-style-type: none"> <li>• The optional <b>system</b> and <b>user</b> keywords display the registered system and user policies.</li> <li>• If no keywords are specified, EEM registered policies for all event types are displayed in time order.</li> </ul> |
| Step 3 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                                              |
| Step 4 | <b>event manager scheduler suspend</b><br><b>Example:</b><br>Device(config)# event manager scheduler suspend                                                                                                                                                                                 | Immediately suspends the execution of all EEM policies.                                                                                                                                                                                                                                                                                        |
| Step 5 | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                                                                                                                                                                                       | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                           |

## Displaying Embedded Event Manager History Data

Perform this optional task to change the size of the history tables and to display EEM history data.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **event manager history size** {events | traps} [size]
4. **exit**
5. **show event manager history events** [detailed] [maximum number]
6. **show event manager history traps** {server | policy}

## DETAILED STEPS

---

### Step 1 enable

Enables privileged EXEC mode. Enter your password if prompted.

#### Example:

```
Device> enable
```

### Step 2 configure terminal

Enters global configuration mode.

#### Example:

```
Device# configure terminal
```

### Step 3 event manager history size {events | traps} [size]

Use this command to change the size of the EEM event history table or the size of the EEM SNMP trap history table. In the following example, the size of the EEM event history table is changed to 30 entries:

#### Example:

```
Device(config)# event manager history size events 30
```

### Step 4 exit

Exits global configuration mode and returns to privileged EXEC mode.

#### Example:

```
Device(config)# exit
```

### Step 5 show event manager history events [detailed] [maximum number]

Use this command to display detailed information about each EEM event, for example:

#### Example:

```
Device# show event manager history events
No. Time of Event Event Type Name
1 Fri Aug13 21:42:57 2004 snmp applet: SAAping1
2 Fri Aug13 22:20:29 2004 snmp applet: SAAping1
3 Wed Aug18 21:54:48 2004 snmp applet: SAAping1
4 Wed Aug18 22:06:38 2004 snmp applet: SAAping1
5 Wed Aug18 22:30:58 2004 snmp applet: SAAping1
6 Wed Aug18 22:34:58 2004 snmp applet: SAAping1
7 Wed Aug18 22:51:18 2004 snmp applet: SAAping1
8 Wed Aug18 22:51:18 2004 application applet: CustApp1
```

### Step 6 show event manager history traps {server | policy}

Use this command to display the EEM SNMP traps that have been sent either from the EEM server or from an EEM policy. In the following example, the EEM SNMP traps that were triggered from within an EEM policy are displayed.

**Example:**

```
Device# show event manager history traps policy
No. Time Trap Type Name
1 Wed Aug18 22:30:58 2004 policy EEM Policy Director
2 Wed Aug18 22:34:58 2004 policy EEM Policy Director
3 Wed Aug18 22:51:18 2004 policy EEM Policy Director
```

## Displaying Embedded Event Manager Registered Policies

Perform this optional task to display registered EEM policies.

### SUMMARY STEPS

1. **enable**
2. **show event manager policy registered [event-type *event-name*] [time-ordered| name-ordered]**

### DETAILED STEPS

#### Step 1 **enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

#### Step 2 **show event manager policy registered [event-type *event-name*] [time-ordered| name-ordered]**

Use this command with the **time-ordered** keyword to display information about currently registered policies sorted by time, for example:

**Example:**

```
Device# show event manager policy registered time-ordered
No. Type Event Type Time Registered Name
1 applet snmp Thu May30 05:57:16 2004 memory-fail
 oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val
 {5120000} poll-interval 90
 action 1.0 syslog priority critical msg "Memory exhausted; current available memory
 is $_snmp_oid_val bytes"
 action 2.0 force-switchover
2 applet syslog Wed Jul16 00:05:17 2004 intf-down
 pattern {.*UPDOWN.*Ethernet1/0.*}
 action 1.0 cns-event msg "Interface state change: $_syslog_msg"
```

Use this command with the **name-ordered** keyword to display information about currently registered policies sorted by name, for example:

**Example:**

```
Device# show event manager policy registered name-ordered
No. Type Event Type Time Registered Name
1 applet syslog Wed Jul16 00:05:17 2004 intf-down
 pattern {.*UPDOWN.*Ethernet1/0.*}
 action 1.0 cns-event msg "Interface state change: $_syslog_msg"
2 applet snmp Thu May30 05:57:16 2004 memory-fail
 oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val
 {5120000} poll-interval 90
 action 1.0 syslog priority critical msg "Memory exhausted; current available memory
is $_snmp_oid_val bytes"
 action 2.0 force-switchover
```

Use this command with the **event-type** keyword to display information about currently registered policies for the event type specified in the *event-name* argument, for example:

#### Example:

```
Device# show event manager policy registered event-type syslog
No. Type Event Type Time Registered Name
1 applet syslog Wed Jul16 00:05:17 2004 intf-down
 pattern {.*UPDOWN.*Ethernet1/0.*}
 action 1.0 cns-event msg "Interface state change: $_syslog_msg"
```

## Configuring Event SNMP Notification

Perform this task to configure SNMP notifications.

#### Before you begin

- SNMP event manager must be configured using the **snmp-server manager** command.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **event** [**tag** *event-tag*] **snmp-notification oid** *oid-string* **oid-val** *comparison-value* **op** *operator* [**maxrun** *maxruntime-number*] [**src-ip-address** *ip-address*] [**dest-ip-address** *ip-address*] [**default** *seconds*] [**direction** {**incoming** | **outgoing**}] [**msg-op** {**drop** | **send**}]
5. **end**

#### DETAILED STEPS

|        | Command or Action                                          | Purpose                                                                                                            |
|--------|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br><br>Device> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

| Step 4 | <b>event</b> [ <b>tag</b> <i>event-tag</i> ] <b>snmp-notification oid</b> <i>oid-string</i> <b>oid-val</b> <i>comparison-value</i> <b>op</b> <i>operator</i> [ <b>maxrun</b> <i>maxruntime-number</i> ] [ <b>src-ip-address</b> <i>ip-address</i> ] [ <b>dest-ip-address</b> <i>ip-address</i> ] [ <b>default</b> <i>seconds</i> ] [ <b>direction</b> { <b>incoming</b>   <b>outgoing</b> }] [ <b>msg-op</b> { <b>drop</b>   <b>send</b> }]<br><b>Example:</b><br><pre>Device(config-applet)# event snmp-notification dest-ip-address 192.168.1.1 oid 1 op eq oid-val 10</pre> | Specifies the event criteria for an Embedded Event Manager (EEM) applet that is run by sampling Simple Network Management Protocol (SNMP) notification. |
| Step 5 | <b>end</b><br><b>Example:</b><br><pre>Device(config-applet)# end</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Exits applet configuration mode and returns to privileged EXEC mode.                                                                                    |

## Configuring Multiple Event Support

The multiple event support feature adds the ability to register multiple events in the EEM server. The multiple event support involves one or more event occurrences, one or more tracked object states, and a time period for the event to occur. The event parameters are specified in the CLI commands. The data structure to handle multiple events contains multiple event identifiers and correlation logic. This data is used to register multiple events in the EEM Server.

### Setting the Event Configuration Parameters

The **trigger** command enters the trigger applet configuration mode and specifies the multiple event configuration statements for EEM applets. The trigger statement is used to relate multiple event statement using the *tag* argument specified in each event statement. The events are raised based on the specified parameters.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **event** [**tag** *event-tag*] **cli pattern** *regular-expression* **sync** {**yes** | **no skip** {**yes** | **no**}} [**occurs** *num-occurrences*] [**period** *period-value*] [**maxrun** *maxruntime-number*]
5. **trigger** [**occurs** *occurs-value*] [**period** *period-value*] [**period-start** *period-start-value*] [**delay** *delay-value*]

6. **correlate** {**event** *event-tag* | **track** *object-number*} [*boolean-operator* **event** *event-tag*]
7. **attribute** **tag** *event-tag* [**occurs** *occurs-value*]
8. **action** *label* **cli command** *cli-string*

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                           |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                                                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>event manager applet</b> <i>applet-name</i><br><b>Example:</b><br>Device(config)# event manager applet EventInterface                                                                                                                                                                                                                                                                                               | Registers an applet with EEM and enters applet configuration mode.                                                                                                                                                                |
| <b>Step 4</b> | <b>event</b> [ <b>tag</b> <i>event-tag</i> ] <b>cli pattern</b> <i>regular-expression</i> <b>sync</b> { <b>yes</b>   <b>no skip</b> { <b>yes</b>   <b>no</b> }} [ <b>occurs</b> <i>num-occurrences</i> ] [ <b>period</b> <i>period-value</i> ] [ <b>maxrun</b> <i>maxruntime-number</i> ]<br><b>Example:</b><br>Device(config-applet)# event tag 1.0 cli pattern "show bgp all" sync yes occurs 32 period 60 maxrun 60 | Specifies the event criteria for an EEM applet that is run by matching a Cisco IOS command-line interface (CLI) command.                                                                                                          |
| <b>Step 5</b> | <b>trigger</b> [ <b>occurs</b> <i>occurs-value</i> ] [ <b>period</b> <i>period-value</i> ] [ <b>period-start</b> <i>period-start-value</i> ] [ <b>delay</b> <i>delay-value</i> ]<br><b>Example:</b><br>Device(config-applet)# trigger occurs 1 period-start "0 8 * * 1-5" period 60                                                                                                                                    | Specifies the complex event configuration parameters for an EEM applet.                                                                                                                                                           |
| <b>Step 6</b> | <b>correlate</b> { <b>event</b> <i>event-tag</i>   <b>track</b> <i>object-number</i> } [ <i>boolean-operator</i> <b>event</b> <i>event-tag</i> ]<br><b>Example:</b><br>Device(config-applet)# correlate event 1.0 or event 2.0                                                                                                                                                                                         | Specifies a complex event correlation in the trigger mode for an EEM applet.<br><br><b>Note</b> When "and" is used to group events such as traps or syslog messages, then the default trigger occurrence window is three minutes. |
| <b>Step 7</b> | <b>attribute</b> <b>tag</b> <i>event-tag</i> [ <b>occurs</b> <i>occurs-value</i> ]<br><b>Example:</b><br>Device(config-applet)# attribute tag 1.0 occurs 1                                                                                                                                                                                                                                                             | Specifies up to eight attribute statements to build a complex event for an EEM applet.                                                                                                                                            |

|        | Command or Action                                                                                                                                  | Purpose                                                                          |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Step 8 | <b>action</b> <i>label</i> <b>cli command</b> <i>cli-string</i><br><b>Example:</b><br>Device(config-applet)# action 1.0 cli command "show pattern" | Specifies the action of executing a CLI command when an EEM applet is triggered. |

### Examples

In the following example, applet is run if the **show bgp all** CLI command and any syslog message that contains the string "COUNT" occurred within a period 60 seconds.

```

event manager applet delay_50
 event tag 1.0 cli pattern "show bgp all" sync yes occurs 32 period 60 maxrun 60
 event tag 2.0 syslog pattern "COUNT"
 trigger occurs 1 delay 50
 correlate event 1.0 or event 2.0
 attribute tag 1.0 occurs 1
 attribute tag 2.0 occurs 1
 action 1.0 cli command "show pattern"
 action 2.0 cli command "enable"
 action 3.0 cli command "config terminal"
 action 4.0 cli command " ip route 192.0.2.0 255.255.255.224 192.0.2.12"
 action 91.0 cli command "exit"
 action 99.0 cli command "show ip route | incl 192.0.2.5"

```

## Configuring EEM Class-Based Scheduling

To schedule Embedded Event Manager (EEM) policies and set policy scheduling options, perform this task. In this task, two EEM execution threads are created to run applets assigned to the default class.

The EEM policies will be assigned a class using the **class** keyword when they are registered. EEM policies registered without a class will be assigned to the default class. Threads that have default class, will service the default class when the thread is available for work. Threads that are assigned specific class letters will service any policy with a matching class letter when the thread is available for work.

If there is no EEM execution thread available to run the policy in the specified class and a scheduler rule for the class is configured, the policy will wait until a thread of that class is available for execution. Synchronous policies that are triggered from the same input event should be scheduled in the same execution thread.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager scheduler** {*applet* | *axp* | *call-home*} **thread class** *class-options* **number** *thread-number*
4. **exit**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                | Enters global configuration mode.                                                                                                                                                                                   |
| <b>Step 3</b> | <b>event manager scheduler {applet   axp   call-home}</b><br><b>thread class class-options number thread-number</b><br><b>Example:</b><br>Device(config)# event manager scheduler applet<br>thread class default number 2 | Schedules EEM policies and sets policy scheduling options. <ul style="list-style-type: none"> <li>• In this example, two EEM execution threads are created to run applets assigned to the default class.</li> </ul> |
| <b>Step 4</b> | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                                                                                                                    | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                |

## Holding a Scheduled EEM Policy Event or Event Queue

To hold a scheduled EEM policy event or event queue in the EEM scheduler, perform this task. In this task, all pending EEM policies are displayed. A policy identified using a job ID of 2 is held in the EEM scheduler, and the final step shows that the policy with a job ID of 2 has changed status from pending to held.

## SUMMARY STEPS

1. **enable**
2. **show event manager policy pending [queue-type {applet | call-home | axp | script} class class-options | detailed]**
3. **event manager scheduler hold {all | policy job-id | queue-type {applet | call-home | axp | script} class class-options} [processor {rp\_primary| rp\_standby}]**
4. **show event manager policy pending [queue-type {applet | call-home | axp | script} class class-options | detailed]**

## DETAILED STEPS

|               | Command or Action                                  | Purpose                                                                                                            |
|---------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|        | Command or Action                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <p><b>show event manager policy pending</b> [queue-type {applet   call-home   axp   script} class class-options   detailed]</p> <p><b>Example:</b></p> <pre>Device# show event manager policy pending</pre>                                                 | Displays the pending EEM policies.                                                                                                                                                            |
| Step 3 | <p><b>event manager scheduler hold</b> {all   policy job-id   queue-type {applet   call-home   axp   script} class class-options} [processor {rp_primary   rp_standby}]</p> <p><b>Example:</b></p> <pre>Device# event manager scheduler hold policy 2</pre> | <p>Holds a scheduled EEM policy event or event queue in the EEM scheduler.</p> <ul style="list-style-type: none"> <li>In this example, a policy with a job ID of 2 is put on hold.</li> </ul> |
| Step 4 | <p><b>show event manager policy pending</b> [queue-type {applet   call-home   axp   script} class class-options   detailed]</p> <p><b>Example:</b></p> <pre>Device# show event manager policy pending</pre>                                                 | Displays the status of EEM policy put on hold in Step 3 as held, along with other pending policies.                                                                                           |

### Examples

The following example shows how to view all pending EEM policies and to hold the EEM policy with a job ID of 2.

```
Device# show event manager policy pending
no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
Device# event manager scheduler hold policy 2
Device# show event manager policy pending

no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 held Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

## Resuming Execution of EEM Policy Events or Event Queues

To resume the execution of specified EEM policies, perform this task. In this task, the policy that was put on hold in the Holding a Scheduled EEM Policy Event or Event Queue task is now allowed to resume execution.

### SUMMARY STEPS

- enable
- show event manager policy pending
- event manager scheduler release {all | policy policy-id | queue-type {applet | call-home | axp | script}} class class-options [processor {rp\_primary | rp\_standby}]
- show event manager policy pending

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                                                                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                               |
| <b>Step 2</b> | <b>show event manager policy pending</b><br><b>Example:</b><br><pre>Device# show event manager policy pending</pre>                                                                                                                                                        | Displays the pending and held EEM policies.<br><b>Note</b> Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.                                                            |
| <b>Step 3</b> | <b>event manager scheduler release</b> {all   policy <i>policy-id</i>   queue-type {applet   call-home   axp   script}} class <i>class-options</i> [processor {rp_primary   rp_standby}]<br><b>Example:</b><br><pre>Device# event manager scheduler release policy 2</pre> | Resumes execution of specified EEM policies. <ul style="list-style-type: none"> <li>• The example shows how to resume the execution of the policy with job ID of 2.</li> </ul>                                                                                   |
| <b>Step 4</b> | <b>show event manager policy pending</b><br><b>Example:</b><br><pre>Device# show event manager policy pending</pre>                                                                                                                                                        | Displays the status of the EEM policy resumed in Step 3 as pending, along with other pending policies.<br><b>Note</b> Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference. |

## Examples

The following example shows how to view all pending EEM policies, to specify the policy that will resume execution, and to see that the policy is now back in a pending status.

```
Device# show event manager policy pending

no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 held Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
Rotuer# event manager scheduler release policy 2
Rotuer# show event manager policy pending

no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

## Clearing Pending EEM Policy Events or Event Queues

Perform this task to clear EEM policies that are executing or pending execution. In this task, the EEM policy with a job ID of 2 is cleared from the pending queue. The **show event manager policy pending** command is used to display the policies that are pending before and after the policy is cleared.

## SUMMARY STEPS

1. `enable`
2. `show event manager policy pending`
3. `event manager scheduler clear {all | policy job-id | queue-type {applet | call-home | axp | script} class class-options} [processor {rp_primary | rp_standby}]`
4. `show event manager policy pending`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                                                                                                                                                    | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                       |
| Step 2 | <p><code>show event manager policy pending</code></p> <p><b>Example:</b></p> <pre>Device# show event manager policy pending</pre>                                                                                                                                                 | <p>Displays the pending EEM policies.</p> <p><b>Note</b> Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.</p>                                         |
| Step 3 | <p><code>event manager scheduler clear {all   policy <i>job-id</i>   queue-type {applet   call-home   axp   script} class <i>class-options</i>} [processor {rp_primary   rp_standby}]</code></p> <p><b>Example:</b></p> <pre>Device# event manager scheduler clear policy 2</pre> | <p>Clears EEM policies that are executing or pending execution.</p> <ul style="list-style-type: none"> <li>• In this example, the EEM policy with a job ID of 2 is cleared from the pending queue.</li> </ul>                                   |
| Step 4 | <p><code>show event manager policy pending</code></p> <p><b>Example:</b></p> <pre>Device# show event manager policy pending</pre>                                                                                                                                                 | <p>Displays all the pending EEM policies except the policy cleared in Step 3.</p> <p><b>Note</b> Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.</p> |

## Examples

The following example shows how to clear the EEM policy with a job ID of 2 that was pending execution. The **show** commands are used to display the policies that are pending before and after the policy is cleared.

```
Device# show event manager policy pending
no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three

Device# event manager scheduler clear policy 2
Device# show event manager policy pending
```

```

no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three

```

## Modifying the Scheduling Parameters of EEM Policy Events or Event Queues

To modify the scheduling parameters of the EEM policies, perform this task. The **show event manager policy pending** command displays policies that are assigned to the B or default class. All the currently pending policies are then changed to class A. After the configuration modification, the **show event manager policy pending** command shows all policies assigned as class A.

### SUMMARY STEPS

1. **enable**
2. **show event manager policy pending**
3. **event manager scheduler modify** {all | policy *job-id* | queue-type {applet | call-home | axp | script} | class *class-options*} [queue-priority {high | last | low | normal}][processor {rp\_primary | rp\_standby}]
4. **show event manager policy pending**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                   |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                        |
| Step 2 | <b>show event manager policy pending</b><br><b>Example:</b><br>Device# show event manager policy pending                                                                                                                                                                                                      | Displays the pending EEM policies.<br><b>Note</b> Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.                                              |
| Step 3 | <b>event manager scheduler modify</b> {all   policy <i>job-id</i>   queue-type {applet   call-home   axp   script}   class <i>class-options</i> } [queue-priority {high   last   low   normal}][processor {rp_primary   rp_standby}]<br><b>Example:</b><br>Device# event manager scheduler modify all class A | Modifies the scheduling parameters of the EEM policies. <ul style="list-style-type: none"> <li>• In this example, all currently pending EEM policies are assigned to class A.</li> </ul>                                                  |
| Step 4 | <b>show event manager policy pending</b><br><b>Example:</b><br>Device# show event manager policy pending                                                                                                                                                                                                      | Displays the EEM policies modified in Step 3 along with other pending policies.<br><b>Note</b> Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference. |

## Examples

The following example shows how to modify the scheduling parameters of the EEM policies. In this example, the **show event manager policy pending** command displays policies that are assigned to the B or default class. All the currently pending policies are then changed to class A. After the configuration modification, the **show event manager policy pending** command verifies that all policies are now assigned as class A.

```
Device# show event manager policy pending
no. class status time of event event type name
1 default pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 default pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 B pend Thu Sep 7 02:54:04 2006 syslog applet: three

Device# event manager scheduler modify all class A
Device# show event manager policy pending

no. class status time of event event type name
1 A pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 A pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 A pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

## Verifying Class-Based Active EEM Policies

To verify the active or the running EEM policies, use the **show event manager policy active** command.

### SUMMARY STEPS

1. **show event manager policy active** [*queue-type* {*applet* | *call-home* | *axp* | *script*}] *class class-options* | *detailed*]

### DETAILED STEPS

---

**show event manager policy active** [*queue-type* {*applet* | *call-home* | *axp* | *script*}] *class class-options* | *detailed*]

This command displays only the running EEM policies. This command includes **class**, **detailed** and **queue-type** optional keywords. The following is sample output from this command:

#### Example:

```
Device# show event manager policy active
no. job id p s status time of event event type name
1 12598 N A running Mon Oct29 20:49:37 2007 timer watchdog loop.tcl
2 12609 N A running Mon Oct29 20:49:42 2007 timer watchdog loop.tcl
3 12620 N A running Mon Oct29 20:49:46 2007 timer watchdog loop.tcl
4 12650 N A running Mon Oct29 20:49:59 2007 timer watchdog loop.tcl
5 12842 N A running Mon Oct29 20:51:13 2007 timer watchdog loop.tcl
default class - 6 applet events
no. job id p s status time of event event type name
1 15852 N A running Mon Oct29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
2 15853 N A running Mon Oct29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
3 15854 N A running Mon Oct29 21:11:10 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
4 15855 N A running Mon Oct29 21:11:10 2007 timer watchdog WDOG_SYSLG_CNTR_TRACK_INTF_APPL
```

```

5 15856 N A running Mon Oct29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
6 15858 N A running Mon Oct29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL

```

## Verifying Class-Based Active EEM Policies

To verify the active or the running EEM policies, use the **show event manager policy active** command.

### SUMMARY STEPS

1. **show event manager policy active** [*queue-type* {*applet*|*call-home* | *axp* | *script*}] *class class-options* | *detailed*]

### DETAILED STEPS

**show event manager policy active** [*queue-type* {*applet*|*call-home* | *axp* | *script*}] *class class-options* | *detailed*]

This command displays only the running EEM policies. This command includes **class**, **detailed** and **queue-type** optional keywords. The following is sample output from this command:

#### Example:

```

Device# show event manager policy active
no. job id p s status time of event event type name
1 12598 N A running Mon Oct29 20:49:37 2007 timer watchdog loop.tcl
2 12609 N A running Mon Oct29 20:49:42 2007 timer watchdog loop.tcl
3 12620 N A running Mon Oct29 20:49:46 2007 timer watchdog loop.tcl
4 12650 N A running Mon Oct29 20:49:59 2007 timer watchdog loop.tcl
5 12842 N A running Mon Oct29 20:51:13 2007 timer watchdog loop.tcl
default class - 6 applet events
no. job id p s status time of event event type name
1 15852 N A running Mon Oct29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
2 15853 N A running Mon Oct29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
3 15854 N A running Mon Oct29 21:11:10 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
4 15855 N A running Mon Oct29 21:11:10 2007 timer watchdog WDOG_SYSLG_CNTR_TRACK_INTF_APPL
5 15856 N A running Mon Oct29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
6 15858 N A running Mon Oct29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL

```

## Verifying Pending EEM Policies

To verify the EEM policies that are pending for execution, use the **show event manager policy pending** command. Use the optional keywords to specify EEM class-based scheduling options.

### SUMMARY STEPS

1. **show event manager policy pending** [*queue-type* {*applet*|*call-home* | *axp* | *script*}] *class class-options* | *detailed*]

### DETAILED STEPS

**show event manager policy pending** [*queue-type* {*applet*|*call-home* | *axp* | *script*}] *class class-options* | *detailed*]

This command displays only the pending policies. This command includes **class**, **detailed** and **queue-type** optional keywords. The following is sample output from this command:

**Example:**

```
Device# show event manager policy pending
no. job id p s status time of event event type name
1 12851 N A pend Mon Oct29 20:51:18 2007 timer watchdog loop.tcl

## Configuring EEM Applet (Interactive CLI) Support

The synchronous applets are enhanced to support interaction with the local console (tty) using two commands, **action gets** and **action puts**, and these commands allow users to enter and display input directly on the console. The output for synchronous applets will bypass the system logger. The local console will be opened by the applets and serviced by the corresponding synchronous Event Detector pty. Synchronous output will be directed to the opened console.

### Reading and Writing Input from the Active Console for Synchronous EEM Applets

Use the following tasks to implement EEM applet interactive CLI support:

#### Reading Input from the Active Console

When a synchronous policy is triggered, the related console is stored in the publish information specification. The policy director will query this information in an event\_reqinfo call, and store the given console information for use by the **action gets** command.

The **action gets** command reads a line of the input from the active console and stores the input in the variable. The trailing new line will not be returned.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **event none**
5. **action** *label* **gets** *variable*
6. **action** *label* **syslog** [**priority** *priority-level*] **msg** *msg-text*
7. **exit**

#### DETAILED STEPS

|        | Command or Action                    | Purpose                                                                 |
|--------|--------------------------------------|-------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b> | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |

|               | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device> enable                                                                                                                                                                          |                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                              | Enters global configuration mode.                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>event manager applet</b> <i>applet-name</i><br><b>Example:</b><br>Device(config)# event manager applet action                                                                        | Registers the applet with the EEM and enters applet configuration mode.                                                                                                                                                           |
| <b>Step 4</b> | <b>event none</b><br><b>Example:</b><br>Device(config-applet)# event none                                                                                                               | Specifies that an EEM policy is to be registered with the EEM and can be run manually.                                                                                                                                            |
| <b>Step 5</b> | <b>action</b> <i>label gets variable</i><br><b>Example:</b><br>Device(config-applet)# action label2 gets input                                                                          | Gets input from the local console in a synchronous applet and stores the value in the given variable when an EEM applet is triggered.                                                                                             |
| <b>Step 6</b> | <b>action</b> <i>label syslog [priority priority-level] msg msg-text</i><br><b>Example:</b><br>Device(config-applet)# action label3 syslog msg "Input entered was \" <i>\$input</i> \"" | Specifies the action to be taken when an EEM applet is triggered. <ul style="list-style-type: none"> <li>In this example, the action to be taken is to write the value of the variable specified in Step 5, to syslog.</li> </ul> |
| <b>Step 7</b> | <b>exit</b><br><b>Example:</b><br>Device(config-applet)# exit                                                                                                                           | Exits applet configuration mode and returns to privileged EXEC mode.                                                                                                                                                              |

### Example

The following example shows how to get the input from the local tty in a synchronous applet and store the value

```
Device(config)# event manager applet action
Device(config-applet)# event none
Device(config-applet)# action label2 gets input
Device(config-applet)# action label3 syslog msg "Input entered was \"$input\""
```

## Writing Input to the Active Console

When a synchronous policy is triggered, the related console is stored in the publish information specification. The policy director will query this information in an event\_reqinfo call, and store the given console information for use by the **action puts** command.

The **action puts** command will write the string to the active console. A new line will be displayed unless the **newline** keyword is specified. The output from the **action puts** command for a synchronous applet is displayed directly to the console, bypassing the system logger. The output of the **action puts** command for an asynchronous applet is directed to the system logger.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **event none**
5. **action** *label* **regexp** *string-pattern string-input* [*string-match* [*string-submatch1*] [*string-submatch2*] [*string-submatch3*]]
6. **action** *label* **puts** [**newline**] *string*
7. **exit**
8. **event manager run** *applet-name*

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                            | Purpose                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                   | Enters global configuration mode.                                                                                  |
| Step 3 | <b>event manager applet</b> <i>applet-name</i><br><b>Example:</b><br>Device(config)# event manager applet action                                                                             | Registers the applet with the EEM and enters applet configuration mode.                                            |
| Step 4 | <b>event none</b><br><b>Example:</b><br>Device(config-applet)# event none                                                                                                                    | Specifies that an EEM policy is to be registered with the EEM and can be run manually.                             |
| Step 5 | <b>action</b> <i>label</i> <b>regexp</b> <i>string-pattern string-input</i><br>[ <i>string-match</i> [ <i>string-submatch1</i> ] [ <i>string-submatch2</i> ]<br>[ <i>string-submatch3</i> ]] | Specifies the action to match the regular expression pattern on an input string when an EEM applet is triggered.   |

|               | Command or Action                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Device(config-applet)# action 1 regexp "(.*) (.*) (.*)" "one two three" _match _sub1</pre>                                                  |                                                                                                                                                                                                                                                                     |
| <b>Step 6</b> | <p><b>action</b> <i>label</i> <b>puts</b> [<b>newline</b>] <i>string</i></p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 2 puts "match is \$_match"</pre> | <p>Specifies the action of printing data directly to the local console when an EEM applet is triggered.</p> <ul style="list-style-type: none"> <li>The <b>newline</b> keyword is optional and is used to suppress the display of the new line character.</li> </ul> |
| <b>Step 7</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-applet)# exit</pre>                                                                                        | <p>Exits applet configuration mode and returns to privileged EXEC mode.</p>                                                                                                                                                                                         |
| <b>Step 8</b> | <p><b>event manager run</b> <i>applet-name</i></p> <p><b>Example:</b></p> <pre>Device# event manager run action</pre>                                                   | <p>Manually runs a registered EEM policy.</p> <ul style="list-style-type: none"> <li>In this example, the policy registered in Step 3 is triggered and the associated actions specified in Step 5 and Step 6 are executed.</li> </ul>                               |

### Example

The following example shows how the **action puts** command prints data directly to the local console:

```
Device(config-applet)# event manager applet puts
Device(config-applet)# event none
Device(config-applet)# action 1 regexp "(.*) (.*) (.*)" "one two three" _match _sub1
Device(config-applet)# action 2 puts "match is $_match"
Device(config-applet)# action 3 puts "submatch 1 is $_sub1"
Device# event manager run puts
match is one two three
submatch 1 is one
```

## Configuring SNMP Library Extensions

Depending on your release, the SNMP Library Extensions feature allows you to perform the following configurations.

### Prerequisites

To use this feature, you must be running Cisco IOS Release 12.4(22)T or a later release.

### SNMP Get and Set Operations

The SNMP Library Extensions feature extends the EEM applet **action info** and Tcl **sys\_reqinfo\_snmp** commands to include functionality for SNMP get-one, get-next, getid and set-any operations.

## SNMP Get Operation

The SNMP event manager performs the SNMP get operation to retrieve one or more variables for the managed objects. Using the **action info type snmp oid get-type** and **action info type snmp getid** commands, you can configure the SNMP event manager to send an SNMP get request by specifying the variables to retrieve, and the IP address of the agent.

For example, if you want to retrieve the variable with the OID value of 1.3.6.1.2.1.1.1, you should specify the variable value, that is 1.3.6.1.2.1.1.1. If the specified values do not match, a trap will be generated and an error message will be written to the syslog history.

The **action info type snmp oid get-type** command specifies the type of the get operation to be performed. To retrieve the exact variable, the get operation type should be specified as **exact**. To retrieve a lexicographical successor of the specified OID value, the get operation type should be set to **next**.

The table below shows the built-in variables, in which the values retrieved from SNMP get operation are stored.

*Table 199: Built-in Variables for action info type snmp oid Command*

| Built-in Variable       | Description                                           |
|-------------------------|-------------------------------------------------------|
| <b>_info_snmp_oid</b>   | The SNMP object ID.                                   |
| <b>_info_snmp_value</b> | The value string of the associated SNMP data element. |

## GetID Operation

The **action info type snmp getid** command retrieves the following variables from the SNMP entity:

- sysDescr.0
- sysObjectID.0
- sysUpTime.0
- sysContact.0
- sysName.0
- sysLocation.0

The table below shows the built-in variables, in which the values retrieved from the SNMP getID operation are stored.

*Table 200: Built-in Variables for action info type snmp getid Command*

| Built-in Variable                   | Description                                    |
|-------------------------------------|------------------------------------------------|
| <b>_info_snmp_syslocation_oid</b>   | The OID value of the sysLocation variable.     |
| <b>_info_snmp_syslocation_value</b> | The value string for the sysLocation variable. |
| <b>_info_snmp_sysdescr_oid</b>      | The OID value of the sysDescr variable.        |
| <b>_info_snmp_sysdescr_value</b>    | The value string for the sysDescr variable.    |
| <b>_info_snmp_sysobjectid_oid</b>   | The OID value of the sysObjectID variable.     |

| Built-in Variable                         | Description                                    |
|-------------------------------------------|------------------------------------------------|
| <code>_info_snmp_sysobjectid_value</code> | The value string for the sysObjectID variable. |
| <code>_info_snmp_sysuptime_oid</code>     | The OID value of the sysUptime variable.       |
| <code>_info_snmp_sysuptime_value</code>   | The value string for the sysUptime variable.   |
| <code>_info_snmp_syscontact_oid</code>    | The OID value of the sysContact variable.      |
| <code>_info_snmp_syscontact_value</code>  | The value string for the sysContact variable.  |

The get operation requests can be sent to both local and remote hosts.

## SNMP Set Operation

All SNMP variables are assigned a default value in the MIB view. The SNMP event manager can modify the value of these MIB variables through set operation. The set operation can be performed only on the system that allows read-write access.

To perform a set operation, you must specify the type of the variable and the value associated with it.

The table below shows the valid OID types and values for each OID type.

**Table 201: OID Type and Value for Set Operation**

| OID Type            | Description                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>counter32</b>    | A 32-bit number with a minimum value of 0. When the maximum value is reached, the counter resets to 0. Integer value in the range from 0 to 4294967295 is valid.                                                                                           |
| <b>gauge</b>        | A 32-bit number with a minimum value of 0. For example, the interface speed on a device is measured using a gauge object type. Integer value in the range from 0 to 4294967295 is valid.                                                                   |
| <b>integer</b>      | A 32-bit number used to specify a numbered type within the context of a managed object. For example, to set the operational status of a device interface, 1 represents up and 2 represents down. Integer value in the range from 0 to 4294967295 is valid. |
| <b>ipv4</b>         | IP version 4 address. IPv4 address in dotted decimal notation is valid.                                                                                                                                                                                    |
| <b>octet string</b> | An octet string in hexadecimal notation used to represent physical addresses. Text strings are valid.                                                                                                                                                      |
| <b>string</b>       | An octet string in text notation used to represent text strings. Text strings are valid.                                                                                                                                                                   |

| OID Type   | Description                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------|
| unsigned32 | A 32-bit number used to represent decimal value. Unsigned integer value in the range from 0 to 4294967295 is valid. |

The set operation can be carried out on both local and remote hosts.

## SNMP Traps and Inform Requests

Traps are SNMP notifications that alert the SNMP manager or the NMS to a network condition.

SNMP inform requests refer to the SNMP notifications that alert the SNMP manager to a network condition and request for confirmation of receipt from the SNMP manager.

An SNMP event occurs when SNMP MIB object ID values are sampled, or when the SNMP counter crosses a defined threshold. If the notifications are enabled and configured for such events, the SNMP traps or inform messages are generated. An SNMP notification event is triggered when an SNMP trap or inform message is received by the event manager server.

To send an SNMP trap or inform message when an Embedded Event Manager (EEM) applet is triggered, the **action info type snmp trap** and **action info type snmp inform** commands are used. The CISCO-EMBEDDED-EVENT-MGR-MIB.mib is used to define the trap and inform messages.

## Configuring EEM Applet for SNMP Get and Set Operations

While registering a policy with the event manager server, the actions associated with an SNMP event can be configured.

Perform this task to configure EEM applet for SNMP set and get operations.

### Before you begin

- SNMP event manager must be configured using the **snmp-server manager** command.
- The SNMP community string should be set by using the **snmp-server community** command to enable access to the SNMP entity.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. Do one of the following:
  - **event snmp oid** *oid-value* **get-type** {**exact** | **next**} **entry-op** *operator* **entry-val** *entry-value* [**exit-comb** | **and**] [**exit-op** *operator*] [**exit-val** *exit-value*] [**exit-time** *exit-time-value*] **poll-interval** *poll-int-value*
5. **action label info type snmp oid** *oid-value* **get-type** {**exact** | **next**} [**community** *community-string*] [**ipaddr** *ip-address*]
6. **action label info type snmp oid** *oid-value* **set-type** *oid-type* *oid-type-value* **community** *community-string* [**ipaddr** *ip-address*]
7. **action label info type snmp getid** *oid-value* [**community** *community-string*] [**ipaddr** *ip-address*]

## 8. exit

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                  |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                       |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                        |
| <b>Step 3</b> | <b>event manager applet <i>applet-name</i></b><br><b>Example:</b><br>Device(config)# event manager applet snmp                                                                                                                                                                                                                                                                                                                                                                                                                                    | Registers the applet with the event manager server and enters applet configuration mode.                                                                                                                                                                                                                                 |
| <b>Step 4</b> | Do one of the following: <ul style="list-style-type: none"> <li>• <b>event snmp oid <i>oid-value</i> get-type {exact   next} entry-op <i>operator</i> entry-val <i>entry-value</i>[exit-comb   and}] [exit-op <i>operator</i>] [exit-val <i>exit-value</i>] [exit-time <i>exit-time-value</i>] poll-interval <i>poll-int-value</i></b></li> </ul> <b>Example:</b><br>Device(config-applet)# event snmp oid<br><b>Example:</b><br>1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact<br><b>Example:</b><br>entry-op lt entry-val 5120000 poll-interval 90 | Specifies the event criteria that cause the EEM applet to run. <ul style="list-style-type: none"> <li>• In this example, an EEM event is triggered when free memory falls below the value of 5120000.</li> <li>• Exit criteria are optional, and if not specified, event monitoring is reenabled immediately.</li> </ul> |
| <b>Step 5</b> | <b>action label info type snmp oid <i>oid-value</i> get-type {exact  next} [community <i>community-string</i>] [ipaddr <i>ip-address</i>]</b><br><b>Example:</b><br>Device(config-applet)# action 1.3 info type<br><b>Example:</b><br>snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type<br><b>Example:</b><br>exact community public ipaddr 172.17.16.69                                                                                                                                                                                             | Specifies the type of get operation to perform. <ul style="list-style-type: none"> <li>• In this example, the type of get operation is specified as exact and community string is specified as public.</li> </ul>                                                                                                        |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                     |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <p><b>action label info type snmp oid <i>oid-value</i> set-type <i>oid-type</i> <i>oid-type-value</i> community <i>community-string</i> [<i>ipaddr ip-address</i>]</b></p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 1.4 info type</pre> <p><b>Example:</b></p> <pre>snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 set-type</pre> <p><b>Example:</b></p> <pre>integer 42220 sysName.0 community rw ipaddr</pre> <p><b>Example:</b></p> <pre>172.17.16.69</pre> | <p>(Optional) Specifies the variable to be set.</p> <ul style="list-style-type: none"> <li>In this example, the sysName.0 variable is specified for the set operation and community string is specified as rw.</li> </ul> <p><b>Note</b> For set operation, you must specify the SNMP community string.</p> |
| Step 7 | <p><b>action label info type snmp getid <i>oid-value</i> [<i>community</i> <i>community-string</i>] [<i>ipaddr ip-address</i>]</b></p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 1.3 info type</pre> <p><b>Example:</b></p> <pre>snmp getid community public ipaddr 172.17.16.69</pre>                                                                                                                                                                 | <p>(Optional) Specifies if the individual variables should be retrieved by the getid operation.</p>                                                                                                                                                                                                         |
| Step 8 | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config)# exit</pre>                                                                                                                                                                                                                                                                                                                                                                                              | <p>Exits global configuration mode and returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                 |

## Configuring EEM Applet for SNMP OID Notifications

Perform this task to configure SNMP notifications.

### Before you begin

- SNMP event manager must be configured using the **snmp-server manager** command and SNMP agents must be configured to send and receive SNMP traps generated for an EEM policy.
- SNMP traps and informs must be enabled by using the **snmp-server enable traps event-manager** and **snmp-server enable traps** commands, to allow traps and inform requests to be sent from the device to the event manager server.

### SUMMARY STEPS

- enable
- configure terminal

3. **event manager applet** *applet-name*
4. Do one of the following:
  - **event snmp oid** *oid-value* **get-type** {**exact** | **next**} **entry-op** *operator* **entry-val** *entry-value* [**exit-comb** | **and**] [**exit-op** *operator*] [**exit-val** *exit-value*] [**exit-time** *exit-time-value*] **poll-interval** *poll-int-value*
5. **action label info type snmp var** *variable-name* **oid** *oid-value* *oid-type* *oid-type-value*
6. **action label info type snmp trap enterprise-oid** *enterprise-oid-value* **generic-trapnum** *generic-trap-number* **specific-trapnum** *specific-trap-number* **trap-oid** *trap-oid-value* **trap-var** *trap-variable*
7. **action label info type snmp inform trap-oid** *trap-oid-value* **trap-var** *trap-variable* **community** *community-string* **ipaddr** *ip-address*
8. **exit**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                  |

|---------------|------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Step 8</b> | <b>exit</b><br><b>Example:</b><br><br>Device(config)# exit | Exits global configuration mode and returns to privileged mode. |

## Configuring Variable Logic for EEM Applets

The Variable Logic for EEM Applets feature adds the ability to apply conditional logic within EEM applets. Before variable logic is introduced, applets have a linear structure where each action is executed in the order in which they are configured when the event is triggered. Conditional logic introduces a control structure that can change the flow of actions within applets depending on conditional expressions. Each control structure can contain a list of applet actions including looping and if/else actions which determine if the structure is executed or not.

The information in applet configuration mode is presented as background to set the context for the action commands.

To provide a consistent user interface between the Tool Command Language (Tcl) and the applet (CLI) based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl based implementation.
- Event specification data is written using the CLI applet submode configuration statements in the applet-based implementation.

Applet configuration mode is entered using the event manager applet command. In applet configuration mode the config prompt changes to (config-applet)#. In applet configuration mode two types of config statements are supported:

- event - used to specify the event criteria to cause this applet to run.
- action - used to specify a built-in action to perform.

Multiple **action** applet config commands are allowed within an applet configuration. If no **action** applet config command is present, a warning is displayed, upon exit, stating no statements are associated with this applet. When no statements are associated with this applet, events get triggered but no action is taken. If no commands are specified in applet configuration mode, the applet will be removed upon exit. The exit applet config command is used to exit from applet configuration mode.

Depending on your release, the Variable Logic for EEM Applets feature allows you to perform the following configurations.

### Prerequisites

To use this feature, you must be running Cisco IOS Release 12.4(22)T or a later release.

### Configuring Variable Logic for EEM Applets

EEM 3.0 adds new applet action commands to permit simple variable logic within applets.

To configure the variable logic using action commands perform the following tasks.

## Specifying a Loop of Conditional Blocks

To specify a loop of a conditional block when an EEM applet is triggered, perform this task. In this task, a conditional loop is set to check if the value of the variable is less than 10. If the value of the variable is less than 10, then the message 'i is \$\_i' is written to the syslog.

**Note** Depending on your release, the **set** (EEM) command is replaced by the **action set** command. See the **action label set** command for more information. If the set (EEM) command is entered in certain releases, the IOS parser translates the **set** command to the **action label set** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **action label set**
5. **action label while** *string\_op1 operator string\_op2*
6. Add any action as required.
7. **action label end**

|--------|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                   |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                          | Enters global configuration mode.                                                                                                                                                    |
| Step 3 | <b>event manager applet</b> <i>applet-name</i><br><b>Example:</b><br>Device(config)# event manager applet condition | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.                                                                                     |
| Step 4 | <b>action label set</b><br><b>Example:</b><br>Device(config-applet)# <b>action 1.0 set i 2</b>                      | Sets an action for the event. <ul style="list-style-type: none"> <li>• In this example, the value of the variable i is set to 2.</li> </ul>                                          |
| Step 5 | <b>action label while</b> <i>string_op1 operator string_op2</i><br><b>Example:</b>                                  | Specifies a loop of a conditional block. <ul style="list-style-type: none"> <li>• In this example, a loop is set to check if the value of the variable i is less than 10.</li> </ul> |

|               | Command or Action                                                                                                          | Purpose                                                                                                                                                                             |
|---------------|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <code>Device(config-applet)# action 2 while \$i lt 10</code>                                                               |                                                                                                                                                                                     |
| <b>Step 6</b> | <p>Add any action as required.</p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 3 syslog msg "i is \$i"</pre> | <p>Performs the action as indicated by the action command.</p> <ul style="list-style-type: none"> <li>In this example, the message 'i is \$_i' is written to the syslog.</li> </ul> |
| <b>Step 7</b> | <p><code>action label end</code></p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 3 end</pre>                 | Exits from the running action.                                                                                                                                                      |

## Specifying if else Conditional Blocks

To specify the beginning of an if conditional statement followed by an else conditional statement, perform this task. The if or else conditional statements can be used in conjunction with each other or separately. In this task, the value of a variable is set to 5. An if conditional block is then specified to check if the value of the variable is less than 10. Provided the if conditional block is satisfied, an action command to output the message 'x is less than 10' is specified.

Following the if conditional block, an else conditional block is specified. Provided the if conditional block is not satisfied, an action command to output the message 'x is greater than 10' is specified.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **action label set** *variable-name variable-value*
5. **action label if** [*stringop1*] {**eq** | **gt** | **ge** | **lt** | **le** | **ne**} [*stringop2*]
6. Add any action as required.
7. **action label else**
8. Add any action as required.
9. **end**

## Specifying foreach Iterating Statements

To specify a conditional statement that iterates over an input string using the delimiter as a tokenizing pattern, perform this task. The foreach iteration statement is used to iterate through a collection to get the desired information. The delimiter is a regular expression pattern string. The token found in each iteration is assigned to the given iterator variable. All arithmetic calculations are performed as long integers with out any checks for overflow. In this task, the value of the variable x is set to 5. An iteration statement is set to run through

the input string red, blue, green, orange. For every element in the input string, a corresponding message is displayed on the screen.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **action label foreach** [*string-iterator*] [*string-input*] [*string-delimiter*]
5. Specify any action command
6. **action label end**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                       |

|--------|--------------------------------------------------------------------------------------------------------|--------------------------------|
| Step 6 | <p><b>action label end</b></p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 4.0 end</pre> | Exits from the running action. |

## Using Regular Expressions

To match a regular expression pattern with an input string, perform this task. Using regular expressions, you can specify the rules for a set of possible strings to be matched.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **action label regexp** *string-pattern string-input* [*string-match* [*string-submatch1*] [*string-submatch2*] [*string-submatch3*]]

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                                                                                                                                                                               | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                              |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                                                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                      |
| Step 3 | <p><b>event manager applet</b> <i>applet-name</i></p> <p><b>Example:</b></p> <pre>Device(config)# event manager applet<br/>regexp</pre>                                                                                                                                                                | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.                                                                                                                                                                                                                                                                                                       |
| Step 4 | <p><b>action label regexp</b> <i>string-pattern string-input</i> [<i>string-match</i> [<i>string-submatch1</i>] [<i>string-submatch2</i>] [<i>string-submatch3</i>]]</p> <p><b>Example:</b></p> <pre>Device(config-applet)# action 2.0 regexp "(.*)<br/>(.*) (.*)" "red blue green" _match _sub1</pre> | <p>Specifies an expression pattern to match with an input string.</p> <ul style="list-style-type: none"> <li>• In this example, an input string of ‘red blue green’ is specified. When the expression pattern matches the input string, the entire result <b>red blue green</b> is stored in the variable <b>_match</b> and the submatch <b>red</b> is stored in the variable <b>_sub1</b>.</li> </ul> |

## Incrementing the Values of Variables

To increment the value of variables, perform this task. In this task, the value of a variable is set to 20 and then the value is incremented by 12.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **action label set**
5. **action label increment** *variable-name long-integer*

### DETAILED STEPS

|               | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                              |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                          | Enters global configuration mode.                                                                                                                                                    |
| <b>Step 3</b> | <b>event manager applet</b> <i>applet-name</i><br><b>Example:</b><br>Device(config)# event manager applet increment                                 | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.                                                                                     |
| <b>Step 4</b> | <b>action label set</b><br><b>Example:</b><br>Device(config-applet)# <b>action 1.0 set varname 20</b>                                               | Sets an action for the event. <ul style="list-style-type: none"> <li>• In this example, the value of the variable is set to 20.</li> </ul>                                           |
| <b>Step 5</b> | <b>action label increment</b> <i>variable-name long-integer</i><br><b>Example:</b><br>Device(config-applet)# <b>action 2.0 increment varname 12</b> | Increments the value of variable by the specified long integer. <ul style="list-style-type: none"> <li>• In this example, the value of the variable is incremented by 12.</li> </ul> |

## Configuring Event SNMP Object

Perform this task to register the Simple Network Management Protocol (SNMP) object event for an Embedded Event Manager (EEM) applet that is run by sampling SNMP object.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **event snmp-object oid** *oid-value* **type** *value* **sync** {**yes** | **no**} **skip** {**yes** | **no**} **istable** {**yes** | **no**} [**default** *seconds*] [**maxrun** *maxruntime-number*]
5. **exit**

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>Purpose</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

If the <b>maxrun</b> keyword is not specified, the default applet run time is 20 seconds.</li> <li>• The <i>milliseconds</i> argument is the maximum runtime of the applet in milliseconds. If the argument is not specified, the default 20-second run-time limit is used.</li> </ul> |
| <b>Step 5</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config)# exit</pre> | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Disabling AAA Authorization

Perform this task to allow EEM policies to bypass AAA authorization when triggered.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name* [**authorization bypass**] [**class** *class-options*] [**trap**]
4. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                | Purpose                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                       | Enters global configuration mode.                                                                                  |
| Step 3 | <b>event manager applet</b> <i>applet-name</i> [ <b>authorization bypass</b> ] [ <b>class</b> <i>class-options</i> ] [ <b>trap</b> ]<br><b>Example:</b><br>Device(config)# event manager applet one class A authorization bypass | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.                   |
| Step 4 | <b>exit</b><br><b>Example:</b><br>Device(config-aaplet)# exit                                                                                                                                                                    | Exits device configuration applet mode and returns to privileged EXEC mode.                                        |

## Configuring Description of an Embedded Event Manager Applet

Perform this task to describe an EEM applet. The description of an applet can be added in any order, before or after any other applet configuration. Configuring a new description for an applet that already has a description overwrites the current description. An applet description is optional.

Perform this task to configure a new description for an applet.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **description** *line*
5. **event syslog pattern** *regular-expression*
6. **action** *label* **syslog msg** *msg-text*
7. **end**

## DETAILED STEPS

|        | Command or Action                | Purpose                                                                                                            |
|--------|----------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device> enable                                                                                                                                    |                                                                                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>event manager applet</b> <i>applet-name</i><br><b>Example:</b><br>Device(config)# event manager applet increment                               | Registers the applet with the EEM and enters applet configuration mode.                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <b>description</b> <i>line</i><br><b>Example:</b><br>Device(config-applet)# description "This applet looks for the word count in syslog messages" | Adds or modifies the description of an EEM applet that is run by sampling Simple Network Management Protocol (SNMP).                                                                                                                                                                                          |
| <b>Step 5</b> | <b>event syslog pattern</b> <i>regular-expression</i><br><b>Example:</b><br>Device(config-applet)# event syslog pattern "count"                   | Specifies the event criteria for an Embedded Event Manager (EEM) applet that is run by matching syslog messages.                                                                                                                                                                                              |
| <b>Step 6</b> | <b>action</b> <i>label</i> <b>syslog msg</b> <i>msg-text</i><br><b>Example:</b><br>Device(config-applet)# action 1 syslog msg hi                  | Specifies the action to be taken when an EEM applet is triggered. <ul style="list-style-type: none"> <li>• In this example, the action taken is to write a message to syslog.</li> <li>• The <i>msg-text</i> argument can be character text, an environment variable, or a combination of the two.</li> </ul> |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config-applet)# end                                                                                       | Exits applet configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                          |

# Configuration Examples for Writing Embedded Event Manager Policies Using Tcl

## Embedded Event Manager Applet Configuration Examples

The following examples show how to create an EEM applet for some of the EEM event detectors. These examples follow steps outlined in the [Registering and Defining an Embedded Event Manager Applet, on page 2013](#).

### Application-Specific Event Detector

The following example shows how a policy named EventPublish\_A runs every 20 seconds and publishes an event type numbered 1 to an EEM subsystem numbered 798. The subsystem value of 798 specifies that a publish event has occurred from an EEM policy. A second policy named EventPublish\_B is registered to run when the EEM event type 1 occurs with subsystem 798. When the EventPublish\_B policy runs, it sends a message to syslog containing data passed as an argument from the EventPublish\_A policy.

```
event manager applet EventPublish_A
 event timer watchdog time 20.0
 action 1.0 syslog msg "Applet EventPublish_A"
 action 2.0 publish-event sub-system 798 type 1 arg1 twenty
 exit
event manager applet EventPublish_B
 event application sub-system 798 type 1
 action 1.0 syslog msg "Applet EventPublish_B arg1 $_application_data1"
```

### CLI Event Detector

The following example shows how to specify an EEM applet to run when the Cisco IOS **write memory** CLI command is run. The applet provides a notification that this event has occurred via a syslog message. In the example, the **sync** keyword is configured with the **yes** argument, and this means that the event detector is notified when this policy completes running. The exit status of the policy determines whether the CLI command will be executed. In this example, the policy exit status is set to one and the CLI command runs.

```
event manager applet cli-match
 event cli pattern "write mem.*" sync yes
 action 1.0 syslog msg "$_cli_msg Command Executed"
 set 2.0 _exit_status 1
```

The following example shows an applet which matches the **cli pattern** with the test argument. When **show access-list test** is entered, the CLI event detector matches the test argument, and the applet is triggered. The **debug event manager detector cli** output is added to show num\_matches is set to one.

```
!
event manager applet EEM-PIPE-TEST
 event cli pattern "test" sync yes
 action 1.0 syslog msg "Pattern matched!"
!
*Aug 23 23:19:59.827: check_eem_cli_policy_handler: command_string=show access-lists test
*Aug 23 23:19:59.827: check_eem_cli_policy_handler: num_matches = 1, response_code = 4
*Aug 23 23:19:59.843: %HA_EM-6-LOG: EEM-PIPE-TEST: Pattern matched!
```

---

**Note** The functionality provided in the CLI event detector only allows a regular expression pattern match on a valid IOS CLI command itself. This does not include text after a pipe (|) character when redirection is used.

---

The following example shows that when **show version | include test** is entered, the applet fails to trigger because the CLI event detector does not match on characters entered after the pipe (|) character and the **debug event manager detector cli** output shows num\_matches is set to zero.

```
*Aug 23 23:20:16.827: check_eem_cli_policy_handler: command_string=show version
*Aug 23 23:20:16.827: check_eem_cli_policy_handler: num_matches = 0, response_code = 1
```

### Counter Event Detector and Timer Event Detector

The following example shows that the EventCounter\_A policy is configured to run once a minute and to increment a well-known counter called critical\_errors. A second policy--EventCounter\_B--is registered to be triggered when the well-known counter called critical\_errors exceeds a threshold of 3. When the EventCounter\_B policy runs, it resets the counter to 0.

```
event manager applet EventCounter_A
 event timer watchdog time 60.0
 action 1.0 syslog msg "EventCounter_A"
 action 2.0 counter name critical_errors op inc value 1
 exit
event manager applet EventCounter_B
 event counter name critical_errors entry-op gt entry-val 3 exit-op lt exit-val 3
 action 1.0 syslog msg "EventCounter_B"
 action 2.0 counter name critical_errors op set value 0
```

### Interface Counter Event Detector

The following example shows how a policy named EventInterface is triggered every time the receive\_throttle counter for Fast Ethernet interface 0/0 is incremented by 5. The polling interval to check the counter is specified to run once every 90 seconds.

```
event manager applet EventInterface
 event interface name FastEthernet0/0 parameter receive_throttle entry-op ge entry-val 5
 entry-val-is-increment true poll-interval 90
 action 1.0 syslog msg "Applet EventInterface"
```

### Resource Event Detector

The following example shows how to specify event criteria based on an ERM event report for a policy defined to report high CPU usage:

```
event manager applet policy-one
 event resource policy cpu-high
 action 1.0 syslog msg "CPU high at $_resource_current_value percent"
```

### RF Event Detector

The RF event detector is only available on networking devices that contain dual Route Processors (RPs). The following example shows how to specify event criteria based on an RF state change notification:

```
event manager applet start-rf
 event rf event rf_prog_initialization
 action 1.0 syslog msg "rf state rf_prog_initialization reached"
```

### RPC Event Detector

The RPC event detector allows an outside entity to make a Simple Object Access Protocol (SOAP) request to the device and invokes a defined EEM policy or script. The following example shows how an EEM applet called Event\_RPC is being registered to run an EEM script:

```
event manager applet Event_RPC
 event rpc
 action print puts "hello there"
```

The following example shows the format of the SOAP request and reply message:

```
<?xml version="1.0" encoding="UTF-8"?>
<SOAP:Envelope xmlns:SOAP="http://www.cisco.com/eem.xsd">
 <SOAP:Body>
 <run_eemscript>
 <script_name>Event_RPC</script_name>
 </run_eemscript>
 </SOAP:Body>
</SOAP:Envelope>
]]>]]>
<?xml version="1.0" encoding="UTF-8"?><SOAP:Envelope
xmlns:SOAP="http://www.cisco.com/eem.xsd"><SOAP:Body>
<run_eemscript_response><return_code>0</return_code><output></output></run_eemscript_response></SOAP:Body></SOAP:Envelope>]]>]]>
```

### SNMP Event Detector

The following example shows how to specify an EEM applet to run when the CPU usage is greater than 75 percent. When the EEM applet runs, the CLI commands **enable** and **show cpu processes** are run, and an e-mail containing the result of the **show cpu processes** command is sent to an engineer.

```
event manager applet snmpcpu75
 event snmp oid 1.3.6.1.4.1.9.9.109.1.1.1.1.3.1 get-type exact entry-op ge entry-val 75
 poll-interval 10
 action 1.0 cli command "enable"
 action 2.0 cli command "show process cpu"
 action 3.0 mail server "192.168.1.146" to "engineer@cisco.com" from "devtest@cisco.com"
 subject "B25 PBX Alert" body "$_cli_result"
```

The next example is more complex and shows how to configure an EEM applet that causes a switch to the secondary (redundant) Route Processor (RP) when the primary RP runs low on memory.

This example illustrates a method for taking preventative action against a software fault that causes a memory leak. The action taken here is designed to reduce downtime by switching over to a redundant RP when a possible memory leak is detected.

The figure below shows a dual RP device that is running an EEM image. An EEM applet has been registered through the CLI using the **event manager applet** command. The applet will run when the available memory on the primary RP falls below the specified threshold of 5,120,000 bytes. The applet actions are to write a message to syslog that indicates the number of bytes of memory available and to switch to the secondary RP.

**Figure 141: Dual RP Topology**

The commands used to register the policy are shown below.

```
event manager applet memory-demo
 event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000
 poll-interval 90
 action 1.0 syslog priority critical msg "Memory exhausted; current available memory is
```

```
$_snmp_oid_val bytes"
action 2.0 force-switchover
```

The registered applet is displayed using the **show event manager policy registered** command:

```
Device# show event manager policy registered
No. Type Event Type Time Registered Name
1 applet snmp Thu Jan30 05:57:16 2003 memory-demo
oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val {5120000}
poll-interval 90
action 1.0 syslog priority critical msg "Memory exhausted; current available memory is
$_snmp_oid_val bytes"
action 2.0 force-switchover
```

For the purpose of this example, a memory depletion is forced on the device, and a series of **show memory** commands are executed to watch the memory deplete:

```
Device# show memory
 Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212348444 119523060 92825384 92825384 92365916
Fast 53565260 131080 70360 60720 60720 60668
Device# show memory
 Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212364664 164509492 47855172 47855172 47169340
Fast 53565260 131080 70360 60720 60720 60668
Device# show memory
 Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212369492 179488300 32881192 32881192 32127556
Fast 53565260 131080 70360 60720 60720 60668
```

When the threshold is reached, an EEM event is triggered. The applet named memory-demo runs, causing a syslog message to be written to the console and a switch to be made to the secondary RP. The following messages are logged:

```
00:08:31: %HA_EM-2-LOG: memory-demo: Memory exhausted; current available memory is
4484196 bytes
00:08:31: %HA_EM-6-FMS_SWITCH_HARDWARE: fh_io_msg: Policy has requested a hardware
switchover
```

The following is partial output from the **show running-config** command on both the primary RP and the secondary (redundant) RP:

```
redundancy
mode sso
.
!
event manager applet memory-demo
event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val
5120000 poll-interval 90
action 1.0 syslog priority critical msg "Memory exhausted; current available memory
is $_snmp_oid_val bytes"
action 2.0 force-switchover
```

### SNMP Notification Event Detector

The following example shows how to configure the **snmp-server community public RW** and **snmp-server manager** commands before **event snmp-notification** is configured.

```
snmp-server community public RW
snmp-server manager
```

The following example shows how an EEM applet called SNMP\_Notification is being registered to run an EEM script when the device receives an SNMP notification on destination IP address 192.168.1.1 for object ID 1 whose value equals 10.

```
event manager applet SNMP_Notification
 event snmp-notification dest_ip_address 192.168.1.1 oid 1 op eq oid-value 10
 action 1 policy eem_script
```

### Syslog Event Detector

The following example shows how to specify an EEM applet to run when syslog identifies that Ethernet interface 1/0 is down. The applet sends a message about the interface to syslog.

```
event manager applet interface-down
 event syslog pattern \.*UPDOWN.*Ethernet1/0.*" occurs 4
 action 1.0 syslog msg "Ethernet interface 1/0 changed state 4 times"
```

## Configuration Examples for Embedded Event Manager Applet

### Example Identity Event Detector

The following example shows how a policy named “EventIdentity” is triggered every time the authentication on the Fast Ethernet interface 0 is success.

```
event manager applet EventIdentity
 event identity interface FastEthernet0 authc success
 action 1.0 syslog msg "Applet EventIdentity"
```

### Example MAT Event Detector

The following example shows how a policy named “EventMat” is triggered every time a mac-address is learned in the mac-address-table.

```
event manager applet EventMat
 event mat interface FastEthernet0
 action 1.0 syslog msg "Applet EventMat"
```

### Example Neighbor-Discovery Event Detector

The following example shows how a policy named “EventNeighbor” is triggered when a Cisco Discovery Protocol (CDP) cache entry changes.

```
event manager applet EventNeighbor
 event neighbor-discovery interface FastEthernet0 cdp all
 action 1.0 syslog msg "Applet EventNeighbor"
```

## Embedded Event Manager Manual Policy Execution Examples

The following examples show how to use the none event detector to configure an EEM policy (applet or script) to be run manually.

### Using the event manager run Command

This example shows how to run a policy manually using the **event manager run** command. The policy is registered using the **event none** command under applet configuration mode and then run from global configuration mode using the **event manager run** command.

```
event manager applet manual-policy
 event none
 action 1.0 syslog msg "Manual-policy triggered"
end
!
event manager run manual-policy
```

### Using the action policy Command

This example shows how to run a policy manually using the **action policy** command. The policy is registered using the **event none** command under applet configuration mode, and then the policy is executed using the **action policy** command in applet configuration mode.

```
event manager applet manual-policy
 event none
 action 1.0 syslog msg "Manual-policy triggered"
 exit
!
event manager applet manual-policy-two
 event none
 action 1.0 policy manual-policy
 end
!
event manager run manual-policy-two
```

## Embedded Event Manager Watchdog System Monitor (Cisco IOS) Event Detector Configuration Example

The following example shows how to configure three EEM applets to demonstrate how the Cisco IOS watchdog system monitor (IOSWDSysMon) event detector works.

### Watchdog System Monitor Sample1 Policy

The first policy triggers an applet when the average CPU usage for the process named IP Input is greater than or equal to 1 percent for 10 seconds:

```
event manager applet IOSWD_Sample1
 event ioswdsysmon sub1 cpu-proc taskname "IP Input" op ge val 1 period 10
 action 1.0 syslog msg "IOSWD_Sample1 Policy Triggered"
```

### Watchdog System Monitor Sample2 Policy

The second policy triggers an applet when the total amount of memory used by the process named Net Input is greater than 100 kb:

```
event manager applet IOSWD_Sample2
 event ioswdsysmon sub1 mem-proc taskname "Net Input" op gt val 100 is-percent false
 action 1.0 syslog msg "IOSWD_Sample2 Policy Triggered"
```

### Watchdog System Monitor Sample3 Policy

The third policy triggers an applet when the total amount of memory used by the process named IP RIB Update has increased by more than 50 percent over the sample period of 60 seconds:

```
event manager applet IOSWD_Sample3
 event ioswdsysmon sub1 mem-proc taskname "IP RIB Update" op gt val 50 is-percent true
 period 60
 action 1.0 syslog msg "IOSWD_Sample3 Policy Triggered"
```

The three policies are configured, and then repetitive large pings are made to the networking device from several workstations, causing the networking device to register some usage. This will trigger policies 1 and 2, and the console will display the following messages:

```
00:42:23: %HA_EM-6-LOG: IOSWD_Sample1: IOSWD_Sample1 Policy Triggered
00:42:47: %HA_EM-6-LOG: IOSWD_Sample2: IOSWD_Sample2 Policy Triggered
```

To view the policies that are registered, use the **show event manager policy registered** command:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system ioswdsysmon Off Fri Jul 23 02:27:28 2004 IOSWD_Sample1
 sub1 cpu_util {taskname {IP Input} op ge val 1 period 10.000 }
 action 1.0 syslog msg "IOSWD_Sample1 Policy Triggered"
2 applet system ioswdsysmon Off Fri Jul 23 02:23:52 2004 IOSWD_Sample2
 sub1 mem_used {taskname {Net Input} op gt val 100 is_percent FALSE}
 action 1.0 syslog msg "IOSWD_Sample2 Policy Triggered"
3 applet system ioswdsysmon Off Fri Jul 23 03:07:38 2004 IOSWD_Sample3
 sub1 mem_used {taskname {IP RIB Update} op gt val 50 is_percent TRUE period 60.000 }
 action 1.0 syslog msg "IOSWD_Sample3 Policy Triggered"
```

## Configuration SNMP Library Extensions Examples

### SNMP Get Operations Examples

The following example shows how to send a get request to the local host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
 1.3.6.1.2.1.1.1.0 get-type exact entry-op
 lt entry-val
 5120000 poll-interval
 90
Device(config-applet)# action 1.3 info type snmp oid
 1.3.6.1.2.1.1.1.0 get-type exact
 community
 public
Device(config-applet)# action 1.3 info type snmp oid
```

```
1.3.6.1.2.1.1.4.0 get-type next community
public
```

The following log message will be written to the SNMP event manager log:

```
1d03h:%HA_EM-6-LOG: lg: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgn: 1.3.6.1.2.1.1.5.0
```

The following example shows how to send a get request to a remote host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp oid
1.3.6.1.2.1.1.4.0 get-type next community
public ipaddr
172.17.16.69
Device(config-applet)# action 1.3 info type snmp getid
1.3.6.1.2.1.1.1.0 community
public ipaddr
172.17.16.69
```

The following log message is written to the SNMP event manager log:

```
1d03h:%HA_EM-6-LOG: lg: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgn: 1.3.6.1.2.1.1.5.0
```

## SNMP GetID Operations Examples

The following example shows how to send a getid request to the local host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp getid
community
public
```

The following log message is written to the SNMP event manager log:

```
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_oid=1.3.6.1.2.1.1.5.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_value=jubjub.cisco.com
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_oid=1.3.6.1.2.1.1.6.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_value=
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysdescr_oid=1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_oid=1.3.6.1.2.1.1.2.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_value=products.222
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_oid=1.3.6.1.2.1.1.3.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_oid=10131676
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_oid=1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_value=YYY
```

The following example shows how to send a getid request to a remote host.

```

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp getid
1.3.6.1.2.1.1.1.0 community
public ipaddr
172.17.16.69

```

The following log message is written to the SNMP event manager log:

```

1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_oid=1.3.6.1.2.1.1.5.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_value=jubjub.cisco.com
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_oid=1.3.6.1.2.1.1.6.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_value=
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysdescr_oid=1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_oid=1.3.6.1.2.1.1.2.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_value=products.222
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_oid=1.3.6.1.2.1.1.3.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_oid=10131676
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_oid=1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_value=YYY

```

## Set Operations Examples

The following example shows how to perform a set operation on the local host.

```

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp oid
1.3.6.1.2.1.1.4.0 set-type
integer
5 sysName.0 community
public

```

The following log message is written to the SNMP event manager log:

```

1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lset: XXX

```

The following example shows how to perform a set operation on a remote host.

```

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp oid
1.3.6.1.2.1.1.4.0 set-type integer
5 sysName.0 community
public ipaddr
172.17.16.69

```

The following log message is written to the SNMP event manager log:

```
1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lset: XXX
```

## Generating SNMP Notifications Examples

The following example shows how to configure SNMP traps for the sysUpTime.0 variable:

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp var
sysUpTime.0 oid
1.3.6.1.4.1.9.9.43.1.1.6.1.3.41 integer
2
Device(config-applet)# action 1.4 info type snmp trap
enterprise-oid
ciscoSyslogMIB.2 generic-trapnum
6 specific-trapnum
1 trap-oid
1.3.6.1.4.1.9.9.41.2.0.1 trap-var
sysUpTime.0
```

The following output is generated if the debug snmp packets command is enabled:

```
Device# debug snmp packets
1d04h: SNMP: Queuing packet to 172.69.16.2
1d04h: SNMP: V1 Trap, ent ciscoSyslogMIB.2, addr 172.19.rap 1
clogHistoryEntry.3 = 4
clogHistoryEntry.6 = 9999
1d04h: SNMP: Queuing packet to 172.19.208.130
1d04h: SNMP: V1 Trap, ent ciscoSyslogMIB.2, addr 172.19.rap 1
clogHistoryEntry.3 = 4
clogHistoryEntry.6 = 9999
1d04h: SNMP: Packet sent via UDP to 172.69.16.2
1d04h: SNMP: Packet sent via UDP to 172.69.16.2
infra-viewl0:

clogHistSeverity = error(4)
clogHistTimestamp = 9999
```

The following example shows how to configure SNMP inform requests for the sysUpTime.0 variable:

```

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op
 lt entry-val
 5120000 poll-interval
 90
Device(config-applet)# action 1.3 info type snmp var
 sysUpTime.0 oid
1.3.6.1.4.1.9.9.43.1.1.6.1.3.41 integer
 2
Device(config-applet)# action 1.4 info type snmp inform
 trap-oid
1.3.6.1.4.1.9.9.43.2.0.1 trap-var
 sysUpTime.0 community
 public ipaddr
 172.19.209.24

```

The following output is generated if the debug snmp packets command is enabled:

```

Device# debug snmp packets
1d04h: SNMP: Inform request, reqid 24, errstat 0, erridx 0
sysUpTime.0 = 10244391
snmpTrapOID.0 = ciscoConfigManMIB.2.0.1
ccmHistoryEventEntry.3.40 = 1
1d04h: SNMP: Packet sent via UDP to 172.19.209.24.162
1d04h: SNMP: Packet received via UDP from 172.19.209.24 on FastEthernet0/0
1d04h: SNMP: Response, reqid 24, errstat 0, erridx 0
1d04h: SNMP: Response, reqid 24, errstat 0, erridx 0
1d04h: SNMP: Inform request, reqid 25, errstat 0, erridx 0
sysUpTime.0 = 10244396
snmpTrapOID.0 = ciscoConfigManMIB.2.0.1
ccmHistoryEventEntry.3.41 = 2
1d04h: SNMP: Packet sent via UDP to 172.19.209.24.162
1d04h: SNMP: Packet received via UDP from 172.19.209.24 on FastEthernet0/0
1d04h: SNMP: Response, reqid 25, errstat 0, erridx 0

5d04h: SNMP: Packet received via UDP from 172.19.209.23 on FastEthernet0/0
5d04h: SNMP: Inform request, reqid 25, errstat 0, erridx 0

```

## Configuring Variable Logic for EEM Applets Examples

The following sections provide examples on some selected action commands. For information on all the action commands supporting variable logic within applets, see the table below.

In this example, conditional loops **while**, **if** and **foreach** are used to print data. Other action commands such as **action divide**, **action increment** and **action puts** are used to define the actions to be performed when the conditions are met.

```
event manager applet printdata
```

```

event none
action 100 set colors "red green blue"
action 101 set shapes "square triangle rectange"
action 102 set i "1"
action 103 while $i lt 6
action 104 divide $i 2
action 105 if $_remainder eq 1
action 106 foreach_iterator "$colors"
action 107 puts newline "$_iterator "
action 108 end
action 109 puts ""
action 110 else
action 111 foreach_iterator "$shapes"
action 112 puts newline "$_iterator "
action 113 end
action 114 puts ""
action 115 end
action 116 increment i
action 117 end

```

When the event manager applet ex is run, the following output is obtained:

```

event manager run printdata
red green blue
square triangle rectange
red green blue
square triangle rectange
red green blue

```

In this example, two environment variables `poll_interface` and `max_rx_rate` are set to `F0/0` and `3` respectively. Every 30 seconds there is a poll on an interface for rx rate. If the rx rate is greater than the threshold, a syslog message is displayed.

This applet makes use of the `foreach` conditional statement to poll the interface, the `if` conditional block to compare the value under `RXPS` with `max_rx_rate` that was set in the EEM environment variable.

```

event manager environment poll_interfaces F0/0
event manager environment max_rx_rate 3
ev man app check_rx_rate
ev timer watchdog name rx_timer time 30
action 100 foreach int $poll_interfaces
action 101 cli command "en"
action 102 cli command "show int $int summ | beg -----"
action 103 foreach line $_cli_result "\n"
action 105 regexp ".*[0-9]+\s+[0-9]+\s+[0-9]+\s+[0-9]+\s+[0-9]+\s+[0-9]+\s+([0-9])\s+.*" $line
junk rxps
action 106 if $_regexp_result eq 1
action 107 if $rxps gt $max_rx_rate
action 108 syslog msg "Warning rx rate for $int is > than threshold. Current value is
$rxps
(threshold is $max_rx_rate)"
action 109 end
action 110 end
action 111 end
action 112 end

```

Example syslog message:

```

Oct 16 09:29:26.153: %HA_EM-6-LOG: c: Warning rx rate for F0/0 is > than threshold.
Current value is 4 (threshold is 3)
The output of show int F0/0 summ is of the format:

```

```
#show int f0/0 summ

*: interface is up
IHQ: pkts in input hold queue IQD: pkts dropped from input queue
OHQ: pkts in output hold queue OQD: pkts dropped from output queue
RXBS: rx rate (bits/sec) RXPS: rx rate (pkts/sec)
TXBS: tx rate (bits/sec) TXPS: tx rate (pkts/sec)
TRTL: throttle count

Interface IHQ IQD OHQ OQD RXBS RXPS TXBS TXPS TRTL

* FastEthernet0/0 0 87283 0 0 0 0 0 0 0
```

**Note** To use other action commands supporting variable logic within applets, use the commands listed in the table below.

**Table 202: Available action commands**

| Action Commands         | Purpose                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| action add              | Adds the value of two variables when an EEM applet is triggered.                                                                         |
| action append           | Appends the given value to the current value of a variable when an EEM applet is triggered.                                              |
| action break            | Causes an immediate exit from a loop of actions when an EEM applet is triggered                                                          |
| action comment          | Adds comments to an applet when an EEM applet is triggered                                                                               |
| action context retrieve | Retrieves variables identified by a given set of context name keys when an EEM applet is triggered.                                      |
| action context save     | Saves information across multiple policy triggers when an EEM applet is triggered.                                                       |
| action continue         | Continues with a loop of actions when an EEM applet is triggered.                                                                        |
| action decrement        | Decrements the value of a variable when an EEM applet is triggered.                                                                      |
| action divide           | Divides the dividend value by the given divisor value when an EEM applet is triggered.                                                   |
| action else             | Specifies the beginning of else conditional action block in if / else conditional action block when an EEM applet is triggered.          |
| action elseif           | Identifies the beginning of the else conditional action block in the else / if conditional action block when an EEM applet is triggered. |

| Action Commands                  | Purpose                                                                                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action end                       | Specifies the identification of the end of an conditional action block in the if / else and while conditional action block when an EEM applet is triggered. |
| action exit                      | Specifies an immediate exit from the running applet configuration when an EEM applet is triggered.                                                          |
| action foreach                   | Specifies the iteration of an input string using the delimiter as a tokenizing pattern, when an EEM applet is triggered.                                    |
| action gets                      | Gets an input from the local TTY in a synchronous applet and store the value in the given variable when an EEM applet is triggered.                         |
| action if                        | Specifies the identification of the beginning of an if conditional block when an EEM applet is triggered.                                                   |
| action if goto                   | Instructs the applet to jump to a given label if the specified condition is true when an EEM applet is triggered.                                           |
| action increment                 | Increments the value of a variable when an EEM applet is triggered.                                                                                         |
| action info type interface-names | Specifies the action of obtaining interface names when an EEM applet is triggered.                                                                          |
| action info type snmp getid      | Retrieves the individual variables from a Simple Network Management Protocol (SNMP) entity during the SNMP get operation.                                   |
| action info type snmp inform     | Sends an SNMP inform requests when an EEM applet is triggered.                                                                                              |
| action info type snmp oid        | Specifies the type of SNMP get operation and the object to retrieve during the SNMP set operation, when an EEM applet is triggered.                         |
| action info type snmp trap       | Sends SNMP trap requests when an EEM applet is triggered.                                                                                                   |
| action info type snmp var        | Creates a variable for an SNMP object identifier (OID) and its value from an EEM applet                                                                     |
| action multiply                  | Specifies the action of multiplying the variable value with a specified given integer value when an EEM applet is triggered.                                |
| action puts                      | Enables the action of printing data directly to the local tty when an EEM applet is triggered.                                                              |

| Action Commands       | Purpose                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| action regexp         | Specifies the action of matching a regular expression pattern on an input string when an EEM applet is triggered.                             |
| action set (EEM)      | Specifies the action of setting the value of a variable when an EEM applet is triggered.                                                      |
| action string compare | Specifies the action of comparing two unequal strings when an EEM applet is triggered.                                                        |
| action string equal   | Specifies the action of verifying whether or not two strings are equal when an EEM applet is triggered                                        |
| action string first   | Specifies the action of returning the index on the first occurrence of string1 within string2 when an EEM applet is triggered.                |
| action string index   | Specifies the action of returning the characters specified at a given index value when an EEM applet is triggered.                            |
| action string last    | Specifies the action of returning the index on the last occurrence of string1 within string 2 when an EEM applet is triggered.                |
| action string length  | Specifies the action of returning the number of characters in a string when the EEM applet is triggered.                                      |
| action string match   | Specifies the action of returning 1 to the <code>\$_string_result</code> , if the string matches the pattern when an EEM applet is triggered. |
| action string range   | Specifies the action of storing a range of characters in a string when an EEM applet is triggered.                                            |
| action string replace | Specifies the action of storing a new string by replacing range of characters in the specified string when an EEM applet is triggered.        |
| action string tolower | Specifies the action of storing specific range of characters of a string in lowercase when an EEM applet is triggered.                        |
| action string toupper | Specifies the action of storing specific range of characters of a string in uppercase when an EEM applet is triggered.                        |
| action string trim    | Specifies the action to trim a string when an EEM applet is triggered.                                                                        |

| Action Commands         | Purpose                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| action string trimleft  | Specifies the action to trim the characters of one string from the left end of another string when an EEM applet is triggered. |
| action string trimright | Specifies the action to trim the characters one string from the right end of another string when an EEM applet is triggered.   |
| action subtract         | Subtracts the value of a variable from another value when an EEM applet is triggered.                                          |
| action while            | Specifies the action of identifying the beginning of a loop of conditional block when an EEM applet is triggered.              |

## Configuring Event SNMP-Object Examples

The following example shows the SET operation and the value to set is in `$_snmp_value` and it is managed by the script. The example below saves the oid and its value as contexts to be retrieved later.

```
event manager applet snmp-object1
 description "APPLET SNMP-OBJ-1"
 event snmp-object oid 1.3.6.1.2.1.31.1.1.1.18 type string sync no skip no istable yes
 default 0
 action 1 syslog msg "SNMP-OBJ1:TRIGGERED" facility "SNMP_OBJ"
 action 2 context save key myoid variable "_snmp_oid"
 action 3 context save key myvalue variable "_snmp_value"
```

## Configuring Description of an EEM Applet Examples

The following example shows how to add or modify the description for an Embedded Event Manager (EEM) applet that is run by sampling Simple Network Management Protocol (SNMP):

```
event manager applet test
 description "This applet looks for the word count in syslog messages"
 event syslog pattern "count"
 action 1 syslog msg hi
```

## Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 203: Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI**

| Feature Name               | Releases  | Feature Information                                                    |
|----------------------------|-----------|------------------------------------------------------------------------|
| Embedded Event Manager 4.0 | 15.2(5)E1 | This feature was introduced and is supported only on c2960cx platform. |

## CHAPTER 101

# Writing Embedded Event Manager Policies Using Tcl

---

This module describes how software developers can write and customize Embedded Event Manager (EEM) policies using Tool command language (Tcl) scripts to handle Cisco software faults and events. EEM is a policy-driven process by means of which faults in the Cisco software system are reported through a defined application programming interface (API). The EEM policy engine receives notifications when faults and other events occur. EEM policies implement recovery on the basis of the current state of the system and the actions specified in the policy for a given event. Recovery actions are triggered when the policy is run.

- [Prerequisites for Writing Embedded Event Manager Policies Using Tcl, on page 2075](#)
- [Information About Writing Embedded Event Manager Policies Using Tcl, on page 2075](#)
- [How to Write Embedded Event Manager Policies Using Tcl, on page 2082](#)
- [Configuration Examples for Writing Embedded Event Manager Policies Using Tcl, on page 2111](#)
- [Additional References, on page 2132](#)

## Prerequisites for Writing Embedded Event Manager Policies Using Tcl

- Before writing EEM policies, you should be familiar with the “ Embedded Event Manager Overview ” module.
- If you want to write EEM policies using the command-line interface (CLI) commands, you should be familiar with the “ Writing Embedded Event Manager Policies Using the Cisco IOS CLI ” module.

## Information About Writing Embedded Event Manager Policies Using Tcl

### EEM Policies

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or reach a threshold. An EEM policy is an entity that defines an event and the actions to be taken

when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the command-line interface (CLI) configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

### EEM Applet

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs. In EEM applet configuration mode, three types of configuration statements are supported. The event commands are used to specify the event criteria to trigger the applet to run, the action commands are used to specify an action to perform when the EEM applet is triggered, and the **set** command is used to set the value of an EEM applet variable. Currently only the `_exit_status` variable is supported for the **set** command.

Only one event configuration command is allowed within an applet configuration. When applet configuration submode is exited and no event command is present, a warning is displayed stating that no event is associated with the applet. If no event is specified, the applet is not considered registered. When no action is associated with the applet, events are still triggered but no actions are performed. Multiple action configuration commands are allowed within an applet configuration. Use the **show event manager policy registered** command to display a list of registered applets.

Before modifying an EEM applet, be aware that the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. It is safe to modify the applet without unregistering it, because changes are written to a temporary file. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

Action configuration commands within an applet are uniquely identified using the *label* argument, which can be any string value. Actions are sorted within an applet in ascending alphanumeric key sequence using the *label* argument as the sort key, and they are run using this sequence. The same *label* argument can be used in different applets; the labels must be unique only within one applet.

The Embedded Event Manager schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the event and action commands that are entered and registers the applet to be run when a specified event occurs.

For more details about writing EEM policies using the Cisco IOS CLI, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

### EEM Script

All Embedded Event Manager scripts are written in Tcl. Tcl is a string-based command language that is interpreted at run time. The version of Tcl supported is Tcl version 8.3.4 plus added script support. Scripts are defined using an ASCII editor on another device, not on the networking device. The script is then copied to the networking device and registered with EEM. Tcl scripts are supported by EEM. As an enforced rule, Embedded Event Manager policies are short-lived run time routines that must be interpreted and executed in less than 20 seconds of elapsed time. If more than 20 seconds of elapsed time are required, the `maxrun` parameter may be specified in the `event_register` statement to specify any desired value.

EEM policies use the full range of the Tcl language’s capabilities. However, Cisco provides enhancements to the Tcl language in the form of Tcl command extensions that facilitate the writing of EEM policies. The main categories of Tcl command extensions identify the detected event, the subsequent action, utility information, counter values, and system information.

EEM allows you to write and implement your own policies using Tcl. Writing an EEM script involves:

- Selecting the event Tcl command extension that establishes the criteria used to determine when the policy is run.
- Defining the event detector options associated with detecting the event.
- Choosing the actions to implement recovery or respond to the detected event.

## EEM Policy Tcl Command Extension Categories

There are different categories of EEM policy Tcl command extensions.

**Note** The Tcl command extensions available in each of these categories for use in all EEM policies are described in later sections in this document.

*Table 204: EEM Policy Tcl Command Extension Categories*

| Category                                                                                                 | Definition                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EEM event Tcl command extensions (three types: event information, event registration, and event publish) | This category is represented by the <b>event_register_</b> xxx family of event-specific commands. There is a separate event information Tcl command extension in this category as well: <b>event_reqinfo</b> . This is the command used in policies to query the EEM for information about an event. There is also an EEM event publish Tcl command extension <b>event_publish</b> that publishes an application-specific event. |
| EEM action Tcl command extensions                                                                        | These Tcl command extensions (for example, <b>action_syslog</b> ) are used by policies to respond to or recover from an event or fault. In addition to these extensions, developers can use the Tcl language to implement any action desired.                                                                                                                                                                                    |
| EEM utility Tcl command extensions                                                                       | These Tcl command extensions are used to retrieve, save, set, or modify application information, counters, or timers.                                                                                                                                                                                                                                                                                                            |
| EEM system information Tcl command extensions                                                            | This category is represented by the <b>sys_reqinfo_</b> xxx family of system-specific information commands. These commands are used by a policy to gather system information.                                                                                                                                                                                                                                                    |
| EEM context Tcl command extensions                                                                       | These Tcl command extensions are used to store and retrieve a Tcl context (the visible variables and their values).                                                                                                                                                                                                                                                                                                              |

## General Flow of EEM Event Detection and Recovery

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, the core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs.

When an event or fault is detected, Embedded Event Manager determines from the event publishers--an example would be the OIR events publisher in the figure below--if a registration for the encountered fault or event has occurred. EEM matches the event registration information with the event data itself. A policy registers for the detected event with the Tcl command extension `event_register _xxx`. The event information Tcl command extension `event_reqinfo` is used in the policy to query the Embedded Event Manager for information about the detected event.

Figure 142: Embedded Event Manager Core Event Detectors

## Safe-Tcl

Safe-Tcl is a safety mechanism that allows untrusted Tcl scripts to run in an interpreter that was created in the safe mode. The safe interpreter has a restricted set of commands that prevent accessing some system resources and harming the host and other applications. For example, it does not allow commands to access critical Cisco IOS file system directories.

Cisco-defined scripts run in full Tcl mode, but user-defined scripts run in Safe-Tcl mode. Safe-Tcl allows Cisco to disable or customize individual Tcl commands. For more details about Tcl commands, go to <http://www.tcl.tk/man/>.

The following list of Tcl commands are restricted with a few exceptions. Restrictions are noted against each command or command keyword:

- `cd` --Change directory is not allowed to one of the restricted Cisco directory names.

- **encoding** --The commands **encoding names**, **encoding convertfrom**, and **encoding convertto** are permitted. The **encoding system** command with no arguments is permitted, but the **encoding system** command with the **?encoding?** keyword is not permitted.
- **exec** --Not permitted.
- **fconfigure** --Permitted.
- **file** --The following are permitted:
  - **file dirname**
  - **file exists**
  - **file extension**
  - **file isdirectory**
  - **file join**
  - **file pathtype**
  - **file rootname**
  - **file split**
  - **file stat**
  - **file tail**
- **file** --The following are not permitted:
  - **file atime**
  - **file attributes**
  - **file channels**
  - **file copy**
  - **file delete**
  - **file executable**
  - **file isfile**
  - **file link**
  - **file lstat**
  - **file mkdir**
  - **file mtime**
  - **file nativename**
  - **file normalize**
  - **file owned**
  - **file readable**
  - **file readlink**
  - **file rename**
  - **file rootname**
  - **file separator**
  - **file size**
  - **file system**
  - **file type**
  - **file volumes**
  - **file writable**
- **glob** --The **glob** command is not permitted when searching in one of the restricted Cisco directories. Otherwise, it is permitted.

- **load** --Only files that are in the user policy directory or the user library directory are permitted to be loaded. Static packages (for example, libraries that consist of C code) are not permitted to be loaded with the **load** command.
- **open** --The **open** command is not allowed for a file that is located in one of the restricted Cisco directories.
- **pwd** --The **pwd** command is not permitted.
- **socket** --The **socket** command is permitted.
- **source** --The **source** command is permitted for files that are in the user policy directory or the user library directory.

## Bytecode Support for EEM 2.4

EEM 2.4 introduces bytecode language (BCL) support by accepting files with the standard bytecode script extension `.tbc`. Tcl version 8.3.4 defines a BCL and includes a compiler that translates Tcl scripts into BCL. Valid EEM policy file extensions in EEM 2.4 for user and system policies are `.tcl` (Tcl Text files) and `.tbc` (Tcl bytecode files).

Storing Tcl scripts in bytecode improves the execution speed of the policy because the code is precompiled, creates a smaller policy size, and obscures the policy code. Obfuscation makes it a little more difficult to modify scripts and hides logic to preserve intellectual property rights.

Support for bytecode is being added to provide another option for release of supported and trusted code. We recommend that you only run well understood, or trusted and supported software on network devices. To generate Tcl bytecode for IOS EEM support, use TclPro versions 1.4 or 1.5.

To translate a Tcl script to bytecode you can use `procomp`, part of Free TclPro Compiler, or Active State Tcl Development Kit. When a Tcl script is compiled using `procomp`, the code is scrambled and a `.tbc` file is generated. The bytecode files are platform-independent and can be generated on any operating system on which TclPro is available, including Windows, Linux, and UNIX. `Procomp` is part of TclPro and available from <http://www.tcl.tk/software/tclpro>.

## Registration Substitution

In addition to regular Tcl substitution, EEM 2.3 permits the substitution of an individual parameter in an EEM event registration statement line with an environment variable.

EEM 2.4 introduces the ability to replace multiple parameters in event registration statement lines with a single environment variable.

---

**Note** Only the first environment variable supports multiple parameter substitution. Individual parameters can still be specified with additional environment variables after the initial variable.

---

To illustrate the substitution, a single environment variable, `$_eem_syslog_statement` is configured as:

```
::cisco::eem::event_register_syslog pattern COUNT
```

Using the registration substitution, the `$_eem_syslog_statement` environment variable is used in the following EEM user policy:

```
$_eem_syslog_statement occurs $_eem_occurs_val
action_syslog "this is test 3"
```

Environment variables must be defined before a policy using them is registered. To define the `$_eem_syslog_statement` environment variable:

```
Device(config)# event manager environment eem_syslog_statement
::cisco::eem::event_register_syslog pattern COUNT
Device(config)# event manager environment eem_occurs_val 2
```

## Cisco File Naming Convention for EEM

All Embedded Event Manager policy names, policy support files (for example, e-mail template files), and library filenames are consistent with the Cisco file naming convention. In this regard, Embedded Event Manager policy filenames adhere to the following specification:

- An optional prefix--Mandatory.--indicating, if present, that this is a system policy that should be registered automatically at boot time if it is not already registered. For example: Mandatory.sl\_text.tcl.
- A filename body part containing a two-character abbreviation (see the table below) for the first event specified; an underscore part; and a descriptive field part that further identifies the policy.
- A filename suffix part defined as .tcl.

Embedded Event Manager e-mail template files consist of a filename prefix of email\_template, followed by an abbreviation that identifies the usage of the e-mail template.

Embedded Event Manager library filenames consist of a filename body part containing the descriptive field that identifies the usage of the library, followed by \_lib, and a filename suffix part defined as .tcl.

**Table 205: Two-Character Abbreviation Specification**

|    |                            |
|----|----------------------------|
| ap | event_register_appl        |
| cl | event_register_cli         |
| ct | event_register_counter     |
| go | event_register_gold        |
| if | event_register_interface   |
| io | event_register_ioswdsysmon |
| la | event_register_ipsla       |
| nf | event_register_nf          |
| no | event_register_none        |
| oi | event_register_oir         |
| pr | event_register_process     |
| rf | event_register_rf          |

|    |                                  |
|----|----------------------------------|
| rs | event_register_resource          |
| rt | event_register_routing           |
| rp | event_register_rpc               |
| sl | event_register_syslog            |
| sn | event_register_snmp              |
| st | event_register_snmp_notification |
| so | event_register_snmp_object       |
| tm | event_register_timer             |
| tr | event_register_track             |
| ts | event_register_timer_subscriber  |
| wd | event_register_wdsysmon          |

# How to Write Embedded Event Manager Policies Using Tcl

## Registering and Defining an EEM Tcl Script

Perform this task to configure environment variables and register an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When an EEM policy is registered, the software examines the policy and registers it to be run when the specified event occurs.

### Before you begin

You must have a policy available that is written in the Tcl scripting language. Sample policies are provided--see the details in the [Sample EEM Policies, on page 2093](#) to see which policies are available for the Cisco IOS release image that you are using--and these sample policies are stored in the system policy directory.

### SUMMARY STEPS

1. **enable**
2. **show event manager environment** [**all**] *variable-name*
3. **configure terminal**
4. **event manager environment** *variable-name string*
5. Repeat [Registering and Defining an EEM Tcl Script](#) to configure all the environment variables required by the policy to be registered in [Registering and Defining an EEM Tcl Script](#).
6. **event manager policy** *policy-filename* [**type** {**system**|**user**}] [**trap**]
7. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>show event manager environment [all] variable-name</b><br><b>Example:</b><br><pre>Device# show event manager environment all</pre>                                                                                | (Optional) Displays the name and value of EEM environment variables. <ul style="list-style-type: none"> <li>• The optional <b>all</b> keyword displays all the EEM environment variables.</li> <li>• The optional <i>variable-name</i> argument displays information about the specified environment variable.</li> </ul>                                                                                                                                                                                                       |
| Step 3 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 4 | <b>event manager environment variable-name string</b><br><b>Example:</b><br><pre>Device(config)# event manager environment _cron_entry 0-59/2 0-23/1 * * 0-6</pre>                                                   | Configures the value of the specified EEM environment variable. <ul style="list-style-type: none"> <li>• In this example, the software assigns a CRON timer environment variable to be set to the second minute of every hour of every day.</li> </ul>                                                                                                                                                                                                                                                                          |
| Step 5 | Repeat <a href="#">Registering and Defining an EEM Tcl Script</a> to configure all the environment variables required by the policy to be registered in <a href="#">Registering and Defining an EEM Tcl Script</a> . | --                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 6 | <b>event manager policy policy-filename [type {system user}] [trap]</b><br><b>Example:</b><br><pre>Device(config)# event manager policy tm_cli_cmd.tcl type system</pre>                                             | Registers the EEM policy to be run when the specified event defined within the policy occurs. <ul style="list-style-type: none"> <li>• Use the <b>system</b> keyword to register a Cisco-defined system policy.</li> <li>• Use the <b>user</b> keyword to register a user-defined system policy.</li> <li>• Use the <b>trap</b> keyword to generate an SNMP trap when the policy is triggered.</li> <li>• In this example, the sample EEM policy named <code>tm_cli_cmd.tcl</code> is registered as a system policy.</li> </ul> |
| Step 7 | <b>exit</b><br><b>Example:</b><br><pre>Device(config)# exit</pre>                                                                                                                                                    | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Examples

In the following example, the **show event manager environment** privileged EXEC command is used to display the name and value of all EEM environment variables.

```
Device# show event manager environment all
No. Name Value
1 _cron_entry 0-59/2 0-23/1 * * 0-6
2 _show_cmd show ver
3 _syslog_pattern .*UPDOWN.*Ethernet1/0.*
4 _config_cmd1 interface Ethernet1/0
5 _config_cmd2 no shut
```

## Displaying EEM Registered Policies

Perform this optional task to display EEM registered policies.

### SUMMARY STEPS

1. **enable**
2. **show event manager policy registered** [**event-type** *event-name*] [**time-ordered**|**name-ordered**] [**detailed** *policy-filename*]

### DETAILED STEPS

#### Step 1 enable

Enables privileged EXEC mode. Enter your password if prompted.

#### Example:

```
Device> enable
```

#### Step 2 show event manager policy registered [event-type *event-name*] [time-ordered|name-ordered] [detailed *policy-filename*]

Use this command with the **time-ordered** keyword to display information about currently registered policies sorted by time, for example:

#### Example:

```
Device# show event manager policy registered time-ordered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Wed May11 01:43:18 2005 tm_cli_cmd.tcl
 name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7}
 nice 0 priority normal maxrun 240
2 system syslog Off Wed May11 01:43:28 2005 sl_intf_down.tcl
 occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
 nice 0 priority normal maxrun 90
3 system proc abort Off Wed May11 01:43:38 2005 pr_cdp_abort.tcl
 instance 1 path {cdp2.iosproc}
 nice 0 priority normal maxrun 20
```

Use this command with the **name-ordered** keyword to display information about currently registered policies sorted by name, for example:

**Example:**

```
Device# show event manager policy registered name-ordered
No. Type Event Type Trap Time Registered Name
1 system proc abort Off Wed May11 01:43:38 2005 pr_cdp_abort.tcl
 instance 1 path {cdp2.iosproc}
 nice 0 priority normal maxrun 20
2 system syslog Off Wed May11 01:43:28 2005 sl_intf_down.tcl
 occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
 nice 0 priority normal maxrun 90
3 system timer cron Off Wed May11 01:43:18 2005 tm_cli_cmd.tcl
 name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7}
 nice 0 priority normal maxrun 240
```

Use this command with the **event-type** keyword to display information about currently registered policies for the event type specified in the *event-name* argument, for example:

**Example:**

```
Device# show event manager policy registered event-type syslog
No. Type Event Type Time Registered Name
1 system syslog Wed May11 01:43:28 2005 sl_intf_down.tcl
 occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
 nice 0 priority normal maxrun 90
```

## Unregistering EEM Policies

Perform this task to remove an EEM policy from the running configuration file. Execution of the policy is canceled.

### SUMMARY STEPS

1. **enable**
2. **show event manager policy registered** [**event-type** *event-name*][**system**| **user**] [**time-ordered**| **name-ordered**] [**detailed** *policy-filename*]
3. **configure terminal**
4. **no event manager policy** *policy-filename*
5. **exit**
6. Repeat [Unregistering EEM Policies](#) to ensure that the policy has been removed.

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                           | Purpose                                                                                                            |

|               | <p><b>Example:</b></p> <pre>Device# show event manager policy registered</pre>                                                                                                      | <ul style="list-style-type: none"> <li>The optional <b>system</b> or <b>user</b> keyword displays the registered system or user policies.</li> <li>If no keywords are specified, EEM registered policies for all event types are displayed in time order.</li> </ul> |
| <b>Step 3</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                    |
| <b>Step 4</b> | <p><b>no event manager policy <i>policy-filename</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# no event manager policy pr_cdp_terminate.tcl</pre>                         | <p>Removes the EEM policy from the configuration, causing the policy to be unregistered.</p> <ul style="list-style-type: none"> <li>In this example, the <b>no</b> form of the command is used to unregister a specified policy.</li> </ul>                          |
| <b>Step 5</b> | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config)# exit</pre>                                                                                                           | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                 |
| <b>Step 6</b> | <p>Repeat <a href="#">Unregistering EEM Policies</a> to ensure that the policy has been removed.</p> <p><b>Example:</b></p> <pre>Device# show event manager policy registered</pre> | --                                                                                                                                                                                                                                                                   |

## Examples

In the following example, the **show event manager policy registered** privileged EXEC command is used to display the three EEM policies that are currently registered:

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Tue Oct11 01:43:18 2005 tm_cli_cmd.tcl
 name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7}
 nice 0 priority normal maxrun 240.000
2 system syslog Off Tue Oct11 01:43:28 2005 sl_intf_down.tcl
 occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
 nice 0 priority normal maxrun 90.000
3 system proc abort Off Tue Oct11 01:43:38 2005 pr_cdp_terminate.tcl
 instance 1 path {cdp2.iosproc}
 nice 0 priority normal maxrun 20.000
```

After the current policies are displayed, it is decided to delete the `pr_cdp_terminate.tcl` policy using the **no** form of the **event manager policy** command:

```
Device# configure terminal
```

```
Device(config)# no event manager policy pr_cdp_terminate.tcl
Device(config)# exit
```

The **show event manager policy registered** privileged EXEC command is entered again to display the EEM policies that are currently registered. The policy `pr_cdp_terminate.tcl` is no longer registered.

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Tue Oct11 01:45:17 2005 tm_cli_cmd.tcl
 name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7}
 nice 0 priority normal maxrun 240.000
2 system syslog Off Tue Oct11 01:45:27 2005 sl_intf_down.tcl
 occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
 nice 0 priority normal maxrun 90.000
```

## Suspending EEM Policy Execution

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them, might be necessary for reasons of temporary performance or security.

### SUMMARY STEPS

1. **enable**
2. **show event manager policy registered** [**event-type** *event-name*][**system**| **user**] [**time-ordered**| **name-ordered**] [**detailed** *policy-filename*]
3. **configure terminal**
4. **event manager scheduler suspend**
5. **exit**

### DETAILED STEPS

|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>show event manager policy registered</b> [ <b>event-type</b> <i>event-name</i> ][ <b>system</b>   <b>user</b> ] [ <b>time-ordered</b>   <b>name-ordered</b> ] [ <b>detailed</b> <i>policy-filename</i> ]<br><b>Example:</b><br>Device# show event manager policy registered | (Optional) Displays the EEM policies that are currently registered. <ul style="list-style-type: none"> <li>• The optional <b>system</b> or <b>user</b> keyword displays the registered system or user policies.</li> <li>• If no keywords are specified, EEM registered policies for all event types are displayed in time order.</li> </ul> |
| <b>Step 3</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                            |

|               | Command or Action                                                                                            | Purpose                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| <b>Step 4</b> | <b>event manager scheduler suspend</b><br><b>Example:</b><br>Device(config)# event manager scheduler suspend | Immediately suspends the execution of all EEM policies.              |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                       | Exits global configuration mode and returns to privileged EXEC mode. |

### Examples

In the following example, the **show event manager policy registered** privileged EXEC command is used to display all the EEM registered policies:

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Sat Oct11 01:43:18 2003 tm_cli_cmd.tcl
 name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7}
 nice 0 priority normal maxrun 240.000
2 system syslog Off Sat Oct11 01:43:28 2003 sl_intf_down.tcl
 occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
 nice 0 priority normal maxrun 90.000
3 system proc abort Off Sat Oct11 01:43:38 2003 pr_cdp_abort.tcl
 instance 1 path {cdp2.iosproc}
 nice 0 priority normal maxrun 20.000
```

The **event manager scheduler suspend** command is entered to immediately suspend the execution of all EEM policies:

```
Device# configure terminal
Device(config)# event manager scheduler suspend
*Nov 2 15:34:39.000: %HA_EM-6-FMS_POLICY_EXEC: fh_io_msg: Policy execution has been
suspended
```

## Managing EEM Policies

Perform this task to specify a directory to use for storing user library files or user-defined EEM policies.

**Note** This task applies only to EEM policies that are written using Tcl scripts.

### SUMMARY STEPS

1. **enable**
2. **show event manager directory user [library| policy]**
3. **configure terminal**
4. **event manager directory user {library path| policy path}**

## 5. exit

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                         |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> enable                                                                                                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                              |
| Step 2 | <b>show event manager directory user [library  policy]</b><br><b>Example:</b><br>Device# show event manager directory user library                                                                                                                 | (Optional) Displays the directory to use for storing EEM user library or policy files. <ul style="list-style-type: none"> <li>• The optional <b>library</b> keyword displays the directory to use for user library files.</li> <li>• The optional <b>policy</b> keyword displays the directory to use for user-defined EEM policies.</li> </ul> |
| Step 3 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                               |
| Step 4 | <b>event manager directory user {library path  policy path}</b><br><b>Example:</b><br>Device(config)# event manager directory user library disk0:/user_library<br><br>Device(config)# event manager directory user library bootflash:/user_library | Specifies a directory to use for storing user library files or user-defined EEM policies. <ul style="list-style-type: none"> <li>• Use the <i>path</i> argument to specify the absolute pathname to the user directory.</li> </ul>                                                                                                              |
| Step 5 | <b>exit</b><br><b>Example:</b><br>Device(config)# exit                                                                                                                                                                                             | Exits global configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                                            |

## Examples

In the following example, the **show event manager directory user** privileged EXEC command is used to display the directory, if it exists, to use for storing EEM user library files:

```
Device# show event manager directory user library
disk0:/user_library
```

```
Device# show event manager directory user library
bootflash:/user_library
```

# Modifying History Table Size and Displaying EEM History Data

Perform this optional task to change the size of the history tables and to display EEM history data.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager history size {events | traps} [size]**
4. **exit**
5. **show event manager history events [detailed] [maximum number]**
6. **show event manager history traps [server | policy]**

## DETAILED STEPS

### Step 1 enable

Enables privileged EXEC mode. Enter your password if prompted.

#### Example:

```
Device> enable
```

### Step 2 configure terminal

Enters global configuration mode.

#### Example:

```
Device# configure terminal
```

### Step 3 event manager history size {events | traps} [size]

Use this command to change the size of the EEM event history table or the size of the EEM SNMP trap history table. In the following example, the size of the EEM event history table is changed to 30 entries:

#### Example:

```
Device(config)# event manager history size events 30
```

### Step 4 exit

Exits global configuration mode and returns to privileged EXEC mode.

#### Example:

```
Device(config)# exit
```

### Step 5 show event manager history events [detailed] [maximum number]

Use this command to display information about each EEM event that has been triggered.

#### Example:

```
Device# show event manager history events
No. Time of Event Event Type Name
```

```

1 Fri Sep 9 13:48:40 2005 syslog applet: one
2 Fri Sep 9 13:48:40 2005 syslog applet: two
3 Fri Sep 9 13:48:40 2005 syslog applet: three
4 Fri Sep 9 13:50:00 2005 timer cron script: tm_cli_cmd.tcl
5 Fri Sep 9 13:51:00 2005 timer cron script: tm_cli_cmd.tcl

```

**Step 6** `show event manager history traps [server | policy]`

Use this command to display the EEM SNMP traps that have been sent either from the EEM server or from an EEM policy.

**Example:**

```

Device# show event manager history traps
No. Time Trap Type Name
1 Fri Sep 9 13:48:40 2005 server applet: four
2 Fri Sep 9 13:57:03 2005 policy script: no_snmp_test.tcl

```

## Displaying Software Modularity Process Reliability Metrics Using EEM

Perform this optional task to display reliability metrics for Cisco IOS Software Modularity processes. The `show event manager metric processes` command is supported only in Software Modularity images.

**SUMMARY STEPS**

1. `enable`
2. `show event manager metric process {all|process-name}`

**DETAILED STEPS****Step 1** `enable`

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 2** `show event manager metric process {all|process-name}`

Use this command to display the reliability metric data for processes. The system keeps a record of when processes start and end, and this data is used as the basis for reliability analysis. In this partial example, the first and last entries showing the metric data for the processes on all the cards inserted in the system are displayed.

**Example:**

```

Device# show event manager metric process all
=====
process name: devc-pty, instance: 1
sub_system id: 0, version: 00.00.0000

last event type: process start
recent start time: Fri Oct10 20:34:40 2005
recent normal end time: n/a

```

```

recent abnormal end time: n/a
number of times started: 1
number of times ended normally: 0
number of times ended abnormally: 0
most recent 10 process start times:

Fri Oct10 20:34:40 2005

most recent 10 process end times and types:
cumulative process available time: 6 hours 30 minutes 7 seconds 378 milliseconds
cumulative process unavailable time: 0 hours 0 minutes 0 seconds 0 milliseconds
process availability: 0.100000000
number of abnormal ends within the past 60 minutes (since reload): 0
number of abnormal ends within the past 24 hours (since reload): 0
number of abnormal ends within the past 30 days (since reload): 0
.
.
.
=====
process name: cdp2.iosproc, instance: 1
sub_system id: 0, version: 00.00.0000

last event type: process start
recent start time: Fri Oct10 20:35:02 2005
recent normal end time: n/a
recent abnormal end time: n/a
number of times started: 1
number of times ended normally: 0
number of times ended abnormally: 0
most recent 10 process start times:

Fri Oct10 20:35:02 2005

most recent 10 process end times and types:

cumulative process available time: 6 hours 29 minutes 45 seconds 506 milliseconds
cumulative process unavailable time: 0 hours 0 minutes 0 seconds 0 milliseconds
process availability: 0.100000000
number of abnormal ends within the past 60 minutes (since reload): 0
number of abnormal ends within the past 24 hours (since reload): 0
number of abnormal ends within the past 30 days (since reload): 0

```

## Troubleshooting Tips

Use the **debug event manager** command in privileged EXEC mode to troubleshoot EEM command operations. Use any debugging command with caution because the volume of output generated can slow or stop the device operations. We recommend that this command be used only under the supervision of a Cisco engineer.

## Modifying the Sample EEM Policies

Perform this task to modify one of the sample policies. Cisco software contains some sample policies in the images that contain the Embedded Event Manager. Developers of EEM policies may modify these policies by customizing the event for which the policy is to be run and the options associated with logging and responding to the event. In addition, developers may select the actions to be implemented when the policy runs.

## Sample EEM Policies

Cisco includes a set of sample policies shown in the table below. You can copy the sample policies to a user directory and then modify the policies, or you can write your own policies. Tcl is currently the only Cisco-supported scripting language for policy creation. Tcl policies can be modified using a text editor such as Emacs. Policies must execute within a defined number of seconds of elapsed time, and the time variable can be configured within a policy. The default is currently 20 seconds.

The table below describes the sample EEM policies.

**Table 206: Sample EEM Policy Descriptions**

| Name of Policy         | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pr_cdp_abort.tcl       | Introduced with Cisco Software Modularity images. This policy monitors for cdp2.iosproc process termination events. It will log a message to SYSLOG and send an e-mail with the details of the termination.                                                                                                                                         |
| pr_crash_reporter.tcl  | Introduced with Cisco Software Modularity images. This policy monitors for all process termination events. When an event occurs, the policy will send crash information, including the crashdump file, to the specified URL where a CGI script processes the data.                                                                                  |
| pr_iprouting_abort.tcl | Introduced with Cisco Software Modularity images. This policy monitors for iprouting.iosproc process termination events. It will log a message to SYSLOG and send an e-mail with the details of the termination.                                                                                                                                    |
| sl_intf_down.tcl       | This policy runs when a configurable syslog message is logged. It will execute a configurable CLI command and e-mail the results.                                                                                                                                                                                                                   |
| tm_cli_cmd.tcl         | This policy runs using a configurable CRON entry. It will execute a configurable CLI command and e-mail the results.                                                                                                                                                                                                                                |
| tm_crash_history.tcl   | Introduced with Cisco Software Modularity images. This policy runs at midnight every day and e-mails a process crash history report to a specified e-mail address.                                                                                                                                                                                  |
| tm_crash_reporter.tcl  | This policy runs 5 seconds after it is registered. If the policy is saved in the configuration, it will also run each time that the device is reloaded. The policy will prompt for the reload reason. If the reload was due to a crash, the policy will search for the latest crashinfo file and send this information to a specified URL location. |
| tm_fsyz_usage.tcl      | Introduced with Cisco Software Modularity images. This policy runs using a configurable CRON entry and monitors disk space usage. A syslog message will be displayed if disk space usage crosses configurable thresholds.                                                                                                                           |
| wd_mem_reporter.tcl    | Introduced with Cisco Software Modularity images. This policy reports on low system memory conditions when the amount of memory available falls below 20 percent of the initial available system memory. A syslog message will be displayed and, optionally, an e-mail will be sent.                                                                |

For more details about the sample policies available and how to run them, see the [EEM Event Detector Demo Examples, on page 2111](#).

## SUMMARY STEPS

1. **enable**
2. **show event manager policy available detailed** *policy-filename*
3. Cut and paste the contents of the sample policy displayed on the screen to a text editor.
4. Edit the policy and save it with a new filename.
5. Copy the new file back to the device flash memory.
6. **configure terminal**
7. **event manager directory user** {*library path*|*policy path*}
8. **event manager policy** *policy-filename* [**type** {*system*|*user*}] [**trap**]

## DETAILED STEPS

### Step 1 enable

Enables privileged EXEC mode. Enter your password if prompted.

#### Example:

```
Device> enable
```

### Step 2 show event manager policy available detailed *policy-filename*

Displays the actual specified sample policy including details about the environment variables used by the policy and instructions for running the policy. The **detailed** keyword was introduced for the **show event manager policy available** and the **show event manager policy registered** commands. Depending on your release, you may need to copy one of the two Tcl scripts from the configuration examples section in this document (see the [Programming Policies with Tcl Sample Scripts Example, on page 2119](#)). In the following example, details about the sample policy `tm_cli_cmd.tcl` are displayed on the screen.

#### Example:

```
Device# show event manager policy available detailed tm_cli_cmd.tcl
```

### Step 3 Cut and paste the contents of the sample policy displayed on the screen to a text editor.

Use the edit and copy functions to move the contents from the device to a text editor on another device.

### Step 4 Edit the policy and save it with a new filename.

Use the text editor to modify the policy as a Tcl script. For file naming conventions, see the [Cisco File Naming Convention for EEM, on page 2081](#).

### Step 5 Copy the new file back to the device flash memory.

Copy the file to the flash file system on the device--typically `disk0:`. For more details about copying files, see the "Using the Cisco IOS File System" chapter in the *Configuration Fundamentals Configuration Guide*.

Copy the file to the flash file system on the device--typically `bootflash:`. For more details about copying files, see the "Using the Cisco IOS File System" chapter in the *Configuration Fundamentals Configuration Guide*.

### Step 6 configure terminal

Enters global configuration mode.

#### Example:

```
Device# configure terminal
```

**Step 7** `event manager directory user {library path} policy path}`

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the `user_library` directory on `disk0` is specified as the directory for storing user library files.

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the `user_library` directory on `bootflash` is specified as the directory for storing user library files.

**Example:**

```
Device(config)# event manager directory user library disk0:/user_library
```

```
Device(config)# event manager directory user library bootflash:/user_library
```

**Step 8** `event manager policy policy-filename [type {system| user}] [trap]`

Registers the EEM policy to be run when the specified event defined within the policy occurs. In the following example, the new EEM policy named `test.tcl` is registered as a user-defined policy.

**Example:**

```
Device(config)# event manager policy test.tcl type user
```

---

## Programming EEM Policies with Tcl

Perform this task to help you program a policy using Tcl command extensions. We recommend that you copy an existing policy and modify it. There are two required parts that must exist in an EEM Tcl policy: the `event_register` Tcl command extension and the body. All other sections shown in the [Tcl Policy Structure and Requirements, on page 2095](#) concept are optional.

### Tcl Policy Structure and Requirements

All EEM policies share the same structure, shown in the figure below. There are two parts of an EEM policy that are required: the `event_register` Tcl command extension and the body. The remaining parts of the policy are optional: environment must defines, namespace import, entry status, and exit status.

Figure 143: Tcl Policy Structure and Requirements

The start of every policy must describe and register the event to detect using an **event\_register** Tcl command extension. This part of the policy schedules the running of the policy. The following example Tcl code shows how to register the **event\_register\_timer** Tcl command extension:

```
::cisco::eem::event_register_timer cron name crontimer2 cron_entry $_cron_entry maxrun 240
```

The environment must defines section is optional and includes the definition of environment variables. The following example Tcl code shows how to check for, and define, some environment variables.

```
Check if all the env variables that we need exist.
If any of them does not exist, print out an error msg and quit.
if {[info exists _email_server]} {
 set result \
 "Policy cannot be run: variable _email_server has not been set"
 error $result $errorInfo
}
if {[info exists _email_from]} {
 set result \
 "Policy cannot be run: variable _email_from has not been set"
 error $result $errorInfo
}
if {[info exists _email_to]} {
 set result \
 "Policy cannot be run: variable _email_to has not been set"
 error $result $errorInfo
}
```

The namespace import section is optional and defines code libraries. The following example Tcl code shows how to configure a namespace import section.

```
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```

The body of the policy is a required structure and might contain the following:

- The **event\_reqinfo** event information Tcl command extension that is used to query the EEM for information about the detected event.
- The action Tcl command extensions, such as **action\_syslog**, that are used to specify EEM specific actions.

- The system information Tcl command extensions, such as **sys\_reqinfo\_routername**, that are used to obtain general system information.
- Use of the SMTP library (to send e-mail notifications) or the CLI library (to run CLI commands) from a policy.
- The **context\_save** and **context\_retrieve** Tcl command extensions that are used to save Tcl variables for use by other policies.

The following example Tcl code shows the code to query an event and log a message as part of the body section.

```
Query the event info and log a message.
array set arr_einfo [event_reqinfo]

if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}

global timer_type timer_time_sec
set timer_type $arr_einfo(timer_type)
set timer_time_sec $arr_einfo(timer_time_sec)

Log a message.
set msg [format "timer event: timer type %s, time expired %s" \
 $timer_type [clock format $timer_time_sec]]

action_syslog priority info msg $msg
if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}
```

## EEM Entry Status

The entry status part of an EEM policy is used to determine if a prior policy has been run for the same event, and to determine the exit status of the prior policy. If the `_entry_status` variable is defined, a prior policy has already run for this event. The value of the `_entry_status` variable determines the return code of the prior policy.

Entry status designations may use one of three possible values: 0 (previous policy was successful), Not=0 (previous policy failed), and Undefined (no previous policy was executed).

## EEM Exit Status

When a policy finishes running its code, an exit value is set. The exit value is used by the Embedded Event Manager to determine whether or not to apply the default action for this event, if any. A value of zero means do not perform the default action. A value of nonzero means perform the default action. The exit status will be passed to subsequent policies that are run for the same event.

## EEM Policies and Cisco Error Number

Some EEM Tcl command extensions set a Cisco Error Number Tcl global variable `_cerrno`. Whenever `_cerrno` is set, four other Tcl global variables are derived from `_cerrno` and are set along with it (`_cerr_sub_num`, `_cerr_sub_err`, `_cerr_posix_err`, and `_cerr_str`).

For example, the **action\_syslog** command in the example below sets these global variables as a side effect of the command execution:

```
action_syslog priority warning msg "A sample message generated by action_syslog"
if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}
```

### `_cerrno`: 32-Bit Error Return Values

The `_cerrno` set by a command can be represented as a 32-bit integer of the following form:

```
XYSSSSSSSSSSSSSEEEEEEEEEPPPPPPPP
```

For example, the following error return value might be returned from an EEM Tcl command extension:

```
862439AE
```

This number is interpreted as the following 32-bit value:

```
10000110001001000011100110101110
```

This 32-bit integer is divided up into the five variables shown in the table below.

**Table 207: `_cerrno`: 32-Bit Error Return Value Variables**

| Variable       | Description                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XY             | The error class (indicates the severity of the error). This variable corresponds to the first two bits in the 32-bit error return value; 10 in the case above, which indicates CERR_CLASS_WARNING:<br><br>See the table below for the four possible error class encodings specific to this variable. |
| SSSSSSSSSSSSSS | The subsystem number that generated the most recent error (13 bits = 8192 values). This is the next 13 bits of the 32-bit sequence, and its integer value is contained in <code>\$_cerr_sub_num</code> .                                                                                             |
| Variable       | Description                                                                                                                                                                                                                                                                                          |
| EEEEEEEE       | The subsystem specific error number (8 bits = 256 values). This segment is the next 8 bits of the 32-bit sequence, and the string corresponding to this error number is contained in <code>\$_cerr_sub_err</code> .                                                                                  |
| PPPPPPPP       | The pass-through POSIX error code (9 bits = 512 values). This represents the last of the 32-bit sequence, and the string corresponding to this error code is contained in <code>\$_cerr_posix_err</code> .                                                                                           |

### Error Class Encodings for XY

The first variable, XY, references the possible error class encodings shown in the table below.

**Table 208: Error Class Encodings**

|    |                    |
|----|--------------------|
| 00 | CERR_CLASS_SUCCESS |
| 01 | CERR_CLASS_INFO    |
| 10 | CERR_CLASS_WARNING |
| 11 | CERR_CLASS_FATAL   |

An error return value of zero means SUCCESS.

## SUMMARY STEPS

1. **enable**
2. **show event manager policy available detailed** *policy-filename*
3. Cut and paste the contents of the sample policy displayed on the screen to a text editor.
4. Define the required **event\_register** Tcl command extension.
5. Add the appropriate namespace under the `::cisco` hierarchy.
6. Program the `must defines` section to check for each environment variable that is used in this policy.
7. Program the body of the script.
8. Check the entry status to determine if a policy has previously run for this event.
9. Check the exit status to determine whether or not to apply the default action for this event, if a default action exists.
10. Set Cisco Error Number (`_cerno`) Tcl global variables.
11. Save the Tcl script with a new filename, and copy the Tcl script to the device.
12. **configure terminal**
13. **event manager directory user** *{library path| policy path}*
14. **event manager policy** *policy-filename* [**type** *{system| user}*] [**trap**]
15. Cause the policy to execute, and observe the policy.
16. Use debugging techniques if the policy does not execute correctly.

## DETAILED STEPS

### Step 1

**enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

### Step 2

**show event manager policy available detailed** *policy-filename*

Displays the actual specified sample policy including details about the environment variables used by the policy and instructions for running the policy. The **detailed** keyword was introduced for the **show event manager policy available** and the **show event manager policy registered** commands. Depending on your release, you must copy one of the two Tcl scripts from the configuration examples section in this document (see the [Programming Policies with Tcl Sample](#)

[Scripts Example, on page 2119](#)). In the following example, details about the sample policy `tm_cli_cmd.tcl` are displayed on the screen.

**Example:**

```
Device# show event manager policy available detailed tm_cli_cmd.tcl
```

**Step 3** Cut and paste the contents of the sample policy displayed on the screen to a text editor.

Use the edit and copy functions to move the contents from the device to a text editor on another device. Use the text editor to edit the policy as a Tcl script.

**Step 4** Define the required **event\_register** Tcl command extension.

Choose the appropriate **event\_register** Tcl command extension from the table below for the event that you want to detect, and add it to the policy.

*Table 209: EEM Event Registration Tcl Command Extensions*

| Event Registration Tcl Command Extensions |
|-------------------------------------------|
| event_register_appl                       |
| event_register_cli                        |
| event_register_counter                    |
| event_register_gold                       |
| event_register_interface                  |
| event_register_ioswdsysmon                |
| event_register_ipsla                      |
| event_register_nf                         |
| event_register_none                       |
| event_register_oir                        |
| event_register_process                    |
| event_register_resource                   |
| event_register_rf                         |
| event_register_routing                    |
| event_register_rpc                        |
| event_register_snmp                       |
| event_register_snmp_notification          |
| event_register_snmp_object                |
| event_register_syslog                     |

| Event Registration Tcl Command Extensions |
|-------------------------------------------|
| event_register_timer                      |
| event_register_timer_subscriber           |
| event_register_track                      |
| event_register_wdysysmon                  |

**Step 5** Add the appropriate namespace under the ::cisco hierarchy.

Policy developers can use the new namespace ::cisco in Tcl policies in order to group all the extensions used by Cisco IOS EEM. There are two namespaces under the ::cisco hierarchy, and the table below shows which category of EEM Tcl command extension belongs under each namespace.

**Table 210: Cisco IOS EEM Namespace Groupings**

| Namespace    | Category of Tcl Command Extension |
|--------------|-----------------------------------|
| ::cisco::eem | EEM event registration            |
|              | EEM event information             |
|              | EEM event publish                 |
|              | EEM action                        |
|              | EEM utility                       |
|              | EEM context library               |
|              | EEM system information            |
|              | CLI library                       |
| ::cisco::lib | SMTP library                      |

**Note** Make sure that you import the appropriate namespaces or use the qualified command names when using the above commands.

**Step 6** Program the must defines section to check for each environment variable that is used in this policy.

This is an optional step. Must defines are a section of the policy that tests whether any EEM environment variables that are required by the policy are defined before the recovery actions are taken. The must defines section is not required if the policy does not use any EEM environment variables. EEM environment variables for EEM scripts are Tcl global variables that are defined external to the policy before the policy is run. To define an EEM environment variable, use the Embedded Event Manager configuration command **event manager environment** CLI command. By convention all Cisco EEM environment variables begin with “\_” (an underscore). In order to avoid future conflict, customers are urged not to define new variables that start with “\_”.

**Note** You can display the Embedded Event Manager environment variables set on your system by using the **show event manager environment** privileged EXEC command.

For example, Embedded Event Manager environment variables defined by the sample policies include e-mail variables. The sample policies that send e-mail must have the variables shown in the table below set in order to function properly.

The table below describes the e-mail-specific environment variables used in the sample EEM policies.

**Table 211: E-mail-Specific Environmental Variables Used by the Sample Policies**

| Environment Variable | Description                                                             | Example                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _email_server        | A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail. | The e-mail server name can be in any one of the following template formats: <ul style="list-style-type: none"> <li>• username:password@host</li> <li>• username@host</li> <li>• host</li> </ul> |
| _email_to            | The address to which e-mail is sent.                                    | engineering@example.com                                                                                                                                                                         |
| _email_from          | The address from which e-mail is sent.                                  | devtest@example.com                                                                                                                                                                             |
| _email_cc            | The address to which the e-mail must be copied.                         | manager@example.com                                                                                                                                                                             |

The following example of a must define section shows how to program a check for e-mail-specific environment variables.

### Example of Must Defines

#### Example:

```

if {[info exists _email_server]} {
 set result \
 "Policy cannot be run: variable _email_server has not been set"
 error $result $errorInfo
}
if {[info exists _email_from]} {
 set result \
 "Policy cannot be run: variable _email_from has not been set"
 error $result $errorInfo
}
if {[info exists _email_to]} {
 set result \
 "Policy cannot be run: variable _email_to has not been set"
 error $result $errorInfo
}
if {[info exists _email_cc]} {
 set result \
 "Policy cannot be run: variable _email_cc has not been set"
 error $result $errorInfo
}

```

### Step 7

Program the body of the script.

In this section of the script, you can define any of the following:

- The **event\_reqinfo** event information Tcl command extension that is used to query the EEM for information about the detected event.
- The action Tcl command extensions, such as **action\_syslog**, that are used to specify EEM specific actions.

- The system information Tcl command extensions, such as **sys\_reqinfo\_routername**, that are used to obtain general system information.
- The **context\_save** and **context\_retrieve** Tcl command extensions that are used to save Tcl variables for use by other policies.
- Use of the SMTP library (to send e-mail notifications) or the CLI library (to run CLI commands) from a policy.

**Step 8** Check the entry status to determine if a policy has previously run for this event.

If the prior policy is successful, the current policy may or may not require execution. Entry status designations may use one of three possible values: 0 (previous policy was successful), Not=0 (previous policy failed), and Undefined (no previous policy was executed).

**Step 9** Check the exit status to determine whether or not to apply the default action for this event, if a default action exists.

A value of zero means do not perform the default action. A value of nonzero means perform the default action. The exit status will be passed to subsequent policies that are run for the same event.

**Step 10** Set Cisco Error Number (`_cerrno`) Tcl global variables.

Some EEM Tcl command extensions set a Cisco Error Number Tcl global variable `_cerrno`. Whenever `_cerrno` is set, four other Tcl global variables are derived from `_cerrno` and are set along with it (`_cerr_sub_num`, `_cerr_sub_err`, `_cerr_posix_err`, and `_cerr_str`).

For example, the **action\_syslog** command in the example below sets these global variables as a side effect of the command execution:

**Example:**

```
action_syslog priority warning msg "A sample message generated by action_syslog
if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}
```

**Step 11** Save the Tcl script with a new filename, and copy the Tcl script to the device.

Embedded Event Manager policy filenames adhere to the following specification:

- An optional prefix--Mandatory.--indicating, if present, that this is a system policy that should be registered automatically at boot time if it is not already registered. For example: Mandatory.sl\_text.tcl.
- A filename body part containing a two-character abbreviation (see [EEM Policies and Cisco Error Number, on page 2098](#)) for the first event specified; an underscore character part; and a descriptive field part further identifying the policy.
- A filename suffix part defined as .tcl.

For more details, see the [Cisco File Naming Convention for EEM, on page 2081](#).

Copy the file to the flash file system on the device--typically disk0:. For more details about copying files, see the "Using the Cisco IOS File System" chapter in the Cisco IOS Configuration Fundamentals Configuration Guide .

Copy the file to the flash file system on the device--typically bootflash:. For more details about copying files, see the "Using the Cisco IOS File System" chapter in the Cisco IOS Configuration Fundamentals Configuration Guide .

**Step 12** **configure terminal**

Enters global configuration mode.

**Example:**

```
Device# configure terminal
```

**Step 13** **event manager directory user** *{library path| policy path}*

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the `user_library` directory on `disk0` is specified as the directory for storing user library files.

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the `user_library` directory on `bootflash` is specified as the directory for storing user library files.

**Example:**

```
Device(config)# event manager directory user library disk0:/user_library
```

```
Device(config)# event manager directory user library bootflash:/user_library
```

**Step 14** **event manager policy** *policy-filename* [**type** *{system| user}*] [**trap**]

Registers the EEM policy to be run when the specified event defined within the policy occurs. In the following example, the new EEM policy named `cl_mytest.tcl` is registered as a user-defined policy.

**Example:**

```
Device(config)# event manager policy cl_mytest.tcl type user
```

**Step 15** Cause the policy to execute, and observe the policy.

To test that the policy runs, generate the conditions that will cause the policy to execute and observe that the policy runs as expected.

**Step 16** Use debugging techniques if the policy does not execute correctly.

Use the Cisco IOS **debug event manager** CLI command with its various keywords to debug issues. Refer to the [Troubleshooting Tips, on page 2104](#) for details about using Tcl-specific keywords.

## Troubleshooting Tips

- Use the **debug event manager tcl commands** CLI command to debug issues with Tcl extension commands. When enabled, this command displays all data that is passed in and read back from the TTY session that handles the CLI interactions. This data helps ensure users that the commands they are passing to the CLI are valid.
- The CLI library allows users to run CLI commands and obtain the output of commands in Tcl. Use the **debug event manager tcl cli-library** CLI command to debug issues with the CLI library.
- The SMTP library allows users to send e-mail messages to an SMTP e-mail server. Use the **debug event manager tcl smtp\_library** CLI command to debug issues with the SMTP library. When enabled, this command displays all data that is passed in and read back from the SMTP library routines. This data helps ensure users that the commands they are passing to the SMTP library are valid.
- Tcl is a flexible language that allows you to override commands. For example, you can modify the **set** command and create a version of the **set** command that displays a message when a scalar variable is set.

When the **set** command is entered in a policy, a message is displayed anytime a scalar variable is set, and this provides a way to debug scalar variables. To view an example of this debugging technique, see the [Tracing Tcl set Command Operations Example, on page 2130](#).

To view examples of the some of these debugging techniques, see the [Debugging Embedded Event Manager Policies Examples, on page 2128](#).

## Creating an EEM User Tcl Library Index

Perform this task to create an index file that contains a directory of all the procedures contained in a library of Tcl files. This task allows you to test library support in EEM Tcl. In this task, a library directory is created to contain the Tcl library files, the files are copied into the directory, and an index (tclIndex) is created that contains a directory of all the procedures in the library files. If the index is not created, the Tcl procedures will not be found when an EEM policy is run that references a Tcl procedure.

### SUMMARY STEPS

1. On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl library files into the directory.
2. **telsh**
3. **auto\_mkindex** *directory\_name* \*.tcl
4. Copy the Tcl library files and the tclIndex file to the directory used for storing user library files on the target device.
5. Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.
6. **enable**
7. **configure terminal**
8. **event manager directory user library** *path*
9. **event manager directory user policy** *path*
10. **event manager policy** *policy-name* [type {system | user}] [trap ]
11. **event manager run** *policy-name*

### DETAILED STEPS

**Step 1** On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl library files into the directory.

The following example files can be used to create a tclIndex on a workstation running the Tcl shell:

**lib1.tcl**

**Example:**

```
proc test1 {} {
 puts "In procedure test1"
}

proc test2 {} {
 puts "In procedure test2"
}
```

**lib2.tcl****Example:**

```
proc test3 {} {
 puts "In procedure test3"
}
```

**Step 2** **tclsh**

Use this command to enter the Tcl shell.

**Example:**

```
workstation% tclsh
```

**Step 3** **auto\_mkindex** *directory\_name* \*.tcl

Use the **auto\_mkindex** command to create the tclIndex file. The tclIndex file that contains a directory of all the procedures contained in the Tcl library files. We recommend that you run auto\_mkindex inside a directory because there can only be a single tclIndex file in any directory and you may have other Tcl files to be grouped together. Running auto\_mkindex in a directory determines which tcl source file or files are indexed using a specific tclIndex.

**Example:**

```
workstation% auto_mkindex eem_library *.tcl
```

The following example TclIndex is created when the lib1.tcl and lib2.tcl files are in a library file directory and the **auto\_mkindex** command is run.

**tclIndex****Example:**

```
Tcl autoload index file, version 2.0
This file is generated by the "auto_mkindex" command
and sourced to set up indexing information for one or
more commands. Typically each line is a command that
sets an element in the auto_index array, where the
element name is the name of a command and the value is
a script that loads the command.

set auto_index(test1) [list source [file join $dir lib1.tcl]]
set auto_index(test2) [list source [file join $dir lib1.tcl]]
set auto_index(test3) [list source [file join $dir lib2.tcl]]
```

**Step 4** Copy the Tcl library files and the tclIndex file to the directory used for storing user library files on the target device.

**Step 5** Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.

The directory for storing user-defined EEM policies can be the same directory used in Step 4. The following example user-defined EEM policy can be used to test the Tcl library support in EEM.

**libtest.tcl****Example:**

```
::cisco::eem::event_register_none

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```

```

global auto_index auto_path

puts [array names auto_index]

if { [catch {test1} result]} {
 puts "calling test1 failed result = $result $auto_path"
}

if { [catch {test2} result]} {
 puts "calling test2 failed result = $result $auto_path"
}
if { [catch {test3} result]} {
 puts "calling test3 failed result = $result $auto_path"
}

```

**Step 6**    **enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 7**    **configure terminal**

Enables global configuration mode.

**Example:**

```
Device# configure terminal
```

**Step 8**    **event manager directory user library *path***

Use this command to specify the EEM user library directory; this is the directory to which the files were copied.

**Example:**

```
Device(config)# event manager directory user library disk2:/eem_library
```

**Step 9**    **event manager directory user policy *path***

Use this command to specify the EEM user policy directory; this is the directory to which the file was copied.

**Example:**

```
Device(config)# event manager directory user policy disk2:/eem_policies
```

**Step 10**    **event manager policy *policy-name* [type {system | user}] [trap ]**

Use this command to register a user-defined EEM policy. In this example, the policy named libtest.tcl is registered.

**Example:**

```
Device(config)# event manager policy libtest.tcl
```

**Step 11**    **event manager run *policy-name***

Use this command to manually run an EEM policy. In this example, the policy named libtest.tcl is run to test the Tcl support in EEM. The example output shows that the test for Tcl support in EEM was successful.

**Example:**

```
Device(config)# event manager run libtest.tcl
The following output is displayed:
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test1
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test2
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test3
```

## Creating an EEM User Tcl Package Index

Perform this task to create a Tcl package index file that contains a directory of all the Tcl packages and version information contained in a library of Tcl package files. Tcl packages are supported, depending on your release, using the Tcl **package** keyword.

Tcl packages are located in either the EEM system library directory or the EEM user library directory. When a **package require** Tcl command is executed, the user library directory is searched first for a pkgIndex.tcl file. If the pkgIndex.tcl file is not found in the user directory, the system library directory is searched. In this task, a Tcl package directory--the pkgIndex.tcl file--is created in the appropriate library directory using the **pkg\_mkIndex** command to contain information about all of the Tcl packages contained in the directory along with version information. If the index is not created, the Tcl packages will not be found when an EEM policy is run that contains a **package require** Tcl command.

Using the Tcl package support in EEM, users can gain access to packages such as XML\_RPC for Tcl. When the Tcl package index is created, a Tcl script can easily make an XML-RPC call to an external entity.

---

**Note** Packages implemented in C programming code are not supported in EEM.

---

### SUMMARY STEPS

1. On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl package files into the directory.
2. **tclsh**
3. **pkg\_mkindex** *directory\_name* \*.tcl
4. Copy the Tcl library files and the pkgIndex file to the directory used for storing user library files on the target device.
5. Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.
6. **enable**
7. **configure terminal**
8. **event manager directory user library** *path*
9. **event manager directory user policy** *path*
10. **event manager policy** *policy-name* [**type** {system | user}] [**trap**]
11. **event manager run** *policy-name*

## DETAILED STEPS

---

**Step 1** On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl package files into the directory.

**Step 2** **tclsh**

Use this command to enter the Tcl shell.

**Example:**

```
workstation% tclsh
```

**Step 3** **pkg\_mkindex** *directory\_name* \*.tcl

Use the **pkg\_mkindex** command to create the pkgIndex file. The pkgIndex file contains a directory of all the packages contained in the Tcl library files. We recommend that you run **pkg\_mkindex** inside a directory because there can only be a single pkgIndex file in any directory and you may have other Tcl files to be grouped together. Running **pkg\_mkindex** in a directory determines which Tcl package file or files are indexed using a specific pkgIndex.

**Example:**

```
workstation% pkg_mkindex eem_library *.tcl
```

The following example pkgIndex is created when some Tcl package files are in a library file directory and the **pkg\_mkindex** command is run.

**pkgIndex**

**Example:**

```
Tcl package index file, version 1.1
This file is generated by the "pkg_mkIndex" command
and sourced either when an application starts up or
by a "package unknown" script. It invokes the
"package ifneeded" command to set up package-related
information so that packages will be loaded automatically
in response to "package require" commands. When this
script is sourced, the variable $dir must contain the
full path name of this file's directory.
package ifneeded xmlrpc 0.3 [list source [file join $dir xmlrpc.tcl]]
```

**Step 4** Copy the Tcl library files and the pkgIndex file to the directory used for storing user library files on the target device.

**Step 5** Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.

The directory for storing user-defined EEM policies can be the same directory used in Step 4. The following example user-defined EEM policy can be used to test the Tcl package support in EEM.

**packagetest.tcl**

**Example:**

```
::cisco::eem::event_register_none maxrun 1000000.000
#
test if xmlrpc available
#
#
Namespace imports
```

```
#
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
#
package require xmlrpc
puts "Did you get an error?"
```

**Step 6**     **enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 7**     **configure terminal**

Enables global configuration mode.

**Example:**

```
Device# configure terminal
```

**Step 8**     **event manager directory user library** *path*

Use this command to specify the EEM user library directory; this is the directory to which the files in were copied.

**Example:**

```
Device(config)# event manager directory user library disk2:/eem_library
```

**Step 9**     **event manager directory user policy** *path*

Use this command to specify the EEM user policy directory; this is the directory to which the file was copied.

**Example:**

```
Device(config)# event manager directory user policy disk2:/eem_policies
```

**Step 10**    **event manager policy** *policy-name* [**type** {system | user}] [**trap**]

Use this command to register a user-defined EEM policy. In this example, the policy named packetest.tcl is registered.

**Example:**

```
Device(config)# event manager policy packetest.tcl
```

**Step 11**    **event manager run** *policy-name*

Use this command to manually run an EEM policy. In this example, the policy named packetest.tcl is run to test the Tcl package support in EEM.

**Example:**

```
Device(config)# event manager run packetest.tcl
```

# Configuration Examples for Writing Embedded Event Manager Policies Using Tcl

## Assigning a Username for a Tcl Session Examples

The following example shows how to set a username to be associated with a Tcl session. If you are using authentication, authorization, and accounting (AAA) security and implement authorization on a command basis, you should use the **event manager session cli username** command to set a username to be associated with a Tcl session. The username is used when a Tcl policy executes a CLI command. TACACS+ verifies each CLI command using the username associated with the Tcl session that is running the policy. Commands from Tcl policies are not usually verified because the device must be in privileged EXEC mode to register the policy. In the example, the username is yourname, and this is the username that is used whenever a CLI command session is initiated from within an EEM policy.

```
configure terminal
event manager session cli username yourname
end
```

## EEM Event Detector Demo Examples

### EEM Sample Policy Descriptions

This configuration example features some of the sample EEM policies:

- `ap_perf_test_base_cpu.tcl`--Is run to measure the the CPU performance of EEM policies.
- `no_perf_test_init.tcl`--Is run to measure the CPU performance of EEM policies.
- `sl_intf_down.tcl`--Is run when a configurable syslog message is logged. It executes up to two configurable CLI commands and e-mails the results.
- `tm_cli_cmd.tcl`--Is run using a configurable CRON entry. It executes a configurable CLI command and e-mails the results.
- `tm_crash_reporter.tcl`--Is run 5 seconds after it is registered and 5 seconds after the device boots up. When triggered, the script attempts to find the reload reason. If the reload reason was due to a crash, the policy searches for the related crashinfo file and sends this information to a URL location specified by the user in the environment variable `_crash_reporter_url`.
- `tm_fsys_usage.tcl`--This policy runs using a configurable CRON entry and monitors disk space usage. A syslog message is displayed if disk space usage crosses configurable thresholds.

### Event Manager Environment Variables for the Sample Policies

Event manager environment variables are Tcl global variables that are defined external to the EEM policy before the policy is registered and run. The sample policies require three of the e-mail environment variables to be set ; only `_email_cc` is optional. Other required and optional variable settings are outlined in the following tables.

The table below describes the EEM environment variables that must be set before the `ap_perf_test_base_cpu.tcl` sample policy is run.

**Table 212: Environment Variables Used in the `ap_perf_test_base_cpu.tcl` Policy**

| Environment Variable          | Description                                                                                                                                                                                                    | Example                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <code>_perf_iterations</code> | The number of iterations over which to run the measurement.                                                                                                                                                    | <b>100</b>                                             |
| <code>_perf_cmd1</code>       | The first non interactive CLI command that is executed as part of the measurement test. This variable is optional and need not be specified.                                                                   | <b>enable</b>                                          |
| <code>_perf_cmd2</code>       | The second non interactive CLI command that is as part of the measurement test. To use <code>_perf_cmd2</code> , <code>_perf_cmd1</code> must be defined. This variable is optional and need not be specified. | <b>show version</b>                                    |
| <code>_perf_cmd3</code>       | The third non interactive CLI command that is as part of the measurement test. To use <code>_perf_cmd3</code> , <code>_perf_cmd1</code> must be defined. This variable is optional and need not be specified.  | <b>show interface<br/>counters protocol<br/>status</b> |

The table below describes the EEM environment variables that must be set before the `no_perf_test_init.tcl` sample policy is run.

**Table 213: Environment Variables Used in the `no_perf_test_init.tcl` Policy**

| Environment Variable          | Description                                                                                                                                                                                                    | Example                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <code>_perf_iterations</code> | The number of iterations over which to run the measurement.                                                                                                                                                    | <b>100</b>                                             |
| <code>_perf_cmd1</code>       | The first non interactive CLI command that is executed as part of the measurement test. This variable is optional and need not be specified.                                                                   | <b>enable</b>                                          |
| <code>_perf_cmd2</code>       | The second non interactive CLI command that is as part of the measurement test. To use <code>_perf_cmd2</code> , <code>_perf_cmd1</code> must be defined. This variable is optional and need not be specified. | <b>show version</b>                                    |
| <code>_perf_cmd3</code>       | The third non interactive CLI command that is as part of the measurement test. To use <code>_perf_cmd3</code> , <code>_perf_cmd1</code> must be defined. This variable is optional and need not be specified.  | <b>show interface<br/>counters protocol<br/>status</b> |

The table below describes the EEM environment variables that must be set before the `sl_intf_down.tcl` sample policy is run.

**Table 214: Environment Variables Used in the `sl_intf_down.tcl` Policy**

| Environment Variable      | Description                                       | Example                      |
|---------------------------|---------------------------------------------------|------------------------------|
| <code>_config_cmd1</code> | The first configuration command that is executed. | <b>interface Ethernet1/0</b> |

| Environment Variable | Description                                                                                                          | Example                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------|------------------------------|
| _config_cmd2         | The second configuration command that is executed. This variable is optional and need not be specified.              | <b>no shutdown</b>           |
| _syslog_pattern      | A regular expression pattern match string that is used to compare syslog messages to determine when the policy runs. | . *UPDOWN.*FastEthernet0/0.* |

The table below describes the EEM environment variables that must be set before the tm\_cli\_cmd.tcl sample policy is run.

**Table 215: Environment Variables Used in the tm\_cli\_cmd.tcl Policy**

| Environment Variable | Description                                                    | Example               |
|----------------------|----------------------------------------------------------------|-----------------------|
| _cron_entry          | A CRON specification that determines when the policy will run. | 0-59/1 0-23/1 * * 0-7 |
| _show_cmd            | The CLI command to be executed when the policy is run.         | <b>show version</b>   |

The table below describes the EEM environment variables that must be set before the tm\_crash\_reporter.tcl sample policy is run.

**Table 216: Environment Variables Used in the tm\_crash\_reporter.tcl Policy**

| Environment Variable  | Description                                                                                                                                       | Example                                    |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| _crash_reporter_debug | A value that identifies whether debug information for tm_crash_reporter.tcl will be enabled. This variable is optional and need not be specified. | 1                                          |
| _crash_reporter_url   | The URL location to which the crash report is sent.                                                                                               | http://www.example.com/fm/interface_tm.cgi |

The table below describes the EEM environment variables that must be set before the tm\_fsys\_usage.tcl sample policy is run.

**Table 217: Environment Variables Used in the tm\_fsys\_usage.tcl Policy**

| Environment Variable | Description                                                                                                                                                                                                           | Example               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| _tm_fsys_usage_cron  | A CRON specification that is used in the <b>event_register</b> Tcl command extension. If unspecified, the tm_fsys_usage.tcl policy is triggered once per minute. This variable is optional and need not be specified. | 0-59/1 0-23/1 * * 0-7 |
| _tm_fsys_usage_debug | When this variable is set to a value of 1, disk usage information is displayed for all entries in the system. This variable is optional and need not be specified.                                                    | 1                     |

| Environment Variable     | Description                                                                                                                                                                                                                                                                               | Example            |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| _tm_fsys_usage_freebytes | Free byte threshold for systems or specific prefixes. If free space falls below a given value, a warning is displayed. This variable is optional and need not be specified.                                                                                                               | disk2:98000000     |
| _tm_fsys_usage_percent   | Disk usage percentage thresholds for systems or specific prefixes. If the disk usage percentage exceeds a given percentage, a warning is displayed. If unspecified, the default disk usage percentage is 80 percent for all systems. This variable is optional and need not be specified. | nvrnram:25 disk2:5 |

### Registration of Some EEM Policies

Some EEM policies must be unregistered and then reregistered if an EEM environment variable is modified after the policy is registered. The `event_register_xxx` statement that appears at the start of the policy contains some of the EEM environment variables, and this statement is used to establish the conditions under which the policy is run. If the environment variables are modified after the policy has been registered, the conditions may become invalid. To avoid any errors, the policy must be unregistered and then reregistered. The following variables are affected:

- `_cron_entry` in the `tm_cli_cmd.tcl` policy
- `_syslog_pattern` in the `sl_intf_down.tcl` policy

### Basic Configuration Details for All Sample Policies

To allow e-mail to be sent from the Embedded Event Manager, the `hostname` and `ip domain-name` commands must be configured. The EEM environment variables must also be set. After a Cisco IOS image has been booted, use the following initial configuration, substituting appropriate values for your network. The environment variables for the `tm_fsys_usage` sample policy (see the table above) are all optional and are not listed here:

```
hostname cpu
ip domain-name example.com
event manager environment _email_server ms.example.net
event manager environment _email_to username@example.net
event manager environment _email_from engineer@example.net
event manager environment _email_cc projectgroup@example.net
event manager environment _cron_entry 0-59/2 0-23/1 * * 0-7
event manager environment _show_cmd show event manager policy registered
event manager environment _syslog_pattern .*UPDOWN.*FastEthernet0/0
event manager environment _config_cmd1 interface Ethernet1/0
event manager environment _config_cmd2 no shutdown
event manager environment _crash_reporter_debug 1
event manager environment _crash_reporter_url
http://www.example.com/fm/interface_tm.cgi
end
```

### Using the Sample Policies

This section contains the following configuration scenarios to demonstrate how to use the some sample Tcl policies:

### Running the Mandatory.go\_\*.tcl Sample Policy

There are GOLD TCL scripts for each test which runs as a part of GOLD EEM Policy. You can modify the TCL script for the test, specify the consecutive failure count, and also change the default corrective action. For example, one could choose to power down a linecard card, instead of reset or other CLI based actions.

For each registered test, a default TCL script is available, which can be registered with the system, and matches with the default action. This can be then overridden by modifying these scripts.

The following table shows a list of the mandatory policies that GOLD installed into EEM. Each of the policies performs some sort of action such as resetting the card or disabling the port.

| GOLD Tcl Scripts            | Test                         |
|-----------------------------|------------------------------|
| Mandatory.go_asicsync.tcl   | TestAsicSync                 |
| Mandatory.go_bootup.tcl     | Common for all bootup tests. |
| Mandatory.go_fabric.tcl     | TestFabricHealth             |
| Mandatory.go_fabrich0.tcl   | TestFabricCh0Health          |
| Mandatory.go_fabrich1.tcl   | TestFabricCh1Health          |
| Mandatory.go_ipsec.tcl      | TestIPSecEncrypDecrypPkt     |
| Mandatory.go_mac.tcl        | TestMacNotification          |
| Mandatory.go_nondislp.tcl   | TestNonDisruptiveLoopback    |
| Mandatory.go_scratchreg.tcl | TestScratchRegister          |
| Mandatory.go_sprping.tcl    | TestSPRPIbandPing            |

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode, where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the mandatory.go\_\*.tcl policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command again to verify that the policy has been registered.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
 event manager policy Mandatory.go_spuriousisr.tcl
end
show event manager policy registered
show event manager environment
```

### Running the ap\_perf\_test\_base\_cpu.tcl and no\_perf\_test\_init.tcl Sample Policies

These sample policies measure the CPU performance of EEM policies. The policies help find the average execution time of each EEM policy and use the CLI library to execute the configuration commands specified in the EEM environment variables `_perf_cmd1` and, optionally, `_perf_cmd2` and `_perf_cmd3`.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode, where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, enter the **service timestamps debug datetime msec** command and then you can register the `ap_perf_test_base_cpu.tcl` and `no_perf_test_init.tcl` policies with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command again to verify that the policy has been registered.

The policies `ap_perf_test_base_cpu.tcl` and `no_perf_test_init.tcl` need to be registered together, as they run as a test suite. You can run the `no_perf_test_init.tcl` policy to start the tests. Analyze the results using the syslog messages from each iteration. The total number of iteration is specified by the variable `_perf_iterations`. Take the time difference and divide it by the total number of iterations to get the average execution time of each EEM policy.

```
enable
show event manager policy registered
show event manager policy available
show event manager environment
configure terminal
 service timestamps debug datetime msec
 event manager environment _perf_iterations 100
 event manager policy ap_perf_test_base_cpu.tcl
 event manager policy no_perf_test_init.tcl
end
show event manager policy registered
show event manager policy available
show event manager environment
event manager run no_perf_test_init.tcl
```

### Running the `no_perf_test_init.tcl` Sample Policy

This sample policy measures the the cpu performance of EEM policies. The policy helps to find the average execution time of each EEM policy and uses the CLI library to execute the configuration commands specified in the EEM environment variables `_perf_cmd1` and, optionally, `_perf_cmd2` and `_perf_cmd3`.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode, where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the `no_perf_test_init.tcl` policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command again to verify that the policy has been registered.

Analyze the results using the syslog messages from each iteration. The total number of iteration is specified by the variable `_perf_iterations`. Take the time difference and divide it by the total number of iterations to get the average execution time of each EEM policy.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
 event manager policy no_perf_test_init.tcl
end
```

```
show event manager policy registered
show event manager environment
```

### Running the `sl_intf_down.tcl` Sample Policy

This sample policy demonstrates the ability to modify the configuration when a syslog message with a specific pattern is logged. The policy gathers detailed information about the event and uses the CLI library to execute the configuration commands specified in the EEM environment variables `_config_cmd1` and, optionally, `_config_cmd2`. An e-mail message is sent with the results of the CLI command.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode, where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the `sl_intf_down.tcl` policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command again to verify that the policy has been registered.

The policy runs when an interface goes down. Enter the **show event manager environment** command to display the current environment variable values. Unplug the cable (or configure a shutdown) for the interface specified in the `_syslog_pattern` EEM environment variable. The interface goes down, prompting the syslog daemon to log a syslog message about the interface being down, and the syslog event detector is called.

The syslog event detector reviews the outstanding event specifications and finds a match for interface status change. The EEM server is notified, and the server runs the policy that is registered to handle this event--`sl_intf_down.tcl`.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
 event manager policy sl_intf_down.tcl
end
show event manager policy registered
show event manager environment
```

### Running the `tm_cli_cmd.tcl` Sample Policy

This sample policy demonstrates the ability to periodically execute a CLI command and to e-mail the results. The CRON specification “0-59/2 0-23/1 \* \* 0-7” causes this policy to be run on the second minute of each hour. The policy gathers detailed information about the event and uses the CLI library to execute the configuration commands specified in the EEM environment variable `_show_cmd`. An e-mail message is sent with the results of the CLI command.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the `tm_cli_cmd.tcl` policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command to verify that the policy has been registered.

The timer event detector triggers an event for this case periodically according to the CRON string set in the EEM environment variable `_cron_entry`. The EEM server is notified, and the server runs the policy that is registered to handle this event--`tm_cli_cmd.tcl`.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
 event manager policy tm_cli_cmd.tcl
end
show event manager policy registered
```

### Running the `tm_crash_reporter.tcl` Sample Policy

This sample policy demonstrates the ability to send an HTTP-formatted crash report to a URL location. If the policy registration is saved in the startup configuration file, the policy is triggered 5 seconds after bootup. When triggered, the script attempts to find the reload reason. If the reload reason was due to a crash, the policy searches for the related crashinfo file and sends this information to a URL location specified by the user in the environment variable `_crash_reporter_url`. A CGI script, `interface_tm.cgi`, has been created to receive the URL from the `tm_crash_reporter.tcl` policy and save the crash information in a local database on the target URL machine.

A Perl CGI script, `interface_tm.cgi`, has been created and is designed to run on a machine that contains an HTTP server and is accessible by the device that runs the `tm_crash_reporter.tcl` policy. The `interface_tm.cgi` script parses the data passed into it from `tm_crash_reporter.tcl` and appends the crash information to a text file, creating a history of all crashes in the system. Additionally, detailed information on each crash is stored in three files in a crash database directory that is specified by the user. Another Perl CGI script, `crash_report_display.cgi`, has been created to display the information stored in the database created by the `interface_tm.cgi` script. The `crash_report_display.cgi` script should be placed on the same machine that contains `interface_tm.cgi`. The machine should be running a web browser such as Internet Explorer or Netscape. When the `crash_report_display.cgi` script is run, it displays the crash information in a readable format.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the `tm_crash_reporter.tcl` policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command to verify that the policy has been registered.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
 event manager policy tm_crash_reporter.tcl
end
show event manager policy registered
```

### Running the `tm_fsys_usage.tcl` Sample Policy

This sample policy demonstrates the ability to periodically monitor disk space usage and report through syslog when configurable thresholds have been crossed.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode, where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the `tm_fsys_usage.tcl` policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command again to verify that the policy has been registered. If you had configured any of the optional environment variables that are used in the `tm_fsys_usage.tcl` policy, the **show event manager environment** command displays the configured variables.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
 event manager policy tm_fsys_usage.tcl
 end
show event manager policy registered
show event manager environment
```

## Programming Policies with Tcl Sample Scripts Example

This section contains some of the sample policies that are included as EEM system policies. For more details about these policies, see the [EEM Event Detector Demo Examples, on page 2111](#).

### Mandatory.go\_ipsec.tcl Sample Policy

The following sample policy for the TestIPSecEncrypDecrypPkt Test.

```
::cisco::eem::event_register_gold card all testing_type monitoring test_name TestIPSecEncrypDecrypPkt consecutive_failure 6 platform_action 0 queue_priority last
#
GOLD TestIPSecEncrypDecrypPkt Test TCL script
#
March 2005, Hai Qiu
#
Copyright (c) 2005-2007 by cisco Systems, Inc.
All rights reserved.
#
#
Register for TestIPSecEncrypDecrypPkt test even
the elements for register the event
card [all | card #]
sub_card [all | sub_card #]
severity_major | severity_minor | severity_normal default : severity_normal
new_failure [true | false] default: dont_care
testing_type [bootup | ondemand | schedule | monitoring]
test_name [test name]
test_id [test #]
consecutive_failure [consecutive_failure #]
platform_action [action_flag]
action_flag [0 | 1 | 2]
queue_priority [normal | low | high | last] default: normal
#
Note:
1: "card" element is required. If other elements are not specified,
treat them as dont care, or default.
```

```

#
2: action_flag is platform specific. It is up to platform to
determine what action need to be taken based on the value
For Cat6k platform
action_flag 0 : TCL script take action to reset card
action_flag 1 : TCL script doesn't take action to reset card
action_flag 2 : TCL script takes action to reset card for bootup diag
when there is major error
action_flag 3 : TCL script doesn't take action to reset card for
bootup diag when there is major error
#
3: "queue_priority last" would guarantee this policy will be executed last
if there are other EEM events in queue with queue priority other
than "last"
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
1. query the information of latest triggered eem event
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {

 error $result $errorInfo
}
Use "diagn action mod mod# test testname default" command
for default platform action
if [catch {cli_exec $cli1(fd) "diagnostic action mod $card test TestIPSecEncrypD
ecrypPkt default"} result] {
 error $result $errorInfo
} else {
 set cmd_output $result
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
 error $result $errorInfo
}
}

```

### ap\_perf\_test\_base\_cpu.tcl Sample Policy

The following sample policy measures the CPU performance of EEM policies.

```

::cisco::eem::event_register_appl sub_system 798 type 9999
#-----
EEM policy used for measuring the cpu performance of EEM policies.
#
July 2005, Cisco EEM team
#
Copyright (c) 2005, 2006 by cisco Systems, Inc.

```

```

All rights reserved.
#-----
###
Input arguments:
###
arg1 $iter - current iteration count
###
The following EEM environment variables are used:
###
_perf_iterations (mandatory) - number of iterations over which we
will run our measurement.
Example:
event manager environment _perf_iterations 100
###
_perf_cmd1 (optional) - optional non interactive cli command
to be executed as part of the
measurement test.
Example:
event manager environment _perf_cmd1 enable
###
_perf_cmd2 (optional) - optional non interactive cli command
to be executed as part of the
measurement test.
To use _perf_cmd2, _perf_cmd1 MUST
be defined.
Example:
event manager environment _perf_cmd2 show ver
###
_perf_cmd3 (optional) - optional non interactive cli command
to be executed as part of the
measurement test.
To use _perf_cmd3, _perf_cmd1 MUST
be defined.
Example:
event manager environment _perf_cmd3 show int counters protocol status
###
Description:
Iterate through _perf_iterations of this policy.
It is up to the user to calculate the average
execution time based on the system timestamps.
Optional commands _perf_cmd1,
_perf_cmd2 and _perf_cmd3 are executed if defined.
###
A value of 100 is a good starting point.
###
Outputs:
Console output.
###
Usage example:
>conf t
>service timestamps debug datetime msec
>event manager environment _perf_iterations 100
>event manager policy ap_perf_base_cpu.tcl
>event manager policy no_perf_test_init.tcl
>end
2d19h: %SYS-5-CONFIG_I: Configured from console by console
>event manager run no_perf_test_init.tcl
###
Oct 16 14:57:17.284: %SYS-5-CONFIG_I: Configured from console by console
>event manager run no_perf_test_init.tcl
###
Oct 16 19:32:02.772: %HA_EM-6-LOG:
eem_policy/no_perf_test_init.tcl: EEM performance test start
Oct 16 19:32:03.115: %HA_EM-6-LOG:

```

```

eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test iteration 1
Oct 16 19:32:03.467: %HA_EM-6-LOG:
eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test iteration 2
...
Oct 16 19:32:36.936: %HA_EM-6-LOG:
eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test iteration 100
Oct 16 19:32:36.936: %HA_EM-6-LOG:
eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test end
###
The user must calculate execution time and average time of execution.
In this example, total time = 19:32:36.936 - 19:32:02.772 = 34.164
Average script execution time = 341.64 milliseconds
###

### tm\_cli\_cmd.tcl Sample Policy

The following sample policy runs a configurable CRON entry. The policy executes a configurable Cisco IOS CLI command and e-mails the results. An optional log file can be defined to which the output is appended with a timestamp.

```

::cisco::eem::event_register_timer cron name crontimer2 cron_entry $_cron_entry maxrun 240
#-----
EEM policy that will periodically execute a cli command and email the
results to a user.
#
July 2005, Cisco EEM team
#
Copyright (c) 2005 by cisco Systems, Inc.
All rights reserved.
#-----
The following EEM environment variables are used:
###
_cron_entry (mandatory) - A CRON specification that determines
when the policy will run. See the
IOS Embedded Event Manager
documentation for more information
on how to specify a cron entry.

```

```

Example: _cron_entry 0-59/1 0-23/1 * * 0-7
###
_log_file (mandatory without _email_....)
- A filename to append the output to.
If this variable is defined, the
output is appended to the specified
file with a timestamp added.
Example: _log_file bootflash:/my_file.log
###
_email_server (mandatory without _log_file)
- A Simple Mail Transfer Protocol (SMTP)
mail server used to send e-mail.
Example: _email_server mailserver.example.com
###
_email_from (mandatory without _log_file)
- The address from which e-mail is sent.
Example: _email_from devtest@example.com
###
_email_to (mandatory without _log_file)
- The address to which e-mail is sent.
Example: _email_to engineering@example.com
###
_email_cc (optional)
- The address to which the e-mail must
be copied.
Example: _email_cc manager@example.com
###
_show_cmd (mandatory)
- The CLI command to be executed when
the policy is run.
Example: _show_cmd show version
###
check if all required environment variables exist
If any required environment variable does not exist, print out an error msg and quit

error $result $ErrorInfo
}
}
}

```

### sl\_intf\_down.tcl Sample Policy

The following sample policy runs when a configurable syslog message is logged. The policy executes a configurable CLI command and e-mails the results.

```

::cisco::eem::event_register_syslog occurs 1 pattern $_syslog_pattern maxrun 90

#-----
EEM policy to monitor for a specified syslog message.
Designed to be used for syslog interface-down messages.
When event is triggered, the given config commands will be run.
#
July 2005, Cisco EEM team
#
Copyright (c) 2005 by cisco Systems, Inc.
All rights reserved.
#-----

The following EEM environment variables are used:
###
_syslog_pattern (mandatory) - A regular expression pattern match string
that is used to compare syslog messages
to determine when policy runs
Example: _syslog_pattern .*UPDOWN.*FastEthernet0/0.*
###
_email_server (mandatory) - A Simple Mail Transfer Protocol (SMTP)
mail server used to send e-mail.
Example: _email_server mailserver.example.com
###
_email_from (mandatory) - The address from which e-mail is sent.
Example: _email_from devtest@example.com
###
_email_to (mandatory) - The address to which e-mail is sent.
Example: _email_to engineering@example.com
###
_email_cc (optional) - The address to which the e-mail must
be copied.
Example: _email_cc manager@example.com
###
_config_cmd1 (optional) - The first configuration command that
is executed.
Example: _config_cmd1 interface Ethernet1/0
###
_config_cmd2 (optional) - The second configuration command that
is executed.
Example: _config_cmd2 no shutdown
###

check if all the env variables we need exist
If any of them doesn't exist, print out an error msg and quit
if {[info exists _email_server]} {
 set result \

```

```

 "Policy cannot be run: variable _email_server has not been set"
 error $result $errorInfo
 }
 if {[info exists _email_from]} {
 set result \
 "Policy cannot be run: variable _email_from has not been set"
 error $result $errorInfo
 }
 if {[info exists _email_to]} {
 set result \
 "Policy cannot be run: variable _email_to has not been set"
 error $result $errorInfo
 }
 if {[info exists _email_cc]} {
 #_email_cc is an option, must set to empty string if not set.
 set _email_cc ""
 }
}

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

1. query the information of latest triggered eem event
array set arr_einfo [event_reqinfo]

if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}

set msg $arr_einfo(msg)
set config_cmds ""

2. execute the user-defined config commands
if [catch {cli_open} result] {
 error $result $errorInfo
} else {
 array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {

}

if {[info exists _config_cmd2]} {
 if [catch {cli_exec $cli1(fd) $_config_cmd2} result] {
 error $result $errorInfo
 }
 append config_cmds "\n"
 append config_cmds $_config_cmd2
}

if [catch {cli_exec $cli1(fd) "end"} result] {
 error $result $errorInfo
}
}

```

```

if [catch {cli_close $cli(fd) $cli(tty_id)} result] {
 error $result $errorInfo
}

after 60000
3. send the notification email
set routername [info hostname]
if {[string match "" $routername]} {
 error "Host name is not configured"
}

if [catch {smtp_subst [file join $tcl_library email_template_cfg.tm]} result] {
 error $result $errorInfo
}

if [catch {smtp_send_email $result} result] {
 error $result $errorInfo
}

```

The following e-mail template file is used with the EEM sample policy above:

```

email_template_cfg.tm
Mailservername: $_email_server
From: $_email_from
To: $_email_to
Cc: $_email_cc
Subject: From router $routername: Periodic $_show_cmd Output
$cmd_output

```

## Debugging Embedded Event Manager Policies Examples

The following examples show how to debug the CLI library and the SMTP library.

### Debugging the CLI Library

The CLI library allows users to run CLI commands and obtain the output of commands in Tcl. An Embedded Event Manager **debug** command has been provided for users of this library. The command to enable CLI library debugging is **debug event manager tcl cli\_library**. When enabled, this command displays all data that is passed in and read back from the TTY session that handles the CLI interactions. This data helps ensure users that the commands that they are passing to the CLI are valid.

### Example of the debug event manager tcl cli\_library Command

This example uses the sample policy `sl_intf_down.tcl`. When triggered, `sl_intf_down.tcl` passes a configuration command to the CLI through the CLI library. The command passed in below is **show event manager environment**. This command is not a valid command in configuration mode. Without the **debug** command enabled, the output is shown below:

```

00:00:57:sl_intf_down.tcl[0]:config_cmds are show eve man env
00:00:57:%SYS-5-CONFIG_I:Configured from console by vty0

```

Notice that with the output above the user would not know whether or not the command succeeded in the CLI. With the **debug event manager tcl cli\_library** command enabled, the user sees the following:

```

01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : CTL : cli_open called.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson>
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson>enable
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson#

```

```

01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson#configure terminal
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : Enter configuration commands, one
per line. End with CNTL/Z.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson(config)#
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson(config)#show event manager
environment
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT :
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : % Invalid input detected at '^'
marker.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson(config)#
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson(config)#end
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson#
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : CTL : cli_close called.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson#exit
01:17:07: sl_intf_down.tcl[0]: config_cmds are show event manager environment
01:17:07: %SYS-5-CONFIG_I: Configured from console by vty0

```

The output above shows that **show event manager environment** is an invalid command in configuration mode. The IN keyword signifies all data passed in to the TTY through the CLI library. The OUT keyword signifies all data read back from the TTY through the CLI library. The CTL keyword signifies helper functions used in the CLI library. These helper functions are used to set up and remove connections to the CLI.

### Debugging the SMTP Library

The SMTP library allows users to send e-mail messages to an SMTP e-mail server. An Embedded Event Manager **debug** command has been provided for users of this library. The command to enable SMTP library debugging is **debug event manager tcl smtp\_library**. When enabled, this command displays all data that is passed in and read back from the SMTP library routines. This data helps ensure users that the commands that they are passing to the SMTP library are valid.

### Example of the debug event manager tcl smtp\_library Command

This example uses the sample policy `tm_cli_cmd.tcl`. When triggered, `tm_cli_cmd.tcl` runs the command **show event manager policy available system** through the CLI library. The result is then mailed to a user through the SMTP library. The output will help debug any issues related to using the SMTP library.

With the **debug event manager tcl smtp\_library** command enabled, the users see the following on the console:

```

00:39:46: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 220 XXXX.example.com ESMTP XXXX

## Tracing Tcl set Command Operations Example

Tcl is a flexible language. One of the flexible aspects of Tcl is that you can override commands. In this example, the Tcl `set` command is renamed as `_set` and a new version of the `set` command is created that displays a message containing the text “setting” and appends the scalar variable that is being set. This example can be used to trace all instances of scalar variables being set.

```

rename set _set
proc set {var args} {
 puts [list setting $var $args]
 uplevel _set $var $args
};

```

When this is placed in a policy, a message is displayed anytime a scalar variable is set, for example:

```
02:17:58: sl_intf_down.tcl[0]: setting test_var 1
```

## RPC Event Detector Example

```

TCL script (rpccli.tcl):
::cisco::eem::event_register_rpc
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
proc run_cli { clist } {
 set rbuf ""
 if {[llength $clist] < 1} {
 return -code ok $rbuf
 }
 if {[catch {cli_open} result]} {
 return -code error $result
 }
}

```

```

 } else {
 array set cliarr $result
 }
 if {[catch {cli_exec $cliarr(fd) "enable"} result]} {
 return -code error $result
 }
 if {[catch {cli_exec $cliarr(fd) "term length 0"} result]} {
 return -code error $result
 }
 foreach cmd $clist {
 if {[catch {cli_exec $cliarr(fd) $cmd} result]} {
 return -code error $result
 }
 }
 append rbuf $result
 }
 if {[catch {cli_close $cliarr(fd) $cliarr(tty_id)} result]} {
 puts "WARNING: $result"
 }
 return -code ok $rbuf
}
}
proc run_cli_interactive { clist } {
 set rbuf ""
 if {[length $clist] < 1} {
 return -code ok $rbuf
 }
 if {[catch {cli_open} result]} {
 return -code error $result
 }
 } else {
 array set cliarr $result
 }
 if {[catch {cli_exec $cliarr(fd) "enable"} result]} {
 return -code error $result
 }
 if {[catch {cli_exec $cliarr(fd) "term length 0"} result]} {
 return -code error $result
 }
 }
 foreach cmd $clist {
 array set sendexp $cmd
 if {[catch {cli_write $cliarr(fd) $sendexp(send)} result]} {
 return -code error $result
 }
 }
 foreach response $sendexp(responses) {
 array set resp $response
 if {[catch {cli_read_pattern $cliarr(fd) $resp(expect)} result]} {
 return -code error $result
 }
 if {[catch {cli_write $cliarr(fd) $resp(reply)} result]} {
 return -code error $result
 }
 }
 if {[catch {cli_read $cliarr(fd)} result]} {
 return -code error $result
 }
 }
 append rbuf $result
 }
 if {[catch {cli_close $cliarr(fd) $cliarr(tty_id)} result]} {
 puts "WARNING: $result"
 }
 }
 return -code ok $rbuf
}
}
array set arr_einfo [event_reqinfo]
set args $arr_einfo(argc)
set cmds [list]
for { set i 0 } { $i < $args } { incr i } {

```

```

set arg "arg${i}"
Split each argument on the '^' character. The first element is
the command, and each subsequent element is a prompt followed by
a response to that prompt.
set cmdlist [split $arr_einfo($arg) "^"]
set cmdarr(send) [lindex $cmdlist 0]
set cmdarr(responses) [list]
if { [expr ([llength $cmdlist] - 1) % 2] != 0 } {
return -code 88
}
set cmdarr(responses) [list]
for { set j 1 } { $j < [llength $cmdlist] } { incr j 2 } {
set resp(expect) [lindex $cmdlist $j]
set resp(reply) [lindex $cmdlist [expr $j + 1]]
lappend cmdarr(responses) [array get resp]
}
lappend cmds [array get cmdarr]
}
set rc [catch {run_cli_interactive $cmds} output]
if { $rc != 0 } {
error $output $errorInfo
return -code 88
}
puts $output

```

## CHAPTER 102

# Signed Tcl Scripts

---

The Signed Tcl Scripts feature allows you to create a certificate to generate a digital signature and sign a Tool Command Language (Tcl) script with that digital signature. This feature also allows you to work with existing scripts and certificates. The digital signature is verified for authentication and then run with trusted access to the Tcl interpreter. If the script does not contain the digital signature, the script may run in a limited mode for untrusted scripts, or may not run at all.

- [Prerequisites for Signed Tcl Scripts, on page 2135](#)
- [Restrictions for Signed Tcl Scripts, on page 2135](#)
- [Information About Signed Tcl Scripts, on page 2136](#)
- [How to Configure Signed Tcl Scripts, on page 2137](#)
- [Configuration Examples for Signed Tcl Script, on page 2150](#)
- [Additional References, on page 2154](#)
- [Feature Information for Signed Tcl Scripts, on page 2155](#)
- [Glossary, on page 2155](#)
- [Notices, on page 2156](#)

## Prerequisites for Signed Tcl Scripts

For this feature to work, the Cisco public key infrastructure (PKI) configuration trustpoint commands must be enabled.

## Restrictions for Signed Tcl Scripts

For this feature to work, you must be running the following:

- Cisco IOS Crypto image
- OpenSSL Version 0.9.7a or above
- Expect

# Information About Signed Tcl Scripts

The Signed Tcl Scripts feature introduces security for the Tcl scripts. This feature allows you to create a certificate to generate a digital signature and sign a Tcl script with that digital signature. This certificate examines the Tcl scripts prior to running them. The script is checked for a digital signature from Cisco. In addition, third parties may also sign a script with a digital signature. You may wish to sign your own internally developed Tcl scripts or you could use a script developed by a third party. If the script contains the correct digital signature, it is believed to be authentic and runs with full access to the Tcl interpreter. If the script does not contain the digital signature, the script may be run in a limited mode, known as Safe Tcl mode, or may not run at all.

To create and use signed Tcl scripts, you should understand the following concepts:

## Cisco PKI

Cisco PKI provides certificate management to support security protocols such as IP security (IPsec), secure shell (SSH), and secure socket layer (SSL). A PKI is composed of the following entities:

- Peers communicating on a secure network
- At least one certification authority (CA) that grants and maintains certificates
- Digital certificates, which contain information such as the certificate validity period, peer identity information, encryption keys that are used for secure communication, and the signature of the issuing CA
- An optional registration authority (RA) to offload the CA by processing enrollment requests
- A distribution mechanism (such as Lightweight Directory Access Protocol [LDAP] or HTTP) for certificate revocation lists (CRLs)

PKI provides you with a scalable, secure mechanism for distributing, managing, and revoking encryption and identity information in a secured data network. Every routing device participating in the secured communication is enrolled in the PKI in a process where the routing device generates a Rivest, Shamir, and Adelman (RSA) key pair (one private key and one public key) and has its identity validated by a trusted routing device (also known as a CA or trustpoint).

After each routing device enrolls in a PKI, every peer (also known as an end host) in a PKI is granted a digital certificate that has been issued by a CA. When peers must negotiate a secured communication session, they exchange digital certificates. Based on the information in the certificate, a peer can validate the identity of another peer and establish an encrypted session with the public keys contained in the certificate.

## RSA Key Pair

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key is included in the certificate so that peers can use it to encrypt data that is sent to the device. The private key is kept on the device and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.

RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

## Certificate and Trustpoint

A certification authority (CA), also known as a trustpoint, manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use a CA provided by a third-party CA vendor, or you can use an internal CA, which is the Cisco Certificate Server.

## How to Configure Signed Tcl Scripts

### Generating a Key Pair

The key pair consists of a private key and a public key. The private key is intended to be kept private, accessible only to the creator. The public key is generated from the private key and is intended to be known to the public.

To generate a key pair, use the **openssl genrsa** command and then the **openssl rsa** command.

#### SUMMARY STEPS

1. **openssl genrsa -out** *private-key-file* *bit-length*
2. **ls -l**
3. **openssl rsa -in** *private-key-file* **-pubout -out** *public-key-file*
4. **ls -l**

#### DETAILED STEPS

**Step 1** **openssl genrsa -out** *private-key-file* *bit-length*

This command generates a private key that is *bit-length* bits long and writes the key to the *private-key-file* file.

```
Host% openssl genrsa -out privkey.pem 2048
```

#### Example:

```
Generating RSA private key, 2048 bit long modulus
.....+++
.....+++
e is 65537 (0x10001)
```

**Step 2** **ls -l**

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
total 8
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
```

The `privkey.pem` file contains the private key generated using the `openssl genrsa` command.

**Step 3** `openssl rsa -in private-key-file -pubout -out public-key-file`

This command generates a public key based on the specified private key in the `private-key-file` file and writes the public key to the `public-key-file` file.

**Example:**

```
Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem
writing RSA key
```

**Step 4** `ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
total 16
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The `pubkey.pem` file contains the public key generated from the private key using the `openssl rsa` command.

## Generating a Certificate

Perform this task to generate a certificate. To generate an X.509 certificate, use the `openssl req` command.

### SUMMARY STEPS

1. `openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`
2. `ls -l`

### DETAILED STEPS

**Step 1** `openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`

This command creates an X.509 certificate, with full access to a private key that is stored in the `private-key-file` file, and stores the certificate in the `certificate-file` file. The certificate is configured to expire in `expiration-days` days.

To complete the command, enter the following Distinguished Name (DN) information when prompted:

- Country name
- State or province name
- Organization name
- Organizational unit name
- Common name
- Email address

At each prompt, text enclosed in square brackets indicates the default value that will be used if you do not enter a value before you press Enter.

This example shows how to create an X.509 certificate that has full access to the private key in the `privkey.pem` file. The certificate is written to the `cert.pem` file and will expire 1095 days after the creation date.

#### Example:

```
Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095
```

You are about to be asked to enter information that will be incorporated into your certificate request.

What you are about to enter is what is called a Distinguished Name or a DN.

There are quite a few fields but you can leave some blank

For some fields there will be a default value, If you enter '.', the field will be left blank.

-----

Country Name (2 letter code) [GB]:**US**

State or Province Name (full name) [Berkshire]:**California**

Locality Name (eg, city) [Newbury]:**San Jose**

Organization Name (eg, company) [My Company Ltd]:**Cisco Systems, Inc.**

Organizational Unit Name (eg, section) []:**DEPT\_ACCT**

Common Name (eg, your name or your server's hostname) []:**Jane**

Email Address []:**janedoe@company.com**

## Step 2 **ls -l**

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

#### Example:

```
Host% ls -l
```

```
total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The `cert.pem` file contains the X.509 certificate created using the `openssl req` command.

## Signing the Tcl Scripts

Perform this task to sign the Tcl scripts. You will need to sign the Tcl file and output in OpenSSL document in pkcs7 (PKCS#7) format.

To sign the Tcl file, use the **openssl smime** command with the **-sign** keyword.

### SUMMARY STEPS

1. **openssl smime -sign -in** *tcl-file* **-out** *signed-tcl-file* **-signer** *certificate-file* **-inkey** *private-key-file* **-outform DER -binary**
2. **ls -l**

### DETAILED STEPS

**Step 1** **openssl smime -sign -in** *tcl-file* **-out** *signed-tcl-file* **-signer** *certificate-file* **-inkey** *private-key-file* **-outform DER -binary**

This command signs the Tcl filename *tcl-file* using the certificate stored in *certificate-file* and the private key stored in *private-key-file* file and then writes the signed Tcl file in DER PKCS#7 format to the *signed-tcl-file* file.

**Example:**

```
Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem -outform DER -binary
```

**Step 2** **ls -l**

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l

total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The *hello.pk7* file contains the signed Tcl file created by the **openssl smime** command from the unsigned Tcl file named *hello* and using the X.509 certificate in the *cert.pem* file.

## Verifying the Signature

Perform this task to verify that the signature matches the data, use the **openssl smime** command with the **-verify** keyword. The original Tcl content must be provided in the input file, because the file does not have the original content.

## SUMMARY STEPS

1. `openssl smime -verify -in signed-tcl-file -CAfile certificate-file -inform DER -content tcl-file`
2. `ls -l`

## DETAILED STEPS

### Step 1 `openssl smime -verify -in signed-tcl-file -CAfile certificate-file -inform DER -content tcl-file`

This command verifies the signed Tcl file stored in DER PKCS#7 format in *signed-tcl-file* using the trusted Certificate Authority (CA) certificates in *certificate-file* and then writes the detached content to the file *tcl-file*.

The following example shows how to verify the signature with the input file `hello.pk7`:

#### Example:

```
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello

puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
Verification successful
```

**Note** The SSL command page describes `-in filename` as the input message to be encrypted or signed or the MIME message to be decrypted or verified. For more information, go to <http://www.openssl.org/>.

### Step 2 `ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

#### Example:

```
Host% ls -l

total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 13 10:18 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:17 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The `hello` file contains the content detached from the signed Tcl file `hello.pk7` by running the `openssl smime` command with the `-verify` keyword. If the verification was successful, the signer's certificates are written to the X.509 certificate in the `cert.pem` file.

## Converting the Signature into Nonbinary Data

Perform this task to convert the signature from binary to nonbinary data.

## SUMMARY STEPS

1. `xxd -ps signed-tcl-file > nonbinary-signature-file`
2. Create a script that displays **#Cisco Tcl Signature V1.0** in the first line and inserts a comment character (#) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string “\_sig” to the name of the input file.
3. Run the script, supplying the name of the file containing the nonbinary signature file (*nonbinary-signature-file*) as the input argument.
4. `ls -l`
5. `cat signed-tcl-file commented-nonbinary-signature-file > signed-tcl-script`
6. `cat signed-tcl-script`

## DETAILED STEPS

**Step 1** `xxd -ps signed-tcl-file > nonbinary-signature-file`

This command converts the signature in *signed-tcl-file* from binary to nonbinary data and stores it as a hexadecimal dump in the file *nonbinary-signature-file*.

### Example:

```
Host% xxd -ps hello.pk7 > hello.hex
```

**Step 2** Create a script that displays **#Cisco Tcl Signature V1.0** in the first line and inserts a comment character (#) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string “\_sig” to the name of the input file.

In this example the `cat` command is used to display the contents of the script file named `my_append`.

### Example:

```
Host% cat my_append

#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0}
set newline {}
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
puts $my_new_handle $newline
puts $my_new_handle $my_first
foreach line [split [read $my_handle] "\n"] {
 set new_line (#)
 append new_line $line
 puts $my_new_handle $new_line
}

close $my_new_handle
close $my_handle
```

**Step 3** Run the script, supplying the name of the file containing the nonbinary signature file (*nonbinary-signature-file*) as the input argument.

In this example, the `my_append` script is run with the nonbinary signature file `hello.hex` specified as input. The output file will be named `hello.hex_sig`.

**Example:**

```
Host% my_append hello.hex
```

**Step 4** **ls -l**

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```

```
total 80
-rw-r--r-- 1 janedoe eng12 1659 Jun 13 10:18 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:17 hello
-rw-r--r-- 1 janedoe eng12 3815 Jun 13 10:20 hello.hex
-rw-r--r-- 1 janedoe eng12 3907 Jun 13 10:22 hello.hex_sig
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rwxr--r-- 1 janedoe eng12 444 Jun 13 10:22 my_append
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The hello.hex file contains nonbinary data (stored as a hexadecimal dump) converted from the binary signature in the signed Tcl file hello.pk7. The my\_append file contains the script that inserts a comment character at the beginning of each line of the input file. The hello.hex\_sig file is the file created by running the my\_append script on the nonbinary signature file.

**Step 5** **cat signed-tcl-file commented-nonbinary-signature-file > signed-tcl-script**

This command appends the contents of the nonbinary signature file (*commented-nonbinary-signature-file*) to the signed Tcl file stored in DER PKCS#7 format (in the *signed-tcl-file* file). The concatenated output is written to the file *signed-tcl-script*.

**Example:**

```
Host% cat hello hello.hex_sig > hello.tcl
```

**Step 6** **cat signed-tcl-script**

This command displays the contents of the file *signed-tcl-script*, which is the concatenation of content detached from the signed Tcl file and the nonbinary signature file.

**Example:**

```
Host% cat hello.tcl
```

```
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"

```

## Configuring the Device with a Certificate

Perform this task to configure the device with a certificate.

### Before you begin

You must already have a Cisco IOS Crypto image; otherwise you cannot configure a certificate.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment terminal**
5. **exit**
6. **crypto pki authenticate** *name*
7. At the prompt, enter the base-encoded CA certificate.
8. **scripting tcl secure-mode**
9. **scripting tcl trustpoint name** *name*
10. **scripting tcl trustpoint untrusted** {**execute** | **safe-execute** | **terminate**}
11. **exit**
12. **tclsafe**

### DETAILED STEPS

---

**Step 1**      **enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 2**      **configure terminal**

Enters global configuration mode.

**Example:**

```
Device# configure terminal
```

**Step 3**      **crypto pki trustpoint** *name*

Declares the device is to use the Certificate Authority (CA) *mytrust* and enters ca-trustpoint configuration mode.

**Example:**

```
Device(config)# crypto pki trustpoint mytrust
```

**Step 4**      **enrollment terminal**

Specifies manual cut-and-paste certificate enrollment. When this command is enabled, the device displays the certificate request on the console terminal, allowing you to enter the issued certificate on the terminal.

**Example:**

```
Device(ca-trustpoint)# enrollment terminal
```

**Step 5**      **exit**

Exits ca-trustpoint configuration mode and returns to global configuration mode.

**Example:**

```
Device(ca-trustpoint)# exit
```

**Step 6**      **crypto pki authenticate name**

Retrieves the CA certificate and authenticates it. Check the certificate fingerprint if prompted.

**Note**      Because the CA signs its own certificate, you should manually authenticate the public key of the CA by contacting the CA administrator when you perform this command.

**Example:**

```
Device(config)# crypto pki authenticate mytrust
```

**Step 7**      At the prompt, enter the base-encoded CA certificate.**Example:**

```
Enter the base 64 encoded CA certificate.
End with a blank line or the word "quit" on a line by itself

wcpBIJsLaJu6ZUJQ17IqdsWsa3fHd5qq0/k8P9z0YAYrf3+MFQr4ibvsYvHLO087
o2JslgW4qz34pqNh
Certificate has the following attributes:
 Fingerprint MD5: 1E327DBB 330936EB 2FB8EACB 4FD1133E
 Fingerprint SHA1: EE7FF9F4 05148842 B9D50FAC D76FDC9C E0703246
% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.
% Certificate successfully imported
```

**Step 8**      **scripting tcl secure-mode**

Enables signature verification of the interactive Tcl scripts.

```
Device(config)# scripting tcl secure-mode
```

**Step 9**     **scripting tcl trustpoint name** *name*

Associates an existing configured trustpoint name with a certificate to verify Tcl scripts.

```
Device(config)# scripting tcl trustpoint name mytrust
```

**Step 10**    **scripting tcl trustpoint untrusted** {**execute** | **safe-execute** | **terminate**}

(Optional) Allows the interactive Tcl scripts to run regardless of the scripts failing in the signature check or in untrusted mode using one of the three keywords: **execute**, **safe-execute**, or **terminate**.

- **execute** --Executes Tcl scripts even if the signature verification fails. If the **execute** keyword is configured, signature verification is not at all performed.

**Note**     Use of this keyword is usually not recommended because the signature verification is not at all performed.

The **execute** keyword is provided for internal testing purposes and to provide flexibility. For example, in a situation where a certificate has expired but the other configurations are valid and you want to work with the existing configuration, then you can use the execute keyword to work around the expired certificate.

- **safe-execute** --Allows the script to run in safe mode. You can use the tclsafe command and also enter the interactive Tcl shell safe mode to explore the safe mode Tcl commands that are available. In order to get a better understanding of what is available in this limited safe mode, use the tclsafe Exec command to explore the options.
- **terminate** --Stops any script from running and reverts to default behavior. The default policy is to terminate. When the last trustpoint name is removed, the untrusted action is also removed. The untrusted action cannot be entered until at least one trustpoint name is configured for Tcl.

The following example shows how to execute the Tcl script in safe mode using the **safe-execute** keyword when the signature verification fails.

```
Device(config)# scripting tcl trustpoint untrusted safe-execute
```

**Step 11**    **exit**

Exits global configuration mode and returns to privileged EXEC mode.

```
Device(config)# exit
```

**Step 12**    **tclsafe**

(Optional) Enables the interactive Tcl shell untrusted safe mode. This allows you to manually run Tcl commands from the Cisco command line interface in untrusted safe mode.

```
Device# tclsafe
```

**Example:**

---

## Verifying the Trustpoint

To display the trustpoints that are configured in the device, use the **show crypto pki trustpoints** command.

### SUMMARY STEPS

1. **enable**
2. **show crypto pki trustpoints**

### DETAILED STEPS

---

#### Step 1 **enable**

This command enables privileged EXEC mode.

**Example:**

```
Device> enable
```

#### Step 2 **show crypto pki trustpoints**

This command displays the trustpoints that are configured in the device.

**Example:**

```
Device# show
crypto pki trustpoints

Trustpoint mytrust:
 Subject Name:
 ea=janedoe@cisco.com
 cn=Jane
 ou=DEPT_ACCT
 o=Cisco
 l=San Jose
 st=California
 c=US
 Serial Number: 00
 Certificate configured.
```

---

## Verifying the Signed Tcl Script

To verify that the Signed Tcl Script is properly running, use the **debug crypto pki transactions** command and the **tclsh** command.

### SUMMARY STEPS

1. **enable**

2. **debug crypto pki transactions**
3. **tclsh flash:signed-tcl-file**

## DETAILED STEPS

### Step 1 enable

This command enables privileged EXEC mode.

#### Example:

```
Device> enable
```

### Step 2 debug crypto pki transactions

This command display debugging messages for the trace of interaction (message type) between the CA and the device.

#### Example:

```
Device# debug crypto pki transactions
Crypto PKI Trans debugging is on
```

### Step 3 tclsh flash:signed-tcl-file

This command executes the Tcl script in Tcl shell.

**Note** The file should be a signed Tcl file.

#### Example:

```
Device# tclsh flash:hello.tcl

hello
argc = 0
argv =
argv0 = flash:hello.tcl
tcl_interactive = 0
device#
*Apr 21 04:46:18.563: CRYPTO_PKI: locked trustpoint mytrust, refcount is 1
*Apr 21 04:46:18.563: The PKCS #7 message has 0 verified signers.
*Apr 21 04:46:18.563: CRYPTO_PKI: Success on PKCS7 verify!
*Apr 21 04:46:18.563: CRYPTO_PKI: unlocked trustpoint mytrust, refcount is 0
```

## What to Do Next

- To get an overview of Crypto, refer to the “Part 5: Implementing and Managing a PKI” section of the *Security Configuration Guide*.

# Configuration Examples for Signed Tcl Script

## Generating a Key Pair Example

The following example shows how to generate the key pair--a private key and a public key:

### Generate a Private Key: Example

```
Host% openssl genrsa -out privkey.pem 2048
Generating RSA private key, 2048 bit long modulus
.....+++
.....+++
e is 65537 (0x10001)
Host% ls -l
total 8
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
Host%
```

### Generate a Public Key from the Private Key

```
Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem
writing RSA key
Host% ls -l
total 16
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

## Generating a Certificate Example

The following example shows how to generate a certificate:

```
Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value, If you enter '.', the field will be left
blank.

Country Name (2 letter code) [GB]:US
State or Province Name (full name) [Berkshire]:California
Locality Name (eg, city) [Newbury]:San Jose
Organization Name (eg, company) [My Company Ltd]:Cisco Systems, Inc.
Organizational Unit Name (eg, section) []:DEPT_ACCT
Common Name (eg, your name or your server's hostname) []:Jane
Email Address []:janedoe@company.com
Host% ls -l
total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

## Signing the Tcl Scripts Example

The following example shows how to sign the Tcl scripts:

```
Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem
-outform DER -binary
Host% ls -l
total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

## Verifying the Signature Example

The following example shows how to verify the signature:

```
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
Verification successful
```

## Converting the Signature with Nonbinary Data Example

The following example shows how to convert the Tcl signature with nonbinary data:

```
#Cisco Tcl Signature V1.0
Then append the signature file to the end of the file.
Host% xxd -ps hello.pk7 > hello.hex
Host% cat my_append
#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0}
set newline {}
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]

puts $my_new_handle $newline
puts $my_new_handle $my_first
foreach line [split [read $my_handle] "\n"] {
 set new_line {#}
 append new_line $line
 puts $my_new_handle $new_line
}

close $my_new_handle
close $my_handle
Host% my_append hello.hex
Host% ls -l
total 80
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 3815 Jun 13 10:20 hello.hex
```

## Converting the Signature with Nonbinary Data Example

```

-rw-r--r-- 1 janedoe eng12 3907 Jun 13 10:22 hello.hex_sig
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rwxr--r-- 1 janedoe eng12 444 Jun 13 10:22 my_append
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
Host% cat hello hello.hex_sig > hello.tcl
Host% cat hello.tcl
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"

## Feature Information for Signed Tcl Scripts

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

*Table 218: Feature Information for Signed Tcl Scripts*

| Feature Name       | Releases  | Feature Information                                           |
|--------------------|-----------|---------------------------------------------------------------|
| Signed Tcl Scripts | 15.2(5)E1 | This feature was introduced and is supported only on c2960cx. |

## Glossary

CA--certification authority. Service responsible for managing certificate requests and issuing certificates to participating IPsec network devices. This service provides centralized key management for the participating devices and is explicitly trusted by the receiver to validate identities and to create digital certificates.

certificates--Electronic documents that bind a user's or device's name to its public key. Certificates are commonly used to validate a digital signature.

CRL--certificate revocation list. Electronic document that contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when the certificate was issued and when it expires. A new CRL is issued when the current CRL expires.

IPsec--IP security

peer certificate--Certificate presented by a peer, which contains the peer's public key and is signed by the trustpoint CA.

PKI--public key infrastructure. System that manages encryption keys and identity information for components of a network that participate in secured communications.

RA--registration authority. Server that acts as a proxy for the CA so that CA functions can continue when the CA is offline. Although the RA is often part of the CA server, the RA could also be an additional application, requiring an additional device to run it.

RSA keys--Public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. An RSA key pair (a public and a private key) is required before you can obtain a certificate for your device.

SHA1--Secure Hash Algorithm 1

SSH--secure shell

SSL--secure socket layer

## CHAPTER 103

# EEM CLI Library Command Extensions

All command-line interface (CLI) library command extensions belong to the `::cisco::eem` namespace.

This library provides users the ability to run CLI commands and get the output of the commands in Tcl. Users can use commands in this library to spawn an exec and open a virtual terminal channel to it, write the command to execute to the channel so that the command will be executed by exec, and read back the output of the command.

There are two types of CLI commands: interactive commands and non-interactive commands.

For interactive commands, after the command is entered, there will be a "Q&A" phase in which the device will ask for different user options, and the user is supposed to enter the answer for each question. Only after all the questions have been answered properly will the command run according to the user's options until completion.

For noninteractive commands, once the command is entered, the command will run to completion. To run different types of commands using an EEM script, different CLI library command sequences should be used, which are documented in the "Using the CLI Library to Run a Noninteractive Command" section and in the "Using the CLI Library to Run an Interactive Command" section in the `cli_write` Tcl command.

The vty lines are allocated from the pool of vty lines that are configured using the `line vty` CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

Your release may support XML-PI. For details about the XML-PI support, the new CLI library command extensions, and some examples of how to implement XML-PI, see EEM CLI Library XML-PI Support.

## cli\_close

Closes the exec process and releases the vty and the specified channel handler connected to the command-line interface (CLI).

### Syntax

```
cli_close fd tty_id
```

### Arguments

|        |                                                                             |
|--------|-----------------------------------------------------------------------------|
| fd     | (Mandatory) The CLI channel handler.                                        |
| tty_id | (Mandatory) The TTY ID returned from the <b>cli_open</b> command extension. |

### Result String

None

### Set\_cerrno

Cannot close the channel.

## cli\_exec

Writes the command to the specified channel handler to execute the command. Then reads the output of the command from the channel and returns the output.

### Syntax

```
cli_exec fd cmd
```

### Arguments

|     |                                                               |
|-----|---------------------------------------------------------------|
| fd  | (Mandatory) The command-line interface (CLI) channel handler. |
| cmd | (Mandatory) The CLI command to execute.                       |

### Result String

The output of the CLI command executed.

### Set\_cerrno

Error reading the channel.

## cli\_get\_ttyname

Returns the real and pseudo TTY names for a given TTY ID.

### Syntax

```
cli_get_ttyname tty_id
```

### Arguments

|        |                                                                             |
|--------|-----------------------------------------------------------------------------|
| tty_id | (Mandatory) The TTY ID returned from the <b>cli_open</b> command extension. |
|--------|-----------------------------------------------------------------------------|

### Result String

```
pty %s tty %s
```

### Set\_cerrno

None

## cli\_open

Allocates a vty, creates an EXEC command-line interface (CLI) session, and connects the vty to a channel handler. Returns an array including the channel handler.

---

**Note** Each call to **cli\_open** initiates a Cisco IOS EXEC session that allocates a Cisco IOS vty line. The vty remains in use until the **cli\_close** routine is called. The vty lines are allocated from the pool of vty lines that are configured using the **line vty** CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

---

### Syntax

```
cli_open
```

### Arguments

None

### Result String

```
"tty_id {%s} pty {%d} tty {%d} fd {%d}"
```

| Event Type    | Description          |
|---------------|----------------------|
| <b>tty_id</b> | TTY ID.              |
| <b>pty</b>    | PTY device name.     |
| <b>tty</b>    | TTY device name.     |
| <b>fd</b>     | CLI channel handler. |

**Set\_cerrno**

- Cannot get pty for EXEC.
- Cannot create an EXEC CLI session.
- Error reading the first prompt.

## cli\_read

Reads the command output from the specified command-line interface (CLI) channel handler until the pattern of the device prompt occurs in the contents read. Returns all the contents read up to the match.

**Syntax**

```
cli_read fd
```

**Arguments**

|           |                                      |
|-----------|--------------------------------------|
| <b>fd</b> | (Mandatory) The CLI channel handler. |
|-----------|--------------------------------------|

**Result String**

All the contents read.

**Set\_cerrno**

Cannot get device name.

---

**Note** This Tcl command extension will block waiting for the device prompt to show up in the contents read.

---

## cli\_read\_drain

Reads and drains the command output of the specified command-line interface (CLI) channel handler. Returns all the contents read.

**Syntax**

```
cli_read_drain fd
```

**Arguments**

|    |                                      |
|----|--------------------------------------|
| fd | (Mandatory) The CLI channel handler. |
|----|--------------------------------------|

**Result String**

All the contents read.

**Set\_cerrno**

None

## cli\_read\_line

Reads one line of the command output from the specified command-line interface (CLI) channel handler. Returns the line read.

**Syntax**

```
cli_read_line fd
```

**Arguments**

|    |                                      |
|----|--------------------------------------|
| fd | (Mandatory) The CLI channel handler. |
|----|--------------------------------------|

**Result String**

The line read.

**Set\_cerrno**

None

---

**Note** This Tcl command extension will block waiting for the end of line to show up in the contents read.

---

## cli\_read\_pattern

Reads the command output from the specified command-line interface (CLI) channel handler until the pattern that is to be matched occurs in the contents read. Returns all the contents read up to the match.

---

**Note** The pattern matching logic attempts a match by looking at the command output data as it is delivered from the Cisco IOS command. The match is always done on the most recent 256 characters in the output buffer unless there are fewer characters available, in which case the match is done on fewer characters. If more than 256 characters in the output buffer are required for the match to succeed, the pattern will not match.

---

**Syntax**

```
cli_read_pattern fd ptn
```

**Arguments**

|     |                                                                                         |
|-----|-----------------------------------------------------------------------------------------|
| fd  | (Mandatory) The CLI channel handler.                                                    |
| ptn | (Mandatory) The pattern to be matched when reading the command output from the channel. |

**Result String**

All the contents read.

**Set\_cerrno**

None

---

**Note** This Tcl command extension will block waiting for the specified pattern to show up in the contents read.

---

## cli\_run

Iterates over the items in the clist and assumes that each one is a command-line-interface (CLI) command to be executed in the enable mode. On success, returns the output of all executed commands and on failure, returns error from the failure.

**Syntax**

```
cli_run clist
```

**Arguments**

|       |                                                  |
|-------|--------------------------------------------------|
| clist | (Mandatory) The list of commands to be executed. |
|-------|--------------------------------------------------|

**Result String**

Output of all the commands that are executed or an error message.

**Set \_cerrno**

None.

**Sample Usage**

The following example shows how to use the **cli\_run** command extension.

```
set clist [list {sh run} {sh ver} {sh event man pol reg}]
cli_run { clist }
```

# cli\_run\_interactive

Provides a sublist to the clist which has three items. On success, returns the output of all executed commands and on failure, returns error from the failure. Also uses arrays when possible as a way of making things easier to read later by keeping expect and reply separated.

**Syntax**

```
cli_run_interactive clist
```

**Arguments**

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clist | <p>(Mandatory) List of three items:</p> <ul style="list-style-type: none"> <li>• command– Command to be executed</li> <li>• expect– A regular expression pattern match for the expected reply prompt</li> <li>• responses– A list of possible responses to the reply prompt constructed as an array of two items: <ul style="list-style-type: none"> <li>• expect– A regular expression pattern match for a possible reply prompt</li> <li>• reply- A reply for that expected prompt</li> </ul> </li> </ul> |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Result String**

Output of all the commands that are executed or an error message. As each command is executed its output is appended to a result variable. Upon exhaustion of the input list, the CLI channel is closed and the aggregate result is returned.

**Set \_cerrno**

None.

**Sample Usage**

The following example shows how to clear counters for interface fa0/0 use the cli\_run\_interactive command extension.

```

set cmdarr(command) "clear counters fa0/0"
set cmdarr(responses) [list]
set resps(expect) {[confirm]}
set resps(reply) "y"
lappend cmdarr(responses) [array get resps]
set rc [catch {cli_run_interactive [list [array get cmdarr]]} result]

```

Possible errors raised include:

- cannot get pty for exec
- cannot spawn exec
- error reading the first prompt
- error reading the channel
- cannot close channel

## cli\_write

Writes the command that is to be executed to the specified CLI channel handler. The CLI channel handler executes the command.

### Syntax

```
cli_write fd cmd
```

### Arguments

|     |                                         |
|-----|-----------------------------------------|
| fd  | (Mandatory) The CLI channel handler.    |
| cmd | (Mandatory) The CLI command to execute. |

### Result String

None

### Set\_cerrno

None

### Sample Usage

As an example, use configuration CLI commands to bring up Ethernet interface 1/0:

```

if [catch {cli_open} result] {
puts stderr $result
exit 1
} else {
array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {
puts stderr $result
exit 1
}

```

```

}
if [catch {cli_exec $cli1(fd) "config t"} result] {
puts stderr $result
exit 1
}
if [catch {cli_exec $cli1(fd) "interface Ethernet1/0"} result] {
puts stderr $result
exit 1
}
if [catch {cli_exec $cli1(fd) "no shut"} result] {
puts stderr $result
exit 1
}
if [catch {cli_exec $cli1(fd) "end"} result] {
puts stderr $result
exit 1
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} } result] {
puts stderr $result
exit 1
}

```

### Using the CLI Library to Run a Noninteractive Command

To run a noninteractive command, use the **cli\_exec** command extension to issue the command, and then wait for the complete output and the device prompt. For example, the following shows the use of configuration CLI commands to bring up Ethernet interface 1/0:

```

if [catch {cli_open} result] {
error $result $errorInfo
} else {
set fd $result
}
if [catch {cli_exec $fd "en"} result] {
error $result $errorInfo
}
if [catch {cli_exec $fd "config t"} result] {
error $result $errorInfo
}
if [catch {cli_exec $fd "interface Ethernet1/0"} result] {
error $result $errorInfo
}
if [catch {cli_exec $fd "no shut"} result] {
error $result $errorInfo
}
if [catch {cli_exec $fd "end"} result] {
error $result $errorInfo
}
if [catch {cli_close $fd} result] {
error $result $errorInfo
}
}

```

### Using the CLI Library to Run an Interactive Command

To run interactive commands, three phases are needed:

- Phase 1: Issue the command using the **cli\_write** command extension.
- Phase 2: Q&A Phase. Use the **cli\_read\_pattern** command extension to read the question (the regular pattern that is specified to match the question text) and the **cli\_write** command extension to write back the answers alternately.

- Phase 3: Noninteractive phase. All questions have been answered, and the command will run to completion. Use the **cli\_read** command extension to wait for the complete output of the command and the device prompt.

For example, use CLI commands to do squeeze bootflash: and save the output of this command in the Tcl variable `cmd_output`.

```

if [catch {cli_open} result] {
error $result $errorInfo
} else {
array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {
error $result $errorInfo
}

Phase 1: issue the command
if [catch {cli_write $cli1(fd) "squeeze bootflash:"} result] {
error $result $errorInfo
}

Phase 2: Q&A phase
wait for prompted question:
All deleted files will be removed. Continue? [confirm]
if [catch {cli_read_pattern $cli1(fd) "All deleted"} result] {
error $result $errorInfo
}
write a newline character
if [catch {cli_write $cli1(fd) "\n"} result] {
error $result $errorInfo
}
wait for prompted question:
Squeeze operation may take a while. Continue? [confirm]
if [catch {cli_read_pattern $cli1(fd) "Squeeze operation"} result] {
error $result $errorInfo
}
write a newline character
if [catch {cli_write $cli1(fd) "\n"} result] {
error $result $errorInfo
}

Phase 3: noninteractive phase
wait for command to complete and the router prompt
if [catch {cli_read $cli1(fd) } result] {
error $result $errorInfo
} else {
set cmd_output $result
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
error $result $errorInfo
}

```

The following example causes a device to be reloaded using the CLI **reload** command. Note that the EEM **action\_reload** command accomplishes the same result in a more efficient manner, but this example is presented to illustrate the flexibility of the CLI library for interactive command execution.

```

1. execute the reload command
if [catch {cli_open} result] {
error $result $errorInfo
} else {
array set cli1 $result

```

```

}
if [catch {cli_exec $cli1(fd) "en"} result] {
 error $result $errorInfo
}
if [catch {cli_write $cli1(fd) "reload"} result] {
 error $result $errorInfo
} else {
 set cmd_output $result
}
if [catch {cli_read_pattern $cli1(fd) ".*(System configuration has been modified. Save\\? \\[yes/no\\]:)"} result] {
 error $result $errorInfo
} else {
 set cmd_output $result
}
if [catch {cli_write $cli1(fd) "no"} result] {
 error $result $errorInfo
} else {
 set cmd_output $result
}
if [catch {cli_read_pattern $cli1(fd) ".*(Proceed with reload\\? \\[confirm\\])"} result]
{
 error $result $errorInfo
} else {
 set cmd_output $result
}
if [catch {cli_write $cli1(fd) "y"} result] {
 error $result $errorInfo
} else {
 set cmd_output $result
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
 error $result $errorInfo
}
}

```

## EEM 4.0 CLI Library XML-PI Support

### EEM CLI Library XML-PI Support

XML Programmatic Interface (XML-PI) was introduced in Cisco IOS Release 12.4(22)T. XML-PI provides a programmable interface which encapsulates IOS command-line interface (CLI) show commands in XML format in a consistent way across different Cisco products. Customers using XML-PI will be able to parse IOS show command output from within Tcl scripts using well-known keywords instead of having to depend on the use of regular expression support to "screen-scrape" output.

The benefit of using the XML-PI command extensions is to facilitate the extraction of specific output information that is generated using a CLI **show** command. Most show commands return many fields within the output and currently a regular expression has to be used to extract specific information that may appear in the middle of a line. XML-PI support provides a set of Tcl library functions to facilitate the parsing of output from the IOS CLI format extension in the form of:

```

show
<
show-command
> | format
{

```

```
spec-file
}
```

where a spec-file is a concatenation of all Spec File Entries (SFE) for each **show** command currently supported. As part of the XML-PI project a default spec-file will be included in the IOS Release 12.4(22)T images. The default spec-file will have a small set of commands and the SFE for the commands will have a subset of the possible tags. If no spec-file is provided with the format command, the default spec-file is used.

For more general details about XML-PI, see the "XML-PI" module.

## CHAPTER 104

# EEM Context Library Command Extensions

All the Tcl context library command extensions belong to the `::cisco::eem` namespace.

- [context\\_retrieve](#), on page 2171
- [context\\_save](#), on page 2174

## context\_retrieve

Retrieves Tcl variable(s) identified by the given context name, and possibly the scalar variable name, the array variable name, and the array index. Retrieved information is automatically deleted.

**Note** Once saved information is retrieved, it is automatically deleted. If that information is needed by another policy, the policy that retrieves it (using the **context\_retrieve** command extension) should also save it again (using the **context\_save** command extension).

### Syntax

```
context_retrieve ctxt [var] [index_if_array]
```

### Arguments

|                |                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------|
| ctxt           | (Mandatory) Context name.                                                                                            |
| var            | (Optional) Scalar variable name or array variable name. Defaults to a null string if this argument is not specified. |
| index_if_array | (Optional) The array index.                                                                                          |

**Note** The `index_if_array` argument will be ignored when the `var` argument is a scalar variable.

If `var` is unspecified, retrieves the whole variable table saved in the context.

If `var` is specified and `index_if_array` is not specified, or if `index_if_array` is specified but `var` is a scalar variable, retrieves the value of `var`.

If `var` is specified, and `index_if_array` is specified, and `var` is an array variable, retrieves the value of the specified array element.

### Result String

Resets the Tcl global variables to the state that they were in when the save was performed.

### Set\_cerrno

- A string displaying `_cerrno`, `_cerr_sub_num`, `_cerr_sub_err`, `_cerr_posix_err`, `_cerr_str` due to `appl_reqinfo` error.
- Variable is not in the context.

### Sample Usage

The following examples show how to use the `context_save` and `context_retrieve` command extension functionality to save and retrieve data. The examples are shown in save and retrieve pairs.

#### Example 1: Save

If `var` is unspecified or if a pattern is specified, saves multiple variables to the context.

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvara 123
set testvarb 345
set testvarc 789
if {[catch {context_save TESTCTX "testvar*"} errmsg]} {
 action_syslog msg "context_save failed: $errmsg"
} else {
 action_syslog msg "context_save succeeded"
}
```

#### Example 1: Retrieve

If `var` is unspecified, retrieves multiple variables from the context.

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

if {[catch {foreach {var value} [context_retrieve TESTCTX] {set $var $value}} errmsg]} {
 action_syslog msg "context_retrieve failed: $errmsg"
} else {
 action_syslog msg "context_retrieve succeeded"
}

if {[info exists testvara]} {
 action_syslog msg "testvara exists and is $testvara"
} else {
 action_syslog msg "testvara does not exist"
}

if {[info exists testvarb]} {
 action_syslog msg "testvarb exists and is $testvarb"
}
```

```

} else {
 action_syslog msg "testvarb does not exist"
}
if {[info exists testvarc]} {
 action_syslog msg "testvarc exists and is $testvarc"
} else {
 action_syslog msg "testvarc does not exist"
}

```

### Example 2: Save

If var is specified, saves the value of var.

```

::cisco::eem::event_register_none

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvar 123
if {[catch {context_save TESTCTX testvar} errmsg]} {
 action_syslog msg "context_save failed: $errmsg"
} else {
 action_syslog msg "context_save succeeded"
}

```

### Example 2: Retrieve

If var is specified and index\_if\_array is not specified, or if index\_if\_array is specified but var is a scalar variable, retrieves the value of var.

```

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {set testvar [context_retrieve TESTCTX testvar]} errmsg]} {
 action_syslog msg "context_retrieve failed: $errmsg"
} else {
 action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
 action_syslog msg "testvar exists and is $testvar"
} else {
 action_syslog msg "testvar does not exist"
}

```

### Example 3: Save

If var is specified, saves the value of var even if it is an array.

```

::cisco::eem::event_register_none

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {[catch {context_save TESTCTX testvar} errmsg]} {
 action_syslog msg "context_save failed: $errmsg"
} else {
 action_syslog msg "context_save succeeded"
}

```

**Example 3: Retrieve**

If `var` is specified, and `index_if_array` is not specified, and `var` is an array variable, retrieves the entire array.

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {array set testvar [context_retrieve TESTCTX testvar]} errmsg]} {
 action_syslog msg "context_retrieve failed: $errmsg"
} else {
 action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
 action_syslog msg "testvar exists and is [array get testvar]"
} else {
 action_syslog msg "testvar does not exist"
}
```

**Example 4: Save**

If `var` is specified, saves the value of `var` even if it is an array.

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {[catch {context_save TESTCTX testvar} errmsg]} {
 action_syslog msg "context_save failed: $errmsg"
} else {
 action_syslog msg "context_save succeeded"
}
```

**Example 4: Retrieve**

If `var` is specified, and `index_if_array` is specified, and `var` is an array variable, retrieves the specified array element value.

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {set testvar [context_retrieve TESTCTX testvar testvar1]} errmsg]} {
 action_syslog msg "context_retrieve failed: $errmsg"
} else {
 action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
 action_syslog msg "testvar exists and is $testvar"
} else {
 action_syslog msg "testvar doesn't exist"
}
```

## context\_save

Saves Tcl variables that match a given pattern in current and global namespaces with the given context name as identification. Use this Tcl command extension to save information outside of a policy. Saved information can be retrieved by a different policy using the **context\_retrieve** command extension.

**Note** Once saved information is retrieved, it is automatically deleted. If that information is needed by another policy, the policy that retrieves it (using the **context\_retrieve** command extension) should also save it again (using the **context\_save** command extension).

### Syntax

```
context_save ctxt [pattern]
```

### Arguments

|         |                                                                                                                                                                                                                                                                                                                                                                             |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ctxt    | (Mandatory) Context name.                                                                                                                                                                                                                                                                                                                                                   |
| pattern | (Optional) The glob-style pattern as used by the <b>string match</b> Tcl command. If this argument is not specified, the pattern defaults to the wildcard *.<br><br>There are three constructs used in glob patterns: <ul style="list-style-type: none"> <li>• * = all characters</li> <li>• ? = 1 character</li> <li>• [abc] = match one of a set of characters</li> </ul> |

### Result String

None

### Set \_cerrno

A string displaying \_cerrno, \_cerr\_sub\_num, \_cerr\_sub\_err, \_cerr\_posix\_err, \_cerr\_str due to appl\_setinfo error.

### Sample Usage

The following examples show how to use the **context\_save** and **context\_retrieve** command extension functionality to save and retrieve data. The examples are shown in save and retrieve pairs.

#### Example 1: Save

If var is unspecified or if a pattern is specified, saves multiple variables to the context.

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvara 123
set testvarb 345
set testvarc 789
if {[catch {context_save TESTCTX "testvar*"} errmsg]} {
 action_syslog msg "context_save failed: $errmsg"
} else {
 action_syslog msg "context_save succeeded"
}
```

**Example 1: Retrieve**

If var is unspecified, retrieves multiple variables from the context.

```

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

if {[catch {foreach {var value} [context_retrieve TESTCTX] {set $var $value}} errmsg]} {
 action_syslog msg "context_retrieve failed: $errmsg"
} else {
 action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvara]} {
 action_syslog msg "testvara exists and is $testvara"
} else {
 action_syslog msg "testvara does not exist"
}
if {[info exists testvarb]} {
 action_syslog msg "testvarb exists and is $testvarb"
} else {
 action_syslog msg "testvarb does not exist"
}
if {[info exists testvarc]} {
 action_syslog msg "testvarc exists and is $testvarc"
} else {
 action_syslog msg "testvarc does not exist"
}
}

```

**Example 2: Save**

If var is specified, saves the value of var.

```

::cisco::eem::event_register_none

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvar 123
if {[catch {context_save TESTCTX testvar} errmsg]} {
 action_syslog msg "context_save failed: $errmsg"
} else {
 action_syslog msg "context_save succeeded"
}
}

```

**Example 2: Retrieve**

If var is specified and index\_if\_array is not specified, or if index\_if\_array is specified but var is a scalar variable, retrieves the value of var.

```

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {set testvar [context_retrieve TESTCTX testvar]} errmsg]} {
 action_syslog msg "context_retrieve failed: $errmsg"
} else {
 action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
 action_syslog msg "testvar exists and is $testvar"
} else {
}
}

```

```

 action_syslog msg "testvar does not exist"
 }

```

### Example 3: Save

If var is specified, saves the value of var even if it is an array.

```

::cisco::eem::event_register_none

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {[catch {context_save TESTCTX testvar} errmsg]} {
 action_syslog msg "context_save failed: $errmsg"
} else {
 action_syslog msg "context_save succeeded"
}

```

### Example 3: Retrieve

If var is specified, and index\_if\_array is not specified, and var is an array variable, retrieves the entire array.

```

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {array set testvar [context_retrieve TESTCTX testvar]} errmsg]} {
 action_syslog msg "context_retrieve failed: $errmsg"
} else {
 action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
 action_syslog msg "testvar exists and is [array get testvar]"
} else {
 action_syslog msg "testvar does not exist"
}

```

### Example 4: Save

If var is specified, saves the value of var even if it is an array.

```

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {[catch {context_save TESTCTX testvar} errmsg]} {
 action_syslog msg "context_save failed: $errmsg"
} else {
 action_syslog msg "context_save succeeded"
}

```

### Example 4: Retrieve

If var is specified, and index\_if\_array is specified, and var is an array variable, retrieves the specified array element value.

```

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {set testvar [context_retrieve TESTCTX testvar testvar1]} errmsg]} {

```

```
 action_syslog msg "context_retrieve failed: $errmsg"
 } else {
 action_syslog msg "context_retrieve succeeded"
 }
 if {[info exists testvar]} {
 action_syslog msg "testvar exists and is $testvar"
 } else {
 action_syslog msg "testvar doesn't exist"
 }
}
```

## CHAPTER 105

# EEM Event Registration Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

[type ?]

- A question mark ? represents a variable to be entered.
- Choices between arguments are represented by pipes, for example:

priority low|normal|high

---

**Note** For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

---

**Note** Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

## event\_register\_appl

Registers for an application event. Use this Tcl command extension to run a policy when an application event is triggered following another policy's execution of an **event\_publish** Tcl command extension; the **event\_publish** command extension publishes an application event.

In order to register for an application event, a subsystem must be specified. Either a Tcl policy or the internal Embedded Event Manager (EEM) API can publish an application event. If the event is being published by a policy, the sub\_system argument that is reserved for a policy is 798.

### Syntax

```
event_register_appl [tag ?] sub_system ? type ? [queue_priority low|normal|high|last] [maxrun
?] [nice 0|1]
```

### Arguments

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag        | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                                                                    |
| sub_system | (Mandatory) Number assigned to the EEM policy that published the application event. The number is set to 798 because all other numbers are reserved for Cisco use. If this argument is not specified, all components are matched.                                                                                                                                                                                                                                                                        |
| type       | (Mandatory) Event subtype within the specified event. The sub_system and type arguments uniquely identify an application event. If this argument is not specified, all types are matched. If you specify this argument, you must choose an integer between 1 and 4294967295, inclusive.<br><br>There must be a match of component and type between the <b>event_publish</b> command extension and the <b>event_register_appl</b> command extension in order for the publishing and registration to work. |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

If multiple conditions exist, the application event will be raised when all the conditions are satisfied.

**Result String**

None

**Set\_cerrno**

No

```

| Event Type        | Description                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id          | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type        | Type of event.                                                                                                                                              |
| event_type_string | An ASCII string that represents the name of the event for this event type.                                                                                  |

| Event Type                                    | Description                                                                                                                                                                   |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_pub_sec</b><br><b>event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the Embedded Event Manager (EEM).                                                                      |
| <b>sub_system</b>                             | Number assigned to the EEM policy that published the application event. Number is set to 798 because all other numbers are reserved for Cisco use.                            |
| <b>type</b>                                   | Event subtype within the specified component.                                                                                                                                 |
| <b>data1 data2 data3 data4</b>                | Argument data that is passed to the application-specific event when the event is published. The data is character text, an environment variable, or a combination of the two. |

## event\_register\_cli

Registers for a CLI event. Use this Tcl command extension to run a policy when a CLI command of a specific pattern is entered based on pattern matching performed against an expanded CLI command.

**Note** The user can enter an abbreviated CLI command, such as **sh mem summary**, and the parser will expand the command to **show memory summary** to perform the matching.

**Note** The functionality provided in the CLI event detector only allows a regular expression pattern match on a valid IOS CLI command itself. This does not include text after a pipe character when redirection is used.

### Syntax

```
event_register_cli [tag ?] sync yes|no skip yes|no
[occurs ?] [period ?] pattern ? [default ?] [enter] [questionmark] [tab] [mode]
[queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

### Arguments

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag  | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                                                                                                        |
| sync | (Mandatory) A "yes" means that the policy (the event publish) will run synchronously with the CLI command; a "no" means that the event publish will be performed asynchronously with the CLI command. The event detector will be notified when the policy completes running. The exit status of the policy indicates whether or not the CLI command should be executed: if the exit status is zero, which means that the policy is executed successfully, the CLI command will not be executed; otherwise, the CLI command will be executed. |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skip           | <p>Mandatory if the sync argument is "no" and should not exist if the sync argument is "yes." If the skip argument is "yes," it means that the CLI command should not be executed. If the skip argument is "no," it means that the CLI command should be executed.</p> <p><b>Caution</b> When the skip argument is "yes," unintended results may be produced if the pattern match is made for configuration commands because the CLI command that matches the regular expression will not be executed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| occurs         | <p>(Optional) The number of occurrences before the event is raised. If this argument is not specified, the event is raised on the first occurrence. If this argument is specified, it must be an integer between 1 and 4294967295, inclusive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| period         | <p>(Optional) Specifies a backward looking time window in which all CLI events must occur (the occurs clause must be satisfied) in order for an event to be published (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent event is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pattern        | <p>(Mandatory) Specifies the regular expression used to perform the CLI command pattern match.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| default        | <p>(Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| enter          | <p>(Optional) Specifies to perform the event match when the user presses the Enter key. When this parameter is used, the input string will not be expanded before matching.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| questionmark   | <p>(Optional) Specifies to perform the event match when the user presses the ? key. When this parameter is used, the input string will not be expanded before matching.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|        |                                                                                                                                                                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tab    | (Optional) Specifies to perform the event match when the user presses the Tab key. When this parameter is used, the input string will not be expanded before matching.                                                                                                                                                                       |
| mode   | (Optional) Events will only be generated when the parser is in the specified parser mode. The available modes can be listed using the <b>show parser dump</b> CLI command. The mode parameter is checked when any one of the optional parameters--enter, questionmark, or tab-- is specified.                                                |
| maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
| nice   | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                    |

If multiple conditions are specified, the CLI event will be raised when all the conditions are matched.

### Result String

None

### Set\_cerrno

No

**Note** This policy runs before the CLI command is executed. For example, suppose policy\_CLI is registered to run when the **copy** command is entered. When the **copy** command is entered, the CLI event detector finds a pattern match and triggers this policy to run. When the policy execution ends, the CLI event detector determines if the **copy** command needs to be executed according to "sync", "skip" (set in the policy), and the exit status of the policy execution if needed.

### Event\_reqinfo

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u
event_severity %u msg {%s} msg_count %d line %u key %u tty %u error_code %u"
```

| Event Type                      | Description                                                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id                        | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type                      | Type of event.                                                                                                                                              |
| event_type_string               | An ASCII string that represents the name of the event for this event type.                                                                                  |
| event_pub_sec<br>event_pub_msec | The time, in seconds and milliseconds, at which the event was published to the EEM.                                                                         |
| event_severity                  | The severity of the event.                                                                                                                                  |

| Event Type | Description                                                                                                                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| msg        | Text entered at the CLI prompt.                                                                                                                                                                                    |
| msg_count  | Number of times the pattern matched before the event was triggered.                                                                                                                                                |
| line       | The text the parser was able to expand up to the point where the matched key was entered.                                                                                                                          |
| key        | The enter, questionmark, or tab key.                                                                                                                                                                               |
| tty        | Corresponds to the line number the user is executing the command on.                                                                                                                                               |
| error_code | The error code in CLI.<br>0 --No error from parser up to point where a key was entered.<br>1--Command is ambiguous up to point where a key was entered.<br>4--Unknown command up to point where a key was entered. |

## event\_register\_counter

Registers for a counter event as both a publisher and a subscriber. Use this Tcl command extension to run a policy on the basis of a named counter crossing a threshold. This event counter, as a subscriber, identifies the name of the counter to which it wants to subscribe and depends on another policy or another process to actually manipulate the counter. For example, let policyB act as a counter policy, whereas policyA (although it does not need to be a counter policy) uses **register\_counter**, **counter\_modify**, or **unregister\_counter** Tcl command extensions to manipulate the counter defined in policyB.

### Syntax

```
event_register_counter [tag ?] name ? entry_op gt|ge|eq|ne|lt|le entry_val ?
exit_op gt|ge|eq|ne|lt|le exit_val ? [queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

### Arguments

|           |                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag       | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                     |
| name      | (Mandatory) Name of the counter.                                                                                                                                                                          |
| entry_op  | (Mandatory) Entry comparison operator used to compare the current counter value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met. |
| entry_val | (Mandatory) Value with which the current counter value should be compared to decide if the counter event should be raised.                                                                                |
| exit_op   | (Mandatory) Exit comparison operator used to compare the current counter value with the exit value; if true, event monitoring for this event will be reenabled.                                           |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| exit_val       | (Mandatory) Value with which the current counter value should be compared to decide if the exit criteria are met.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nice           | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo**

```
"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u"
"name {%s}"
```

| Event Type | Description                                                                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id   | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type | Type of event.                                                                                                                                              |

| Event Type                   | Description                                                                     |
|------------------------------|---------------------------------------------------------------------------------|
| event_type_string            | An ASCII string that represents the name of the event for this event type.      |
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, when the event was published to the EEM. |
| name                         | Counter name.                                                                   |

## event\_register\_gold

Registers for a Generic Online Diagnostic (GOLD) failure event. Use this Tcl command extension to run a policy on the basis of a Generic Online Diagnostic (GOLD) failure event for the specified card and subcard.

### Syntax

```
event_register_gold card all|card_number
[subcard all|subcard_number]
[new_failure TRUE|FALSE]
[severity_major TRUE]
[severity_minor TRUE]
[severity_normal TRUE]
[action_notify TRUE|FALSE]
[testing_type [bootup|ondemand|schedule|monitoring]]
[test_name [testname]]
[test_id [testnumber]]
[consecutive_failure consecutive_failure_number]
[platform_action [action_flag]]
[maxrun ?]
[queue_priority low|normal|high|last]
[nice 0|1]
```

### Arguments

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| card    | <p>(Mandatory) Specifies whether all cards or one card is to be monitored:</p> <ul style="list-style-type: none"> <li>• card all--Specifies that all cards are to be monitored. This is the default.</li> <li>• card-number--Specifies that the card identified by the number card-number is to be monitored.</li> </ul> <p>This argument must be specified to complete the <b>event_register_gold</b>Tcl command extension.</p> |
| subcard | <p>(Optional) Specifies that one or more subcards are to be monitored:</p> <ul style="list-style-type: none"> <li>• subcard all--Specifies that all subcards are to be monitored.</li> <li>• subcard-number--Specifies that the subcard identified by the number subcard-number is to be monitored.</li> </ul> <p>If this argument is not specified, all subcards are monitored by default.</p>                                  |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Event Type    | Description                                             |
|---------------|---------------------------------------------------------|
| action_notify | Action notify information in GOLD event: true or false. |

| Event Type                                    | Description                                                                                                                                                                                                                                     |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bl</b>                                     | The boot-up diagnostic level, which can be one of the following values: <ul style="list-style-type: none"> <li>• 0: complete diagnostic</li> <li>• 1: minimal diagnostics</li> <li>• 2: bypass diagnostic</li> </ul>                            |
| <b>card</b>                                   | Card information for the GOLD event.                                                                                                                                                                                                            |
| <b>cf</b> <i>testnum</i>                      | Consecutive failure, where <i>testnum</i> is the test number. For example, <b>cf3</b> is the EEM built-in environment variable for consecutive failure of test 3.                                                                               |
| <b>ci</b>                                     | Card index.                                                                                                                                                                                                                                     |
| <b>cn</b>                                     | Card name.                                                                                                                                                                                                                                      |
| <b>ec</b> <i>testnum</i>                      | Test error code, where <i>testnum</i> is the test number. For example, <b>ec3</b> is the EEM built-in environment variable for the error code of test 3.                                                                                        |
| <b>event_id</b>                               | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.                                                                                     |
| <b>event_pub_msec</b><br><b>event_pub_sec</b> | The time, in milliseconds and seconds, when the event was published to the EEM.                                                                                                                                                                 |
| <b>event_severity</b>                         | GOLD event severity, which can be one of the following values: <ul style="list-style-type: none"> <li>• normal</li> <li>• minor</li> <li>• major.</li> </ul>                                                                                    |
| <b>event_type</b>                             | Type of event.                                                                                                                                                                                                                                  |
| <b>event_type_string</b>                      | An ASCII string that represents the name of the event for this event type.                                                                                                                                                                      |
| <b>lf</b> <i>testnum</i>                      | Last fail time, where <i>testnum</i> is the test number. For example, <b>lf3</b> is the EEM built-in variable for the last fail time of test 3.<br><br>The timestamp format is <i>mmm dd yyyy hh:mm:ss</i> . For example, Mar 11 1960 08:47:00. |
| <b>new_failure</b>                            | The new test failure information in a GOLD event flag: true or false.                                                                                                                                                                           |
| <b>overall_result</b>                         | The overall diagnostic result, which can be one of the following values: <ul style="list-style-type: none"> <li>• 0: OK</li> <li>• 3: minor error</li> <li>• 4: major error</li> <li>• 14: unknown result</li> </ul>                            |

| Event Type                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pc</b>                                        | Port counts.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>rc</b> <i>testnum</i>                         | Test total run count, where <i>testnum</i> is the test number. For example, <b>rc3</b> is the EEM built-in variable for the total run count of test 3.                                                                                                                                                                                                                                                                       |
| <b>sn</b>                                        | Card serial number.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>sub_card</b>                                  | The subcard on which a GOLD failure event was detected.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ta</b> <i>testnum</i>                         | Test attribute, where <i>testnum</i> is the test number. For example, <b>ta3</b> is the EEM built-in variable for the test attribute of test 3.                                                                                                                                                                                                                                                                              |
| <b>tc</b>                                        | Test counts.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>tf</b> <i>testnum</i>                         | Total failure count, where <i>testnum</i> is the test number. For example, <b>tf3</b> is the EEM built-in variable for the total failure count of test 3.                                                                                                                                                                                                                                                                    |
| <b>tn</b> <i>testnum</i>                         | Test name, where <i>testnum</i> is the test number. For example, <b>tn3</b> is the EEM built-in variable for the name of test 3.                                                                                                                                                                                                                                                                                             |
| <b>tr</b> <i>testnum</i>                         | Test result, where <i>testnum</i> is the test number. For example, <b>tr6</b> is the EEM built-in variable for test 6 where test 6 is not a per-port test and not a per-device test.<br><br>The test result is one of the following values: <ul style="list-style-type: none"> <li>• P: diagnostic result Pass</li> <li>• F: diagnostic result Fail</li> <li>• U: diagnostic result Unknown</li> </ul>                       |
| <b>tr</b> <i>testnum</i> <b>d</b> <i>devnum</i>  | Per-device test result, where <i>testnum</i> is the test number and <i>devnum</i> is the device number. For example, <b>tr3d20</b> is the EEM built-in variable for the test result for test 3, device 20.<br><br>The test result is one of the following values: <ul style="list-style-type: none"> <li>• P: diagnostic result Pass</li> <li>• F: diagnostic result Fail</li> <li>• U: diagnostic result Unknown</li> </ul> |
| <b>tr</b> <i>testnum</i> <b>p</b> <i>portnum</i> | Per-port test result, where <i>testnum</i> is the test number and <i>portnum</i> is the device number. For example, <b>tr5p20</b> is the EEM built-in variable for the test result for test 3, port 20.<br><br>The test result is one of the following values: <ul style="list-style-type: none"> <li>• P: diagnostic result Pass</li> <li>• F: diagnostic result Fail</li> <li>• U: diagnostic result Unknown</li> </ul>    |

| Event Type | Description                                                                                                                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tt         | The testing type, which can be one of the following: <ul style="list-style-type: none"> <li>• 1: A boot-up diagnostic</li> <li>• 2: An on-demand diagnostic</li> <li>• 3: A schedule diagnostic</li> <li>• 4: A monitoring diagnostic</li> </ul> |

## event\_register\_identity

Registers for an identity event. Use this Tcl command extension to generate an event when AAA authentication or authorization is successful or failure or after normal user traffic on the port is allowed to flow.

### Syntax

```
event_register_identity [tag ?] interface ?
[aaa-attribute ?]
[authc {all | fail | success}]
[authz {all | fail | success}]
[authz-complete]
[mac-address ?]
[queue_priority {normal | low | high | last}]
[maxrun ?] [nice {0 | 1}]
```

### Arguments

|                |                                                                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag            | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                      |
| interface      | A regular expression pattern to match against interface names.                                                                                                                                                                                                                                                                             |
| aaa-attribute  | (Optional) A regular expression that can be used to filter events by specific AAA attributes.                                                                                                                                                                                                                                              |
| authc          | (Optional) Triggers events on successful, failed or both successful and failed authentication.                                                                                                                                                                                                                                             |
| authz          | (Optional) Triggers events on successful, failed or both successful and failed authorization.                                                                                                                                                                                                                                              |
| authz-complete | (Optional) Triggers events once the device connected to the interface is fully authenticated, authorized and normal traffic has begun to flow on that interface.                                                                                                                                                                           |
| mac-address    | (Optional) A regular expression pattern that can be used to filter events by mac addresses of the remote device.                                                                                                                                                                                                                           |
| maxrun         | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p>The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Result String**

```

| Event Type                          | Description                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| <b>event_type</b>                   | Type of event.                                                                                                                                              |
| <b>event_type_string</b>            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| <b>event_pub_sec event_pub_msec</b> | The time, in seconds and milliseconds, at which the event was published to the EEM.                                                                         |
| <b>event_severity</b>               | The severity of the event.                                                                                                                                  |

| Event Type                        | Description                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>identity_stage</b>             | One among authentication, authorization or authorization-complete stages.                                                                                        |
| <b>identity_status</b>            | Success or one of these failure types: fail_authc, fail_aaa_server, fail_no_response, fail_timeout, fail_authz. For authorization-complete it is always success. |
| <b>interface</b>                  | The interface for the event.                                                                                                                                     |
| <b>identity_mac</b>               | The MAC address of the remote device for the event.                                                                                                              |
| <b>identity_&lt;attribute&gt;</b> | For each AAA attribute, a set a dynamic variable to the value corresponding to that AAA attribute in the attribute or value list.                                |

## event\_register\_interface

Registers for an interface counter event. Use this Tcl command extension to generate an event when specified interface counters exceed specified thresholds.

### Syntax

```
event_register_interface [tag ?] name ?
parameter ? entry_op gt|ge|eq|ne|lt|le
entry_val ? entry_val_is_increment TRUE|FALSE
entry_type value|increment|rate
[exit_comb or|and]
[exit_op gt|ge|eq|ne|lt|le]
[exit_val ?] [exit_val_is_increment TRUE|FALSE]
[exit_type value|increment|rate]
[exit_time ?] [poll_interval ?]
[average_factor ?] [queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

### Arguments

|      |                                                                                                                                                       |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag  | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script. |
| name | (Mandatory) The name of the interface being monitored, for example, Ethernet 0/0. Abbreviations and spaces are not allowed.                           |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| parameter (continued)  | <ul style="list-style-type: none"> <li>• output_errors--Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this may not balance with the sum of the enumerated output errors, because some datagrams may have more than one error, and others may have errors that do not fall into any of the specifically tabulated categories.</li> <li>• output_errors_underrun--Number of times that the transmitter has been running faster than the device can handle.</li> <li>• output_packets_dropped--Number of packets dropped because of a full output queue.</li> <li>• receive_broadcasts--Number of broadcast or multicast packets received by the interface.</li> <li>• receive_giants--Number of packets that are discarded because they exceed the maximum packet size of the medium.</li> <li>• receive_rate_bps--Interface receive rate in bytes per second.</li> <li>• receive_rate_pps--Interface receive rate in packets per second.</li> <li>• receive_runts--Number of packets that are discarded because they are smaller than the minimum packet size of the medium.</li> <li>• receive_throttle--Number of times that the receiver on the port was disabled, possibly because of buffer or processor overload.</li> <li>• reliability--Reliability of the interface as a fraction of 255 (255/255 is 100 percent reliability), calculated as an exponential average over 5 minutes.</li> <li>• rxload--Receive rate of the interface as a fraction of 255 (255/255 is 100 percent).</li> <li>• transmit_rate_bps--Interface transmit rate in bytes per second.</li> <li>• transmit_rate_pps--Interface transmit rate in packets per second.</li> <li>• txload--Transmit rate of the interface as a fraction of 255 (255/255 is 100 percent).</li> </ul> |
| entry_op               | (Mandatory) The comparison operator used to compare the current interface value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| entry_val              | (Mandatory) The value at which the event will be triggered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| entry_val_is_increment | <p>(Mandatory) If TRUE, the entry_val field is treated as an incremental difference and is compared with the difference between the current counter value and the value when the event was last true (the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. If FALSE, the entry_val field is compared against the current counter value.</p> <p><b>Note</b> This keyword has been deprecated, and if specified, the syntax is converted into equivalent entry-type keyword syntax.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| entry-type            | <p>Specifies a type of operation to be applied to the object ID specified by the entry-val argument.</p> <p>Value is defined as the actual value of the entry-val argument.</p> <p>Increment uses the entry-val field as an incremental difference and the entry-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing.</p> <p>Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change.</p>                                                |
| exit_comb             | (Optional) Used to indicate the combination of exit condition tests required to rearm the event trigger; if the and operator is specified, both exit value and exit time tests must be true to cause rearm; if the or operator is specified, either exit value or exit time tests can be true to cause event monitoring to be rearmed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| exit_op               | (Optional) The comparison operator used to compare the current interface value with the exit value; if true, event monitoring for this event will be reenabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| exit_val              | (Optional) The value at which the event is rearmed to be monitored again.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| exit_val_is_increment | <p>(Optional) If TRUE, the exit_val field is treated as an incremental difference and is compared with the difference between the current counter value and the value when the event was last true. A negative value checks the incremental difference for a counter that is decreasing. If FALSE, the exit_val field is compared against the current counter value.</p> <p><b>Note</b> In Cisco IOS Release 12.4(20)T, this keyword is deprecated, and if specified, the syntax is converted into equivalent exit-type keyword syntax.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| exit-type             | <p>(Optional) Specifies a type of operation to be applied to the object ID specified by the exit-val argument. If not specified, the value is assumed.</p> <p>Value is defined as the actual value of the exit-val argument.</p> <p>Increment uses the exit-val field as an incremental difference and the exit-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing.</p> <p>Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change.</p> |
| exit_time             | (Optional) The time period at which the event is rearmed to be monitored again (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| poll_interval  | (Optional) The frequency used to collect the samples (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 60 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). The poll interval value must not be less than 1 second. The default is 1 second.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| average-factor | (Optional) Number in the range from 1 to 64 used to calculate the period used for rate-based calculations. The average-factor value is multiplied by the poll-interval value to derive the period in milliseconds. The minimum average factor value is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nice           | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Result String**

None

**Set\_cerrno**

No

| Event Type                                    | Description                                                                                                                                                                                     |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                               | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.                                     |
| <b>event_type</b>                             | Type of event.                                                                                                                                                                                  |
| <b>event_type_string</b>                      | An ASCII string that represents the name of the event for this event type.                                                                                                                      |
| <b>event_pub_sec</b><br><b>event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                                                                 |
| <b>event_severity</b>                         | Interface event severity, which can be one of the following values: <ul style="list-style-type: none"> <li>• normal</li> <li>• minor</li> <li>• major</li> </ul>                                |
| <b>name</b>                                   | Name of the interface.                                                                                                                                                                          |
| <b>parameter</b>                              | Name of the parameter.                                                                                                                                                                          |
| <b>value</b>                                  | The incremental/decremental difference compared to the last event triggered or the absolute value of the parameter being monitored, depending on the specified value of entry_val_is_increment. |

## event\_register\_ioswdsysmon

Registers for an IOSWDSysMon event. Use this Tcl command extension to generate an event when a Cisco IOS task exceeds specific CPU utilization or memory thresholds. A Cisco IOS task is called a Cisco IOS process in native Cisco IOS.

### Syntax

```
event_register_ioswdsysmon [tag ?] [timewin ?] [sub12op and|or] [sub1 ?] [sub2 ?]
[queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

### Arguments

|          |                                                                                                                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag      | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                    |
| timewin  | (Optional) Defines the time window within which all of the subevents must occur in order for an event to be generated (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). |
| sub12_op | (Optional) The combination operator for comparison between subevent 1 and subevent 2.                                                                                                                                                                                                                                                    |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sub1           | (Optional) The subevent 1 specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| sub2           | (Optional) The subevent 2 specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nice           | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Subevent Syntax**

```
cpu_proc path ? taskname ? op gt|ge|eq|ne|lt|le val ? [period ?]
mem_proc path ? taskname ? op gt|ge|eq|ne|lt|le val ? [is_percent TRUE|FALSE] [period ?]
```

**Subevent Arguments**

|          |                                                                                                                                                                        |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cpu_proc | (Mandatory) Specifies the use of a sample collection of CPU statistics.                                                                                                |
| path     | (Mandatory) Software Modularity images only. The pathname of the POSIX process that contains the Cisco IOS scheduler to be monitored. For example, /sbin/cdp2.iosproc. |
| taskname | (Mandatory) The name of the Cisco IOS task to be monitored.                                                                                                            |
| op       | (Mandatory) The comparison operator used to compare the collected usage sample with the specified value; if true, an event will be raised.                             |
| val      | (Mandatory) The value to be compared.                                                                                                                                  |

|            |                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| period     | (Optional) The elapsed time period for the collection samples to be averaged (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |
| mem_proc   | (Mandatory) Specifies the use of a sample collection of memory statistics.                                                                                                                                                                                                                                                                                        |
| is_percent | (Optional) Whether the specified value is a percentage.                                                                                                                                                                                                                                                                                                           |

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo**

```
"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u"
"num_subs %u"
```

| Event Type                   | Description                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type                   | Type of event.                                                                                                                                              |
| event_type_string            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| num_subs                     | Number of subevents.                                                                                                                                        |

Where the subevent info string is for a CPU\_UTIL subevent,

```
"{type %s procname {%s} pid %u taskname {%s} taskid %u value %u sec %ld msec %ld}"
```

| Subevent Type | Description                            |
|---------------|----------------------------------------|
| type          | Type of subevent.                      |
| procname      | POSIX process name for this subevent.  |
| pid           | POSIX process ID for this subevent.    |
| taskname      | Cisco IOS task name for this subevent. |

| Subevent Type | Description                                                |
|---------------|------------------------------------------------------------|
| taskid        | Cisco IOS task ID for this subevent.                       |
| value         | Actual average CPU utilization over the measured interval. |
| sec , msec    | Elapsed time period for this measured interval.            |

Where the subevent info string is for a MEM\_UTIL subevent,

```
"(type %s procname {%s} pid %u taskname {%s} taskid %u is_percent %s value %u diff %d"
"sec %ld msec %ld)"
```

| Subevent Type | Description                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| type          | Type of subevent.                                                                                                                           |
| procname      | POSIX process name for this subevent.                                                                                                       |
| pid           | POSIX process ID for this subevent.                                                                                                         |
| taskname      | Cisco IOS task name for this subevent.                                                                                                      |
| taskid        | Cisco IOS task ID for this subevent.                                                                                                        |
| is_percent    | TRUE or FALSE depending on whether the value is a percentage value.                                                                         |
| value         | Total memory use in KB or the actual average memory utilization for this measured interval.                                                 |
| diff          | The percentage difference between the oldest sample in the measured interval and the latest sample; a negative value represents a decrease. |
| sec , msec    | Elapsed time period for this measured interval.                                                                                             |

## event\_register\_ipsla

Registers for an event that is triggered by the **event ipsla** command. Use this Tcl command to publish an event when an IPSLA reaction is triggered. The group ID or the operation ID is required to register the event.

### Syntax

```
event_register_ipsla [tag ?] group_name ? operation_id ? [reaction_type ?]
[dest_ip_addr ?][queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

### Arguments

|            |                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag        | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script. |
| group_name | (Mandatory) Specifies the IP SLAs group name.                                                                                                         |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operation_id    | (Mandatory) Specifies the IP SLA operation ID. Number must be in the range from 1 to 2147483647.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| reaction_type   | <p>(Optional) Specifies the reaction to be taken for the specified IP SLAs operation.</p> <p>Type of IP SLAs reaction--One of the following keywords can be specified: <b>connectionLoss</b>, <b>icpif</b>, <b>jitterAvg</b>, <b>jitterDSAvg</b>, <b>jitterSDAvg</b>, <b>maxOfNegativeDS</b>, <b>maxOfNegativeSD</b>, <b>maxOfPositiveDS</b>, <b>maxOfPositiveSD</b>, <b>mos</b>, <b>packetLateArrival</b>, <b>packetLossDS</b>, <b>packetLossSD</b>, <b>packetMIA</b>, <b>packetOutOfSequence</b>, <b>rtt</b>, <b>timeout</b> or <b>verifyError</b> can be specified.</p> <p>Type of IP SLAs reaction. One of the following keywords can be specified:</p> <ul style="list-style-type: none"> <li>• connectionLoss</li> <li>• icpif</li> <li>• jitterAvg</li> <li>• jitterDSAvg</li> <li>• jitterSDAvg</li> <li>• maxOfNegativeDS</li> <li>• maxOfNegativeSD</li> <li>• maxOfPositiveDS</li> <li>• maxOfPositiveSD</li> <li>• mos</li> <li>• packetLateArrival</li> <li>• packetLossDS</li> <li>• packetLossSD</li> <li>• packetMIA</li> <li>• packetOutOfSequence</li> <li>• rtt</li> <li>• timeout</li> <li>• verifyError</li> </ul> |
| dest_ip_address | (Optional) Specifies the destination IP address of the destination port for which the IP SLAs events are monitored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Result String**

None

| Event Type        | Description                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id          | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type        | The type of event to monitor for the create, update, and delete flow.                                                                                       |
| event_type_string | An ASCII string that represents the name of the event for this event type.                                                                                  |

| Event Type                   | Description                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, when the event was published to the EEM.                                                        |
| event_severity               | The severity of the event.                                                                                                             |
| group_name                   | The name of the IPSLA group.                                                                                                           |
| operation_id                 | The IPSLA operation ID.                                                                                                                |
| condition                    | The condition of IPSLA, which can be one of the following: <ul style="list-style-type: none"> <li>cleared</li> <li>occurred</li> </ul> |
| reaction_type                | The IPSLA reaction type.                                                                                                               |
| dest_ip_address              | The IPSLA destination IP address.                                                                                                      |
| threshold rising             | The IPSLA configured rising threshold value.                                                                                           |
| threshold falling            | The IPSLA configured falling threshold value.                                                                                          |
| measured_threshold_value     | The measured threshold value of the IPSLA operation.                                                                                   |
| threshold_count1             | Corresponds to the argument of the threshold type1.                                                                                    |
| threshold_count2             | Corresponds to the argument of the threshold type2.                                                                                    |

## event\_register\_mat

Registers for a MAT event. Use this Tcl command extension to generate an event when a mac-address is learned in the mac-address-table.

### Syntax

```
event_register_identity [tag ?] interface ?
[mac-address ?]
[type {add | delete}]
[hold-down ?]
[maxrun ?]
```

### Arguments

|             |                                                                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag         | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.        |
| interface   | A regular expression pattern to match against interface names.                                                                                               |
| mac-address | Mandatory if the interface parameter is not specified. A regular expression pattern that can be used to filter events by mac addresses of the remote device. |

|           |                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | (Optional) Filter based on a mac-address-table event type of add or delete. If not specified, the event type is not used in determining whether the event should be triggered.                                                                                                                                                               |
| hold-down | (Optional) When a mac-address-table event comes in, the hold-down timer can be set to make the event to wait between 1 and 4294967295 seconds before processing the policy. If not set then the policy is not delayed in being processed.                                                                                                    |
| maxrun    | (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo For EEM\_EVENT\_MAT**

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u
event_severity %u notification %u intf_name %u mac_address {%s}"
```

| Event Type                          | Description                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| <b>event_type</b>                   | Type of event.                                                                                                                                              |
| <b>event_type_string</b>            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| <b>event_pub_sec event_pub_msec</b> | The time, in seconds and milliseconds, at which the event was published to the EEM.                                                                         |
| <b>event_severity</b>               | The severity of the event.                                                                                                                                  |
| <b>notification</b>                 | Notification type--add or delete.                                                                                                                           |
| <b>intf_name</b>                    | The interface name for the address table entry.                                                                                                             |
| <b>mac_address</b>                  | The mac-address for the address table entry.                                                                                                                |

# event\_register\_neighbor\_discovery

Registers for a neighbor discover event. Use this Tcl command extension to generate an event when a Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP) cache entry or a interface link status changes.

## Syntax

```
event_register_neighbor_discovery [tag ?] interface ?
[cdp {add | update | delete | all}]
[lldp {add | update | delete | all}]
[link-event]
[line-event]
[queue_priority {normal | low | high | last}]
[maxrun ?] [nice {0 | 1}]
```

## Arguments

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag        | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| interface  | A regular expression pattern to match against interface names.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| cdp        | Trigger an event when a matching CDP event occurs. One of the following options should be specified. <ul style="list-style-type: none"> <li>• add--Trigger events only when a new CDP cache entry is created in the CDP table.</li> <li>• all--Trigger an event when a CDP cache entry is added or deleted from the CDP cache table and when a remote CDP device sends a keepalive to update the CDP cache entry.</li> <li>• delete--trigger events only when a CDP cache entry is deleted from the CDP table.</li> <li>• update--trigger an event when a CDP cache entry is added to the CDP table or when the remote CDP device sends a CDP keepalive to update the CDP cache entry.</li> </ul>  |
| lldp       | Trigger an event when a matching lldp event occurs. One of the following options should be specified. <ul style="list-style-type: none"> <li>• add--Trigger events only when a new cdp cache entry is created in the cdp table.</li> <li>• all--Trigger an event when a cdp cache entry is added or deleted from the cdp cache table and when a remote cdp device sends a keepalive to update the cdp cache entry.</li> <li>• delete--trigger events only when a cdp cache entry is deleted from the cdp table.</li> <li>• update--trigger an event when a cdp cache entry is added to the cdp table or when the remote cdp device sends a cdp keepalive to update the cdp cache entry.</li> </ul> |
| line-event | Trigger an event when the interface line protocol status changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| link-event | Trigger an event when the interface link status changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p>The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo For EEM\_EVENT\_NEIGHBOR\_DISCOVERY**

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u event_severity %u nd_notification {%s}"
```

| Event Type                   | Description                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type                   | Type of event.                                                                                                                                              |
| event_type_string            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, at which the event was published to the EEM.                                                                         |

| Event Type                            | Description                                                                                                                                                                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_severity</b>                 | The severity of the event.                                                                                                                                                                                                                                   |
| Common Event_Reqinfo                  |                                                                                                                                                                                                                                                              |
| <b>nd_notification</b>                | The type of notification--cdp-add, cdp-update, cdp-delete, lldp-add, lldp-update, lldp-delete, link, line.                                                                                                                                                   |
| <b>nd_intf_linkstatus</b>             | The current interface link status, up or down.                                                                                                                                                                                                               |
| <b>nd_intf_linestatus</b>             | The current interface line status, down, goingdown, init, testing, up, reset, admindown, deleted.                                                                                                                                                            |
| <b>nd_local_intf_name</b>             | The local interface name for the event.                                                                                                                                                                                                                      |
| <b>nd_short_local_intf_name</b>       | The short name of the local interface for the event.                                                                                                                                                                                                         |
| <b>nd_port_id</b>                     | The port id as identified by either the cdp or lldp protocol. This is not set for link or line protocol events.                                                                                                                                              |
| CDP-specific Event_reqinfo            |                                                                                                                                                                                                                                                              |
| <b>nd_protocol</b>                    | Identifies which protocol triggered the event, for CDP it will always be set to cdp.                                                                                                                                                                         |
| <b>nd_proto_notif</b>                 | Identifies which type of protocol event triggered the event, add, update or delete.                                                                                                                                                                          |
| <b>nd_proto_new_entry</b>             | If set to 1, the event was triggered because the cache entry is new, otherwise it will be set to 0.                                                                                                                                                          |
| <b>nd_cdp_entry_name</b>              | The name of the cdp cache entry in the cdp table.                                                                                                                                                                                                            |
| <b>nd_cdp_hold_time</b>               | The time remaining until the cdp cache entry expires and is deleted from the cdp table. This time will be reset to some maximum by an update from the cdp neighbor. It is usually set to 0 for new entries.                                                  |
| <b>nd_cdp_mgmt_domain</b>             | The CDP VTP management domain.                                                                                                                                                                                                                               |
| <b>nd_cdp_platform</b>                | The platform name reported by the remote device.                                                                                                                                                                                                             |
| <b>nd_cdp_version</b>                 | The version of code running on the remote device.                                                                                                                                                                                                            |
| <b>nd_cdp_capabilities_string</b>     | The contents of the CDP capabilities field in a string format: Router, Trans-Bridge, Source-Route-Bridge, Switch, Host, IGMP, Repeater, Phone, Remotely-Managed device, CVTA phone port, Two-port Mac Relay or any combination of these separated by commas. |
| <b>nd_cdp_capabilities_bits</b>       | The CDP capabilities bits in a hexadecimal number preceded with 0x.                                                                                                                                                                                          |
| <b>nd_cdp_capabilities_bit_[0-31]</b> | A series of values that will be set to YES if that bit in the capabilities field is set or NO if it is not set.                                                                                                                                              |

| Event Type                                 | Description                                                                                                                                                                         |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LLDP-specific Event_reqinfo</b>         |                                                                                                                                                                                     |
| <b>nd_protocol</b>                         | Identifies which protocol triggered the event, for LLDP it will always be set to lldp.                                                                                              |
| <b>nd_proto_notif</b>                      | Identifies which type of protocol event triggered the event, add, update or delete.                                                                                                 |
| <b>nd_proto_new_entry</b>                  | If set to 1, the event was triggered because the cache entry is new, otherwise it will be set to 0.                                                                                 |
| <b>nd_lldp_chassis_id</b>                  | The chassis id field from the LLDP cache entry.                                                                                                                                     |
| <b>nd_lldp_system_name</b>                 | The system name from the LLDP cache entry.                                                                                                                                          |
| <b>nd_lldp_system_description</b>          | The system description field from the LLDP cache entry.                                                                                                                             |
| <b>nd_lldp_ttl</b>                         | The LLDP time to live field from the LLDP cache entry.                                                                                                                              |
| <b>nd_lldp_port_description</b>            | The port description field from the LLDP cache entry.                                                                                                                               |
| <b>nd_lldp_system_capabilities_string</b>  | The LLDP system capabilities field from the LLDP cache entry. Provided as a string that can contain O, P, B, W, R, T, C, S or any combination of these separated by commas.         |
| <b>nd_lldp_enabled_capabilities_string</b> | The LLDP enabled system capabilities field from the LLDP cache entry. Provided as a string that can contain O, P, B, W, R, T, C, S or any combination of these separated by commas. |
| <b>nd_lldp_system_capabilities_bits</b>    | The LLDP system capabilities bits field from the LLDP cache entry. Provided as a hexadecimal number preceded by 0x.                                                                 |
| <b>nd_lldp_enabled_capabilities_bits</b>   | The LLDP enabled capabilities bits field from the LLDP cache entry. Provided as a hexadecimal number preceded by 0x.                                                                |
| <b>nd_lldp_capabilities_bits</b>           | The LLDP capabilities bits field from the LLDP cache entry. Provided as a hexadecimal number preceded by 0x.                                                                        |
| <b>nd_lldp_capabilities_bit_[0-31]</b>     | A series of values that will be set to YES if that bit in the capabilities field is set or NO if it is not set.                                                                     |

## event\_register\_nf

Registers for an event when a NetFlow event is triggered by the **event nf** command. Use this Tel command to publish an event when an NetFlow reaction is triggered..

### Syntax

```
event_register_nf [tag ?] monitor_name ? event_type create|update|delete
exit_event_type create|update|delete event1-event4 ? [maxrun ?] [nice 0|1]
```

## Arguments

|                 |                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag             | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                        |
| monitor_name    | (Mandatory) The name of the NetFlow monitor.                                                                                                                                                                                                                                                                                                 |
| event_type      | (Mandatory) The type of event to monitor for the create, update, and delete flow.                                                                                                                                                                                                                                                            |
| exit_event_type | (Mandatory) The event-type (create, delete, update) at which the event is rearmed to be monitored again.                                                                                                                                                                                                                                     |
| event1- event4  | (Mandatory) Specifies the event and its attributes to monitor. Valid values are <b>event1</b> , <b>event2</b> , <b>event3</b> , and <b>event4</b> .<br><br>The subevent keywords can be used alone, together, or in any combination with each other, but each keyword can be used only once.                                                 |
| maxrun          | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
| nice            | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                    |

## Subevent Syntax

```
field ? rate_interval ? event1 only entry_value ? entry_op eq|ge|gt|le|lt|wc
[exit_value ?] [exit_op eq|ge|gt|le|lt|wc] [exit_rate_interval ? event1 only]
```

## Subevent Arguments

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| field         | (Mandatory) Specifies the cache or field attribute to be monitored. One of the following attributes can be specified: <ul style="list-style-type: none"> <li>• <b>counter</b> {<b>bytes</b>   <b>packets</b>}--Specifies the counter fields.</li> <li>• <b>datalink</b> {<b>dot1q</b>   <b>mac</b>}--Specifies the datalink (layer2) fields.</li> <li>• <b>flow</b> {<b>direction</b>   <b>sampler</b>}--Specifies the flow identifying fields.</li> <li>• <b>interface</b> {<b>input</b>   <b>output</b>}--Specifies the interface fields.</li> <li>• <b>ipv4</b> <i>field-type</i>-- Specifies the IPv4 fields.</li> <li>• <b>ipv6</b> <i>field-type</i>-- IPv6 fields</li> <li>• <b>routing</b> <i>routing-attribute</i> -- Specifies the routing attributes.</li> <li>• <b>timestamp</b> <b>sysuptime</b> {<b>first</b>   <b>last</b>}--Specifies the timestamp fields.</li> <li>• <b>transport</b> <i>field-type</i>-- Specifies the Transport layer fields.</li> </ul> |
| rate_interval | (Mandatory) Specifies the rate interval value in seconds used to calculate the rate. This field is only valid for event1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| entry_value        | (Mandatory) Specifies the field or rate value.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| entry_op           | (Mandatory) Specifies the field operator.<br>The comparison operator valid values are: <ul style="list-style-type: none"> <li>• <b>eq</b> - Equal to</li> <li>• <b>ge</b> - Greater than or equal to</li> <li>• <b>gt</b> - Greater than</li> <li>• <b>le</b> - Less than or equal to</li> <li>• <b>lt</b> - Less than</li> <li>• <b>wc</b> - Wildcard</li> </ul>                                                                                                                            |
| exit_value         | (Optional) The value at which the event is rearmed to be monitored again.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| exit_op            | (Optional) The comparison operator used to compare the current event field or rate value with the exit value; if true, event monitoring for this event is reenabled.<br>The comparison operator valid values are: <ul style="list-style-type: none"> <li>• <b>eq</b> - Equal to</li> <li>• <b>ge</b> - Greater than or equal to</li> <li>• <b>gt</b> - Greater than</li> <li>• <b>le</b> - Less than or equal to</li> <li>• <b>lt</b> - Less than</li> <li>• <b>wc</b> - Wildcard</li> </ul> |
| exit_rate_interval | (Optional) Specifies the exit rate interval value in seconds used to calculate the exit rate value. This field is only valid for event1.                                                                                                                                                                                                                                                                                                                                                     |

| Event Type | Description |
|------------|-------------|
|------------|-------------|

|                                     |                                                                                                                                                             |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| <b>event_type</b>                   | The type of event to monitor for the create, update, and delete flow.                                                                                       |
| <b>event_type_string</b>            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| <b>event_pub_sec event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| <b>event_severity</b>               | The severity of the NetFlow event.                                                                                                                          |
| <b>monitor_name</b>                 | The name of the NetFlow monitor.                                                                                                                            |
| <b>event1-event4_field</b>          | Specifies the event and its attributes to monitor. Valid values are <b>event1</b> , <b>event2</b> , <b>event3</b> , and <b>event4</b> .                     |
| <b>event1-event4_value</b>          | Specifies the event value and its attributes to monitor. Valid values are <b>event1</b> , <b>event2</b> , <b>event3</b> , and <b>event4</b> .               |

## event\_register\_none

Registers for an event that is triggered by the **event manager run** command. These events are handled by the None event detector that screens for this event.

### Syntax

```
event_register_none [tag ?] [sync {yes|no}] [default ?] [queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

### Arguments

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag     | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                                                                                                     |
| sync    | (Optional) A "yes" or a "no" is required to complete this keyword. <ul style="list-style-type: none"> <li>• If the yes keyword is specified, the policy will run synchronously with the CLI command.</li> <li>• If the no keyword is specified, the policy will run asynchronously with the CLI command.</li> </ul>                                                                                                                                                                                                                       |
| default | (Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds. |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. ## event\_register\_oir

Registers for an online insertion and removal (OIR) event. Use this Tcl command extension to run a policy on the basis of an event raised when a hardware card OIR occurs. These events are handled by the OIR event detector that screens for this event.

### Syntax

```
event_register_oir [tag ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

### Arguments

|     |                                                                                                                                                       |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script. |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------|

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Event Type                   | Description                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event ID. |
| event_type                   | Type of event.                                                                                                                                              |
| event_type_string            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |

| Event Type | Description                                                                                                   |
|------------|---------------------------------------------------------------------------------------------------------------|
| slot       | Slot number for the affected card.                                                                            |
| event      | Indicates a string, removed or online, that represents either an OIR removal event or an OIR insertion event. |

## event\_register\_process

Registers for a process event. Use this Tcl command extension to run a policy on the basis of an event raised when a Cisco IOS Software Modularity process starts or stops. These events are handled by the System Manager event detector that screens for this event. This Tcl command extension is supported only in Software Modularity images.

### Syntax

```
event_register_process [tag ?] abort|term|start|user_restart|user_shutdown
[sub_system ?] [version ?] [instance ?] [path ?] [node ?]
[queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

### Arguments

|               |                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag           | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                     |
| abort         | (Mandatory) Abnormal process termination. Process may terminate because of exiting with a nonzero exit status, receiving a kernel-generated signal, or receiving a SIGTERM or SIGKILL signal that is not sent because of user request.    |
| term          | (Mandatory) Normal process termination.                                                                                                                                                                                                   |
| start         | (Mandatory) Process start.                                                                                                                                                                                                                |
| user_restart  | (Mandatory) Process termination due to the process restart request from the CLI command.                                                                                                                                                  |
| user_shutdown | (Mandatory) Process termination due to the process kill request from the CLI command.                                                                                                                                                     |
| sub_system    | (Optional) Number assigned to the EEM policy that published the process event. Number is set to 798 because all other numbers are reserved for Cisco use.                                                                                 |
| version       | (Optional) Version number of the process assigned by the version manager. Must be of the form major_number.minor_number.level. If specified, each component of the version number must be an integer between 1 and 4294967295, inclusive. |
| instance      | (Optional) Process instance ID. If specified, this argument must be an integer between 1 and 4294967295, inclusive.                                                                                                                       |
| path          | (Optional) Process pathname (a regular expression string). If the value of the process-name argument contains embedded blanks, enclose it in double quotation marks. Use path ".*" to match all processes.                                |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node           | <p>(Optional) The node name is a string that consists of the word "node" followed by two fields separated by a slash character using the following format:</p> <p>node&lt;slot-number&gt;/&lt;cpu-number&gt;</p> <p>The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. For example, the SP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be specified as node0/0. The RP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be addressed as node0/1. If the node argument is not specified, the default node specification is always the regular expression pattern match of * representing all applicable nodes.</p>                                                                                                                                                                                                                                                                                      |
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

If an optional argument is not specified, the event matches all possible values of the argument. If multiple arguments are specified, the process event will be raised when all the conditions are matched.

**Result String**

None

**Set\_cerrno**

| Event Type                                    | Description                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                               | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.                                                                                                                                                                             |
| <b>event_type</b>                             | Type of event.                                                                                                                                                                                                                                                                                                                          |
| <b>event_type_string</b>                      | An ASCII string that represents the name of the event for this event type.                                                                                                                                                                                                                                                              |
| <b>event_pub_sec event_pub_msec</b>           | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                                                                                                                                                                                                         |
| <b>sub_system</b>                             | Number assigned to the EEM policy that published the application-specific event. Number is set to 798 because all other numbers are reserved for Cisco use.                                                                                                                                                                             |
| <b>instance</b>                               | Process instance ID.                                                                                                                                                                                                                                                                                                                    |
| <b>process_name</b>                           | Process name.                                                                                                                                                                                                                                                                                                                           |
| <b>path</b>                                   | Process absolute name including path.                                                                                                                                                                                                                                                                                                   |
| <b>exit_status</b>                            | Process last exit status.                                                                                                                                                                                                                                                                                                               |
| <b>respawn_count</b>                          | Number of times that the process was restarted.                                                                                                                                                                                                                                                                                         |
| <b>last_respawn_sec<br/>last_respawn_msec</b> | The calendar time when the last restart occurred.                                                                                                                                                                                                                                                                                       |
| <b>fail_count</b>                             | Number of restart attempts of the process that failed. This count will be reset to 0 when the process is successfully restarted.                                                                                                                                                                                                        |
| <b>dump_count</b>                             | Number of core dumps taken of the process.                                                                                                                                                                                                                                                                                              |
| <b>node_name</b>                              | Name of the node that the process is on. The node name is a string that consists of the word "node" followed by two fields separated by a slash character using the following format:<br><br><b>node</b> <i>slot-number / cpu-number</i><br><br>The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. |

## event\_register\_resource

Registers for an Embedded Resource Manager (ERM) event. Use this Tcl command extension to run a policy on the basis of an ERM event report for a specified policy. ERM events are screened by the EEM Resource event detector, allowing an EEM policy to be run when a match occurs for the specified ERM policy.

### Syntax

```
event_register_resource policy policy-name [queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

### Arguments

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| policy         | (Mandatory) Specifies the use of a policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| policy-name    | (Mandatory) Name of an ERM policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nice           | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Event Type                          | Description                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| <b>event_type</b>                   | Type of event.                                                                                                                                              |
| <b>event_type_string</b>            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| <b>event_pub_sec event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| <b>owner_id</b>                     | The Embedded Resource Manager (ERM) owner ID.                                                                                                               |
| <b>user_id</b>                      | The ERM user ID.                                                                                                                                            |
| <b>time_sent</b>                    | The ERM event time, in nanoseconds.                                                                                                                         |
| <b>dampen_time</b>                  | The ERM dampen time, in nanoseconds.                                                                                                                        |
| <b>notify_data_flags</b>            | The ERM notify data flag.                                                                                                                                   |
| <b>level</b>                        | The ERM event level. The four event levels are normal, minor, major, and critical.                                                                          |
| <b>direction</b>                    | The ERM event direction. The event direction can be one of the following: up, down, or no change.                                                           |
| <b>configured_threshold</b>         | The configured ERM threshold.                                                                                                                               |
| <b>current_value</b>                | The current value reported by ERM.                                                                                                                          |
| <b>policy_violation_flag</b>        | The ERM policy violation flag; either false or true.                                                                                                        |
| <b>policy_id</b>                    | The ERM policy ID.                                                                                                                                          |

## event\_register\_rf

Registers for a Redundancy Facility (RF) event. Use this Tcl command extension to run a policy when an RF progression or status event notification occurs.

### Syntax

```
event_register_rf [tag ?] event ?
[queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

**Arguments**

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag   | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| event | <p>(Mandatory) Name of the RF progression or status event. Valid values are:</p> <ul style="list-style-type: none"> <li>• RF_PROG_ACTIVE</li> <li>• RF_PROG_ACTIVE_DRAIN</li> <li>• RF_PROG_ACTIVE_FAST = 200</li> <li>• RF_PROG_ACTIVE_PRECONFIG</li> <li>• RF_PROG_ACTIVE_POSTCONFIG</li> <li>• RF_PROG_EXTRALOAD</li> <li>• RF_PROG_HANDBACK</li> <li>• RF_PROG_INITIALIZATION</li> <li>• RF_PROG_PLATFORM_SYNC</li> <li>• RF_PROG_STANDBY_BULK</li> <li>• RF_PROG_STANDBY_COLD</li> <li>• RF_PROG_STANDBY_CONFIG</li> <li>• RF_PROG_STANDBY_FILESYS</li> <li>• RF_PROG_STANDBY_HOT</li> <li>• RF_PROG_STANDBY_OIR_SYNC_DONE</li> <li>• RF_REGISTRATION_STATUS</li> <li>• RF_STATUS_MAINTENANCE_ENABLE</li> <li>• RF_STATUS_MANUAL_SWACT</li> <li>• RF_STATUS_OPER_REDUNDANCY_MODE_CHANGE</li> <li>• RF_STATUS_PEER_COMM</li> <li>• RF_STATUS_PEER_PRESENCE</li> <li>• RF_STATUS_REDUNDANCY_MODE_CHANGE</li> <li>• RF_STATUS_SWACT_INHIBIT</li> </ul> |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo**

```
"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u"
"event {%s}"
```

| Event Type        | Description                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id          | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type        | Type of event.                                                                                                                                              |
| event_type_string | An ASCII string that represents the name of the event for this event type.                                                                                  |

| Event Type                                 | Description                                                                         |
|--------------------------------------------|-------------------------------------------------------------------------------------|
| <b>event_pub_sec</b> <b>event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the EEM.     |
| <b>event</b>                               | RF progression or status event notification that caused this event to be published. |

## event\_register\_routing

Registers for an event that is triggered by the **event routing** command. These events are handled by the routing event detector to publish an event when route entries change in Routing Information Base (RIB) infrastructure. Use this Tcl command extension to run a routing policy for this script. The network IP address for the route to be monitored must be specified.

### Syntax

```
event_register_routing [tag ?] network ? length [ge|le|ne] [type add|remove|modify|all]
[protocol ?] [queue_priority normal|low|high|last] [maxrun ?] [nice {0 | 1}]
```

### Arguments

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag      | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| network  | Specifies the network IP address. The network number can be any valid IP address or prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| length   | Specifies the length of the network mask in bits. The bit mask can be a number from 0 to 32. <ul style="list-style-type: none"> <li>• <b>ge</b> --(Optional) Specifies the minimum prefix length to be matched. The <b>ge</b> keyword represents greater than or equal to operator.</li> <li>• <b>le</b> --(Optional) Specifies the maximum prefix length to be matched. The <b>le</b> keyword represents the less than or equal to operator.</li> <li>• <b>ne</b> --(Optional) Specifies the prefix length not to be matched. The <b>ne</b> keyword represents not equal to operator.</li> </ul> <p>When <b>ge</b>, <b>le</b> and <b>ne</b> keywords are not configured, an exact match of network length is processed.</p> |
| type     | (Optional) Specifies the desired policy trigger. The type options are <b>add</b> , <b>remove</b> , <b>modify</b> , and <b>all</b> . The default is <b>all</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| protocol | (Optional) Specifies the protocol value for the network being monitored. One of the following protocols can be used: <b>all</b> , <b>bgp</b> , <b>connected</b> , <b>eigrp</b> , <b>isis</b> , <b>iso-igrp</b> , <b>mobile</b> , <b>odr</b> , <b>ospf</b> , <b>rip</b> , and <b>static</b> . The default is <b>all</b> .                                                                                                                                                                                                                                                                                                                                                                                                     |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Result String**

| Event Type        | Description                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id          | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type        | Type of event.                                                                                                                                              |
| event_type_string | An ASCII string that represents the name of the event for this event type.                                                                                  |

| Event Type                          | Description                                                                         |
|-------------------------------------|-------------------------------------------------------------------------------------|
| <b>event_pub_sec event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the EEM.     |
| <b>event_severity</b>               | The severity of the event.                                                          |
| <b>network</b>                      | The network prefix in IP address format                                             |
| <b>mask</b>                         | The network mask in IP address format                                               |
| <b>protocol</b>                     | Type of network protocol.                                                           |
| <b>type</b>                         | Type of event to add, remove or modify.                                             |
| <b>lastgateway</b>                  | The last known gateway.                                                             |
| <b>distance</b>                     | The administrative distance.                                                        |
| <b>time_sec time_msec</b>           | Time of event in seconds and milliseconds, when the event was published to the EEM. |
| <b>metric</b>                       | Path metric.                                                                        |
| <b>lastinterface</b>                | The last known interface.                                                           |

## event\_register\_rpc

Registers for an event that is triggered by the EEM SSH Remote Procedure Call (RPC) command. These events are handled by the RPC event detector that screens for this event. Use this Tcl command extension to run a RPC policy for this script.

### Syntax

```
event_register_rpc [queue_priority {normal | low | high | last}] [maxrun <sec.msec>] [nice
{0 | 1}] [default <sec.msec>]
```

**Arguments**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| default        | <p>(Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## event\_register\_snmp

Registers for a Simple Network Management Protocol (SNMP) statistics event. Use this Tcl command extension to run a policy when a given counter specified by an SNMP object ID (oid) crosses a defined threshold.

### Syntax

```
event_register_snmp [tag ?] oid ? get_type exact|next
entry_op gt|ge|eq|ne|lt|le entry_val ?
entry_type value|increment|rate
[exit_comb or|and]
[exit_op gt|ge|eq|ne|lt|le] [exit_val ?]
[exit_type value|increment|rate]
[exit_time ?] poll_interval ? [average_factor ?]
[queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

**Arguments**

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag        | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| oid        | (Mandatory) OID number of data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). The types of OIDs allowed are: <ul style="list-style-type: none"> <li>• COUNTER_TYPE</li> <li>• COUNTER_64_TYPE</li> <li>• GAUGE_TYPE</li> <li>• INTEGER_TYPE</li> <li>• OCTET_PRIM_TYPE</li> <li>• OPAQUE_PRIM_TYPE</li> <li>• TIME_TICKS_TYPE</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| entry_op   | (Mandatory) Entry comparison operator used to compare the current OID data value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| get_type   | (Mandatory) Type of SNMP get operation that needs to be applied to the OID specified. If the get_type argument is "exact," the value of the specified OID is retrieved; if the get_type argument is "next," the value of the lexicographical successor to the specified OID is retrieved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| entry_val  | (Mandatory) Value with which the current oid data value should be compared to decide if the SNMP event should be raised.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| entry-type | Specifies a type of operation to be applied to the object ID specified by the entry-val argument.<br>Value is defined as the actual value of the entry-val argument.<br><br>Increment uses the entry-val field as an incremental difference and the entry-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing.<br><br>Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change. |
| exit_comb  | (Optional) Exit combination operator used to indicate the combination of exit condition tests required to decide if the exit criteria are met so that the event monitoring can be reenabled. If it is "and," both exit value and exit time tests must be passed to meet the exit criteria. If it is "or," either exit value or exit time tests can be passed to meet the exit criteria. When exit_comb is "and," exit_op, and exit_val (exit_time) must exist. When exit_comb is "or," (exit_op and exit_val) or (exit_time) must exist.                                                                                                                                                                                                                                                                                                                                                                                |
| exit_op    | (Optional) Exit comparison operator used to compare the current oid data value with the exit value; if true, event monitoring for this event will be reenabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| exit_val       | (Optional) Value with which the current oid data value should be compared to decide if the exit criteria are met.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| exit-type      | <p>(Optional) Specifies a type of operation to be applied to the object ID specified by the exit-val argument. If not specified, the value is assumed.</p> <p>Value is defined as the actual value of the exit-val argument.</p> <p>Increment uses the exit-val field as an incremental difference and the exit-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing.</p> <p>Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change.</p>                                              |
| exit_time      | (Optional) Number of POSIX timer units after an event is raised when event monitoring will be enabled again. Specified in SSSSSSSSS[.MMM] format where SSSSSSSSS must be an integer number representing seconds between 0 and 4294967295, inclusive. MMM represents milliseconds and must be an integer number between 0 and 999.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| poll_interval  | (Mandatory) Interval between consecutive polls in POSIX timer units. Currently the interval is forced to be at least 1 second (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| average-factor | (Optional) Number in the range from 1 to 64 used to calculate the period used for rate-based calculations. The average-factor value is multiplied by the poll-interval value to derive the period in milliseconds. The minimum average factor value is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |

|        |                                                                                                                                                                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
| nice   | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                    |

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo**

```
"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u"
"event_severity {%s} oid {%s} val {%s} delta_val {%s}"
```

| Event Type                          | Description                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| <b>event_type</b>                   | Type of event.                                                                                                                                              |
| <b>event_type_string</b>            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| <b>event_pub_sec event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| <b>event_severity</b>               | SNMP event severity, which can be one of the following values: <ul style="list-style-type: none"> <li>• normal</li> <li>• minor</li> <li>• major</li> </ul> |
| <b>oid</b>                          | Object ID of data element, in SNMP dot notation.                                                                                                            |
| <b>val</b>                          | Value of the data element.                                                                                                                                  |
| <b>delta_val</b>                    | Delta value between the value of the policies.                                                                                                              |

## event\_register\_snmp\_notification

Registers for a Simple Network Management Protocol (SNMP) notification trap event. Use this Tcl command extension to run a policy when an SNMP trap with the specified SNMP object ID (oid) is encountered on a specific interface or address. The **snmp-server manager** CLI command must be enabled for the SNMP notifications to work using Tcl policies.

### Syntax

```
event_register_snmp_notification [tag ?] oid ? oid_val ?
op {gt|ge|eq|ne|lt|le}
[maxrun ?]
[src_ip_address ?]
[dest_ip_address ?]
[queue_priority {normal|low|high|last}]
[maxrun ?]
[nice {0|1}]
[default ?]
[direction {incoming|outgoing}]
[msg_op {drop|send}]
```

### Arguments

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag     | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                                           |
| oid     | (Mandatory) OID number of the data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). If the specified OID ends with a dot (.), then all OIDs that start with the OID number before the dot are matched. The types of OIDs allowed are: <ul style="list-style-type: none"> <li>• COUNTER_TYPE</li> <li>• COUNTER_64_TYPE</li> <li>• GAUGE_TYPE</li> <li>• INTEGER_TYPE</li> <li>• OCTET_PRIM_TYPE</li> <li>• OPAQUE_PRIM_TYPE</li> <li>• TIME_TICKS_TYPE</li> </ul> |
| oid_val | (Mandatory) OID value with which the current OID data value should be compared to decide if the SNMP event should be raised.                                                                                                                                                                                                                                                                                                                                                    |
| op      | (Mandatory) Comparison operator used to compare the current OID data value with the SNMP Protocol Data Unit (PDU) OID data value; if this is true, an event is raised.                                                                                                                                                                                                                                                                                                          |
| maxrun  | (Optional) Maximum run time of the script (specified in sssssss[.mmm] format, where sssssss must be an integer representing seconds between 0 and 31536000, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.                                                                                                                                          |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_ip_address  | (Optional) Source IP address where the SNMP notification trap originates. The default is all; it is set to receive SNMP notification traps from all IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| dest_ip_address | (Optional) Destination IP address where the SNMP notification trap is sent. The default is all; it is set to receive SNMP traps from all destination IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| queue_priority  | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the queue_priority_last argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| default         | (Optional) Specifies the time period in seconds during which the snmp notification event detector waits for the policy to exit. The time period is specified in ssssssss[.mmm] format, where ssssssss must be an integer representing seconds between 0 and 4294967295 and mmm must be an integer representing milliseconds between 0 and 999.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| nice            | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| direction       | (Optional) The direction of the incoming or outgoing SNMP trap or inform PDU to filter. The default value is incoming.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| msg_op          | (Optional) The action to be taken on the SNMP PDU (drop it or send it) once the event is triggered. The default value is send.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Event Type                          | Description                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| <b>event_type</b>                   | Type of event.                                                                                                                                              |
| <b>event_type_string</b>            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| <b>event_pub_sec event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| <b>oid</b>                          | An user specified object ID.                                                                                                                                |
| <b>oid_val</b>                      | An user specified object ID value.                                                                                                                          |
| <b>src_ip_addr</b>                  | The source IP address of the SNMP protocol data unit (PDU).                                                                                                 |
| <b>dest_ip_addr</b>                 | The destination IP address of the SNMP PDU.                                                                                                                 |
| <b>x_x_x_x_x (varbinds)</b>         | The SNMP PDU varbind information.                                                                                                                           |
| <b>trap_oid</b>                     | Indicates the trap OID value.                                                                                                                               |
| <b>enterprise_oid</b>               | Indicates the enterprise OID value.                                                                                                                         |
| <b>generic_trap</b>                 | Indicates one of a number of generic trap types. There are seven generic trap numbers zero to six.                                                          |
| <b>specific_trap</b>                | Indicates one of a number of specific trap codes.                                                                                                           |

## event\_register\_snmp\_object

Registers for a Simple Network Management Protocol (SNMP) object event. Use this Tcl command extension to replace the value when an SNMP with the specified SNMP-object ID (OID) is encountered on a specific interface or address.

### Syntax

```
event_register_snmp_object oid ?
type {int|uint|counter|counter64|gauge|ipv4||oid|string}
sync {yes|no}
skip {yes|no}
[istable {yes|no}]
[default ?]
[queue_priority {normal|low|high|last}]
[maxrun ?]
[nice {0|1}]
```

**Arguments**

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid     | <p>(Mandatory) OID number of the data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). If the specified OID ends with a dot (.), then all OIDs that start with the OID number before the dot are matched. The types of OIDs allowed are:</p> <ul style="list-style-type: none"> <li>• COUNTER_TYPE</li> <li>• COUNTER_64_TYPE</li> <li>• GAUGE_TYPE</li> <li>• INTEGER_TYPE</li> <li>• OCTET_PRIM_TYPE</li> <li>• OPAQUE_PRIM_TYPE</li> <li>• TIME_TICKS_TYPE</li> </ul>                                                                                                    |
| type    | (Mandatory) OID value type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| sync    | <p>(Mandatory) A "yes" means that the EEM policy will be notified. If the applet set_exit_status or Tcl return value is 0, then SNMP will handle the request. If the return value is 1, SNMP will use the value provided by the policy for the get request and will not process the set request. A "no" means that EEM will not be notified and SNMP will handle the request.</p> <p>Only one OID can be associated with a synchronous policy. However, multiple synchronous policies can be registered for the same OID.</p>                                                             |
| skip    | Mandatory if the sync argument is "no" and should not exist if the sync argument is "yes." If the skip argument is "yes," it means that SNMP will handle the request. If the skip argument is "no," it means that SNMP will act as if the object does not exist.                                                                                                                                                                                                                                                                                                                          |
| istable | (Optional) A value of "no" means the OID is scalar object, and "yes" means the OID is table object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| default | (Optional) The time period during which the SNMP Object event detector waits for the policy to exit (specified in ssssssss[.mmm] format, where ssssssss must be an integer representing seconds between 0 and 4294967295, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to process the set or get request normally by SNMP subsystem. If this argument is not specified, the default time period is set to 30 seconds. |
| maxrun  | (Optional) Maximum run time of the script (specified in ssssssss[.mmm] format, where ssssssss must be an integer representing seconds between 0 and 31536000, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.                                                                                                                                                                                                                                                  |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the queue_priority_last argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo**

```
"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u event_severity {%s}" "oid {%s} request {%s} request_type {%s} value %u"
```

| Event Type                   | Description                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type                   | Type of event.                                                                                                                                              |
| event_type_string            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| event_severity               | The severity of the event.                                                                                                                                  |
| oid                          | The ID of the SNMP object in the received get or set request.                                                                                               |

| Event Type   | Description                                            |
|--------------|--------------------------------------------------------|
| request      | The get or set request type.                           |
| request_type | The type of request (exact or next).                   |
| value        | For set requests only. The value to set the object to. |

## event\_register\_syslog

Registers for a syslog event. Use this Tcl command extension to trigger a policy when a syslog message of a specific pattern is logged after a certain number of occurrences during a certain period of time.

### Syntax

```
event_register_syslog [tag ?] [occurs ?] [period ?] pattern ?
[priority all|emergencies|alerts|critical|errors|warnings|notifications|
informational|debugging|0|1|2|3|4|5|6|7]
[queue_priority low|normal|high|last]
[severity_fatal] [severity_critical] [severity_major]
[severity_minor] [severity_warning] [severity_notification]
[severity_normal] [severity_debugging]
[maxrun ?] [nice 0|1]
```

### Arguments

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag      | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                      |
| occurs   | (Optional) Number of occurrences before the event is raised; if not specified, the event is raised on the first occurrence. If specified, the value must be greater than 0.                                                                                                                                                                                                                                                                |
| period   | (Optional) Time interval, in seconds and milliseconds, during which the one or more occurrences must take place in order to raise an event (specified in SSSSSSSSS[.MMM] format where SSSSSSSSS must be an integer number representing seconds between 0 and 4294967295, inclusive, and where MMM represents milliseconds and must be an integer number between 0 and 999). If this argument is not specified, no period check is applied. |
| pattern  | (Mandatory) A regular expression used to perform syslog message pattern match. This argument is what the policy uses to identify the logged syslog message.                                                                                                                                                                                                                                                                                |
| priority | (Optional) The message priority to be screened. If this argument is specified, only messages that are at the specified logging priority level, or lower, are screened. If this argument is not specified, the default priority is 0.                                                                                                                                                                                                       |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| severity_xxx   | <p>(Optional) The event severity to be screened. If this argument is specified, only messages that are at the specified severity level are screened. See the table titled "Severity Level Mapping For Syslog Events" for the severity level mapping for syslog events.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

If multiple conditions are specified, the syslog event will be raised when all the conditions are matched.

**Table 219: Severity Level Mapping For Syslog Events**

| Severity Keyword      | Syslog Priority | Description                                          |
|-----------------------|-----------------|------------------------------------------------------|
| severity_fatal        | LOG_EMERG (0)   | System is unusable.                                  |
| severity_critical     | LOG_ALERT (1)   | Critical conditions, immediate attention required.   |
| severity_major        | LOG_CRIT (2)    | Major conditions.                                    |
| severity_minor        | LOG_ERR (3)     | Minor conditions.                                    |
| severity_warning      | LOG_WARNING (4) | Warning conditions.                                  |
| severity_notification | LOG_NOTICE (5)  | Basic notification, informational messages.          |
| severity_normal       | LOG_INFO (6)    | Normal event, indicates returning to a normal state. |
| severity_debugging    | LOG_DEBUG (7)   | Debugging messages.                                  |

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo**

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u"
"msg {%s}"
```

| Event Type                          | Description                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| <b>event_type</b>                   | Type of event.                                                                                                                                              |
| <b>event_type_string</b>            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| <b>event_pub_sec event_pub_msec</b> | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| <b>msg</b>                          | The last syslog message that matches the pattern.                                                                                                           |

## event\_register\_timer

Creates a timer and registers for a timer event as both a publisher and a subscriber. Use this Tel command extension when there is a need to trigger a policy that is time specific or timer based. This event timer is both an event publisher and a subscriber. The publisher part indicates the conditions under which the named timer is to go off. The subscriber part identifies the name of the timer to which the event is subscribing.

---

**Note** Both the CRON and absolute time specifications work on local time.

---

**Syntax**

```
event_register_timer [tag ?] watchdog|countdown|absolute|cron
[name ?] [cron_entry ?]
[time ?]
[queue_priority low|normal|high|last] [maxrun ?]
[nice 0|1]
```

**Arguments**

| name       | (Optional) Name of the timer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| cron_entry | <p>(Optional) Must be specified if the CRON timer type is specified. Must not be specified if any other timer type is specified. A cron_entry is a partial UNIX crontab entry (the first five fields) as used with the UNIX CRON daemon.</p> <p>A cron_entry specification consists of a text string with five fields. The fields are separated by spaces. The fields represent the time and date when CRON timer events will be triggered. The fields are described in the table titled "Time and Date When CRON Events Will Be Triggered."</p> <p>Ranges of numbers are allowed. Ranges are two numbers separated with a hyphen. The specified range is inclusive. For example, 8-11 for an hour entry specifies execution at hours 8, 9, 10, and 11.</p> <p>A field may be an asterisk (*), which always stands for "first-last."</p> <p>Lists are allowed. A list is a set of numbers (or ranges) separated by commas. Examples: "1,2,5,9" and "0-4,8-12".</p> <p>Step values can be used in conjunction with ranges. Following a range with "/&lt;number&gt;" specifies skips of the number's value through the range. For example, "0-23/2" can be used in the hour field to specify an event that is triggered every other hour. Steps are also permitted after an asterisk, so if you want to say "every two hours", use "* /2".</p> <p>Names can also be used for the month and the day of week fields. Use the first three letters of the particular day or month (case does not matter). Ranges or lists of names are not allowed.</p> <p>The day on which a timer event is triggered can be specified by two fields: day of month and day of week. If both fields are restricted (that is, are not *), an event will be triggered when either field matches the current time. For example, "30 4 1,15 * 5" would cause an event to be triggered at 4:30 a.m. on the 1st and 15th of each month, plus every Friday.</p> <p>Instead of the first five fields, one of seven special strings may appear. These seven special strings are described in the table titled "Special Strings for cron_entry."</p> <p>Example 1: "0 0 1,15 * 1" would trigger an event at midnight on the 1st and 15th of each month, as well as on every Monday. To specify days by only one field, the other field should be set to *; "0 0 * * 1" would trigger an event at midnight only on Mondays.</p> <p>Example 2: "15 16 1 * *" would trigger an event at 4:15 p.m. on the first day of each month.</p> <p>Example 3: "0 12 * * 1-5" would trigger an event at noon on Monday through Friday of each week.</p> <p>Example 4: "@weekly" would trigger an event at midnight once a week on Sunday.</p> |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| time           | (Optional) Must be specified if a timer type other than CRON is specified. Must not be specified if the CRON timer type is specified. For watchdog and countdown timers, the number of seconds and milliseconds until the timer expires; for the absolute timer, the calendar time of the expiration time. Time is specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999. An absolute expiration date is the number of seconds and milliseconds since January 1, 1970. If the date specified has already passed, the timer expires immediately.                                                                                                                                                                                                                                                                                                                       |
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nice           | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 220: Time and Date When CRON Events Will Be Triggered**

| Field        | Allowed Values                                                                       |
|--------------|--------------------------------------------------------------------------------------|
| minute       | 0-59                                                                                 |
| hour         | 0-23                                                                                 |
| day of month | 1-31                                                                                 |
| month        | 1-12 (or names, see below)                                                           |
| day of week  | 0-7 (0 or 7 is Sun, or names; see the table titled "Special Strings for cron_entry") |

**Table 221: Special Strings for cron\_entry**

| String    | Meaning                            |
|-----------|------------------------------------|
| @yearly   | Trigger once a year, "0 0 1 1 *".  |
| @annually | Same as @yearly.                   |
| @monthly  | Trigger once a month, "0 0 1 * *". |
| @weekly   | Trigger once a week, "0 0 * * 0".  |
| @daily    | Trigger once a day, "0 0 * * *".   |
| @midnight | Same as @daily.                    |
| @hourly   | Trigger once an hour, "0 * * * *". |

**Result String**

None

**Set \_cerrno**

No

**Event\_reqinfo**

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u"
"timer_type %s timer_time_sec %ld timer_time_msec %ld"
"timer_remain_sec %ld timer_remain_msec %ld"
```

| Event Type                            | Description                                                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event_id</b>                       | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| <b>event_type</b>                     | Type of event.                                                                                                                                              |
| <b>event_type_string</b>              | An ASCII string that represents the name of the event for this event type.                                                                                  |
| <b>event_pub_sec event_pub_msec</b>   | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| <b>timer_type</b>                     | Type of the timer. Can be one of the following: <ul style="list-style-type: none"> <li>• watchdog</li> <li>• countdown</li> <li>• absolute</li> </ul>       |
| <b>timer_time_sec timer_time_msec</b> | Time when the timer expired.                                                                                                                                |

| Event Type                            | Description                                    |
|---------------------------------------|------------------------------------------------|
| timer_remain_sec<br>timer_remain_msec | The remaining time before the next expiration. |

**See Also**

event\_register\_timer\_subscriber

## event\_register\_timer\_subscriber

Registers for a timer event as a subscriber. Use this Tcl command extension to identify the name of the timer to which the event timer, as a subscriber, wants to subscribe. The event timer depends on another policy or another process to actually manipulate the timer. For example, let policyB act as a timer subscriber policy, but policyA (although it does not need to be a timer policy) uses register\_timer, timer\_arm, or timer\_cancel Tcl command extensions to manipulate the timer referenced in policyB.

**Syntax**

```
event_register_timer_subscriber watchdog|countdown|absolute|cron
name ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

|           |                                |
|-----------|--------------------------------|
| watchdog  | (Mandatory) Watchdog timer.    |
| countdown | (Mandatory) Countdown timer.   |
| absolute  | (Mandatory) Absolute timer.    |
| cron      | (Mandatory) CRON timer.        |
| name      | (Mandatory) Name of the timer. |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Note** An EEM policy that registers for a timer event or a counter event can act as both publisher and subscriber.

**Result String**

None

event\_register\_timer

## event\_register\_track

Registers for a report event from the Cisco IOS Object Tracking subsystem. Use this Tcl command extension to trigger a policy on the basis of a Cisco IOS Object Tracking subsystem report for a specified object number.

**Syntax**

```
event_register_track ? [tag ?] [state up|down|any] [queue_priority low|normal|high|last]
[maxrun ?]
[nice 0|1]
```

**Arguments**

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ? (represents a number) | (Mandatory) Tracked object number in the range from 1 to 500, inclusive.                                                                                                                                                                                                                                                                                                                                                                                    |
| tag                     | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                                                                                                                                                       |
| state                   | (Optional) Specifies that the tracked object transition will cause an event to be raised. If <b>up</b> is specified, an event will be raised when the tracked object transitions from a down state to an up state. If <b>down</b> is specified, an event will be raised when the tracked object transitions from an up state to a down state. If <b>any</b> is specified, an event will be raised when the tracked object transitions to or from any state. |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_priority | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |
| maxrun         | <p>(Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| nice           | <p>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

If an optional argument is not specified, the event matches all possible values of the argument.

| Event Type        | Description                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id          | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event ID. |
| event_type        | Type of event.                                                                                                                                              |
| event_type_string | An ASCII string that represents the name of the event for this event type.                                                                                  |

| Event Type                   | Description                                                                            |
|------------------------------|----------------------------------------------------------------------------------------|
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, when the event was published to the EEM.        |
| track_number                 | Number of the tracked object that caused the event to be triggered.                    |
| track_state                  | State of the tracked object when the event was triggered; valid states are up or down. |

## event\_register\_wdsysmon

Registers for a Watchdog system monitor event. Use this Tcl command extension to register for a composite event which is a combination of several subevents or conditions. For example, you can use this command to register for the combination of conditions wherein the CPU usage of a certain process is over 80 percent and the memory used by the process is greater than 50 percent of its initial allocation. This Tcl command extension is supported only in Software Modularity images.

### Syntax

```
event_register_wdsysmon [tag ?] [timewin ?]
[sub12_op and|or|andnot]
[sub23_op and|or|andnot]
[sub34_op and|or|andnot]
[sub1 subevent-description]
[sub2 subevent-description]
[sub3 subevent-description]
[sub4 subevent-description] [node ?]
[queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

Each argument is position independent.

**Note** Operator definitions: and (logical and operation), or (logical or operation), andnot (logical and not operation). For example, "sub12\_op and" is defined as raise an event when subevent 1 and subevent 2 are true; "sub23\_op or" is defined as raise an event when the condition specified in sub12\_op is true or subevent 3 is true. The logic can be diagrammed using: if (((sub1 sub12\_op sub2) sub23\_op sub3) sub34\_op sub4) is TRUE, raise event

### Arguments

|         |                                                                                                                                                                                                                                                                                                                                 |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag     | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.                                                                                                                                                                           |
| timewin | (Optional) Time window within which all of the subevents have to occur in order for an event to be generated (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sub12_op             | (Optional) Combination operator for comparison between subevent 1 and subevent 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| sub23_op             | (Optional) Combination operator for comparison between subevent 1 and 2 and subevent 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| sub34_op             | (Optional) Combination operator for comparison between subevent 1 and 2 and subevent 3 and subevent 4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| sub1                 | (Optional) Indicates that subevent 1 is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| subevent-description | (Optional) Syntax for the subevent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| sub2                 | (Optional) Indicates that subevent 2 is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| sub3                 | (Optional) Indicates that subevent 3 is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| sub4                 | (Optional) Indicates that subevent 4 is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| node                 | <p>(Optional) The node name to be monitored for deadlock conditions is a string that consists of the word "node" followed by two fields separated by a slash character using the following format:</p> <pre>node&lt;slot-number&gt;/&lt;cpu-number&gt;</pre> <p>The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. For example, the SP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be specified as node0/0. The RP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be addressed as node0/1. If the node argument is not specified, the default node specification is the local node on which the registration is done.</p>                                                                                                                                                                                                                                                                            |
| queue_priority       | <p>(Optional) Priority level at which the script will be queued:</p> <ul style="list-style-type: none"> <li>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</li> <li>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</li> <li>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</li> <li>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</li> </ul> <p>If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.</p> <p><b>Note</b> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</p> <p>If this argument is not specified, the default queuing priority is normal.</p> |

|        |                                                                                                                                                                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
| nice   | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.                                                                                                                                                    |

### Subevents

The syntax of subevent descriptions can be one of seven cases.

For arguments in subevent description, the following constraints apply on the value of number arguments:

- For `dispatch_mgr`, `val` must be an integer between 0 and 4294967295, inclusive.
- For `cpu_proc` and `cpu_tot`, `val` must be an integer between 0 and 100, inclusive.
- For `mem_proc`, `mem_tot_avail`, and `mem_tot_used`, if `is_percent` is FALSE, `val` must be an integer between 0 and 4294967295, inclusive.

1. `deadlock procname ?`

### Arguments

|          |                                                                                                                                                                                   |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| procname | (Mandatory) A regular expression that specifies the process name that you wish to monitor for deadlock conditions. This subevent will ignore the time window even if it is given. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

2. `dispatch_mgr [procname ?] [op gt|ge|eq|ne|lt|le] [val ?] [period ?]`

### Arguments

|          |                                                                                                                                                                                                                                                                                                                                                             |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| procname | (Optional) A regular expression that specifies the process name that you wish to monitor for <code>dispatch_manager</code> status.                                                                                                                                                                                                                          |
| op       | (Optional) Comparison operator used to compare the collected number of events with the specified value; if true, an event will be raised.                                                                                                                                                                                                                   |
| val      | (Optional) The value with which the number of events that have occurred should be compared.                                                                                                                                                                                                                                                                 |
| period   | (Optional) The time period for the number of events that have occurred (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |

3. `cpu_proc [procname ?] [op gt|ge|eq|ne|lt|le] [val ?] [period ?]`

**Arguments**

|          |                                                                                                                                                                                                                                                                                                                                                         |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| procname | (Optional) A regular expression that specifies the process name that you wish to monitor for CPU utilization conditions.                                                                                                                                                                                                                                |
| op       | (Optional) Comparison operator used to compare the collected CPU usage sample percentage with the specified percentage value; if true, an event will be raised.                                                                                                                                                                                         |
| val      | (Optional) The percentage value with which the average CPU usage during the sample period should be compared.                                                                                                                                                                                                                                           |
| period   | (Optional) The time period for averaging the collection of samples (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |

4. cpu\_tot [op gt|ge|eq|ne|lt|le] [val ?] [period ?]

**Arguments**

|        |                                                                                                                                                                                                                                                                                                                                                         |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| op     | (Optional) Comparison operator used to compare the collected total system CPU usage sample percentage with the specified percentage value; if true, an event will be raised.                                                                                                                                                                            |
| val    | (Optional) The percentage value with which the average CPU usage during the sample period should be compared.                                                                                                                                                                                                                                           |
| period | (Optional) The time period for averaging the collection of samples (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |

5. mem\_proc [procname ?] [op gt|ge|eq|ne|lt|le] [val ?] [is\_percent TRUE|FALSE] [period ?]

**Arguments**

|            |                                                                                                                                                                                                                                                                                                                                                                           |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| procname   | (Optional) A regular expression that specifies the process name that you wish to monitor for memory usage.                                                                                                                                                                                                                                                                |
| op         | (Optional) Comparison operator used to compare the collected memory used with the specified value; if true, an event will be raised.                                                                                                                                                                                                                                      |
| val        | (Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If memory usage has increased from 150 KB to 300 KB within the time period, the percentage increase is 100. This is the value with which the measured value should be compared. |
| is_percent | (Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.                                                                                                                                                                                                                                              |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| period | (Optional) If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
6. mem_tot_avail [op gt|ge|eq|ne|lt|le] [val ?] [is_percent TRUE|FALSE] [period ?]
```

### Arguments

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| op         | (Optional) Comparison operator used to compare the collected available memory with the specified value; if true, an event will be raised.                                                                                                                                                                                                                                                                                                             |
| val        | (Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If available memory usage has decreased from 300 KB to 150 KB within the time period, the percentage decrease is 50. This is the value with which the measured value should be compared.                                                                    |
| is_percent | (Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.                                                                                                                                                                                                                                                                                                                          |
| period     | (Optional) If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |

```
7. mem_tot_used [op gt|ge|eq|ne|lt|le] [val ?] [is_percent TRUE|FALSE] [period ?]
```

### Arguments

|            |                                                                                                                                                                                                                                                                                                                                                                           |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| op         | (Optional) Comparison operator used to compare the collected used memory with the specified value; if true, an event will be raised.                                                                                                                                                                                                                                      |
| val        | (Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If memory usage has increased from 150 KB to 300 KB within the time period, the percentage increase is 100. This is the value with which the measured value should be compared. |
| is_percent | (Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.                                                                                                                                                                                                                                              |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| period | <p>(Optional) If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</p> <p><b>Note</b> This argument is mandatory if is_percent is set to TRUE; otherwise, it is optional.</p> |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Result String**

None

**Set\_cerrno**

No

**Event\_reqinfo**

```
"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u"
"num_subs %u"
```

| Event Type                   | Description                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_id                     | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type                   | Type of event.                                                                                                                                              |
| event_type_string            | An ASCII string that represents the name of the event for this event type.                                                                                  |
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, when the event was published to the EEM.                                                                             |
| num_subs                     | Subevent number.                                                                                                                                            |

Where the subevent info string is for a deadlock subevent:

```
"{type %s num_entries %u entries {entry 1, entry 2, ...}}"
```

| Subevent Type | Description                                           |
|---------------|-------------------------------------------------------|
| type          | Type of wdsysmon subevent.                            |
| num_entries   | Number of processes and threads in the deadlock.      |
| entries       | Information of processes and threads in the deadlock. |

Where each entry is:

```
"{node {%s} procname {%s} pid %u tid %u state %s b_node %s b_procname %s b_pid %u
b_tid %u}"
```

Assume that the entry describes the scenario in which Process A thread m is blocked on process B thread n:

| Subevent Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>node</b>       | Name of the node that process A thread m is on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>procname</b>   | Name of process A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>pid</b>        | Process ID of process A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>tid</b>        | Thread ID of process A thread m.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>state</b>      | Thread state of process A thread m. Can be one of the following: <ul style="list-style-type: none"> <li>• STATE_CONDVAR</li> <li>• STATE_DEAD</li> <li>• STATE_INTR</li> <li>• STATE_JOIN</li> <li>• STATE_MUTEX</li> <li>• STATE_NANOSLEEP</li> <li>• STATE_READY</li> <li>• STATE_RECEIVE</li> <li>• STATE_REPLY</li> <li>• STATE_RUNNING</li> <li>• STATE_SEM</li> <li>• STATE_SEND</li> <li>• STATE_SIGSUSPEND</li> <li>• STATE_SIGWAITINFO</li> <li>• STATE_STACK</li> <li>• STATE_STOPPED</li> <li>• STATE_WAITPAGE</li> <li>• STATE_WAITTHREAD</li> </ul> |
| <b>b_node</b>     | Name of the node that process B thread is on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>b_procname</b> | Name of process B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>b_pid</b>      | Process ID of process B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Subevent Type | Description                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------|
| <b>b_tid</b>  | Thread ID of process B thread n; 0 means that process A thread m is blocked on all threads of process B. |

**For dispatch\_mgr Subevent**

```
"{type %s node {%s} procname {%s} pid %u value %u sec %ld msec %ld}"
```

| <b>node</b>     | Name of the node that the POSIX process is on.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>procname</b> | POSIX process name for this subevent.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>pid</b>      | POSIX process ID for this subevent.<br><b>Note</b> The three fields above describe the owner process of this dispatch manager.                                                                                                                                                                                                                                                                                        |
| <b>value</b>    | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the number of events processed by the dispatch manager is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the total number of events processed by this dispatch manager is in the given time window. |
| <b>sec msec</b> | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <b>sec</b> and <b>msec</b> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.     |

**For cpu\_proc Subevent**

```
"{type %s node {%s} procname {%s} pid %u value %u sec %ld msec %ld}"
```

| Subevent Type   | Description                                                                                                                              |

| Subevent Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>is_percent</b> | Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value).                                                                                                                                                                                                                                                                                                                                                                               |
| <b>value</b>      | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the process used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged process used memory utilization is in the given time window.                                                                                                                                                                   |
| Subevent Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>diff</b>       | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <b>diff</b> is the percentage difference between the first process used memory sample ever collected and the latest process used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <b>diff</b> is the percentage difference between the oldest and latest process used memory utilization in the specified time window. |
| <b>sec msec</b>   | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <b>sec</b> and <b>msec</b> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.                                                                                                                       |

If the **is\_percent** argument is FALSE, and the **sec** and **msec** arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **value** is the process used memory in the latest sample.
- **diff** is 0.
- **sec** and **msec** are both 0.

If the **is\_percent** argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **value** is the averaged process used memory sample value in the specified time window.
- **diff** is 0.
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest samples in this time window.

If the **is\_percent** argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **value** is 0.
- **diff** is the percentage difference between the oldest and latest process used memory samples in the specified time window.
- **sec** and **msec** are the actual time difference between the time stamps of the oldest and latest process used memory samples in this time window.

If the **is\_percent** argument is TRUE, and the **sec** and **msec** arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **value** is 0.
- **diff** is the percentage difference between the first process used memory sample ever collected and the latest process used memory sample.
- **sec** and **msec** are the actual time difference between the time stamps of the first process used memory sample ever collected and the latest process used memory sample.

#### For mem\_tot\_avail Subevent

```
"{type %s node {%s} is_percent %s used %u avail %u diff %d sec %ld msec %ld}"
```

| Subevent Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>type</b>       | Type of wdsysmon subevent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>node</b>       | Name of the node for which the total available memory is being monitored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>is_percent</b> | Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value).                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>used</b>       | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the total used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged total used memory utilization is in the given time window.                                                                                                                                                                                |
| <b>avail</b>      | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <b>avail</b> is in the latest total available memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <b>avail</b> is the total available memory utilization in the specified time window.                                                                                                                                             |
| <b>diff</b>       | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <b>diff</b> is the percentage difference between the first total available memory sample ever collected and the latest total available memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <b>diff</b> is the percentage difference between the oldest and latest total available memory utilization in the specified time window. |
| <b>sec msec</b>   | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, they are the actual time difference between the time stamps of the oldest and latest samples in this time window.                                                                                                                                                                    |

If the **is\_percent** argument is FALSE, and the **sec** and **msec** arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **used** is the total used memory in the latest sample.
- **avail** is the total available memory in the latest sample.
- **diff** is 0.

- **sec** and **msec** are both 0.

If the **is\_percent** argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **used** is 0.
- **avail** is the averaged total available memory sample value in the specified time window.
- **diff** is 0.
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest total available memory samples in this time window.

If the **is\_percent** argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **used** is 0.
- **avail** is 0.
- **diff** is the percentage difference between the oldest and latest total available memory samples in the specified time window.
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest total available memory samples in this time window.

If the **is\_percent** argument is TRUE, and the **sec** and **msec** arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **used** is 0.
- **avail** is 0.
- **diff** is the percentage difference between the first total available memory sample ever collected and the latest total available memory sample.
- **sec** and **msec** are the actual time difference between the time stamps of the first total available memory sample ever collected and the latest total available memory sample.

**For mem\_tot\_used Subevent**

```
"{type %s node %s} is_percent %s used %u avail %u diff %d sec %ld msec %ld}"
```

| Subevent Type     | Description                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>type</b>       | Type of wdsysmon subevent.                                                                                                                                |
| <b>node</b>       | Name of the node for which the total used memory is being monitored.                                                                                      |
| <b>is_percent</b> | Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value). |

| Subevent Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>used</b>     | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the total used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged total used memory utilization is in the given time window.                                                                                                                                                                 |
| <b>avail</b>    | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <b>avail</b> is in the latest total used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <b>avail</b> is the total used memory utilization in the specified time window.                                                                                                                                        |
| <b>diff</b>     | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <b>diff</b> is the percentage difference between the first total used memory sample ever collected and the latest total used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <b>diff</b> is the percentage difference between the oldest and latest total used memory utilization in the specified time window. |
| <b>sec msec</b> | If the <b>sec</b> and <b>msec</b> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <b>sec</b> and <b>msec</b> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.                                                                                                                 |

If the **is\_percent** argument is FALSE, and the **sec** and **msec** arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **used** is the total used memory in the latest sample,
- **avail** is the total available memory in the latest sample,
- **diff** is 0,
- **sec** and **msec** are both 0,

If the **is\_percent** argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **used** is the averaged total used memory sample value in the specified time window,
- **avail** is 0,
- **diff** is 0,
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest total used memory samples in this time window,

If the **is\_percent** argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **used** is 0.
- **avail** is 0.

- **diff** is the percentage difference between the oldest and latest total used memory samples in the specified time window.
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest total used memory samples in this time window.

If the **is\_percent** argument is TRUE, and the sec and msec arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **used** is 0.
- **avail** is 0.
- **diff** is the percentage difference between the first total used memory sample ever collected and the latest total used memory sample.
- **sec** and **msec** are the actual time difference between the time stamps of the first total used memory sample ever collected and the latest total used memory sample.

---

**Note** Inside a subevent description, each argument is position independent.

---

## CHAPTER 106

# EEM Event Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

[type ?]

- A question mark ? represents a variable to be entered.
- Choices between arguments are represented by pipes, for example:

priority low|normal|high

---

**Note** For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

---

**Note** Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

---

- [event\\_completion](#), on page 2263
- [event\\_completion\\_with\\_wait](#), on page 2264
- [event\\_publish](#), on page 2265
- [event\\_wait](#), on page 2268

## event\_completion

Sends a notification to the EEM server that the policy is done servicing the event that triggered it. The event only takes a single argument which is the **return\_code** of this event instance.

### Syntax

```
event_completion status ?
```

**Arguments**

|        |                                                                                                                                                  |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| status | (Mandatory) Exit status (return_code) of this event instance. A value of zero indicates no error and any other integer value indicates an error. |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|

**Result String**

None

**Set\_cerrno**

No

## event\_completion\_with\_wait

The **event\_completion\_with\_wait** command combines the two commands **event\_completion** and **event\_wait** into a single command for ease of use.

The **event\_completion** command sends a notification to the EEM server that the policy is done servicing the event that triggered it. The event only takes a single argument which is the **return\_code** of this event instance.

The **event\_wait** places the Tcl policy into a sleep state. When the Tcl policy receives a new signal announcing a new event, the policy is placed into a wake state and again returns to a sleep state. This loop continues. If **event\_wait** policy is invoked before **event\_completed** policy, an error results and the policy exits.

**Syntax**

```
event_completion_with_wait status ? [refresh_vars]
```

**Arguments**

|              |                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| status       | (Mandatory) exit_status (return_code) of this event instance. A value of zero indicates no error. Any other integer value indicates an error.          |
| refresh_vars | (Optional) Indicates whether built-in and environment variables should be updated (refreshed) from the EEM Policy Director during this event instance. |

**Result String**

None

**Set\_cerrno**

Yes

**Sample Usage**

Here is a similar example as above using this single command:

```
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```

```

set i 1
while {1 == 1} { # Start high performance policy loop
 array set arr_einfo [event_reqinfo]
 if {$_cerno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
 }
 action_syslog msg "event $i serviced" priority info
 if {$i == 5} {
 action_syslog msg "Exiting after servicing 5 events" priority info
 exit 0
 }
 incr i
 array set _event_state_arr [event_completion_with_wait status 0 refresh_vars 1]
 if {$_event_state_arr(event_state) != 0} {
 action_syslog msg "Exiting: failed event_state " \
 "$event_state_arr(event_state)" priority info
 exit 0
 }
}
}

```

**Note** The running configuration output is the same as the event\_publishTcl command.

## event\_publish

Publishes an application-specific event.

### Syntax

```
event_publish sub_system ? type ? [arg1 ?] [arg2 ?] [arg3 ?] [arg4 ?]
```

### Arguments

|                   |                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sub_system        | (Mandatory) Number assigned to the EEM policy that published the application-specific event. Number is set to 798 because all other numbers are reserved for Cisco use.                     |
| type              | (Mandatory) Event subtype within the specified component. The sub_system and type arguments uniquely identify an application event. Must be an integer between 1 and 4294967295, inclusive. |
| [arg1 ?]-[arg4 ?] | (Optional) Four pieces of application event publisher string data.                                                                                                                          |

### Result String

None

### Set\_cerno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

### Sample Usage

This example demonstrates how to use the **event\_publish** Tcl command extension to execute a script *n* times repeatedly to perform some function (for example, to measure the amount of CPU time taken by a given group of Tcl statements). This example uses two Tcl scripts.

Script1 publishes a type 9999 EEM event to cause Script2 to run for the first time. Script1 is registered as a none event and is run using the Cisco IOS CLI **event manager run** command. Script2 is registered as an EEM application event of type 9999, and this script checks to see if the application publish arg1 data (the iteration number) exceeds the EEM environment variable test\_iterations value. If the test\_iterations value is exceeded, the script writes a message and exits; otherwise the script executes the remaining statements and reschedules another run. To measure the CPU utilization for Script2, use a value of test\_iterations that is a multiple of 10 to calculate the amount of average CPU time used by Script2.

To run the Tcl scripts, enter the following Cisco IOS commands:

```
configure terminal
 event manager environment test_iterations 100
 event manager policy script1.tcl
 event manager policy script2.tcl
 end
 event manager run script1.tcl
```

The Tcl script Script2 will be executed 100 times. If you execute the script without the extra processing and derive the average CPU utilization, and then add the extra processing and repeat the test, you can subtract the former CPU utilization from the later CPU utilization to determine the average for the extra processing.

#### Script1 (script1.tcl)

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
Query the event info.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}

action_syslog priority info msg "EEM application_publish test start"
if {$_cerrno != 0} {
 set result [format \
 "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}

Cause the first iteration to run.
event_publish sub_system 798 type 9999 arg1 0
if {$_cerrno != 0} {
 set result [format \
 "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
```

```

 error $result
}

Script2 (script2.tcl)

::cisco::eem::event_register_appl sub_system 798 type 9999

Check if all the required environment variables exist.
If any required environment variable does not exist, print out an error msg and quit.
if (![info exists test_iterations]) {
 set result \
 "Policy cannot be run: variable test_iterations has not been set"
 error $result $errorInfo
}

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

Query the event info.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}

Data1 contains the arg1 value used to publish this event.
set iter $arr_einfo(data1)

Use the arg1 info from the previous run to determine when to end.
if {$iter >= $test_iterations} {
 # Log a message.
 action_syslog priority info msg "EEM application_publish test end"
 if {$_cerrno != 0} {
 set result [format \
 "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
 }
 exit 0
}
set iter [expr $iter + 1]

Log a message.
set msg [format "EEM application_publish test iteration %s" $iter]
action_syslog priority info msg $msg
if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}

Do whatever processing that you want to measure here.

Cause the next iteration to run. Note that the iteration is passed to the
next operation as arg1.
event_publish sub_system 798 type 9999 arg1 $iter
if {$_cerrno != 0} {
 set result [format \
 "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
}
}

```

## event\_wait

Places the Tcl policy into a sleep state. When the Tcl policy receives a new signal announcing a new event, the policy is placed into a wake state and again returns to a sleep state. This loop continues. If **event\_wait** policy is invoked before **event\_completed** policy, an error results and the policy exits.

### Syntax

```
event_wait [refresh_vars]
```

### Arguments

|              |                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| refresh_vars | (Optional) Indicates whether built-in and environment variables should be updated (refreshed) from the EEM Policy Director during this event instance. |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

### Result String

None

### Set\_cerrno

No

### Sample Usage

The **event\_wait** event detector returns an array type value with a single element named **event\_state**. Event\_state is a value sent back from the EEM Server indicating whether or not an error has occurred in processing the event. An example of an error here would be if the user configured **event\_wait** before configuring **event\_completion** when handling the event instance.

The following sample output shows the use of both **event\_completion** and **event\_wait**Tcl commands:

```
::cisco::eem::event_register_syslog tag e1 occurs 1 pattern CLEAR maxrun 0
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set i 1
while {1 == 1} { # Start high performance policy loop
 array set arr_einfo [event_reqinfo]
 if {$_cerrno != 0} {
 set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
 error $result
 }
 action_syslog msg "event $i serviced" priority info
 if {$i == 5} {
 action_syslog msg "Exiting after servicing 5 events" priority info
 exit 0
 }
 incr i
 event_completion status 0
 array set _event_state_arr [event_wait refresh_vars 0]
 if {$_event_state_arr(event_state) != 0} {
 action_syslog msg "Exiting: failed event_state " \
 " $_event_state_arr(event_state)" priority info
 }
}
```

```

 exit 0
 }
}

```

Here is an example of the running configuration:

```

Device#

```

Also while an event has been serviced and is waiting for the next event to come in **show event manager policy active** command will display the following output:

```

Device#show event manager policy active
Key: p - Priority :L - Low, H - High, N - Normal, Z - Last
 s - Scheduling node :A - Active, S - Standby
default class - 1 script event
no. job id p s status time of event event type name
1 11 N A wait Mon Oct20 14:15:24 2008 syslog
high_perf_example.tcl

```

In the above example the status is wait. This indicates that the policy is waiting for the next event to come in.

## CHAPTER 107

# EEM Library Debug Command Extensions

- [cli\\_debug](#), on page 2271
- [smtp\\_debug](#), on page 2271

## cli\_debug

Prints a command-line interface (CLI) debug statement to syslog. This Tcl command extension is used to print a CLI debug statement to syslog if the **debug event manager tcl cli\_library** Cisco IOS CLI command is in effect.

### Syntax

```
cli_debug spec_string debug_string
```

### Arguments

|              |                                                                                       |
|--------------|---------------------------------------------------------------------------------------|
| spec_string  | (Mandatory) The spec_string argument is used to indicate the type of debug statement. |
| debug_string | (Mandatory) The debug_string argument is used to indicate the debugging text.         |

### Result String

None

### Set\_cerrno

No

## smtp\_debug

Prints a Simple Mail Transfer Protocol (SMTP) debug statement to syslog. This Tcl command extension prints a SMTP debug statement to syslog if the **debug event manager tcl smtp\_library** Cisco IOS command-line interface (CLI) command is in effect.

## Syntax

```
smtp_debug spec_string debug_string
```

## Arguments

|              |                                                                                       |
|--------------|---------------------------------------------------------------------------------------|
| spec_string  | (Mandatory) The spec_string argument is used to indicate the type of debug statement. |
| debug_string | (Mandatory) The debug_string argument is used to indicate the debugging text.         |

## Result String

None

## Set\_cerrno

No

## CHAPTER 108

# EEM Multiple Event Support Tcl Command Extensions

---

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

[type ?]

- A question mark ? represents a variable to be entered.
- Choices between arguments are represented by pipes, for example:

priority low|normal|high

---

**Note** For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

---

**Note** Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

---

- [attribute](#), on page 2273
- [correlate](#), on page 2274
- [trigger](#), on page 2275

## attribute

Specifies a complex event.

### Syntax

```
attribute tag ? [occurs ?]
```

**Arguments**

|               |                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tag</b>    | Specifies a tag using the <i>event-tag</i> argument that can be used with the <b>attribute</b> command to associate an event.                                                            |
| <b>occurs</b> | (Optional) Specifies the number of occurrences before an EEM event is triggered. If not specified, an EEM event is triggered on the first occurrence. The range is from 1 to 4294967295. |

**Result String**

None

**Set\_cerrno**

No

# correlate

Builds a single complex event and allows boolean logic to relate events and tracked objects.

**Syntax**

```
correlate event ? track ? [andnot | and | or] event ? track ?
```

**Arguments**

|               |                                                                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event</b>  | Specifies the event that can be used with the <b>trigger</b> command to support multiple event statements within an script.<br><br>If the event associated with the <i>event-tag</i> argument occurs for the number of times specified by the <b>trigger</b> command, the result is true. If not, the result is false. |
| <b>track</b>  | Specifies the event object number for tracking. The range is from 1 to 500.<br><br>If the tracked object is set, the result of the evaluation is true. If the tracked object is not set or is undefined, the result of the evaluation is false. This result is regardless of the state of the object.                  |
| <i>andnot</i> | (Optional) Specifies that if event 1 occurs the action is executed, and if event 2 and event 3 occur together the action is not executed.                                                                                                                                                                              |
| and           | (Optional) Specifies that if event 1 occurs the action is executed, and if event 2 and event 3 occur together the action is executed.<br><br><b>Note</b> When "and" is used to group events such as traps or syslog messages, then the default trigger occurrence window is three minutes.                             |
| or            | (Optional) Specifies that if event 1 occurs the action is executed, or else if event 2 and event 3 occur together the action is executed.                                                                                                                                                                              |

**Result String**

None

**Set \_cerno**

No

# trigger

Specifies the multiple event configuration ability of Embedded Event Manager (EEM) events. A multiple event is one that can involve one or more event occurrences, one or more tracked object states, and a time period for the event to occur. The events are raised based on the specified parameters.

**Syntax**

```
trigger [occurs ?] [period ?] [period-start ?] [delay ?]
```

**Arguments**

|                     |                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>occurs</b>       | (Optional) Specifies the number of times the total correlation occurs before an EEM event is raised. When a number is not specified, an EEM event is raised on the first occurrence. The range is from 1 to 4294967295.                                                                                                                                             |
| <b>period</b>       | (Optional) Time interval in seconds and optional milliseconds, during which the one or more occurrences must take place. This is specified in the format ssssssss[.mmm], where ssssssss must be an integer number representing seconds between 0 and 4294967295, inclusive and mmm represents milliseconds and must be an integer number between 0 to 999.          |
| <b>period-start</b> | (Optional) Specifies the start of an event correlation window. If not specified, event monitoring is enabled after the first CRON period occurs.                                                                                                                                                                                                                    |
| <b>delay</b>        | (Optional) Specifies the number of seconds and optional milliseconds after which an event will be raised if all the conditions are true (specified in the format ssssssss[.mmm], where ssssssss must be an integer number representing seconds between 0 and 4294967295, inclusive and mmm represents milliseconds and must be an integer number between 0 to 999). |

**Result String**

None

**Set \_cerno**

No

trigger

## CHAPTER 109

# EEM SMTP Library Command Extensions

All Simple Mail Transfer Protocol (SMTP) library command extensions belong to the `::cisco::lib` namespace.

To use this library, the user needs to provide an e-mail template file. The template file can include Tcl global variables so that the e-mail service and the e-mail text can be configured through the **event manager environment Cisco IOS** command-line interface (CLI) configuration command. There are commands in this library to substitute the global variables in the e-mail template file and to send the desired e-mail context with the To address, CC address, From address, and Subject line properly configured using the configured e-mail server.

### E-Mail Template

The e-mail template file has the following format:

---

**Note** Based on RFC 2554, the SMTP e-mail server name--Mailservername-- can be in any one of the following template formats: `username:password@host`, `username@host`, or `host`.

---

```
Mailservername:<space><the list of candidate SMTP server addresses>
From:<space><the e-mail address of sender>
To:<space><the list of e-mail addresses of recipients>
Cc:<space><the list of e-mail addresses that the e-mail will be copied to>
Sourceaddr:<space><the IP addresses of the recipients>
Subject:<subject line>
<a blank line>
<body>
```

---

**Note** Note that the template normally includes Tcl global variables for configuration.

---

In a Tcl policy, the port number can be specified by a "Port" line in the e-mail template. If port is not specified, the default port of 25 is used.

Below is a sample e-mail template file:

```
Mailservername: $_email_server
From: $_email_from
To: $_email_to
Cc: $_email_cc
```

```
Sourceaddr: $_email_ipaddr
Port: <port number>
Subject: From router $routername: Process terminated
process name: $process_name
subsystem: $sub_system
exit status: $exit_status
respawn count: $respawn_count
```

- [smtp\\_send\\_email, on page 2278](#)
- [smtp\\_subst, on page 2279](#)

## smtp\_send\_email

Given the text of an e-mail template file with all global variables already substituted, sends the e-mail out using Simple Mail Transfer Protocol (SMTP). The e-mail template specifies the candidate mail server addresses, To addresses, CC addresses, From address, subject line, and e-mail body.

---

**Note** A list of candidate e-mail servers can be provided so that the library will try to connect the servers on the list one by one until it can successfully connect to one of them.

---

### Syntax

```
smtp_send_email text
```

### Arguments

<code>text</code>	(Mandatory) The text of an e-mail template file with all global variables already substituted.
-------------------	------------------------------------------------------------------------------------------------

### Result String

None

### Set \_cerrno

- Wrong 1st line format--Mailservername:list of server names.
- Wrong 2nd line format--From:from-address.
- Wrong 3rd line format--To:list of to-addresses.
- Wrong 4th line format--CC:list of cc-addresses.
- Error connecting to mail server:--\$sock closed by remote server (where \$sock is the name of the socket opened to the mail server).
- Error connecting to mail server:--\$sock reply code is \$k instead of the service ready greeting (where \$sock is the name of the socket opened to the mail server; \$k is the reply code of \$sock).
- Error connecting to mail server:--cannot connect to all the candidate mail servers.
- Error disconnecting from mail server:--\$sock closed by remote server (where \$sock is the name of the socket opened to the mail server).

## Sample Scripts

After all needed global variables in the e-mail template are defined:

```
if [catch {smtp_subst [file join $tcl_library email_template_sm]} result] {
 puts stderr $result
 exit 1
}
if [catch {smtp_send_email $result} result] {
 puts stderr $result
 exit 1
}
```

# smtp\_subst

Given an e-mail template file `e-mail_template`, substitutes each global variable in the file by its user-defined value. Returns the text of the file after substitution.

## Syntax

```
smtp_subst e-mail_template
```

## Arguments

e-mail_template	(Mandatory) Name of an e-mail template file in which global variables need to be substituted by a user-defined value. An example filename could be <code>/disk0://example.template</code> which represents a file named <code>example.template</code> in a top-level directory on an ATA flash disk in slot 0.
-----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Result String

The text of the e-mail template file with all the global variables substituted.

## Set \_cerrno

- cannot open e-mail template file
- cannot close e-mail template file

smtp\_subst

## CHAPTER 110

# EEM System Information Tcl Command Extensions

---

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

[type ?]

- A question mark ? represents a variable to be entered.
- Choices between arguments are represented by pipes, for example:

priority low|normal|high

---

**Note** All EEM system information commands--`sys_reqinfo_XXX`--have the Set \_cerno section set to yes.

---

---

**Note** For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

---

**Note** Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

---

- [sys\\_reqinfo\\_cli\\_freq](#), on page 2282
- [sys\\_reqinfo\\_cli\\_history](#), on page 2283
- [sys\\_reqinfo\\_cpu\\_all](#), on page 2283
- [sys\\_reqinfo\\_crash\\_history](#), on page 2284
- [sys\\_reqinfo\\_mem\\_all](#), on page 2285
- [sys\\_reqinfo\\_proc](#), on page 2286
- [sys\\_reqinfo\\_proc\\_all](#), on page 2288
- [sys\\_reqinfo\\_routename](#), on page 2288
- [sys\\_reqinfo\\_snmp](#), on page 2289
- [sys\\_reqinfo\\_syslog\\_freq](#), on page 2290

- [sys\\_reqinfo\\_syslog\\_history](#), on page 2291

## sys\_reqinfo\_cli\_freq

Queries the frequency information of all command-line interface (CLI) events.

### Syntax

```
sys_reqinfo_cli_freq
```

### Arguments

None

### Result String

```
rec_list {{CLI frequency string 0},{CLI frequency str 1}, ...}
```

Where each CLI frequency string is:

```
time_sec %ld time_msec %ld match_count %u raise_count %u occurs %u period_sec %ld period_msec %ld
pattern {%s}
```

rec_list	Marks the start of the CLI event frequency list.
time_sec time_msec	Last time when this CLI event was raised.
match count	Number of times that a CLI command matches the pattern specified by this CLI event specification.
raise_count	Number of times that this CLI event was raised. The following fields are information about the CLI event specification: <ul style="list-style-type: none"> <li>• sync--A "yes" means that event publish should be performed synchronously. The event detector will be notified when the Event Manager Server has completed publishing the event. The Event Manager Server will return a code that indicates whether or not the CLI command should be executed.</li> <li>• skip--A "yes" means that the CLI command should not be executed if the sync flag is not set.</li> </ul>
occurs	Number of occurrences before an event is raised; if this argument is not specified, an event is raised on the first occurrence.
period_sec period_msec	Number of occurrences must occur within this number of POSIX timer units in order to raise event; if this argument is not specified, it does not apply.
pattern	Regular expression used to perform CLI command pattern matching.

### Set\_cerrno

Yes

## sys\_reqinfo\_cli\_history

Queries the history of command-line interface (CLI) commands.

### Syntax

```
sys_reqinfo_cli_history
```

### Arguments

None

### Result String

```
rec_list {{CLI history string 0}, {CLI history str 1},...}
```

Where each CLI history string is:

```
time_sec %ld time_msec %ld cmd {%s}
```

rec_list	Marks the start of the CLI command history list.
time_sec time_msec	Time when the CLI command was run.
cmd	Text of the CLI command.

### Set\_cerrno

Yes

## sys\_reqinfo\_cpu\_all

Queries the CPU utilization of the top processes (both POSIX processes and IOS processes) during a specified time period and in a specified order. This Tcl command extension is supported only in Software Modularity images.

### Syntax

```
sys_reqinfo_cpu_all order cpu_used [sec ?] [msec ?] [num ?]
```

### Arguments

order	(Mandatory) Order used for sorting the CPU utilization of processes.
cpu_used	(Mandatory) Specifies that the average CPU utilization, for the specified time window, will be sorted in descending order.

sec msec	(Optional) The time period, in seconds and milliseconds, during which the average CPU utilization is calculated. Must be integers in the range from 0 to 4294967295. If not specified, or if both sec and msec are specified as 0, the most recent CPU sample is used.
num	(Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.

**Result String**

```
rec_list {{process CPU info string 0},{process CPU info string 1}, ...}
```

Where each process CPU info string is:

```
pid %u name {%s} cpu_used %u
```

rec_list	Marks the start of the process CPU information list.
pid	Process ID.
name	Process name.
cpu_used	Specifies that if sec and msec are specified with a number greater than zero, the average percentage is calculated from the process CPU utilization during the specified time period. If sec and msec are both zero or not specified, the average percentage is calculated from the process CPU utilization in the latest sample.

**Set\_cerrno**

Yes

## sys\_reqinfo\_crash\_history

Queries the crash information of all processes that have ever crashed. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```
sys_reqinfo_crash_history
```

**Arguments**

None

**Result String**

```
rec_list {{crash info string 0},{crash info string 1}, ...}
```

Where each crash info string is:

```
job_id %u name {%s} respawn_count %u fail_count %u dump_count %u
inst_id %d exit_status 0x%x exit_type %d proc_state {%s} component_id 0x%x
crash_time_sec %ld crash_time_msec %ld
```

job_id	System manager assigned job ID for the process. An integer between 1 and 4294967295, inclusive.
name	Process name.
respawn_count	Total number of restarts for the process.
fail_count	Number of restart attempts of the process. This count is reset to zero when the process is successfully restarted.
dump_count	Number of core dumps performed.
inst_id	Process instance ID.
exit_status	Last exit status of the process.
exit_type	Last exit type.
proc_state	Sysmgr process states. One of the following: error, forced_stop, hold, init, ready_to_run, run, run_rnode, stop, waitEOltimer, wait_rnode, wait_spawntimer, wait_tpl.
component_id	Version manager assigned component ID for the component to which the process belongs.
crash_time_sec crash_time_msec	Seconds and milliseconds since January 1, 1970, which represent the last time the process crashed.

**Set \_cerrno**

Yes

## sys\_reqinfo\_mem\_all

Queries the memory usage of the top processes (both POSIX and IOS) during a specified time period and in a specified order. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```
sys_reqinfo_mem_all order allocates|increase|used [sec ?] [msec ?] [num ?]
```

**Arguments**

order	(Mandatory) Order used for sorting the memory usage of processes.
allocates	(Mandatory) Specifies that the memory usage is sorted by the number of process allocations during the specified time window, and in descending order.
increase	(Mandatory) Specifies that the memory usage is sorted by the percentage of process memory increase during the specified time window, and in descending order.
used	(Mandatory) Specifies that the memory usage is sorted by the current memory used by the process.

sec msec	(Optional) The time period, in seconds and milliseconds, during which the process memory usage is calculated. Must be integers in the range from 0 to 4294967295. If both sec and msec are specified and are nonzero, the number of allocations is the difference between the number of allocations in the oldest and latest samples collected in the time period. The percentage is calculated as the percentage difference between the memory used in the oldest and latest samples collected in the time period. If not specified, or if both sec and msec are specified as 0, the first sample ever collected is used as the oldest sample; that is, the time period is set to be the time from startup until the current moment.
num	(Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.

### Result String

```
rec_list {{process mem info string 0},{process mem info string 1}, ...}
```

Where each process mem info string is:

```
pid %u name {%s} delta_allocs %d initial_alloc %u current_alloc %u percent_increase %d
```

rec_list	Marks the start of the process memory usage information list.
pid	Process ID.
name	Process name.
delta_allocs	Specifies the difference between the number of allocations in the oldest and latest samples collected in the time period.
initial_alloc	Specifies the amount of memory, in kilobytes, used by the process at the start of the time period.
current_alloc	Specifies the amount of memory, in kilobytes, currently used by the process.
percent_increase	Specifies the percentage difference between the memory used in the oldest and latest samples collected in the time period. The percentage difference can be expressed as $\text{current\_alloc} - \text{initial\_alloc} \times 100$ and divided by $\text{initial\_alloc}$ .

### Set\_cerrno

Yes

## sys\_reqinfo\_proc

Queries the information about a single POSIX process. This Tcl command extension is supported only in Software Modularity images.

### Syntax

```
sys_reqinfo_proc job_id ?
```

**Arguments**

job_id	(Mandatory) System manager assigned job ID for the process. Must be an integer between 1 and 4294967295, inclusive.
--------	---------------------------------------------------------------------------------------------------------------------

**Result String**

```
job_id %u component_id 0x%x name {%s} helper_name {%s} helper_path {%s} path {%s}
node_name {%s} is_respawn %u is_mandatory %u is_hold %u dump_option %d
max_dump_count %u respawn_count %u fail_count %u dump_count %u
last_respawn_sec %ld last_respawn_msec %ld inst_id %u proc_state %s
level %d exit_status 0x%x exit_type %d
```

job_id	System manager assigned job ID for the process. An integer between 1 and 4294967295, inclusive.
component_id	Version manager assigned component ID for the component to which the process belongs.
name	Process name.
helper_name	Helper process name.
helper_path	Executable path of the helper process.
path	Executable path of the process.
node_name	System manager assigned node name for the node to which the process belongs.
is_respawn	Flag that specifies that the process can be respawned.
is_mandatory	Flag that specifies that the process must be alive.
is_hold	Flag that specifies that the process is spawned until called by the API.
dump_option	Core dumping options.
max_dump_count	Maximum number of core dumping permitted.
respawn_count	Total number of restarts for the process.
fail_count	Number of restart attempts of the process. This count is reset to zero when the process is successfully restarted.
dump_count	Number of core dumps performed.
last_respawn_sec last_respawn_msec	Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the last time the process was started.
inst_id	Process instance ID.
proc_state	Sysmgr process states. One of the following: error, forced_stop, hold, init, ready_to_run, run, run_rnode, stop, waitEOltimer, wait_rnode, wait_spawntimer, wait_tpl.

level	Process run level.
exit_status	Last exit status of the process.
exit_type	Last exit type.

**Set\_cerrno**

Yes

## sys\_reqinfo\_proc\_all

Queries the information of all POSIX processes. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```
sys_reqinfo_proc_all
```

**Arguments**

None

**Result String**

```
rec_list {{process info string 0}, {process info string 1},...}
```

Where each process info string is the same as the result string of the **sysreq\_info\_proc** Tcl command extension.

**Set\_cerrno**

Yes

## sys\_reqinfo\_routename

Queries the device name.

**Syntax**

```
sys_reqinfo_routename
```

**Arguments**

None

**Result String**

```
routename %s
```

Where routename is the name of the device.

### Set\_cerrno

Yes

## sys\_reqinfo\_snmp

Queries the value of the entity specified by a Simple Network Management Protocol (SNMP) object ID.

### Syntax

```
sys_reqinfo_snmp oid ? get_type exact|next
```

### Arguments

oid	(Mandatory) SNMP OID in dot notation (for example, 1.3.6.1.2.1.2.1.0).
get_type	(Mandatory) Type of SNMP get operation that needs to be applied to the specified oid. If the get_type is "exact," the value of the specified oid is retrieved; if the get_type is "next," the value of the lexicographical successor to the specified oid is retrieved.

### Result String

```
oid {%s} value {%s}
```

oid	SNMP OID.
value	Value string of the associated SNMP data element.

### Set\_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 37) FH_ENOSNMPDATA (can't retrieve data from SNMP)
```

This error means that there was no data for the SNMP object type.

```
(_cerr_sub_err = 51) FH_ESTATSTYP (invalid statistics data type)
```

This error means that the SNMP statistics data type was invalid.

```
(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

## sys\_reqinfo\_syslog\_freq

Queries the frequency information of all syslog events.

### Syntax

```
sys_reqinfo_syslog_freq
```

### Arguments

None

### Result String

```
rec_list {{event frequency string 0}, {log freq str 1}, ...}
```

Where each event frequency string is:

```
time_sec %ld time_msec %ld match_count %u raise_count %u occurs %u
period_sec %ld period_msec %ld pattern {%s}
```

time_sec time_msec	Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the time the last event was raised.
match_count	Number of times that a syslog message matches the pattern specified by this syslog event specification since event registration.
raise_count	Number of times that this syslog event was raised.
occurs	Number of occurrences needed in order to raise the event; if not specified, the event is raised on the first occurrence.
period_sec period_msec	Number of occurrences must occur within this number of POSIX timer units in order to raise the event; if not specified, the period check does not apply.
pattern	Regular expression used to perform syslog message pattern matching.

### Set\_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
```

This error means that an internal EEM request for memory failed.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 45) FH_ESEQNUM (sequence or workset number out of sync)
```

This error means that the event detector sequence or workset number was invalid.

```
(_cerr_sub_err = 46) FH_EREGEMPTY (registration list is empty)
```

This error means that the event detector registration list was empty.

```
(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

## sys\_reqinfo\_syslog\_history

Queries the history of the specified syslog message.

### Syntax

```
sys_reqinfo_syslog_history
```

### Arguments

None

### Result String

```
rec_list {{log hist string 0}, {log hist str 1}, ...}
```

Where each log hist string is:

```
time_sec %ld time_msec %ld msg {%s}
```

time_sec time_msec	Seconds and milliseconds since January 1, 1970, which represent the time the message was logged.
msg	Syslog message.

### Set\_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 44) FH_EHISTEMPTY (history list is empty)
```

This error means that the history list was empty.

```
(_cerr_sub_err = 45) FH_ESEQNUM (sequence or workset number out of sync)
```

This error means that the event detector sequence or workset number was invalid.

```
(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

## CHAPTER 111

# EEM Utility Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

[type ?]

- A question mark ? represents a variable to be entered.
- Choices between arguments are represented by pipes, for example:

priority low|normal|high

---

**Note** For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

---

**Note** Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

---

- [appl\\_read](#), on page 2294
- [appl\\_reqinfo](#), on page 2294
- [appl\\_setinfo](#), on page 2295
- [counter\\_modify](#), on page 2296
- [description](#), on page 2297
- [fts\\_get\\_stamp](#), on page 2298
- [register\\_counter](#), on page 2299
- [register\\_timer](#), on page 2300
- [timer\\_arm](#), on page 2302
- [timer\\_cancel](#), on page 2303
- [unregister\\_counter](#), on page 2304

## appl\_read

Reads Embedded Event Manager (EEM) application volatile data. This Tcl command extension provides support for reading EEM application volatile data. EEM application volatile data can be published by a Cisco software process that uses the EEM application publish API. EEM application volatile data cannot be published by an EEM policy.

---

**Note** Currently there are no Cisco software processes that publish application volatile data.

---

### Syntax

```
appl_read name ? length ?
```

### Arguments

name	(Mandatory) Name of the application published string data.
length	(Mandatory) Length of the string data to read. Must be an integer number between 1 and 4294967295, inclusive.

### Result String

```
data %s
```

Where data is the application published string data to be read.

### Set\_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 7) FH_ENOSUCHKEY (could not find key)
```

This error means that the application event detector info key or other ID was not found.

```
(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
```

This error means that an internal EEM request for memory failed.

## appl\_reqinfo

Retrieves previously saved information from the Embedded Event Manager (EEM). This Tcl command extension provides support for retrieving information from EEM that has been previously saved with a unique

key, which must be specified in order to retrieve the information. Note that retrieving the information deletes it from EEM. It must be resaved if it is to be retrieved again.

### Syntax

```
appl_reqinfo key ?
```

### Arguments

key	(Mandatory) The string key of the data.
-----	-----------------------------------------

### Result String

```
data %s
```

Where data is the application string data to be retrieved.

### Set \_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 7) FH_ENOSUCHKEY (could not find key)
```

This error means that the application event detector info key or other ID was not found.

## appl\_setinfo

Saves information in the Embedded Event Manager (EEM). This Tcl command extension provides support for saving information in the Embedded Event Manager that can be retrieved later by the same policy or by another policy. A unique key must be specified. This key allows the information to be retrieved later.

### Syntax

```
appl_setinfo key ? data ?
```

### Arguments

key	(Mandatory) The string key of the data.
data	(Mandatory) The application string data to save.

### Result String

None

**Set\_cerrno**

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 8) FH_EDUPLICATEKEY (duplicate appl info key)
```

This error means that the application event detector info key or other ID was a duplicate.

```
(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
```

This error means that an internal EEM request for memory failed.

```
(_cerr_sub_err = 34) FH_EMAXLEN (maximum length exceeded)
```

This error means that the object length or number exceeded the maximum.

```
(_cerr_sub_err = 43) FH_EBADLENGTH (bad API length)
```

This error means that the API message length was invalid.

## counter\_modify

Modifies a counter value.

**Syntax**

```
counter_modify event_id ? val ? op nop|set|inc|dec
```

**Arguments**

event_id	(Mandatory) The counter event ID returned by the <b>register_counter</b> Tcl command extension. Must be an integer between 0 and 4294967295, inclusive.
val	(Mandatory) <b>Note</b> Mandatory except when the op nop argument value combination is specified. <ul style="list-style-type: none"> <li>• If op is set, this argument represents the counter value that is to be set.</li> <li>• If op is inc, this argument is the value by which to increment the counter.</li> <li>• If op is dec, this argument is the value by which to decrement the counter.</li> </ul>

op	<p>(Mandatory)</p> <ul style="list-style-type: none"> <li>• nop--Retrieves the current counter value.</li> <li>• set--Sets the counter value to the given value.</li> <li>• inc--Increments the counter value by the given value.</li> <li>• dec--Decrements the counter value by the given value.</li> </ul>
----	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Result String

```
val_remain %d
```

Where val\_remain is the current value of the counter.

### Set\_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)
```

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 30) FH_ECTBADOPER (bad counter threshold operator)
```

This error means that the counter event detector set or modify operator was invalid.

## description

Provides a brief description of the registered policy.

### Syntax

```
description ?
```

### Arguments

line	(Optional) Brief description of the policy consisting of 1 to 240 characters.
------	-------------------------------------------------------------------------------

**Result String**

None

**Set\_cerrno**

Yes

**Sample Usage**

The description statement is entered by the author of the policy. It can appear before or after any event registration statement in Tcl. The policy can have only one description.

---

**Note** Registration of a policy with more than one description statement will fail.

---

The following example shows how a brief description is provided for the **event\_register\_syslog** policy:

```
::cisco::eem::description "This Tcl command looks for the word count in syslog messages."
::cisco::eem::event_register_syslog tag 1 ...
::cisco::eem::event_register_snmp_object tag 2 ...
::cisco::eem::trigger {
 ::cisco::eem::correlate event 1 and event 2
 ::cisco::eem::attribute tag 1 occurs 1
 ::cisco::eem::attribute tag 2 occurs 1
}
```

## fts\_get\_stamp

Returns the time period elapsed since the last software boot. Use this Tcl command extension to return the number of nanoseconds since boot in an array "nsec nnnn" where nnnn is the number of nanoseconds.

**Syntax**

```
fts_get_stamp
```

**Arguments**

None

**Result String**

```
nsec %d
```

Where nsec is the number of nanoseconds since boot.

**Set\_cerrno**

No

# register\_counter

Registers a counter and returns a counter event ID. This Tcl command extension is used by a counter publisher to perform this registration before using the event ID to manipulate the counter.

## Syntax

```
register_counter name ?
```

## Arguments

<b>name</b>	(Mandatory) The name of the counter to be manipulated.
-------------	--------------------------------------------------------

## Result String

```
event_id %d
event_spec_id %d
```

Where `event_id` is the counter event ID for the specified counter; it can be used to manipulate the counter by the **unregister\_counter** or **counter\_modify** Tcl command extensions. The `event_spec_id` argument is the event specification ID for the specified counter.

## Set\_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX `errno` value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 4) FH_EINITONCE (Init() is not yet done, or done twice.)
```

This error means that the request to register the specific event was made before the EEM event detector had completed its initialization.

```
(_cerr_sub_err = 6) FH_EBADEVENTTYPE (unknown EEM event type)
```

This error means that the event type specified in the internal event specification was invalid.

```
(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
```

This error means that an internal EEM request for memory failed.

```
(_cerr_sub_err = 10) FH_ECORRUPT (internal EEM API context is corrupt)
```

This error means that the internal EEM API context structure is corrupt.

```
(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)
```

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 12) FH_ENOSUCHEID (unknown event ID)
```

This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 16) FH_EBADFMPPTR (bad ptr to fh_p data structure)
```

This error means that the context pointer that is used with each EEM API call is incorrect.

```
(_cerr_sub_err = 17) FH_EBADADDRESS (bad API control block address)
```

This error means that a control block address that was passed in the EEM API was incorrect.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 25) FH_ESUBSEXCEED (number of subscribers exceeded)
```

This error means that the number of timer or counter subscribers exceeded the maximum.

```
(_cerr_sub_err = 26) FH_ESUBSIDXINV (invalid subscriber index)
```

This error means that the subscriber index was invalid.

```
(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

```
(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)
```

This error means that the EEM event detector that handles this request is not available.

## register\_timer

Registers a timer and returns a timer event ID. This Tcl command extension is used by a timer publisher to perform this registration before using the event ID to manipulate the timer if it does not use the **event\_register\_timer** command extension to register as a publisher and subscriber.

### Syntax

```
register_timer watchdog|countdown|absolute|cron name ?
```

### Arguments

name	(Mandatory) The name of the timer to be manipulated.
------	------------------------------------------------------

### Result String

```
event_id %u
```

Where `event_id` is the timer event ID for the specified timer (can be used to manipulate the timer by the `timer_arm` or `timer_cancel` command extensions).

### Set `_cerrno`

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX `errno` value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 4) FH_EINITONCE (Init() is not yet done, or done twice.)
```

This error means that the request to register the specific event was made before the EEM event detector had completed its initialization.

```
(_cerr_sub_err = 6) FH_EBADEVENTTYPE (unknown EEM event type)
```

This error means that the event type specified in the internal event specification was invalid.

```
(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
```

This error means that an internal EEM request for memory failed.

```
(_cerr_sub_err = 10) FH_ECORRUPT (internal EEM API context is corrupt)
```

This error means that the internal EEM API context structure is corrupt.

```
(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)
```

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 16) FH_EBADFMPPTR (bad ptr to fh_p data structure)
```

This error means that the context pointer that is used with each EEM API call is incorrect.

```
(_cerr_sub_err = 17) FH_EBADADDRESS (bad API control block address)
```

This error means that a control block address that was passed in the EEM API was incorrect.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 25) FH_ESUBSEXCEED (number of subscribers exceeded)
```

This error means that the number of timer or counter subscribers exceeded the maximum.

```
(_cerr_sub_err = 26) FH_ESUBSIDXINV (invalid subscriber index)
```

This error means that the subscriber index was invalid.

```
(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

```
(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)
```

This error means that the EEM event detector that handles this request is not available.

## timer\_arm

Arms a timer. The type could be CRON, watchdog, countdown, or absolute.

### Syntax

```
timer_arm event_id ? cron_entry ?|time ?
```

### Arguments

event_id	(Mandatory) The timer event ID returned by the <b>register_timer</b> command extension. Must be an integer between 0 and 4294967295, inclusive.
cron_entry	(Mandatory) Must exist if the timer type is CRON. Must not exist for other types of timer. CRON timer specification uses the format of the CRON table entry.
time	(Mandatory) Must exist if the timer type is not CRON. Must not exist if the timer type is CRON. For watchdog and countdown timers, the number of seconds and milliseconds until the timer expires; for an absolute timer, the calendar time of the expiration time (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). An absolute expiration date is the number of seconds and milliseconds since January 1, 1970. If the date specified has already passed, the timer expires immediately.

### Result String

```
sec_remain %ld msec_remain %ld
```

Where sec\_remain and msec\_remain are the remaining time before the next expiration of the timer.

---

**Note** A value of 0 will be returned for the sec\_remain and msec\_remain arguments if the timer type is CRON.

---

### Set\_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 6) FH_EBADEVENTTYPE (unknown EEM event type)
```

This error means that the event type specified in the internal event specification was invalid.

```
(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
```

This error means that an internal EEM request for memory failed.

```
(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)
```

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 12) FH_ENOSUCHEID (unknown event ID)
```

This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 27) FH_ETMDELAYZR (zero delay time)
```

This error means that the time specified to arm a timer was zero.

```
(_cerr_sub_err = 42) FH_ENOTREGISTERED (request for event spec that is unregistered)
```

This error means that the event was not registered.

```
(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

```
(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)
```

This error means that the EEM event detector that handles this request is not available.

## timer\_cancel

Cancels a timer.

### Syntax

```
timer_cancel event_id ?
```

### Arguments

event_id	(Mandatory) The timer event ID returned by the <b>register_timer</b> command extension. Must be an integer between 0 and 4294967295, inclusive.
----------	-------------------------------------------------------------------------------------------------------------------------------------------------

**Result String**

```
sec_remain %ld msec_remain %ld
```

Where `sec_remain` and `msec_remain` are the remaining time before the next expiration of the timer.

---

**Note** A value of 0 will be returned for `sec_remain` and `msec_remain` if the timer type is CRON .

---

**Set\_cerrno**

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX `errno` value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 6) FH_EBADEVENTTYPE (unknown EEM event type)
```

This error means that the event type specified in the internal event specification was invalid.

```
(_cerr_sub_err = 7) FH_ENOSUCHKEY (could not find key)
```

This error means that the application event detector info key or other ID was not found.

```
(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)
```

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 12) FH_ENOSUCHEID (unknown event ID)
```

This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

```
(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)
```

This error means that the EEM event detector that handles this request is not available.

## unregister\_counter

Unregisters a counter. This Tcl command extension is used by a counter publisher to unregister a counter that was previously registered with the **register\_counter** Tcl command extension.

## Syntax

```
unregister_counter event_id ? event_spec_id ?
```

## Arguments

event_id	(Mandatory) Counter event ID returned by the <b>register_counter</b> command extension. Must be an integer between 0 and 4294967295, inclusive.
event_spec_id	(Mandatory) Counter event specification ID for the specified counter returned by the <b>register_counter</b> command extension. Must be an integer between 0 and 4294967295, inclusive.

## Result String

None

## Set\_cerrno

Yes

```
(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
```

This error means that an internal EEM request for memory failed.

```
(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)
```

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 26) FH_ESUBSIDXINV (invalid subscriber index)
```

This error means that the subscriber index was invalid.

```
(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

```
(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)
```

This error means that the EEM event detector that handles this request is not available.

■ unregister\_counter

- [Copying an Image File from One Stack Member to Another, on page 2348](#)

## Working with the Flash File System

### Information About the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software bundles and configuration files. The default flash file system on the device is named flash:.

As viewed from the active device, or any stack member, flash: refers to the local flash device, which is the device attached to the same device on which the file system is being viewed. In a device stack, each of the flash devices from the various stack members can be viewed from the active device. The names of these flash file systems include the corresponding device member numbers. For example, flash-3:, as viewed from the active device, refers to the same file system as does flash: on stack member 3. Use the **show file systems** privileged EXEC command to list all file systems, including the flash file systems in the device stack.

Only one user at a time can manage the software bundles and configuration files for a device stack .

### Displaying Available File Systems

To display the available file systems on your device, use the **show file systems** privileged EXEC command as shown in this example for a standalone device:

```
Device# show file systems
```

## Displaying Available File Systems

```

File Systems:
 Size(b) Free(b) Type Flags Prefixes
* 15998976 5135872 flash rw flash:
 - - opaque rw bs:
 - - opaque rw vb:
 524288 520138 nvram rw nvram:
 - - network rw tftp:
 - - opaque rw null:
 - - opaque rw system:
 - - opaque ro xmodem:
 - - opaque ro ymodem:

```

This example shows a device stack. In this example, the active device is stack member 1; the file system on stack member 2 is displayed as flash-2; the file system on stack member 3 is displayed as flash-3; and so on up to stack member 8, displayed as flash-8: for a 8-member stack. The example also shows the crashinfo directories and a USB flash drive plugged into the active device:

```

Device# show file systems
File Systems:

Table 222: show file systems Field Descriptions

Field	Value
Size(b)	Amount of memory in the file system in bytes.
Free(b)	Amount of free memory in the file system in bytes.
Type	<p>Type of file system.</p> <p><b>disk</b>—The file system is for a flash memory device, USB flash, and crashinfo file.</p> <p><b>network</b>—The file system for network devices; for example, an FTP server or and HTTP server.</p> <p><b>nvr</b>am—The file system is for a NVRAM device.</p> <p><b>opaque</b>—The file system is a locally generated pseudo file system (for example, the system) or a download interface, such as brimux.</p> <p><b>unknown</b>—The file system is an unknown type.</p>
Flags	<p>Permission for file system.</p> <p><b>ro</b>—read-only.</p> <p><b>rw</b>—read/write.</p> <p><b>wo</b>—write-only.</p>

Field	Value
Prefixes	<p>Alias for file system.</p> <p><b>crashinfo:</b>—Crashinfo file.</p> <p><b>flash:</b>—Flash file system.</p> <p><b>ftp:</b>—FTP server.</p> <p><b>http:</b>—HTTP server.</p> <p><b>https:</b>—Secure HTTP server.</p> <p><b>nvr:</b>—NVRAM.</p> <p><b>null:</b>—Null destination for copies. You can copy a remote file to null to find its size.</p> <p><b>r:</b>—Remote Copy Protocol (RCP) server.</p> <p><b>s:</b>—Session Control Protocol (SCP) server.</p> <p><b>system:</b>—Contains the system memory, including the running configuration.</p> <p><b>t:</b>—TFTP network server.</p> <p><b>usbflash0:</b>—USB flash memory.</p> <p><b>x:</b>—Obtain the file from a network machine by using the Xmodem protocol.</p> <p><b>y:</b>—Obtain the file from a network machine by using the Ymodem protocol.</p>

## Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the **cd** *filesystem:* privileged EXEC command. You can set the default file system to omit the *filesystem:* argument from related commands. For example, for all privileged EXEC commands that have the optional *filesystem:* argument, the system uses the file system specified by the **cd** command.

By default, the default file system is *flash:*.

You can display the current default file system as specified by the **cd** command by using the **pwd** privileged EXEC command.

## Displaying Information About Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command. To display information about files on a file system, use one of the privileged EXEC commands listed in the following table.

Table 223: Commands for Displaying Information About Files

Command	Description
<b>dir</b> [/all] [filesystem:filename]	Displays a list of files on a file system.
<b>show file systems</b>	Displays more information about each of the files on a file system.
<b>show file information</b> file-url	Displays information about a specific file.
<b>show file descriptors</b>	Displays a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.

## Changing Directories and Displaying the Working Directory

Follow these steps to change directories and to display the working directory:

### SUMMARY STEPS

1. **enable**
2. **dir** *filesystem:*
3. **cd** *directory\_name*
4. **pwd**
5. **cd**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>dir</b> <i>filesystem:</i> <b>Example:</b>  Device# <b>dir</b> flash:	Displays the directories on the specified file system. For <i>filesystem:</i> , use flash: for the system board flash device.
<b>Step 3</b>	<b>cd</b> <i>directory_name</i> <b>Example:</b>  Device# <b>cd</b> new_configs	Navigates to the specified directory.  The command example shows how to navigate to the directory named <i>new_configs</i> .
<b>Step 4</b>	<b>pwd</b> <b>Example:</b>	Displays the working directory.

	Command or Action	Purpose
	Device# pwd	
<b>Step 5</b>	<b>cd</b> <b>Example:</b> Device# cd	Navigates to the default directory.

## Creating Directories

Beginning in privileged EXEC mode, follow these steps to create a directory:

### SUMMARY STEPS

1. **dir** *filesystem:*
2. **mkdir** *directory\_name*
3. **dir** *filesystem:*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>dir</b> <i>filesystem:</i> <b>Example:</b> Device# dir flash:	Displays the directories on the specified file system. For <i>filesystem:</i> , use <b>flash:</b> for the system board flash device.
<b>Step 2</b>	<b>mkdir</b> <i>directory_name</i> <b>Example:</b> Device# mkdir new_configs	Creates a new directory. Directory names are case sensitive and are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, slashes, quotes, semicolons, or colons.
<b>Step 3</b>	<b>dir</b> <i>filesystem:</i> <b>Example:</b> Device# dir flash:	Verifies your entry.

## Removing Directories

To remove a directory with all its files and subdirectories, use the **delete /force /recursive** *filesystem:/file-url* privileged EXEC command.

Use the **/recursive** keyword to delete the named directory and all subdirectories and the files contained in it. Use the **/force** keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process.

For *filesystem*, use **flash:** for the system board flash device. For *file-url*, enter the name of the directory to be deleted. All of the files in the directory and the directory are removed.

**Caution** When directories are deleted, their contents cannot be recovered.

## Copying Files

To copy a file from a source to a destination, use the **copy source-url destination-url** privileged EXEC command. For the source and destination URLs, you can use **running-config** and **startup-config** keyword shortcuts. For example, the **copy running-config startup-config** command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (**xmodem:**, **ymodem:**) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include ftp:, rcp:, and tftp: and have these syntaxes:

- FTP—ftp:[[/username [:password]@location]/directory]/filename
- RCP—rcp:[[/username@location]/directory]/filename
- TFTP—tftp:[[/location]/directory]/filename

Local writable file systems include flash:

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the **copy flash: flash:** command is invalid)

## Copying Files from One Device in a Stack to Another Device in the Same Stack

To copy a file from one device in a stack to another device in the same stack, use the **flash-X:** notation, where **X** is the device number.

To view all devices in a stack, use the **show switch** command in privileged EXEC mode, as in the following example of a 9-member device stack:

```
Switch#show switch
Switch/Stack Mac Address : 046c.9d01.3b80 - Local Mac Address
Mac persistency wait time: 4 mins
```

Switch#	Role	Mac Address	Priority	H/W Version	Current State
*1	Active	046c.9d01.3b80	15	P4B	Ready
2	Standby	046c.9d01.0f80	13	P3C	Ready
3	Member	046c.9d01.1180	11	P4B	Ready
4	Member	046c.9d01.0e80	9	P3C	Ready
5	Member	046c.9d01.4d00	7	P3C	Ready
6	Member	046c.9d01.2800	5	P3C	Ready
7	Member	046c.9d01.6e80	3	P4B	Ready
8	Member	046c.9d01.8180	1	P4B	Ready

To view all file systems available to copy on a specific device, use the **copy** command as in the following example of a 5-member stack:

This example shows how to copy a config file stored in the flash partition of device 2 to the flash partition of device 4. It assumes that device 2 and device 4 are in the same stack.

```
Device# copy flash-2:config.txt flash-4:config.txt
```

## Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the **delete** [**/force**] [**/recursive**] [*filesystem:*]/*file-url* privileged EXEC command.

Use the **/recursive** keyword for deleting a directory and all subdirectories and the files contained in it. Use the **/force** keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the **/force** and **/recursive** keywords for deleting old software images that were installed by using the **archive download-sw** command but are no longer needed.

If you omit the *filesystem:* option, the device uses the default device specified by the **cd** command. For *file-url*, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

---

**Caution** When files are deleted, their contents cannot be recovered.

---

This example shows how to delete the file *myconfig* from the default flash memory device:

```
Device# delete myconfig
```

## Creating, Displaying and Extracting Files

You can create a file and write files into it, list the files in a file, and extract the files from a file as described in the next sections.

Beginning in privileged EXEC mode, follow these steps to create a file, display the contents, and extract it:

### SUMMARY STEPS

1. **archive tar /create** *destination-url* **flash:** /*file-url*
2. **archive tar /table** *source-url*
3. **archive tar /xtract** *source-url* **flash:** /*file-url* [*dir/file...*]
4. **more** [ /*ascii* | /*binary* | /*ebcdic* ] /*file-url*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>archive tar /create</b> <i>destination-url</i> <b>flash:</b> / <i>file-url</i> Example:	Creates a file and adds files to it.

	Command or Action	Purpose
	<pre>device# archive tar /create tftp:172.20.10.30/saved. flash:/new-configs</pre>	<p>For destination-url, specify the destination URL alias for the local or network file system and the name of the file to create:</p> <ul style="list-style-type: none"> <li>Local flash file system syntax: <ul style="list-style-type: none"> <li><b>flash:</b></li> </ul> </li> <li>FTP syntax: <ul style="list-style-type: none"> <li><b>ftp:</b>[[//username[:password]@location]/directory]/-filename.</li> </ul> </li> <li>RCP syntax: <ul style="list-style-type: none"> <li><b>rcp:</b>[[//username@location]/directory]/-filename.</li> </ul> </li> <li>TFTP syntax: <ul style="list-style-type: none"> <li><b>tftp:</b>[[//location]/directory]/-filename.</li> </ul> </li> </ul> <p>For <b>flash:/file-url</b>, specify the location on the local flash file system in which the new file is created. You can also specify an optional list of files or directories within the source directory to add to the new file. If none are specified, all files and directories at this level are written to the newly created file.</p>
Step 2	<p><b>archive tar /table source-url</b></p> <p><b>Example:</b></p> <pre>device# archive tar /table flash: /new_configs</pre>	<p>Displays the contents of a file.</p> <p>For <i>source-url</i>, specify the source URL alias for the local or network file system. The <i>-filename</i> is the file to display. These options are supported:</p> <ul style="list-style-type: none"> <li>Local flash file system syntax: <ul style="list-style-type: none"> <li><b>flash:</b></li> </ul> </li> <li>FTP syntax: <ul style="list-style-type: none"> <li><b>ftp:</b>[[//username[:password]@location]/directory]/-filename.</li> </ul> </li> <li>RCP syntax: <ul style="list-style-type: none"> <li><b>rcp:</b>[[//username@location]/directory]/-filename.</li> </ul> </li> <li>TFTP syntax: <ul style="list-style-type: none"> <li><b>tftp:</b>[[//location]/directory]/-filename.</li> </ul> </li> </ul> <p>You can also limit the file displays by specifying a list of files or directories after the file. Only those files appear. If none are specified, all files and directories appear.</p>
Step 3	<p><b>archive tar /xtract source-url flash:/file-url [dir/file...]</b></p> <p><b>Example:</b></p> <pre>device# archive tar /xtract tftp:/172.20.10.30/saved. flash:/new-configs</pre>	<p>Extracts a file into a directory on the flash file system.</p> <p>For <i>source-url</i>, specify the source URL alias for the local file system. The <i>-filename</i> is the file from which to extract files. These options are supported:</p> <ul style="list-style-type: none"> <li>Local flash file system syntax: <ul style="list-style-type: none"> <li><b>flash:</b></li> </ul> </li> <li>FTP syntax:</li> </ul>

	Command or Action	Purpose
		<p><b>ftp</b>:<code>[[//username[:password]@location]/directory]/-filename.</code></p> <ul style="list-style-type: none"> <li>• RCP syntax:</li> </ul> <p><b>rcp</b>:<code>[[//username@location]/directory]/-filename.</code></p> <ul style="list-style-type: none"> <li>• TFTP syntax:</li> </ul> <p><b>tftp</b>:<code>[[//location]/directory]/-filename.</code></p> <p>For <b>flash</b>:<code>/file-url [dir/file...]</code>, specify the location on the local flash file system from which the file is extracted. Use the <code>dir/file...</code> option to specify a list of files or directories within the file to be extracted. If none are specified, all files and directories are extracted.</p>
<b>Step 4</b>	<p><b>more</b> <code>[ /ascii   /binary   /ebcdic ] /file-url</code></p> <p><b>Example:</b></p> <pre>device# more flash:/new-configs</pre>	Displays the contents of any readable file, including a file on a remote file system.

## Working with Configuration Files

### Information on Configuration Files

Configuration files contain commands entered to customize the function of the Cisco IOS software. A way to create a basic configuration file is to use the setup program or to enter the setup privileged EXEC command.

You can copy (download) configuration files from a TFTP, FTP, or RCP server to the running configuration or startup configuration of the switch. You might want to perform this for one of these reasons:

- To restore a backed-up configuration file.
- To use the configuration file for another switch. For example, you might add another switch to your network and want it to have a configuration similar to the original switch. By copying the file to the new switch, you can change the relevant parts rather than recreating the whole file.
- To load the same configuration commands on all the switches in your network so that all the switches have similar configurations.

You can copy (upload) configuration files from the switch to a file server by using TFTP, FTP, or RCP. You might perform this task to back up a current configuration file to a server before changing its contents so that you can later restore the original configuration file from the server.

The protocol you use depends on which type of server you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.

## Guidelines for Creating and Using Configuration Files

Creating configuration files can aid in your switch configuration. Configuration files can contain some or all of the commands needed to configure one or more switches. For example, you might want to download the same configuration file to several switches that have the same hardware configuration.

Use these guidelines when creating a configuration file:

- We recommend that you connect through the console port or Ethernet management port for the initial configuration of the switch. If you are accessing the switch through a network connection instead of through a direct connection to the console port or Ethernet management port, keep in mind that some configuration changes (such as changing the switch IP address or disabling ports) can cause a loss of connectivity to the switch.
- If no password has been set on the switch, we recommend that you set one by using the **enable secret** *secret-password* global configuration command.

---

**Note** The **copy {ftp: | rcp: | tftp:} system:running-config** privileged EXEC command loads the configuration files on the switch as if you were entering the commands at the command line. The switch does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration might not be replaced or negated. In this case, the resulting configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, copy the configuration file directly to the startup configuration (by using the **copy {ftp: | rcp: | tftp:} nvram:startup-config** privileged EXEC command), and reload the switch.

---

## Configuration File Types and Location

Startup configuration files are used during system startup to configure the software. Running configuration files contain the current configuration of the software. The two configuration files can be different. For example, you might want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration but not save the configuration by using the **copy running-config startup-config** privileged EXEC command.

The running configuration is saved in DRAM; the startup configuration is stored in the NVRAM section of flash memory.

## Creating a Configuration File By Using a Text Editor

When creating a configuration file, you must list commands logically so that the system can respond appropriately. This is one method of creating a configuration file:

### SUMMARY STEPS

1. Copy an existing configuration from a switch to a server.

2. Open the configuration file in a text editor, such as vi or emacs on UNIX or Notepad on a PC.
3. Extract the portion of the configuration file with the desired commands, and save it in a new file.
4. Copy the configuration file to the appropriate server location. For example, copy the file to the TFTP directory on the workstation (usually /tftpboot on a UNIX workstation).
5. Make sure the permissions on the file are set to world-read.

## DETAILED STEPS

- 
- Step 1** Copy an existing configuration from a switch to a server.
- Step 2** Open the configuration file in a text editor, such as vi or emacs on UNIX or Notepad on a PC.
- Step 3** Extract the portion of the configuration file with the desired commands, and save it in a new file.
- Step 4** Copy the configuration file to the appropriate server location. For example, copy the file to the TFTP directory on the workstation (usually /tftpboot on a UNIX workstation).
- Step 5** Make sure the permissions on the file are set to world-read.
- 

## Copying Configuration Files By Using TFTP

You can configure the switch by using configuration files you create, download from another switch, or download from a TFTP server. You can copy (upload) configuration files to a TFTP server for storage.

### Preparing to Download or Upload a Configuration File By Using TFTP

Before you begin downloading or uploading a configuration file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the /etc/inetd.conf file contains this line:

```
tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot
```

Make sure that the /etc/services file contains this line:

```
tftp 69/udp
```

---

**Note** You must restart the inetd daemon after modifying the /etc/inetd.conf and /etc/services files. To restart the daemon, either stop the inetd process and restart it, or enter a **fastboot** command (on the SunOS 4.x) or a **reboot** command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

---

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the **ping** command.
- Ensure that the configuration file to be downloaded is in the correct directory on the TFTP server (usually /tftpboot on a UNIX workstation).
- For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.

- Before uploading the configuration file, you might need to create an empty file on the TFTP server. To create an empty file, enter the **touch filename** command, where *filename* is the name of the file you will use when uploading it to the server.
- During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.

## Downloading the Configuration File By Using TFTP

To configure the switch by using a configuration file downloaded from a TFTP server, follow these steps:

### SUMMARY STEPS

1. Copy the configuration file to the appropriate TFTP directory on the workstation.
2. Verify that the TFTP server is properly configured.
3. Log into the switch through the console port, the Ethernet management port, or a Telnet session.
4. Download the configuration file from the TFTP server to configure the switch.

### DETAILED STEPS

- 
- Step 1** Copy the configuration file to the appropriate TFTP directory on the workstation.
- Step 2** Verify that the TFTP server is properly configured.
- Step 3** Log into the switch through the console port, the Ethernet management port, or a Telnet session.
- Step 4** Download the configuration file from the TFTP server to configure the switch.

Specify the IP address or hostname of the TFTP server and the name of the file to download.

Use one of these privileged EXEC commands:

```
copy tftp:[[//location]/directory]/filename] system:running-config
copy tftp:[[//location]/directory]/filename] nvram:startup-config
copy tftp:[[//location]/directory]/filename] flash[n]:/directory/startup-config
```

The configuration file downloads, and the commands are executed as the file is parsed line-by-line.

---

### Example

This example shows how to configure the software from the file `tokyo-config` at IP address 172.16.2.155:

```
Switch# copy tftp://172.16.2.155/tokyo-config system:running-config
Configure using tokyo-config from 172.16.2.155? [confirm] y
Booting tokyo-config from 172.16.2.155:!!! [OK - 874/16000 bytes]
```

## Uploading the Configuration File By Using TFTP

To upload a configuration file from a switch to a TFTP server for storage, follow these steps:

## SUMMARY STEPS

1. Verify that the TFTP server is properly configured.
2. Log into the switch through the console port, the Ethernet management port, or a Telnet session
3. Upload the switch configuration to the TFTP server. Specify the IP address or hostname of the TFTP server and the destination filename.

## DETAILED STEPS

- 
- Step 1** Verify that the TFTP server is properly configured.
- Step 2** Log into the switch through the console port, the Ethernet management port, or a Telnet session
- Step 3** Upload the switch configuration to the TFTP server. Specify the IP address or hostname of the TFTP server and the destination filename.

Use **one** of these privileged EXEC commands:

- **copy system:running-config tftp:**[[[//location]/directory]/filename]
- **copy nvram:startup-config tftp:**[[[//location]/directory]/filename]
- **copy flash[n]:/directory/startup-config tftp:**[[[//location]/directory]/filename]

The file is uploaded to the TFTP server.

---

### Example

This example shows how to upload a configuration file from a switch to a TFTP server:

```
Switch# copy system:running-config tftp://172.16.2.155/tokyo-config
Write file tokyo-config on host 172.16.2.155? [confirm] y
#
Writing tokyo-config!!! [OK]
```

## Copying a Configuration File from the Device to an FTP Server

You can copy a configuration file from the device to an FTP server.

### Understanding the FTP Username and Password

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy a configuration file from the device to a server using FTP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the **copy** EXEC command, if a username is specified.
2. The username set by the **ip ftp username** global configuration command, if the command is configured.
3. Anonymous.

The device sends the first valid password it encounters in the following sequence:

1. The password specified in the **copy** command, if a password is specified.
2. The password set by the **ip ftp password** command, if the command is configured.
3. The device forms a password *username @devicename.domain*. The variable *username* is the username associated with the current session, *devicename* is the configured host name, and *domain* is the domain of the device.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the device.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more information.

Use the **ip ftp username** and **ip ftp password** global configuration commands to specify a username and password for all copies. Include the username in the **copy** EXEC command if you want to specify a username for that copy operation only.

## Preparing to Download or Upload a Configuration File By Using FTP

Before you begin downloading or uploading a configuration file by using FTP, do these tasks:

- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the **ping** command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the **show users** privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the **ip ftp username** *username* global configuration command during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the **copy** command if you want to specify a username for only that copy operation.
- When you upload a configuration file to the FTP server, it must be properly configured to accept the write request from the user on the switch.

For more information, see the documentation for your FTP server.

## Downloading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using FTP:

### SUMMARY STEPS

1. **configure terminal**
2. **ip ftp username** *username*
3. **ip ftp password** *password*
4. **end**
5. Do one of the following:

- **copy system:running-config ftp:** [[[/[username [:password ]@]location]/directory ]/filename ]
- **copy nvram:startup-config ftp:** [[[/[username [:password ]@]location]/directory ]/filename ]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode on the switch.  This step is required only if you override the default remote username or password (see Steps 2, 3, and 4).
<b>Step 2</b>	<b>ip ftp username</b> <i>username</i>	(Optional) Change the default remote username.
<b>Step 3</b>	<b>ip ftp password</b> <i>password</i>	(Optional) Change the default password.
<b>Step 4</b>	<b>end</b>	Return to privileged EXEC mode.
<b>Step 5</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy system:running-config ftp:</b> [[[/[username [:password ]@]location]/directory ]/filename ]</li> <li>• <b>copy nvram:startup-config ftp:</b> [[[/[username [:password ]@]location]/directory ]/filename ]</li> </ul>	Using FTP, copy the configuration file from a network server to the running configuration or to the startup configuration file.

### Example

This example shows how to copy a configuration file named `host1-confg` from the `netadmin1` directory on the remote server with an IP address of `172.16.101.101` and to load and run those commands on the switch:

```
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host1-confg
system:running-config
Configure using host1-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-confg:![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101
```

This example shows how to specify a remote username of `netadmin1`. The software copies the configuration file `host2-confg` from the `netadmin1` directory on the remote server with an IP address of `172.16.101.101` to the switch startup configuration.

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin1
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy ftp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-confg]? host2-confg
Configure using host2-confg from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-confg:![OK]
[OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101
```

## Uploading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using FTP:

### SUMMARY STEPS

1. **configure terminal**
2. **ip ftp username** *username*
3. **ip ftp password** *password*
4. **end**
5. Do one of the following:
  - **copy system:running-config ftp:** [[[/[*username* [:*password* ]@]*location*]/*directory* ]/*filename* ]  
or
  - **copy nvram:startup-config ftp:** [[[/[*username* [:*password* ]@]*location*]/*directory* ]/*filename* ]

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode on the switch.  This step is required only if you override the default remote username or password (see Steps 2, 3, and 4).
Step 2	<b>ip ftp username</b> <i>username</i>	(Optional) Change the default remote username.
Step 3	<b>ip ftp password</b> <i>password</i>	(Optional) Change the default password.
Step 4	<b>end</b>	Return to privileged EXEC mode.
Step 5	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy system:running-config ftp:</b> [[[/[<i>username</i> [:<i>password</i> ]@]<i>location</i>]/<i>directory</i> ]/<i>filename</i> ] or</li> <li>• <b>copy nvram:startup-config ftp:</b> [[[/[<i>username</i> [:<i>password</i> ]@]<i>location</i>]/<i>directory</i> ]/<i>filename</i> ]</li> </ul>	Using FTP, store the switch running or startup configuration file to the specified location.

### Example

This example shows how to copy the running configuration file named switch2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

```
Switch# copy system:running-config
ftp://netadmin1:mypass@172.16.101.101/switch2-config
Write file switch2-config on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#
```

This example shows how to store a startup configuration file on a server by using FTP to copy the file:

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin2
```

```
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy nvram:startup-config ftp:
Remote host[]? 172.16.101.101
Name of configuration file to write [switch2-config]?
Write file switch2-config on host 172.16.101.101?[confirm]
! [OK]
```

## Copying Configuration Files By Using RCP

The RCP provides another method of downloading, uploading, and copying configuration files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

The RCP requires a client to send a remote username with each RCP request to a server. When you copy a configuration file from the switch to a server, the Cisco IOS software sends the first valid username in this list:

- The username specified in the **copy** command if a username is specified.
- The username set by the **ip rcmd remote-username username** global configuration command if the command is configured.
- The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the **username** command, the switch software sends the Telnet username as the remote username.
- The switch hostname.

For a successful RCP copy request, you must define an account on the network server for the remote username. If the server has a directory structure, the configuration file is written to or copied from the directory associated with the remote username on the server. For example, if the configuration file is in the home directory of a user on the server, specify that user's name as the remote username.

## Preparing to Download or Upload a Configuration File By Using RCP

Before you begin downloading or uploading a configuration file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the **ping** command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the **show users privileged EXEC** command to view the valid username. If you do not want to use this username, create a new RCP username by using the **ip rcmd remote-username username global**

configuration command to be used during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the RCP username. Include the username in the copy command if you want to specify a username for only that copy operation.

- When you upload a file to the RCP server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server. For example, suppose that the switch contains these configuration lines:

```
hostname Switch1
ip rcmd remote-username User0
```

If the switch IP address translates to Switch1.company.com, the .rhosts file for User0 on the RCPserver should contain this line:

```
Switch1.company.com Switch1
```

For more information, see the documentation for your RCP server.

## Downloading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using RCP:

### SUMMARY STEPS

1. **configure terminal**
2. **ip rcmd remote-username *username***
3. **end**
4. Do one of the following:
  - **copy rcp:[[//*username*@]*location*]/*directory*]/*filename*]**system:running-config****
  - **copy rcp:[[//*username*@]*location*]/*directory*]/*filename*]**nvrाम:startup-config****

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode on the switch.  This step is required only if you override the default remote username (see Steps 2 and 3).
<b>Step 2</b>	<b>ip rcmd remote-username <i>username</i></b>	(Optional) Change the default remote username.
<b>Step 3</b>	<b>end</b>	Return to privileged EXEC mode.
<b>Step 4</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy rcp:[[//<i>username</i>@]<i>location</i>]/<i>directory</i>]/<i>filename</i>]<b>system:running-config</b></b></li> <li>• <b>copy rcp:[[//<i>username</i>@]<i>location</i>]/<i>directory</i>]/<i>filename</i>]<b>nvrाम:startup-config</b></b></li> </ul>	Using RCP, copy the configuration file from a network server to the running configuration or to the startup configuration file.

### Example

This example shows how to copy a configuration file named `host1-config` from the `netadmin1` directory on the remote server with an IP address of `172.16.101.101` and load and run those commands on the switch:

```
Switch# copy rcp://netadmin1@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101
```

This example shows how to specify a remote username of `netadmin1`. Then it copies the configuration file `host2-config` from the `netadmin1` directory on the remote server with an IP address of `172.16.101.101` to the startup configuration:

```
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin1
Switch(config)# end
Switch# copy rcp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config
Configure using host2-config from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:![OK]
[OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by rcp from 172.16.101.101
```

## Uploading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using RCP

### SUMMARY STEPS

1. **configure terminal**
2. **ip rcmd remote-username *username***
3. **end**
4. Do one of the following:
  - **copy system:running-config rcp:[[*//username@location*]/*directory*]/*filename*]**
  - **copy nvram:startup-config rcp:[[*//username@location*]/*directory*]/*filename*]**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode on the switch.  This step is required only if you override the default remote username (see Steps 2 and 3).
Step 2	<b>ip rcmd remote-username <i>username</i></b>	(Optional) Specify the remote username.

	Command or Action	Purpose
Step 3	end	Return to privileged EXEC mode.
Step 4	Do one of the following: <ul style="list-style-type: none"> <li>• <b>copy system:running-config</b>  <b>rcp:[[/username@]location]/directory]/filename]</b></li> <li>• <b>copy nvram:startup-config</b>  <b>rcp:[[/username@]location]/directory]/filename]</b></li> </ul>	Using RCP, copy the configuration file from a switch running configuration or startup configuration file to a network server.

### Example

This example shows how to copy the running configuration file named switch2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

```
Switch# copy system:running-config
rcp://netadmin1@172.16.101.101/switch2-config
Write file switch-config on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#
```

This example shows how to store a startup configuration file on a server:

```
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin2
Switch(config)# end
Switch# copy nvram:startup-config rcp:
Remote host[]? 172.16.101.101
Name of configuration file to write [switch2-config]?
Write file switch2-config on host 172.16.101.101?[confirm]
![OK]
```

## Clearing Configuration Information

You can clear the configuration information from the startup configuration. If you reboot the switch with no startup configuration, the switch enters the setup program so that you can reconfigure the switch with all new settings.

### Clearing the Startup Configuration File

To clear the contents of your startup configuration, use the **erase nvram:** or the **erase startup-config** privileged EXEC command.

**Note** You cannot restore the startup configuration file after it has been deleted.

### Deleting a Stored Configuration File

To delete a saved configuration from flash memory, use the **delete flash:filename** privileged EXEC command. Depending on the setting of the file prompt global configuration command, you might be prompted for

confirmation before you delete a file. By default, the switch prompts for confirmation on destructive file operations. For more information about the file prompt command, see the Cisco IOS Command Reference for Release 12.4.

---

**Note** You cannot restore a file after it has been deleted.

---

## Replacing and Rolling Back Configurations

The configuration replacement and rollback feature replaces the running configuration with any saved Cisco IOS configuration file. You can use the rollback function to roll back to a previous configuration.

## Information on Configuration Replacement and Rollback

### Configuration Archive

The Cisco IOS configuration archive is intended to provide a mechanism to store, organize, and manage an archive of Cisco IOS configuration files to enhance the configuration rollback capability provided by the **configure replace** command. Before this feature was introduced, you could save copies of the running configuration using the **copy running-config destination-url** command, storing the replacement file either locally or remotely. However, this method lacked any automated file management. On the other hand, the Configuration Replace and Configuration Rollback feature provides the capability to automatically save copies of the running configuration to the Cisco IOS configuration archive. These archived files serve as checkpoint configuration references and can be used by the **configure replace** command to revert to previous configuration states.

The **archive config** command allows you to save Cisco IOS configurations in the configuration archive using a standard location and filename prefix that is automatically appended with an incremental version number (and optional timestamp) as each consecutive file is saved. This functionality provides a means for consistent identification of saved Cisco IOS configuration files. You can specify how many versions of the running configuration are kept in the archive. After the maximum number of files are saved in the archive, the oldest file is automatically deleted when the next, most recent file is saved. The **show archive** command displays information for all configuration files saved in the Cisco IOS configuration archive.

The Cisco IOS configuration archive, in which the configuration files are stored and available for use with the **configure replace** command, can be located on the following file systems: FTP, HTTP, RCP, TFTP.

### Configuration Replace

The **configure replace** privileged EXEC command replaces the running configuration with any saved configuration file. When you enter the **configure replace** command, the running configuration is compared with the specified replacement configuration, and a set of configuration differences is generated. The resulting differences are used to replace the configuration. The configuration replacement operation is usually completed in no more than three passes. To prevent looping behavior no more than five passes are performed.

You can use the **copy source-url running-config** privileged EXEC command to copy a stored configuration file to the running configuration. When using this command as an alternative to the **configure replace target-url** privileged EXEC command, note these major differences:

- The **copy**source-url**running-config** command is a merge operation and preserves all the commands from both the source file and the running configuration. This command does not remove commands from the running configuration that are not present in the source file. In contrast, the **configure replace**target-url command removes commands from the running configuration that are not present in the replacement file and adds commands to the running configuration that are not present.
- You can use a partial configuration file as the source file for the **copy**source-url**running-config** command. You must use a complete configuration file as the replacement file for the **configure replace**target-url command.

## Configuration Rollback

You can also use the **configure replace** command to roll back changes that were made since the previous configuration was saved. Instead of basing the rollback operation on a specific set of changes that were applied, the configuration rollback capability reverts to a specific configuration based on a saved configuration file.

If you want the configuration rollback capability, you must first save the running configuration before making any configuration changes. Then, after entering configuration changes, you can use that saved configuration file to roll back the changes by using the **configure replace**target-url command.

You can specify any saved configuration file as the rollback configuration. You are not limited to a fixed number of rollbacks, as is the case in some rollback models.

## Configuration Guidelines

Follow these guidelines when configuring and performing configuration replacement and rollback:

- Make sure that the switch has free memory larger than the combined size of the two configuration files (the running configuration and the saved replacement configuration). Otherwise, the configuration replacement operation fails.
- Make sure that the switch also has sufficient free memory to execute the configuration replacement or rollback configuration commands.
- Certain configuration commands, such as those pertaining to physical components of a networking device (for example, physical interfaces), cannot be added or removed from the running configuration.
  - A configuration replacement operation cannot remove the **interface**interface-id command line from the running configuration if that interface is physically present on the device.
  - The **interface**interface-id command line cannot be added to the running configuration if no such interface is physically present on the device.
- When using the **configure replace** command, you must specify a saved configuration as the replacement configuration file for the running configuration. The replacement file must be a complete configuration generated by a Cisco IOS device (for example, a configuration generated by the **copy running-config**destination-url command).

---

**Note** If you generate the replacement configuration file externally, it must comply with the format of files generated by Cisco IOS devices.

---

## Configuring the Configuration Archive

Using the **configure replace** command with the configuration archive and with the **archive config** command is optional but offers significant benefit for configuration rollback scenarios. Before using the **archive config** command, you must first configure the configuration archive. Starting in privileged EXEC mode, follow these steps to configure the configuration archive:

### SUMMARY STEPS

1. **configure terminal**
2. **archive**
3. **path***url*
4. **maximum***number*
5. **time-period** *minutes*
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.
Step 2	<b>archive</b>	Enter archive configuration mode.
Step 3	<b>path</b> <i>url</i>	Specify the location and filename prefix for the files in the configuration archive
Step 4	<b>maximum</b> <i>number</i>	<p>(Optional) Set the maximum number of archive files of the running configuration to be saved in the configuration archive .</p> <p><i>number</i>-Maximum files of the running configuration file in the configuration archive. Valid values are from 1 to 14. The default is 10.</p> <p><b>Note</b> Before using this command, you must first enter the <b>path</b> archive configuration command to specify the location and filename prefix for the files in the configuration archive.</p>
Step 5	<b>time-period</b> <i>minutes</i>	<p>(Optional) Set the time increment for automatically saving an archive file of the running configuration in the configuration archive.</p> <p><i>minutes</i>-Specify how often, in minutes, to automatically save an archive file of the running configuration in the configuration archive</p>
Step 6	<b>end</b>	Return to privileged EXEC mode.
Step 7	<b>show running-config</b>	Verify the configuration.

	Command or Action	Purpose
Step 8	<code>copy running-config startup-config</code>	(Optional) Save your entries in the configuration file.

## Performing a Configuration Replacement or Rollback Operation

Starting in privileged EXEC mode, follow these steps to replace the running configuration file with a saved configuration file:

### SUMMARY STEPS

1. `archive config`
2. `configure terminal`
3. Make necessary changes to the running configuration.
4. `exit`
5. `configure replace target-url [list] [force] [time seconds] [nolock]`
6. `configure confirm`
7. `copy running-config startup-config`

### DETAILED STEPS

#### Step 1 `archive config`

(Optional) Save the running configuration file to the configuration archive.

**Note** Enter the **path** archive configuration command before using this command.

#### Step 2 `configure terminal`

Enter global configuration mode.

#### Step 3 Make necessary changes to the running configuration.

—

#### Step 4 `exit`

Return to privileged EXEC mode.

#### Step 5 `configure replace target-url [list] [force] [time seconds] [nolock]`

Replace the running configuration file with a saved configuration file.

**target-url**—URL (accessible by the file system) of the saved configuration file that is to replace the running configuration, such as the configuration file created in Step 2 by using the **archive config** privileged EXEC command

**list**—Display a list of the command entries applied by the software parser during each pass of the configuration replacement operation. The total number of passes also appears.

**force**—Replace the running configuration file with the specified saved configuration file without prompting you for confirmation.

**timeseconds**—Specify the time (in seconds) within which you must enter the **configure confirm** command to confirm replacement of the running configuration file. If you do not enter the **configure confirm** command within the specified time limit, the configuration replacement operation is automatically stopped. (In other words, the running configuration file is restored to the configuration that existed before you entered the **configure replace** command).

**Note** You must first enable the configuration archive before you can use the **time** seconds command line option.

**no-lock**— Disable the locking of the running configuration file that prevents other users from changing the running configuration during a configuration replacement operation.

**Step 6** **configure confirm**

(Optional) Confirm replacement of the running configuration with a saved configuration file.

**Note** Use this command only if the **time** seconds keyword and argument of the **configure replace** command are specified.

**Step 7** **copy running-config startup-config**

(Optional) Save your entries in the configuration file.

## Working with Software Images

### Information on Working with Software Images

This section describes how to archive (download and upload) software image files, which contain the system software, the Cisco IOS code, and the embedded device manager software.

**Note** Instead of using the **copy** privileged EXEC command or the **archive tar** privileged EXEC command, we recommend using the **archive download-sw** and **archive upload-sw** privileged EXEC commands to download and upload software image files. For switch stacks, the **archive download-sw** and **archive upload-sw** privileged EXEC commands can only be used through the stack's active switch. Software images downloaded to the stack's active switch are automatically downloaded to the rest of the stack members.

To upgrade a switch in the stack that has an incompatible software image, use the **archive copy-sw** privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

You can download a switch image file from a TFTP, FTP, or RCP server to upgrade the switch software. If you do not have access to a TFTP server, you can download a software image file directly to your PC or workstation by using a web browser (HTTP) and then by using the device manager or Cisco Network Assistant to upgrade your switch. For information about upgrading your switch by using a TFTP server or a web browser (HTTP), see the release notes.

You can replace the current image with the new one or keep the current image in flash memory after a download.

You upload a switch image file to a TFTP, FTP, or RCP server for backup purposes. You can use this uploaded image for future downloads to the same switch or to another of the same type.

The protocol that you use depends on which type of server you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.

**Note** For a list of software images and the supported upgrade paths, see the release notes.

## Image Location on the Switch

The Cisco IOS image is stored as a .bin file in a directory that shows the version number. A subdirectory contains the files needed for web management. The image is stored on the system board flash memory (flash:).

You can use the **show version** privileged EXEC command to see the software version that is currently running on your switch. In the display, check the line that begins with System image file is... . It shows the directory name in flash memory where the image is stored.

You can also use the **dir** filesystem : privileged EXEC command to see the directory names of other software images that might be stored in flash memory.

## File Format of Images on a Server or Cisco.com

Software images located on a server or downloaded from Cisco.com are provided in a tar file format, which contains these files:

- An info file, which serves as a table of contents for the tar file
- One or more subdirectories containing other images and files, such as Cisco IOS images and web management files

This example shows some of the information contained in the info file. The table provides additional details about this information:

```
system_type:0x00000000: image-name
 image_family:xxxx
 stacking_number:x
 info_end:

version_suffix:xxxx
 version_directory:image-name
 image_system_type_id:0x00000000
 image_name:image-nameB.bin
 ios_image_file_size:6398464
 total_image_file_size:8133632
 image_feature:IP|LAYER_3|PLUS|MIN_DRAM_MEG=128
 image_family:xxxx
 stacking_number:x
 board_ids:0x401100c4 0x00000000 0x00000001 0x00000003 0x00000002 0x00008000 0x00008002

0x40110000
 info_end
```

**Table 224: info File Description**

Field	Description
version_suffix	Specifies the Cisco IOS image version string suffix
version_directory	Specifies the directory where the Cisco IOS image and the HTML subdirectory are installed

Field	Description
image_name	Specifies the name of the Cisco IOS image within the tar file
ios_image_file_size	Specifies the Cisco IOS image size in the tar file, which is an approximate measure of how much flash memory is required to hold just the Cisco IOS image
total_image_file_size	Specifies the size of all the images (the Cisco IOS image and the web management files) in the tar file, which is an approximate measure of how much flash memory is required to hold them
image_feature	Describes the core functionality of the image
image_min_dram	Specifies the minimum amount of DRAM needed to run this image
image_family	Describes the family of products on which the software can be installed

## Copying Image Files Using TFTP

You can download a switch image from a TFTP server or upload the image from the switch to a TFTP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes; this uploaded image can be used for future downloads to the same or another switch of the same type .

**Note** Instead of using the **copy** privileged EXEC command or the **archive tar** privileged EXEC command, we recommend using the **archive download-sw** and **archive upload-sw** privileged EXEC commands to download and upload software image files. For switch stacks, the **archive download-sw** and **archive upload-sw** privileged EXEC commands can only be used through the stack's active switch. Software images downloaded to the stack's active switch are automatically downloaded to the rest of the stack members.

To upgrade a switch with an incompatible software image, use the **archive copy-sw** privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

## Preparing to Download or Upload an Image File By Using TFTP

Before you begin downloading or uploading an image file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the `/etc/inetd.conf` file contains this line:

```
tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot
```

Make sure that the `/etc/services` file contains this line:

```
tftp 69/udp
```

---

**Note** You must restart the `inetd` daemon after modifying the `/etc/inetd.conf` and `/etc/services` files. To restart the daemon, either stop the `inetd` process and restart it, or enter a `fastboot` command (on the SunOS 4.x) or a **reboot** command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

---

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the **ping** command.
- Ensure that the image to be downloaded is in the correct directory on the TFTP server (usually `/tftpboot` on a UNIX workstation).
- For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.
- Before uploading the image file, you might need to create an empty file on the TFTP server. To create an empty file, enter the **touch** filename command, where filename is the name of the file you will use when uploading the image to the server.
- During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.

## Downloading an Image File By Using TFTP

You can download a new image file and replace the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 3 to download a new image from a TFTP server and overwrite the existing image. To keep the current image, go to Step 3.

### SUMMARY STEPS

1. Copy the image to the appropriate TFTP directory on the workstation. Make sure that the TFTP server is properly configured.
2. Log into the switch through the console port or a Telnet session.
3. **archive download-sw /overwrite /reload tftp:** [ [ //location ] /directory ] /image-name.tar
4. **archive download-sw /leave-old-sw /reload tftp:** [ [ //location ] /directory ] /image-name.tar

### DETAILED STEPS

---

**Step 1** Copy the image to the appropriate TFTP directory on the workstation. Make sure that the TFTP server is properly configured.

---

**Step 2** Log into the switch through the console port or a Telnet session.

—

**Step 3** **archive download-sw/overwrite/reload tftp:** [ [ // *location* ] / *directory* ] / *image-name.tar*

Download the image file from the TFTP server to the switch, and overwrite the current image.

- The **/overwrite** option overwrites the software image in flash memory with the downloaded image.
- The **/reload** option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For // *location* , specify the IP address of the TFTP server.
- For *directory/image-name.tar* specify the directory (optional) and the image to download. Directory and image names are case sensitive.

**Step 4** **archive download-sw/leave-old-sw/reload tftp:** [ [ // *location* ] / *directory* ] / *image-name.tar*

Download the image file from the TFTP server to the switch, and keep the current image.

- The **/leave-old-sw** option keeps the old software version after a download.
- The **/reload** option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For // *location*, specify the IP address of the TFTP server.
- For *directory/image-name.tar* specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it cancels the process and reports an error. If you specify the **/overwrite** option, the download algorithm removes the existing image on the flash device whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note** If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the **/overwrite** option.

If you specify the **/leave-old-sw**, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image on the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you keep the old image during the download process (you specified the **/leave-old-sw** keyword), you can remove it by entering the **delete/force/recursive filesystem :/ file-url** privileged EXEC command. For *filesystem*, use **flash:** for the system board flash device. For *file-url*, enter the directory name of the old image. All the files in the directory and the directory are removed.

**Note** For the download and upload algorithms to operate properly, do not rename image names

## Uploading an Image File Using TFTP

You can upload an image from the switch to a TFTP server. You can later download this image to the switch or to another switch of the same type.

Use the upload feature only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to a TFTP server:

### SUMMARY STEPS

1. Make sure the TFTP server is properly configured
2. Log into the switch through the console port or a Telnet session.
3. **archive upload-sw tftp:**`[[// location ]/directory ]/image-name .tar`

### DETAILED STEPS

---

**Step 1** Make sure the TFTP server is properly configured

—

**Step 2** Log into the switch through the console port or a Telnet session.

—

**Step 3** **archive upload-sw tftp:**`[[// location ]/directory ]/image-name .tar`

Upload the currently running switch image to the TFTP server.

- For `// location`, specify the IP address of the TFTP server.
- For `/directory/image-name.tar` specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The `image-name.tar` is the name of the software image to be stored on the server.

The **archive upload-sw** privileged EXEC command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

---

## Copying Image Files Using FTP

You can download a switch image from an FTP server or upload the image from the switch to an FTP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the switch or another switch of the same type.

**Note** Instead of using the **copy** privileged EXEC command or the **archive tar** privileged EXEC command, we recommend using the **archive download-sw** and **archive upload-sw** privileged EXEC commands to download and upload software image files. For switch stacks, the **archive download-sw** and **archive upload-sw** privileged EXEC commands can only be used through the stack's active switch. Software images downloaded to the stack's active switch are automatically downloaded to the rest of the stack members.

To upgrade a switch with an incompatible software image, use the **archive copy-sw** privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

## Preparing to Download or Upload an Image File By Using FTP

You can copy images files to or from an FTP server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy an image file from the switch to a server by using FTP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the **archive download-sw** or **archive upload-sw** privileged EXEC command if a username is specified.
- The username set by the **ip ftp username** username global configuration command if the command is configured.
- Anonymous.

The switch sends the first valid password in this list:

- The password specified in the **archive download-sw** or **archive upload-sw** privileged EXEC command if a password is specified.
- The password set by the **ip ftp password** password global configuration command if the command is configured.
- The switch forms a password named `username@switchname.domain`. The variable `username` is the username associated with the current session, `switchname` is the configured hostname, and `domain` is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from you.

Use the **ip ftp username** and **ip ftp password** commands to specify a username and password for all copies. Include the username in the **archive download-sw** or **archive upload-sw** privileged EXEC command if you want to specify a username only for that operation.

If the server has a directory structure, the image file is written to or copied from the directory associated with the username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user's name as the remote username.

Before you begin downloading or uploading an image file by using FTP, do these tasks:

- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the **ping** command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the **show users** privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the **ip ftp username** username global configuration command. This new name will be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the **archive download-sw** or **archive upload-sw** privileged EXEC command if you want to specify a username for that operation only.
- When you upload an image file to the FTP server, it must be properly configured to accept the write request from the user on the switch.

For more information, see the documentation for your FTP server.

## Downloading an Image File By Using FTP

You can download a new image file and overwrite the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 7 to download a new image from an FTP server and overwrite the existing image. To keep the current image, go to Step 7.

### SUMMARY STEPS

1. Verify that the FTP server is properly configured.
2. Log into the switch through the console port or a Telnet session.
3. **configure terminal**
4. **ip ftp username** *username*
5. **ip ftp password***password*
6. **end**
7. **archive download-sw /overwrite/reload**  
**ftp:** [ [ / / *username* [ :*password* ] @*location* ] / *directory* ] / *image-name.tar*
8. **archive download-sw /leave-old-sw/reload**  
**ftp:** [ [ / / *username* [ :*password* ] @*location* ] / *directory* ] / *image-name.tar*

### DETAILED STEPS

---

**Step 1** Verify that the FTP server is properly configured.

—

**Step 2** Log into the switch through the console port or a Telnet session.

—

**Step 3** **configure terminal**

Enter global configuration mode.

This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).

**Step 4** `ip ftp username username`

(Optional) Change the default remote username.

**Step 5** `ip ftp password password`

(Optional) Change the default password.

**Step 6** `end`

Return to privileged EXEC mode.

**Step 7** `archive download-sw /overwrite/reload ftp: [ [ /username [:password] @location ] /directory ] /image-name.tar`

Download the image file from the FTP server to the switch, and overwrite the current image.

- The `/overwrite` option overwrites the software image in flash memory with the downloaded image.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `//username [:password]` specify the username and password; these must be associated with an account on the FTP server.
- For `@ location`, specify the IP address of the FTP server.
- For `directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

**Step 8** `archive download-sw /leave-old-sw/reload ftp: [ [ /username [:password] @location ] /directory ] /image-name.tar`

Download the image file from the FTP server to the switch, and keep the current image.

- The `/leave-old-sw` option keeps the old software version after a download.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `//username [:password]` specify the username and password; these must be associated with an account on the FTP server.
- For `@ location`, specify the IP address of the FTP server.
- For `directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it cancels the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device, whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note** If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option.

If you specify the `/leave-old-sw`, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image onto the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the `/leave-old-sw` keyword), you can remove it by entering the `delete/force/recursive filesystem :/file-url` privileged EXEC command. For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the directory name of the old software image. All the files in the directory and the directory are removed.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

## Uploading an Image File By Using FTP

You can upload an image from the switch to an FTP server. You can later download this image to the same switch or to another switch of the same type.

Use the upload feature only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an FTP server:

### SUMMARY STEPS

1. **configure terminal**
2. **ip ftp username***username*
3. **ip ftp password***password*
4. **end**
5. **archive upload-sw ftp:** [ [ / / [*username* [ :*password*] @ ] *location*] / *directory*] / *image-name.tar*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.  This step is required only if you override the default remote username or password (see Steps 2, 3, and 4.)
Step 2	<b>ip ftp username</b> <i>username</i>	(Optional) Change the default remote username.
Step 3	<b>ip ftp password</b> <i>password</i>	(Optional) Change the default password.
Step 4	<b>end</b>	Return to privileged EXEC mode.
Step 5	<b>archive upload-sw</b> <b>ftp:</b> [ [ / / [ <i>username</i> [ : <i>password</i> ] @ ] <i>location</i> ] / <i>directory</i> ] / <i>image-name.tar</i>	Upload the currently running switch image to the FTP server.  <ul style="list-style-type: none"> <li>• For <i>//username:password</i>, specify the username and password. These must be associated with an account on the FTP server.</li> <li>• For <i>@location</i>, specify the IP address of the FTP server.</li> <li>• For <i>/directory/image-name.tar</i>, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The <i>image-name .tar</i> is the name of the software image to be stored on the server.</li> </ul> <p>The <b>archive upload-sw</b> command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. 	Command or Action	Purpose
		<p>are uploaded, the upload algorithm creates the tar file format.</p> <p><b>Note</b> For the download and upload algorithms to operate properly, do not rename image names.</p>

## Copying Image Files Using RCP

You can download a switch image from an RCP server or upload the image from the switch to an RCP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download. You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the same switch or another of the same type.

**Note** Instead of using the **copy** privileged EXEC command or the **archive tar** privileged EXEC command, we recommend using the **archive download-sw** and **archive upload-sw** privileged EXEC commands to download and upload software image files. For switch stacks, the **archive download-sw** and **archive upload-sw** privileged EXEC commands can only be used through the stack's active switch. Software images downloaded to the stack's active switch are automatically downloaded to the rest of the stack members. To upgrade a switch with an incompatible software image, use the **archive copy-sw** privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

## Preparing to Download or Upload an Image File Using RCP

RCP provides another method of downloading and uploading image files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

RCP requires a client to send a remote username on each RCP request to a server. When you copy an image from the switch to a server by using RCP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the **archive download-sw** or **archive upload-sw** privileged EXEC command if a username is specified.
- The username set by the **ip rcmd remote-username** *username* global configuration command if the command is entered.

- The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the **username** command, the switch software sends the Telnet username as the remote username.
- The switch hostname.

For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the image file is written to or copied from the directory associated with the remote username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user's name as the remote username.

Before you begin downloading or uploading an image file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the **ping** command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the **show users** privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the **ip rcmd remote-username username** global configuration command to be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and there is no need to set the RCP username. Include the username in the **archive download-sw** or **archive upload-sw** privileged EXEC command if you want to specify a username only for that operation.
- When you upload an image to the RCP to the server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server.

For example, suppose the switch contains these configuration lines:

```
hostname Switch1
ip rcmd remote-username User0
```

If the switch IP address translates to *Switch1.company.com*, the .rhosts file for User0 on the RCP server should contain this line:

```
Switch1.company.com Switch1
```

For more information, see the documentation for your RCP server.

## Downloading an Image File using RCP

You can download a new image file and replace or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 6 to download a new image from an RCP server and overwrite the existing image. To keep the current image, go to Step 6.

### SUMMARY STEPS

1. Verify that the RCP server is properly configured.
2. Log into the switch through the console port or a Telnet session.
3. **configure terminal**
4. **ip rcmd remote-username username**

5. **end**
6. **archive download-sw /overwrite/reload**  
**rcp:** [ [ [ //username@ ] /location ] /directory ] /image-name.tar
7. **archive download-sw /leave-old-sw/reload**  
**rcp:** [ [ [ // [username@] location ] /directory ] /image-name.tar

## DETAILED STEPS

---

- Step 1** Verify that the RCP server is properly configured.
- 
- Step 2** Log into the switch through the console port or a Telnet session.
- 
- Step 3** **configure terminal**
- Enter global configuration mode.
- This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).
- Step 4** **ip rcmd remote-username** *username*
- (Optional) Specify the remote username.
- Step 5** **end**
- Return to privileged EXEC mode.
- Step 6** **archive download-sw /overwrite/reload rcp:** [ [ [ //username@ ] /location ] /directory ] /image-name.tar
- Download the image file from the RCP server to the switch, and overwrite the current image.
- The **/overwrite** option overwrites the software image in flash memory with the downloaded image.
  - The **/reload** option reloads the system after downloading the image unless the configuration has been changed and not been saved.
  - For *//username* specify the username. For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username.
  - For *@ location*, specify the IP address of the RCP server.
  - For */directory/image-name.tar*, specify the directory (optional) and the image to download. Directory and image names are case sensitive.
- Step 7** **archive download-sw /leave-old-sw/reload rcp:** [ [ [ // [username@] location ] /directory ] /image-name.tar
- Download the image file from the FTP server to the switch, and keep the current image.
- The **/leave-old-sw** option keeps the old software version after a download.
  - The **/reload** option reloads the system after downloading the image unless the configuration has been changed and not been saved.
  - For *//username* specify the username. For the RCP copy request to execute, an account must be defined on the network server for the remote username.
  - For *@ location*, specify the IP address of the RCP server.
  - For */directory/image-name.tar*, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it cancels the process and reports an error. If you specify the **/overwrite** option, the download algorithm removes the existing image on the flash device, whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note** If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the **/overwrite** option.

If you specify the **/leave-old-sw**, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image onto the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the **/leave-old-sw** keyword), you can remove it by entering the **delete/force/recursive filesystem :/file-url** privileged EXEC command. For *filesystem*, use **flash:** for the system board flash device. For *file-url*, enter the directory name of the old software image. All the files in the directory and the directory are removed.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

## Uploading an Image File using RCP

You can upload an image from the switch to an RCP server. You can later download this image to the same switch or to another switch of the same type.

The upload feature should be used only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an RCP server:

### SUMMARY STEPS

1. **configure terminal**
2. **ip rcmd remote-username***username*
3. **end**
4. **archive upload-sw rcp:** [ [ / / [ *username* @ ] *location* ] / *directory* ] / *image-name.tar*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.  This step is required only if you override the default remote username or password (see Steps 2 and 3.)
Step 2	<b>ip rcmd remote-username</b> <i>username</i>	Optional) Specify the remote username.
Step 3	<b>end</b>	Return to privileged EXEC mode.

	Command or Action	Purpose
Step 4	<b>archive upload-sw</b> <b>rcp:</b> [ [ [ / [ <i>username@</i> ] <i>location</i> ] / <i>directory</i> ] / <i>image-name.tar</i>	<p>Upload the currently running switch image to the RCP server.</p> <ul style="list-style-type: none"> <li>• For <i>//username</i>, specify the username; for the RCP copy request to execute, an account must be defined on the network server for the remote username.</li> <li>• For <i>@location</i>, specify the IP address of the RCP server.</li> <li>• For <i>/directory/image-name.tar</i>, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive.</li> <li>• The <i>image-name.tar</i> is the name of software image to be stored on the server.</li> </ul> <p>The <b>archive upload-sw</b> command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.</p> <p><b>Note</b> For the download and upload algorithms to operate properly, do not rename image names.</p>

## Copying an Image File from One Stack Member to Another

For switch stacks, the **archive download-sw** and **archive upload-sw** privileged EXEC commands can be used only through the stack's active switch. Software images downloaded to the stack's active switch are automatically downloaded to the rest of the stack members.

To upgrade a switch that has an incompatible software image, use the **archive copy-sw** privileged EXEC command to copy the software image from an existing stack member to the one that has incompatible software. That switch automatically reloads and joins the stack as a fully functioning member.

**Note** To successfully use the **archive copy-sw** privileged EXEC command, you must have downloaded from a TFTP server the images for both the stack member switch being added and the stack's active switch. You use the **archive download-sw** privileged EXEC command to perform the download.

Beginning in privileged EXEC mode from the stack member that you want to upgrade, follow these steps to copy the running image file from the flash memory of a different stack member:

### SUMMARY STEPS

1. **archive copy-sw / destination-system** *destination-stack-member-number* / **force-reload***source-stack-member-number*
2. **reload slot***stack-member-number*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>archive copy-sw /destination-system</b> <i>destination-stack-member-number /</i> <b>force-reload</b> <i>source-stack-member-number</i>	<p>Copy the running image file from a stack member, and then unconditionally reload the updated stack member.</p> <p><b>Note</b> At least one stack member must be running the image that is to be copied to the switch that is running the incompatible software</p> <p>For / <b>destination-system</b><i>destination-stack-member-number</i>, specify the number of the stack member (the destination) to which to copy the source running image file. If you do not specify this stack member number, the default is to copy the running image file to all stack members.</p> <p>Specify /<b>force-reload</b> to unconditionally force a system reload after successfully downloading the software image.</p> <p>For <i>source-stack-member-number</i>, specify the number of the stack member (the source) from which to copy the running image file. The stack member number range is 1 to 9.</p>
<b>Step 2</b>	<b>reload slot</b> <i>stack-member-number</i>	Reset the updated stack member, and put this configuration change into effect.
