Configuring IP SLAs UDP Jitter Operations

This document describes how to configure an IP Service Level Agreements (SLAs) UDP jitter operation to analyze round-trip delay, one-way delay, one-way jitter, one-way packet loss, and connectivity in networks that carry UDP traffic in IPv4 or IPv6 networks. This module also demonstrates how the data gathered using the UDP jitter operation can be displayed and analyzed using Cisco software commands.

- Finding Feature Information, page 1
- Prerequisites, page 1
- Information About IP SLAs UDP Jitter Operations, page 2
- How to Configure IP SLAs UDP Jitter Operations, page 3
- Configuration Examples for IP SLAs UDP Jitter Operations, page 13
- Additional References, page 13
- Feature Information for IP SLAs UDP Jitter Operations, page 14

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites

- Time synchronization, such as that provided by NTP, is required between the source and the target device in order to provide accurate one-way delay (latency) measurements. To configure NTP on the source and target devices, perform the tasks in the "Performing Basic System Management" chapter of the Network Management Configuration Guide. Time synchronization is not required for the one-way jitter and packet loss measurements, however. If the time is not synchronized between the source and target...
devices, one-way jitter and packet loss data will be returned, but values of “0” will be returned for the one-way delay measurements provided by the UDP jitter operation.

- Before configuring any IP SLAs application, you can use the `show ip sla application` command to verify that the operation type is supported on your software image.

### Information About IP SLAs UDP Jitter Operations

#### IP SLAs UDP Jitter Operation

The IP SLAs UDP jitter operation was primarily designed to diagnose network suitability for real-time traffic applications such as voice over IP (VoIP), video over IP, or real-time conferencing.

Jitter means inter-packet delay variance. When multiple packets are sent consecutively from source to destination, for example, 10 ms apart, and if the network is behaving ideally, the destination should be receiving them 10 ms apart. But if there are delays in the network (like queuing, arriving through alternate routes, and so on) the arrival delay between packets might be greater than or less than 10 ms. Using this example, a positive jitter value indicates that the packets arrived greater than 10 ms apart. If the packets arrive 12 ms apart, then positive jitter is 2 ms; if the packets arrive 8 ms apart, then negative jitter is 2 ms. For delay-sensitive networks like VoIP, positive jitter values are undesirable, and a jitter value of 0 is ideal.

However, the IP SLAs UDP jitter operation does more than just monitor jitter. As the UDP jitter operation includes the data returned by the IP SLAs UDP operation, the UDP jitter operation can be used as a multipurpose data gathering operation. The packets IP SLAs generates carry packet-sending and receiving sequence information, and sending and receiving time stamps from the source and the operational target. Based on this information, UDP jitter operations are capable of measuring the following:

- Per-direction jitter (source to destination and destination to source)
- Per-direction packet loss
- Per-direction delay (one-way delay)
- Round-trip delay (average round-trip time)

As the paths for sending and receiving data may be different (asymmetric), the per-direction data allows you to more readily identify where congestion or other problems are occurring in the network.

The UDP jitter operation functions by generating synthetic (simulated) UDP traffic. The UDP jitter operation sends N UDP packets, each of size S, T milliseconds apart, from a source device to a target device, at a given frequency of F. By default, ten packet frames (N), each with a payload size of 10 bytes (S), are generated every 10 ms (T), and the operation is repeated every 60 seconds (F). Each of these parameters is user-configurable, so as to best simulate the IP service you are providing, or want to provide, as shown in the table below.

<p>| Table 1: UDP Jitter Operation Parameters |
|------------------------------------------|---------------------------------|----------------------------------|</p>

### Configuring IP SLAs UDP Jitter Operations

#### How to Configure IP SLAs UDP Jitter Operations

**Configuring the IP SLAs Responder on the Destination Device**

- **Note**: A responder should not configure a permanent port for the same sender. If the responder configures a permanent port for the same sender, even if the packets are successfully sent (no timeout or packet-loss issues), the jitter values will be zero.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Do one of the following:
   - `ip sla responder`
   - `ip sla responder udp-echo  ipaddress  ip-address  port  port`
4. **exit**

### Configuring and Scheduling a UDP Jitter Operation on the Source Device

Perform only one of the following tasks:
# Configuring a Basic UDP Jitter Operation on the Source Device

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip sla operation-number`
4. `udp-jitter {destination-ip-address | destination-hostname} destination-port [source-ip {ip-address | hostname}] [source-port port-number] [control {enable | disable}] [num-packets number-of-packets] [interval interpacket-interval]`
5. `frequency seconds`
6. `end`
7. `show ip sla configuration [operation-number]`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ip sla operation-number</code></td>
<td>Begins configuration for an IP SLAs operation and enters IP SLA config.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# ip sla 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> `udp-jitter {destination-ip-address</td>
<td>destination-hostname} destination-port [source-ip {ip-address</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ip-sla)# udp-jitter 172.29.139.134 5000</td>
<td>Use the <code>control disable</code> keyword combination only if you disable the IP SLAs control protocol on both the source and destination devices.</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
---|---
**Step 5** frequency <i>seconds</i> | (Optional) Sets the rate at which a specified IP SLAs operation repeats.

**Example:**
```
Device(config-ip-sla-jitter)# frequency 30
```

**Step 6** end | Returns to privileged EXEC mode.

**Example:**
```
Device(config-ip-sla-jitter)# end
```

**Step 7** show ip sla configuration [operation-number] | (Optional) Displays configuration values including all defaults for all IP SLAs operations or a specified operation.

**Example:**
```
Device# show ip sla configuration 10
```

### What to Do Next
To configure the percentile option for your operation, see the "Configuring the IP SLAs - Percentile Support for Filtering Outliers" module.

### Configuring a UDP Jitter Operation with Additional Characteristics

**Note**
- The IP SLAs UDP jitter operation does not support the IP SLAs History feature (statistics history buckets) because of the large data volume involved with UDP jitter operations. This means that the following commands are not supported for UDP jitter operations: `history buckets-kept`, `history filter`, `history lives-kept`, `samples-of-history-kept`, and `show ip sla history`.

- The MIB used by IP SLAs (CISCO-RTTMON-MIB) limits the hours-of-statistics kept for the UDP jitter operation to two hours. Configuring a larger value using the `history hours-of-statistics` global configuration change will not increase the value beyond two hours. However, the Data Collection MIB can be used to collect historical data for the operation. For information, see the CISCO-DATA-COLLECTION-MIB at [http://www.cisco.com/go/mibs](http://www.cisco.com/go/mibs).

### Before You Begin
Before configuring a UDP jitter operation on the source device, the IP SLAs Responder must be enabled on the target device (the operational target). The IP SLAs Responder is available only on Cisco IOS software-based devices. To enable the Responder, perform the task in the “Configuring the IP SLAs Responder on the Destination Device” section.
SUMMARY STEPS

1. enable
2. configure terminal
3. ip sla operation-number
4. udp-jitter {destination-ip-address | destination-hostname} destination-port [source-ip {ip-address | hostname}] [source-port port-number] [control {enable | disable}] [num-packets number-of-packets] [interval interpacket-interval]
5. history distributions-of-statistics-kept size
6. history enhanced [interval seconds] [buckets number-of-buckets]
7. frequency seconds
8. history hours-of-statistics-kept hours
9. owner owner-id
10. request-data-size bytes
11. history statistics-distribution-interval milliseconds
12. tag text
13. threshold milliseconds
14. timeout milliseconds
15. Do one of the following:
   • tos number
   • traffic-class number
16. flow-label number
17. verify-data
18. vrf vrf-name
19. end
20. show ip sla configuration [operation-number]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 3**  
`ip sla operation-number`  
Example:  
Device(config)# ip sla 10  

**Step 4**  
`udp-jitter {destination-ip-address | destination-hostname} destination-port [source-ip {ip-address | hostname} | source-port port-number] [control {enable | disable}] [num-packets number-of-packets] [interval interpacket-interval]`  
Example:  
Device(config-ip-sla)# udp-jitter 172.29.139.134 5000

**Step 5**  
`history distributions-of-statistics-kept size`  
Example:  
Device(config-ip-sla-jitter)# history distributions-of-statistics-kept 5

**Step 6**  
`history enhanced [interval seconds] [buckets number-of-buckets]`  
Example:  
Device(config-ip-sla-jitter)# history enhanced interval 900 buckets 100

**Step 7**  
`frequency seconds`  
Example:  
Device(config-ip-sla-jitter)# frequency 30

**Step 8**  
`history hours-of-statistics-kept hours`  
Example:  
Device(config-ip-sla-jitter)# history hours-of-statistics-kept 4

**Step 9**  
`owner owner-id`  
Example:  
Device(config-ip-sla-jitter)# owner admin

**Purpose**

**Step 3** Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

**Step 4** Configures the IP SLAs operation as a UDP jitter operation and enters UDP jitter configuration submode.
- Use the `control disable` keyword combination only if you disable the IP SLAs control protocol on both the source and target devices.

**Step 5** (Optional) Sets the number of statistics distributions kept per hop during an IP SLAs operation.

**Step 6** (Optional) Enables enhanced history gathering for an IP SLAs operation.

**Step 7** (Optional) Sets the rate at which a specified IP SLAs operation repeats.

**Step 8** (Optional) Sets the number of hours for which statistics are maintained for an IP SLAs operation.

**Step 9** (Optional) Configures the Simple Network Management Protocol (SNMP) owner of an IP SLAs operation.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 10</strong> request-data-size <em>bytes</em></td>
<td>(Optional) Sets the protocol data size in the payload of an IP SLAs operation's request packet.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ip-sla-jitter)# request-data-size 64</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> history statistics-distribution-interval <em>milliseconds</em></td>
<td>(Optional) Sets the time interval for each statistics distribution kept for an IP SLAs operation.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ip-sla-jitter)# history statistics-distribution-interval 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> tag <em>text</em></td>
<td>(Optional) Creates a user-specified identifier for an IP SLAs operation.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ip-sla-jitter)# tag TelnetPollServer1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> threshold <em>milliseconds</em></td>
<td>(Optional) Sets the upper threshold value for calculating network monitoring statistics created by an IP SLAs operation.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ip-sla-jitter)# threshold 10000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong> timeout <em>milliseconds</em></td>
<td>(Optional) Sets the amount of time an IP SLAs operation waits for a response from its request packet.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ip-sla-jitter)# timeout 10000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong> Do one of the following:</td>
<td>(Optional) In an IPv4 network only, defines the ToS byte in the IPv4 header of an IP SLAs operation.</td>
</tr>
<tr>
<td>• tos <em>number</em></td>
<td>or</td>
</tr>
<tr>
<td>• traffic-class <em>number</em></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ip-sla-jitter)# tos 160</td>
<td>(Optional) In an IPv6 network only, defines the traffic class byte in the IPv6 header for a supported IP SLAs operation.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ip-sla-jitter)# traffic-class 160</td>
<td></td>
</tr>
</tbody>
</table>
Step 16  
**flow-label number**  
*Purpose:* (Optional) In an IPv6 network only, defines the flow label field in the IPv6 header for a supported IP SLAs operation.  
*Example:*  
Device(config-ip-sla-jitter)# flow-label 112233

Step 17  
**verify-data**  
*Purpose:* (Optional) Causes an IP SLAs operation to check each reply packet for data corruption.  
*Example:*  
Device(config-ip-sla-jter)# verify-data

Step 18  
**vrf vrf-name**  
*Purpose:* (Optional) Allows monitoring within Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs) using IP SLAs operations.  
*Example:*  
Device(config-ip-sla-jitter)# vrf vpn-A

Step 19  
**end**  
*Purpose:* Returns to privileged EXEC mode.  
*Example:*  
Device(config-ip-sla-jitter)# end

Step 20  
**show ip sla configuration [operation-number]**  
*Purpose:* (Optional) Displays configuration values including all defaults for all IP SLAs operations or a specified operation.  
*Example:*  
Device# show ip sla configuration 10

---

**What to Do Next**

To configure the percentile option for your operation, see the “Configuring the IP SLAs - Percentile Support for Filtering Outliers” module.

**Scheduling IP SLAs Operations**

- All IP SLAs operations to be scheduled must be already configured.
- The frequency of all operations scheduled in a multioperation group must be the same.
- The list of one or more operation ID numbers to be added to a multioperation group is limited to a maximum of 125 characters in length, including commas (,).
SUMMARY STEPS

1. enable
2. configure terminal
3. Do one of the following:
   • `ip sla schedule operation-number [life {forever | seconds}] [start-time [{hh:mm:ss} [month day | day month] | pending | now | after hh:mm:ss]] [ageout seconds] [recurring]
   • `ip sla group schedule group-operation-number operation-id-numbers {schedule-period schedule-period-range | schedule-together} [ageout seconds] [frequency group-operation-frequency] [life {forever | seconds}] [start-time{{hh:mm:ss} [month day | day month] | pending | now | after hh:mm:ss}]

4. exit
5. show ip sla group schedule
6. show ip sla configuration

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>

<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 Do one of the following:</td>
<td></td>
</tr>
<tr>
<td>• `ip sla schedule operation-number [life {forever</td>
<td>seconds}] [start-time {{hh:mm:ss} [month day</td>
</tr>
<tr>
<td>• `ip sla group schedule group-operation-number operation-id-numbers {schedule-period schedule-period-range</td>
<td>schedule-together} [ageout seconds] [frequency group-operation-frequency] [life {forever</td>
</tr>
<tr>
<td>Example: Device(config)# ip sla schedule 10 life forever start-time now</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Example:**

```bash
Device(config)# ip sla group schedule 1 3,4,6-9 life forever start-time now
```

**Step 4**

**exit**

**Example:**

```bash
Device(config)# exit
```

**Step 5**

**show ip sla group schedule**

**Example:**

```bash
Device# show ip sla group schedule
```

**Step 6**

**show ip sla configuration**

**Example:**

```bash
Device# show ip sla configuration
```

### Troubleshooting Tips

- If the IP SLAs operation is not running and not generating statistics, add the `verify-data` command to the configuration of the operation (while configuring in IP SLA configuration mode) to enable data verification. When data verification is enabled, each operation response is checked for corruption. Use the `verify-data` command with caution during normal operations because it generates unnecessary overhead.

- Use the `debug ip sla trace` and `debug ip sla error` commands to help troubleshoot issues with an IP SLAs operation.

### What to Do Next

To add proactive threshold conditions and reactive triggering for generating traps (or for starting another operation) to an IP SLAs operation, see the "Configuring Proactive Threshold Monitoring" section.

To display and interpret the results of an IP SLAs operation, use the `show ip sla statistics` command. Check the output for fields that correspond to criteria in your service level agreement to determine whether the service metrics are acceptable.
Configuration Examples for IP SLAs UDP Jitter Operations

Example Configuring a UDP Jitter Operation

In the following example, two operations are configured as UDP jitter operations, with operation 2 starting five seconds after the first operation. Both operations will run indefinitely.

```
ip sla 1
  udp-jitter 20.0.10.3 65051 num-packets 20
  request-data-size 160
  tos 128
  frequency 30
  ip sla schedule 1 start-time after 00:05:00
ip sla 2
  udp-jitter 20.0.10.3 65052 num-packets 20 interval 10
  request-data-size 20
  tos 64
  frequency 30
  ip sla schedule 2 start-time after 00:05:05
```

On the target (destination) device:

```
ip sla responder
```

Feature Information for IP SLAs UDP Jitter Operations

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
