

Commvault Email Archiving for Cisco Customers

Solve Your Biggest Email Archive Challenges

More than half of all companies worldwide store critical business information in email—sometimes exclusively—according to a study by IDC. Chances are your company is one of them. So it's more important than ever to have an email-archiving strategy that ensures business continuity and information availability.

Cisco has partnered with Commvault, a leading email-archiving vendor, to provide Cisco® email security customers with first-class email-archiving capabilities. Commvault's single, unified data management platform supports detailed archiving policies for any email environment. You can classify your data and define policies, automate email data management to optimize storage, and easily scale as volumes grow. Use proactive data compliance and legal discovery features to save money and time. And since Commvault lets you manage all data with a single index, you can easily archive other types of data beyond email, including files, applications, and more, all with the same Commvault archiving solution.

With two independent product offerings, Cisco Email Security and Commvault now provide a more complete solution. Through our partnership, it is now easier to choose the best email security and archiving solutions for your organization.

Protect Your Business and Reduce Costs

Email security and archiving protect your organization so you can focus on running your business. The Cisco Email Security Appliance offers high-availability email protection against constant, dynamic, and rapidly changing threats. Commvault software helps you control the data growth and infrastructure costs of your messaging environment while reducing risks associated with corporate, legal, or regulatory governance.

These Commvault features help Cisco email security customers solve the most daunting email archiving challenges:

- **Content-based retention** allows you to automatically organize, classify, and store only relevant data that is aligned to business priorities. By some estimates, you can reduce retention costs by up to 70 percent while streamlining discovery.

Benefits

- **Provide email archiving and e-discovery solutions** from Commvault to complement Cisco's email security portfolio
- **Choose among flexible deployment options**—on-premises, hybrid, or cloud
- **Simplify data management** and increase efficiency by using a single, unified console
- **Respond to legal, compliance, and regulatory requests** quickly, and decrease cost and business risk
- **Improve server performance** and backup windows by decreasing the size of primary data volumes

“Things are much more straightforward for the end-user, and as an organization we have regained control over email from a compliance perspective.”
