Cisco NGFW's integration with other platforms allows businesses to identify with one platform to be shared with the others. This gives us the ability to have more consistent management, so we can streamline our processes.

"From one control panel we’ve got everything from traditional firewalling to the next-generation firewall techniques today, coupling that with analytics and other platforms.

"Other companies just tout firewall appliances. Cisco isn’t like other security companies that are primarily hardware or primarily software. Cisco is both. That’s important to us, because we know we need control over endpoints, in the cloud, and on-prem at our properties.

"The combination of Umbrella and Firepower NGFW enables us to proactively block threats we weren’t blocking before. Isolation faster and easier, and clients with unspecified endpoint policies that were preventing our students against attacks. With Cisco, we can autonomously acquire the skills and knowledge they need to train graduates.

"The decision to use Cisco firewall was because Cisco could offer us an integrated platform. Cisco... could offer this solution in a single box.

"I know with a Cisco firewall such as ASA/FTD, there is nothing I can't do with it. I feel like the Firepower 4100 and Firepower 2100 Series. I support high performance computing in the Data Center, and not slowing down throughput is very important.

"The biggest help for me was the high throughput performance of the new hardware platform that Cisco has been pushing. It's allowed us to have the most advanced next-gen firewall techniques today… coupling that with analytics and other platforms.
