Cisco UCS C460 M4 Rack Server Exceeds One Million Queries per Hour on the TPC-H Benchmark at the 3000-GB Scale Factor

Performance Brief
May 2016

The Cisco UCS® C460 M4 Rack Server delivers more than one million queries per hour while delivering the best nonclustered TPC-H benchmark performance at the 3000-GB scale factor.

Industry-Leading Performance for Decision Support
Crossing the one million query-per-second threshold for a four-socket server is a milestone. So is the fact that, powered by the same Intel® Xeon® processor E7-8890 v3 CPUs, Cisco delivers 15-percent better performance and 17-percent better price/performance than the nearest competition on the nonclustered TPC-H benchmark at the 3000-GB scale factor (compare to Lenovo x3850 X6 server results).

This newest result (Table 1) offers a dramatic example of how the Intel Xeon processors, massive memory capacity, internal solid-state disk (SSD) storage, and PCIe storage acceleration of the Cisco UCS C460 M4 Rack Server deliver data warehouse performance for databases running on Microsoft SQL Server 2016 Enterprise Edition. When you incorporate servers such as the Cisco UCS C460 M4 as part of the Cisco Unified Computing System™ (Cisco UCS), you can run your other Microsoft and non-Microsoft workloads in the same unified system with integrated management and low-latency, 10- and 40-Gbps unified fabric connectivity between servers.

TPC-H Benchmark

The TPC-H benchmark is an industry-standard decision-support system benchmark. It is designed to measure the capability of a system to examine large volumes of data, process queries with a high degree of complexity, and return answers to critical business questions. The TPC-H benchmark evaluates a composite performance metric (QphH@size) and a price-to-performance metric...
Cisco UCS C460 M4 Rack Server Exceeds One Million Queries per Hour on the TPC-H Benchmark at the 3000-GB Scale Factor

Record-Setting Performance

These benchmark results demonstrate the highest nonclustered TPC-H result ever reported at the 3000-GB scale factor, so you can have confidence in the performance of Cisco servers.

Disclosures

The Transaction Processing Performance Council (TPC) is a nonprofit corporation founded to define transaction processing and database benchmarks, and to disseminate objective and verifiable performance data to the industry. TPC membership includes major hardware and software companies. TPC-H, QphH, and $/QphH are trademarks of the TPC. The performance results described in this document are derived from detailed benchmark results available as of May 16, 2016, at http://www.tpc.org/tpch/default.asp.

Cisco UCS C460 M4 Rack Server

The Cisco UCS C460 M4 delivers the balanced I/O, memory, and computing capacity needed for large-scale analytical and business intelligence applications. The system is a 4-rack-unit (4RU) rack server that supports the following Intel Xeon processor E7 family CPUs: E7-8800 v2, v3, and v4; E7-4800 v2, v3, and v4; and E7-2800 v2. The server supports up to 6 terabytes (TB) of double-data-rate-3 (DDR3) or DDR4 memory in 96 slots, and up to 12 Small Form-Factor (SFF) hot-swappable SAS, SATA, or SSD drives.

Benchmark Configuration

For the benchmark, the server was equipped with 3 TB of memory and four 2.5-GHz Intel Xeon processor E7-8890 v3 CPUs. The system ran Microsoft SQL Server 2016 Enterprise Edition and Windows Server 2012 R2 Standard Edition.

The test database and log files resided on four 1600-GB SanDisk Fusion-io memory SX350 PCIe Application Accelerators and four 400-GB Enterprise Performance SAS SSDs respectively. The SSD drives were accessed through a Cisco 12-Gbps SAS Modular RAID Controller with a 1-GB flash-backed write cache module.

($/QphH@size) that measure the performance of various decision-support systems by running sets of queries against a standard database under controlled conditions.

Figure 1 At the 3000-GB Scale Factor the Cisco UCS C460 M4 Rack Server Beats Lenovo by 17 Percent in Price/Performance

With 10 full-height Generation 3 PCI Express (Gen3 PCIe) slots, the server supports massive I/O capacity and the capability to accommodate graphics engines to accelerate rendering operations.
