How good are you at speaking switch?

If your data center could talk right now, it would say:

01. The traffic these days is terrible. There's so much of it that everything just ends up in a huge tangle. And that's just the beginning.

02. By 2020, we'll have 3X the traffic in our own private cloud.

03. There are so many things happening right here and in different clouds that I can't keep track. But we need to. Because by 2020, 70% of enterprise spend will be cloud based.

I'm not even human, and security worries are keeping me up at night. These worries won't go away either. Through 2020, 95% of cloud security failures will be the customer's fault.

When you upgrade to the Cisco Nexus 9000 Series Switch, you answer your data center concerns with a switch that will:

01. Welcome all the Gs. Handle all the next-gen bandwidth—10G, 25G, 40G, 50G, 100G—without breaking a sweat. And without breaking the bank.

02. Bring back your lunch hour. Work smoothly across all workloads, optimize workflow, automate manual processes, and provide 44% IT staff time savings. More time for new projects. And fries.

03. Show you exactly what's happening, where, and why. Gain 100% visibility across every flow, from any virtual machine, in any cloud, wirelessly. And 100% accuracy on every app connection. You'll know how your data center is at the center of digital transformation.
