How good are you at speaking switch?

If your data center could talk right now, it would say:

1. The traffic these days is terrible. There’s so much of it that everything just ends up in a huge tangle.

2. There are so many things happening right here, and in different clouds that I can’t keep track. But we need to. By 2020, we’ll have 3X the traffic in our own private cloud.

3. I’m not even human, and security worries are keeping me up at night. Those worries won’t go away, either. Through 2020, 95% of cloud security failures will be the customer’s fault.

When you upgrade to the Cisco Nexus 9000 Series Switch, you answer your data center concerns with a switch that will:

01 Welcome all the Gs.

02 Bring back your lunch hour.

03 Show you exactly what’s happening, where, and why.
