Payment Card Industry Data Security Standard
Preparing for the June 30, 2018, deadline to disable SSL/early TLS

Are you compliant with PCI DSS?
This white paper presents information about the Payment Card Industry (PCI) Data Security Standard (DSS). PCI DSS is applicable to any entity that accepts credit cards as a payment method or that stores, processes, or transmits a cardholder’s data.

PCI DSS overview
The PCI Security Standards Council is a global organization founded in 2006 by American Express, Discover, JCB International, MasterCard, and Visa Inc. The council maintains, evolves, and promotes Payment Card Industry standards for the safety of cardholder data. The individual payment brands share equally in the governance and execution of the council’s work.

What is PCI DSS?
- PCI DSS provides a baseline of 12 technical and operational requirements, which are designed to protect cardholder data and mirror security best practices (Table 1).
- PCI DSS applies to all entities that engage in card processing, including merchants, processors, acquirers, issuers, and all other payment service providers.
- PCI DSS also applies to all entities that store, process, or transmit Cardholder Data (CHD) and/or Sensitive Authentication Data (SAD).

Note: This white paper does not discuss the entire set of PCI DSS requirements. It focuses mainly on requirements 2 and 4, which have the greatest impact on Cisco® collaboration endpoints and systems.

Table 1. PCI DSS goals and requirements

<table>
<thead>
<tr>
<th>Goals</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build and maintain a secure network</td>
<td>1. Install and maintain a firewall configuration to protect cardholder data</td>
</tr>
<tr>
<td></td>
<td>2. Do not use vendor-supplied defaults for system passwords and other security parameters</td>
</tr>
<tr>
<td>Protect cardholder data</td>
<td>3. Protect stored cardholder data</td>
</tr>
<tr>
<td></td>
<td>4. Encrypt transmission of cardholder data across open, public networks</td>
</tr>
<tr>
<td>Maintain a vulnerability management program</td>
<td>5. Protect all systems against malware and regularly update antivirus software or programs</td>
</tr>
<tr>
<td></td>
<td>6. Develop and maintain secure systems and applications</td>
</tr>
<tr>
<td>Implement strong access control measures</td>
<td>7. Restrict access to cardholder data by business need-to-know</td>
</tr>
<tr>
<td></td>
<td>8. Identify and authenticate access to system components</td>
</tr>
<tr>
<td></td>
<td>9. Restrict physical access to cardholder data</td>
</tr>
<tr>
<td>Regularly monitor and test networks</td>
<td>10. Track and monitor all access to network resources and cardholder data</td>
</tr>
<tr>
<td></td>
<td>11. Regularly test security systems and processes</td>
</tr>
<tr>
<td>Maintain an information security policy</td>
<td>12. Maintain a policy that addresses information security for employees and contractors</td>
</tr>
</tbody>
</table>

Cisco Unified Communications

**What are the implications?**

PCI DSS requirements must be met by June 30, 2018. The individual payment brands will enforce compliance with PCI DSS and determine any penalties for noncompliance.

The payment brands may, at their discretion, fine a bank or finance institution from $5,000 to $100,000 per month for PCI compliance violations. Penalties are not openly discussed or widely publicized.
Qualified Security Assessor (QSA) companies are independent security organizations that have been qualified by the PCI Security Standards Council to validate an entity’s adherence to PCI DSS. QSA companies leverage certified assessment tools such as Nessus or Qualys to validate adherence to PCI DSS. For a complete list of vendors, refer to the QSA approved scanning vendors on the PCI security standards website.

How are on-premises unified communications affected by PCI DSS?

The PCI DSS v3.2 Frequently Asked Questions (FAQ) states:

“PCI DSS requirements apply wherever account data is stored, processed, or transmitted. While PCI DSS does not explicitly reference the use of VoIP, VoIP traffic that contains cardholder data is in scope for applicable PCI DSS controls, in the same way that other IP network traffic containing cardholder data would be. [...] VoIP traffic containing account data that is stored, processed or transmitted internally over an entity’s network, or transmitted externally by the entity, is in scope for applicable PCI DSS controls.”

Note: While VoIP is in scope for PCI DSS, the lack of explicit and in-depth considerations for VoIP systems has led to varied interpretations of what is required for PCI DSS compliance for VoIP systems.

What PCI DSS controls can be used to protect VoIP telephony systems?

Transport Layer Security

After June 30, 2018, all entities must end use of Secure Sockets Layer (SSL) and early versions of Transport Layer Security (TLS) as a security control and use only secure versions of the protocol. (Note: An allowance for certain point-of-sale POS and Point-of-Interaction (POI) terminals is described in the last bullet below.)

• Prior to June 30, 2018, existing implementations that use SSL and/or early TLS must have a formal Risk Mitigation and Migration Plan in place.

• POS and POI terminals (and the SSL/TLS termination points to which they connect) that can be verified as being not susceptible to any known exploits for SSL and early TLS may continue using these as a security control after June 30, 2018.

Two major PCI DSS requirements are highlighted as part of the migration:

2.3 – Encrypt all non-console administrative access with strong cryptography.

4.1 – Use strong cryptography and security protocols to safeguard sensitive cardholder data during transmission over open, public networks.

For more details on the migration from SSL and early TLS, refer to the PCI Security Standards Council Information Supplement.

Recommendations

The PCI DSS Council considers strong encryption to be a security best practice. It recommends the use of TLS 1.1 or later, and strongly encourages using TLS 1.2. SSL and early TLS (1.0) are not allowed under PCI DSS v3.2.

Cisco Collaboration Secured Architecture

Cisco is committed to a strong focus on security beyond PCI DSS compliance. You can find more details about Cisco Collaboration Secured Architecture at Cisco Preferred Architectures.
**Cisco Collaboration Software**

To support TLS 1.2, administrators should update the collaboration environment to software release 11.5.1 (SU3), and contact center software to release 11.6(1).

A software upgrade is required for the following applications:

- Cisco Unified Communications Manager
- Cisco Unified Contact Center Enterprise solutions
  - Cisco Unified Customer Voice Portal
  - Cisco Virtualized Voice Browser
  - Cisco Finesse
  - Cisco Unified Intelligence Center
  - Cisco Live Data
  - Cisco SocialMiner
  - Cisco Enterprise Chat and Email
  - Cisco Remote Expert Mobile
  - Cisco Unified Contact Center Management Portal
- Cisco Unified Contact Center Express solutions
- Cisco Customer Journey Platform
- IM and Presence
- Cisco Unity® Connection
- Cisco Prime® Collaboration Deployment for releases earlier than 11.5.1 (SU3)
Cisco voice endpoints

- **Legacy Cisco IP phones**
Consider replacing any legacy Cisco IP phones (6900, 7900, 8900, and 9900 Series) with newer models such as the 7800 or 8800 Series. The 7800 and 8800 Series phones support TLS 1.2. For more information, see Table 2 and the Cisco Endpoints portfolio page.

Alternatively, to comply with PCI DSS, administrators can configure and modify several parameters in legacy devices and servers. After these changes are applied to achieve compliance, the phones will lose some advanced functionalities and will become similar to a basic analog phone.

For more details about impacts on functionality due to modification of parameters, see Table 3.

- **Cisco IP Phones 7800 and 8800 Series**
Cisco IP Phones 7800 and 8800 Series should be upgraded with firmware release 12.1 in order to support TLS 1.2.

Table 2 lists the TLS support in Cisco IP phone models.

For more details on security improvements in the latest Cisco IP phones, please refer to the **Cisco IP Phone 7800 and 8800 Series Security Overview**.

Table 2. TLS support in Cisco IP phone series

<table>
<thead>
<tr>
<th>Phone models</th>
<th>Version</th>
<th>7900</th>
<th>6900, 8900, 9900</th>
<th>7811, 7821, 7841, 7861</th>
<th>8811, 8821, 8841, 8845, 8851, 8861, 8865</th>
</tr>
</thead>
<tbody>
<tr>
<td>TLS 1.0</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>TLS 1.2</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

- **Cisco Jabber**
To support TLS 1.2, administrators should upgrade Cisco Jabber® to Release 11.7 or later.

Cisco IP Communicator does not support TLS 1.2. Cisco recommends upgrading to Cisco Jabber Release 11.7 or later instead of using IP Communicator.

Table 3. Restrictions and Workarounds for Legacy Voice Endpoints in an environment where TLS 1.0/1.1 are disabled

<table>
<thead>
<tr>
<th>Feature</th>
<th>Restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy phones in Encrypted mode</td>
<td>Legacy phones in Encrypted mode will not work. There is no workaround.</td>
</tr>
<tr>
<td>Legacy phones in Authenticated mode</td>
<td>Legacy phones in Authenticated mode will not work. There is no workaround.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Feature</th>
<th>Restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP phone services using secure URLs based on HTTPS</td>
<td><strong>Restriction</strong>&lt;br&gt;IP phone services using secure URLs based on HTTPS will not work.&lt;br&gt;Workaround to use IP phone services: Use HTTP for all underlying service options (for example, corporate directory and personal directory). HTTP is not recommended, since it is not secure for sensitive data for features such as Extension Mobility.&lt;br&gt;Drawbacks of using HTTP include:&lt;br&gt;• Provisioning challenges when configuring HTTP for legacy phones and HTTPS for supported phones.&lt;br&gt;• No resiliency for IP phone services.&lt;br&gt;• Performance impacts on the server handling IP phone services.</td>
</tr>
<tr>
<td>Extension Mobility Cross Cluster (EMCC) on legacy phones</td>
<td>EMCC is not supported with TLS 1.2 on legacy phones.&lt;br&gt;Workaround to enable EMCC:&lt;br&gt;1. Enable EMCC over HTTP instead of HTTPS.&lt;br&gt;2. Turn on mixed mode on all Cisco Unified Communications Manager clusters.&lt;br&gt;3. Use the same USB e-tokens for all Cisco Unified Communications Manager clusters.</td>
</tr>
<tr>
<td>Locally Significant Certificates (LSC) on legacy phones</td>
<td>LSC is not supported with TLS 1.2 on legacy phones. As a result, 802.1X and phone VPN authentication based on LSC are not available.&lt;br&gt;Workaround for 802.1X: Authentication based on MIC or password with EAP-MD5 on older phones. However, those are not recommended.&lt;br&gt;Workaround for VPN: Use phone VPN authentication based on end-user username and password.</td>
</tr>
<tr>
<td>Encrypted Trivial File Transfer Protocol (TFTP) configuration files</td>
<td>Encrypted TFTP configuration files are not supported with TLS 1.2 on legacy phones, even with a Manufacturer Installed Certificate (MIC). There is no workaround.</td>
</tr>
<tr>
<td>Cisco Unified Communications Manager certificate renewal causes legacy phones to lose trust</td>
<td>Legacy phones lose trust when the Cisco Unified Communications Manager certificate is renewed. For example, a phone cannot get new configurations after renewing the certificate. This is applicable only in Cisco Unified Communications Manager 11.5.1.&lt;br&gt;Workaround: To prevent legacy phones from losing trust, complete one of the following steps:&lt;br&gt;1. Temporarily allow TLS 1.0 (multiple Cisco Unified Communications Manager reboots).&lt;br&gt;2. Before enabling the CUCM certificate, set the Cluster For Roll Back to Pre 8.0 enterprise parameter to True. By default, this setting disables the security.</td>
</tr>
</tbody>
</table>
## Feature

<table>
<thead>
<tr>
<th>Feature</th>
<th>Restriction</th>
</tr>
</thead>
</table>
| Connections to nonsupported versions of Cisco Unified Communications Manager | TLS 1.2 connections to older versions of Cisco Unified Communications Manager that do not support the higher TLS version do not work. For example, a TLS 1.2 SIP trunk connection to Cisco Unified Communications Manager Release 9.x does not work because that release does not support TLS 1.2. You can use one of the following workarounds:  
  - Use nonsecure trunks, although this is not recommended.  
  - Upgrade the nonsupported version to a release that does support TLS 1.2. |
| Certificate Trust List (CTL) client | The CTL client does not support TLS 1.2.  
  Workarounds:  
  - Temporarily allow TLS 1.0 when using the CTL client and then move the cluster to Common Criteria mode. Configure the Minimum TLS to 1.1 or 1.2.  
  - Migrate to the Tokenless CTL by using the CLI command `utils ctl setcluster mixed-mode` in Common Criteria mode. Configure the Minimum TLS to 1.1 or 1.2. |
| Address book synchronizer | There is no workaround. |

## Cisco video endpoints

- **Legacy Cisco TelePresence**  
  - Newer Tandberg Codec (TC) endpoints support Collaboration Endpoint Software (CE) Release 9.1(3).  
  - For legacy TC endpoints such as C-Series, EX, MX200 or MX300 G1, or Profile, consider upgrading to Cisco TelePresence® TC software release 7.3(11).  
  - Legacy immersive systems such as the TX9000 series and Cisco TelePresence System will not support TLS 1.2.

- **Cisco Collaboration Endpoint Software**  
  Consider upgrading any CE endpoints (Cisco DX70 or DX80 or Cisco TelePresence MX200 or MX300 G2, MX700 or MX800, or SX Series) to Cisco CE software release 9.1(3).

  *Note: Cisco DX650 endpoints on Android should be replaced with newer hardware. This model is not PCI DSS compliant.*
Summary of endpoint considerations

For details on all other components, please refer to the Compatibility Matrix.

Table 4. Suggested hardware migrations

<table>
<thead>
<tr>
<th>If you have...</th>
<th>Cisco recommends...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy telephones: 9900, 8900, 7900, 6900 Series</td>
<td>Replace legacy phones with Cisco IP. Phone 8800 or 7800 Series that support TLS 1.2.</td>
</tr>
<tr>
<td>Legacy video systems: TX or CTS Series, DX 650</td>
<td>Replace legacy video systems with Cisco DX Series, SX Series, MX Series, or Cisco Spark Room Series.</td>
</tr>
<tr>
<td>Software clients: Cisco Jabber or IP Communicator</td>
<td>Replace legacy IP Communicator with Cisco Jabber Release 11.7 or later.</td>
</tr>
</tbody>
</table>

Find more information about the current portfolio on the Cisco Endpoints portfolio page.
Summary
The PCI Data Security Standard v3.2 requires systems handling card data to comply by June 30, 2018. Customers using Cisco endpoints, Cisco Unified Communications, Cisco Unified Contact Center, and Customer Journey Platform are encouraged to develop action plans to comply with this standard by identifying potentially noncompliant devices and software versions and making any necessary changes, including upgrading hardware and software if needed.

Please contact your Cisco account team or Cisco partner for additional information and support.
