Virtual collaboration saved one organization 30% in management and infrastructure costs

5 essentials for the digital workplace.

It’s not news. Workplaces are going digital. An effective digital workplace, whether it be a software development office, a retail distributor, or a manufacturing facility, boosts productivity and makes it easier for employees to get their jobs done quickly and with more accuracy.

1. Keep employees connected.

Employees need to access business applications in ways that work for them. It’s the best way to help them stay productive and innovative. The decision to provide employees with devices or opt for a bring-your-own-device (BYOD) policy depends on your security protocols and your business needs.

2. Give people the right tools for the job.

Provide access to the applications employees need, no matter where they are. The best business apps help teams work seamlessly, even if team members are traveling, working from home, or in a different location, moving files, emails, and collaborating on project documents in real time.

3. Invest in video.

There are times when an in-person meeting isn’t possible, but email or phone isn’t enough. Real-time presence combines voice, video, and content sharing, improving communication quality, building trust, and eliminating errors.

4. Choose the right infrastructure.

Even small gaps in connectivity can hurt your business. Plus, more and more BYOD, cloud collaboration, and cloud-based applications can be a risk for a reliance on hardware. Companies need a robust infrastructure that can support these innovations.

5. Secure your digital space.

As the threat to your business is resized, traditional security solutions aren’t enough. Today’s workforce needs security solutions that protect your network across the attack continuum.
