Profile Introduction

This document focuses on a typical 3-tier design used in storage area network (SAN) environments of banking customers. This is sometimes referred as *edge-core-edge* design. Within the 3-tier design, servers and storage devices are connected to edge switches. Both sets of edge switches connect to core switches through inter-switch links.

Switches used in the profile were Multilayer Director class 9700, as well as the 9500 series in some cases. They provide uncompromised availability, scalability, flexibility, security, ease of management, and transparent integration of new technologies. With data centers continually growing, SAN administrators can now design networks that meet their current needs and can scale for demanding growth. Cisco MDS 9710 and 9706 Multilayer Director class switches, along with MDS 9513, provide embedded features to help SAN administrators in these tasks.

Among the challenges specific to these environments are:

- **High availability**—MDS directors offer redundancy for all major components, with 1+1 redundant supervisors, N:N grid-redundant power supplies, and N+1 redundant backplane fabric modules. The N+1 redundancy on fabric modules provides protection against any loss of bandwidth if one of the fabric modules fails.
- **Performance and scalability**—MDS 9700 directors provide bandwidth of up to 1.5 Tbps per slot. MDS 9700 directors are designed to support line-rate 32 Gbps Fibre Channel on the same platforms in the future, without needing to replace the chassis. The MDS 9700 directors enable scale-out and scale-up architectures by providing the highest scale numbers.
- **Slowdrain detection**—The MDS directors are also architected to detect slow drain problems in the network. Slow drain problem in the fabric can occur due to several reasons such as server performance issues, host bus adapter issues, and speed mismatches between fast and slow devices in a network. Hardware-based slow drain detection in MDS switches happens at a granularity of 1 ms, which is almost instantaneous. MDS switches can also recover based on features such as stuck port recovery, congestion drop, and no-credit drop.
- **Operational simplicity**—Cisco Data Center Network Manager (DCNM) provides end-to-end visibility into the SAN network through a single-pane view, enabling effective health monitoring, diagnostics, and troubleshooting through GUI-based utilities. Cisco MDS also uses single operating system NX-OS across MDS product portfolio, along with Nexus switches. This helps with ease of installation, configuration, monitoring, and troubleshooting using the same set of CLI commands across the Cisco DC product lineup.
- **Interoperability**—MDS directors can interoperate with other SAN vendor switches such as Brocade. The switch needs to operate in interop mode and should be running the recommended code version mentioned here for working with other vendor switches.
- **Replication**—MDS directors can facilitate in remote data replication among the data centers using IP Storage Services Module. The ability to efficiently replicate critical data on a global scale not only ensures a higher level of protection for valuable corporate information but also promotes increased utilization of backup resources, reduces the impact of a catastrophic failure at a single site, and lowers total cost of storage ownership. Inter-VSAN routing (IVR) can help in routing between virtual storage area networks (VSANs) of different data centers during replication.

The following table summarizes key areas on which this profile focuses.

Table 1 *Multilayer Director storage profile summary*

Deployment areas	Features/hardware
High availability	Redundant supervisor Redundant fabric module Redundant power supply and fans
Performance and scalability	Maximum supported zones, per the scalability guide Maximum supported device-alias, per the scalability guide Maximum supported zone db size, per the scalability guide
Slowdrain detection	Port Monitor Port Guard (using Port Monitor) DCNM monitoring
Operational simplicity	DCNM Device Manager Same NX-OS In-Service Software Upgrade (ISSU)
Interoperability	VSAN interop mode
Replication	FCIP IVR

Network Profile

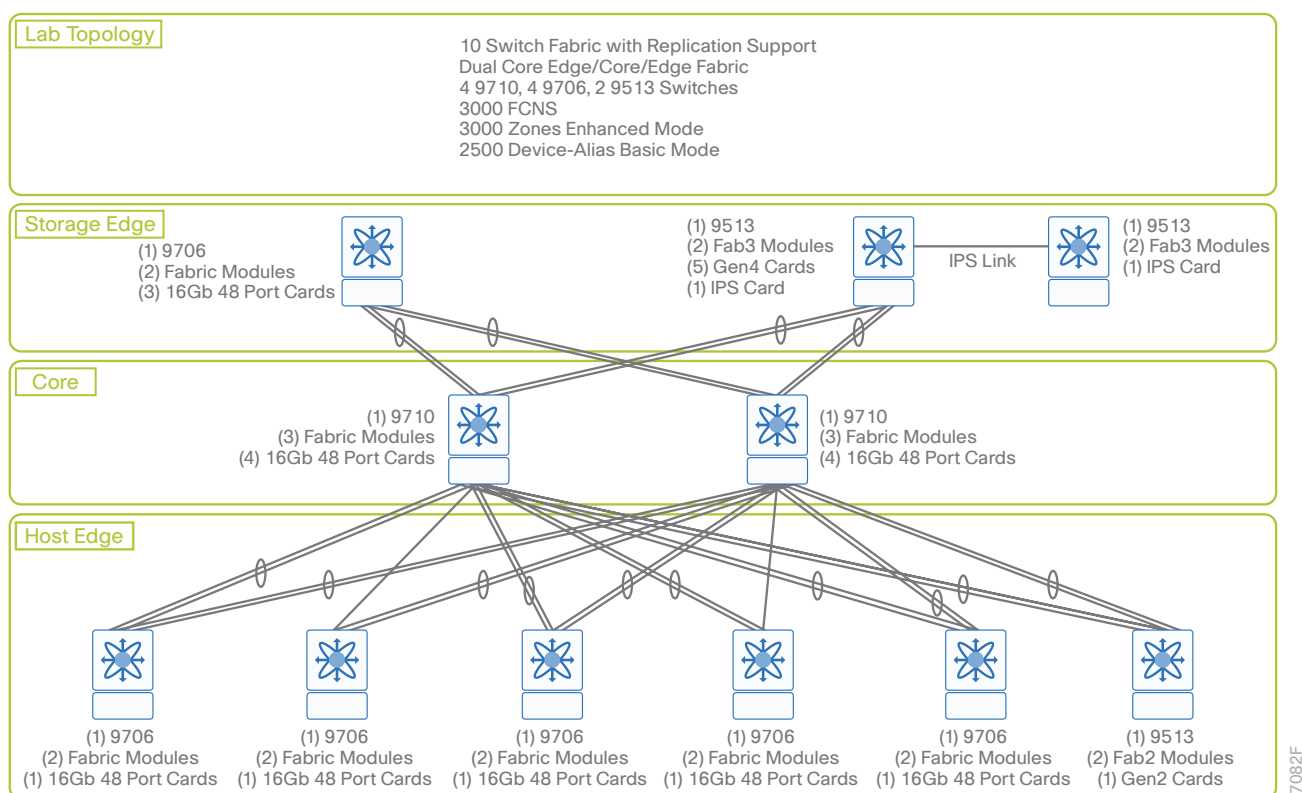

Based on research, customer feedback, and configuration samples, this profile is designed with a deployment topology that is generic and can easily be modified to fit any specific deployment scenario.

TOPOLOGY DIAGRAM

Figure 1 shows the 3-tier design used for validation of this profile.

The topology represents a typical edge-core-edge deployment with 9710s in the core layer and 9706/9513 as edge switches. There is also an FCIP link between 9513 switches in the edge.

Figure 1 Topology overview

7082F

HARDWARE PROFILE

Table 2 defines the set of relevant hardware, servers, test equipment, and endpoints that are used to complete the end-to-end profile deployment.

This list of hardware, along with the relevant software versions and the role of these devices, complements the actual physical topology that is defined in Figure 1.

Table 2 Hardware profile

VM and HW	Description
MDS 9710	Core switches
MDS 9706	Edge switches for server and storage
MDS 9513	Edge switches for server and storage+replication
JDSU	Traffic generation and congestion for slow drain scenarios
UCS servers	TACACS server, DCCM server, and SNMP polling
Laptop	DCCM client

TEST ENVIRONMENT

This section describes the features and the relevant scale (wherever applicable) at which the features are deployed across the physical topology. Based on the use cases, which are mentioned in a later section, scale is increased to the maximum supported number, per the scalability guide. Table 3 lists the scale for each feature.

Table 3 Base feature scale

Feature	Scale
Fabric size	10 switch fabric
Platform	Four 9710, four 9706, two 9513 switches
VSANs	2 including default
FCNS	3000
Zoning (enhanced mode)	3000
Device-alias (basic mode)	2500
NPIV	Enabled in edge hosts
RBAC	Customized roles defined
AAA	TACACS +
Port Monitor	Configured on trunk and access ports
CallHome	Enabled
CFS	CFS region used for device-alias
Slow drain	Alerts are configured
DCCM	Integrated with external oracle database
SNMP	SNMP MIB walks

Use Case Scenarios

TEST METHODOLOGY

The use cases shown in Table 4 will be executed using the topology shown in Figure 1, along with the test environment already explained in this document. With respect to the longevity for this profile setup, the CPU and memory usage would be monitored overnight as well as during the weekends, along with any mem-leak checks. In order to test robustness, certain negative events would be triggered during the use case testing.

USE CASES

Table 4 describes the use cases that were executed on this profile. These use cases are divided into buckets of technology areas to show the complete coverage of the deployment scenarios.

The customer use case is composed of system upgrade/bring-up, operational triggers/configuration changes, steady state/usability, network events/link flaps, and resiliency/error recovery.

Table 4 List of use case scenarios

No.	Focus area	Use cases
System upgrade/bring-up		
1	Hardware migration	<ul style="list-style-type: none"> ▪ Brownfield (mixed fabric) migration from 9500 to 9700 ▪ Pure 9500 fabric -> mixed fabric -> pure 9700 fabric ▪ Greenfield (pure 9700 fabric) upgrade in 9700 environment ▪ Interop migration from brocade to 9700
2	Software upgrade—ISSU	<ul style="list-style-type: none"> ▪ Different software version combinations in Brownfield (mixed fabric) and Greenfield (pure 9700 fabric) deployments ▪ Use of CLI for upgrade ▪ Use of DCNM for upgrade (batch upgrade of multiple switches) ▪ Scale configuration
3	Control plane sync	<ul style="list-style-type: none"> ▪ Synchronization monitored across fabric for different applications like zone, device alias, fcns, fcdomain, cfs, etc. using CLI and DCNM
4	Traffic flow	<ul style="list-style-type: none"> ▪ Traffic flows monitored across fabric using CLI and DCNM ▪ Flows are mainly FC (host to storage) and FCIP (storage to storage) flows

Table 4 continued

Steady state/usability		
5	Multiple instances of DCNM	<ul style="list-style-type: none"> Managing different software versions of switches
6	Longevity and soak	<ul style="list-style-type: none"> Memory leak checks Traffic flow verification Control plane application counter verification
Operational triggers/configuration changes		
7	Zoneset activation/merge with maximum supported scale numbers	<ul style="list-style-type: none"> Maximum supported zone db size, per the scalability guide in Brownfield (mixed fabric) and Greenfield (pure 9700 fabric) deployments Maximum supported zones/zonesets, per the scalability guide in Brownfield (mixed fabric) and Greenfield (pure 9700 fabric) deployments
8	Device-alias activation/merge with max supported scale numbers	<ul style="list-style-type: none"> Maximum supported device-alias, per the scalability guide in Brownfield (mixed fabric) and Greenfield (pure 9700 fabric) deployments
9	Addition of IVR in replication environment	<ul style="list-style-type: none"> IVR activation in replication environment IVR merger in replication environment
10	SNMP polling	<ul style="list-style-type: none"> Several instances of SNMP walk running. Specific SNMP OID polling
Network events/link flaps		
11	Slowport detection/diagnostics	<ul style="list-style-type: none"> Slow port scenario including sub 100 ms detection Stuck port scenario TxWait scenario for Gen4 and Luke LC Relevant Port Monitor/Port Guard configuration for all slow drain scenarios Diagnostics in DCNM Logs in form of syslog, rmon and OBFL
12	DCNM	<ul style="list-style-type: none"> Migration from post gre to oracle database OHMS/GOLD diagnostics access via Device Manager and CLI Loopback tests using DM/CLI
13	Convergence/redundancy	<ul style="list-style-type: none"> Measurement/comparison of traffic convergence during module reload, switch reload, link flap, and fabric module reload triggers
14	Switch reload	<ul style="list-style-type: none"> Fabric convergence during switch reload

Table 4 continued

Resiliency/error recovery		
15	Process crash	<ul style="list-style-type: none"> ▪ Stateless and stateful process restart after crash ▪ Process killing on every LC and SUP ▪ Process crashes leading to system switchover ▪ Process crashes when flash partition is full
16	Hardware failure	<ul style="list-style-type: none"> ▪ System recovery after ASIC, module, Xbar, SUP failure ▪ Any collaterals due to ASIC, module, Xbar, sup failure
17	Online Insertion and Removal (OIR)	<ul style="list-style-type: none"> ▪ System recovery after OIR of module, Xbar, power supply, fan, sup ▪ Any collaterals due to OIR of module, Xbar, power supply, fan, sup
18	ISSU with scale configuration	<ul style="list-style-type: none"> ▪ Any failures during ISSU with multi D scale configuration, per the scalability guide
19	Software and hardware counters	<ul style="list-style-type: none"> ▪ Clearing different software and hardware counters ▪ Sync between software and hardware counters
