5 ways your network can give you more security

Choose a network built on security, with the agility to support innovation.

1 Right person, right place, right time

Are you prepared to stop unexpected activity in its tracks? Cisco® Digital Network Architecture (DNA) simplifies the provisioning of network access to accelerate security operations and consistently enforce policy. Make sure you're ready to stop network threats and meet compliance goals more easily.

CISCO TRUSTSEC® >   SECURITY IMPLEMENTATION SERVICES >

//CODiE//

Cisco Stealthwatch is the 2016 CODiE winner for best network security solution.

2 Should that be happening?

Because sophisticated attackers often lurk undetected in the network interior, continuous monitoring is critical to network safety. Go beyond conventional threat detection and harness the power of network analytics. Embed security anomaly detection throughout the network, so you can uncover and stop attacks that bypass the perimeter.

3 Who goes where?

Software-defined security policies help simplify access control and maintain regulatory compliance and policy segmentation. When you dynamically control network access across wired, wireless, and VPN connections, your network can assess vulnerabilities and apply threat intelligence to reduce risks and contain suspicious devices.

4 Secure your branches

Organizations using Cisco TrustSec reported a reduction in operational costs ranging from

25–80%*

With Intelligent WAN, you can protect your extended network with the same encryption, visibility, and ease of management as your campus. Get secure connectivity and threat defense by taking advantage of VPN, firewall, network segmentation encryption techniques, and threat defense capabilities. Cisco DNA ensures that your branches get the security they need.
