Introduction

This guide provides a reference for the Cisco Telemetry Broker Manager web interface. Cisco Telemetry Broker (at times referred to as CTB in this document) enables you to ingest network telemetry from many inputs, transform the telemetry format, and forward that telemetry to one or multiple destinations.

Audience

This guide is designed for the person responsible for maintaining network telemetry flow and monitoring network telemetry.

Common Terms

The following terms appear in this guide:

Abbreviation	Description
Destinations	Locations to which Cisco Telemetry Broker forwards telemetry. Cisco Telemetry Broker supports multiple types of destinations.
Exporters	Devices on a customer's network that forward traffic to an Input on the Cisco Telemetry Broker. Exporters are typically defined by an IP address.
Inputs	Ways in which Cisco Telemetry Broker collects or receives telemetry from a customer network. Cisco Telemetry Broker supports multiple types of inputs.
Connections	User-defined logic that tells Cisco Telemetry Broker how to forward telemetry from a single input to a single destination.
Telemetry	Any type of data that the Customer produces that is useful for analytical purposes. Examples include UDP packets, IPFIX, syslog, and JSON.

If you are currently using UDP Director, note that you can import your existing forwarding rules as an XML file and import it into Cisco Telemetry Broker. You need to make sure you do this before you add any destinations. For more details, see [Import UDP Director Configuration](#).

Configure Accessibility Features

In order to have access to configure available website accessibility features, you must use Chrome as your browser when using the Cisco Telemetry Broker Manager web interface. Following are examples of some accessibility features you won't have the ability to configure if you use a browser other than Chrome. (This list is not comprehensive.)

The ability to do the following:

- Highlight each item on a web page
- Show color in compact tab bar
- Specify to never use certain font sizes

Common Abbreviations

The following abbreviations appear in this guide:

Abbreviation	Description
DNS	Domain Name Server
GB	Gigabyte
HTTPS	Hypertext Transfer Protocol (Secure)
NAT	Network Address Translation
SSH	Secure Shell
UDPD	UDP Director
URL	Universal Resource Locator
VLAN	Virtual Local Area Network
VM	Virtual Machine

Dashboard

This page provides a snapshot of the configuration settings, system health, main metrics, and licensing information for your Cisco Telemetry Broker system.

How to Find This Page

From the Cisco Telemetry Broker main menu on the left side of the page, choose **Dashboard**, or click the Cisco logo (in the upper left corner of the page).

View the Following Components

Inputs

This component displays telemetry for the last 24 hours for the following information:

- The number of inputs that have been configured in Cisco Telemetry Broker.
- The amount of telemetry received from all inputs.
- The average value is calculated from the last 30 days of telemetry.
- The number of inputs for which no connection has been configured. This number is represented by the number in the **No Destination** field.
- Each segment on the doughnut chart displays the amount of telemetry received from each input. When you hover your cursor over a segment of this chart, you can view the following information:
 - the input name
 - the amount of telemetry received from this specific input for the last 24 hours

Destinations

This component displays telemetry for the last 24 hours for the following information:

- The number of destinations that have been configured in Cisco Telemetry Broker.
- The amount of telemetry sent to all destinations.
- The average daily rate of telemetry sent to all destinations. The average value is calculated from the last 30 days of telemetry.
- The number of destinations not accepting telemetry that is being sent to them (represented by the number in the Unreachable field). If any unreachable destinations exist, an alert icon is displayed next to the number. To see the list of unreachable destinations, hover over this icon.

- Each segment on the doughnut chart displays the amount of telemetry sent to each destination. When you hover your cursor over a segment of this chart, you can view the following information:
 - the destination name
 - the amount of telemetry sent to this specific destination for the last 24 hours

Broker Nodes

This section is grouped by cluster, under the associated cluster name. If no high availability clusters exist, all broker nodes are grouped under the "No Cluster" subheading.

- Each arc shows the percentage of the broker node's received rate against the node's theoretical capacity. The arc is marked with the applicable color. Refer to the following table for an explanation of an arc's color.

Color	Definition
Red (Critical)	The percentage of capacity reached for the broker node is 100%.
Orange (Warning)	The percentage of capacity reached for the broker node is from 80% to 99.99%.
Blue (Informational)	The percentage of capacity reached for the broker node is < (less than) 80%.

- To access a broker node's page, click the node's name.
- If a broker node has any alerts, an alert icon is displayed next to the node name. To see the list of all existing alerts for that broker node, hover over the alert icon.

Alerts

Alerts are messages that indicate that your system may not be working correctly or that you need to check an area on your system.

The Alerts component lists up to the last 10 alerts that have either occurred and are still active or that have been resolved. To view additional alerts, click the **See more...** link at the bottom of the component.

Alerts marked by a red critical icon or an orange warning icon are still active. Refer to the following table for more information about these icons.

Alert Type	Definition
Critical 	Indicates that an exceptional condition impacting the overall system functionality is impacted and system operation is degraded. Refer to Appendix B for the complete list of alerts.
Warning 	Indicates a part of the system is misconfigured and/or is not working correctly. The overall system health is not impacted by this. Refer to Appendix B for the complete list of alerts.

Alerts that have been resolved are marked with a white check mark in a blue circle. The list begins with the newest alert at the top and ends with the oldest alert at the bottom. To view additional alerts, click the **See more...** link at the bottom of the list.

The following parameters apply to this component:

- By default, the list of the 10 most recent unresolved alerts (or less, depending on how many currently exist) is displayed. The number of unresolved alerts is displayed on the **Unresolved** button at the top of this component.
- To see a list of all the alerts, click the **All** button at the top of this component. The number of all alerts that have occurred is displayed on the **All** button at the top of this component.
- To filter by additional options, use the **Most Recent on Top** drop-down list.
- Alert entries contain the following information:
 - Alert name.
 - Associated broker node, input, or destination. Click a broker node name to open its Broker Node Details page, and click an input name to open its Input Details page. Some alerts might also contain the associated destination name.
 - The date and time the alert began. Resolved alerts also display the date and time it was resolved.

CPU

For both the Manager node and each broker node, this component shows the following telemetry information for the last 30 days:

- Number of CPUs available.
- Percentage used of the available CPUs (represented by the bar color).

- The 1-minute load average per the number of available CPUs for each broker node (to see this data, hover over the broker node name.)

Refer to the following table for an explanation of the color displayed on each bar.

Color	Definition
Red (Critical)	The percentage of maximum CPU load reached for the node is 100%.
Orange (Warning)	The percentage of maximum CPU load reached for the node is from 80% to 99.99%.
Blue (Informational)	The percentage of maximum CPU load reached for the node is < (less than) 80%.

Licensing

This component displays telemetry for the last 14 days.

- The dotted blue line shows the average GB per day for the last 7 days. To see this number, hover your cursor over the dotted line. This number is the entitlement number sent to Smart Software Licensing for calculating license fees, and it will match the value displayed on the Telemetry Broker Smart Licensing page.
- Each bar in the chart represents a different day. The bar at the rightmost side of the chart represents the previous day and then proceeds to each prior day as you move to the left.
- To see the exact amount of GB received for a specific day, hover your cursor over the associated bar. The date associated with this bar is also displayed.
- If a product is not yet registered, a warning displays in the upper right corner showing how many days remain until the trial license expires.

Telemetry Flows

This component displays telemetry for the last 24 hours.

- The different types of telemetry received by all inputs (represented by telemetry on the left side of the chart) and sent to all destinations (represented by telemetry on the right side).
- To show the exact value for a flow, hover your cursor over the flow to open its tooltip.

-
- For Cisco XDR destinations, the telemetry statistics displayed here represent uncompressed data sent to Cisco XDR. Therefore, these statistics may be disproportionate to the actual telemetry sent (represented in the Destinations component).

Metrics

The charts in this section display the following data for the last 24 hours:

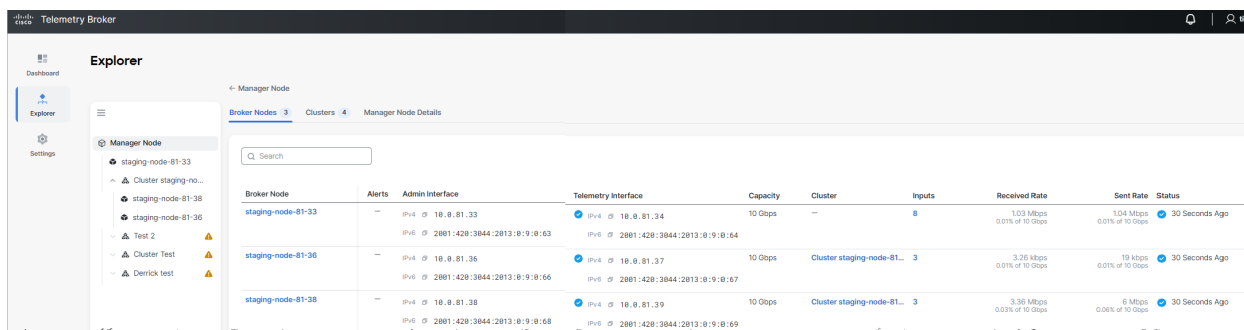

Total Received Rate The total amount of telemetry received from all inputs.

Total Sent Rate The total amount of telemetry sent to all destinations.

Explorer

After you choose **Explorer** from the main menu on the left side of the page, the Manager Node page opens by default, and the following tabs are displayed at the top of the page, with the Broker Nodes tab chosen by default:

- **Broker Nodes**
- **Clusters**
- **Manager Node Details**

When you choose a ...	The following tabs are displayed at the top of the page ...
broker node from the Tree View	<ul style="list-style-type: none"> • Data Flow • Inputs • Destinations • Broker Node Details
cluster from the Tree View	<ul style="list-style-type: none"> • Data Flow • Inputs • Destinations • Cluster Details

How to Find This Page

From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.

Navigate the Tree View

On the left side of this page is the Tree View, a menu from which you can view information on several different pages (described in the sections below). The breadcrumbs near the top of this page shows you where you are in relation to the options you have chosen from this menu.

Use the  (**Tree View**) icon to toggle between closing and opening the Tree View.

Within the Tree View you can see the following hierarchy of information listed. Level 1 is at the top of the Tree View (Manager Node), and as you move down the list, each subsequent level (nested underneath its parent) is listed, ending in Level 3 entries at the bottom of the Tree View.

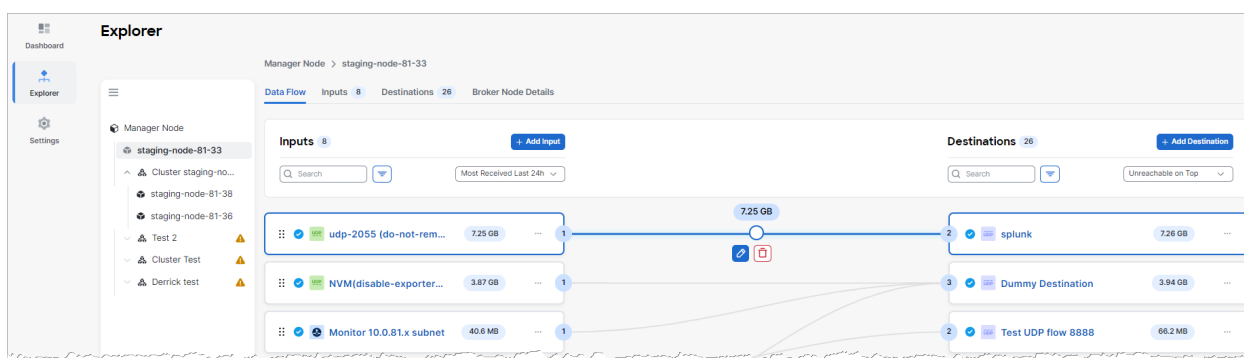

When you click this entry type from the Tree View...	This page opens...
<p>Level 1: Manager node</p>	<p>The Broker Nodes page with a list of all the broker nodes in your Cisco Telemetry Broker system.</p> <p>You can also choose from the following tabs from this view:</p> <ul style="list-style-type: none"> • Clusters Lists all the clusters in your Cisco Telemetry Broker system. • Manager Node Details Provides details about the Manager node.
<p>Level 2: A stand-alone broker node or a cluster</p>	<p>The Data Flow page, showing how the inputs assigned to the entity you chose (stand-alone broker node or cluster)</p>

When you click this entry type from the Tree View...	This page opens...
	<p>are connected to destinations.</p> <p>You can also choose from the following tabs from this view:</p> <ul style="list-style-type: none"> • Inputs Lists the inputs assigned to the entity (broker node or cluster) you chose. • Destinations Lists the destinations in your Cisco Telemetry Broker system. • Broker Node Details Provides details of the broker node (if you chose a broker node). • Cluster Details Provides details of the cluster you chose (if you chose a cluster).
<p>Level 3: A broker node contained within a particular cluster</p>	<p>The Data Flow page, showing how the inputs assigned to the broker node are connected to destinations.</p> <p>You can also choose from the following tabs from this view:</p> <ul style="list-style-type: none"> • Inputs Lists the inputs assigned to the broker node. • Destinations Lists the destinations in your Cisco Telemetry Broker system. • Broker Node Details Provides details of the broker node.

Data Flow

This page shows how the inputs are connected to the various destinations on a specific broker node, and allows you to add, update, or delete them. Note that in v2.2 and later, an input is local to a broker node or cluster. Adding, updating, or deleting an input on a broker node or cluster has no impact on any other broker node or cluster. This behavior is different from earlier versions where an input was shared among broker nodes and clusters, and you could choose to assign it to various broker nodes.

However, destinations continue to be global (they are shared among all the broker nodes). When you add, update, or delete a destination, these changes are reflected across all broker nodes and clusters.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**, then choose a broker node or cluster from the Tree View.
2. From the menu at the top of the page, choose **Data Flow**.

View Snapshot Information in Input and Destination Cards

- Input or destination status (indicated by a status icon). For more information, see [Alert and Status Icons](#).
- Type of input or destination (represented by a unique icon). Hover over the icon to see entity type.
- Input or destination name.
- Any applicable alert (indicated by an alert icon). For more information, see [Alert and Status Icons](#).
- The total data received (for inputs) or sent (for destinations) for the last 24 hours.

- The number of inputs or destinations for a particular entity.
 - (Input card) The number of destinations to which the input is connected, represented by the number on the right edge of each card (**12**). If a **Plus** icon is displayed, this indicates that the input has no connected destinations.
 - (Destination card) The number of inputs to which the destination is assigned, represented by the number on the left edge of each card (**12**).

View Data Flows

Input and Destination Cards

Each input and destination is represented by a card on the left and right sides of the page, respectively. Each card displays the following information.

The lines you see that connect various inputs to various destinations represent the connections that exist between those particular inputs and destinations. For information about adding connections, refer to the [Connections](#) section.

You can view the data flows for any input or destination by clicking an input or destination card.

You can click a connection between an input and a destination to see the following information:

- The  (**Edit Connections**) icon . See [Data Flow](#).
- The  (**Remove**) icon. See [Data Flow](#).
- The **44.4 MB** (**Sent Last 24**) icon. This number represents the amount of telemetry sent from the associated input to the associated destination for the last 24 hours.

Refer to the following table to learn what visual changes occur when you click vs. when you hover over a card. These visual changes enable you to more easily see the information related to the card you have chosen.

Click vs. Hover

When you ...	The ...
Hover over a card	<ul style="list-style-type: none"> • Border of the card turns blue. • Data flow lines for that input or destination turn dark blue. All other lines on the Data Flow page remain light blue.

When you ...	The ...
Click a card	<ul style="list-style-type: none"> • Border of the card turns blue. • Data flow lines for that input or destination turn dark blue. All other lines on the Data Flow page remain gray.

To deselect a card, click it again or click anywhere outside the card (including clicking on another card).

Alert and Status Icons

To view the description for an existing alert or status icons for a specific input or destination, hover your cursor over the associated icon. Refer to the following table for the various descriptions. For a list of Cisco Telemetry Broker alerts, see [Appendix B: Supported Alerts](#).

Alert Type	Definition
Critical 	Indicates that an exceptional condition impacting the overall system functionality is impacted and system operation is degraded. Refer to Appendix B for the complete list of alerts.
Warning 	Indicates a part of the system is misconfigured and/or is not working correctly. The overall system health is not impacted by this. Refer to Appendix B for the complete list of alerts.

Status Type	Definition
Active 	Input or destination is active.
Inactive 	Input or destination is inactive.

Filter Your Search

Filter

Use the  (**Filter**) icon to filter your search for inputs and destinations.

1. Click the  (**Filter**) icon in either the Inputs list or the Destinations list, depending on what you want to filter.
Either the Filter Inputs or Filter Destinations dialog opens, within which are filter options you can choose.
2. Choose as many filters as necessary, and when you are finished, click **Apply**.
3. (Conditional) If you want to reset the settings to what they originally were before you began to make changes, click **Reset**.

When you use one or more filters, all filters are ANDed together; therefore, all returned results must match the search criteria for all of the filters.

Clear Filters

If you receive one or more results but do not see any for which you are searching, it could be that you have configured too many filters. In this instance, we recommend that you eliminate one filter at a time to see if any of your intended results show.

- If you want to clear an individual filter field or apply additional filters, click the Filter button (which contains the number of filters applied). When the Filter panel opens, make your changes and click **Apply**. Click **Reset** to remove all filter criteria.

Search

In the Search field, type the name of the input or destination (depending on which list you are in) for which you are searching. As you start to type your entry, the field dynamically filters to display a list of entries that contains any of the characters you have entered.

Keep in mind that you can create multiple inputs with the same name as well as create multiple destinations with the same name. So if you search for an input or destination for which there are more than one with the same name, all matching entries will be displayed on the Data Flow page after your search has finished processing.

Import UDP Director Configuration

From either the UDP Director, or the Manager that manages the UDP Director, you can export your current UDP Director destination and rule configuration as an XML file and

import it into Cisco Telemetry Broker. For more details, see [Appendix C: Import UDP Director Configuration](#).

Once you have created your first destination, you no longer have the option to import a UDP Director configuration.

Importing a UDP Director configuration overwrites your current Cisco Telemetry Broker configuration, including all currently configured inputs, destinations, and rules.

Inputs

On the right edge of each card, either the  (**Plus**) icon or the  (**Connected Destinations**) icon is displayed.

- If a **Plus** icon is displayed, this indicates that the input has no connected destinations.
- The **Connected Destination** icon displays the number of destinations to which the input is connected. When you hover over it, it changes to the **Plus** icon.
- To view details for an input, on the applicable card, click the  (**Ellipsis**) icon > **View Input**.

View an Input

On the applicable card, click the  (**Ellipsis**) icon > **View Input**.

Add an Input

1. Click **Add Input** in the upper right corner of the Inputs list.
The Add Input dialog opens.
2. Choose the input type from the drop-down list and click **Next**.
The second Add Input dialog opens.
3. Configure all applicable fields and click **+ Add Input**.
The Assignments dialog opens.

Edit an Input

1. Click the Input name within the applicable card, or, on the applicable card, click the  (**Ellipsis**) icon > **Edit Input**.
The Edit Input dialog opens.

2. Make your edits. To view details for this input on the Input Details page, click the

(**View Details**) icon .

3. When finished, click **Save**.

Copy an Input

To copy an input to a broker node or cluster, complete either of the following procedures.

Via the Input Card

1. On the applicable input card, click the **⋮ (Ellipsis)** icon > **Copy Input**.

The Copy Input dialog opens.

2. Configure all applicable fields and click **Save**.

Drag and Drop

1. Hold the left-click button on your mouse and drag the input card over the top of the applicable broker node listed in the menu on the left.

When you release the left-click button, the Copy Input dialog opens.

2. Configure all applicable fields and click **Save**.

Delete an Input

1. On the applicable input card, click the **⋮ (Ellipsis)** icon > **Delete Input**.
2. In the Remove Input dialog, click **Remove**.

Destinations

On the left edge of each card, the **12 (Connected Inputs)** icon is displayed. This icon represents the number of inputs to which the destination is connected

View a Destination

On the applicable destination card, click the **⋮ (Ellipsis)** icon > **View Destination**.

Add a Destination

1. Click **Add Destination** in the upper right corner of the Destinations list.

The Add Destination panel opens.

2. Choose the destination type from the drop-down list and click **Next**.

The second Add Destination dialog opens.

3. Complete the applicable fields and click **+ Add Destination**.

The new destination card is now displayed in the Destination list on the Data Flow page.

Edit a Destination

1. On the applicable card, click the **⋮ (Ellipsis)** icon > **Edit Destination**.

The Edit Destination panel opens.

2. Make your edits. To view details for this destination on the Destination Details page,

click the  **(View Details)** icon .

3. Click **Save**.

Delete a Destination

On the applicable card, click the **⋮ (Ellipsis)** icon > **Delete Destination**.

Connections

Connect to a Destination

Do one of the following:

Drag and drop the applicable input card onto the applicable destination card.

OR

1. On the applicable input card, click the **⋮ (Ellipsis)** icon > **Connect to a Destination**.

The Connect to a Destination dialog opens.

2. Complete all applicable fields and click **Save**.

Edit a Connection

You can edit only UDP inputs, and for these inputs you can edit only the entries in the **Track data received against these** field. Use this field to add subnets over which you want this destination to received telemetry. Only traffic coming from exporter IPs within the specified subnet will be forwarded.

1. Click the connection line between the applicable input and destination, then click the  **(Edit)** icon.

The Connection panel opens.

2. Make your edits and **click Save**.

Delete a Connection

Click the connection line between the applicable input and destination, then click the  **(Remove)** icon.

The input and destination are no longer connected, so telemetry will no longer be sent from this input to this destination.

Broker Nodes

The Cisco Telemetry Broker Nodes page displays a list of all of your broker nodes.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.

The Manager Node option in the Tree View is enabled by default.

2. From the menu at the top of the page, choose **Broker Nodes**. Note that the number beside the Broker Nodes tab heading represents the total number of broker nodes.

View Broker Nodes

You can view the following information on this page:

- Broker node name
- Associated alerts
- Admin interface (Management Network) IPv4/IPv6 addresses
- Telemetry interface IPv4/IPv6 addresses
- Capacity of the broker node
- The high availability cluster to which the broker node belongs (if any)
- The number of inputs per node
- Received and Sent rate in bps
- Status of the broker node and the last time the Manager node communicated with it

As you start to type your entry in the Search field, the table dynamically filters to display a list of entries that contain the characters you have entered.

Sort Columns

Where applicable, use the ▲ (**Move Up**) icon and the ▼ (**Move Down**) icon at the top of a column to reverse the sort order of the column. Note that you must first click the column name before you can view the icons.

Copy Numeric Strings

Click the  (**Copy**) icon to copy numeric strings such as IP addresses and subnet masks.

View Details of a Broker Node

You can view more detailed information about a particular broker node. To do this, in the applicable row, click the desired broker node name in the Broker Node column. For information about this page, see the next section, [Broker Node Details](#).

Broker Node Details

On this page you can view details about a particular broker node.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.
2. Choose a broker node from the Tree View, then choose **Broker Node Details** from the menu at the top of the page.

OR

On the Broker Nodes page, in the Broker Nodes table, click the applicable broker node name in the Broker Node column.

View Details

Across the top of the page you can view the following information:

- Hostname and Admin interface (Management Network) IPv4/IPv6 addresses
- Status of the input and the last time it received telemetry
- Associated alerts
- Received rate (in bytes per second) for the last 24 hours
- Sent rate (in bytes per second) for the last 24 hours

Copy Numeric Strings

Click the  (**Copy**) icon to copy numeric strings such as IP addresses and subnet masks.

Telemetry Interface

This section contains the following information:

- Interface index
- Interface name
- MAC address
- PCI address

- Capacity (bps)
- IPv4 address/subnet prefix length
- IPv4 gateway address
- IPv6 address/subnet prefix length
- IPv6 gateway/address
- Interface MTU (bytes)

Monitor Interface

By default, the monitor interface is not selected. If you will be assigning a flow generator input to a particular broker node, then you need to select the monitor interface and configure its mtu. To do this, run `ctb-install --config` on the broker node.

 A broker node supports only one monitor interface.

This section contains the following information:

- Interface index
- Interface name
- MAC address
- PCI address
- Capacity (bps)
- Interface MTU (bytes)

Edit a Broker Node

To edit a broker node, complete these steps:

1. In the Telemetry Interface section, click the  (**Edit**) icon and make your desired changes.
2. Click **Save**.

Remove a Broker Node

When you remove a broker node from the Manager node, that broker node is deleted from the database, and it is no longer assigned to any of the inputs and destinations to which it was previously assigned. Though the broker node is still available for selection in the metric graphs, the name associated with it changes to the term "Broker Node" followed by the Broker Node's ID and the phrase "deleted." For example, Broker Node (ID 10) deleted.

The graphs still include data from the deleted broker node as long as data exists for that broker node. Once the data expires, the associated broker node is no longer available for selection from any of the Per Broker Node drop-down lists (located on the Destinations and Inputs pages).

Note the following parameters regarding the removal of a broker node:

- To ensure that the configuration information is deleted, you must run `ctb-manage` and select **deactivate**.
- If you do not complete the actions described in the previous bullet, the broker node continues to run with the previously saved configuration, and it does so without sending statistics to the Manager node.
- If you add back a previously deleted broker node to the same Manager node, you still need to configure it as a new appliance (assign a telemetry IP address, assign inputs, etc.)

To remove a broker node, complete these steps:

1. In the upper right corner, click **Remove Broker Node**.
2. In the Remove dialog, click **Remove**.

Back Up and Restore Inputs and Rules for a Broker Node

If you want to back up inputs and rules for an existing broker node, use the backup and restore options.

You might want to do this in the following scenarios:

- You want to remove a broker node but save its existing inputs and rules.
- You want to copy the existing inputs and rules of a broker node to a new broker node.

The process is as follows:

1. Complete a backup of the existing broker node's inputs and rules. On the Broker Nodes Details page of the broker node whose inputs and rules you want to back up, click **Backup Rules**.
2. Restore the inputs and rules of the broker node from Step 1 to the new broker node. On the Broker Nodes Details page of the new broker node, click **Restore Rules**.

Do not add, remove, or modify any destinations from the time the backup file is created and until it has been restored to the desired broker node, because this will cause the restore process to fail.

Note the following parameters:

- All existing inputs and rules are overwritten by the restoration file; however, the destinations that were associated with these inputs and rules are not deleted.
- You can back up and restore a broker node's inputs and rules only within the same Cisco Telemetry Broker deployment and same version.
- You cannot back up or restore inputs that require a password.

Metrics

Details of the Metrics information are described below. The Metrics section shows telemetry this broker node receives over time, both by input and by destination.

You can view these metrics over several time frames by clicking any of the following desired time frames in the upper right corner of the table:

- Last hour
- Last 4 hours
- Last 24 hours
- Last 7 days
- Last 30 days

Received Rate table

This table shows telemetry that this broker node has received over time.

Use the  (**Filter**) icon to filter the telemetry by the following parameters. You can choose more than one option within each filter.

- Per Input
- Per Exporter

Compare to Capacity Toggle

- When the **Compare to Capacity Toggle** icon is disabled () , you can view the current Received Rate values (in 1-minute intervals) for telemetry received from the applicable input(s) . (You must first click **Last 1h** from the time frame options bar in the upper right corner of the table.) Move your cursor over the x_axis (the horizontal line that reflects the time) to find a specific minute in time.
- When the **Compare to Capacity Toggle** icon is enabled () , you can view the Received Rate values as they compare to the threshold. Rates that exceed the 90 percent threshold need to be investigated, as these are cause for concern.

Sent Rate table

This table shows telemetry that this broker node has sent over time.

Use the  (**Filter**) icon to filter the telemetry per destination. You can choose more than one destination within the filter.

Compare to Capacity Toggle

- When the **Compare to Capacity Toggle** icon is disabled () , you can view the current Sent Rate values (in 1-minute intervals) for telemetry sent to the applicable destination(s) . (You must first click **Last 1h** from the time frame options bar in the upper right corner of the table.) Move your cursor over the x_axis (the horizontal line that reflects the time) to find a specific minute in time.
- When the **Compare to Capacity Toggle** icon is enabled () , you can view the Sent Rate values as they compare to the threshold. Rates that exceed the 90 percent threshold need to be investigated, as these are cause for concern.

If the received rate or sent rate are exceeding the threshold, add an additional broker node to increase capacity.

1-Minute Load Average table

CPU load average of the chosen broker node over 1-minute intervals of time. (You must first click **Last 1h** from the time frame options bar in the upper right corner of the Metrics section.) Move your cursor over the x_axis (the horizontal line that reflects the time) to find a specific minute in time. When the load average exceeds the threshold, which is set to the number of CPUs (the value represented by the y_axis), your network telemetry flow rate slows down.

Memory Usage table

Memory consumption and total available memory over 3-minute intervals of time. (You must first click **Last 1h** from the time frame options bar in the upper right corner of the Metrics section.) Move your cursor over the x_axis (the horizontal line that reflects the time) to find a specific 3-minute interval in time. Rates that exceed the 80 percent threshold need to be investigated, as these are cause for concern.

Disk Storage table

Disk storage used and total available storage over 3-minute intervals of time. (You must first click **Last 1h** from the time frame options bar in the upper right corner of the Metrics section.) Move your cursor over the x_axis (the horizontal line that reflects the time) to

find a specific 3-minute interval in time. Rates that exceed the 80 percent threshold need to be investigated, as these are cause for concern.

If you find that the load average, memory usage, or disk storage are exceeding the associated threshold, expand the resource allocation for your VM.

Clusters

The Clusters page lists the clusters configured for your Cisco Telemetry Broker system.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.

The Manager Node option in the Tree View is enabled by default.

2. From the menu at the top of the page, choose **Clusters**. Note that the number beside the Clusters tab heading represents the total number of clusters.

View Cluster Information

You can view the following information on this page:

- Cluster name
- Virtual IP addresses
- The number of broker node assigned to the cluster
- The number of inputs assigned to the cluster
- Actions (edit or remove a cluster)

Sort Columns

Where applicable, use the ▲ (**Move Up**) icon and the ▼ (**Move Down**) icon at the top of a column to reverse the sort order of the column. Note that you must first click the column name before you can view the icons.

Copy Numeric Strings

Click the  (**Copy**) icon to copy numeric strings such as IP addresses and subnet masks.

Add a Cluster

1. In the upper right corner of the page, click **+ Add Cluster**.

The Add Cluster dialog opens.

2. Configure all applicable information.
3. Click **Add Cluster**.

A Confirm dialog opens that lists important information to be aware of before confirming your edits.

4. If you want to finalize your edits, click **Confirm**. Otherwise, click **Cancel**.

- It can take up to 3 minutes for the configuration to propagate and for the VIP addresses to become available on your network.

Edit a Cluster

1. In the row containing the applicable cluster, click the  (**Edit**) icon.

The Edit Cluster dialog opens.

2. Make your changes.
3. When finished, click **Save**.

Remove a Cluster

1. In the row containing the applicable cluster, click the  (**Remove**) icon.

The Remove Cluster dialog opens.

2. Click **Remove**.

View Cluster Details

You can view more detailed information about a particular cluster. To do this, in the applicable row, click the desired cluster name in the Cluster column. For information about this page, see the next section, [Cluster Details](#).

For information about managing clusters, refer to the "Manage High Availability Clusters" section in the Cisco Telemetry Broker Virtual Deployment Guide.

Cluster Details

The Cluster Details page lists the details of all clusters configured for your Cisco Telemetry Broker system.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.
2. Choose a cluster from the Tree View, then choose **Cluster Details** from the menu at the top of the page.

OR

On the Clusters page, in the Clusters table, click the applicable cluster name in the Cluster column.

View Cluster Details

You can view the following data on this page:

- Cluster name
- IPv4 address and IPv6 address
- A list of the broker nodes that belong to the cluster, along with the following related details for each broker node:
 - Broker node name
 - Associated alerts
 - Admin interface
 - Telemetry interface
 - Capacity of the broker node
 - Number of inputs assigned to the broker node
 - Received Rate
 - Sent Rate
 - Status

To view the Broker Node Details page for a broker node, click a broker node name in the List of Broker Nodes table.

Sort Columns

Where applicable, use the ▲ (**Move Up**) icon and the ▼ (**Move Down**) icon at the top of a column to reverse the sort order of the column. Note that you must first click the column name before you can view the icons.

Copy Numeric Strings

Click the  (**Copy**) icon to copy numeric strings such as IP addresses and subnet masks.

Edit a Cluster's Configuration

1. In the appropriate cluster section, click the  (**Edit**) icon .

The Edit Cluster dialog opens.

2. Make your edits and click **Save**.

A Confirm dialog opens that lists important information to be aware of before confirming your edits.

3. If you want to finalize your edits, click **Confirm**. Otherwise, click **Cancel**.

Remove a Cluster

1. In the appropriate cluster section, click the  (**Remove**) icon.

The Remove Cluster dialog opens.

2. Click **Remove**.

For information about managing clusters, refer to the "Manage High Availability Clusters" section in the Cisco Telemetry Broker Virtual Deployment Guide.

High Availability Clusters

Cisco Telemetry Broker high availability provides highly available IPv4 and IPv6 virtual IP addresses to be targets for your inputs, ensuring reliable delivery of telemetry from inputs to destinations.

To establish Broker Node high availability, you can create high availability clusters and assign multiple broker nodes to each. In each cluster, one broker node is designated *Active*, meaning it passes telemetry and serves metrics to Cisco Telemetry Broker, and the rest are designated *Passive*, meaning they are not passing telemetry or serving metrics currently. If an Active broker node stops passing telemetry or otherwise loses connectivity with Cisco Telemetry Broker, one of the Passive broker nodes is promoted to Active broker node and starts passing telemetry.

Note the following about clusters:

- Each broker node can only belong to one cluster at a time.
- You can create a cluster without assigning a broker node, but note that the cluster will not receive telemetry until you add a node.
- You can assign an input to an empty cluster, but note that the cluster will not receive telemetry until you add a node.
- When you assign a broker node to a cluster, the UDP and Proxy Log inputs are deleted.
- When you remove a broker node from a cluster, that node no longer has any inputs assigned to that cluster.
- Keep in mind that if you create a cluster with only one broker node and this broker node fails, no other broker node is available to be promoted to Active broker node. Similarly, if all broker nodes within a cluster fail, no broker node can be promoted to Active broker node. If a broker node fails, bring it back online as soon as possible.
- You cannot choose which broker node is active in a given cluster.

-
- If an Active broker node for a virtual IP address fails, one of the Passive broker nodes in the same cluster becomes the Active broker node for the virtual IP address. When the failed broker node comes back up again, it remains a Passive broker node. If you want to make that node active again, you will need to do so manually using the provided commands. (To view these commands, see the "Move a VIP to a Specific Node" section in the Cisco Telemetry Broker Virtual Appliance Deployment and Configuration Guide.)
 - You can assign either a virtual IPv4 address, a virtual IPv6 address, or both, to a cluster. Note the following guidelines:
 - If assigning a virtual IPv4 address, in each broker node's telemetry interface you must have configured the IPv4 address in the same subnet of the virtual IPv4 address.
 - If assigning a virtual IPv6 address, in each broker node's telemetry interface you must have configured the IPv6 address in the same subnet of the virtual IPv6 address.

Cisco Telemetry Broker uses this virtual IP address to communicate with the cluster and promote Passive broker nodes to Active broker nodes when an Active broker node loses connectivity with Cisco Telemetry Broker.

For information about how HA clusters are updated during the Cisco Telemetry Broker software update process, see [Software Update](#).

Manager Node Details

The Cisco Telemetry Broker Manager Node Details page shows details and metrics for your Cisco Telemetry Broker Manager.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.

The Manager Node option in the Tree View is enabled by default.

2. From the menu at the top of the page, choose **Manager Node Details**.

View Details

Across the top of the page you can view the following information:

- Hostname and Admin interface (Management Network) IPv4/IPv6 addresses
- Associated alerts
- Current memory use and total memory available
- Current disk storage use and total disk storage space available
- Metrics Details

Metrics

Details of the Metrics information are described below.

1-Minute Load Average table

CPU load average of the chosen broker node over 1-minute intervals of time. (You must first click **Last 1h** from the time frame options bar in the upper right corner of the Metrics section.) Move your cursor over the x_axis (the horizontal line that reflects the time) to find a specific minute in time. When the load average exceeds the threshold, which is set to the number of CPUs (the value represented by the y_axis), your network telemetry flow rate slows down.

Memory Usage table

Memory consumption and total available memory over 1-minute intervals of time. (You must first click **Last 1h** from the time frame options bar in the upper right corner of the Metrics section.) Move your cursor over the x_axis (the horizontal line that reflects the time) to find a specific 3-minute interval in time. Any rate that exceeds the 80 percent threshold need to be investigated, as these are cause for concern.

Disk Storage table

Disk storage used and total available storage over 3-minute intervals of time. (You must first click **Last 1h** from the time frame options bar in the upper right corner of the Metrics section.) Move your cursor over the x_axis (the horizontal line that reflects the time) to find a specific 3-minute interval in time. Any rate that exceeds the 80 percent threshold need to be investigated, as these are cause for concern.

If you find that the load average, memory usage, or disk storage are exceeding the associated threshold, expand the resource allocation for your VM.

You can view these metrics over several time frames by clicking any of the following desired time frames in the upper right corner of the Metrics table:

- Last hour
- Last 4 hours
- Last 24 hours
- Last 7 days
- Last 30 days

Inputs

Cisco Telemetry Broker enables you to configure inputs to listen for different types of telemetry that you want processed. Refer to the following list for examples. For information about how to enable a virtual broker node to receive telemetry from a Flow Generator input, as well as how to add more CPUs, memory, and a network interface to a broker node, refer to the [Cisco Telemetry Broker Virtual Appliance Deployment and Configuration Guide](#).

- If you want to collect UDP packets on port 2055 on all broker nodes, you should create a UDP Input configured to listen on port 2055 on one node and then copy the input to all broker nodes.
- If you want to process VPC Flow Log telemetry, you should create a VPC Flow Log input.
- If you want to process NSG Flow Log telemetry, you should create an NSG Flow Log input.
- If you want to generate IPFIX records from raw network traffic, you should configure a monitor interface on a broker node to receive SPAN port traffic and create a Flow Generator input.
- If you want to generate IPFIX records based on log messages from a web proxy server, you should create a proxy log input. Note: the log messages will be parsed based on regex patterns. Examples patterns are provided, but you can create a new pattern (see 'Configure Your Own regex Patterns/Mappings' in [Appendix G: Proxy Log Input Configuration Guide](#).)

You can forward telemetry from a Flow Generator input to Cisco XDR or UDP IPv4 and IPv6 destinations.

The Flow Generator sends IPFIX records over IPv4 if only an IPv4 address is assigned to the telemetry interface of the broker node, and over IPv6 if only an IPv6 address is assigned to the telemetry interface of the broker node.

When a broker node telemetry interface is in dual stack mode (assigned both IPv4 and IPv6 addresses) and you enable the **Prefer IPv6 over IPv4** option in the **Add Input** panel for a Flow Generator input, the Flow Generator will use IPv6 to send IPFIX records; otherwise, it will use IPv4.

Note that if your system is receiving IPv4 from an input, it can forward IPFIX to only IPv4 destinations. If your system is receiving IPv6 from an input, it can forward IPFIX to only IPv6 destinations.

Rules for Adding, Editing, and Removing Inputs

- To begin collecting telemetry on a broker node or cluster, you need to create one or more inputs for that node or cluster.
- When you remove a cluster or node from the Manager node, all inputs assigned to that cluster or node are removed.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.
2. Choose a broker node or cluster from the Tree View, then choose **Inputs** from the menu at the top of the page. Note that the number beside the Inputs tab heading represents the total number of inputs.

You can see the following information on the Inputs page:

- Status.
- Input type.
- Input name.
- Associated alerts.
- Assigned destinations. (To see the list of the destinations assigned to an input, click the associated ⓘ (**Information**) icon.)
- The amount of telemetry received by each input for the last 24 hours.
- The combined rate of telemetry received by each input for the last 24 hours.
- Actions (copy, edit, or remove an input).

Filter Your Search

Filter

1. Click  **Filter**.

The Filter Inputs dialog opens within which are filter options you can choose.

2. Choose as many filters as necessary, and when you are finished, click **Apply**.
3. (Conditional) If you want to reset all filters, click **Reset**.

When you use one or more filters, all filters are ANDed together; therefore, all returned results must match the search criteria for all of the filters.

Clear Filters

- If you receive one or more results but do not see any for which you are searching, it could be that you have configured too many filters. In this instance, we recommend that you eliminate one filter at a time to see if any of your intended results show.
- To clear one or more filter fields, click  **Filter** (which contains the number of filters applied). When the Filter Inputs panel opens, make your changes and click **Apply**.

Search

In the Search field, type the name of the input for which you are searching. As you start to type your entry, the field dynamically filters to display a list of entries that contains any of the characters you have entered.

Sort Columns

Where applicable, use the ▲ (**Move Up**) icon and the ▼ (**Move Down**) icon at the top of a column to reverse the sort order of the column. Note that you must first click the column name before you can view the icons.

Import UDP Director Configuration

From either the UDP Director or the Manager that manages the UDP Director, you can export your current UDP Director configuration as an XML file and import it into Cisco Telemetry Broker. For more details, see [Appendix C: Import UDP Director Configuration](#).

Once you have created your first destination, you no longer have the option to import a UDP Director configuration.

Importing a UDP Director configuration overwrites your current Cisco Telemetry Broker configuration, including all currently configured inputs, destinations, and rules.

Add an Input

Please note that there are some restrictions when assigning an input to a node:

- All input types can be assigned to nodes that are not part of clusters.
- HA compatible inputs (UDP and Proxy Log) can be assigned to clusters, but they cannot be assigned to nodes that are part of a cluster.
- Inputs which are not HA compatible (VPC/NSG Flow Log and Flow Generator) can be assigned to nodes that are part of a cluster, but they cannot be assigned to clusters.

1. In the upper right corner of the page, click **+ Add Input**.

The Add Input dialog opens.

2. Select the input type and click **Next**.

A second Add Input dialog opens.

3. Configure all applicable fields. For information about the Disable Exporters Tracking toggle, see [Disable Exporters Tracking](#).

4. When finished, click **Add Input**.

Disable Exporters Tracking

If you are adding a UDP input type, you may want to turn on the Disable Exporters Tracking feature. To turn on Disable Exporters Tracking, click the **Disable Exporters Tracking** toggle (the toggle turns blue).

Exporters are tracked by default (Disable Exporters Tracking is turned off and toggle is gray).

Cisco Telemetry Broker tracks every exporter that sends telemetry to a UDP input. However, when you have many unique exporters sending telemetry to a single UDP input, you may need to turn on Disable Exporters Tracking to ensure the system does not suffer performance issues.

When you turn on Disable Exporters Tracking, metrics are no longer calculated for each exporter. However, you can still view the aggregate metrics that are being processed by the UDP input, though your system will have the following limitations:

- **Input Details page** The Exporters section no longer displays per-exporter metrics. (This page opens when you click a UDP input name on the Inputs page.) However, it will display the number of exporters seen by each broker node configured for the

associated input.

- **Broker Nodes Details page** The Per Exporter drop-down list for the Received Rate graph no longer includes exporters from any UDP Inputs where exporter tracking has been disabled. (This page opens when you click a broker node name on the Broker Nodes tab.)

Although metrics are no longer calculated for each exporter, data for that exporter is still shown for as long as data exists (for the metrics database retention interval).

The data retention interval is a low-level database parameter and is not configurable from the interface.

Example: The retention interval is 8 days. An exporter stopped sending data on August 10, so it will retain data from August 10-18. Today is August 20.

- If you filter a chart for 7 days or 30 days, the chart continues to show data for that exporter, since August 10-18 falls within 7-30 days ago.
- If you filter a chart for 4 hours or 24 hours, the chart no longer shows data for that exporter, since August 10-18 falls outside those intervals.

Copy an Input

1. In the Actions column for the applicable input, click the  (**Copy**) icon.

The Copy Input dialog opens.

2. Configure all applicable fields and click **Save**.

Edit an Input

1. In the row containing the applicable input, click the  (**Edit**) icon.

The Edit Input dialog opens.

2. Make your changes. To view details for this input on the Input Details page, click the

(**View Details**) icon.

3. When finished, click **Save**.

Remove an Input

When you delete an input, Cisco Telemetry Broker stops receiving telemetry from that input and deletes any connections associated with this input.

That input is still available for selection in the metric graphs, but the name associated with it is the term "Input" followed by the Input's ID and the phrase "deleted." For example, Input (ID 10) deleted. The graphs still include data from the deleted input as long as data exists for that input. Once the data expires, the associated input is no longer available for selection from any of the Per Input drop-down lists (located on the Destinations and Broker Nodes pages).

To remove an input, complete the following steps:

1. In the row containing the applicable input, click the  (**Remove**) icon.

The Remove Input dialog opens.

2. Click **Remove**.

View Details of an Input

You can view more detailed information about a particular input. To do this, in the row containing the applicable input, click the input name. For information about this page, see [Input Details](#).

Input Details

On this page you can view more detailed information about a particular input.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.
2. Choose a broker node or cluster from the Tree View, then choose **Inputs** from the menu at the top of the page. Note that the number beside the Inputs tab heading represents the total number of inputs.
3. In the Inputs List table, click an input in the Input Name column.

View Details

Across the top of the page you can view the following information, depending on the input type:

- Input type.
- Status.
- Broker node that the input is assigned to. To access the Broker Node Details page for the assigned broker node, click its name.
- Associated alerts.

- The amount of telemetry received by this input for the last 24 hours.
- The rate of telemetry received by this input for the last 24 hours.

Copy Numeric Strings

Click the  (**Copy**) icon to copy numeric strings such as IP addresses and subnet masks.

More Details

Click the drop-down arrow to view additional information about the input. This information varies depending on the input type. Examples of details are input name, blob service SAL URL, and IP address.

Edit an Input

1. In the upper right corner of the page, click  **Edit Input**.
The Edit Input panel opens.
2. Make your changes. For information about the Disable Exporters Tracking toggle, see [Disable Exporters Tracking](#).
3. When finished, click **Save**.

Disable Exporters Tracking

If you are adding a UDP input type, you may want to turn on the Disable Exporters Tracking feature. To turn on Disable Exporters Tracking, click the **Disable Exporters Tracking** toggle (the toggle turns blue).

Exporters are tracked by default (Disable Exporters Tracking is turned off and toggle is gray).

Cisco Telemetry Broker tracks every exporter that sends telemetry to a UDP input. However, when you have many unique exporters sending telemetry to a single UDP input, you may need to turn on Disable Exporters Tracking to ensure the system does not suffer performance issues.

When you turn on Disable Exporters Tracking, metrics are no longer calculated for each exporter. However, you can still view the aggregate metrics that are being processed by the UDP input, though your system will have the following limitations:

- **Input Details page** The Exporters section no longer displays per-exporter metrics. (This page opens when you click a UDP input name on the Inputs page.) However, it will display the number of exporters seen by each broker node configured for the associated input.

- **Broker Nodes Details page** The Per Exporter drop-down list for the Received Rate graph no longer includes exporters from any UDP Inputs where exporter tracking has been disabled. (This page opens when you click a broker node name on the Broker Nodes tab.)

Although metrics are no longer calculated for each exporter, data for that exporter is still shown for as long as data exists (for the metrics database retention interval).

The data retention interval is a low-level database parameter and is not configurable from the interface.

Example: The retention interval is 8 days. An exporter stopped sending data on August 10, so it will retain data from August 10-18. Today is August 20.

- If you filter a chart for 7 days or 30 days, the chart continues to show data for that exporter, since August 10-18 falls within 7-30 days ago.
- If you filter a chart for 4 hours or 24 hours, the chart no longer shows data for that exporter, since August 10-18 falls outside those intervals.

Copy an Input

1. In the upper right corner of the page, click  **Copy Input**.

The Copy Input dialog opens.

2. Configure all applicable fields and click **Save**.

Remove an Input

When you delete an input, Cisco Telemetry Broker stops receiving telemetry on the specified port and deletes any connections associated with this input.

That input is still available for selection in the metric graphs, but the name associated with it is the term "Input" followed by the Input's ID and the phrase "deleted." For example, Input (ID 10) deleted. The graphs still include data from the deleted input as long as data exists for that input. Once the data expires, the associated input is no longer available for selection from any of the Per Input drop-down lists (located on the Destinations and Broker Nodes pages).

To remove a UDP input, complete the following steps:

1. In the upper right corner of the page, click  **Remove Input**.

The Remove Input Dialog opens.

2. Click **Remove**.

Connected Destinations

Where applicable, use the ▲ (**Move Up**) icon and the ▼ (**Move Down**) icon at the top of a column to reverse the sort order of the column. Note that you must first click the column name before you can view the icons.

This section includes the following information, depending on the destination type:

- Total number of destinations connected to this input. (This number is displayed after the "Connected Destinations" title.)
- Status.
- Destination type.
- Destination name of the connection destination.
- Associated alerts.
- The amount of telemetry sent to this destination for the last 24 hours.
- The rate of telemetry sent to this destination for the last 24 hours.
- Actions (edit or remove a connection).

Create a Connection

 A connection always consists of just 1 input and 1 destination. However, note that an input can send data to more than one particular destination. You would simply create another connection to do that.

1. In the upper right corner of the table, click **+ Connect to**.
The Connect to a Destination panel opens.
2. Choose the destination.
3. (Conditional) If you choose a UDP input, the **Track data received against these subnets** field opens. This field serves as a filter mechanism to determine which traffic is sent to the destination. Only traffic coming from exporter IPs within the specified subnet will be forwarded. Enter the subnets over which this destination will receive the applicable telemetry. Separate entries with a comma.

If you leave the **Track data received against these subnets** field empty, it will default to a single subnet that includes all traffic.

- For IPv4 IP subnets, the CIDR IP address range will be 0.0.0.0/0.
- For IPv6 IP subnets, the CIDR IP address range will be ::/0.

4. Click **Save**.

Edit a Connection

You can only edit connections to a destination if the input is UDP, and for these inputs you can edit only the entries in the **Track data received against these subnets** field. Use this field to add subnets over which you want this destination to received telemetry. Only traffic coming from exporter IPs within the specified subnet will be forwarded.

1. To edit a connection, click the  (**Edit**) icon at the end of the applicable row.

The Connect to Destination panel opens.

2. Make your edits and click **Save**.

Remove a Connection

1. To remove a connection, click the  icon at the end of the applicable row.
2. Click **Remove**.

Metrics

In the Metrics section you will see a Received Rate table showing the rate at which this input has received telemetry over time.

You can view these metrics over different time frames (listed below) by clicking the buttons in the upper right corner (4 hours is the default):

- Last hour
- Last 4 hours
- Last 24 hours
- Last 7 days
- Last 30 days

Use the  (**Filter**) icon to filter the telemetry per exporter. You can choose more than one exporter within the filter.

Exporters

In this section you can see the following information:

- The number of unique exporters (represented by the number in the bubble at the end of the Exporters title).
- Status

- Exporter IP address.
- Telemetry type.
- Number of destinations.
- The amount of telemetry received from each exporter for the last 24 hours.
- The rate of telemetry received from each exporter for the last 24 hours.

Search

In the Search field, type the name of the exporter for which you are searching. As you start to type your entry, the field dynamically filters to display a list of entries that contains any of the characters you have entered.

Filter

Use the  (**Filter**) icon to filter your search by status and telemetry type.

- If you want to clear all filters, click the **x** beside the Filter button.
- If you want to clear an individual filter field or apply additional filters, click the Filter button (which contains the number of filters applied). When the Filter Exporters panel opens, make your changes and click **Apply**. Click **Reset** to remove all filter criteria.

When you use one or more filters, all filters are ANDed together; therefore, all returned results must match the search criteria for all of the filters.

Add a Flow Generator Input

You need to specify the telemetry interface IP before you add a Flow Generator input.

For information about this, see the "Enable a Flow Generator Input on a Broker Node (Optional)" section in the Virtual Appliance Deployment and Configuration Guide.

Destinations

Cisco Telemetry Broker supports sending telemetry to the following types of destinations:

- **UDP Destinations** A destination that receives UDP data at a specific IP address and port.
- **Cisco XDR Destination** A destination that points data to a customer-owned Cisco XDR Analytics account.

Configuring a Cisco XDR destination can limit system performance (in terms of uploaded FPS). Factors that can contribute to this are the size of flow records, the compression achievable for those flow records, and the bandwidth available for which to send telemetry from the broker nodes to XDR Analytics.

Cisco Telemetry Broker supports only one Cisco XDR destination per Cisco Telemetry Broker system.

Under most circumstances, assuming less than 100 bytes per flow record, Cisco Telemetry Broker should be able to send:

- 40K FPS per broker node (assuming there exists 8 cores per broker node) for a virtual deployment.
- 300K FPS per broker node for a hardware deployment (M6).

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.
2. Choose a broker node or cluster from the Tree View, then choose **Destinations** from the menu at the top of the page. Note that the number beside the Destinations tab heading represents the total number of destinations.

Cisco Telemetry Broker sends telemetry to destinations. A connection describes the telemetry that a destination would like to receive from a particular telemetry stream.

From this page, you can add additional destinations as well as modify and update them. For each destination, you can add additional connections and receive telemetry from different telemetry inputs. You can configure multiple connections (1 telemetry input per connection) per destination.

You can see the following information on the Destinations page:

- Status.
- Destination type.
- Destination name.
- Associated alerts.
- Assigned inputs. (To see the list of inputs assigned to a destination, click the  **(Information)** icon.)
- The amount of telemetry sent to each destination for the last 24 hours.
- The combined rate of telemetry sent to each destination for the last 24 hours.

Import UDP Director Configuration

From either the UDP Director or the Manager that manages the UDP Director, you can export your current UDP Director destination and rule configuration as an XML file and import it into Cisco Telemetry Broker. For more details, see [Appendix C: Import UDP Director Configuration](#).

Once you have created your first destination, you no longer have the option to import a UDP Director configuration.

Importing a UDP Director configuration overwrites your current Cisco Telemetry Broker configuration, including all currently configured inputs, destinations, and rules.

Filter Your Search

Filter

1. Click  **Filter**.

The Filter Inputs dialog opens within which are filter options you can choose.

2. Choose as many filters as necessary, and when you are finished, click **Apply**.
3. (Conditional) If you want to reset all filters, click **Reset**.

When you use one or more filters, all filters are ANDed together; therefore, all returned results must match the search criteria for all of the filters.

Clear Filters

- If you receive one or more results but do not see any for which you are searching, it could be that you have configured too many filters. In this instance, we recommend that you eliminate one filter at a time to see if any of your intended results show.
- To clear one or more filter fields, click  **Filter** (which contains the number of filters applied). When the Filter Inputs panel opens, make your changes and click **Apply**.

Search

In the Search field, type the name of the destination for which you are searching. As you start to type your entry, the field dynamically filters to display a list of entries that contains any of the characters you have entered.

Keep in mind that you can create multiple destinations with the same name. So if you search for a destination for which there are more than one with the same name, all matching entries will be displayed after your search has finished processing.

Sort Columns

Where applicable, use the ▲ (**Move Up**) icon and the ▼ (**Move Down**) icon at the top of a column to reverse the sort order of the column. Note that you must first click the column name before you can view the icons.

Add a Destination

Add a UDP Destination

1. In the upper right corner of the page, click **+ Add Destination**.
The Add Destination panel opens.
2. Enter or select a destination type and click **Next**.
3. Configure all applicable fields. If you want to be alerted of destinations that are unreachable or unresponsive, enable the  (**Reachability Check**) icon (the bar is blue when enabled). For more information about the Reachability Check feature, see the next section, "Reachability Check."
4. When finished, click **Add Destination**.

- The Reachability Check feature is available only for non-Cisco XDR Analytics destinations.
- You can disable this feature on a per destination basis.

- Disable this feature if your destination or firewall rule configuration will result in false positive alerts.

Reachability Check

The Reachability Check feature alerts users of destinations that are unreachable or unresponsive so they can mitigate any network damage caused by the forwarding of telemetry to a non-existent destination.

The feature crafts zero-length UDP packets and sends them to the configured UDP port of the destination. The broker node listens for ICMP Host Unreachable or Port Unreachable responses to determine if the destination is unreachable. The absence of any response indicates that the destination is most likely receiving telemetry.

Add a Cisco XDR Destination

- In Cisco Telemetry Broker, you can add only 1 Cisco XDR Destination per system.
- Cisco Telemetry Broker extracts flow data from NetFlow V5, NetFlow V9, and IPFIX packets, and sends this data to XDR Analytics.
- If your Cisco Telemetry Broker deployment contains light telemetry, it may take up to 20 minutes for telemetry to appear on the Destinations page after you add an Cisco XDR destination.

Before you add a Cisco XDR destination, you need to obtain an SCA Service Key and the SCA Host URL. Cisco XDR uses this key to authenticate Cisco Telemetry Broker, and Cisco Telemetry Broker uses the URL to send telemetry to XDR Analytics.

Locate the key and the URL

1. Log in to Cisco XDR Analytics.
2. From the main menu, click **Settings > Sensor**.
3. Locate and copy the Service key and the Service host at the bottom of the page. .

Add the Cisco XDR destination

1. Log in to Cisco Telemetry Broker.
2. In the upper right corner of the page, click **Add Destination > SCA (XDR) Destination**.
3. Enter a destination **Name**.
4. Enter the **SCA Service Key**. Ensure that you paste the entire key.

5. Enter the **SCA Host URL**. Ensure that you paste the entire URL.
6. Click **Save**.

Once you've configured Cisco XDR as a Cisco Telemetry Broker destination, you should be able to see telemetry from Cisco Telemetry Broker in the XDR Analytics Event Viewer within 30 minutes. If you do not, please contact swatchc-support@cisco.com with your portal URL for assistance.

Edit a Destination

1. In the row containing the applicable destination, click the  (**Edit**) icon.
2. Make your changes. To view details for this input on the Destination Details page, click the  (**View Details**) icon.
3. When finished, click **Save**.

Remove a Destination

When you delete a destination, that destination is still available for selection in the metric graphs, but the name associated with it is the term "Destination" followed by the destination's ID and the phrase "deleted." For example, Destination (ID 10) deleted. The graphs still include data from the deleted destination as long as data exists for that destination. Once the data expires, the associated destination is no longer available for selection from any of the Per Destination drop-down lists (located on the Broker Nodes page).

To remove a destination, complete the following steps:

1. In the row containing the applicable destination, click the  (**Remove**) icon.
The Remove Destination dialog opens.
2. Click **Remove**.

View Details of a Destination

You can view more detailed information about a particular destination. To do this, in the row containing the applicable destination, click the destination name. For information about this page, see the next section, [Destination Details](#).

Destination Details

On this page you can view more detailed information about a particular destination.

How to Find This Page

1. From the Cisco Telemetry Broker main menu on the left side of the page, choose **Explorer**.
2. Choose a broker node or cluster from the Tree View, then choose **Destinations** from the menu at the top of the page. Note that the number beside the Destinations tab heading represents the total number of destinations.
3. In the Destinations List table, click a destination in the Destination Name column.

View Details

Across the top of the page you can view the following information, depending on the destination type:

- If the Reachability Check option is on or off
- Destination type
- Status
- Destination IP address
- Destination port number over which it receives telemetry
- Associated alerts
- The amount of telemetry sent to this destination from the associated input for the last 24 hours
- The rate of telemetry sent to this destination from the associated input for the last 24 hours

For Cisco XDR destination only: Statistics displayed in the Sent Rate section are transformed and compressed data. The Sent Last and Sent Rate statistics in the Connected Inputs/Exporters section are original data (before being transformed and compressed).

Copy Numeric Strings

Click the  (**Copy**) icon to copy numeric strings such as IP addresses and subnet masks.

Edit a Destination

1. In the upper right corner of the page, click  **Edit Destination**.

The Edit Destination panel opens.

2. Make your changes. If you want to be alerted of destinations that are unreachable or unresponsive, enable the  (**Reachability Check**) icon (the bar is blue when enabled). For more information about the Reachability Check feature, see the next section, "Reachability Check."
3. When finished, click **Save**.

Reachability Check

The Reachability Check feature alerts users of destinations that are unreachable or unresponsive so they can mitigate any network damage caused by the forwarding of telemetry to a non-existent destination.

The feature crafts zero-length UDP packets and sends them to the configured UDP port of the destination. The broker node listens for ICMP Host Unreachable or Port Unreachable responses to determine if the destination is unreachable. The absence of any response indicates that the destination is most likely receiving telemetry.

For information about how to configure the amount of time before Cisco Telemetry Broker marks a telemetry input as inactive, see [General](#).

Remove a Destination

When you delete a destination, that destination is still available for selection in the metric graphs, but the name associated with it is the term "Destination" followed by the destination's ID and the phrase "deleted." For example, Destination (ID 10) deleted. The graphs still include data from the deleted destination as long as data exists for that destination. Once the data expires, the associated destination is no longer available for selection from any of the Per Destination drop-down lists (located on the Broker Nodes page).

To remove a destination, complete the following steps:

1. In the upper right corner of the page, click  **Remove Destination**.

The Remove Destination Dialog opens.

2. Click **Remove**.

Connected Inputs/Exporters

The first number in the bubble following this title represents the total number of inputs assigned to this destination, and the second number represents the total number of exporters assigned to all inputs that are assigned to this destination.

Where applicable, use the  (**Move Up**) icon and the  (**Move Down**) icon at the top of a column to reverse the sort order of the column. Note that you must first click the column name before you can view the icons.

This section includes the following information, depending on the input type:

- Status.
- Input type.
- Input name.
- Number of exporters sending data to a particular input.
- The amount of telemetry sent from the input for the last 24 hours.
- The rate of telemetry sent from the input for the last 24 hours.
- Actions (Edit or remove a connection).

Filter the Table

- Click **All** to see a list of all the inputs that are connected to this destination. The number in parentheses in the All button represents the total number of inputs assigned to this destination, and it should match the first number displayed in the bubble at the end of the "Connected Inputs/Exporters" title.
- Click **No Exporters** to see a list of only inputs that have no assigned exporters.

Edit a Connection

You can only edit connections to a destination if the input is UDP, and for these inputs you can edit only the entries in the **Track data received against these subnets** field. Use this field to add subnets over which you want this destination to receive telemetry. Only traffic coming from exporter IPs within the specified subnet will be forwarded.

1. To edit a connection, click the  (**Edit**) icon at the end of the applicable row.
The Connect to Destination panel opens.
2. Make your edits and click **Save**.

Remove a Connection

1. To remove a connection, click the ( **Remove**) icon at the end of the applicable row.
2. Click **Remove**.

Metrics: Sent Rate

In the Metrics section you will see a Sent Rate table showing the rate at which inputs have sent telemetry to this destination over time.

You can view these metrics over different time frames (listed below) by clicking the buttons in the upper right corner (4 hours is the default):

- Last hour
- Last 4 hours
- Last 24 hours
- Last 7 days
- Last 30 days

Use the  (**Filter**) icon to filter the telemetry by the following parameters. You can choose more than one option within each filter.

- Per Telemetry Type
- Per Input
- Per Exporter
- Per Broker Node

For Cisco XDR destinations, you can filter the telemetry in this table only per broker node or per the total amount received.

Application Settings

The Application Settings control your Cisco Telemetry Broker deployment. The following settings are available:

General

Software Update

Smart Licensing

User Management

TLS Certificate

Notifications

General

From the Cisco Telemetry Broker main menu on the left side of the page, choose **Settings**.

*The Settings page opens. The **General** tab is selected by default.*

Configure Inactivity Interval

The Inactivity Interval configuration allows you to configure the amount of time before Cisco Telemetry Broker marks a telemetry input or a destination as inactive. For an input, this indicates that no telemetry has been received for the configured time frame, and for a destination, that no telemetry has been sent for the configured time frame.

1. In the Inactivity Interval section, choose an **Inactivity Interval** in minutes from the Inactivity Interval drop-down list.
2. Click **Save**.

Configure HTTPS Proxy

The HTTPS Proxy configuration allows you to configure HTTPS proxy server settings if Cisco Telemetry Broker connects to the internet using an HTTPS proxy.

 Cisco Telemetry Broker does not support using HTTP proxy servers.

1. In the HTTPS Proxy section, enable **Use HTTPS proxy**.
2. Enter an **IP Address** and **Port**.
3. Click **Save**.

Software Update

The Software Update page shows the current Cisco Telemetry Broker version of your Manager node and broker nodes, and it allows you to upgrade to the current released version.

The update upgrades your Manager and all of your managed broker nodes to the newest version. Before performing the update, we recommend that you take a VM snapshot of your Cisco Telemetry Broker VMs. You can use this snapshot to revert to the current state in case you receive an unexpected error.

The system is unresponsive during the update process. First it updates your Manager, and then it updates the broker nodes. While your Manager updates, you may not see the proper state of your Cisco Telemetry Broker deployment. While your broker nodes update, they may not properly pass sent telemetry to destinations.

The Cisco Telemetry Broker HA cluster is designed to ensure there is no down time during an upgrade; therefore, in an HA cluster, the Manager always updates only one node at a time. When updating an HA cluster, the Manager node updates nodes in that cluster by order of creation. When a node starts to update, it first puts itself into standby mode. If this is the active node, the Cisco Telemetry Broker functionality is transferred to the alternate node. This occurs before the previously active node stops processing telemetry. This ensures that there is minimal to no telemetry loss during an upgrade.

There are several issues that you need to be aware of when upgrading to the latest version to ensure a successful upgrade. For more information, refer to the latest version of the Release Notes.

1. Click the  **(Settings)** icon.
The Application Settings page opens.
2. Click the **Software Update** tab. The number 1 is displayed beside this menu option when a newer version of software is available.

Upgrade Your Cisco Telemetry Broker Deployment

Download the Update File

1. Go to [Cisco Software Central](#).
2. In the Download and Upgrade section, choose **Access Download**.
3. Type **Cisco Telemetry Broker** in the search field.
4. Choose the **Manager Node Software**.
5. Download the CTB Update Bundle file.

Upload the Update File

1. In the Cisco Telemetry Broker Manager, click the  **(Settings)** icon.

The Application Settings page opens.

2. Click the **Software Update** tab.
3. In the upper right corner of the page, click **Upload Update File**.
4. Choose the file you downloaded.

You may need to wait several minutes for the upload to finish, based on the time estimates displayed. After the file is uploaded, you will receive a message informing you that a software update is now available.

5. Click **Update Cisco Telemetry Broker**.

You will not be able to navigate within Cisco Telemetry Broker while the Manager node is updated to the latest version. The update process takes about 10 minutes.

6. When the update has completed, you will be prompted to log back in to Cisco Telemetry Broker.

A loading indicator will appear next to each broker node that is being updated.

Smart Licensing

The Smart Software Licensing page shows the state of your Cisco Telemetry Broker Smart Licensing.

Cisco Telemetry Broker licensing is based on GB ingested by your broker nodes per day.

1. Click the  **(Settings)** icon.

The Application Settings page opens.

2. Click the **Smart Licensing** tab.

Using the Actions button in the upper right corner of the page, you can do any of the following:

- Renew Authorization Now
- Renew Registration Now
- Reregister
- Deregister

To view or edit transport settings, click **View/Edit** in the Transport Settings field.

User Management

1. Click the  (**Settings**) icon.
The Application Settings page opens.
2. Click the **User Management** tab.

Add a User

1. Click **Add User**.
2. Enter the user's **First Name** and **Last Name**.
3. Enter the **Username**. Neither you or the user can change this username once it is created.
4. Enter the user's **Email**.
5. Enter a password in the **New Password** field and enter it again in the **Confirm Password** field. Make sure to adhere to the password guidelines.
6. Click **+ Add User**.

Edit a User

1. In the row that contains the user you want to edit, click the  (**Actions**) icon > **Edit Profile**.
2. Complete your edits.
3. Click **Save**.

Remove a User

1. In the row that contains the user you want to remove, click the **Actions** icon > **Remove User**.
2. Click **Remove**.

Change a User's Password

1. In the row that contains the user whose password you want to change, click the **Actions** icon > **Change Password**.
2. In the **Password** field, enter the logged-in user's password.
3. In the **Confirm Password** field, enter a new password in the **Password** field, then enter it again.
4. Click **Change Password**.

TLS Certificate

On this page you can view the following information:

- Hostname
- Certificate expiration date and time
- Subject name and issuer name (under Certificate details)

 The certificate and the private key must be PEM-encoded.

 The private key file cannot be password-protected.

Upload TLS Certificate

1. Click the  (**Settings**) icon.
The Application Settings page opens.
2. Click the **TLS Certificate** tab.
3. To view certificate details, click the **Certificate details drop-down arrow**. In this section you can view the Subject Name, Issuer Name, and Subject Alternate Name.
4. In the upper right corner of the page, click **Upload TLS Certificate**.
5. In the Upload TLS certificate dialog that opens, click **Choose File** for each certificate and each private key you want to upload.
6. Click **Upload**.

Re-register Broker Nodes

After you upload the appropriate TLS certificates, you need to enable the connection between the Manager node and the broker nodes by re-registering each broker node.

1. Use SSH or the VM server console to log in to the appliance as **admin**.
2. Enter this command:

```
sudo ctb-manage
```

You are informed that a Manager configuration already exists.

3. Choose **Option C "Re-fetch the manager's certificate but keep everything else"**.

Notifications

Syslog Notifications

1. Click the  (**Settings**) icon.

The Application Settings page opens.

2. Click the **Notifications** tab.

To see a list of supported alerts, click the **Supported Alerts drop-down arrow** at the top of the page. You can direct Cisco Telemetry Broker to send a syslog notification when any alert is generated. For a list of these alerts, refer to [Appendix B: Supported Alerts](#).

 Currently you cannot configure custom alert types.

Configure the Syslog Server

First, you need to configure the Syslog server settings.

1. In the Syslog Server Address field, click **Configure**. If you have already configured the Syslog server, the Edit option is displayed. +
2. Enter the applicable Syslog server address (this can be an IPv4 address, IPv6 address, or a DNS name) and port number.
3. Click **Save**.

Enable the Syslog Server to Receive Notifications

Next, do the following:

- Enable the **Send Syslog Notifications** toggle ()

After you configure the Syslog server, you must enable this toggle, or the Syslog server will not receive notifications. Once you have enabled this toggle, then when your Cisco Telemetry Broker triggers an alert, it immediately sends a syslog notification to the Syslog server.

Send a Test Syslog Notification

Whenever you choose to do so, you can manually send a test syslog notification to the syslog server. This test notification checks that the Syslog server is successfully receiving syslog messages.

Every time you send a test syslog notification, a copy of the message appears under the **Sent Test** button. This enables you to compare the sent message with the message that the Syslog server receives.

If you log out of Cisco Telemetry Broker, when you log in again the messages will no longer be displayed.

 You must manually check the syslog server to verify that a test notification was received.

To send a test syslog notification, complete the following steps:

1. Enable the **Send Syslog Notifications** toggle (.
2. Click **Send Test**.
3. In the confirmation dialog, click **Send**.

Severity and Facility Values

Telemetry Broker hardcodes the severity value to *warning* and the facility value to *local0*.

Email Notifications

1. Click the  (**Settings**) icon.
The Application Settings page opens.
2. Click the **Notifications** tab.

You can direct Cisco Telemetry Broker to send an email notification when any alert is generated. For a list of these alerts, refer to [Appendix B: Supported Alerts](#).

 Currently you cannot configure custom alert types.

Configure the SMTP Server

First, you need to configure the SMTP server settings.

1. In the SMTP Server field, click **Configure**. If you have already configured the SMTP server, the Edit option is displayed.
2. Enter the applicable SMTP server address (this can be an IPv4 address, IPv6 address, or a DNS name), port number, and the email address from which the alerts will be sent.
3. Designate whether or not you want to require authentication. If you do, enter the SMTP server's username and password into the associated fields.
4. Choose the encryption type.
5. Click **Save**.

Enable a User to Receive Email Notifications

After you configure the SMTP server, you must enable Cisco Telemetry Broker to send email notifications, or the designated users will not receive notifications.

1. Enable the **Send Email Notifications** toggle (.
2. In the Recipients field, click **Edit**.
3. In the Edit Recipients dialog that opens, choose every user whom you want to have the ability to receive email notifications.
4. Click **Save**.

Send a Test Email Notification

Whenever you choose to do so, you can manually send a test email notification for all alerts. This test email notification checks that the SMTP server has been correctly configured and that all appropriate users will successfully receive email notifications for any alerts (to which they are assigned) that occur.

1. Enable the **Send Email Notifications** toggle (.
2. Click **Send Test**.
3. If you need to edit the list of users who will receive this test email notification, then in the Send Test dialog that opens, click **Choose** and make your edits.
4. Click **Send**.

Profile Settings

On this page you can view information such as your name, username, email, and account status. You cannot view your password (as it is hidden), but you can change it.

How to Find This Page

In the upper right corner, click the  **Profile** button > **Profile Settings**.

The Profile Settings page opens.

Edit Account Details

To change your name or email address, complete the following steps:

1. In the Account Details section, click the  **Edit Account** button.

The Edit Account Details dialog opens.

2. Complete your edits.
3. Click **Save**.

Change Your Password

1. In the Password section, click the  **Change Password** button.

The Change Password dialog opens.

2. Complete all fields.
3. Click **Change Password**.

Expand Cisco Telemetry Broker Manager and Broker Node Disk Size

With Cisco Telemetry Broker, you can expand the disk size of both the Manager and any broker node.

1. Back Up the Partition Table Information

Log in to the appliance and run the following command.

```
admin@ctb-nfik72TO:~$ sudo sgdisk -p /dev/sda > partition_table_$(date +%Y_%m_%d_%H_%M_%S').txt
```

This creates a file similar to the `partition_table_2021_07_09_15_51_04.txt` file, with contents similar to the following:

```
Disk /dev/sda: 81920000 sectors, 39.1 GiB
Model: Virtual disk
Sector size (logical/physical): 512/512 bytes
Disk identifier (GUID): B078BED8-2BD0-4EEA-9149-BA93FC8A299D
Partition table holds up to 128 entries
Main partition table begins at sector 2 and ends at sector 33
First usable sector is 34, last usable sector is 81919966
Partitions will be aligned on 2048-sector boundaries
Total free space is 4029 sectors (2.0 MiB)
```

Number	Start (sector)	End (sector)	Size	Code	Name
1	2048	4095	1024.0 KiB	EF02	
2	4096	491519	238.0 MiB	8300	
3	491520	3844095	1.6 GiB	8200	
4	3844096	33767423	14.3 GiB	8300	
5	33767424	63690751	14.3 GiB	8300	
6	63690752	81917951	8.7 GiB	8300	

The total size of the disk (`/dev/ada`) is 39.1 GB and the size of the Cisco Telemetry Broker application partition (`/dev/sda6`) is 8.7 GB.

2. Delete All Existing VM Snapshots for the Appliance

You cannot resize the ESXi VM disk when snapshots exist. In order to increase the disk size we need to delete all existing snapshots.

1. Log in to the ESXi console (vSphere or Web Client).
2. Right-click the VM and choose **Snapshots > Manage Snapshots > Delete All**.

3. Increase the Disk Size of the Appliance

1. Log in to the ESXi console (vSphere or Web Client).
2. From the list of VMs in the left panel, select the appliance.
3. From the toolbar at the top of the page, click the  (Edit) icon.
4. In the Hard Disk 1 row, increase to the desired size.
5. Reboot the VM.
6. Log in and verify that the new size has been applied by running this command:

```
$ sudo sgdisk -p /dev/sda
Disk /dev/sda: 125829120 sectors, 60.0 GiB
Model: Virtual disk
Sector size (logical/physical): 512/512 bytes
Disk identifier (GUID): B078BED8-2BD0-4EEA-9149-BA93FC8A299D
Partition table holds up to 128 entries
Main partition table begins at sector 2 and ends at sector 33
First usable sector is 34, last usable sector is 81919966
Partitions will be aligned on 2048-sector boundaries
Total free space is 4029 sectors (2.0 MiB)
```

Number	Start (sector)	End (sector)	Size	Code	Name
1	2048	4095	1024.0 KiB	EF02	
2	4096	491519	238.0 MiB	8300	
3	491520	3844095	1.6 GiB	8200	
4	3844096	33767423	14.3 GiB	8300	
5	33767424	63690751	14.3 GiB	8300	
6	63690752	81917951	8.7 GiB	8300	

4. Run ctb-part-resize.sh Script

1. Take a snapshot of the VM.
2. Run the following command:

```
$ sudo /opt/titan/bin/ctb-part-resize.sh

WARNING

This program will update /dev/sda6 to use the full remaining free space
available on /dev/sda.

It is HIGHLY RECOMMENDED that you take a backup of any important data/configuration
before proceeding.

Do you wish to proceed?y
<134>Mar  8 15:35:30 ctb-disk-resize: Moving the partition table header to the end of the
disk(/dev/sda)
```

```
Warning: The kernel is still using the old partition table.
The new table will be used at the next reboot or after you
run partprobe(8) or kpartx(8)
The operation has completed successfully.

run partprobe(8) or kpartx(8)
The operation has completed successfully.
<134>Mar  8 15:35:33 ctb-disk-resize: Updating kernel partition tables
<134>Mar  8 15:35:34 ctb-disk-resize: Resizing /dev/sda6
resize2fs 1.44.5 (15-Dec-2018)
Filesystem at /dev/sda6 is mounted on /var/lib/titan; on-line resizing required
old_desc_blocks = 2, new_desc_blocks = 2
The filesystem on /dev/sda6 is now 2412283 (4k) blocks long.
```

5. Verify that Space has been Allocated

Run the following command:

```
$ df -h /dev/sda
Filesystem      Size  Used Avail Use% Mounted on
/dev/sda4       14G   5.6G  7.7G  42% /
/dev/sda2       227M   80M  132M  38% /boot
/dev/sda5       14G   41M   14G   1% /mnt/alt_root
/dev/sda6       8.5G  172M   7.9G   3% /var/lib/titan
```

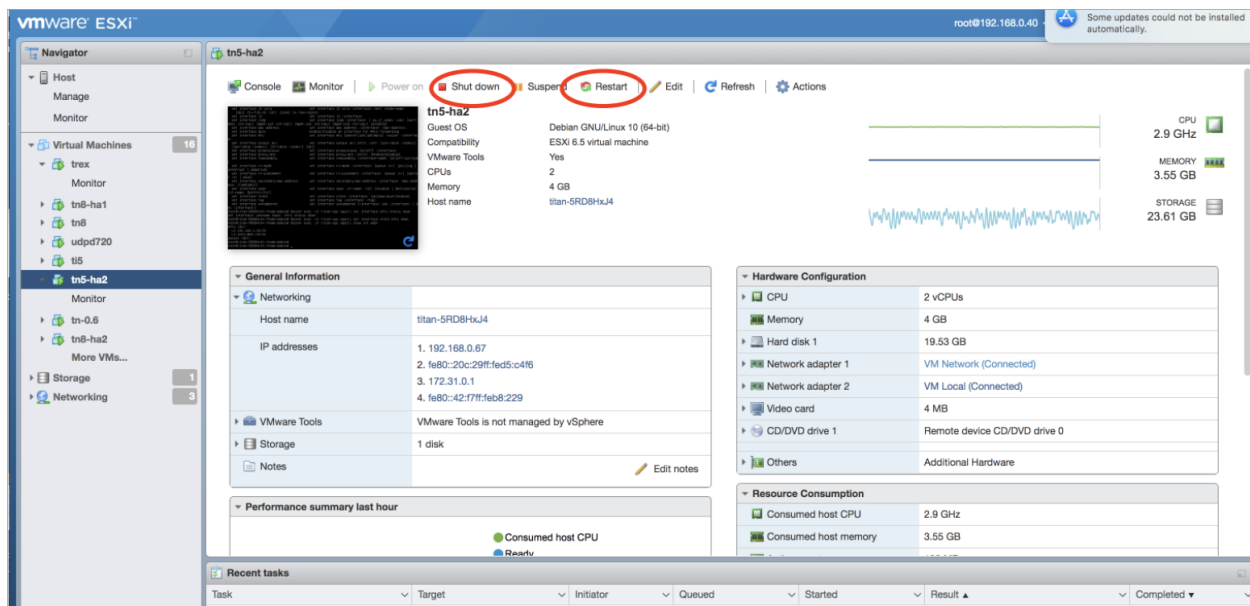

Shut Down or Reboot Cisco Telemetry Broker

If at some point you need to shut down or reboot Cisco Telemetry Broker, complete the following steps:

1. Log in to the CTB Manager or CTB Broker Node via ssh or the console with the user name **admin**.
 - To shut down, enter `sudo shutdown now`
 - To reboot, enter `sudo shutdown -r now`
2. Log in to the VMWare console and verify that the VM has completed the shutdown or has rebooted properly.

Optionally, you can also shut down or reboot using VMWare. To do this, complete the following steps:

1. Log in to the VMWare console and select the applicable VM.
2. Depending on if you want to shut down or reboot, click one of the following options displayed at the top of the page:

Appendix A: Supported IPFIX Fields for Cisco Telemetry Broker

The table in this appendix contains a list of the IPFIX fields that Cisco Telemetry Broker supports.

Cisco Telemetry Broker extracts the numeric IDs (each numeric ID includes an Element ID and a PEN) from Information Elements within NetFlow messages and maps each of them to an associated descriptive name.

If Cisco Telemetry Broker doesn't recognize the numeric ID for an Information Element, the element information is still sent to Cisco XDR Analytics, but Cisco Telemetry Broker assigns a name to it using this format:

unknownID_<ElementID>_<PEN>

If you want to view the description for any element ID, see the [Cisco Secure Network Analytics Information Elements Guide](#).

ElementID	PEN	Name

Appendix B: Supported Alerts

The following table contains the list of Cisco Telemetry Broker alerts.

Alert	Description
Appliance Disk Space Critically Low	The appliance's disk has less than 1G of free space. System operation is degraded.
Appliance Low Disk Space	This appliance's disk usage has reached 80% of its capacity.
Broker Node Dropping Packets	This node is dropping packets. Please make sure the broker node is not overloaded or misconfigured.
Broker Node Not Seen	This node has not communicated with the Manager for [x] minutes.
Config Error	Config failed validation.
Destination Unreachable	This destination has sent a "destination unreachable" ICMP message.
SAS URL Close to Expiration	The input's SAS URL is about to expire. Please provide a new SAS URL.
SAS URL Expired	The input's SAS URL has expired. Please provide a new SAS URL.
TLS Certificate Close to Expiration	The Manager's TLS certificate is about to expire. Please install a new certificate.
TLS Certificate Expired	The Manager's TLS certificate has expired. Please install a new certificate.

Appendix C: Import UDP Director Configuration

Please note that importing UDP Director destination and rule configurations is optional.

Export Your UDP Director Configuration

1. Log in to the UDP Director console as an **admin**.
2. Click the **Configuration** tab.
3. Click **Forwarding Rules**.
4. Choose **Export (Export the configuration file to local system)**.
5. Save the file to your workstation.

Export Your UDP Director Configuration From a Manager

1. Log in to the Web App as **sysadmin**.
2. Click the  (**Global Settings**) icon.
3. From the drop-down menu, choose **UDP Director Configuration**.
4. Click the **Actions** menu.
5. Choose **Export Forwarding Rules**.
6. Click **Save**.

Import Your UDP Director Configuration into Cisco Telemetry Broker

You can import your UDP Director Configuration only before you configure any destinations.

1. Log in to the Cisco Telemetry Broker Manager node.
2. Click the **Destinations** tab.
3. Click **Upload XML File**.
4. Choose the applicable file and click **Open**.

Appendix D: Differences in Types of Inputs and Destinations

Input Types

Input Type; HA- Compatible?	Max per Node or Cluster	Ingest Method	Exporter IP seen by Destination	Input Details on CTB User Interface
<p>UDP;</p> <p>Yes, can be assigned to the node or cluster</p>	N/A	<p>Exporters send UDP packets to the telemetry interface.</p> <p>If input is assigned to a cluster, then exporters send UDP packets to the virtual IP address.</p>	Original exporter IP address.	<ul style="list-style-type: none"> • Exporter IP address is the original Exporter IP address • Received rate is the raw data rate
<p>VPC Flow logs;</p> <p>No, can only be assigned to the node</p>	N/A	<p>CTB fetches compressed Flow log files via the management interface using TCP.</p> <p>Flow logs are transformed to IPFIX packets and sent to applicable destinations.</p>	Exporter IP address the user configured on the user interface.	<ul style="list-style-type: none"> • Exporter IP address is the one configured on the user interface by the user • Received rate is the data rate after it has been transformed

Input Type; HA- Compatible?	Max per Node or Cluster	Ingest Method	Exporter IP seen by Destination	Input Details on CTB User Interface
<p>NSG Flow logs;</p> <p>No, can only be assigned to the node</p>	N/A	<p>CTB fetches Flow log data blocks via the management interface using TCP.</p> <p>Flow logs are transformed to IPFIX packets and sent to applicable destinations.</p>	<p>Exporter IP address the user configured on the user interface.</p>	<ul style="list-style-type: none"> • Exporter IP address is the one configured on the user interface by the user • Received rate is the data rate after it has been transformed
<p>Flow Generator;</p> <p>No, can only be assigned to the node</p>	1	<p>CTB sniffs traffic on the monitor interface.</p> <p>IPFIX packets are generated based on the statistics of monitored flows and sent to applicable destinations.</p>	<p>Broker node's telemetry IP address.</p>	<ul style="list-style-type: none"> • Exporter IP address is 169.254.255.100 or fd00:feed:beef::100 • Received rate is the data rate of generated IPFIX packets
<p>Proxy logs;</p> <p>Yes, can be assigned to the node or</p>	5	<p>Exporters send Proxy logs to the telemetry interface using TCP or</p>	<p>Broker node's telemetry IP address. If input is</p>	<ul style="list-style-type: none"> • Exporter IP addresses are 169.254.254.3 and fd00:feed:beef::1:3 • Received rate is the

Input Type; HA- Compatible?	Max per Node or Cluster	Ingest Method	Exporter IP seen by Destination	Input Details on CTB User Interface
cluster		UDP. If input is assigned to a cluster, then exporters send UDP packets to the virtual IP address.	assigned to a cluster, then it will be the telemetry IP address of the active node. When the active node is switched, the destination sees a different exporter IP address.	data rate of IPFIX packets after they have been transformed

Destination Types

Destination Type	Data Format Specified by CTB	Output Interface	Destination Details on CTB User Interface
UDP	UDP packets	Sent via the telemetry interface	<ul style="list-style-type: none"> • Sent Rate in the Metrics chart is the UDP data sent rate • You can filter the Metrics chart per exporter, input, telemetry type, or broker node

Destination Type	Data Format Specified by CTB	Output Interface	Destination Details on CTB User Interface
Cisco XDR	Compressed files containing JSON lines	Sent via the management interface using TCP	<ul style="list-style-type: none">• Sent Rate in the Metrics chart is the compressed data sent rate• You can filter the Metrics chart per broker node only

Appendix E: AWS Configuration

You can configure your AWS deployment to export VPC Flow Logs to Cisco Telemetry Broker, then configure Cisco Telemetry Broker to transform the VPC Flow Logs to IPFIX for ingestion by destinations.

Complete the following steps to configure your AWS portal.

Enable Flow Logging

To enable flow logging for one or more VPCs, then send the flow logs to an S3 bucket, complete the following steps:

1. From the AWS VPC main menu, choose **Your VPCs**.
2. Right-click a VPC, then choose **Create Flow Log**.
3. From the Filter drop-down, choose **All** to log accepted and rejected telemetry, or **Accept** to log only accepted telemetry.
4. Choose **Send to an S3 bucket destination**.
5. Enter an **S3 bucket ARN** in which you want to store flow log telemetry.
6. Click **Create**.

Create an IAM User

To create an IAM user that has access to the S3 bucket and record the access key ID and Secret access key, complete the following steps:

1. From the AWS IAM main menu, choose **Users > Add user**.
2. Enter a **User Name**.
3. Choose **Programmatic access**.
4. Click **Next: Permissions**.
5. Click **Next: Tags**.
6. Click **Next: Review**.
7. Click **Create User**.
8. For both the access key ID and the secret access key, click **Show**.
9. Record your Access key ID and Secret access key or click **Download** and save the keys in a secure location. You will need these keys when you create the VPC Flow Logs input in Cisco Telemetry Broker.

Create the S3 Bucket Policy

1. From the AWS IAM main menu, choose **Policies**.
2. Click **Create policy**.
3. Select the JSON tab.
4. Paste the policy you copied from Cisco Telemetry Broker into the JSON editor.
5. Click **Review policy**.
6. In the **Name** field, enter a unique name to identify the policy (for example, **ctb_policy**).
7. Enter a description, such as **Policy to allow Cisco Telemetry Broker access to VPC Flow Logs**.
8. Click **Create Policy**.

Create a User Group

To create a user group, assign the policy to an IAM group, and add your IAM user to the IAM group, complete the following steps:

1. From the AWS IAM main menu, choose **Groups > Create New Group**.
2. Enter the **group name**.
3. Click **Next Step**.
4. Select the Cisco Telemetry Broker policy that you created.
5. Click **Next Step**.
6. Click **Create Group**.
7. From the IAM console, choose **Groups > [Group Name]**.
8. Click the **Users** tab.
9. Click **Add Users to Group** and choose your **Cisco Telemetry Broker user**.
10. Click **Add Users**.

Replace S3 Bucket Code

- Replace your S3 bucket name `<s3_bucket>` with the user's actual s3 bucket name.
- Replace your S3 bucket path `< s3_path>` with the user's actual s3 bucket path.

```
"version": "2012-10-17",
"Statement": [
  {
    "Action": [
      "s3:ListBucket",
    ],
    "Effect": "Allow",
    "Resource": [
      "arn:aws:s3:::<s3_bucket>"
    ]
  },
  {
    "Action": [
      "s3:GetObject"
    ],
    "Effect": "Allow",
    "Resource": [
      "arn:aws:s3:::<s3_path>/*"
    ]
  }
]
```

Appendix F: Azure Configuration

The following instructions detail how to set up a monitoring application that will collect telemetry from your Azure environment for analysis. We recommend that you follow these instructions as a user assigned the *Global Administrator AD* and *Owner* roles for all subscriptions that need monitoring.

If this isn't possible, contact your Azure AD administrator to ensure that for each subscription to be monitored, the user has access to the following Azure resources: authorization, network, storage accounts, and monitoring. For this to occur, you must assign the user the *User access administrator* and *Contributor* roles.

Prerequisites

Before configuring NSG Flow Logs, complete the following steps:

1. **Connect to Azure** Access your Azure portal and follow the instructions to sign in. For command line access, launch a bash console using the console icon located next to the search bar.
2. **Set up Network Watcher** Set up the Network Watcher service for the regions in which you have resource groups to monitor:
 - a. From the main menu, choose **Network Watcher > Overview**.
 - b. Click the **⋮ (Ellipsis)** icon and choose **Enable Network Watcher**, either at the subscription level or on target regions.
3. **Create Storage Accounts** To store NSG Flow Logs, you'll need storage accounts in the same locations (e.g. East US) as your target resource groups. If you don't already have storage accounts in the target locations, you'll need to create some with Blob storage capabilities (StorageV2 or BlobStorage).

Enable NSG Flow Logs

For the NSGs you want to monitor, you'll need to enable Flow Logging by completing the following steps:

1. From the main menu, choose **Network Watcher > Logs > Flow Logs**. The list of already enabled Flow logs appears.
2. To create a new NSG flow log, click **+Create** button.
3. Complete the form, entering the following settings:

- **Subscription:** Select your subscription.
 - **Flow log type:** Select **Network Security Group**. Note that **Virtual Network** type is not supported up to Cisco Telemetry Broker v2.2.1.
 - **Select Target Resource:** Click **Network Security Group**. The **Select network security group** page appears.
 - Select one or more Network security groups that you want to enable and click **Confirm Selection**.
 - **Select Storage account:** Select the **Location, Subscription, and Storage accounts**.
 - **Retention (days):** Enter the number of days you want to retain data. If you want to retain data forever and do not want to apply a retention policy, set **Retention (days)** to 0.
 - Click **Next: Analytics >**, choose **Version 2** for **Flow Logs Version**, and clear **Enable Traffic Analytics**.
 - Click **Review + Create**.
 - Click **Create**.
4. In **Network Watcher > Logs > Flow Logs** page, you will see a new enabled Network security groups, with **Flow log type** as **Network security group**.

 Repeat steps 1 to 4 for each Network security group(s) that you want to enable.

5. In the Azure portal, from the main menu, choose **Storage Accounts > Select Your Account > Data Storage > Containers**. Verify that you see the *insights-logs-networksecuritygroupflowevent* entry in the Containers list. It may take a few minutes for it to appear.

 It might take about 10 minutes for the flow logs to be published. You can navigate through the Tree View to see if the newly enabled Network Security Groups have published their flow log files.

Obtain Blob Service SAS URL

To generate the Blob Service SAS URL that Cisco Telemetry Broker requires, complete the following steps:

1. In the Azure portal, from the main menu, choose **Storage Accounts > Select Your Account > Shared Access Signature**. The form that opens should contain the

following entries:

- **Allowed Services:** Blob
 - **Allowed Resource Types:** Service, Container, Object
 - **Allowed Permissions:** Read, List
 - **Start and Expiry Times:** Set to an interval that you will allow Cisco Telemetry Broker to access
2. Choose **Generate SAS > the connection string**.
 3. Copy the Blob Service SAS URL.

Provide the Blob Service SAS URL when adding the NSG Flow Log to Cisco Telemetry Broker.

Register Azure Flow Log in Cisco Telemetry Broker

To configure Cisco Telemetry Broker to process the NSG Flow Log telemetry and transform it into IPFIX, complete the following steps:

1. Return to Cisco Telemetry Broker.
2. From the Cisco Telemetry Broker main menu, click the **Inputs > NSG Flow Logs** tab.
3. Click **Add NSG Flow Log** (located above the Inputs table in the upper right corner).
The Add NSG Flow Log dialog opens.
4. In the **Input Name** field, enter the input IP address name.
5. In the **Input IP Address** field, enter the input IP address to assign to this Flow Log. Cisco Telemetry Broker uses this IP address as the input address when sending IPFIX generated from the NSG Flow Log. It should be an internal IP address and should not conflict with other IP addresses on your network.

Cisco Telemetry Broker places the following restrictions on the Input IP value to ensure proper brokering of packets. If any of the following conditions are not met, Cisco Telemetry Broker displays an error message:

- Input IP must **not** overlap with the subnet of the Assigned Node's Telemetry interface.
- Input IP must **not** conflict with any existing input IPs in the system.
- Input IP must **not** conflict with any destination IPs in the system.

6. From the **Assigned Broker Node** drop-down list, choose the assigned broker node. This broker node will process all flow log telemetry from the S3 bucket.
7. Choose one or more destinations to ingest the flow log telemetry. Note that Cisco Telemetry Broker transforms NSG Flow Logs to IPFIX.
8. Click **Add NSG Flow Log**.
9. If you have multiple NSG Flow Logs to configure, complete the following steps, in order, for each NSG Flow Log you configure:
 - a. Repeat every step in each previous section in this [Azure Configuration](#) topic.
 - b. Repeat Step 1 through Step 7 in this section.
10. Click **Save**.

Appendix G: Proxy Log Input Configuration Guide

A web proxy server can send log messages to a proxy log input in Cisco Telemetry Broker. These log messages are parsed based on configured regex patterns and then transformed to IPFIX packets.

Proxy log inputs always show exporters as 169.254.254.3 and fd00:feed:beef::1:3 in the Cisco Telemetry Broker Manager web interface, but destinations see IPFIX packet source IP address as the associated broker node's telemetry IP address. The web proxy's IP address appears in the IE exporterIPv4Address or exporterIPv6Address to destinations.

You can connect a proxy log input to one or more destinations configured in Cisco Telemetry Broker. Note the following parameters:

- If a proxy log message is received as an IPv4 packet, it will be forwarded to only IPv4 UDP destinations.
- If a proxy log message is received as an IPv6 packet, it will be forwarded to only IPv6 UDP destinations.

Although Cisco Telemetry Broker allows connecting Proxy Log Input to Cisco XDR destinations, it is not recommended to do so because Cisco XDR does not currently support analytics based on proxy log messages.

Web Proxy Server-side Requirements

You need to configure your server-side web proxy so that it includes the following information in log messages:

- sourceIPAddress
- sourceTransportPort
- destinationIPAddress
- clientOctetDeltaCount (HTTP request direction)
- serverOctetDeltaCount (HTTP response direction)
- method
- url
- responseCode

- duration
- userName

The following are optional fields:

- ts (timestamp)
- contentType
- clientDeltaPacketCount
- serverPacketDeltaCount
- protocol
- scheme
- destinationTransportPort

Cisco Telemetry Broker does not use any other user-defined field in log messages to form IPFIX packets.

IPFIX Templates

We use eight IPFIX templates. Each template has three IP addresses. These can be either all IPv4, all IPv6, or a combination of both. There exists a total of eight different combinations. Refer to the following table when constructing regex patterns and to understand IPFIX flow records.

Variable Name	IE (PEN)	Notes
sourceIPv4Address OR sourceIPv4Address	8 OR 27	Parsed from proxy log message.
destinationIPv4Address OR destinationIPv6Address	12 OR 28	
sourceTransportPort	7	Parsed from proxy log message.
destinationTransportPort	11	Parsed from proxy log message. If this is missing, then 443 or 80 is used (based on

		protocol/scheme/method/url).
octetDeltaCount	1	Parsed from proxy log message.
packetDeltaCount	2	Parsed from proxy log message. If this is missing, then it is estimated based on octetDeltaCount and average packet size.
ingressinterface	10	Use 1.
egressinterface	14	Use 1.
protocolIdentifier	4	Use 6.
tcpControlBits	6	Use 0x13 (c2s) OR 0x18 (s2c).
applicationId	95	4 bytes NBAR ID for proxy server (218104888).
flowSensorApplicationDetails	29832 (PEN 8712)	c2s: method + url + proxy_vendor_info + protocol that proxy uses to send message to Cisco Telemetry Broker. s2c: response_code + proxy_vendor_info + protocol that proxy uses to send message to Cisco Telemetry Broker.
flowStartMilliseconds	152	Use (flowEndMilliseconds-duration).
flowEndMilliseconds	153	Use current time.
ipClassOfService	5	Use 5.
exporterIPv4Address OR exporterIPv6Address	130 OR 131	Source IP address of the log message packet that Cisco Telemetry Broker receives.

userName	371	Parsed from proxy log message. If these are missing, then set this to an empty string.
----------	-----	--

Configuration Parameters

When you choose a proxy log input, you need to configure the following parameters:

- Input name.
- Port: The port to listen on needs to be unique for each broker node (or cluster of nodes).
- Vendor: Proxy server name and version, up to 64 characters.
- Protocol: TCP or UDP.
- Mapping: Use regex patterns to parse log messages. We provide example mappings for some proxy servers, but you will need to create your own mappings based on the log format your server sends out. See the next section, [Configure Your Own Regex Patterns/Mappings](#).
- Average Packet Size: If the log message does not include the **clientDeltaPacketCount** field or **serverDeltaPacketCount** field, Cisco Telemetry Broker estimates the **clientDeltaPacketCount** field or **serverDeltaPacketCount** field using the **clientOctetDeltaCount** field or the **serverOctetDeltaCount** and **Average Packet Size** fields.

Configure Your Own regex Patterns/Mappings

The patterns and mappings in the Dropdown options list are only examples and probably won't fit your actual log format. You may need to create your own regex patterns.

To do this, follow these steps:

1. Go to https://<ctb_manager>/backend/admin.
2. After you log in, find the Dropdown options list.

3. To add a dropdown option, click **Add**. To edit an existing one, click **Change**.

*The following appears if you click **ADD**.*

4. Click **ADD DROPDOWN OPTION +**.

The following page opens on which you can add the regex patterns/mappings:

5. When finished, click **SAVE**. The regex patterns/mappings are now available in the Proxy Logs Input dialog.

Regex Patterns and Field Transform Algorithms

Pattern/Field Transform Algorithm	Example
Grok regex format: <code>%{PATTERN_NAME:variable_name[:type]}</code>	<pre>dstport=% {NONNEGINT:destinationTransportPort:int} would match "dstport=8088" and map resulting integer to destinationTransportPort=8088</pre>

Pattern/Field Transform Algorithm	Example
<p>If no Grok pattern is readily available, you can define custom patterns:</p> <p><PATTERN NAME> <regex definition><newline></p>	<p>ANYTEXT[^\]*\nTZ (?:[PMCEG][SDM]T UTC)</p>
<p>You can use the two customer regex definitions (ANYTEXT and TZ) in the following regex pattern:</p>	<p>devicetime=\\[%{DATE:date}%{TIME:time}%{TZ:timezone}:\\ \\ url=%{ANYTEXT:url}</p> <p>would match the following log</p> <p>devicetime=[26/08/2014:14:52:08 GMT] url=http://pixel.digitserve.com/pixel;r=1</p> <p>Results:</p> <p>date="26/08/2014"</p> <p>time="14:52:08"</p> <p>timezone="GMT"</p> <p>url="http://pixel.digitserve.com/pixel;r=1"</p> <p>You can apply transform algorithms to the parsed results to infer certain IPFIX required fields (which are otherwise missing) to form IPFIX packets.</p> <p>See below for the four transform algorithms that are available for you to use:</p>
<p>Four Transform Algorithms</p> <p>{“key”: {“0”: value}} -- Assign a constant value to a field of key, “0” is this transform id</p> <p>{“key”: {“1”: “key1”}} -- Assign value of a field of key1 to field of key, “1” is this transform id</p> <p>{“key”: {“2”: {“key1”: {“cond1”: value1, “cond2”: value2}}}} – Assign value based on field value of key1 to target field of key, “2” is this transform id</p>	

Pattern/Field Transform Algorithm	Example
<pre>{“key”: {“3”: {op: {“key1”: value1}}}}</pre> -- Perform arithmetic operations to field of key1 to another field of key, “3” is this transform id, op: 1: multiply 2: divide 3: add 4: subtract	

Performance Parameters

The performance parameters for Cisco Telemetry Broker mapping examples are as follows:

- On a VM with 8 vCPUs and no Flow Generator input, we can support ~5k msg/s.
- On a VM with 12 vCPUs and no Flow Generator input, we can support ~8k msgs/s.
- On ST-TB2300-K9 hardware appliance, we can support ~20k msgs/s.

Appendix H: Flow Log Format Fields to IPFIX IE Mapping

Flow Logs Format Field	IPFIX Information Element Name (ID)	IPFIX Enterprise ID	IPFIX IE Type	Notes	Applicable To
version	flowlogVersion (801)	Cisco Systems (9)	Unsigned8		AWS, Azure
