Introduction

Audience
The audience for this document is network administrators who wish to deploy a Catalyst 9000 series switch at a branch or campus using Cisco DNA Center.

About The Solution
Cisco DNA Center can help automate with built-in Plug-and-Play (PnP) functionality and allow switches, routers, and wireless access points to be on-boarded to the network. An agent in the device, call-home Cisco DNA center and downloads the required software and device configuration.

About This Guide
This guide will only focus on how to deploy a single non-fabric switch using Cisco DNA Center to help reduce the cost, remove complexity, and maximize productivity resulting in an overall savings in operational expenses. You may apply this procedure to any Catalyst 9000 series switch but in this guide, we will only focus on Catalyst 9300 switch.

Reader tip
For more information on Cisco DNA Center supported devices please refer to the compatibility matrix information https://www.cisco.com/c/en/us/support/cloud-systems-management/dna-center/products-device-support-tables-list.html

Use Cases
Following are the two use cases covered within this guide:

- Automate day-zero onboarding of a switch with Plug and Play (PnP).
This document contains four major sections:

- The **Define** section presents a high-level overview of the campus LAN which will be designed and deployed through Cisco DNA Center.
- The **Design** section discusses the creation of the site hierarchy within Cisco DNA Center; configuration of various network services necessary for network operations.
- The **Deploy** section discusses discovery of the switch in a campus LAN; Define Golden image for a device in inventory, Create Onboarding Template, Create Network Profiles for Switching, Assign Network Profile to Site, Discover and manage network devices and Return Material Authorization (RMA).
- The **Operate** section briefly discusses the known caveats of device onboarding using PnP and RMA.
Define

Solution overview
Cisco DNA Center can help with the non-fabric wired deployments in various different ways such as – network discovery, network inventory, management of software revisions, Return Material Authorization, etc.

Reader tip
This guide only covers day-zero onboarding of a switch with Plug and Play (PnP) and Return Material Authorization (RMA). For software image management (SWIM) refer to Campus Software Image Management Using Cisco DNA Center Deployment Guide.

Figure 2.
Campus Topology highlighting device onboarding in Access layer.

Cisco DNA Center is designed for intent-based networking (IBN). The solution breaks the process in to Day 0 and Day N. The solution provides a unified approach to provision enterprise networks comprised of Cisco routers, switches, and wireless devices with a near zero touch deployment experience.
When planning to provision any project, the PnP feature within Cisco DNA Center can help pre-provision and add devices to the project. This includes entering device information and setting up a bootstrap configuration, full configuration, and Cisco device image for each device to be installed. The bootstrap configuration enables the PnP Agent, specifies the device interface to be used, and configures a static IP address for it.
Design

Before you proceed you must make sure you already have Cisco DNA Center installed on your network.

Reader tip

For more information on how to install Cisco DNA Center, refer to Software-Defined Access Management Infrastructure Prescriptive Deployment Guide.

Cisco ISE is not required for the use cases covered in this guide.

Complete the following prerequisites before proceeding:

- Configure the site hierarchy within Cisco DNA Center
- Configure network services (ex. DNS, DHCP, etc.) necessary for network operation

Process 1: Configure the site hierarchy within Cisco DNA Center

Configuring the site hierarchy involves defining the network sites for the deployment, and their hierarchical relationships. Network sites consist of areas, buildings, and floors. Their hierarchical relationship is important because child sites automatically inherit certain attributes from parent sites. However, these attributes may be overridden within the child site.

The following are the procedures for configuring the site hierarchy for this design and deployment guide:

- Create an area.
- Create buildings within the area.
- Create floors within each building and import floor maps

Procedure 1. Create an area

Step 1. Login to the Cisco DNA Center. (For example: dnac.company.com)

Tech tip

If SSL is not configured a warning indicating the connection is not secure will appear. For setup purpose you can continue by clicking on Advanced button and click the link to proceed to Cisco DNA Center webpage.

Also, the credentials (userid and password) you enter must have SUPER-ADMIN-ROLE OR NETWORK-ADMIN-ROLE privileges.

Step 2. Navigate to Design > Network Hierarchy.

Step 3. Click Add Site
Step 4. Select Add Area from drop-down menu.

![Cisco DNA Center interface showing network hierarchy and options to add site or import]

Step 5. In the Add Area pop-up window, type in the Area Name and select Parent.

![Add Area pop-up window with fields for Area Name and Parent]

**Tech tip**

For single area enter the Area Name as the City (example: San Jose) and leave Parent as Global. For multi-level areas create parent and child areas in the appropriate order.

For example: Country > State > City (USA > California > San Jose).

To import large number of sites, choose Import Sites as highlighted in the above screenshot.

Step 6. Click the Add button to add the area.

**Procedure 2.** Create building within the area
Step 1. Under Network Hierarchy, click the Add Site again.

Step 2. From the drop-down menu select Add Building.

Step 3. In the Add Building pop-up window, type in the Building Name (example: Building 4).

Step 4. Select the Parent area. (example: San Jose | Global/USA/California/)

Step 5. Enter the building address in the text field under Address.

Step 6. Click the Add button to add the building.

Tech tip

For Latitude and Longitude, enter an Address and select the suggested full address from the drop down and both the fields will be auto populated.

Process 2: Configure network services and device credentials for network operation

In the procedure below configure the following services that align to the site hierarchy in Cisco DNA Center:

- AAA
● DHCP
● DNS
● Syslog
● SNMP

If the services use the same servers across the entire site hierarchy, you can configure them globally. The inheritance properties of the site hierarchy makes global settings available to all sites. Differences for individual sites can then be applied on a site-by-site basis. Then add device credentials to manage scopes of the site hierarchy created in the design.

### Procedure 1. Add network services

**Step 1.** Login to Cisco DNA Center and navigate to Design > Network Settings > Network.

**Step 2.** Select Global in the navigation panel on the left side of the screen.

**Step 3.** Click on the +Add Servers button.

**Step 4.** From the Add Servers popup screen check the boxes next to AAA and NTP and click the OK button.

**Step 5.** Locate the AAA Servers section and fill in the necessary information.

**Tech tip**

Cisco ISE is not required for the use cases covered in this guide but if already have Cisco ISE you may fill in the Cisco ISE info as the AAA services.

**Step 6.** Fill in the information for the remain network properties:

- DHCP
- DNS
- SYSLOG
- SNMP
- NTP
- Time Zone

---

**DHCP Server**

- DHCP
  - 10.4.48.10

**DNS Server**

- Domain Name
  - cisco.local

**SYSLOG Server**

- Cisco DNA Center as syslog server

**SNMP Server**

- Cisco DNA Center as snmp server

**NTP Server**

- NTP
  - 10.4.48.17

**Time Zone**

- Time Zone
  - PST/BADT (PDT)

**Message of the day**

- Message of the day
  - Do not override the existing metd banner on the device

---

**Procedure 2.** Add device credentials to manage.

These device credentials enable discovery and management for the network. For this procedure, follow these steps:

**Step 1.** Navigate to Design > Network Settings > Device Credentials, select an appropriate level of the site hierarchy in the left pane (example: Global for common credentials across the hierarchy).
Step 2. At the top of the CLI Credentials section, click Add, complete the Name / Description (example: IOS Devices), Username, Password, and Enable Password fields, and click Save.

Tech tip

If you are using ISE as your AAA server, you should avoid using admin as the username for device CLI credentials, which can lead to username conflicts with the ISE administrator login, resulting in the inability to log in to devices.

Step 3. Select an SNMP credential type SNMPv2c Read.
Step 4. Click +Add and enter the following info:

- **Name / Description**: ro
- **Read Community**: public

Step 5. Click Save

Step 6. Select an SNMP credential type **SNMPv2c Write**.

Step 7. Click +Add and enter the following info:

- **Name / Description**: rw
- **Read Community**: private

Step 8. For each of the CLI and SNMP credentials assigned, click all radio buttons next to each assignment created, make sure to toggle to **SNMPv2c Write** and select Write.
Step 9. Click Save and a setting successfully acknowledgment is displayed.

The device credentials to be used for network discovery and management should now be available in Cisco DNA Center.
Deploy

This section of the guide implements the two use cases mentioned in the Solution Overview section of this document. Cisco DNA Center is used to automate the deployment of the wired profile created in the Design section of this document.

**Process 3: Automate onboarding of a Switch with Plug and Play (PnP)**

For LAN Automation deployments, CLI and SNMP credentials is supplied to access and prepare one or more supported PnP seed devices, such as 9300 Series Switches for access. Plug-and-Play auto discovers switches directly connected to chosen seed device interfaces and their immediate neighbor switches using Cisco Discovery Protocol, all of which must be running the PnP agent and have no previous configuration. The credentials supplied allow Cisco DNA Center and seed devices to work together to configure the discovered devices and add them into managed inventory.

**Procedure 1. Define Golden image for devices in inventory**

The software image management capability built into Cisco DNA Center is used to upgrade any devices that are not running a recommended image version.

**Tech tip**

In this example switch is upgraded from the default image to 16.9.1.

Use the following steps to apply software updates of images and software maintenance updates (SMUs) to the devices, by importing the required images, marking images as golden, and applying images to devices.

**Step 1.** Login to Cisco DNA Center.

**Step 2.** Go to Design > Image Repository

**Step 3.** Click +Import

**Step 4.** From the Import Image/Add-On dialog, choose a file location, and then click Import.

**Step 5.** Repeat this step for all images that you wish to deploy using Cisco DNA Center.
Tech tip

Images to be used for device families not yet available in Cisco DNA Center will be listed under the Unassigned category.

Step 6. Under Image Repository, click Show Tasks to verify if the import was successful.

![Image Repository Table]

Tech tip

If image import fails, next to the failed image in the list click on See why? for more details.

Step 7. Under Image Repository, click Imported Images to expand the list of all the imported images that are pending to be assigned to a device family.

![Imported Images Table]

Step 8. Click on Assign next to the image name need to be assigned.

![Assign Button]

Step 9. The slide out panel will show the list of device type from CCO based on the image. Check the box next to the Device Series and click Assign.
Step 10. Go to the assigned **Device Family** and click the expand icon and verify the image imported is available to mark as golden.

<table>
<thead>
<tr>
<th>Family</th>
<th>Image Name</th>
<th>Using Image</th>
<th>Version</th>
<th>Golden Image</th>
<th>Device Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Catalyst 9300 Switch</td>
<td>Install Mode (16.11.1.0.312)</td>
<td>1</td>
<td>16.11.1 Add On (N/A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Install Mode (16.9.1.0.70)</td>
<td>1</td>
<td>16.9.1 Add On (N/A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>cat9k_lossx.16.09.01.SPA...</td>
<td>0</td>
<td>16.9.1</td>
<td>Add On (N/A)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Step 11. Click the pencil icon and select the appropriate role, to mark a **Golden Image** for specific device role.

<table>
<thead>
<tr>
<th>Family</th>
<th>Image Name</th>
<th>Using Image</th>
<th>Version</th>
<th>Golden Image</th>
<th>Device Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Catalyst 9300 Switch</td>
<td>Install Mode (16.11.1.0.312)</td>
<td>1</td>
<td>16.11.1 Add On (N/A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Install Mode (16.9.1.0.70)</td>
<td>1</td>
<td>16.9.1 Add On (N/A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>cat9k_lossx.16.09.01.SPA...</td>
<td>0</td>
<td>16.9.1</td>
<td>Add On (N/A)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Step 12. Select **ACCESS** tag.
Verify image is marked as golden and ACCESS tag is selected.

Procedure 2. Create Onboarding Templates

By default, the Onboarding Configuration project is available for creating day-0 templates. You can create your own custom projects. Templates created in custom projects are categorized as day-N templates.

Step 1. Login to Cisco DNA Center.

Step 2. From the home page, choose Tools > Template Editor.

Step 3. From the left pane, next to Onboarding Configuration, click the gear icon and select Add Templates.
Step 4. In the Add New Template window, select Regular Template and fill in the following details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>switch-pnp</td>
</tr>
<tr>
<td>Project Name</td>
<td>Onboarding Configuration (default)</td>
</tr>
<tr>
<td>Tags</td>
<td>branch-sw-pnp</td>
</tr>
<tr>
<td>Device Type(s)</td>
<td>Switches and Hubs &gt; Cisco Cat 9300 Series</td>
</tr>
<tr>
<td>Software Type</td>
<td>IOS-XE</td>
</tr>
<tr>
<td>Software Version</td>
<td>(Optional)</td>
</tr>
</tbody>
</table>

Tech tip

Tagging a configuration template helps you to search a template using the tag name in the search field. Use the tagged template as a reference to configure more devices.

Step 5. Under Device Types, click Edit to view the selected device types. Enter the device (example: Cisco Catalyst 9300 Switch) name in Find field to narrow the devices and choose the device types that you want to apply to the template.

Tech tip

There are different granularity levels for choosing the device type from the hierarchical structure. The device type is used during deployment to ensure that templates deploy devices that match the specified device type criteria. This lets you create specialized templates for specific device models.

Tech tip

Template Editor does not show device product IDs (PIDs); instead, it shows the device series and model description. You can use cisco.com to look up the device data sheet based on the PID, find the device series and model description, and choose the device type appropriately.

Step 6. After choosing the device types, click Back to Add New Template.
Step 7. From the **Software Type** drop-down list, choose the software type **IOS-XE**.

Tech tip
If you select IOS as the software type, the commands apply to all software types, including IOS-XE. This value is used during provisioning to check whether the selected device conforms to the selection in the template.

Step 8. (Optional) For **Software Version**, enter the software version (example: 16.9.1) and Click **Add**.

Tech tip
During provisioning, Cisco DNA Center checks to see if the selected device has the software version listed in the template. If there is a mismatch, the provision skips the template.

Step 9. Select the recently created template from left pane, and in the Template Editor window on the right, enter the configuration for the template.

Tech tip
We have provided a sample configuration in **Appendix A**.

Step 10. To save the template content, from the **Actions** drop-down list, choose **Save**.

Step 11. To commit the template, from the **Actions** drop-down list, choose **Commit**.

Tech tip
Only the committed templates can be associated with a network profile and to use it for provisioning.

Step 12. From the top-right, click the calculator icon to go to the **Form Editor**.
Tech tip

All the form fields are drag and drop to rearrange the order.

Step 13. Select a form field (example: Host Name) and check the Required box:

Step 14. Fill in the remaining details as following:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>Host Name</td>
</tr>
<tr>
<td>Tooltip Text</td>
<td>Enter the switch name</td>
</tr>
<tr>
<td>Default Value</td>
<td>-</td>
</tr>
<tr>
<td>Instructional Text</td>
<td>-</td>
</tr>
<tr>
<td>Maximum Characters</td>
<td>10</td>
</tr>
<tr>
<td>Definition of hostname: Data Type</td>
<td>String</td>
</tr>
<tr>
<td>Definition of hostname: Display Type</td>
<td>Text Field</td>
</tr>
</tbody>
</table>

Tech tip

Repeat the above step for all the fields to have friendly names (example: $vlan_mgmt will become Management VLAN). Based on the variable the data and display type changes. Example for VLAN the data type is integer.

Tech tip

Bind to Source is not supported for Day 0 template, it is only supported for Day 1 template.

Step 15. To test the template, click the button to switch to simulation editor.
Step 16. Click **New Simulation**.

Step 17. Fill in the **Simulation input** form. (Only partial configuration is displayed in the screenshot below.)

Step 18. Click **Run**, and all the variables in the CLI will now display the actual value entered in the form fields on the left.
Tech tip

Make sure to commit the template before proceeding for the latest configuration to take effect during device provisioning.

Procedure 3.  Create Network Profiles for Switching

Define the Onboarding Configuration template that you want to apply to the devices. Such templates contain basic network configuration commands to onboard a device so that it can be managed on the network.

For this procedure, follow these steps:

Step 1. Navigate to Design > Network Profiles.

Step 2. Click +Add Profiles and choose Switching.

Step 3. Give a Profile Name, and Click +Add, under OnBoarding Template(s) tab.

Step 4. Select Cisco Catalyst 9300 Switch from the Device Type drop-down list.

Step 5. Select the Tag Name (example: branch-sw-pnp) from the drop-down list.

Step 6. Select an onboarding configuration template (example: switch-pnp) from the drop-down list.
Step 7. Click Save.

Tech tip
The profile that is thus configured on the switch is applied when the switch is provisioned.

Procedure 4. Assign Network Profile to Site

Each network profile can have multiple device types and sites assigned. But multiple network profiles cannot share the same site, even though two different network profile can be assigned different floors from the same site.

Step 2. Click on Assign Site.

Step 3. On the side panel for Add Sites to Profile, expand Site (example: San Jose) and select Building (example: Building 23).

Step 4. Click Save to complete all required steps for the design phase.
Procedure 5. Discover the controller (PnP Server)

For the device to connect with the controller (PnP Server), there are five options:

- DHCP server, using option 43 (set the IP Address of the controller).
- DHCP server, using a DNS domain name (DNS lookup of pnphelper).
- Cisco Plug and Play Connect (cloud-based device discovery).
- USB key (bootstrap config file).
- Cisco Installer App (For iPhone/Android).

In order for devices to call home to plug and play server in Cisco DNA Center, this guide will cover only the first option, DHCP server, using option 43 for PnP discovery.

Tech tip
For this guide the Option 43 is configured using a Microsoft DHCP server but it can be done using any other DHCP server such as Infoblox or on a router. For more information on DHCP controller discovery, go here.

Step 1. Go to Microsoft DHCP server to configure using option 43.

1. Go to the Scope Options for the specific VLAN.
2. Under General tab, check 043 Vendor Specific Info.
3. Replace the IP address with the correct IP address of the Cisco DNA Center (PnP Server).

![Cisco DNA Center IP Address](image)

4. Copy and paste the ascii

```
option 43 ascii "5A1N;B2;K4;1xxx.xxx.xxx.xxx;J80"
```

5. Click **Apply** and **OK**.

**Step 2.** Connect a single switch (example: Catalyst 9300) to access layer that’s getting onboarded.

**Step 3.** (Optional) Connect the console to a new switch and power it on. Once the device boots up, it will get IP address of the Cisco DNA Center using the option 43 and will do a PnP discovery as below.

--- System Configuration Dialog ---

Would you like to enter the initial configuration dialog? [yes/no]:

Press RETURN to get started!

```
*Oct 5 02:59:17.440: %PNP-E-PROFILE_CONFIG: PnP Discovery profile pnp-zero-touch configured
*Oct 5 02:59:18.285: %CRYPTO_ENGINE-5-KEY_ADDITION: A key named TP-self-signed-882668793 has been generated or imported
*Oct 5 02:59:18.287: %SSH-5-ENABLED: SSH 1.99 has been enabled
*Oct 5 02:59:18.328: %PKI-4-NOCONFIGAUTOSAVE: Configuration was modified. Issue "write memory" to save new IOS PKI config
*Oct 5 02:59:18.370: %CRYPTO_ENGINE-5-KEY_ADDITION: A key named TP-self-signed-882668793.server has been generated or imported
*Oct 5 02:59:19.441: %LINK-5-CHANGED: Interface Vlan1, changed state to administratively down
*Oct 5 02:59:38.000: %SYS-6-STATE_UPDATE: System clock has been updated from 02:59:29 UTC Sat Oct 5 2019 to 02:59:30 UTC Sun Oct 6 2019
Oct 5 02:59:30.000: %PKI-6-AUTHORTITATIVE_CLOCK: The system clock has been set.
Oct 5 02:59:30.003: %SMART_LIC-5-SYSTEM_CLOCK_CHANGED: Smart Agent for Licensing System clock has been changed
Oct 5 02:59:36.765: %AN-6-AN_ABORTED_BY_CONSOLE_INPUT: Autonomic disabled due to User intervention on console. config
Oct 5 02:59:39.046: %PKI-4-NOCONFIGAUTOSAVE: Configuration was modified. Issue "write memory" to save new IOS PKI config
Oct 5 02:59:49.664: %PNP-6-PNP_DISCOVERY_DONE: PnP Discovery done successfully
%Error opening ftp://10.4.48.10/network-config (Timed out)
Oct 5 02:59:54.685: %AUTINSTALL: Tftp script execution not successful for Gi0/0.
Oct 5 03:00:36.923: %KIOSK_REDUndANCY-5-PEER: Active detected switch 2 as standby.
Oct 5 03:00:36.923: %KIOSK_REDUndANCY-5-OK: Standby detected switch 1 as active.
Oct 5 03:00:41.964: %REDUNDANCY-5-PEER_MONITOR_EVENT: Active detected a standby insertion (raw-event=PEER_FOUND(4))
```

Tech tip

When the device is in process of PnP discovery do not touch the device as it will break the PnP process.
Procedure 6. Day-zero provisioning of switch onboarded with PnP

Step 1. Login to Cisco DNA Center.
Step 2. Go to Provision > Devices drop-down and select Plugin and Play

Step 3. Check the status of the switch to make sure it’s Unclaimed before proceeding.

Tech tip

Devices can also be added and claimed using Serial Number and Product ID. On Plug and Play Devices page click on Add and select Single Device, Bulk Devices or Smart Account Devices and provide information respectively.
**Step 4.**  Select the switch and click on **Actions** drop-down and select **Claim** to start the claim wizard.

![Plug and Play Devices (2)](image)

**Tech tip**

Before you claim a switch, if the access to the console is available, monitor the configuration in process by Cisco DNA Center. Copy and paste the following EEM script in the switch console:

```bash
event manager applet catchall
event cli pattern ".*" sync no skip no
action 1 syslog msg "$_cli_msg"
```

**Step 5.**  Assign a site to the device (example: Building 23) and click **Next**.

**Tech tip**

This tech tip is only applicable to a scenario where the floor is added to the building. If the network services and credentials are only applied to a floor and only the building is selected then an error will according while processing the claim request.

![Cisco DNA Center](image)

**Step 6.**  Select the golden image (example: cat9k_iosxe.16.09.01.SPA.bin) and click **Next**.
Tech tip

If an image was marked as golden as shown in Process 3 and Procedure 1, it will be auto assigned in this step.

</tr>
</tbody>
</table>

**Tech tip**

Hit the refresh if it doesn’t change. Now the device will be available under inventory. In case the status changes to Error, click on the device name.

An options panel will slide out from right. Now select the History tab to further investigate the error.
Step 12. Go to Provision > Devices

Step 13. Select the site hierarchy in the left pane.

Step 14. Verify the devices focus is set to Inventory.

Step 15. Select Switches as the Device Type to narrow down the devices.

Step 16. Verify the newly onboarded switch is in the Inventory.
Process 4: Simplified Return Material Authorization (RMA) process.

With hundreds and thousands of devices in an enterprise network, replacing older devices hardware becomes a complex process considering the steps involved such as identifying the replacement hardware with appropriate software version, configuration and copy paste errors involved in configuring the potential replacement and such. Cisco DNA Center offers a complete workflow to seamlessly identify, configure and replace the device hardware in the network.

Checklist before proceeding with RMA.

- Cisco DNA Center release 1.3.1 is installed.
- The replacement switch has the same exact SKU as the RMA device (faulty).
- Replacement switch is racked and powered up.
- All the connections are moved from the RMA device to the replacement switch.
- Replacement switch onboarded using PnP and is available as an unclaimed device in the PnP inventory.
- License on the replacement device should match the license on the faulty device to be replaced.
- Make sure the switch is in INSTALL MODE and not in BUNDLE MODE.
- Faulty switch that needs to be replaced must be in UNREACHABLE state.

Follow the steps below to proceed with the RMA process:

<table>
<thead>
<tr>
<th>Tech tip</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMA feature is available starting in Cisco DNA Center release 1.3.1.</td>
</tr>
</tbody>
</table>

**Tech tip**

For License Check

Run the following command on both the switches (faulty and replacement device) to verify the license:

```
show license right-to-use
```

**Tech tip**

For Mode Check

Run the following command on both the switches (faulty and replacement device) to verify the mode:

```
show version | begin Switch Ports
```
Step 1. Login to Cisco DNA Center

Step 2. Navigate to Provision > Devices and make sure Inventory is selected as the FOCUS.

Step 3. Go to Action > Device Replacement and select Mark for Replacement.

Tech tip
If the option to select Mark Device for Replacement in not available under the drop-down, then verify the current version of Cisco DNA Center is at least release 1.3.1. Also notice the selected device is in Unreachable state.

Step 4. Click Mark.
Tech tip

If there is an error **Error NCRM10085**, it means the software image version is not available in the image repository and needs to be uploaded and assigned to the switch family (example: Cisco Catalyst38xx switch)

---

Step 5. From the **Inventory** drop-down, select **Marked for Replacement** to view all devices that have been marked for replacement,

![Cisco DNA Center](image)

Step 6. Select the radio button next the **Device Name** of the faulty device (example: AD1-3850-12X48U).

![Cisco DNA Center](image)

Step 7. Click **Replace Device** from **Actions** menu to start to RMA workflow.

![Cisco DNA Center](image)

Step 8. Click **Start** to begin the workflow to help find a compatible replacement
Tech tip

User can choose the replacement device from the list of managed devices or use the Unclaimed tab to add the replacement device to Cisco DNA Center using Cisco Plug and Play feature.

Step 9.  Under Available Replacement Devices, select the Unclaimed device that will replace the faulty device and click Next.

Tech tip

Error NCRM11006 indicates the RMA device has not been onboarded using the PnP function so the RMA process will not continue for that device.
Step 10. Review Summary to make sure the faulty device is being replaced with the right new switch and click Next.

Review

We’re almost there. Review the summary below to be sure we’ve got everything covered. If you need to update anything, now is the time to do it.

Summary

Replacing

Device: AD1-3850-12X48U.cisco.local
Serial Number: FOC1912V0ZV

Replacing With

Device: AD1-3850-12X48U.cisco.local
Serial Number: FCW1919D0U0

Installing

OS Image: 16.6.4
License

Configuration: Dated on Sat Oct 12 2019 14:26:23 GMT-0700 (Pacific Daylight Time)

Tech tip

As shown in the above summary, the Configuration for the RMA device was archived on the mentioned date and time stamp. This configuration will be applied to the new replacement device.

Step 11. Select Replace Now and click Submit.
Tech tip

Error NCRM11005 indicates the RMA device is still in REACHABLE state and needs to be UNREACHABLE. Either have the RMA device physical unplugged or make changes in configurations to make in unreachable.

Step 12. Click Monitor Replacement Status once you are presented with the following screen.

Step 13. Click In-Progress under Replace Status for the RMA device.
Step 14. Select the Replace Status tab to monitor the progress of RMA process.

Tech tip
This process may take roughly 15-30 minutes if there are no errors. Hit the Refresh button to make sure the process has not failed due to an error.

Tech tip
As part of the RMA process Cisco ISE information is also applied to the device. But Cisco ISE is not a requirement for RMA use case.

After the RMA process is complete successfully, verify the configuration, image, and license on the new switch are exactly same.
Operate

Known Caveats

- The RMA process **does not** pull the configuration from the Onboarding Configuration Template or the Cloud Day-N Template. The configuration for the RMA devices is saved in the archive and applied to the new replacement device during RMA process.

- RMA supports replacement of similar devices only. For example, a Cisco Catalyst 3850 switch can be replaced only with another Cisco Catalyst 3850 switch. Also, the platform ID of the faulty and replacement devices must be the same.

- If the supervisor engine of the replacement device is different from that of the faulty device, the software image pushed to the replacement device may not be compatible, and the image activation in the replacement device goes to ROMMON mode.

- The RMA workflow supports device replacement only if:
  - Both faulty and replacement devices have the same extension cards.
  - The number of ports in both devices does not vary because of extension cards.

- Make sure that the replacement device is connected to the same port to which the faulty device was connected before.

- Cisco DNA Center does not support legacy license deployment. Also, the RMA workflow does not register the faulty device with CSSM, nor remove the faulty device license from CSSM.

- Cisco DNA Center provisions the replacement device with the running and VLAN configurations of the faulty device available in the archive. If any configuration changes were made to the old device after the latest archive, the replacement device may not have the latest configuration.

- If the replacement device onboards through PnP-DHCP functionality, make sure that the device gets the same IP address after every reload, and the lease timeout of DHCP is more than two hours.

- RMA workflow only supports enabling DNA licenses (DNA/Network Essentials and DNA/Network Advantage) on the replacement device. If the faulty device is running a legacy license (e.g. IP Base, IP Services and etc.), it requires users to enable the licensing on the replacement device outside RMA workflow, except when licenses on the faulty and replacement devices match.

- If users choose zero-touch RMA via PnP, RMA could fail if the replacement device gets the DHCP IP address from an IOS DHCP server initially and image upgrade is involved, since the replacement is very likely to get a new DHCP IP from IOS DHCP server after reboot.

- If the software image from the faulty device is not available in Cisco DNA Center Image repository, RMA workflow will fail since it cannot deploy the software image to the replacement device.
