With In-Room Control you can add custom elements to your Touch10 and DX Series user interface. Such user interface extensions may be controls for lights or blinds, or other peripherals (including one or more video switches to extend the number of video sources available), all controlled by external control systems.

Since both the Cisco video system and the other peripherals now are controlled from the Touch10/DX Series user interface, you will get a consistent user experience throughout the meeting room.

The version of the in-room control utility described in this document, is available for the SX, MX and DX Series video systems running Collaboration Endpoint Software, version CE9.0 or later.

How to Use This Guide
When reading this on javascript enabled devices the left menu bar and the entries in the table of contents are all hyperlinks. You can click on them to go to the topic.

Product Documentation
User guides and compliance and safety information for Cisco TelePresence systems are available at http://www.cisco.com/go/telepresence/docs
We recommend that you visit the Cisco web site regularly for updated versions of this guide.

Who Has Access to the Editor?
In order to access the In-room control editor you will need to have administrator rights.
However, an administrator may create an In-room Control User account. With this account it is possible to log into the codec to run the In-room Control Editor. No other part of the web interface is accessible from this account.
If you use SSH to log into the codec, only a very limited set of the API will be accessible.
Introduction
With In-Room Control you can add custom elements to our Touch10 user interface. Such user interface extensions may be controls for lights or blinds, or other peripherals (including one or more video switches to extend the number of video sources available) all controlled by external control systems.

Since both the Cisco video system and the other peripherals now are controlled from the Touch10 user interface, you will get a consistent user experience throughout the meeting room.

The version of the in-room control feature described in this document, is available for the MX, SX and DX Series video systems running Collaboration Endpoint Software, version CE9.0 or later.
Introduction

In-Room Controls

You can customize the Touch10/DX user interface to allow control of peripherals in a meeting room, for example playback of a sound or movie source, lights and blinds.

You can also add content sensitive controls appearing only when in a call and/or only outside calls.

This means that altogether you have three sets of panels at your disposal:

- **Global panel** has its entry icon in the status bar at the top of the Touch10/DX display. Once established, this entry icon is visible at all times.

- **Home panel** has its entry icon located to the right of the buttons appearing along the bottom of the Touch10/DX display. This entry icon is visible outside calls only.

- **In-Call panel** has its entry icon located to the right of the buttons appearing along the bottom of the Touch10/DX display. This entry icon is visible when in a call only.

Examples of how customization made by means of In-Room Control may appear on the Touch10, with an icon as shown at left and the menu appearing when that icon has been tapped, allowing control of lights and blinds, as shown at right.

More About How In-Room Control Works

To utilize the features of the In-Room Control you will need a Cisco video system with a Touch10/DX user interface, and a third-party control system, for example Crestron, AMX.

The video system’s API, referred to as the xAPI, is the link between the video system and the control system. Use the events and commands exposed by the xAPI when you program the control system.

The simple drag-and-drop editor offers a library of user interface elements, referred to as widgets. You can use these widgets to create your own in-room control panel for the Touch10/DX user interface.

Together, all of this provides a powerful combination of the control system’s functionality and the user-friendly Touch10/DX user interface.

All examples in this document show Touch10 user cases only, but this should not cause difficulties due to the high degree of similarity between the two interfaces.
Creating a User Interface
Creating a User Interface

Creating a User Interface for the Touch10

Use the in-room control editor to create customized panels for peripheral controls on the video system’s Touch10/DX user interface.

Connected to the Video System

If you have access to the video system, you can launch the editor from the video system’s web interface.

If an in-room control panel already has been created on the Touch10/DX, this will automatically load into the editor, ready to act as a starting point for your design.

When you push a new panel to the video system, you will immediately see the result on the Touch10/DX.

Offline

There are two places you can download the offline editor from:

- Or, sign in to a video system’s web interface with administrator credentials, navigate to Integration > In-Room Control, and click Download Editor.

If you choose to download the offline editor, extract the files from the downloaded zip-file. Retain the folder structure.

When using the offline editor you will be working with files, rather than communicating directly with the video system and Touch 10/DX. Apart from this, the offline editor has full functionality.
Creating a User Interface

Launch the In-Room Control Editor

Sign in to the video system’s web interface with administrator credentials, navigate to Integration > In-Room Control, and click Launch Editor.

If there is a set of in-room control panels on the video system already, it will load automatically into the editor. The Create icons (as in the below example) will then read Edit wherever a panel has already been created.

**Offline version.** If you are using the offline version of the editor, use a browser to open the index.html file that you find in the rceditor folder.

With no panels already defined, the user interface will look as shown at right.

Click on as indicated by the text Add your first panel.

The first panel will be of the Home panel type (see the previous pages for more on this). You can change this—see the next page for more.
Creating a User Interface

A Tour of the In-Room Control Editor

The system supports a maximum of three panels:
- In-call (visible during calls only)
- Home (visible outside calls only)
- Global (visible at all times)

An in-room control panel is arranged in pages. Each page consists of one or more rows, which you can populate with text and user interface elements known as widgets.

The maximum number of pages per panel is 50.

Widgets are arranged in a four-column grid. The widgets are placed into the grid according to the following rules:
- A widget fills between one and four columns depending on its size.
- Rows are right-aligned.
- If you add more widgets than fit in one line, widgets wrap to a new line within the same row.

Tip! In addition to clicking the Undo and Redo icons, you may also use the familiar keyboard shortcut commands to copy and paste (Ctrl c & Ctrl v / Cmd c & Cmd v).

Once you start to populate a page of a panel, the widget IDs in use will appear here to provide a simpler overview.

Clicking a panel in the list will display panel properties in the right panel, enabling you to change name, icon and location.

Example of a page not yet populated—in this case the very first page of the Home panel with a single unpopulated row

Drag widgets onto the page to populate it

The properties panel will display settings for any part selected/highlighted with the yellow frame. Selection can be Panel, Page, Row or Widget.

The panel name will appear on the Touch10 together with the In-Room Control button for that panel.

If you want to assign the panel to a different location, this is done here.

Note that you cannot have more than one panel per location.

The Directional pad (New!) can be used to control e.g. Apple TV

The spacer (New!) helps you get a better layout

ID is used to refer to a widget. Text is what appears on the Touch10.

The Widget IDs shown here belong to the active panel (shown with a blue background).

The system supports a maximum of three panels:
Application Programming Interface (API)
API

API for Programming In-Room Controls

Connect to the Video System

The video system’s API (also known as the xAPI) allows bidirectional communication with third-party control systems, such as those from AMX or Crestron. There are multiple ways to access the xAPI:

- Telnet
- SSH
- HTTP/HTTPS
- Ethernet port
- RS-232/serial connection

Regardless of the method you choose, the structure of the xAPI is the same. Choose the access method that suits your application and video system the best.

Consult the API guide for your video system to get a full description of available access methods and how to use the xAPI.

Go to:

Then, click Reference Guides > Command References to find the API guides.

Communicate over the API

The video system and the control system exchange messages through the xAPI to make sure that the Touch10/DX In-Room Control panel always reflects the actual status of the room.

The video system sends one or more events when someone uses one of the controls on the Touch10/DX In-Room Control panel, and the control system should send a command to the video system when there is a change in the room settings.

The video system and the control system exchange messages through the xAPI.

Examples:

- When someone taps a Lights On button on Touch10/DX, the video system sends the associated events. The control system should respond to these events by switching on the lights in the room and send the corresponding command back to the video system.
- When someone switch on the lights in the room, the control system should send a command to the video system, so that the video system can update the Touch10/DX In-Room Control panel to reflect that the light is on.

See the Command reference chapter for an overview of all relevant events, commands and statuses for in-room control.

Pairing Video System and Control System

You can register the control system as a peripheral connected to the video system:

xCommand Peripherals Connect ID: "ID" Type: ControlSystem

where ID is the unique ID for the control system, typically the MAC address.

See the API guide for more details about this command, and its options.

Heartbeats. The control system must send heartbeats to the video system to let the video system know that the control system is connected. The control system stays on the connected devices list (refer to xStatus Peripherals ConnectedDevice) as long as the video system receives these heartbeats from the control system.

xCommand Peripherals HeartBeat ID: "ID" [Timeout: Timeout]

where ID is the unique ID for the control system, typically the MAC address, and Timeout is the number of seconds between each heartbeat. If Timeout is unspecified, it is assumed to be 60 seconds.

Note. If a connected unit ceases to send heartbeats, some time will elapse until the video system detects the absence of heartbeats—as long as up to a couple of minutes.

This works the other way around as well, up to a couple of minutes may elapse until new heartbeats are detected by the codec.
Events for Widget Actions

The video system sends one or more of the following events when someone uses the controls on the Touch10/DX in-room control panel:

- **Pressed** — sent when a widget is first pressed
- **Changed** — sent when changing a widget’s value
  (applies to toggle buttons and sliders only)
- **Released** — sent when a widget is released
  (also when moving away from the widget before releasing)
- **Clicked** — sent when a widget is clicked
  (pressed and released without moving away from the widget).

These events are sent in two versions:

- **UserInterface Extensions Event** — suited for terminal output mode
- **UserInterface Extensions Widget** — suited for XML output mode.

See the table at right to find out the version best suited for your control system to register to.

When, and by which widgets (user interface elements), these events are triggered, are described in the Widgets chapter.

<table>
<thead>
<tr>
<th>UserInterface Extensions Event (suited for terminal output mode)</th>
<th>UserInterface Extensions Widget (suited for XML output mode)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single string contains information about the type of action, which widget triggered the event (identified by the Widget ID), and the widget value.</td>
<td>The type of action, which widget triggered the event (identified by the Widget ID), and the widget value are included as separate elements in the XML tree.</td>
</tr>
</tbody>
</table>

How to register:

**UserInterface Extensions Event**

```
xfeedback register event/UserInterface/Extensions/Event
```

**UserInterface Extensions Widget**

```
xfeedback register event/UserInterface/Extensions/Widget
```

**Example:**

```
*UserInterface Extensions Event Pressed Signal: "WidgetId: Value"
** end
*UserInterface Extensions Event Changed Signal: "WidgetId: Value"
** end
*UserInterface Extensions Event Released Signal: "WidgetId: Value"
** end
*UserInterface Extensions Event Clicked Signal: "WidgetId: Value"
** end
```

```
<Event>
<UserInterface item="1">
<Extensions item="1">
<Widget item="1">
<Action item="1">
<WidgetId item="1">
<WidgetId>
</WidgetId>
</WidgetId>
<Value item="1">
<Value>
</Value>
</Value>
<Type item="1">
<Type>
</Type>
</Type>
</Action>
</Widget>
</Extensions>
</UserInterface>
</Event>
```

Two event versions that a control system can register to: one suited for terminal output mode, the other for XML output mode.
API for Programming In-Room Controls (Cont.)

Event for Panel Update
The video system sends the following event when a new In-Room Control panel is applied:

`LayoutUpdated`—sent when a new in-room control panel for Touch10/10 is exported to the video system.

As a response to this event, the control system should send commands to initialize all widgets so that they reflect the true status of the room settings.

How to register:

```
xfeedback register event/UserInterface/Extensions/Widget/LayoutUpdated
```

Example:
```
*x UserInterface Extensions Widget LayoutUpdated
** end
```

XML output mode:
```
<Event>
  <UserInterface item="1">
    <Extensions item="1">
      <Widget item="1">
        <LayoutUpdated item="1"/>
      </Widget>
    </Extensions>
  </UserInterface>
</Event>
```

Event for Opening or Closing of a Page
If you have given each of your pages a unique Page ID, the system can send events when a page is opened or closed.

`EventPageOpened`—sent when a page is opened
`EventPageClosed`—sent when a page is closed

The pages are like radio buttons, opening another page will close the current page. In that case both the EventPageClosed and the EventPageOpened will be issued.

How to register:

```
xfeedback register event/UserInterface/Extensions/PageOpened
xfeedback register event/UserInterface/Extensions/PageClosed
```

Example:
```
Terminal output mode:
*e UserInterface Extensions Event PageOpened PageId: "appletvpage"
*e UserInterface Extensions Event PageClosed PageId: "appletvpage"
** end
```

XML output mode:
```
<Event>
  <UserInterface item="1">
    <Extensions item="1">
      <Page item="1">
        <Action item="1">
          <PageId item="1">appletvpage</PageId>
          <Type item="1">Opened</Type>
        </Action>
      </Page>
    </Extensions>
  </UserInterface>
</Event>
```

For an example of PageClosed, just substitute Closed for Opened in the example at left. This event will typically be used when you want the controller to take some action based on the event, in this case turning on (off) the AppleTV box for you.
API
API for Programming In-Room Controls (Cont.)

Commands and Statuses
The setValue command, which sets the value of a widget, is essential when working with in-room controls:

```
xCommand UserInterface Extensions Widget SetValue
  Value: Value WidgetId: WidgetId
```

When the video system receives a setValue command, the video system’s status and the Touch10/DX In-Room Control panel are updated accordingly.

It is important that the control system sends setValue commands in the following situations, so that the Touch10/DX In-Room Control panel truly reflects the status of the room:

- When the control system initially connects to the video system.
- When the video system restarts.
- When the control system restarts.
- When a new In-Room Control panel is exported to the video system from the In-Room Control editor (as response to the LayoutUpdated event).
- When someone physically changes something in the room, for example turns on the lights using a wall control.
- As a response to an event, for example when someone has tapped the Lights On button on the Touch10/DX In-Room Control panel.
- The control system must also do all that is necessary in the room to reflect the action on the Touch10/DX In-Room Control panel, for example switch on the light.

Consult the Widgets chapter for more details about which commands apply to the different widgets (user interface elements).

Examples

```
<table>
<thead>
<tr>
<th>User</th>
<th>Video system with Touch 10/DX</th>
<th>Control system</th>
<th>Lights</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tap Lights On</td>
<td>Pressed and Released events for Lights On widget</td>
<td>Set the value of the Lights On widget to active</td>
<td>Turn lights on</td>
</tr>
</tbody>
</table>
```

Message flow—turn on the lights using the controls on Touch 10/DX

```
<table>
<thead>
<tr>
<th>User</th>
<th>Video system with Touch 10/DX</th>
<th>Control system</th>
<th>Lights</th>
</tr>
</thead>
<tbody>
<tr>
<td>The appearance of the light widget has changed to match what the user can see in the room</td>
<td>Set the value of the Lights On widget to active</td>
<td>Signal that lights are on</td>
<td>Turn lights on with wall control</td>
</tr>
</tbody>
</table>
```

Message flow—turn on the lights using the wall control
Widgets
Widgets

Overview of Widgets

About Widgets
The Touch10/DX In-Room Control panel is composed of user interface elements called widgets. You can find the complete widget library in the right pane of the In-Room Control editor.

General tab: Buttons with custom text, group buttons, toggle button, sliders, text fields and more.
Icons tab: Buttons with familiar symbols for Home, Power, Arrow up/down/left/right, Camera controls, Loudspeaker controls, Microphone control, Media player controls, and more.

Each of the widget type available are described on the following pages, with emphasis on:
- Commands that change the value of the widget
- Events that are sent (pressed, changed, released, clicked) and which actions trigger these events
- Examples of commands and events, both in terminal output mode and XML output mode.

Syntax and semantics for all events, commands and statuses that are related to in-room controls (user interface extensions) are included in the Command reference chapter.

The Widget Identifier
All widgets on a Touch10/DX in-room control panel need a unique identifier, a Widget ID. The Widget ID may either be defined by you, or assigned automatically. The Widget ID can be any name or number; we recommend using a descriptive name without special characters. The maximum number of characters is 40.

The Widget ID is the programming link between Touch10/DX, the video system, and the control system. The Widget ID will be included in all events that are associated with a widget, and you must use the same identifier when you send commands to that widget via the code that you write for your control system.

Group Identifiers
One of the widgets, the Group button, has two types of identifiers: The Widget ID refers to the complete group of buttons, while Group IDs are unique identifiers for the individual buttons within the group.

A Group ID is assigned automatically, but can be defined by you instead. A Group ID can be any name or number; we recommend using a descriptive name without special characters. The maximum number of characters is 255.
**Widgets**

**Switch**

### Events

**Changed**—triggered when the button is released.

**Value:** `<on/off>`

**Example:** Press on* on a switch with WidgetId = "togglebutton".

```plaintext
Terminal mode
* UserInterface Extensions Event Changed Signal: "togglebutton:on"
** end
```

**XML mode**

```xml
<Event>
  <UserInterface item="1">
    <Extensions item="1">
      <Widget item="1">
        <Action item="1">
          <WidgetId item="1">togglebutton</WidgetId>
          <Value item="1">on</Value>
          <Type item="1">changed</Type>
        </Action>
      </Widget>
    </Extensions>
  </UserInterface>
</Event>
```

### Commands

The visual appearance of the button changes immediately when you tap it. However, the control system must always send a SetValue command to the video system when the button toggles between on and off. This ensures that the status is updated accordingly.

**Example:** Set a button with WidgetId = "togglebutton" to "on".

```plaintext
xCommand UserInterface Extensions Widget SetValue WidgetId: "togglebutton" Value: "on"
```

---

**About Switches**

Switch is a two-state button which indicates either on or off.

**Example of use:** Anything that can be turned on or off, for example lights, fan, and projector.

You can also use it as a toggle button together with a slider for lights to be dimmed.

---

Switch is a two-state button which indicates either on or off.

**Example of use:** Anything that can be turned on or off, for example lights, fan, and projector.

You can also use it as a toggle button together with a slider for lights to be dimmed.
Slider

Events

<table>
<thead>
<tr>
<th>Event</th>
<th>Triggered when the slider is pressed</th>
<th>Value: N/A</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pressed</td>
<td>Triggered when the slider is moved while holding down, and when the slider is released.</td>
<td>Value: 0-255</td>
</tr>
<tr>
<td>Released</td>
<td>Triggered when the slider is released</td>
<td>Value: 0-255</td>
</tr>
</tbody>
</table>

Example: Press the slider with WidgetId = “slider”, and move it into a new position (“68”), and release.

Terminal mode

```
* UserInterface Extensions Event Pressed Signal: "slider"
** end

* UserInterface Extensions Event Changed Signal: "slider:32"
** end

* UserInterface Extensions Event Changed Signal: "slider:68"
** end

* UserInterface Extensions Event Released Signal: "slider:68"
** end
```

XML mode

```
<Event>
  <UserInterface item="1">
    <Extensions item="1">
      <Widget item="1">
        <Action item="1">
          <WidgetId item="1">slider</WidgetId>
          <Value item="1">68</Value>
          <Type item="1">released</Type>
        </Action>
      </Widget>
    </Extensions>
  </UserInterface>
</Event>
```

About Sliders

A slider selects values within a set range. The minimum value is represented by 0, and the maximum value is represented by 255. When the slider is being pressed and moved, events are sent maximum 5 times a second.

When you tap the bar, the slider is immediately moved to that new position.

Example of use: Dimmable lights, volume control.

Commands

The visual appearance of the slider changes immediately when you tap or slide it. However, the control system must always send a SetValue command to the video system to tell the new position of the slider. This ensures that the status is updated accordingly.

Example: Set the slider with WidgetId = “slider” to position “98”.

```
xCommand UserInterface Extensions Widget SetValue WidgetId: "slider" Value: "98"
```
Buttons with custom text come in different sizes. The size determines the maximum number of characters you can add. Text does not wrap to a new line. You cannot use the `SetValue` command to change the text dynamically.

A button has two states: active and inactive. You do not have to set the button in active state when someone taps it; the button can be used to just send a signal without changing the button’s visual state.

If you want to have the buttons linked so that only one can be selected at a time (radio buttons), consider to use Group buttons (next page).

**Example of use:** Switching things on and off.

```
Example: Press and release the button with WidgetId = "button".

Terminal mode
*e UserInterface Extensions Event Pressed Signal: "button"
** end
*e UserInterface Extensions Event Released Signal: "button"
** end
*e UserInterface Extensions Event Clicked Signal: "button"
** end
```

```
// Pressed
<UserInterface item="1">  
<Extensions item="1">  
<Widget item="1">  
<Action item="1">  
<WidgetId item="1">button</WidgetId>
=Value item="1"></Value>
<Type item="1">clicked</Type>
</Action>
</Widget>
</Extensions>
</UserInterface>
```

**Example:** Highlight the button with WidgetId = "button" (set it in active state).

```
xCommand UserInterface Extensions Widget SetValue WidgetId: "button" Value: "active"
```
Group Button

Events

**Pressed** Triggered when one of the buttons is pressed.  
*Value:* The Group ID of the button (within the group) that was pressed.

**Released** Triggered when one of the buttons is released.  
*Value:* The Group ID of the button (within the group) that was released.

**Example:** There are four buttons in the group with WidgetId = "groupbutton".

Press the button with Group ID = "two":

```
Terminal mode
```

```
*e UserInterface Extensions Event Pressed Signal: "groupbutton:two"

** end
```

```
XML mode
```

```
<Event>
<UserInterface item="1">
<Extensions item="1">
<Widget item="1">
<Action item="1">
<WidgetId item="1">groupbutton</WidgetId>
<Value item="1">two</Value>
<Type item="1">pressed</Type>
</Action>
</Widget>
</Extensions>
</UserInterface>
</Event>
```

Commands

The visual appearance of the button changes immediately when you tap it. However, the control system must always send a SetValue command to the video system when one of the buttons are tapped. This ensures that the status is updated accordingly.

Use the UnSetValue command to release all buttons in the group so that no button is highlighted.

**Example:** Select (highlight) the button with Group ID = "one" in the group with WidgetId = "groupbutton". Then, release all buttons (no buttons are highlighted).

```
xCommand UserInterface Extensions Widget SetValue
WidgetId: "groupbutton" Value: "one"
```

```
xCommand UserInterface Extensions Widget UnsetValue
WidgetId: "groupbutton"
```
Icon Button

Events

**Pressed**
- Triggered when the button is pressed.
- Value: N/A

**Released**
- Triggered when the button is released.
- Value: N/A

**Clicked**
- Triggered when the button is released.
- Value: N/A

Example:

- **TextView**
  
  - UserInterface Extensions Event Pressed Signal: "symbol"
  
  **end**

- UserInterface Extensions Event Released Signal: "symbol"
  
  **end**

- UserInterface Extensions Event Clicked Signal: "symbol"
  
  **end**

---

**XML mode**

```
<Event>
  <UserInterface item="1">
    <Extensions item="1">
      <Widget item="1">
        <Action item="1">
          <WidgetId item="1">symbol</WidgetId>
          <Value item="1"></Value>
          <Type item="1">clicked</Type>
        </Action>
      </Widget>
    </Extensions>
  </UserInterface>
</Event>
```

Commands

Use the `SetValue` command to highlight or not the button in the user interface. A value of "active" will highlight the button, and a value of "inactive" will release it.

Example:

- **TextView**
  
  - Highlight the button with WidgetId = "symbol" (set it in active state)

  ```
  xCommand UserInterface Extensions Widget SetValue WidgetId: "symbol"
  Value: "active"
  ```

About Icon Buttons

Icon buttons share behavior behavior with buttons having custom text.

A button has two states: active and inactive. You do not have to set the button in active state when someone taps it; the button can be used to just send a signal without changing its visual state.

Example of use: Controls for a media player, or other devices that can start, stop, pause.
Spinner

Events

**Pressed**
Triggered when one of the spinner buttons is pressed.
*Value*: `increment/decrement`

**Released**
Triggered when one of the spinner buttons is released.
*Value*: `increment/decrement`

**Clicked**
Triggered when one of the spinner buttons is released.
*Value*: `increment/decrement`

Example: Press and release the decrement button of the spinner with WidgetId = “spinner”.

```
Terminal mode
*e UserInterface Extensions Event Pressed Signal: "spinner:decrement"
** end
*e UserInterface Extensions Event Released Signal: "spinner:decrement"
** end
*e UserInterface Extensions Event Clicked Signal: "spinner:decrement"
** end
```

```
XML mode
<Event>
<UserInterface item="1">
<Extensions item="1">
<Widget item="1">
<Action item="1">
<WidgetId item="1">spinner</WidgetId>
<Value item="1">decrement</Value>
<Type item="1">clicked</Type>
</Action>
</Widget>
</Extensions>
</UserInterface>
</Event>
```

About Spinners

A spinner is used to step through a list of values. You may use the two buttons to increment or decrement a number, or to step through a list of options.

Use the `SetValue` command to add text between the buttons.

**Example of use**: Set the desired temperature in the room.

```
SetValue UserInterface Extensions Widget SetValue WidgetId: "spinner" Value: "22"
```

Commands

**Example**: For the spinner with WidgetId = “spinner”, add the text “22” between the spinner’s increment and decrement buttons.
Widgets

Text

Events
None

Text boxes come in different sizes. They have up to two lines of text and the text automatically wraps to the new line.

A small text box with larger font size and no line wrap is also available.

You can define the initial text for the text box in the editor, and later on use the SetValue command to enter text dynamically.

Example of use: Help text, instructions, explanation of what different presets mean, or informative text from the control system, such as “The projector is warming up.”

The text box with larger font size is primarily meant for status values, such as the current temperature in the room.

About Texts

Commands

Use the SetValue command to set the text in the text box.

Example: Set the following text in the text box with WidgetId = “textbox”:
“The projector is warming up.”

```
xCommand UserInterface Extensions Widget SetValue WidgetId: “textbox”
    Value: “The projector is warming up.”
```
Widgets

Directional Pad

Events

**Pressed** Triggered when the button is pressed.
Value: N/A

**Changed** Triggered when the button is released.
Value: N/A

**Released** Triggered when the button is released.
Value: N/A

**Example:** Press and release the button with WidgetId = “dirpad”.

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Signal Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pressed</td>
<td>UserInterface Extensions Event Pressed Signal: “dirpad:up”</td>
</tr>
<tr>
<td>Changed</td>
<td>UserInterface Extensions Event Released Signal: “dirpad:up”</td>
</tr>
<tr>
<td>Released</td>
<td>UserInterface Extensions Event Clicked Signal: “dirpad:up”</td>
</tr>
</tbody>
</table>

**XML mode**

```
<Event>
  <UserInterface item="1">
    <Extensions item="1">
      <Widget item="1">
        <Action item="1">
          <WidgetId item="1">dirpad:up</WidgetId>
          <Value item="1"></Value>
          <Type item="1">clicked</Type>
        </Action>
      </Widget>
    </Extensions>
  </UserInterface>
</Event>
```

About Directional Pads

The Directional Pad can be regarded as a set of 5 buttons, the four Directional buttons and the Center button.

As can be seen from the examples at left, the event will be of the form:

“<WidgetId>:<the button pushed>”

in which **the button pushed** assumes the value:

*up, down, left, right or center*

**Example of use:** Controlling AppleTV
Widgets
Spacer

About Spacers

The Spacer lets you add space between or after widgets. It is no more than a layout tool.

The width of the spacer is adjustable (1–4). If you set it to maximum it will occupy its own line, making it usable as a vertical spacer, as well.

The Spacer is no more than a layout tool. Consequently, there are no events or commands associated with it.
Command Reference
Events

UserInterface Extensions Event Pressed
Sent by the video system when a widget is first pressed.
Equivalent to the UserInterface Extensions Widget Action event with Type “Pressed”.

*e UserInterface Extensions Event Pressed Signal: \textit{Signal}
in which
\textit{Signal}: String (0, 255)

The format of the string is “\textit{<WidgetId>:<Value>}”, where \textit{<WidgetId>} is the unique identifier of the widget that triggers the event, and \textit{<Value>} is the value of the widget. The range of allowed values depends on the widget type.

UserInterface Extensions Event Changed
Sent by the video system when changing a widget’s value (applies only to toggle buttons and sliders).
Equivalent to the UserInterface Extensions Widget Action event with Type “Changed”.

*e UserInterface Extensions Event Changed Signal: \textit{Signal}
in which
\textit{Signal}: String (0, 255)

The format of the string is “\textit{<WidgetId>:<Value>}”, where \textit{<WidgetId>} is the unique identifier of the widget that triggers the event, and \textit{<Value>} is the value of the widget. The range of allowed values depends on the widget type.

UserInterface Extensions Event Released
Sent by the video system when a widget is released (even if moving the finger out of the widget before releasing it).
Equivalent to the UserInterface Extensions Widget Action event with Type “Released”.

*e UserInterface Extensions Event Released Signal: \textit{Signal}
in which
\textit{Signal}: String (0, 255)

The format of the string is “\textit{<WidgetId>:<Value>}”, where \textit{<WidgetId>} is the unique identifier of the widget that triggers the event, and \textit{<Value>} is the value of the widget. The range of allowed values depends on the widget type.

UserInterface Extensions Event Clicked
Sent by the video system when a widget is clicked (pressed and released without moving the finger out of the widget).
Equivalent to the UserInterface Extensions Widget Action event with Type “Clicked”.

*e UserInterface Extensions Event Clicked Signal: \textit{Signal}
in which
\textit{Signal}: String (0, 255)

The format of the string is “\textit{<WidgetId>:<Value>}”, where \textit{<WidgetId>} is the unique identifier of the widget that triggers the event, and \textit{<Value>} is the value of the widget. The range of allowed values depends on the widget type.
Events

UserInterface Extensions Widget Action
Sent by the video system when someone uses one of the controls on the user interface (in-room control panel).
Equivalent to the UserInterface Extensions Event Type event.
Depending on the action type, this event is equivalent to one of these events:
- UserInterface Extensions Event Pressed
- UserInterface Extensions Event Changed
- UserInterface Extensions Event Released
- UserInterface Extensions Event Clicked Events

<Event>
  <UserInterface item="1">
    <Extensions item="1">
      <Widget item="1">
        <Action item="1">
          <WidgetId item="1">WidgetId</WidgetId>
          <Value item="1">Value</Value>
          <Type item="1">Type</Type>
        </Action>
      </Widget>
    </Extensions>
  </UserInterface>
</Event>

in which:
- **WidgetId**: String (0, 40)
The unique identifier for the widget that triggered the event.
- **Value**: String (0, 255)
The value of the widget. The range of allowed values depends on the widget type.
- **Type**: <Pressed/Changed/Released/Clicked>

- **Pressed**: Sent when a widget is first pressed.
- **Changed**: Sent when changing a widget’s value (only for toggle buttons and sliders).
- **Released**: Sent when a widget is released (even if moving the finger out of the widget before releasing it).
- **Clicked**: Sent when a widget is clicked (pressed and released without moving the finger out of the widget).

UserInterface Extensions Widget LayoutUpdated
Sent by the video system when the configuration file for the user interface extensions has been updated, i.e. when exporting a new configuration from the in-room control editor to the video system.

- `<UserInterface Extensions item="1">`
  - **<Widget item="1">**: WidgetId
  - **<Value item="1">**: Value
  - **<Type item="1">**: Type
- `<Event>`
  - `<UserInterface item="1">`
  - `<Extensions item="1">`
  - `<Widget item="1">`: LayoutUpdated
  - `</Widget>`
  - `<Extensions>`
  - `<UserInterface>`
- `<Event>`
UserInterface Extensions Widget SetValue
This command sets the value of the given widget, and the UserInterface Extensions statuses are updated accordingly. If the value is out of range, the command returns an error.

USAGE:
```
xCommand UserInterface Extensions Widget SetValue: Value
   WidgetId: WidgetId
```

in which

Value: String (0, 255)
The value of the widget. The range of values depends on the widget type.

WidgetId: String (0, 40)
The unique identifier for the widget.

UserInterface Extensions Widget UnsetValue
This command empties the value of the given widget, and the UserInterface Extensions statuses are updated accordingly. The user interface is notified that the widget is no longer selected.

USAGE:
```
xCommand UserInterface Extensions Widget UnsetValue: WidgetId
```

in which

WidgetId: String (0, 40)
The unique identifier for the widget.

UserInterface Extensions Clear
This command deletes all user interface extensions (widgets) from the video system.

USAGE:
```
xCommand UserInterface Extensions Clear
```

UserInterface Extensions List
Use this command to list all user interface extensions (widgets) that exist on the video system.

USAGE:
```
xCommand UserInterface Extensions List
```
UserInterface Extensions Widget [n] WidgetId

This status returns the identifier (WidgetId) and the current value of the widgets.

The value is an empty string until a value is set by using the UserInterface Extensions Widget SetValue command.

**USAGE:**

```plaintext
xstatus UserInterface Extensions
```

**Value** of the result returned:

- **Value:** The value of the widget. Depends on widget type. String (0, 255).
- **WidgetId:** The unique widget identifier. String (0, 40).

Example:

```plaintext
xstatus UserInterface Extensions
* UserInterface Extensions Widget 1 Value: "on"
* UserInterface Extensions Widget 1 WidgetId: "togglebutton"
* UserInterface Extensions Widget 2 Value: "255"
* UserInterface Extensions Widget 2 WidgetId: "slider"
* UserInterface Extensions Widget 3 Value: "Blinds"
* UserInterface Extensions Widget 3 WidgetId: "spinner"
* UserInterface Extensions Widget 4 Value: "inactive"
* UserInterface Extensions Widget 4 WidgetId: "button"
* UserInterface Extensions Widget 5 Value: "2"
* UserInterface Extensions Widget 5 WidgetId: "groupbutton"
* UserInterface Extensions Widget 6 Value: "Projector is ready"
* UserInterface Extensions Widget 6 WidgetId: "textfield"
** end
```
Use of a Video Switch
Use of a Video Switch

Using a 3rd Party Video Switch to Extend the Number of Video Sources Available

The Cisco Touch10 panel can now be configured to show video sources from a 3rd party external video switch in the normal Share Tray view.

The sources will appear, and behave, as any other video source connected directly to the codec. For the user this will be perceived as completely transparent—no video switch seems to be involved.

The video switch feature requires, similar to in-room controls, a third party control system. The control system will use the Codec API to synchronize the source states between the video switch and the Touch10 user interface using a set of API events and commands.

In order to make this work when the user selects a video source from the Touch10, the codec must be set to issue a corresponding event, which in turn shall cause the controller to send appropriate commands to the video switch and the codec.

This event will be issued only if the controller has registered to the codec upon connection, requesting the following from the codec:

```
exFeedback register Event/UserInterface/Presentation/ExternalSource
```

The event issued will be as follows:

```
*e UserInterface Presentation ExternalSource Selected SourceIdentifier: "XXXX"
```

Where "XXXX" is a unique string ID used to identify this source when selecting or setting state—see the following pages for more on this.

Furthermore, there are six commands available to control the system:

**Add**: Adds video source identifiers, including ID of connector, the name to appear on the Touch10, a unique string ID to identify a source when selecting or setting state, and what type of icon to display on Touch10 for each source.

**List**: Returns the current list of external sources.

**Remove**: Removes a source from the list.

**RemoveAll**: Removes all of the sources from the list.

**Select**: Selects a specific source.

**State Set**: Changes the state of a source.

These are all presented in detail on the following pages.

A simple example of a setup using the configuration shown above is provided in the article "Video Switch Example" on page 34.
Use of a Video Switch

Command Details

UserInterface Presentation ExternalSource Add
This command establishes and defines an input source.

```bash
xcommand UserInterface Presentation ExternalSource Add
ConnectorId: ConnectorId Name: Name SourceIdentifier: SourceIdentifier Type: Type
```

in which:
- **ConnectorId**: The ID of the codec connector to which the external switch is connected
- **Name**: Name displayed on touch 10
- **SourceIdentifier**: A unique string ID used to identify this source when selecting or setting state
- **Type**: Decides what icon is displayed on the Touch 10, choose between: <pc/camera/desktop/document_camera/mediaplayer/other/whiteboard>

Example:

```bash
xcommand UserInterface Presentation ExternalSource Add
ConnectorId: 3 Name: "Blu-ray" SourceIdentifier: bluray Type: mediaplayer
```

UserInterface Presentation ExternalSource Remove
This command removes a source from the list.

```bash
xcommand UserInterface Presentation ExternalSource Remove
SourceIdentifier: SourceIdentifier
```

in which:
- **SourceIdentifier** is a unique string ID used to identify this source when selecting or setting state.

UserInterface Presentation ExternalSource RemoveAll
This command removes all sources from the list.

```bash
xcommand UserInterface Presentation ExternalSource RemoveAll
```

UserInterface Presentation ExternalSource List
This command returns the current list of external sources.

```bash
xcommand UserInterface Presentation ExternalSource List
```

UserInterface Presentation ExternalSource Select
Starts to present the selected source if it is in ready state and has a valid ConnectorId. Also shows the item in sharetray as “Presenting”.

```bash
xcommand UserInterface Presentation ExternalSource Select
SourceIdentifier: SourceIdentifier
```

in which:
- **SourceIdentifier** is a unique string ID used to identify this source when selecting or setting state.

UserInterface Presentation ExternalSource State Set
Used to change state of the source with SourceIdentifier.

```bash
xcommand UserInterface Presentation ExternalSource State Set SourceIdentifier: SourceIdentifier State: State
ErrorReason: ErrorReason
```

in which:
- **SourceIdentifier**: is a unique string ID used to identify this source when selecting or setting state
- **State**: <Error/Hidden/NotReady/Ready> Ready is the only presentable state, hidden exists in the list but does not show in the sharetray.
- **ErrorReason**: Optional. Displays in the share tray if the state is set to Error.
Use of a Video Switch

Video Switch Example

A simple example of setup could be:

Controller sending:

```
xcommand UserInterface Presentation ExternalSource Add 
ConnectorId: 3 Name: "Blu-ray" SourceIdentifier: bluray 
Type: mediaplayer
```

```
xcommand UserInterface Presentation ExternalSource Add 
ConnectorId: 3 Name: "Apple TV" SourceIdentifier: appletv 
Type: mediaplayer
```

```
xcommand UserInterface Presentation ExternalSource Add 
ConnectorId: 3 Name: "TV" SourceIdentifier: tv Type: 
mediaplayer
```

The default state is NotReady (Fig. 1)

So the next step for an integrator would be to set them to ready (Fig. 2).

```
xcommand UserInterface Presentation ExternalSource State Set 
State: Ready SourceIdentifier: bluray
```

```
xcommand UserInterface Presentation ExternalSource State Set 
State: Ready SourceIdentifier: appletv
```

```
xcommand UserInterface Presentation ExternalSource State Set 
State: Ready SourceIdentifier: tv
```

If one of the sources is selected on the video switch the controller should send a command accordingly:

```
xcommand UserInterface Presentation ExternalSource Select 
SourceIdentifier: tv
```

If the switch is connected on the chosen connector it will start to present (Fig. 3).

When a user selects another source, by clicking the other source item in the share tray, the codec will send the following event:

```
*e UserInterface Presentation ExternalSource Selected 
SourceIdentifier: "appletv"
```

The Controller should listen to this event and display the selected source.
Troubleshooting
Troubleshooting

Using the Development Tools on the Web Interface for Troubleshooting

Sign In
Sign in to the video system’s web interface with administrator credentials, navigate to Integration > In-Room Control. Click the arrow to show the Development Tools.

Overview of all Widgets and Their Status
The Widget State Overview window lists all widgets, and their status. The status is shown in the Current Value column.

If the Current Value column is empty, the widget has not been initialized and has no value. We recommend that the control system initializes all widgets when it initially connects to the video system.

Send Value Updates to the Video System
A control system sends SetValue commands to the video system, telling it to update a widget. For test purposes, you can use the Update Value column in the Widget State Overview window to simulate a control system.

Enter a value in one of the input fields to immediately send the corresponding SetValue command to the video system. The Current Value column will be updated, and the Touch 10 in-room control panel changes accordingly.

Click Unset to clear the value of the widget (send an UnsetValue command).

If a control system is connected to the video system, the Current Value and Update Value columns may come out-of-sync. The Current Value column always shows the current status, regardless of whether the SetValue command is sent from a real control system, or from the Update Value column.

Check for Events and Status Updates
All events and status updates related to widgets appear immediately in the Log window. Events are prefixed with “e,” and statuses are prefixed with “s.”

Events appear when you use the controls on the Touch 10 user interface, and the status is updated when a command, which changes the video system’s status, is sent to the video system.

If a Panel Fails to Load
If an existing in-room control panel failed to load automatically on launching the editor, you may manually import the panel(s) from codec or load a local file made with the offline editor.

All alternatives erase any unsaved data in the editor, but the existing in-room control panel on the video system is neither overwritten nor deleted until a new panel is exported to the video system.
Tips and Tricks
Recommended Best Practice

Re-register to Get Feedback After Restart
When either the video system or the control system restarts, the control system must re-register to the events that the video system sends when someone uses the Touch10/DX in-room controls or pushes a new in-room control panel to the Touch10/DX.

For terminal output mode:
xfeedback register event/UserInterface/Extensions/Widget

For XML output mode:
xfeedback register event/UserInterface/Extensions/Event
xfeedback register event/UserInterface/Extensions/Widget/LayoutUpdated

Consult the API for in-room control chapter for more details.

Initialize All Widgets
Make sure the control system initializes all the widgets on the Touch10/DX in-room control panel in the following situations:

• When the control system connects to the video system for the first time
• When the video system restarts
• When the control system restarts
• When a new in-room control panel is exported to the video system (as response to a LayoutUpdated event).

If this is not done, then the Touch10/DX may show incorrect values and not truly reflect the status of the room.

Use the SetValue command to set the initial values.

Always send values back to the video system when something changes.

To avoid unexpected behavior and ambiguities, the control system must always send SetValue commands to the video system when something changes. This applies also when the change is triggered by someone using the controls on the Touch10.

For example, it makes no difference if you use a slider on the Touch10/DX in-control panel to dim the light, or a physical dimmer in the room, or another touch panel. The control system must always send the dimmer value back to the video system using the SetValue command.

Update the In-room Control Panel
When you export a new in-room control panel to the video system, the old panel is overwritten and replaced by the new one.

To update, do as follows:
1. Launch the in-room control editor from the video system’s web interface.
2. Create the in-room control panel you want, or import a previously saved panel from file (Import > From file).
3. Click Export > To codec.

Other Useful Stuff
Remember previous values when turning lights off (e.g. a light with a slider for dimming and toggle for on/off), remember the current light state when turning off, and use that value when turning back on.

Example: If the light is at 40%, and the user presses off, she will expect it to go back to 40% (not 100%) when pressing pressing the “on” again. Remember also to set the power switch to off if sliding to 0%.

For blinds, consider using the following strategy: Short press on a direction arrow tilts the blinds. If tilted all the way already, moves the blinds slightly.

Long press on a direction arrow starts moving the blind that direction, doesn’t stop until blinds are all the way up/down.

To stop movement after long pressing, short press any button (stop button is not really necessary)

Remove Entire In-room Control Panel and Icon
If there is an in-room control panel on the video system then there is also a corresponding in-room control icon, either in the Touch10/DX status bar or as a button to the right of the call control buttons. Even if a panel is empty and contains no widgets, both the icon and the panel will be visible.

Do as follows to remove an in-room control panel and icon from Touch10/DX:
1. Launch the in-room control editor from the video system’s web interface.
2. Select the panel to be removed (Global, Homescreen or In-call)
3. Click Delete panel.

Transitioning from 3rd Party Control Systems to CE
If you already have been using a third party control system and want to start using CE as described in this document, we recommend the following:

• Let any programming made to control third party stuff remain untouched.

• Remove all code that controls the Cisco video endpoint as that is now already controlled via the Touch10/DX.

• Reprogram the signalling from the button-presses coming from the third party control system panel so that it listens to button presses from the Touch10/DX instead.

This programming can be very simple to do as the largest control system manufacturers provide modules/drivers for in-room Controls making it very easy to get started with the programming.
Recommended Best Practice (cont.)

Inspirational Examples
The following examples may serve as inspiration and to provide further guidance on best practices. It is by no means mandatory to design and implement controls as illustrated in these examples.

Widget ID
When you drag a widget (e.g., a button) onto a page, you may give it a customized ID.

Widget IDs do not have to be unique. Widgets can share ID, but they must be of the same type.

This means that you can have two sliders in different panels called “main-light” but not one slider and one toggle button both called “main-light”.

To create a duplicate of an existing widget on another page or panel, just use Copy and Paste.

Create Groups of What Belongs Together
Consider grouping controls that belong together on the same page. The pages you create in the in-room control editor appear as separate tabs on the control panel.

Control of Lights
The combination of a slider and a toggle button could be used to control lights. The toggle button switches the lights on or off; the slider serves as a dimmer.

Consider the following strategy:
- Set the slider to minimum when the user turns the lights off
- Set the toggle button to off when the user moves the slider to its minimum
- Remember the value of the slider when the lights are turned off, so that you can return to this value when the lights are turned back on again
- If the light is at 40%, when the user switches it off, he or she would expect it to go back to 40% (not maximum) when switching the lights on again
- When the user selects one of the options in the group button (a light preset), set the sliders and toggle buttons accordingly
- If the lights are changed away from a preset, for instance by changing a slider or toggle button, deselect all options in the group button.

Control of Temperature
The combination of a spinner and a large font text box (value) may be used to control temperature. Use the spinner to set the desired temperature, and the large font text box to show the current temperature.

For the best user experience remember the following:
- Update the large font text box as the temperature in the room changes. Update the text field of the spinner when someone taps the up and down arrows
- Consult the Widgets chapter for details about how to update the spinner’s text field and the large font text box.

Control of Blinds
You can either use a spinner, or up and down arrows from the Icons tab in the widget library.

Consider the following strategy:
- If tilted all the way, move the blinds up or down incrementally
- As response to a long press on a direction arrow, start moving the blinds in that direction. They do not stop until all the way up or down
- Short press any button in order to stop the movement after a long press. Then no separate stop button will be needed.

Use a Button Only to Send a Signal
A button can be used just to send a signal, without changing the button’s state or visual appearance.

As an example, use the All lights on button to switch on all lights. Do not change the button’s color from gray to blue, but update the other light controls to reflect the true status of the room.

Group Buttons
Group buttons are ideal when you want buttons to be linked, so that only one can be selected at a time. For example room presets.

When the individual buttons in a group are too small to contain the text that describes their function, consider to use text boxes for the description.
Who Has Access?

Granting Access to In-Room Control Editor and Extensions API

In order to access the In-room control editor you will need to have administrator rights.

However, an administrator may create an In-room Control User account. With this account it is possible to log into the codec to run the In-room Control Editor. No other part of the web interface is accessible from this account.

If you use SSH to log into the codec, only a very limited set of the API will be accessible.
Room Simulator
Running the Simulator

In order to make it possible to demonstrate the features of the In-Room Control, we have made a simulator for you. The simulator should primarily be regarded as a sales tool.

No external controller is needed when running the simulator.

The simulator uses a predefined In-room Control setup. This cannot be changed. The predefined setup will overwrite the setup in the codec. Your current setup will be backed up in your browser and reinstalled after the session (you will be prompted to confirm that).

Note! As the simulator is self-contained, any controller connected to the codec should be disconnected when running the simulator to avoid conflicts.

Tip! We recommend using Google Chrome browser when running the simulator. Other browsers may fail to run the simulator properly.

To invoke the simulator navigate to Integration > In-Room Control in the web interface and then select Launch Simulator:

The Example Room will now appear. Click on Load Simulator Config. Once successfully loaded click anywhere to remove messages when needed.

Click on the Touch (1) to enlargen it and then click as shown (2) to invoke the In-Room Controls:

You may now play with the controls on the virtual Touch, but also with the switches themselves in the room. Click Clean up to finish and restore previous settings.
