Product documentation
The following documents provide guidance on installation, initial configuration, and operation of the product:

New features in version 2.2
- HD and Full HD modes
- Increased cluster size
- Content improvements
- Lobby screen
- Conference ending notification
- Improvements to telepresence experience
  - Faster audio switching
  - Centered PIPs
- Improved support for Cisco CTS systems
  - Support for TIP endpoint identification and ad hoc TIP calls
  - Encrypted calls
  - Roster list
• Conference locking
• Multichannel audio

- Conference size limits
- Improved text rendering
- IPv6 support
- Send DTMF to endpoints on connect
- TelePresence Server to CUCM trunking
- New help system

**HD and Full HD modes**

In earlier releases the maximum supported video definition of the TelePresence Server was 720p30 (720 horizontal lines, progressive scanning, 30 frames per second) which is now called ‘HD mode’.

This release introduces a new mode called ‘Full HD’ mode which allows for the following maximum video definitions:

- 1080p30 (1080 horizontal lines, progressive scanning, 30 frames per second)
- 720p60 (720 horizontal lines, progressive scanning, 60 frames per second)

Lower resolutions than 720 are also supported at 60 fps in ‘HD mode’.

There are no additional licensing requirements to use Full HD mode, with each screen license enabling a screen in either mode.

A Cisco TelePresence Server can support up to 16 screens in HD mode or up to 12 screens in Full HD mode.

**Increased cluster size**

The clustering feature is improved in this release. This version allows for a cluster of four Cisco TelePresence Server MSE 8710 blades to act as a single TelePresence Server, where previously the maximum cluster size was three blades.

This means that a cluster can now support up to 64 video participants in HD mode or up to 48 participants in Full HD mode.

The number of additional audio and content channels also increases when four blades are in the cluster.

**Content improvements**

The TelePresence Server now dynamically reassigns content ports to ensure that as many participants as possible can see the presentation.

In HD mode, a single Cisco TelePresence Server hardware unit supports 10 content ports and 16 video ports. This specification means that, in previous releases, some participants in full conferences would not have been able to see the presentation.

Version 2.2 of the Cisco TelePresence Server software mitigates this limitation by mixing the content stream into the main video stream for single screen endpoints, thereby freeing up content ports to be reassigned to other endpoints.

Multiple screen endpoints are given preference over the content ports and are guaranteed to receive the content as an extended video stream.

Single screen endpoints that receive the mixed stream now see this stream in a new layout. The layout shows the content in the largest area of the screen and reduces the video streams of other participants to smaller pictures along the bottom of the screen.

This capability of the TelePresence Server is not constrained to individual conferences; if necessary, the TelePresence Server can free up content ports for one conference by mixing the streams to endpoints in other conferences.
Content port priority is granted to endpoints in the following order:

1. Multiple screen systems
2. Single screen / immersive systems
3. All other endpoint types.

To ensure stability, the TelePresence Server does not reassign content ports between endpoints of equal priority.

### Lobby screen

The lobby screen is a new feature in this release. It is a static image with conference details overlaid that will be seen by participants before entering the conference.

The lobby screen shows the conference title and an optional lobby message. It also shows the conference start and end times if the conference is scheduled and not permanent.

You can enable or disable the lobby screen for each conference, or allow individual conferences to use the default lobby screen behavior that you set for the TelePresence Server.

You can set the lobby screen date format on a server-wide basis, and the lobby message for each conference.

### Conference ending notification

The TelePresence Server can now be configured to notify all participants that the conference is coming to an end. You can enable or disable this setting for each conference, or allow individual conferences to use the default settings for the TelePresence Server.

You can use a custom conference ending notification on a server-wide basis. Cisco CTS endpoints render the conference ending message locally rather than using the TelePresence Server’s setting.

### Improvements to TelePresence experience

#### Faster audio switching

Improvements to the audio mixing capabilities enable the TelePresence Server to prepare the outgoing stream more quickly than in previous versions. The delay when the active speaker changes is reduced and participants experience a more natural flow of conversation.

#### Centered PIPs

The automatic layout of the composed video stream is improved. When participants’ video streams are displayed in PIPs across the bottom of the layout, those PIPs are centered where possible.

### Improvements to support for Cisco CTS systems

#### Support for TIP endpoint identification and ad-hoc TIP calls

Cisco TelePresence Server 2.2 supports TIP endpoint identification and ad-hoc TIP calls.

This means that CTS systems, using the newly released CTS 1.7.4 software that includes TIP identification, are better supported in this release. This feature requires Cisco Unified Communications Manager 8.5 or later.

This feature enhances the interoperability and scalability of the TelePresence Server, CUCM, and CTS solution.

In TelePresence Server releases prior to 2.2, Cisco CTS systems needed to be preconfigured using Add Cisco endpoint on the TelePresence Server.

The TelePresence Server can now accept ad-hoc calls from newer CTS systems, or you can preconfigure them using Add new endpoint (rather than Add Cisco endpoint).
The older way of preconfiguring CTS systems has been retained, via the **Add legacy Cisco CTS endpoint** feature, to ensure compatibility with CTS versions prior to 1.7.4 and CUCM versions prior to 8.5.

**Encrypted calls to CTS endpoints**

The TelePresence Server can now set up encrypted calls to Cisco CTS systems, provided that the server has the Encryption feature key installed.

**Roster list display**

The TelePresence Server now sends a roster list of the conference participants to the CTS system. The list displays on the phone attached to the CTS system.

This feature requires the HTTP service to be enabled on the TelePresence Server's IPv4 interface.

**Conference locking**

You can use the phone attached to the CTS system to lock the conference, which means that nobody else can join the conference. This feature requires the HTTP service to be enabled on the TelePresence Server's IPv4 interface.

You can also lock the conference via the TelePresence Server's web interface or the XML-RPC API.

**Multichannel audio for CTS rooms**

The TelePresence Server now supports multichannel audio to and from CTS 3000 series systems, which provides a better meeting experience.

**Conference size limits**

This release of the TelePresence Server enables an administrator to define the maximum number of participants allowed in a conference. There is an audio only participant limit and a video participant limit which, when combined, define the conference's participant limit. No limits are defined for content channels.

Note that the TelePresence Server does not reserve resources and cannot guarantee that the configured limits may always be met; it's possible that the number of participants may be limited by the available resources before the configured limit is achieved.

The TelePresence Server considers multiple screen endpoints as multiple participants.

**Improved text rendering**

In prior releases the TelePresence Server used a bitmap font to display text on endpoint screens. The bitmaps were scaled as appropriate for the screens which did not always provide a visually pleasing result.

Version 2.2 introduces support for a TrueType font. To improve text rendering you'll need to upload the supplied font file to the upgraded TelePresence Server.

The TelePresence Server defaults to the former method of rendering text if you choose not to upload the font, or to remove it.

**IPv6 support**

The TelePresence Server now supports IPv6. You can manually or automatically configure IPv6 or IPv4 addresses on the TelePresence Server's Ethernet interface. You can also set an IPv6 address for the name server(s) and the default gateway.

The web interface supports the CIDR format of IPv6 address. For IPv6 addresses it’s likely that you’ll want to automatically generate the address, for which you can select DHCPv6 or SLAAC, depending on which automatic address allocation system the network is using.
Send DTMF to endpoints on connect

The TelePresence Server now has the ability to send a string of DTMF tones when calling out to an endpoint, which facilitates dialing into systems where additional numbers are required to complete the connection (such as a PIN).

You can enter the DTMF string on the call out parameters of a pre-configured endpoint, or you can specify it via the relevant API call.

Trunking to CUCM (Cisco Unified Communications Manager)

Version 2.2 of the Cisco TelePresence Server software introduces a new method of making calls via Cisco Unified Communications Manager.

You can now trunk the TelePresence Server to CUCM, where previously you were limited to either registering the TelePresence Server directly with CUCM or registering it with a VCS that was trunked to CUCM.

<table>
<thead>
<tr>
<th>Newly supported in this release</th>
<th>Cisco TelePresence Server</th>
<th>Trunk</th>
<th>Cisco Unified Communications Manager</th>
</tr>
</thead>
<tbody>
<tr>
<td>Previously supported (preferred option)</td>
<td>Cisco TelePresence Server</td>
<td>Registered</td>
<td>Cisco TelePresence Video Communications Server (VCS)</td>
</tr>
<tr>
<td>Previously supported (not recommended)</td>
<td>Cisco TelePresence Server</td>
<td>Registered</td>
<td>Cisco Unified Communications Manager</td>
</tr>
</tbody>
</table>

This feature is accessed in the TelePresence Server’s configuration for outbound SIP calls. Instead of simply enabling or disabling a SIP registrar, as before, you now have three options for **Outbound call configuration**:

* **Use registrar**
  - Corresponds to previous release’s Use SIP registrar (checked).

* **Use trunk**
  - New option to trunk to the address/domain combination provided.

* **Call direct**
  - Corresponds to previous release’s Use SIP registrar (not checked).

This new feature also affects endpoint configuration. When you are pre-configuring endpoints on the TelePresence Server you now have an unchecked option to **Call direct** instead of a checked option to **Use gatekeeper**. The endpoints will use either the trunk or the registrar by default, depending on your server-wide setting for **Outbound call configuration**.

The new trunking feature implies support for the following:

1. Either registering the TelePresence Server to CUCM for SIP, or setting a proxy for all outgoing messages.
2. Not registering individual conferences with SIP registrar.
3. Making all outgoing calls via CUCM.
4. Creating a dial plan on CUCM to route calls to the correct TelePresence Server.
5. 32 bit authentication tags.

New help system on TelePresence Server

The TelePresence Server has a new help system that includes better navigation and findability features than the previous system.
## Resolved issues

The following issues were found in previous releases of Cisco TelePresence Server and are resolved in version 2.2 (1.54).

### Resolved since version 2.2 (1.48), August 2011

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSCtt28141</td>
<td>In version 2.2 the range of ephemeral ports supported was not the same as the range supported on previous releases and did not match the range documented. This range was 10000-65535. This issue is now resolved. The correct documented range of 49152-65535 is now supported.</td>
</tr>
<tr>
<td>CSCtx70756</td>
<td>On rare occasions in certain scenarios the TelePresence Server crashed when connecting an H.323 call. This issue is now resolved.</td>
</tr>
<tr>
<td>CSCtx00990</td>
<td>The time stamp of a Call Detail Record (CDR) obtained through the Cisco TelePresence Server API was incorrect when using a time offset. This issue is now resolved.</td>
</tr>
<tr>
<td>CSCtw49857</td>
<td>On rare occasions the slave blade of a TelePresence Server cluster may have rebooted when there were a large number of calls connected with a range of resolutions. This issue is now resolved and this release includes improved backplane stability.</td>
</tr>
<tr>
<td>CSCts23629</td>
<td>The participant media summary CDR event incorrectly reported the position attribute of a stream to/from a single screen endpoint as '1' when it should have been '0'. This issue is now resolved.</td>
</tr>
</tbody>
</table>

### Resolved since version 2.2 (1.43), June 2011

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSCtt83179</td>
<td>On a small proportion of hardware units, the TelePresence Server would occasionally restart unexpectedly. This issue has been resolved in this release.</td>
</tr>
<tr>
<td>CSCtr11850</td>
<td>The upgrade process would sometimes freeze. This issue has been resolved in this release.</td>
</tr>
<tr>
<td>CSCtr11853, CSCtr11860</td>
<td>Some issues were being seen when using Internet Explorer 9 to access the web interface and online help of the TelePresence Server. These issues have been resolved in this release.</td>
</tr>
<tr>
<td>CSCts13246</td>
<td>The TelePresence Server was slightly too sensitive to a change in audio level that registered as a change in speaker, particularly on a CTS 3000 system. This issue has been resolved in this release.</td>
</tr>
<tr>
<td>CSCts15761, CSCts13241</td>
<td>There were some video issues due to instability on the Backplane and Internal links. These have been resolved in this release.</td>
</tr>

</table>
## Open issues

The following issues currently apply to this version of the TelePresence Server software.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSCtr11845</td>
<td>Blades occasionally report changes to backplane link status when another blade in the same chassis reboots. This issue should not impact normal operation.</td>
</tr>
<tr>
<td>CSCtr11856</td>
<td>SIP calls out from the TelePresence Server to a LifeSize endpoint may exhibit garbled audio, in both directions, if the calling parties use the G.722.1.C codec. This is unlikely to occur unless the call cannot fall back on another codec. Try using a different codec to work around this issue.</td>
</tr>
</tbody>
</table>
Limitations

HD quality indicators on CTS endpoints

The lobby screen is a static image that is designed for HD mode, that is, 720 pixels high. When a CTS endpoint displays the lobby screen, it may go on to incorrectly report the quality of the received video stream. The quality indicator may show four bars – for 720p video – even though the endpoint is actually receiving 1080p video and should display five bars.

Encryption required causes issues with some endpoints

Some endpoints such as the Sony XG-80 and HG-90, and the TANDBERG Classic 6000s are unable to join conferences in which encryption is required, even when encryption is enabled on the endpoint. (TANDBERG is now part of Cisco).

Setting these conferences to have optional encryption allows these endpoints to join using encryption.

Using a Room to start a conference that is registered to a SIP registrar may cause issues

If you are using a room to start a conference and the following are true then the configured endpoint may not be called successfully.

You enable SIP registrar in the Room configuration with a numeric ID.

You configure a SIP endpoint (in the top section of the Rooms configuration page).

This is because the endpoint may be called before the conference has completed registration with the SIP registrar. This is less likely to happen if you go to Configuration > System settings, and then enter a username and password in the SIP registrar section, because this speeds up conference registration with the SIP registrar.

Occasionally calls to additional pre-configured SIP endpoints may also fail, if registration is particularly slow.

Clustering limitations

Currently slot 10 does not support clustering.

If a slave fails while there is high utilization on the cluster, some participants in the cluster may receive audio only.

Interoperability

We endeavor to make the TelePresence Server interoperable with all relevant standards-based equipment. However, it is not possible to test all scenarios.

The following list describes the equipment and software revisions that were tested for interoperability with release 2.2. The absence of a device or revision does not imply a lack of interoperability.

Updating to version 2.2(1.54)

**Note:** You **must** back up your configuration **before** upgrading to 2.2(1.54).

You must also remember the administrator user name and password for the backup configuration. You will need these if you ever need to make use of this backup file.

If you are using Call Detail Records (CDR), or any other logs, for billing, auditing or other purposes, you must download and save your logged data. When you reboot the TelePresence Server, as part of the upgrade, you will delete all existing CDRs.

**Prerequisites and software dependencies**

- You need the software package (zipped image file) for this version.
- You should have the true type font file if you want to improve the text rendering. You can get this file, called `ts-font`, from the same place where you download your software, i.e. [http://www.cisco.com/cisco/software/release.html?mdfid=283645287&flowid=21873&softwareid=280886992&release=2.2(1.43)&relind=AVAILABLE&rellifecycle=&reltype=latest](http://www.cisco.com/cisco/software/release.html?mdfid=283645287&flowid=21873&softwareid=280886992&release=2.2(1.43)&relind=AVAILABLE&rellifecycle=&reltype=latest).
- You should also have any licenses and feature keys you need for the upgrade.
- Take a backup of your current configuration and software package, including logs and keys.
• Make sure you have administrative access to the Cisco TelePresence Server(s) and the Cisco TelePresence MSE 8050 Supervisor that manages their chassis.

• If you are upgrading a cluster of TelePresence Servers, you must have access to all of them and you must upgrade them all to the identical build.

• Keep a list of the model numbers and serial numbers of your devices in case you need to contact support.

• Arrange a downtime window and notify users of when the service will be unavailable. The approximate duration of an upgrade is 10 to 20 minutes.

Upgrade via the web interface

1. Unzip the image file locally.
2. Log in to your TelePresence Server's web interface with administrative credentials.
3. The username is admin and there is no password on a new unit.
4. Go to Configuration > Upgrade.
5. In the Main software image section, locate the New image file field. Browse to and select the unzipped new image file.
6. Click Upload software image.

   The web browser uploads the file to the TelePresence Server, which may take a few minutes.

   **Note:** Do not browse away from the Upgrade page, or refresh the page, during the upload process. The upload may fail if you do.

   The web browser refreshes automatically and displays the message Main image upload completed. Close the message.

7. Go to Configuration > Shutdown. Click Shut down TelePresence Server. This option will now change to Confirm TelePresence Server shutdown. Click to confirm.

8. Click the Restart TelePresence Server and upgrade button. This button only appears in the Upgrade page during this process.

   The unit will reboot and upgrade itself which takes a few minutes.

   **Note:** You may be logged out due to inactivity. If this happens, log in again, go to Configuration > Upgrade and click Restart TelePresence Server and upgrade.

9. Go to the Status page to verify that your TelePresence Server is using the new version.

10. Restore your configuration if necessary; refer to the online help for details.

Upgrade via FTP

1. Unzip the image file locally.
2. Connect to the TelePresence Server via ftp.
   For example, enter ftp IP Address at the command prompt, or use an FTP client with a graphical user interface.
3. Supply the administrator username and password.
   Username is admin without a password (on a new unit).
4. Upload the image file.
   For example, enter put ImageFilename at the ftp prompt.
5. Reboot the hardware after the upload.
You can reboot via the upgrade page on the web interface or use the power button on the hardware.
The unit upgrades itself when it restarts.

6. Log in to the web interface and go to the Status page to verify that your TelePresence Server is using the new version.
7. Restore your configuration if necessary; refer to the online help for details.

Notes

- FTP is generally more reliable for upgrades than the web interface.
- You can monitor the upgrade progress via the serial port.

Downgrade instructions

If you need to reverse your upgrade, you can re-install the former version of the software.
The downgrade procedure is the same as the upgrade procedure except you will use the earlier software image.

You need the correct version of the software and your saved configuration before you proceed.
1. Follow the upgrade procedure using the earlier software image.
2. Restart the hardware and check the status via the web interface.
   The status report indicates the software version.
3. Restore your configuration from the saved XML file.

Upgrade the font

Your TelePresence Server may be shipped with the TrueType font pre-installed. You can check this on the Status or Configuration > Upgrade page.

If the font is not present, and you want to use TrueType text rendering on your TelePresence Server instead of the default text rendering method, you must upload the font file.

**Note:** You should do this when the TelePresence Server is not heavily loaded. Also, you must use the supplied font; do not attempt to load a different font file.

Uploading via the web interface:

1. Browse to the TelePresence Server and log in.
2. Click the button to locate and select ts-font (e.g. Browse or Choose file, depending on browser used).
3. Click Upload font.
   After a short while, the Font file status changes to Present.

Uploading via ftp:

1. Open an ftp prompt in the local folder where you downloaded the file ts-font.
2. Open the TelePresence Server and log in.
3. Enter the command `put ts-font font` at the ftp prompt.
   This command copies and renames the file because the TelePresence Server expects a file called font.
   After a short while, the Font file status, on the web interface's upgrade page, changes to Present.
Removing the font:

1. If you want to revert to the default text rendering, click Delete font.
2. Confirm that you want to remove the font file.
   The Font file status changes to Not present.

Accessing Bug Toolkit

Bug Toolkit contains information about open and resolved issues for this release and previous releases, including descriptions of the problems and available workarounds.

2. Sign in with a Cisco.com username and password.

The identifiers listed in these release notes will take you directly to a description of each issue.

Searching Bug Toolkit

To look for information about a specific problem mentioned in this document, enter the identifier in the Search for Bug ID field and click Go.

To look for information when you do not know the ID number:

1. In Select Product Category, choose TelePresence.
2. In Select Products, choose Cisco TelePresence Server.
3. In Software Version, choose the version number.
4. Under Advanced Options, choose one of the following:
   - Use default settings: the system will search for severity 1, 2, and 3 bugs, open and fixed bugs, and only those bugs containing bug details.
   - Use custom settings: you can specify the severity and status parameters yourself, or search for keywords within the bug headline and description.

Getting help

If you experience any problems when configuring or using <product name>, see the "Product documentation" section of these release notes. If you cannot find the answer you need in the documentation, check the web site at http://www.cisco.com/cisco/web/support/index.html where you will be able to:

- Make sure that you are running the most up-to-date software.
- Get help from the Cisco Technical Support team.

Make sure you have the following information ready before raising a case:

- Identifying information for your product, such as model number, firmware version, and software version (where applicable).
- Your contact email address or telephone number.
- A full description of the problem.
