Introduction

ENUM (E.164 Number Mapping) is a way of using DNS NAPTR (Name Authority PoinTeR) records to convert E.164 numbers into routable URIs. ENUM is defined in RFC 3761.

This document describes how to configure your network and your Cisco TelePresence Video Communication Server (Cisco VCS) to enable calls to be placed from inside or outside your network using ENUM dialing to endpoints that have registered using a URI.

To support this deployment scenario:

- The VCS must be configured with an ENUM zone and associated search rule that:
  - removes any suffixes, producing a digit-only dial string
  - specifies a DNS domain where the NAPTR records for that E.164 can be found

- The VCS must be configured with the address of at least one DNS server that is capable of resolving the NAPTR search request.

- A DNS server must be configured with NAPTR records that:
  - defines (using regular expressions) the way in which a presented E.164 number is converted to a routable URI, and
  - defines the transport protocol to be used for the call (e.g. SIP or H.323)

These steps are described in detail in the sections that follow.
Configuring the VCS

Configuring an ENUM zone and search rule

An ENUM zone on the VCS and its associated search rule are used to construct a query for a DNS server with NAPTR records that describe how to convert E.164 numbers into one or more URIs.

In this deployment scenario, we want to query DNS for NAPTR records based on the number that was dialed, ignoring any domain information that has been appended. This requires

- an ENUM zone configured with a DNS domain suffix to be used for the lookup
- a search rule that transforms incoming dialed aliases into digit only numbers

To configure an ENUM zone:

1. Go to the Zones page (VCS configuration > Zones > Zones).
2. Click New. You are taken to the Create zone page.
3. Configure the fields as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Hop count</th>
<th>DNS suffix</th>
<th>H.323 mode</th>
<th>SIP mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter the name you want to give this zone, for example “ENUM lookup zone”</td>
<td>Select ENUM</td>
<td>Leave as default setting</td>
<td>Enter the suffix of the DNS location where the NAPTR records for this ENUM lookup are held, for example enum.search.com</td>
<td>Select On if the result of the ENUM lookup is allowed to be used to generate an H.323 call</td>
<td>Select On if the result of the ENUM lookup is allowed to be used to generate a SIP call</td>
</tr>
</tbody>
</table>

4. Click Create zone.
To configure a search rule:
5. Go to the Search rules page (VCS configuration > Dial plan > Search rules).
6. Click New. You are taken to the Create search rule page.
7. Configure the fields as follows:

<table>
<thead>
<tr>
<th>Rule name</th>
<th>Enter a name for the rule, for example “ENUM lookup”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Enter a longer description of what the rule does</td>
</tr>
<tr>
<td>Priority</td>
<td>Enter 150</td>
</tr>
<tr>
<td>Protocol</td>
<td>Select Any</td>
</tr>
<tr>
<td>Source</td>
<td>Select Any</td>
</tr>
<tr>
<td>Request must be authenticated</td>
<td>Configure this setting according to your authentication policy</td>
</tr>
<tr>
<td>Mode</td>
<td>Select Alias Pattern Match</td>
</tr>
<tr>
<td>Pattern type</td>
<td>Select Regex</td>
</tr>
</tbody>
</table>
| Pattern string    | Enter a regular expression in the format 
(\d+)([@domain]?)? for example (557\d{3})(@vcs.domain)? |
| Pattern behavior  | Select Replace                                        |
| Replace string    | Enter a replace string in the format
<ENUM digits to look up> for example 11 |
| On successful match | Select Continue                                 |
| Target zone       | Select the zone you created in the previous step      |
| State             | Leave as Enabled                                      |

![Create search rule configuration](image)
8. Click **Create search rule**.

In this example, the search rule filters requests to the ENUM zone so that it is only queried for certain digit strings. A transform is also applied to remove any domain that may have been added by a SIP device or by a transform in the VCS to make E164 numbers into URIs.

The above configuration means that when a call is made to **557123** or **557123@vcs.domain** then this ENUM zone will perform a lookup of NAPTR records at: **3.2.1.5.5.enum.search.com**
Configuring the VCS with a DNS server

For the VCS to perform a DNS query for an ENUM zone, it must be configured with at least one DNS server that can resolve the query for the DNS location where the NAPTR records for that particular ENUM lookup are held.

To configure the VCS with details of a DNS server to use:

1. On the VCS, go to the DNS page (System > DNS):

   ![DNS settings page](image1)

   2. In one of the available Address fields, enter the IP address of the DNS server that will be used to resolve the NAPTR query. This could be:
      - an internal DNS server that holds the NAPTR records – for example, use this if you are implementing ENUM dialing for calls within your network only
      - an internal DNS server that directs the query to an external DNS server
      - an external DNS server
Configuring NAPTR on a DNS server

A DNS server that can be queried by the VCS for ENUM lookups needs to be configured with NAPTR records containing:

- `<reverse digit order dotted E164 number> → routable address or regular expression to convert the dialed number into a routable address + transport specification (SIP or H.323)`

BIND style configuration

For example, setting up:

- 557120 to call john.smith@example.com using SIP or H.323
- 557121 to call mary.jones@example.com using SIP
- 557122 to call peter.archibald@myco.com using H.323

/etc/named.conf file

The `named.conf` file specifies (among other things) zones with specific domains and the files (in the `/var/named` directory) that specify the zones’ configuration.

For example:

```plaintext
zone "enum.search.com." IN {
    type master;
    file "enum.enumlookups";
};
```
/var/named/<filename>

Contained in the file /var/named/enum.enumlookups are the details of the configuration of the zone; for an enum zone this contains the Start Of Authority header followed by the NAPTR records containing the reverse ordered dotted digit lookups, their translations and details of the protocol to use to route the call.

For example:

```$TTL 60
@ IN SOA <server name> root (
  2009041201 ; serial number !!! change this to update record
  60 ; refresh period
  60 ; retry time
  120 ; expire time
  60 ; min ttl
 )

SOA = Start of Authority record

IN NS <server name>

NS = Name Server name

0.2.1.7.5.5 IN NAPTR 10 100 "u" "E2U+sip" "!^.*$!john.smith@example.com!" .
IN NAPTR 12 100 "u" "E2U+h323" "!^.*$!john.smith@example.com!" .
1.2.1.7.5.5 IN NAPTR 10 100 "u" "E2U+sip" "!^.*$!mary.jones@example.com!" .
IN NAPTR 12 100 "u" "E2U+h323" "!^.*$!peter.archibald@myco.com!" .

IN = Internet routing
NAPTR = record type
10 = order value (use lowest order value first)
100 = preference value if multiple entries have the same order value
"u" = the result is a routable URI
"E2U+sip" to make SIP call
"E2U+h323" to make h.323 call

Regular expression:
! = delimiter
replace 'from start to end'
with name@domain

... usual Regex expressions can be used
. NAPTR replace
field not used
Appendix 1 – Troubleshooting

Wireshark

TCPDUMP traces taken on VCS or in the network through which VCS’s DNS requests traverse provide a good mechanism for seeing the DNS (ENUM) request and the relevant response.

Dig

Dig is a command that allows the DNS server to be interrogated to check its configuration. Use this command from a Linux system, or download dig for Windows and run that.

Dig of a specific entry

dig -t NAPTR 1.2.1.7.5.5.enum.search.com.

Should result in a response like this:

;; DiG 9.4.1 <<>> -t NAPTR 1.2.1.7.5.5.enum.search.com.
;; global options:  printcmd
;; Got answer:
;; ->>HEADER<<- opcode: QUERY, status: NOERROR, id: 61653
;; flags: qr rd ra; QUERY: 1, ANSWER: 1, AUTHORITY: 1, ADDITIONAL: 2

;; QUESTION SECTION:
;1.2.1.7.5.5.enum.search.com. IN     NAPTR

;; ANSWER SECTION:
1.2.1.7.5.5.enum.search.com. 15 IN    NAPTR   10 100 "u" "E2U+sip" "!^.*$!mary.jones@example.com!" .

;; AUTHORITY SECTION:
enum.search.com. 15     IN      NS      <Authoritative DNS Server domain>.

;; ADDITIONAL SECTION:

Appendix 2 – Using Regex features of NAPTR

The incoming information to the NAPTR lookup is:
\d\./\d\./\d\./...\d

For example 1.2.1.7.5.5

Normal regular expression commands can be used to use these digits in the URI if required.
