About This Guide

Introduction

System Release 2.5 (SR 2.5) is a minor release built on System Release 2.2 (SR 2.2). These release notes contain the following information:

- Descriptions of the standard new features introduced with this system release
- Brief descriptions of new optional features for SR 2.5
- Information you need to prepare your site for an upgrade to SR 2.5
- Change requests (CRs) that were found in previous system releases and corrected in SR 2.5
- A summary of open issues for the standard version of SR 2.5
- A summary of open issues associated with optional features for SR 2.5
- General information on contacting Cisco®
- A list of software versions installed with the base SR 2.5 system

Audience

These release notes are written for system operators, sales and program managers, and field technicians.

Scope

These release notes provide an executive overview of SR 2.5. If you have questions about this release or require more detailed information call Cisco Services.
Software Product Offering

In addition to system releases, Cisco currently offers several other types of software products that enable the cable service provider to better manage their Digital Broadband Delivery System (DBDS) networks:

- **Client Releases (Application Platforms)** offer a bundled software package that includes both the SARA and PowerTV® Operating System (OS). Client releases are compatible with multiple system releases.
  - Client Maintenance Releases address a group of specific change requests that are required before the next client release is available.

- **System Releases** are software releases that are designed to improve or enhance the functionality of the Digital Network Control System (DNCS). A system release can be categorized as one of the following product types:
  - Major Releases and Minor Releases introduce new DBDS functionality while fixing known issues in the network.
  - Service Packs are executable files that are an accumulation of fixed change requests since the last major or minor release. After a service pack is issued for a specific major or minor release, each subsequent service pack includes all previously fixed change requests.
  - Patch Releases are a single, executable file that address an urgent customer issue before the next system release.
  - Maintenance Releases incorporate patch releases and service packs into one software release.

- **Headend Software Releases** are software releases designed specifically for headend components to enhance hardware functionality.

Document Version

This is the second release of these release notes.
Chapter 1
Why Choose System Release 2.5?

Overview

Introduction

SR 2.5 includes many features and enhancements implemented at the request of our customers. Review this chapter to learn more about these exciting changes.

Note: This chapter describes features and enhancements for the standard version of this software release. If you want information on the optional features available for this software release, see Chapter 2, New Optional Features.

In This Chapter

This chapter contains the following topics.

SR 2.5 at a Glance

Overview

This section provides an “at-a-glance” look at the new features and enhancements for SR 2.5. Each feature and enhancement is described in detail later in this chapter.

CableCARD: New Features Bring the CableCARD Module to the Next Level

SR 2.5 includes CableCARD™ module support for the following PKM600 PowerKEY® Conditional Access Module features:

- Automated Content Protection Binding for Two-Way Hosts
- Split Channels

Logging: New Logging Utility Makes Troubleshooting Even Easier

A new button has been added to the Utilities tab that allows you to display information that the DNCS records about critical processes and their libraries.

Instastaging: Stage On Demand in the Subscriber’s Home

Two-way systems can use Instastaging to perform just-in-time staging from subscribers’ homes. Instastaging offers two ways to stage set-tops: subscribers can pick up set-tops at retail centers, and then install and provision the set-tops in their homes; or technicians can install and provision set-tops in subscribers’ homes.

UI Servers: New GUIs Make It Easy to Monitor UI Servers

A new GUI Servers button on the Utilities tab provides access to powerful user interface (UI) server monitoring tools.

Sessions: UI Enhancements Increase Usability of the Session List

New filtering options and more detailed session information make it easier to find the information you need from the session list screens.

More DNCS Enhancements: Improvements Make Familiar Tasks Easier

Several enhancements to existing features throughout the DNCS make common tasks even easier.
CableCARD: New Features Bring the CableCARD Module to the Next Level

Overview

SR 2.5 adds two new features for CableCARD module support: automated content protection binding for two-way hosts and split channel support.

Automated Content Protection Binding for Two-Way Hosts Means Fewer Customer Calls

Note: This feature requires a two-way host to function.

SR 2.5 supports content-protection binding for two-way OpenCable™ Host devices (Hosts). With two-way Hosts, content protection binding occurs automatically, assuming the CableCARD module is already loaded on the DNCS.

After acknowledging the Host as a two-way Host, the CableCARD module sends the Host ID upstream to the DNCS, where the Host ID field is automatically populated on the DNCS. Content protection binding is complete when the DNCS returns an authentication message to the CableCARD module.

For content protection binding to work, the DNCS must be configured properly to ensure two-way communication. For detailed instructions, refer to the DNCS Online Help or to Setting Up the PowerKey CableCARD Module on the DNCS for SR 4.0.

Configure Split Channels for CableCARD Modules and Set-Tops at the Same Time

Configure split channels the same way you always have. The familiar Set Up Split Channel window that appears when you double-click an empty slot in the channel map now applies to set-tops and CableCARD modules.

The SaManager process was modified to support all of the necessary changes to enable split channels for the CableCARD module. Behind the scenes, the SaManager process updates the CableCARD channel map file each time a split channel switches sources (programs).
Logging: New Logging Utility Makes Troubleshooting Even Easier

Overview

The new Logging utility makes it easier than ever to capture key information for troubleshooting. Historically, many of the messages in the dnscsLog file were simply statuses and did not indicate any error conditions. Operators had to filter through a lot of status information to find specific error conditions. The new Logging utility allows you to fine-tune log levels for processes and their libraries. The fine-tuning ensures that the dnscsLog file contains more of the information you need to troubleshoot issues. The dnscsLog file contains information for all processes. Each process also has its own log file, providing access to focused troubleshooting information.

During normal operation, you may choose to log information at the Error Condition level only. If a problem occurs, you can turn on several additional log levels, such as the Alert and Debug levels, to capture more information in the dnscsLog file and the individual process log files.

Note: The dnscsLog file is a very large file; a full day could easily reach 10 MB or more. Use care when Logging to avoid the risk of filling the disk. Logging can impact system performance.

For more information on all of the available log levels and for step-by-step procedures for adjusting log levels, see the DNCS Online Help.

Welcome to the New Logging Interface

Access the new Logging Web User Interface (WUI) from the Utilities tab.

Click the Logging button to open the Logging Summary window, where you can select the type of information the DNCS records about critical processes (and their libraries).
The Logging Summary page allows you to set logging levels for each process on a specific host. If you are using Cisco’s Regional Control System (RCS) solution, you can set the log levels for each remote site.

To view or edit the logging levels for the libraries of a process, select the button next to the process and click Display Libraries. The libraries for the selected process are listed beneath the Logging Summary list, as shown in the following example.
Logging: New Logging Utility Makes Troubleshooting Even Easier, Continued

Where Do Log Files Reside?

After you configure your logging levels, make sure you know how to access the DNCS log file and log files for individual processes. You can open the DNCS log in /var/log/dncsLog and view the data that the DNCS has recorded.

You can find the most recent log files for an individual process in /dvs/dncs/tmp/[name of process.*]. The asterisk (*) represents a numeric value, as you can have a number of different log files for each process.

Notes:

- All processing logging levels can be viewed in /dvs/dncs/tmp.
- Only the Emergency, Alert, Critical, and Error logging levels can be viewed in /var/log/dncsLog.

For more information on how to use log files to maintain a healthy system, see the Maintenance Recommendations for the DBDS System Guide.

Am I Required to Stop and Restart Processes When Enabling or Disabling Logging from the Logging WUI?

No. You can enable and disable logging for a process on the fly without having to stop and restart the process. However, when setting the EMCDEBUG flags, the corresponding process will have to be stopped and restarted (bounced).

Does the Logging Utility Eliminate the Need for EMCDEBUG Flags?

Not yet. While one long-term goal of the Logging utility is to obsolete the need for Enhanced Machine Control Debug (EMCDEBUG) flags, most of the processes still require setting of the EMCDEBUG flags in the .profile file.

At the present time, the eventManager and logManager processes do not require the EMCDEBUG flags to be set. You must continue to maintain your current EMCDEBUG flags in the .profile file on the DNCS to control the output of various processes that still use the old logging scheme.

Note: As a general rule, the only processes that should always be set to debug are bossServer, camPsm, dsm, qamManager, and siManager. Cisco Services may instruct you to temporarily set additional processes to debug for troubleshooting purposes. In these cases, Cisco Services will tell you whether to use the Logging utility or EMCDEBUG flags.
Overview

Instastaging streamlines the set-top staging process for two-way, PowerKEY® Conditional Access Systems. Rather than racking up large quantities of set-tops to stage from your warehouse, you can allow professional installers or your subscribers to stage set-tops on demand.

Professional Instastaging and Subscriber Instastaging: What’s the Difference?

The actual steps to Instastage set-tops from the home are the same for both subscribers and professional installers. However, from a system perspective, professional Instastaging and subscriber Instastaging differ in two important ways: administrative status and package assignment.

Professional Instastaging

Professional Instastaging requires set-tops to be in a Deployed administrative status. In addition, the set-tops on the truck do not have packages pre-assigned to them. Instead, you identify the packages that comprise your standard Instastaging services using the Default Staging Package option from the Set Up Package window.

![Set Up Package Window]

Select this option for each package containing services you want to define as standard Instastaging services.

![Package List Window]

You can use this filter to quickly review your list of default staging packages.
Subscriber Instastaging

Subscriber Instastaging requires set-tops to be in an administrative status of In Service Two Way, and packages must be assigned to the set-top. For subscriber Instastaging, the set-top is placed on the subscriber’s account from a retail center. This placement triggers the billing system to set the administrative status to In Service Two-Way and send a ModifySet-topConfiguration transaction to authorize the set-top for the specific services requested by the customer.

How Does Instastaging Work?

In the home, the installer or subscriber completes the following three-step process to stage the set-top.

1. Connect and plug in the set-top.
2. Wait for the set-top to boot and display four dashes (----) or the current time.
3. Press the Power key to force the set-top to sign on to the network for the first time.

If the set-top successfully signs on and goes into two-way mode, the DNCS will send the required EMMs and authorize the correct services. For professional Instastaging, the set-top receives the default staging packages configured on the DNCS. For subscriber Instastaging, the set-top receives the packages for the services the subscriber ordered from the retail center.

How Do I Turn It On?

To enable Instastaging, you must complete the following tasks. You can find detailed instructions on these tasks in the DNCS Online Help or the Instastaging Guide.

1. Add the following command line to the end of the .profile file using vi or another text editor.

   \texttt{export HCTM\_PROVISIONING\_APP=1}

   \textbf{Note:} Placing this line at the end of the file ensures the correct value is set even if this same entry already appears earlier in the .profile file. As an alternative, you can search for this entry, and, if the entry already exists, you can update the value as shown.

2. Stop Spectrum, DNCS processes, and Application Server processes, and then restart Spectrum, DNCS processes, and Application Server processes.

   \textbf{Important:} Complete this task when system usage is low, such as during a maintenance window.

3. (Optional) If you are using default staging packages to provision set-tops for professional Instastaging, set up the default staging packages on your DNCS.
Instastaging: Stage On Demand in the Subscriber’s Home, Continued

How Do I Configure a Churned Box to Be Instastaging Capable?

Simply take the box out of service. When the admin status is changed to out-of-service, the DNCS will clear the IP address, delete the secure micro record, and then change the admin status to “deployed.”

How Long Will It Take the Box to Receive EMMs?

Boxes should receive EMMs within approximately 5 minutes. This time may vary based on system traffic.

When Instastaging Is Used, What Happens with Respect to IPPV (Credit Limit and Purchase Limit) and VOD Related Settings, Such As the DIS Enable Flag?)

It is critical to set these settings at the same time that the box is placed in either two-way status or deployed status. It is especially important to set the Digital Interactive Service (DIS) Enable flag at this time so that the DNCS will create the Session Based Encryption (SBE)-related EMMs.

What Is the Network Traffic Impact?

Instastaging can actually improve network traffic overall, especially when you use Instastaging for two-way staging in the warehouse. In this case, the EMMs only need to be sent to the one QPSK modulator feeding the staging rack, rather than every QPSK modulator if you were previously staging in a one-way environment.

Where Can I Learn More?

For more information on Instastaging, see the DNCS Online Help or the Instastaging Guide.
UI Servers: New GUIs Make It Easier to Monitor UI Servers

Overview

Simple Object Access Protocol (SOAP) is an XML-based messaging protocol for exchanging information over the Internet. The DNCS uses SOAP servers to integrate new Web-based interfaces with the legacy DNCS database and servers. As an example, the dbUIServer SOAP Server plays an important role in populating the Web-based CableCARD UIs with information from the DNCS database.

Note: On the DNCS Administrative Console, SOAP Servers are also referred to as both GUI servers and UI servers.

Welcome to the New UI Server Interface

On occasion, you may need to check the status of a UI server. For example, if the CableCARD Web interface opens, but no data is populated, you can check to see if the UI server for the CableCARD module (dbUIServer) is running. For SR 2.5, all UI servers are managed by a single Server Manager. If the Server Manager is running, all of the UI servers under this Server Manager should also be running. If desired, you can also view the status for each individual UI server under the Server Manager.

Click the GUI Servers button to open the Select Manager Server window, where you can immediately view the status for the Server Manager.
UI Servers: New GUls Make It Easier to Monitor UI Servers, Continued

For SR 2.5, only one Server Manager appears. Other managers may be added in future system releases as needed. The Server Manager status is color-coded to make it easy for you to determine if the Server Manager is running. Green indicates the Server Manager is active and running. Red and the message “inactive” indicate the Server Manager process is inactive. If you see red and the message “unknown,” the Server Manager returned no status when queried, indicating a communication or configuration issue.

In addition to “active,” “inactive,” or “unknown” statuses, the Manager Status also shows the date and time that the server started and the number of service requests the server has processed since it was started.

You can click Select Server Manager from the left column of the page to view the status for each UI server under this Server Manager.
Which UI Servers Can I Stop and Start from the New Interface?

SR 2.5 uses the following UI servers for Web interfaces. Each of the following servers can be stopped and restarted from the Configure UI Servers page:

- **sgUIServer** provides service group processing support.
- **dbUIServer** provides database access.
- **logUIServer** provides logging utility support.
- **rpcUIServer** provides DNCS server interaction.

If a UI server requires a patch, you can stop the UI server, install the patch, and then restart the UI server. This feature removes the need to stop and restart the entire DNCS for a single UI server patch.

For detailed instructions on stopping and starting UI servers, see the *DNCS Online Help*. 
Sessions: UI Enhancements Increase Usability of the Session List

Overview

Based on usability reviews, significant enhancements were implemented for the Session List WUIs. This section provides an overview of these enhancements.

Quick Path: DNCS Administrative Console> Utilities tab> Sessions

Focus the Session List with New Filtering Options

If you are only interested in sessions for particular QAM modulators (QAMs), new filtering options allow you to display sessions for those QAMs only. Select a single QAM, or use the Ctrl or Shift keys to select multiple QAMs. You can still show session information for all QAMs if desired.
Access Detailed Information for Selected Sessions

Two new menu options make it easy to display details or elements for a selected session.

You can display details or elements for a selected session.
Session Details

When you click **Display Details of Selected Session** from the Session Data Summary window, you can view details such as the MPEG Program Number, PMT PID, PCR PID, and ECM PID for each view of the session. From this page, you also have the option of viewing the details for a specific resource.

The following example shows the resulting Resource Details page that opens when you select a resource and click **Display Selected Resource Details** from the Session Resources page.
Sessions: UI Enhancements Increase Usability of the Session List, Continued

Element Details

When you click **Display Elements of Selected Session**, from the Session Data Summary window, the Session Elements page opens.

From this page, you can view key information for each device associated with the session, including the Input Port, Input TSID, Input MPEG Program Number, Output Port, Output TSID, and Output MPEG Program Number.
More DNCS Enhancements: Improvements Make Familiar Tasks Easier

Overview

Several enhancements to existing features throughout the DNCS application make common tasks even easier. This section provides an overview of these enhancements.

Work with Service Groups from a Web-Based Interface

The existing Service Group user interface was ported to the new Web-based user interface. You can still complete all of the same tasks you always have for service groups. For more information on service groups, see the DNCS Online Help.

Quick Path: DNCS Administrative Console> DNCS tab> Element Provisioning tab> Service Group
More DNCS Enhancements: Improvements Make Familiar Tasks Easier, Continued

Reference Data Rates and Block Sizes from a New Central Location

The Recommendations for Data Carousel Rate Technical Bulletin provides important guidelines for setting data rates, and most application installation guides provide guidelines for setting both the data rate and block size for inband and out-of-band sources. In previous releases, you had to open each individual source to view the data rate and block size for the source. SR 2.5 adds the Data Rate and Block Size columns to the Sources tab. These columns allow you to more quickly compare these values against documented recommendations and guidelines.

To ensure optimum performance as you add more applications to your system, review data rates and block sizes periodically. Depending on your system type (non-RCS or RCS), the following Quick Paths for the Sources path will vary.

- For non-RCS systems:
  
  Quick Path: DNCS Administrative Console> Application Interface Modules tab> BFS Admin> Sources tab

- For RCS systems:

  Quick Path: DNCS Administrative Console> Application Interface Modules tab> BFS Admin> (select Site) > File > Select > Sources tab

![The Data Rate and Block Size source parameters are more visible on the redesigned Sources tab.](image)
More DNCS Enhancements: Improvements Make Familiar Tasks Easier, Continued

Say Goodbye to the Configure Carousel Window and Duplicate Work

In SR 2.5, you still specify the Session ID and Inband Device Name (formerly known as the ATM Device) from the Hosts tab of the BFS Admin window, and you specify Block Sizes and Data Rates in the Sources tab of the BFS Admin window.

In previous system releases, you had to duplicate these entries in the Configure Carousel window for the Operating System Manager (OSM) session (for Code Version Table [CVT] downloads). To access the Configure Carousel window, shown below, you clicked Image on the Element Provisioning tab and then chose Configure Carousel from the Advanced menu option.

In SR 2.5, the OSM session is treated just like other BFS sessions rather than requiring its own unique carousel. This change eliminates the special handling of OSM when adding new BFS sources and sessions. As a result, the Configure Carousel window is no longer needed and has been removed.

Modify Data Carousels in Fewer Steps, Less Time

The OSM carousel is now fully integrated into the BFS carousels. As a result, when adding a new data carousel to the Program Allocation Table (PAT), you no longer need to delete the OSM carousel and add it back to the PAT.

Eliminate Mirror QAMs for PSIP Configuration

The new Non-Cisco Digital Source Definition UI eliminates the need for mirror QAMs in PSIP configuration. Refer to the Program and System Information Protocol Configuration for SR 2.5/SR 3.5 technical bulletin for details.
More DNCS Enhancements: Improvements Make Familiar Tasks Easier, Continued

Set Up the Inband Data Path from a More Logical Location

In previous releases, the inband data path was configured by clicking the **Inband Data Config** button on the Application Interface Module tab. However, setup for the inband data path is machine-specific; and, in a distributed system, each machine may have different inband mode data. For example, each machine may have a different device name and port. For this reason, setting up the inband data path is now done from the Set Up BFS Host window (a machine-specific screen).

As a result, the Inband Data Config button on the Application Interface Module tab has been removed.

**Quick Path:** DNCS Administrative Console> Application Interface Modules tab> BFS Admin > Hosts Tab > File > New
More DNCS Enhancements: Improvements Make Familiar Tasks Easier, Continued

Use MQAMs To Feed Multiple Hubs

A new user interface allows you to associate individual RF outputs in an MQAM with specific hubs. To access this new interface, click the Hubs button under the Port To Hubs column in the Basic Parameters tab for the Set Up MQAM window.

When you click Hubs, the RF Output Port window opens.

To send data from this MQAM modulator to only specific hubs in the headend, select the hub name in the Available Hubs field and then click Add. The hub name moves into the Selected Hubs field. Repeat this step for each hub you want to receive data from this MQAM modulator.

If you want to send data from this MQAM modulator to all hubs in the headend, make sure no hubs appear in the Selected Hubs field. Any QAM with no hubs selected is considered to be feeding all hubs. This allows you to add hubs without having to modify the configuration for QAMs.
More DNCS Enhancements: Improvements Make Familiar Tasks Easier, Continued

Get Targeted Online Help Based on Your Current Task

Clicking the **Help** link on any of the WUI windows in the DNCS Administrative Console now displays help topics for the tasks you can perform from that window. For example, clicking the Help link on the Service Group Setup window displays help for adding, modifying, or deleting a service group. It also explains the differences between standalone, parent, and child service group.

You can still navigate to other Help topics using the Contents, Index, or Search features. Targeted help is available only for WUI windows.
Chapter 2
New Optional Features

Overview

Introduction

SR 2.5 offers several new optional features, including Regional Control System (RCS), Direct ASI, and Overlay. This chapter provides a brief description of each of these optional features.

If you are interested in any of these features, please contact your Cisco North American Marketing Representative for more information.

In This Chapter

This chapter contains the following topics.

<table>
<thead>
<tr>
<th>Topic</th>
<th>See Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regional Control System: A New Solution for Geographic Challenges</td>
<td>2-2</td>

Regional Control System: A New Solution for Geographic Challenges

What’s RCS?

With the RCS solution, an operator at a central DNCS can provision and manage a Remote Network Control Server (RNCS) for each remote site. After each RNCS is configured, a central DNCS and Application Server can communicate with these unmanned sites across a T1-rate data link.

Each RNCS offloads tasks which were historically performed by the DNCS. For example, the DNCS is normally responsible for propagating BFS data to a given set-top population. In an RCS system, the RNCS performs this task. Additionally, with the RNCS in place, network elements can boot from and download directly from the remote platform without involving the central DNCS. The Emergency Alert System (EAS) is also local to the RNCS.
Direct ASI: Direct ASI Replaces the BIG

What’s Direct ASI?

You can now send BFS data directly from the DNCS to a BFS QAM modulator. Direct ASI simplifies your network by eliminating the need for a BFS BIG or for Asynchronous Transfer Mode (ATM) permanent virtual circuits (PVCs).

Direct ASI requires a DVB-ASI card and may require additional network components. Cisco Service engineers can configure your DNCS to support Direct ASI when they upgrade your system to SR 2.5.

Due to Cisco’s previously announced plans to phase out the BIG and the operations advantages of the Direct ASI configuration, sites should begin to budget and plan for this upgrade.
Overlay: Deploy Cisco Set-Tops in Other Networks

What’s Overlay?

Overlay is an optional feature that supports deployment of Cisco set-tops in a non-Cisco network environment. With Overlay enabled on the DNCS, Cisco set-tops and non-Cisco set-tops can be mixed throughout a non-Cisco network, independent of headend, hub, or node location.

You can currently deploy the following Cisco Explorer model set-tops in an Overlay environment:

- 3250
- 3250HD
- 8000
- 8000HD
- 8300
- 8300HD
- 1850
Chapter 3
What Are the Site Requirements?

Overview

Introduction
This chapter provides information to help you prepare for the SR 2.5 upgrade. Please read this entire chapter before you install SR 2.5. This chapter includes important information to help you schedule the appropriate amount of time for the upgrade.

Application Testing
Application testing for SR 2.5 was completed using a sample of applications developed for SR 2.2. SR 2.5 did not affect the functionality of the applications tested.

In This Chapter
This chapter contains the following topics.

<table>
<thead>
<tr>

Hardware and Software Requirements

Introduction
This section provides the hardware and software requirements you must meet before upgrading your system to SR 2.5. You can check your system against these requirements by running the Doctor report.

Running the Doctor Report

Use the following procedure to run the Doctor report on the DNCS.

1. If necessary, open an xterm window on the DNCS.
2. Type `cd /export/home/dncs/doctor` and then press Enter.
   **Result:** The `/export/home/dncs/doctor` directory becomes the working directory.
3. Type `doctor` and then press Enter.
   **Result:** The system generates a list of parameters that you can use to run the Doctor report.
   **Note:** Each parameter causes the Doctor report to generate output with specific configuration information.
4. Type `doctor -g` and then press Enter to view the version of DNCS software installed and the DNCS and Application Server platform, CPU, and disk information.
What to Verify Using the Doctor Report

Using the results of the Doctor report, verify that your system meets the following requirements. For detailed information on reading the data in the Doctor report, see the **DBDS Utilities 5.1 Installation Instructions and DNCS Utilities User’s Guide**.

**Important:** DBDS Utilities 5.1 is required for SR 2.5.

**DNCS System Release**

Your system must be running SR 2.2 at a minimum. In the Doctor report, look for the **SAIdncs** entry under the **All SAI Installed Package Information** section. Ensure the version is **3.0.1.16** or later. If you have installed Service Packs for SR 2.2, your version may include additional letters and numbers. For example, **3.0.1.16p7** is SR 2.2 Service Pack 2.

**DNCS Hardware Requirements**

Ensure your site meets the following DNCS hardware requirements before upgrading to SR 2.5.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Hard Drives</th>
<th>Memory (Minimum)</th>
<th>CPU (Minimum)</th>
</tr>
</thead>
<tbody>

<td>4 X 300 MHz</td>
</tr>
<tr>
<td>Sun Enterprise 250</td>
<td>2 X 9 GB</td>
<td>1 GB</td>
<td>2 X 300 MHz</td>
</tr>
</tbody>
</table>

**Application Server Hardware Requirements**

Ensure your site meets the following Application Server hardware requirements before upgrading to SR 2.5.

**Note:** If you are using another vendor’s application server, contact the vendor to ensure the hardware and software compatibility with Cisco’s SR 2.5.

<table>
<thead>
<tr>

**Application Platform Release Dependencies**

The following table shows the application platform release dependencies for SR 2.5.

**Important:** You must have these versions of application platform software or later installed on your system prior to upgrading to SR 2.5. If you do not install the correct application platform software before you upgrade to SR 2.5, subscribers may see video freezing and black screens when using video-on-demand (VOD) or anything-On-Demand (xD) applications.

## Scheduling Requirements

### How Long Does It Take to Complete the Upgrade?

With the live upgrade, your site only needs to be down for 2 to 3 hours during the entire upgrade process. Most of the upgrade procedures have no system impact. The pre-install and pre-upgrade steps can be performed at any time of day. However, the actual upgrade process normally takes place during a maintenance window beginning at midnight. The following table provides a breakdown of each upgrade process.

<table>
<thead>
<tr>
<th>Process</th>
<th>Length of Time</th>
<th>Activity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-install</td>
<td>1-3 hours</td>
<td>Activities are performed by Cisco Services, including checking the overall health of the system. These activities do not impact the system.</td>
</tr>
</tbody>
</table>
| Pre-upgrade | 3-4 hours      | Backing up the system:  
  - Back up the system components  
  - Back up the DNCS and Application Server files  
  - Complete system checks  
  These activities do not impact the system. |
| Upgrade    | 6-8 hours total; 2-3 of these hours require system outage | Upgrade the DBDS network:  
  - Back up the DNCS database  
  - Install the DNCS and Application Server software  
  - Install and download the component software (QAM, MQAM, GQAM, and QPSK modulator)  
  - Reboot the hardware  
  - Complete functional checks  
  QPSK modulator upgrades and some QAM and MQAM upgrades can be completed with little or no subscriber impact. However, 2-3 hours of the upgrade require system outage. |
| Post-Upgrade | 3-4 hours     | Back up the system:  
  - Back up the file system  
  - Back up the DNCS database  
  These activities do not impact the system. |

Chapter 4
What CRs Are Included in SR 2.5?

Overview

Introduction
This chapter describes change requests (CRs) that were found in previous system releases and corrected in SR 2.5 to improve operational performance of the DNCS.

In This Chapter
This chapter contains the following topics.

<table>
<thead>
<tr>
<th>Topic</th>
<th>See Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issues Corrected in SR 2.5: The Short Story</td>
<td>4-2</td>

</table>
Issues Corrected in SR 2.5: The Short Story

Overview

If you want to see if a specific CR was fixed in this release, refer to the following quick reference list. If you would like to review CRs in more detail, the next section provides descriptions of each issue corrected in SR 2.5.

Quick Reference to Issues Corrected in SR 2.5

The following list provides a one-line description of each fix that was implemented in this release.

<table>
<thead>

</tr>
<tr>
<td>CR 48759</td>
<td>Options -b and -s are implemented in the backupDatabase script</td>
</tr>
</tbody>
</table>
Want to Know More?

Overview

This section provides more detail about each fix in SR 2.5. The descriptions in this section are not intended to be comprehensive. If you have additional questions contact Cisco Services.

File Names Greater Than 100 Characters in Length Now Supported in dncsFilesBackup Script

The DNCS key files consist of those files required to boot the DNCS. The script that backs up the DNCS key files is called **dncsFilesBackup**. Previously, if a DNCS key file name was greater than 100 characters, the dncsFilesBackup script was reporting an error. Although the script was reporting an error, the files were still backed up to tape.

To address this issue, reported in CR 36770, Cisco modified the dncsFilesBackup script to accept filenames greater than 100 characters in length.

Size Limitations for the SAM Bulk Table Are Managed Effectively

Each time you register a service with the SAM, the DNCS assigns the service a unique service ID and, in some cases, a new URL. These URLs are stored in the bulk.tbl file, which is located in the /dvs/dvsFiles/SAM directory. Previously, when the bulk.tbl size limitation of 65 KB was exceeded, a much smaller, incomplete bulk.tbl file was created by saManager. When set-tops downloaded this smaller, incomplete file from the BFS, the set-tops no longer received complete service information. As a result, set-tops displayed black screens and/or continuously rebooted.

To address this issue, reported in CR 38526-01, the DNCS code was updated to ensure a new SubTable is created anytime data threatens to push the size of bulk.tbl over 65 KB. In addition, a new 4-bit SubTable is created for extremely rare cases where the number of unique service IDs exceeds 65536.
EAS Messages Display at Expected Time Intervals

By default, the DNCS resends EAS messages every 2 minutes, though you can reconfigure the resend timer using the MMM\_CLEANUPSEC environment variable. The resend timer determines how often the DNCS resends an active EAS message to set-tops. Resends are necessary for recovery purposes and to ensure set-tops whose states have recently changed receive the message. Previously, when a new EAS message was sent, none of the resend timers for existing EAS messages were cancelled. Because multiple resend timers were active at the same time, the new EAS message was sent more frequently than necessary. Unpredictable timing issues with the EAS message are a result of the message being sent more frequently than necessary.

To address this timing issue, reported in CR 39857, all previous resend timers are now cancelled anytime a new EAS message is sent. When the new EAS message is sent, the only resend timer that is active is the timer for the current EAS message.

Memory Issues with Spectrum Processes Are Corrected

Customers reported that the SpectroSERVER and AlarmView processes associated with Spectrum were consuming upwards of 600 to 700 MB of resident memory each week. Customers had to regularly stop and restart the DNCS to thwart this aggressive memory growth.

To address these memory issues, reported in CR 45626, Cisco applied Aprisma’s patch P121 to customer systems. This patch corrected the AlarmView memory issue; however, SpectroSERVER continued to have memory issues. Aprisma issued a technical bulletin (TB0767-9) that indicated SpectroSERVER would leak under certain conditions. To correct the SpectroSERVER memory issue, Cisco followed the recommendations in this technical bulletin and changed the event\_batch\_max\_size variable from 1 to 100.

Options -b and -s Are Implemented in the backupDatabase Script

The script that backs up the Informix database on the DNCS is called `backupDatabase`. You can run the backupDatabase script with a number of options, including the -b (block size) and -s (tape size) tape device options. Due to a discrepancy in what the script expected, you could not use the -b and -s options. Instead, a workaround had to be used for both options.

To address these issues, reported in CR 48759, Cisco modified the backupDatabase script to recognize the -b and -s options.
Chapter 5
Known Issues for Standard SR 2.5

Overview

Introduction

This chapter provides a summary of known issues for the standard version of this software release.

Note: For a summary of known issues related to optional software features, see Chapter 6, Known Issues for Optional Features.

For More Information

The lists in this chapter are not intended to be comprehensive. If you have questions about a particular change request, contact Cisco Services.

In This Chapter

This chapter contains the following topic.

<table>
<thead>
<tr>
<th>Topic</th>
<th>See Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Known Issues in the Standard Version of SR 2.5</td>
<td>5-2</td>
</tr>
</tbody>
</table>
Known Issues in the Standard Version of SR 2.5

Introduction

Resolutions to the following system release issues are currently in development at Cisco.

CR 27796: Image Files May Not Save Due to File Permissions Settings

The system allows the operator to copy image files with various permissions settings that do not satisfy the CVT user interface during the save operation. As an example, if the permissions of a software image file are set to 555 (read and execute for all users), you cannot save the image file from the Set Up Downloadable File window on the DNCS.

Workaround: When the Save fails to work, the Set Up Downloadable File window issues a “Save Failed” message. To determine if the save operation failed because of file permissions, you can check the dnscsLog file for an “Unable to copy image” log message from osm.

To correct the file permissions, enter the following command. Replace <image> with the name of the image file that needs different permissions.

`chmod 755 <image.name>`

CR 27799: Quitting the Online Help Closes the Help and the DNCS Web-Based Interface

If you select File > Quit from the Help window for a Web-based UI, both the Help window and the Web-based UI close.

Workaround: To close the Help window only, select File > Close or click \[\] in the upper right corner of the Help window.

CR 28741: Files Are Not Automatically Moved to the Correct Carousel

If you add a file to a carousel as an inband file and then change the file to an OOB file, the file is not automatically moved to the OOB carousel. The same is true if you add a file to a carousel as an OOB file and then change the file to an inband file. The OOB file is not automatically moved to the inband carousel.

Workaround: Delete the file, and re-add the file to the correct carousel.

CR 31348: The Services Portal Cannot Be Disabled

Normally, if you set the access level for an application or feature to None from the Set Up User Access window, the button associated with the feature or application is disabled (greyed out). If you set the access level for Services Portal to None, the Services Portal button remains active on the Server Applications tab. Users can still open the SP Service Guide and edit the Services Portal.
Known Issues in the Standard Version of SR 2.5, Continued

CR 32103-03: “Reservation Only” PPV Events Display a Black Screen

For some sites, if you configure a pay-per-view (PPV) event as reservation only, subscribers see a black screen for the event. To resolve this issue, you must configure PPV events as both reservation PPV (RPPV) and impulse PPV (IPPV).

If you are experiencing this issue, please contact Cisco Services for assistance.

CR 43063: If a Device Name Is in Use, You Must Close and Re-Open the User Interface Before Attempting to Enter a Unique Device Name

When you create a new device on the DNCS, such as a new QPSK, the system checks to ensure the name for the new device is not already used by an existing device. Device names must be unique to the entire system, not just unique to the device type.

If the device name is already in use, the system generates an error when you try to save the new device. If you try to create the device with a new name, the save fails again.

Workaround: In order to reverse this error condition, you must close and re-open the device user interface and then create the device with a unique name.
Known Issues in the Standard Version of SR 2.5, Continued

**CR 44642: Use of Browser Navigation Buttons Creates Unexpected Results**

If you use Netscape buttons to navigate Web-based user interfaces, such as the Service Group interfaces, the results are not always consistent with typical Web page navigation. For example, clicking Back may not return both the navigation pane and the main window to the previous pane and window. The result is that the navigation and action choices on the left side of the screen do not match the window on the right side of the screen.

**Note:** The DNCS is migrating to a Web-based application, not simply Web pages. Therefore, it is preferable to use the navigation options provided within the application rather than navigating from the main browser window.

**Workaround:** Hide the Navigation Toolbar from Netscape as shown below. Not only does this hide the Back button, but it also adds valuable screen real estate for the Web-based UIs of the DNCS.

![Netscape 6 Navigation Toolbar](image)

To go back to a previous screen in the Service Group Web interface, use the navigation path provided along the top of each Web-based UI. For example, to go back the Service Group Data window from the Open Service Group window, simply click the Service Group Data hyperlink at the top of the page.

![Service Group data from oliveoil - Netscape 6](image)

**CR 44947: Deleting Nested Packages Deletes a Segment with the Same Name as the Nested Package**

If a nested package and a segment share the same name, both the nested package and the segment are removed from the parent package if you delete the nested package. As a result, you have to re-add the segment to the parent package.

**Workaround:** Do not give segments and nested packages the same name.
Known Issues in the Standard Version of SR 2.5, Continued

CR 47869-01: You Cannot Select Input and Output Ports When Building MPEG Sources

Currently, you can define multiple output ports on a MPEG source and assign multiple ports to different MQAMs of GQAMs or the same MQAM or GQAM. However, when you build the source, the DNCS assumes you want to use the input TSID of the first port. You cannot select individual input ports to tell the MQAM or GQAM the appropriate input TSID to find PIDs. As a result, all sessions intended for port 1 build successfully, and all sessions on port 2 or other ports go into tabman, waiting for status on the MQAM or GQAM.

Workaround: Create a separate MPEG source for each port rather than creating multiple ports to the same source.

CR 48286: BFS Recovery Takes Longer than Expected

Rather than making the next session set up request as soon the current session set up succeeds, bfsServer waits for 30 seconds between making session setup requests. As a result, bfsServer may take a longer time to recover than expected.

CR 48495: Operators Must Define Split Channel Times Using the DNCS Time Zone

When you define the start and end times for split channel in the Set Up Split Channel window, you must enter times using the time zone of the DNCS. If you are configuring split channels for a hub in a different time zone, make sure to convert the times to display properly for the intended time zone.

Example: Your DNCS is on Eastern time, and you want to split a channel for a hub on Pacific time. To split a channel at 3:00 p.m. Pacific time, you would enter 6:00 p.m. as the start time in the Set Up Split Channel window.

CR 50600-03: The Session List May Load Slowly

The more sessions you set up within a 24-hour period, the longer it takes for the Session List to load.

CR 51034: Split Channels On CableCARD Modules Transition Using DNCS Time Zone

CableCARD hosts with CableCARD modules transition between split channel services according to the time zone of the DNCS. However, set-tops on the same hub transition according to the hub’s time zone. Both CableCARD hosts and set-tops should transition between split channel services using the same time zone.
Known Issues in the Standard Version of SR 2.5, Continued

CR 51742-01: Port Label Is Incorrect on the Connectivity Tab for GQAMs

When configuring a GQAM, the Connectivity tab shows an incorrect label of “Input Port 5” for Input Port 4.

![Diagram showing incorrect port label in GQAM Connectivity tab](image)

CR 51843: No Error Message Displays for Invalid Parent IDs

If you create a new service without assigning the service group to a valid parent ID, the system appears to accept the new service group upon saving. However, if you refresh or exit and re-open the Service Group user interface, the newly created service group does not appear. Throughout this process, no error message displays to warn you that the service group will not be saved without a valid parent ID.

CR 51853: Active BFS Sessions Among dsm, bfsServer, and the Database Are Not Synchronized

This CR describes a corner case. Typically, the active BFS sessions are always in sync. If you do experience problems with the BFS and find that the database table entries are out of sync with dsm and bfsServer, you can complete the following workaround to resolve the problem.

**Workaround:** Complete the following steps to correct synchronization issues with active BFS sessions.

1. Stop the bfsServer process.
2. Tear down all bfsSessions.
3. Run clearDbSessions -c.
4. Restart the bfsServer process.
Known Issues in the Standard Version of SR 2.5, Continued

CR 51927: Report Writer Does Not Display All Channels and Sources Correctly

Currently, the Report Writer does not display channels and sources for sessions going from Ethernet inputs to GQAMs.

CR 51974-01: When an Enabled BFS Admin Source Is Deleted, All BFS Sessions Are Torn Down

When you delete a source from the Sources tab of the BFS Administration window, the only sessions that should be torn down automatically are the session for the deleted source and any sessions numbered higher than the session for the deleted source. In addition, if the deletion for the source fails, no sessions should be torn down.

Currently, all BFS sessions are torn down when you delete sources from BFS Administration, even if the deletion of the source fails.

CR 52230-01: Existing OSM Images Are Not Populated Correctly

Currently, an OSM image audit at startup does not work if the BFS server is not available.

CR 52465-01: EAM Audio File Is Not Deleted from BFS

If the MMMServer process restarts during an active Emergency Alert Message (EAM), the aiff audio file for the EAM is not deleted from BFS after the EAM expires.
Known Issues in the Standard Version of SR 2.5, Continued

CR 52603-01: MMMServer May Not Recover and Register with BFS

Correct operation requires you to delete both the MMMAud and MMMCfg servers at the same time before stopping the MMMServer process. When you do this, both servers rebuild correctly when you restart the MMMServer process. If you delete only the MMMAud server (leave the MMMCfg server as is), then the following error conditions occur when you restart the MMMServer process:

- The MMMAud server does not rebuild.
- The MMMServer process does not recover and register with BFS. Instead, the following message appears multiple times in the dncsLog:

  ...MMMBfs::_registerServer(): BFS Error registering with BFS

- You cannot successful send an EAS message with both text and audio content. The user interface disappears without processing the message.

**Workaround:** Currently, if you want avoid these error conditions, you must delete both the MMMAud and MMMCfg servers from the Broadcast File Server List before you stop and restart the MMMServer process. If you have already experienced the error conditions previously detailed, complete the following workaround to correct the error conditions.

1. From the DNCS Administrative Console, click the Application Interface Modules tab.
2. Click BFS Client.
3. From the Broadcast File Server List, select the MMMCfg server.
4. Click File and choose Delete.
5. Stop and restart the MMMServer process again.

**Result:** The MMMServer process registers both the MMMAud server and the MMMCfg server with the BFS.

CR 52833-03: Encrypted Service Content May Go in the Clear Due to sgManager Refresh Cache

This CR describes a corner case. Intermittently, the sgManager sends out a refresh cache to the drm that causes a mismatch between the drm and dsm. This mismatch results in segment information not being sent to the bsm; therefore, the content could go out in the clear.

**Workaround:** A correction to this CR is available through an emergency software patch. Contact your North American Marketing Representative for more information.
Known Issues in the Standard Version of SR 2.5, Continued

CR 53495: System Information Is Not Being Sent in the In Band Stream

Upon recovery of siManager, the SI inserts are not cleared on the distinguished QAM.

CR 53552: RPC Error Messages Received When Using QAM User Interface or auditQam Utility to Reset QAMs

When using the QAM user interface or the auditQam utility to reset a QAM device, you will receive an RPC error message. However, the QAM device will eventually receive the reset command.
Chapter 6
Known Issues for Optional Features

Overview

Introduction

This chapter provides a summary of known issues related to optional features. These CRs only apply if you have the RCS optional feature.

For More Information

The lists in this chapter are not intended to be comprehensive. If you have questions about a particular change request, contact Cisco Services.

In This Chapter

This chapter contains the following topics.

<table>
<thead>
<tr>
<th>Topic</th>
<th>See Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Known Issues for RCS in SR 2.5</td>
<td>6-2</td>
</tr>
</tbody>
</table>
Known Issues for RCS in SR 2.5

CR 48374: BFS Elements Created from All Sites Must Be Edited from All Sites

If you create links, files, directories, servers, and sources using the All Sites feature from the BFS Client, you must make any changes to these elements through the Broadcast File Server List for All Sites. Changes you make to these BFS elements from All Sites are propagated to all of the individual sites by the bfsServer process.

If the BFS elements were originally propagated using the All Sites feature, deleting or editing these elements from individual sites can result in error conditions, such as missing or broken links, that prevent set-tops from receiving BFS services.

Important: If you did not use the All Sites feature to create BFS elements, edit those elements from the individual sites as necessary.

CR 50551: Emergency Alert Messages Are Not Filtered on the Inband Path

The FIPS code filtering is currently only done OOB per QPSK/CMTS. However, hosts without CableCARD modules receive all Emergency Alert Messages through the inband path. In the RNCS architecture, this means if Site2 in Florida receives a tornado warning, Hosts without CableCARD modules at Site3 in Colorado will also receive the warning.
**Known Issues for RCS in SR 2.5, Continued**

**CR 50771-01: Incorrect Site IDs Affect Alarms for RNCS Systems**

Site IDs for RNCS devices are reported correctly in the DNCS database. However, site IDs in the RNCS database are incorrect. For example, if the site ID for a QAM connected to a RNCS is 2, the site ID is 2 in the DNCS database. However, the site ID in the RNCS database is 1.

Given these incorrect site IDs, the RNCS cannot detect when a device, such as a QAM, should be part of its system. As a result, alarms are not issued in Alarm Manager if the device experiences issues, such as failure to connect.

**CR 53407: dncs_host Alias Added To /etc/host Files For RNCS and Object Carousel**

The ntp.conf file uses the dncs_host alias for its server. The dncs_host alias was added to the /etc/host files for the RNCS and the Object Carousel to allow the ntp.conf file to work correctly.

**bfsServer Will Not Go Active When a QAM Is Not Directly Connected to the DNCS**

Some sites do not have headend equipment directly connected to the DNCS. If this scenario is in place, then all QAMs and QPSKs must be routed through a LIONN first.

**Workaround:** To enable this scenario, connect a QAM directly to the DNCS and allow the local BFS Sessions to go active. Once the BFS Sessions go active, you can remove and disable the QAM, then disable the sources for the DNCS. (Do not disable the sources for the RNCS.)
If You Have Questions

If you have technical questions, call Cisco Services for assistance. Follow the menu options to speak with a service engineer.

Access your company's extranet site to view or order additional technical publications. For accessing instructions, contact the representative who handles your account. Check your extranet site often as the information is updated frequently.
Appendix A
What’s Installed with SR 2.5?

Overview

Introduction

This appendix provides a table of the versions of software that will be installed after you upgrade to SR 2.5.

Important: This appendix provides versions for software installed with the base SR 2.5 system. If you have optional features, such as Direct ASI, Overlay, or RCS, check your documentation for these features for version information.

In This Appendix

This appendix contains the following topics.

<table>
