Operations Alert Bulletin
Working with Cisco Services to Recover From a DBDS System Failure

Background
When a Digital Broadband Delivery System (DBDS) failure occurs, your Informix database may be at risk of becoming corrupted, even if your facility uses a standby Digital Network Control System (DNCS). This Operations Alert Bulletin explains the steps you should take after a DBDS system failure.

Recommendation
If you experience a DBDS system failure involving a Solaris panic or an Informix assertion failure, you should contact Cisco Services for assistance. Cisco engineers will defragment your tables and rebuild your indexes using the dncsDbData and formatDbSpace.sh utilities. If these recovery steps are not performed, you may experience other database failures in the future.

Solaris panics are logged in the /var/adm/messages file, and Informix assertion failures are logged in the export/home/informix/online.log. To determine whether you should contact Cisco Services, look for messages in the /export/home/informix/online.log stating that Informix performed work during fast recovery.

Example: Defrag not necessary
The following example indicates that your tables do not need to be defragmented. Messages indicate that no work was needed or performed during the recovery. This example shows what you will see upon startup after a graceful shutdown.

15:16:36  Physical Recovery Started.
15:16:36  Physical Recovery Complete: 0 Pages Restored.
15:16:36  Logical Recovery Started.
15:16:36  20 recovery worker threads will be started.
          0 Committed, 0 Rolled Back, 0 Open, 0 Bad Locks

In this case, you should restart the system and verify that there are no other problems, then check the log files once again for errors.
**Recommendation**

**Example: Defrag necessary**

The following example indicates that you should contact Cisco Services. Messages indicate that 1776 pages were restored, 2995 records were committed, and 14 records were rolled back. This example shows what you will see upon startup after an uncontrolled shutdown.

```
12:09:12  Logical Recovery Started.
12:09:12  20 recovery worker threads will be started.
12:09:17  Logical Recovery Complete.
          2995 Committed, 14 Rolled Back, 0 Open, 0 Bad Locks
```

In cases like this, you should contact Cisco Services to defragment your tables and rebuild your indexes.
