

Release Notes for COS 3.18.1

First Published: December 15, 2017

Last Updated: December 28, 2017

These release notes describes the caveats and other issues resolved or still open in this release. For a list of caveats that apply to COS Release 3.18.1, see [Caveats, page 12](#).

Contents

The following information is in the release notes:

- [Introduction, page 2](#)
- [Feature Overview, page 3](#)
- [Supported Hardware, page 7](#)
- [System Requirements, page 10](#)
- [Installation, page 11](#)
- [Caveats, page 12](#)
- [Related Documentation, page 17](#)
- [Obtain Documentation and Submit a Service Request, page 17](#)

Introduction

Cisco Cloud Object Storage (COS) provides distributed, resilient, high-performance storage and retrieval of binary large object (blob) data. Object storage is distributed across a cluster of hardware systems, or nodes. The storage cluster is resilient against hard drive failure within a node and against node failure within a cluster. Nodes can be added to or removed from the cluster to adjust cluster capacity as needed.

COS has two primary interfaces for content management:

- The OpenStack Swift API, with enhancements to improve quality of service when accessing both large and small media objects
- The Fanout API for efficient storage of unique copies for fair-use compliance

As a managed service of the Cisco Virtualized Video Processing Controller (V2PC), COS is managed through the V2PC graphical web user interface (GUI), which uses REST APIs to simplify COS setup and management. COS also includes a command-line interface (CLI) for management of remote or programmatic content. In addition, COS provides authentication and authorization services using the OpenStack Swauth API.

Through its various management interfaces, COS provides access to large and small media objects, maintains high quality of service, supports cluster management, and coordinates the replication of data across sites to improve resiliency and optimize the physical location of stored data.

New Features and Enhancements

New features in this release include the following:

- V2PC Rolling Updates GUI Client
- Hardened CMC Upgrade Process
- DSE Integration
- Bug fixes

Related Software Products

COS 3.18.1 is a member of the Cisco Virtualized Video Processing (V2P) product suite. As a managed service of V2P, COS and its content are managed through the V2PC GUI. Under V2PC orchestration, COS works with Cisco and third-party applications to provide complete media processing solutions. See the following documents for additional information:

- *Cisco Virtualized Video Processing Controller Deployment Guide*
- *Cisco Virtualized Video Processing Controller User Guide*
- *Cisco Cloud Object Storage Release 3.18.1 User Guide*
- *COS Rolling Update Service User Guide*

Feature Overview

Table 1 provides an overview of the COS features. For full descriptions of these features, see the *Cisco Cloud Object Store Release 3.18.1 User Guide*.

Table 1 **Features Supported in COS Release 3.18.1**

Feature	Description
Cisco UCS and CDE Server Support	<ul style="list-style-type: none"> • COS Release 3.18.1 supports a variety of Cisco UCS and CDE server hardware models and configurations. For details, see Supported Hardware, page 7. • For UCS S3260 nodes without COS preinstalled, COS Release 3.18.1 provides a script to enable setup of one or two COS nodes on the S3260. • For CDE6032 nodes with COS already installed, COS provides a script to configure the CDE6032 for service after installation. A script is also provided for CDE6032 nodes that do not yet have COS installed.
Rolling Update Service (RUS)	<ul style="list-style-type: none"> • Along with the introduction of DEC (Server RAID) comes the need for a way to update COS on each node in a DEC cluster maintaining availability to the application data stored in the cluster. <p>RUS software manages the node-by-node update process so that data within the cluster is always available. For complete details, see the <i>Cisco COS Rolling Update Service User Guide</i>.</p>
COS Metadata Cluster (CMC)	<ul style="list-style-type: none"> • COS Release 3.18.1 uses a separate CMC for the metadata database. Moving the metadata from the COS nodes to a separate platform allows the metadata to grow without reducing the space available for object data on the COS nodes.
COS Lock Manager (CLM)	<ul style="list-style-type: none"> • The CLM runs on the CMC nodes for off-box configurations; it also runs on the COS nodes themselves for on-box configurations.
Automated Node Configuration	<ul style="list-style-type: none"> • A single configuration file for all COS nodes can be stored on an FTP or HTTP server, and then downloaded by the COS initialization routine (cosinit1step) during installation. • A single downloadable configuration file eliminates the need to configure nodes individually, whether manually or via the V2PC GUI. • COS 3.18.1 lets you specify the URL of a configuration file to be used at installation to automatically configure the node according to a predefined template.
Intel Preboot Execution Environment (PXE) Support	<ul style="list-style-type: none"> • PXE can be used to download a network bootstrap program (NBP) to remotely install a COS node over a network.

Table 1 **Features Supported in COS Release 3.18.1 (continued)**

Feature	Description
Improved TCP Transmission	<ul style="list-style-type: none"> • COS 3.18.1 includes optimizations to improve TCP transmit performance.
Small Object Support	<ul style="list-style-type: none"> • For cloud DVR and similar applications, COS 3.18.1 provides Small Object Support to efficiently manage storage of many small files representing media segments.
Fanout Compaction	<ul style="list-style-type: none"> • COS 3.18.1 adds support for compaction of fanout objects to reclaim disk space when copies of a fanout object are deleted before the entire fanout object has been deleted.
V2PC GUI	<ul style="list-style-type: none"> • Lets you quickly and easily access many COS 3.18.1 deployment, monitoring, and alarm functions. • The Node Status page, provides storage and partitions, interfaces, disks, services, and resiliency information. Also shown are raised alarms, if they exist. • Supports configuration of COS node service interface from the GUI. • Supports setting of resiliency policies on a per-cluster basis from the GUI.
V2PC GUI Enhancements	<ul style="list-style-type: none"> • The V2PC GUI has been enhanced to support SLA reporting, alarms and events, COS-VMR load balancing, resiliency groups, and CMC management. • Adjustable SLA reporting thresholds determine the level of Warning and Critical Error messages appearing in the V2PC GUI alarms page. • A Fanout API auth profile for a COS cluster can be configured through the V2PC GUI as well as through the CLI. Previously, the GUI only supported configuring a SWAUTH auth profile.
COS Node Telemetry Forwarding	<ul style="list-style-type: none"> • COS 3.18.1 supports the ability to configure forwarding of log events and statistics to an Elasticsearch instance or Cisco Zeus account for centralized log management and statistical analysis.
High Availability (HA)	<ul style="list-style-type: none"> • COS supports HA as implemented in V2PC, providing redundancy for V2PC VMs. V2PC uses both Cisco and third-party components to support HA.
Swauth API	<ul style="list-style-type: none"> • Simple Auth Service API for authentication of Swift operations. • Based on Swauth Open-Source Middleware API. • Used to manage accounts, users and account service endpoints.

Table 1 **Features Supported in COS Release 3.18.1 (continued)**

Feature	Description
Swift Object Store API	<ul style="list-style-type: none"> • An implementation of a subset of the continually evolving OpenStack Swift API. • Command executions are authenticated using auth tokens provided by Swauth service. • Used to create and manage containers and objects for persistent storage in a COS cluster. • Supports archiving of content from Cisco or ARRIS recorders using DataDirect Networks (DDN) Web Object Scaler (WOS) archive objects.
Fanout API	<ul style="list-style-type: none"> • COS 3.18.1 includes support for a Fanout API to enable interactions with other Cisco and third-party applications orchestrated through V2PC.
Object Store Metadata Resiliency	<ul style="list-style-type: none"> • Metadata resiliency is provided by a distributed and replicated Cassandra document database stored on a separate CMC. • Manual administrative intervention is required on CMC node failure.
Object Store Data Resiliency	<ul style="list-style-type: none"> • Data is resilient to both hard drive and COS node failures. • Local Erasure Coding (LEC), or local COS node data resiliency, is provided by local software RAID. LEC is enabled by default and is configured for two drive failures. We recommend this configuration for resiliency. • Distributed erasure coding (DEC) provides data resiliency across nodes, protecting stored content from loss due to node failure. • COS also supports mirroring of local hard drives as an option. However, LEC is enabled by default, and is the generally recommended choice. <p> Note When configuring local mirroring for resiliency, we recommend using no more than one local mirror copy.</p> <ul style="list-style-type: none"> • Supports configuration of mixed resiliency policies (local erasure with remote mirroring) via the GUI. • Alarms are available for loss of storage.

Table 1 **Features Supported in COS Release 3.18.1 (continued)**

Feature	Description
Resiliency Groups	<ul style="list-style-type: none"> • COS now defines each COS node as a member of a <i>resiliency group</i>, a subdivision of a cluster that provides striping for distributed erasure coding (DEC). Resiliency groups reduce communication overhead between servers by keeping traffic within a resiliency group. Once defined, resiliency groups are maintained as part of cluster and site management, and are transparent to the operator. <p>Each cluster has an associated Cassandra cluster, and a target resiliency that can be met using DEC or mirroring.</p>
Management Interface Bonding	<ul style="list-style-type: none"> • Supports defining two node management interface ports as a primary-backup pair.
Service Load Balancing	<ul style="list-style-type: none"> • COS cluster load balancing is provided by DNS round-robin of a FQDN to multiple physical IPv4 addresses hosted by COS nodes. • Optimal load balancing is provided by extensions to the Swift API through the implementation of HTTP redirect. • Remote smoothing facilitates load balancing by moving content to a new node when it is added to a cluster.
VMR-to-COS Load Balancing	<ul style="list-style-type: none"> • VMR to COS IP discovery and load balancing enables rapid updating of the service directory catalog to reflect changes to VMR-COS interface availability.
Ingest Load Balancing	<p>Ingest load balancing is used for clusters that are configured with multiple resiliency group, and determines which resiliency group hosts the ingest data. This can be done in two ways:</p> <ol style="list-style-type: none"> 1. Proxy Redirect – where the server receiving the ingest request processes the incoming data and sends the corresponding data and parity stripes to servers in the target resilience group. 2. HTTP Redirect – where the server receiving the ingest request redirects the client to resend the request to a server in the target resilience group. <p>The client ingest request will indicate whether or not HTTP redirect is supported; and for the cases where HTTP redirect is not supported, proxy redirect will be used.</p>
COS Cluster Support	<ul style="list-style-type: none"> • Each COS application instance can have one or more clusters created to service that application instance. • Each cluster can have its own asset redundancy policy, shared by all COS nodes that are members of that cluster. • If a cluster is disabled, all member COS nodes will have their interfaces removed from the DNS. Likewise, when a cluster is enabled, all member node interfaces will be added back to the DNS.

Table 1 Features Supported in COS Release 3.18.1 (continued)

Feature	Description
COS AIC Client Management	<ul style="list-style-type: none"> The COS application instance controller (AIC) Client process is monitored by the monit process that runs on each COS node, and if not running, is restarted. The COS AIC Client process creates a PID file that is added to the monit script so it can be monitored and restarted. Command-line scripts support stopping and restarting the AIC Client process manually, bypassing the normal automatic restart process.
Node Decommissioning Paused for Maintenance Mode	<ul style="list-style-type: none"> If a node is in the process of being decommissioned and any node in its cluster is placed in Maintenance mode, the decommissioning process is paused.

Supported Hardware

COS Supported Hardware

Table 1-2 lists the Cisco hardware models and firmware that fully supports the installation of COS Release 3.18.1.

Note

COS Release 3.18.1 has been tested on the hardware models and firmware listed in Table 1-2. It is recommended that you use the specified firmware with the hardware models listed.

Table 1-2 COS 3.18.1 Supported Hardware

Product Name	Storage Bundle	Configuration Supported	Max HDD Capacity	Max Total Storage	SSDs Used by OS and COS	Intel Xeon CPU	Firmware
Cisco CDE6032 (UCS C3K)	4U6	Single Node	56 x 10 TB	560 TB	2 x 480 GB	E5-2695 v4	HUU 2.0(13e)
Cisco CDE6032 (UCS C3K)	4U5	Dual Node	56 x 10 TB	560 TB	4 x 480 GB	E5-2695 v4	HUU 2.0(13e)
Cisco CDE6032 (UCS C3K)	4U3	Dual Node	56 x 6 TB	336 TB	4 x 480 GB	E5-2620 v4	HUU 2.0(13e)
Cisco CDE6032 (UCS C3K)	4U5	Dual Node	56 x 10 TB	560 TB	4 x 480 GB	E5-2620 v4	HUU 2.0(13e), 3.0(1c)
Cisco CDE6032 (UCS C3K-IOE)	4U8	Single Node	56 x 8 TB	560 TB	2 x 480 GB	E5-2680 v4	HUU 3.0(3a)

Table 1-2 *COS 3.18.1 Supported Hardware*

Product Name	Storage Bundle	Configuration Supported	Max HDD Capacity	Max Total Storage	SSDs Used by OS and COS	Intel Xeon CPU	Firmware
Cisco UCS S3260	4U6	Single Node	56 x 10 TB	560 TB	2 x 480 GB	E5-2695 v2	HUU 2.0(13e)
Cisco UCS S3260	4U5	Dual Node	56 x 10 TB	560 TB	4 x 480 GB	E5-2695 v2	HUU 2.0(13e)
Cisco UCS S3260	4U4	Single Node	56 x 6 TB	336 TB	2 x 480 GB	E5-2695 v2	HUU 2.0(13e)
Cisco UCS S3260	4U3	Dual Node	56 x 6 TB	336 TB	4 x 480 GB	E5-2695 v2	HUU 2.0(13e)
Cisco UCS S3260	4U3	Single Node	28 x 6 TB	168 TB	2 x 480 GB	E5-2695 v2	HUU 2.0(13e)
Cisco UCS C3160	4U2	Single Node	54 x 6 TB	324 TB	2 x 400 GB	E5-2695 v2	HUU 2.0(6d)
Cisco UCS C3160	4U1	Single Node	54 x 4 TB	216 TB	2 x 400 GB	E5-2695 v2	HUU 2.0(6d)
Cisco CDE465	4R4	Single Node	36 x 6 TB	216 TB	2 x 480 GB	E5-2670 v3	1.0CDEd

For information about installing the hardware, see the following:

- *Cisco UCS S3260 Storage Server Installation and Service Guide*
- *Cisco UCS C3160 Rack Server Installation and Service Guide*
- *Cisco Content Delivery Engine 465 Hardware Installation Guide*

CMC Supported Hardware

The following CMC hardware is supported in Release 3.14.1 and later.

Product Name	Max DB Capacity	Max Total Storage	SSDs Used by OS and CMC	Intel Xeon CPU
Cisco UCS C220M4 (CMC1)	6 x 1.6TB – Raid10	4.8TB	2 x 1.6TB – \ Raid1	E5-2695v3
Cisco UCS C220M4* (CMC2)	5 x 960GB - JBOD	4.8TB	2 x 120GB – \ Raid1	E5-2630v4

* The UCS C220M4 CMC systems - The Cisco UCS C220 M4 Rack Server is the most versatile, high-density, general-purpose enterprise infrastructure and application server in the industry today. It delivers world-record performance for a wide range of enterprise workloads, including virtualization, collaboration, and bare-metal applications.

The C220 M4 (CMC1) is a 1RU server. When configured for COS CMC, the CMC1 includes the following:

- 2 x 1.6TB solid-state drives (SSDs) in RAID1, for operating system and CMC installation.
- 6 x 1.6TB solid-state drives (SSDs) in RAID10, 4.8TB total storage for Database.
- One system I/O controller providing a total of two 10 GbE ports.

The C220 M4 (CMC2) is a 1RU server. When configured for COS CMC, the CMC2 includes the following:

- 2 x 120GB solid-state drives (SSDs) in RAID1, for operating system and CMC installation.
- 5 x 960GB solid-state drives (SSDs) in JBOD, 4.8TB total storage for Database.
- One system I/O controller providing a total of two 10 GbE ports.

Notes on Cisco CDE6032 Support

COS 3.18.1 supports and comes pre-installed on the Cisco CDE6032, a variant of the UCS S3260 Storage Server that is optimized for COS and related media applications. The CDE6032 includes updated server nodes, uses four 480 GB SSD drives in a hardware RAID configuration as a boot drive, and ships with 560 TB of storage, the maximum currently available for this hardware platform.

Note

Although COS 3.18.1 is pre-installed on the CDE6032, a post-installation script still must be run after installing the hardware. See the *Cisco Cloud Object Storage Release 3.16.1 User Guide* for details.

Notes on Cisco UCS S3260 Support

This release continues support for several UCS S3260 (formerly C3260) configurations. The S3260 platform supports up to two compute nodes and up to 56 storage disks per chassis.

- COS 3.18.1 provides a pre-installation script to enable setup of one or two COS nodes on a UCS S3260 before proceeding with installation of COS software on each COS node configured.
 - If a single node is configured, we recommend using the node with either 28 or 56 disks installed.
 - If two nodes are configured, we recommend installing all 56 disks. The pre-installation script will assign 28 disks to each node.

Note

The pre-installation script is run only once for initial hardware configuration. After that, COS can be reinstalled or upgraded and data or system drives replaced without re-executing the script.

- Following installation, you must select one of three available storage bundles for each node during cosinit:
 - UCS S3260 4U6 (56 disks per node): Select this bundle if you configured a single COS node with 56 x 10 TB disks each.
 - UCS S3260 4U5 (28 disks per node): Select this bundle if you configured a dual COS node setup with 28 x 10 TB disks each.
 - UCS S3260 4U4 (56 disks per node): Select this bundle if you configured a single COS node with 56 x 6 TB disks.

- UCS S3260 4U3 (28 disks per node): Select this bundle if you configured a single COS node with 28 disks installed, or a dual COS node setup with 28 x 6 TB disks each.

**Note**

Knowing which storage bundle is configured allows the system to more accurately report disk issues, such as bad or missing disks, after the node is up and running.

- In a dual node setup, the V2PC web GUI displays the status of only those disks assigned to a particular node:
 - Node1 will list Cisco Disk 01-28.
 - Node2 will list Cisco Disk 29-56.
- On each COS node, eth0 and eth1 are bonded to a bond0 management interface. This differs from the UCS-C3160, where eth0 and eth3 are bonded to a bond0 management interface.

For full details, see **Deploying COS** in the *Cloud Object Storage Release 3.16.1 User Guide*.

System Requirements

COS 3.18.1 operates as a managed service of Cisco V2PC, and COS and its content are managed through the V2PC GUI. For details, see the *Cisco Cloud Object Storage Release 3.16.1 User Guide*.

**Note**

COS 3.18.1 has been tested for compatibility with V2PC Release 3.3.3 (build 3.3.3-16665), available on www.cisco.com. The posted cisco-cos (COS-AIC) application required for integration with V2PC is cisco-cos-bundle-318.1.5.tar. Later releases of COS are expected to be compatible with later versions of V2PC and COS-AIC applications. Contact Cisco for the latest compatibility information.

Supported Environments

COS 3.18.1 supports a Swift and Swauth API environment, and also supports an HTTP-based API for cluster management.

Also, COS 3.18.1 has been tested for compatibility with RUS version 1.3.1 (rus_repo-1.3.1-1.el7.iso).

**Note**

If you have a previously installed RUS version 1.3.2, which was released together with COS 3.16.2 and want to update to RUS version 1.3.1, you will need to first run the following command:

```
rpm -e run
```

then follow the RUS User Guide to install the RUS version 1.3.1.

Installation

Although pre-installed on the CDE6032, COS 3.18.1 must be installed on other compatible UCS or CDE hardware. COS software is provided for installation as a downloadable ISO image that includes the base (CentOS) distribution of Linux along with all of the additional RPM packages needed by a COS node. For installation instructions, see the *Cisco Cloud Object Store Release 3.18.1 User Guide*.

Crash Partition Location

When installed on a UCS C3160, COS Release 3.5.1 created a crash partition on one of the SSDs at the rear of the chassis. With COS 3.18.1, the location of the crash partition depends on the node hardware, as follows:

- When installed on a UCS S3260 (formerly C3260), COS 3.18.1 creates a crash partition along with other system partitions on the software RAID SSDs at the rear of the chassis.
- When installed on a UCS C3160, COS 3.18.1 creates a crash partition along with other system partitions on the RAID system drives, which are the SSDs in chassis slots 55 and 56.

These locations assume a new installation and not an upgrade.

Starting CServer

When starting CServer for the first time, enter the command **service cserver start** at the CLI prompt as shown in the following example:

```
[cos-node@ root]# service cserver start
```

Caution

Starting CServer using the command **service cserver start -C** (or **-c**) results in removal of all content previously stored on the drives in the node. Do not add the **-C** (or **-c**) option unless you intend to wipe all existing content from the drives.

Note

When CServer starts for the first time, an error message similar to “WARNING: unrecognized cpu, using system TSCs per second” may appear on the console. This issue has been observed on UCS S3260 nodes, but does not indicate a problem and can be safely ignored.

Caveats

Caveats describe unexpected behavior in COS software releases. Severity 1 caveats are the most serious caveats; severity 2 caveats are less serious. Severity 3 caveats are moderate caveats, and only selected severity 3 caveats are included in the caveats document.

Caveat numbers and brief descriptions for Cisco COS Release 3.18.1 releases are listed in this section.

Open Caveats

Open Caveats for Cisco COS Release 3.18.1

[Table 3](#) lists the open issues in the COS 3.18.1 release.

Bug details are displayed in the [Bug Search](#).

Table 3 *Open Caveats in COS 3.18.1 Release*

Bug ID	Description
CSCvh00949	Create CMC ACME Project.
CCSvh01189	Read/Delete Performance degrades a lot when we have billion objects in Cassandra.
CSCvh02075	3.17.0-b54: Performance downgraded when 1 COS node is down and repair is on going.
CSCvh07762	Manafesto files in CentOS6 and CentOS7 source trees need to be updated.
CSCvh11464	Trans-coding to different DEC pattern fails when segment size is smaller than 1K.
CSCvh11958	[CMC DSC to DSE Upgrade] Some nodes show as DN after DSE upgrade.
CSCvh13846	3.18.1: After 1 CMC node is down, Rio request failure lasted for 10 min.
CSCvh16782	CMC: salt-minion is not running and disabled for CMC full iso install.
CSCvh19023	Goliath: 3.14.2-b19 KDB at __blk_free_tags+0x8c while test bed had no client traffic.
CSCvh19298	[DSC to DSE Upgrade] HTTP error shows after upgrade all CMC nodes to DSE.
CSCvg69325	cos_3.17.0-b36: Swift get new token, old token still works.
CSCvg80516	CMC: PSB ICMPv4 suite Fails.
CSCvg99209	Mirror Recovery causes long time read response times.
CSCvg99488	Mirror Recovery cause read error.

Resolved Caveats

Resolved Caveats for Cisco COS Release 3.18.1

Table 4 lists the fixed issues in the COS 3.18.1 release.

Bug details are displayed in the [Bug Search](#).

Table 4 *Resolved Caveats in COS 3.18.1 Release*

Bug ID	Description
CSCvh01672	[CMC DSE] Remove dead cassandra node from V2P GUI
CSCvh03043	RUS GUI: Number of remaining nodes is always 0
CSCvh03556	RUS GUI: Concurrent Update has no value selected while editing RUS instance
CSCvh04933	RUS GUI: Many duplicated entries of COS nodes in smrusprogress json document
CSCvh05067	RUS GUI: Need to add scroll bar to the modal for displaying detailed RUS updating progress
CSCvh01631	RUS GUI b155: Starting RUS update failed with error 'toLowerCase of undefined'
CSCvh04192	3.17.0-b57 all nodes in cos cluster hit kdb
CSCvh07556	RUS GUI: Remove a session from GUI but SHOW SOURCES in RUSH still shows it
CSCvh07762	Manafesto files in CentOS6 and CentOS7 source trees need to be updated
CSCvh10491	RUS GUI: RUS instance stuck in executing state if RUS server restarted during updating
CSCvh11232	Ability to disable the code that changes the replication configuration for on-box Cassandra
CSCvh11464	Transcoding to different DEC pattern fails when segment size is smaller than 1K.
CSCvh13772	CSCvg88314 : 317 RUS GUI: View a RUS session, Concurrent Updates still shows optimal
CSCvh14650	CMC Release RPM is not installed with CMC Installation.
CSCvh15081	Fix/Add pre-installation scripts for C3K-IOE and CDE6032
CSCvh16782	CMC: salt-minion is not running and dsabled for CMC full iso install.
CSCvh17224	CSCvg88314 : 317 RUS GUI: Some pop up windows still use "upgrade"
CSCvg11636	Place cos-telemetry-es-docs-3.17.0-cos0.91.noarch.rpm in OUTPUT.
CSCvg28225	LOM::DiskInfo::fillElevatorWithWrites gets stuck when disk runs out of space
CSCvg29997	F802--List Fanout Object--List fanout API will force cos node reboot and stuck client terminal
CSCvg31384	NULL pointer dereference on batch expansion when reassigning stripe ownership.
CSCvg33565	cos UT CMC merge parts
CSCvg40139	CMC-2 node may have too little RAM
CSCvg41391	LEC writes lost when all disks removed.
CSCvg46571	DSE Integration Workflow
CSCvg60765	Pre-installation script needs to allow for multiple vLAN IDs for data ports.

Table 4 **Resolved Caveats in COS 3.18.1 Release (continued)**

Bug ID	Description
CSCvg62837	[CMC DSE] dse should not start automatically after fresh install the cmc full iso
CSCvg65229	[CMC DSE] keyspace cos initializing error after cmcinit
CSCvg67344	Switch Affinity (was adaptive port selection)
CSCvg68938	kdb (Page Fault) after receiving 2 billion HTTP packets
CSCvg69192	salt-master not enabled after installing RUS.
CSCvg73081	[CMC DSE] nodetool decommission failed after remove a cmc node from v2pc
CSCvg73093	[CMC DSE] replication factor should not be adjust if the nodetool decommission failed
CSCvg78426	[v2pc GUI] Metadata Storage is missing GB unit.
CSCvg79545	[CMC DSE] dse should not start automatically after install the cmc repo iso
CSCvg80516	CMC: PSB ICMPv4 suite Fails
CSCvg81189	[CMC DSE]: sometimes dse service status doesn't show in aic_cosnodestatus.
CSCvg81905	Bws is not populated fast enough after a server becomes reachable causing 503 errors.
CSCvg85773	CMC: 1.3.0-68-x86_64 upgrade script issue
CSCvg87072	4.1.0-b108 DSE installation on VM: cos keyspace is not created
CSCvg87805	4.1.0-b108: Installing CMC repo fails due to dependencies
CSCvg87836	V2PC GUI: Details on COS Service Status GUI may disappear if stay on the page for a few seconds.
CSCvg88146	CSCvg88146 : V2PC GUI: Extra "x" button on the UI for adding RUS session.
CSCvg88183	RUS GUI: Starting RUS session failed with error "Cannot call method 'toLowerCase' of undefined".
CSCvg88314	CSCvg88314 : 317 RUS GUI: RUS session show wrong number of total cos nodes.
CSCvg88855	4.1.0-b110 Installing cmc_repo: /opt/cisco/cmc/config/configure_salt_minion.sh: Permission denied.
CSCvg89365	RUS GUI: RUS updating is triggered when a RUS session instance is deleted.
CSCvg89496	RUS GUI: RUS updating won't start if session expired.
CSCvg90376	[V2PC GUI]: Metadata Cluster shouldn't be change when edit existing COS Clusters.
CSCvg92131	RUS GUI: RUS instance in N/A status cannot be deleted from GUI.
CSCvg93378	Include Oracle Java for 3.18 DSE CMC
CSCvg96662	RUS GUI: Support for Source URL Validation.
CSCvg96806	Adjust write priority for on-demand-repair writes.
CSCvg99182	RUS GUI: The alert on new RUS UI cannot be dismissed by clicking the "X" button.
CSCvg99187	RUS GUI: GUI should validate source URL by itself before asking backend to validate it.

Table 4 *Resolved Caveats in COS 3.18.1 Release (continued)*

Bug ID	Description
CSCvg99211	RUS GUI: 403 Forbidden error if validate an invalid source URL.
CSCvg99245	RUS GUI: Missing "Force Update" on RUS instance details on the RUS instance list UI.

Accessing Bug Search Tool

This section explains how to use the Bug Search tool to search for a specific bug or to search for all bugs in a release.

-
- Step 1** Go to <https://tools.cisco.com/bugsearch/>.
- Step 2** At the Log In screen, enter your registered Cisco.com username and password; then, click **Log In**. The Bug Search page opens.

Note If you do not have a Cisco.com username and password, you can register for them at <http://tools.cisco.com/RPF/register/register.do>.

- Step 3** To search for a specific bug, enter the bug ID in the Search For field, and press **Enter**.
- Step 4** To search for bugs in the current release, specify the following criteria:
- Select the **Model/SW Family** Product Category drop-down list box, then enter **Cisco Videoscape Distribution Suite for Television** or select the name from the **Select from list** option.
 - Select **Cisco Videoscape Distribution Suite for Television** from the list that displays.
 - The **Cloud Object Store** type displays in the Software Type drop-down list box.
 - Releases: 3.18.1.
 - Advanced Filter Options—Define custom criteria for an advanced search by selecting an appropriate value from the drop-down lists by choosing either one Filter or multiple filters from the available categories. After each selection, the results page will automatically load below the filters pane. If you select multiple filters, it behaves like an AND condition.
 - Modified Date—Select one of these options to filter bugs: **Last Week**, **Last 30 days**, **Last 6 months**, **Last year**, or **All**.
 - Status—Select **Fixed**, **Open**, **Other**, or **Terminated**.

Select **Fixed** to view fixed bugs. To filter fixed bugs, uncheck the Fixed check box and select the appropriate suboption (Resolved or Verified) that appears below the Fixed check box.

Select **Open** to view all open bugs. To filter the open bugs, uncheck the Open check box and select the appropriate suboptions that appear below the Open check box.

Select **Other** to view any bugs that are duplicates of another bug.

Select **Terminated** to view terminated bugs. To filter terminated bugs, uncheck the Terminated check box and select the appropriate suboption (Closed, Junked, or Unreproducible) that appears below the Terminated check box. Select multiple options as required.
 - Severity—Select the severity level:
 - 1: Catastrophic.
 - 2: Severe
 - 3: Moderate
 - 4: Minor
 - 5: Cosmetic
 - 6: Enhancement

- Rating—Select the bug’s quality rating: **5 Stars** (excellent), **4 or more Stars** (good), **3 or more Stars** (medium), **2 or more Stars** (moderate), **1 or more Stars** (poor), or **No Stars**.
- Support Cases—Select whether the bug **Has Support Cases** or **No Support Cases**.
- Bug Type—Select whether the bug is **Employee Visible & Customer Visible** or **Customer Visible Only**.

Step 5 The Bug Toolkit displays the list of bugs based on the specified search criteria.

Step 6 You can save or email the current search by clicking their respective option.

If you have any problems using the Bug Search tool, log into the Technical Support website at <http://www.cisco.com/cisco/web/support/index.html> or contact the Cisco Technical Assistance Center (TAC).
