* As of 26th February 2016, you cannot order the CE500 and CE1000 appliances from Cisco. See the End-of-sale announcement for other important dates in the lifecycle of these platforms.
Product Documentation

The following documents provide guidance on installation, initial configuration, and operation of the product:

For installing the Expressway, see:

For general administration topics, reference, and maintenance, see:

Other documents that may be relevant in your environment:

- Registrar: See *Cisco Expressway Registrar Deployment Guide* on the Expressway configuration guides page.
- Cisco Spark: Hybrid services knowledge base
- Clustering: See the *Cisco Expressway Cluster Creation and Maintenance Deployment Guide*, for your version, on the Cisco Expressway Series configuration guides page.
  - Cisco Meeting Server configuration guides page
  - See *Cisco Meeting Server API Reference Guide* on the Cisco Meeting Server programming guides page.
- Microsoft Infrastructure:
  - See *Cisco Expressway with Microsoft Infrastructure Deployment Guide* on the Expressway configuration guides page.
  - See *Cisco Jabber and Microsoft Skype for Business Infrastructure Configuration Cheatsheet* on the Expressway configuration guides page.

Edge Traversal Integration with Cisco Meeting Server

The Expressway pair at the edge of the network can now traverse Microsoft SIP traffic to and from Cisco Meeting Server spaces. This enables collaboration in spaces between your users and people from external organizations that use Office 365 or Microsoft Skype for Business infrastructure.

Two Expressway enhancements help you configure these collaboration scenarios:

- The DNS zone can do SRV lookups for the Microsoft federation service (.sipfederationtls._tcp.example.com.)
- Search rules now have the ability to route calls based on which variant of SIP is used on the call

(Preview) IM and Presence Service Federation With Skype for Business or Office 365 Organizations

The Expressway pair at the edge of the network can now traverse messaging and presence traffic between IM and Presence Service and external organizations using Skype for Business or Office 365.

This feature is in preview as it requires corresponding changes to Cisco Unified Communications Manager IM and Presence Service that are not yet released.

Cisco Expressway as H.323 Gatekeeper

X8.8 introduced the ability to use the Expressway-C as a SIP registrar, for TelePresence room and desktop systems. And a new licensing model with that feature.

X8.9 extends the feature to enable H.323 Gatekeeper functionality on the Expressway-C.

When you configure the Expressway as a SIP registrar or H.323 Gatekeeper, you must license it for concurrent systems (the Unified CM model), not for concurrent calls (the VCS model).

For SIP deployments, you can do this by adding either or both of the following license types to the Expressway-C:

- TelePresence Room System License
- Desktop System License

The following SIP devices register as desktop systems with all other devices considered room systems:

- Cisco TelePresence EX60
- Cisco TelePresence EX90
- Cisco DX70
- Cisco DX80

For H.323 deployments, all endpoints consume a TelePresence Room System License. This is due to a limitation in H.323, which does not determine the difference between desktop and room type endpoints.

We therefore recommend SIP as the preferred signaling protocol. H.323 is available as a fall back for endpoints that do not support SIP.

Note: DX systems must be running version CE8.2 or later and EX systems TC7.3.6 or later in order to register as desktop systems (for SIP only). DX and EX systems running earlier versions will still register for SIP but will consume a room system license.

Scope of the registrar feature:

- Option keys containing licenses for local registrations are installed on the Expressway-C.
  These licenses are pooled in a cluster, which means that Expressway-C peers can use each others’ licenses. However, rooms cannot use desktop licenses, and desktop systems cannot use room licenses.
- Registrations from outside the network are proxied to Expressway-C by the Expressway-E. The Expressway-E cannot accept direct registrations.
- Proxy registration is possible with SIP endpoints only and does not apply to H.323 endpoints.
- Device provisioning and FindMe are supported with Cisco TelePresence Management Suite.
- The Large VM or CE1100 can support up to 5000 registrations, or 2500 MRA registrations (proxied to CUCM).
  Local registrations, proxy registrations (via Expressway-E), and MRA registrations, all count towards this number.

Implications of the new licensing model:
New Features in X8.9

- Rich Media Session license usage has been reduced, following the principle that if you have already paid for a registration license you should not also pay for the Rich Media Session.
- Calls between registered systems do not use RMS licenses. Here, ‘registered systems’ means systems registered directly to the Expressway-C, by proxy to the Expressway-C through the Expressway-E, or by proxy through the Expressway pair (MRA) to neighbored Unified CMs.
- Calls from registered systems (as above) to Cisco infrastructure do not use RMS licenses. Currently, this extends only to Cisco Meeting Server, or to TelePresence Server when managed by TelePresence Conductor.
- Calls from registered systems to all other systems use one RMS license. This includes, but is not limited to, the following call types:
  - Business to business calls. Previously required two RMS licenses, now require one on Expressway-E.
  - Business to consumer calls (Jabber Guest). Previously required two RMS licenses, now require one on the Expressway-E.
  - Interoperability gateway calls (including Microsoft Lync / Skype for Business and third-party call control servers where interworking is required). Require one RMS license on the Expressway-C.

For more information:

Expressway Administrator Guide

REST API Expansion

In X8.8, we introduced a new API to simplify remote configuration. Third party systems, such as Cisco Prime Collaboration Provisioning, can now use the API to configure the following features / services on the Expressway:

- Mobile and Remote Access (MRA)
- Business to business (B2B) calls

The API is self-documented using REST API Markup Language (RAML).

Allow Jabber on iOS to Use Safari for SSO Over MRA

This option applies if you use single sign-on (SSO) and have Cisco Jabber iOS endpoints that access Unified Communications services from outside the network. In this case, by default the identity provider’s authentication page is displayed in an embedded web browser (not the Safari browser) on the iOS devices. That default browser is unable to access the iOS trust store, and so cannot use any certificates deployed to the devices. From X8.9, you can optionally configure Expressway-E to allow Jabber on iOS devices to use the native Safari browser. Because the Safari browser is able to access the device trust store, you can now enable password-less authentication or two-factor authentication in your SSO deployment.

Caveat

A potential security issue exists for this option. The mechanism to return browser control from Safari to Jabber after the identity provider authentication completes, uses a custom URL scheme that invokes a custom protocol handler. It’s possible that another application other than Jabber could intercept the scheme and gain control from iOS. In that case, the application would have access to the OAuth token in the URL.

If you are confident that your iOS devices will not have other applications that register the Jabber custom URL scheme, for example because all mobile devices are managed, then it’s safe to enable the option. If you are
New Features in X8.9

Concerned about the possibility of another app intercepting the custom Jabber URL, then do not enable the embedded Safari browser.

Note: Make sure that you apply this option consistently in Expressway—E and in Unified CM. If you decide to enable or disable it in one application, do the same in the other. The relevant settings are:

- Allow Jabber iOS clients to use embedded Safari browser in Expressway—E (Configuration > Unified Communications > Configuration > Single Signon section)
- SSO Login Behavior for iOS in Unified CM (System > Enterprise Parameters > SSO Configuration section)

Supported endpoints

- Cisco Jabber for iOS 11.8 or later, on devices using iOS 9 or later

Supported Unified Communications services

- Cisco Unified Communications Manager 11.5(1)SU1 or later
- Cisco Unity Connection 11.5(1) or later

(Preview) Shared Line / Multiple Line Support for MRA Endpoints

Expressway now supports pass through of Unified CM shared line and multiple line features for endpoints that are connecting by Mobile and Remote Access.

The benefit of this feature is that remote and mobile endpoint users can use features, like barge, conference barge, hold on one device and resume on another, in the same way as they would when they are on the premises.

You need to configure multiple and shared lines for users and their MRA devices on Unified CM.

Required versions:

- Unified CM 11.5(1)SU2 or later
- Expressway X8.9 or later
- Cisco IP Phone 7800 Series and Cisco IP Phone 8800 Series phones, with firmware version 11.5(1) or later

Note: This feature is disabled by default, because it impacts some features on earlier versions of Unified CM.

If you are using a Unified CM version before 11.5(1)SU2, and you enable SIP Path headers on Expressway—C, the following Unified CM features will report the MRA devices' IP addresses instead of the Expressway's IP address:

- Device Mobility
- Real-Time Monitoring Tool (RTMT)
- Cisco Emergency Responder (CER)

Other features may also be affected by this change. The devices' IP addresses are not useful for determining their location, as they are typically from reserved private ranges and could overlap with your organization's internal range.

(Preview) Smart Call Home

Smart Call Home is a free embedded support capability for Expressway. It offers proactive diagnostics and real-time alerts, enabling higher network availability and increased operational efficiency.

Smart Call Home notifies users of Schedule- and Event-based notifications.

- Schedule-based: inventory, telemetry and configuration messages used to generate a Device Report and improve hardware and software quality by identifying failure trends. You can find these notifications posted on the first day of every month.
New Features in X8.9

- Event-based: asynchronous events already supported by Expressway such as alarms and ACRs. You will find these notifications posted to the Smart Call Home server as and when they occur.

  You can opt to keep your organization’s details anonymous. In this case Expressway sends reports to the Smart Call Home server as normal, but the server does not send out notifications.

Secure Install Wizard

The Expressway now includes an Install Wizard that helps make the deployment and configuration of your system easier and more secure.

The Install Wizard guides you through the initial configuration required to get your system up and running securely. Any further configuration is then possible using the web interface or CLI.

Only the person authorized to complete the system installation can access and complete the initial setup on the system console (or VM equivalent). All accounts on the Expressway are disabled upon first boot until the installation is complete. The system is also not accessible over the network interface until the installation has been completed and secured.

In a VM deployment, any preconfigured data gets imported when the VM boots for the first time and you are not required to re-enter data.

The Install Wizard does not affect the upgrade procedure for an existing system, as the system maintains any data that you have already configured.

Improved DiffServ Code Point Marking

If you use our Unified Communications Mobile and Remote Access solution, from X8.9 the Expressway supports improved DSCP (Differentiated Service Code Point) packet marking for traffic passing through the firewall. DSCP is a measure of the Quality of Service level of the packet. To provide more granular control of traffic prioritization, DSCP values are set (marked) for these individual traffic types:

<table>
<thead>
<tr>
<th>Traffic type</th>
<th>Supplied default value</th>
<th>Web UI field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Video</td>
<td>34</td>
<td>QoS Video</td>
</tr>
<tr>
<td>Audio</td>
<td>46</td>
<td>QoS Audio</td>
</tr>
<tr>
<td>XMPP</td>
<td>24</td>
<td>QoS XMPP</td>
</tr>
<tr>
<td>Signaling</td>
<td>24</td>
<td>QoS Signaling</td>
</tr>
</tbody>
</table>

Before X8.9 you had to apply DSCP values to all signaling and media traffic collectively.

You can optionally change the default DSCP values from the **System > Quality of Service** web UI page (or the CLI).

Notes:
- DSCP value "0" specifies standard best-effort service.
- DSCP marking is applied to SIP and H.323 traffic.
- DSCP marking is applied to TURN media, providing the TURN traffic is actually handled by the Expressway.

Existing QoS/DSCP Commands and API are Discontinued

From X8.9 we no longer support the previous methods to specify QoS/DSCP values. The former Web UI settings QoS Mode and QoS Value, CLI commands `xConfiguration IP QoS Mode and xConfiguration IP QoS Value` and corresponding API are now discontinued. Do not use these commands.

What if I currently use these commands?

When you upgrade the Expressway, any existing QoS value you have defined is automatically applied to the new fields and replaces the supplied defaults. For example, if you had a value of 20 defined, all four DSCP settings (QoS
Audio, QoS Video, QoS XMPP, QoS Signaling) are set to 20 also.

We don’t support downgrades. If you need to revert to your pre-upgrade software version, the QoS settings are reset to their original supplied defaults. So QoS Mode is set to None and QoS Value is set to 0. You will need to manually redefine the values you want to use.

Improved Maintenance Mode

Maintenance mode on the Expressway has been enhanced so that you can bring an MRA system down in a managed way.

When you engage maintenance mode, the Expressway stops accepting new calls or proxy (MRA) traffic. Existing calls and chat sessions are not affected.

As users end their sessions normally, the system comes to a point when it is not processing any traffic of a certain type, and then it shuts that service down.

If users try to make new calls or start new chat sessions while the Expressway is in maintenance mode, the clients will receive a service unavailable response, and they might then choose to use another peer (if they are capable). This fail-over behavior depends on the client, but restarting the client should resolve any connection issues if there are active peers in the cluster.

The Unified Communications status pages also show (Maintenance Mode) in any places where MRA services are affected.

Other Changes and Enhancements

- The Expressway now supports advanced account security mode.
- You can nominate an administrator account as an emergency account. In case the Expressway disallows local authentication but is unable to connect to a remote authentication service.
- We have removed the limitation that TURN services should not be enabled on a system that is being used for MRA. We did this to allow services that require TURN to coexist with MRA. One example is edge traversal for Cisco Meeting Server.

  **Note:** This change does not make Jabber Guest compatible with MRA. It also does not mean that TURN can be used for MRA. The change simply means that MRA is not impacted if you enable TURN services (for other reasons).
- We have discontinued the pre-X8.9 API and CLI commands for defining QoS/DSCP values: xConfiguration IP QoS Mode and xConfiguration IP QoS Value. They are replaced by new commands / web UI settings.
- The web administration port is now configurable, on the **System > Administration** page. The default port is still 443.
From X8.9 onwards, automated intrusion protection is enabled, by default, for the following categories:

- http-ce-auth
- http-ce-intrusion
- sshpfwd-auth
- sshpfwd-intrusion
- xmpp-intrusion

This change affects new systems. Upgraded systems keep their existing protection configuration.

Open and Resolved Issues

Follow the links below to read the most recent information about the open and resolved issues in this release.

- All open issues, sorted by date modified (recent first)
- Issues resolved by X8.9

Notable Issues in this Version

**CSCva36208: Rich Media Session license is not consumed by Single NIC Expressway-E hosting Jabber Guest service**

Changes to the licensing model in X8.8 revealed an issue with licensing of the Jabber Guest service on the Expressway-E server. When the Expressway pair is part of the "Single NIC" Jabber Guest deployment, the Expressway-E should count one RMS license for each Jabber Guest call, but it does not.

This issue could cause confusion about the server's load because the usage appears low, even when the server is processing multiple calls. We recommend the Dual NIC Jabber Guest deployment.

If you are using the single NIC deployment, make sure your Expressway-E is correctly licensed to ensure continuity of service when upgrading in future.

Limitations

Unsupported Features (General)

- DTLS is not supported through the Expressway-C/Expressway-E. SRTP is used to secure calls instead; attempts to make DTLS calls will fail.
- SIP UPDATE method. Features that rely on the SIP UPDATE method ([RFC 3311](https://tools.ietf.org/html/rfc3311)) will not work as expected because the Expressway does not support this method.
- Audio calls may be licensed as video calls in some circumstances. Calls that are strictly audio-ONLY consume fewer licenses than video calls. However, when audio calls include non-audio channels, such as the iX channel that enables ActiveControl, they are treated as video calls for licensing purposes.

Unsupported Cisco Meeting Server Web Proxy

**CAUTION:** Do not use the Meeting Server Web Proxy feature. This feature is not supported with this release of Expressway, due to known issues.

We've added a reverse https proxy for Meeting Server, which enables off-premises users to browse to a Meeting Server Web Bridge. Users can manage or join spaces without having any software other than a supported browser.
The proxy requires very little additional configuration on the Expressway pair; you simply enter the Meeting Server listening address on the Expressway-C, and the pair makes use of the existing traversal connection to proxy external https requests to that address.

You can enable the Meeting Server Web Proxy on the same Expressway pair as MRA or other traversal features, but you cannot use it when the pair is configured for Jabber Guest.

- Supported browsers.

Unsupported Endpoint Features When Using MRA

Note: This list contains known limitations and is not exhaustive. The MRA deployment does not necessarily support pass through of line-side features provided by Cisco Unified Communications Manager. Absence of such items from this list does not imply that they are supported.

- Call recording for Cisco Jabber endpoints connected over Mobile and Remote Access (MRA).
- Cisco IP Phone 88xx and 78xx series support shared line or multiline features when connected through MRA (provided that Path Header support is enabled). We do not support shared line or multiline features over MRA for any other phones, endpoints, or soft clients.
- Directory access mechanisms other than UDS.
- Certificate provisioning to remote endpoints e.g. CAPF.
Features that rely on the SIP UPDATE method (RFC 3311) will not work as expected because the Expressway does not support this method. For example, CUCM and endpoints use UPDATE to implement blind transfer, which does not work correctly via MRA.

Peer-to-peer file transfer when using IM and Presence Service and Jabber is unsupported via MRA
- Managed File Transfer (MFT) with IM and Presence Service 10.5.2 (and later) and Jabber 10.6 (and later) clients is supported via MRA
- File transfer with WebEx Messenger Service and Cisco Jabber is supported via MRA

Additional mobility features including GSM handoff and session persistency.
- Hunt group/hunt pilot/hunt list.
- Self-care portal.
- Jabber SDK is not supported over MRA.

Unsupported Expressway Features and Limitations When Using MRA
- The Expressway cannot be used for Jabber Guest when it is used for Mobile and Remote Access (MRA).
- The Expressway-C used for MRA cannot also be used for Microsoft gateway service. Microsoft gateway service requires a dedicated Expressway-C.
- MRA is not supported in IPv6 only mode.
- Endpoint management capability (SNMP, SSH/HTTP access).
- Multi-domain and multi-customer support is limited as follows:
  - Prior to X8.5, each Expressway deployment supported only one IM&P domain (even though IM and Presence Service 10.0 or later supports Multiple Presence Domains).
  - As of X8.5, you can create multiple deployments on the Expressway-C, but this feature is still limited to one domain per deployment.
  - As of X8.5.1, a deployment can have Multiple Presence Domains. This feature is in preview, and we currently recommend that you do not exceed 50 domains.
- Deployments on Large VM servers are limited to 2500 proxied registrations to Unified CM (the same limit as Small / Medium VM servers).
- Not all contact center features are supported by Expressway when connected through MRA.

Unsupported Contact Center Features When Using MRA
This section applies if you use the Cisco Unified Contact Center Express (Unified CCX) solution through Mobile and Remote Access (MRA).

Expressway does not support some Unified CCX features for contact center agents or other users who connect over MRA. Unsupported features include:
- Deskphone control functions (due to no support for CTI-QBE protocol).
- Built in Bridge (BIB) functions, which means that silent monitoring and recording, and agent greeting are not available.
- Shared line and multiline support for 78xx and 88xx series phones is available as a preview feature from X8.9 but is not in earlier Expressway versions.

Notes:
- Jabber for Mac and Jabber for Windows are not capable of deskphone control when they are connected over MRA. This is because the Expressway pair does not traverse the CTI-QBE protocol.
- If these Jabber applications, or other CTI applications, can connect to CUCM CTIManager (directly or through the VPN) they can provide deskphone control of clients that are connected over MRA.
Interoperability

The interoperability test results for this product are posted to http://www.cisco.com/go/tp-interop, where you can also find interoperability test results for other Cisco TelePresence products.

Notable Interoperability Concerns

X8.7.n (and earlier versions) of Expressway are not interoperable with Cisco Unified Communications Manager IM and Presence Service 11.5(1).

This is caused by a deliberate change in that version of IM and Presence Service, and there is a corresponding change in Expressway X8.8 (and later).

To ensure continuous interoperability, you must upgrade your Expressway systems to X8.9 before you upgrade your IM and Presence Service systems to 11.5(1).

The symptom of the issue is an error on Expressway as follows:

Failed Unable to Communicate with <IM&P node address>. AXL query HTTP error "'HTTPError:500'"

Upgrading to X8.9

Prerequisites and Software Dependencies

Upgrade Caution, PLEASE READ: X8.8 and later versions are more secure than earlier versions. Upgrading could cause your deployments to stop working as expected, so you must check for the following environmental issues before you upgrade to X8.8 or later:

- Minimum versions of Unified Communications infrastructure: Some versions of Unified CM, IM and Presence Service, and Cisco Unity Connection have been patched with CiscoSSL updates. Check that you’re running the minimum versions described in the Mobile and Remote Access deployment guide, before you upgrade Expressway.
  
  See Mobile and Remote Access Through Cisco Expressway on the Expressway configuration guides page. IM and Presence Service 11.5 is an exception. You must upgrade Expressway to X8.8 or later before you upgrade IM and Presence Service to 11.5.

- Certificates: Certificate validation was tightened up in X8.8.
  
  - Try the secure traversal test before and after upgrade (Maintenance > Security certificates > Secure traversal test) to validate TLS connections.
  
  - Are your Unified Communications nodes using valid certificates that were issued by a CA in the Expressway-Cs' trust list?
  
  - If you are using self-signed certificates, are they unique? Does the trusted CA list on Expressway have the self-signed certificates of all the nodes in your deployment?
  
  - Are all entries in the Expressway’s trusted CA list unique? You must remove any duplicates.
  
  - If you have TLS verify enabled on connections to other infrastructure (always on by default for Unified Communications traversal zone, and optional for zones to Unified Communications nodes) you must ensure that the hostname is present in the CN or SAN field of the host’s certificate. We do not recommend disabling TLS verify mode, even though it may be a quick way to resolve a failing deployment.
Upgrading to X8.9

- DNS entries: Do you have forward and reverse DNS lookups for all infrastructure systems that the Expressway interacts with?
  
  **Important!** From version X8.8 onward, you must create forward and reverse DNS entries for all Expressway-E systems, so that systems making TLS connections to them can resolve their FQDNs and validate their certificates.
  
  If the Expressway cannot resolve hostnames and IP addresses of systems, your complex deployments (eg. MRA) could stop working as expected after you upgrade.

- Cluster peers: Do they have valid certificates? If they are using default certificates you should replace them with (at least) internally generated certificates and update the peers' trust lists with the issuing CA.

  **Note:** If you are upgrading to X8.8 or later from an earlier version, clustering communications changed in X8.8 to use TLS connections between peers instead of IPSec. TLS verification is not enforced (by default) after you upgrade, and you’ll see an alarm reminding you to enforce TLS verification.

**Hybrid Services**

Your Management Connector must be up to date before you upgrade your Expressway. You must authorize and accept any upgrades advertised by the Cisco Collaboration Cloud before attempting to upgrade.

**Note:** X8.7.1 is now the minimum version required for Hybrid Services. If you are using Hybrid Services with X8.7, you must upgrade to X8.7.1 or later.

**Existing TMS Agent (Legacy Mode) Provisioning Deployments**

Expressway X8.1 and later no longer supports TMS Agent (legacy mode) provisioning. **Before you upgrade to X8 or later,** if you are using TMS Agent (legacy mode) for provisioning you must first migrate to Cisco TelePresence Management Suite Provisioning Extension which requires TMS 13.2.x. See *Cisco TMS Provisioning Extension Deployment Guide* for instructions about how to migrate.

**Existing OCS Relay Deployments**

Expressway X8.1 and later no longer supports OCS Relay integration with Microsoft Lync 2010 / OCS 2007 R2. If you use OCS Relay you must migrate to using the Microsoft Interoperability B2BUA to route SIP calls between the Expressway and Microsoft infrastructure. See *Cisco VCS and Microsoft Infrastructure Deployment Guide* for information about this deployment.

**Upgrade Instructions**

We recommend that you upgrade Expressway components while the system has low levels of activity.

If you are upgrading a clustered Expressway, you must follow the directions in *Expressway Cluster Creation and Maintenance Deployment Guide*.

To upgrade a non–clustered Expressway:

1. Backup the Expressway (**Maintenance > Backup and restore**).
   
   You should backup your system before upgrading. If you later need to downgrade to an earlier release you will have to restore a backup made against that previous release.

2. Enable maintenance mode:
   
   a. Go to **Maintenance > Maintenance mode**.
   
   b. Set **Maintenance mode** to **On**.
   
   c. Click **Save** and click **OK** on the confirmation dialog.

3. Wait for all calls to clear (**Status > Calls**).

4. Upgrade and restart the Expressway (**Maintenance > Upgrade**).
   
   The web browser interface may timeout during the restart process, after the progress bar has reached the end. This may occur if the Expressway carries out a disk file system check – which it does approximately once every 30 restarts.

The upgrade is now complete and all Expressway configuration should be as expected.
Upgrade Expressway-C and Expressway-E systems connected over a traversal zone

We recommend that Expressway-C (traversal client) and Expressway-E (traversal server) systems that are connected over a traversal zone both run the same software version.

However, we do support a traversal zone link from one Expressway system to another that is running the previous major release of Expressway. This means that you do not have to simultaneously upgrade your Expressway-C and Expressway-E systems.

Note that certain services (such as Mobile and Remote Access) require both the Expressway-C and Expressway-E systems to be running the same software version.

- We strongly recommend installing a new server certificate if you are upgrading from any version of Expressway released prior to X8.1.1.

Using Collaboration Solutions Analyzer

Collaboration Solutions Analyzer is a tool created by Cisco Technical Assistance Center (TAC) to help you with troubleshooting, by analyzing log files from your Cisco Expressway.

To get started:

1. Collect the logs from your Cisco Expressway.
   (You need a customer or partner account to sign in).
3. Paste or drag in your log file.
4. Click Run.

The tool analyzes the log file and displays the information in a format that is much easier to understand than the raw logs. For example, you can generate ladder diagrams to show SIP calls.

Using the Bug Search Tool

The Bug Search Tool contains information about open and resolved issues for this release and previous releases, including descriptions of the problems and available workarounds. The identifiers listed in these release notes will take you directly to a description of each issue.

To look for information about a specific problem mentioned in this document:

1. Using a web browser, go to the Bug Search Tool.
2. Sign in with a cisco.com username and password.
3. Enter the bug identifier in the Search field and click Search.

To look for information when you do not know the identifier:

1. Type the product name in the Search field and click Search.
2. From the list of bugs that appears, use the Filter drop-down list to filter on either Keyword, Modified Date, Severity, Status, or Technology.

Use Advanced Search on the Bug Search Tool home page to search on a specific software version.

The Bug Search Tool help pages have further information on using the Bug Search Tool.

Obtaining Documentation and Submitting a Service Request

Use the Cisco Notification Service to create customized flexible notification alerts to be sent to you via email or by RSS feed.
Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, using the Cisco Bug Search Tool (BST), submitting a service request, and gathering additional information, see *What’s New in Cisco Product Documentation*. To receive new and revised Cisco technical content directly to your desktop, you can subscribe to the *What’s New in Cisco Product Documentation RSS feed*. The RSS feeds are a free service.
